4. Standards sent to BOT for approval.	July 2010
5. Standards filed with regulatory authorities.	September 2010

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

~~**Adverse Reliability Impact**—The impact of an event that results in Bulk Electric System instability; uncontrolled separation or cascading~~None ~~outages.~~

A. Introduction

1. **Title:** Coordination Among Reliability Coordinators
2. **Number:** IRO-014-2
3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.
4. **Applicability:**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months ~~one year~~ after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months ~~one year~~ after Board of Trustees approval.

B. Requirements

- R1. For conditions or activities that impact other Reliability Coordinator Areas, each ~~Each~~ Reliability Coordinator shall have Operating Procedures, Processes, or Plans for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]*
 - 1.1. Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.
 - 1.2. Energy and capacity shortages.
 - 1.3. Planned or unplanned outage information.
 - 1.4. Control of voltage, including the coordination of reactive resources.
 - 1.5. Coordination of information exchange to support reliability assessments.
 - 1.6. Authority to act to prevent and mitigate conditions which ~~instances of~~ could ~~cause~~ ing Adverse Reliability Impacts to other Reliability Coordinator Areas.
- R2. Each Reliability Coordinator's Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be: *[Violation Risk Factor: Lower] [Time Horizon: Same Day Operations ~~Planning~~ and Operations ~~Long-term~~ Planning]*
 - 2.1. Agreed to by all the Reliability Coordinators required to take the indicated action(s).

2.2. Distributed to all Reliability Coordinators that are required to take the indicated action(s).

- R3. [For conditions or activities that impact other Reliability Coordinator Areas](#), eEach Reliability Coordinator shall make notifications and exchange reliability-related information with impacted Reliability Coordinators using its predefined Operating Procedures, Processes, or Plans for conditions that may impact other Reliability Coordinator Areas or other means to accomplish the notifications and exchange of reliability-related information. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations and Operations Planning]*
- R4. Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly, and other communication forums with impacted Reliability Coordinators. *[Violation Risk Factor: Lower][Time Horizon: Real-time Operations]*
- R5. Each Reliability Coordinator, upon identification of an Adverse Reliability Impact, shall notify [all](#) impacted Reliability Coordinators. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R6. Each impacted Reliability Coordinator shall operate as though the problem exists when the identified Adverse Reliability Impact cannot be agreed to by the impacted Reliability Coordinators, *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R7. The Reliability Coordinator with the identified Adverse Reliability Impact shall develop a mitigation plan when the impacted Reliability Coordinators can not agree that the problem exists. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R8. Each impacted Reliability Coordinator shall implement the mitigation plan developed by the Reliability Coordinator who has the identified Adverse Reliability Impact when the impacted Reliability Coordinators can not agree on a mitigation plan [unless such actions would violate safety, equipment, or regulatory or statutory requirements](#). *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*

C. Measures

- M1. Each Reliability Coordinator shall have available the latest approved documented version of Operating Procedures, Processes, or Plans that require notifications, information exchange or the coordination of actions among impacted Reliability Coordinators [for conditions or activities that impact other Reliability Coordinator Areas](#). This documentation may include, but is not limited to, dated, current in force documentation with the specified elements. [\(R1\)](#)
- M2. Each Reliability Coordinator shall have evidence that the Operating Procedures, Processes, or Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were:
- 2.1 Agreed to by all the Reliability Coordinators required to take the indicated action(s).

2.2 Distributed to all Reliability Coordinators that are required to take the indicated action(s).

This evidence may include, but is not limited to dated document with confirmation of receipt or dated electronic communications with confirmation of receipt. [\(R2\)](#)

M3. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it made notifications and exchanged reliability-related information with impacted Reliability Coordinators using its predefined Operating Procedures, Processes, or Plans for conditions [or activities](#) that ~~may~~ impact other Reliability Coordinator Areas or other means to accomplish the notifications and exchange of reliability-related information. [\(R3\)](#)

M4. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it participated in agreed upon (at least weekly) conference calls and other communication forums with impacted Reliability Coordinators. [\(R4\)](#)

M5. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it, upon identification of an Adverse Reliability Impact, notified impacted Reliability Coordinators. [\(R5\)](#)

M6. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it operated as though the problem exists when the identified Adverse Reliability Impact was not agreed to by the impacted Reliability Coordinators. [\(R6\)](#)

M7. Each Reliability Coordinator with the identified Adverse Reliability Impact shall have evidence and provide evidence that it developed a mitigation plan when the impacted Reliability Coordinators could not agree that the problem exists. This evidence may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation. [\(R7\)](#)

M8. Each impacted Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it implemented the mitigation plan developed by the Reliability Coordinator who has the identified Adverse Reliability Impact when the impacted Reliability Coordinators can not agree on a mitigation plan [unless such actions would have violated safety, equipment, or regulatory or statutory requirements](#); [\(R8\)](#)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Compliance Monitoring Period and Reset Time Frame

Not Applicable

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Reliability Coordinator shall retain its current, in force document and any documents in force since the last compliance audit for all Requirements R1, R2, and Measures M1, M2.
- Each Reliability Coordinator shall retain its most recent 12 months of evidence for Requirement R3, R4, ~~R5~~ R5 and Measure M3, M4, ~~M5~~ M5.
- Each Reliability Coordinator shall retain 3 calendar years plus current calendar year of evidence for Requirements ~~R5-R6~~ through R8 and Measures ~~M5-M6~~ through M8.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Reliability Coordinator has Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address one or two of the parts subrequirements.	The Reliability Coordinator has Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address three or four of the parts subrequirements.	The Reliability Coordinator has Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address five of the parts subrequirements.	The Reliability Coordinator failed to have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability.
R2	N/A	The Reliability Coordinator failed to have evidence that the Operating Procedures, Processes, or Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were distributed to all Reliability Coordinators that are required to take action.	The Reliability Coordinator failed to have evidence that the Operating Procedures, Processes, or Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were agreed to by all Reliability Coordinators that are required to take action.	The Reliability Coordinator failed to have evidence that the Operating Procedures, Processes, or Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were agreed to by all Reliability Coordinators that are required to take action and were distributed to all Reliability Coordinators that are required to take action.

Standard IRO-014-2 — Coordination Among Reliability Coordinators

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	N/A	N/A	The Reliability Coordinator failed to make notifications OR exchange reliability-related information with impacted Reliability Coordinators.	The Reliability Coordinator failed to make notifications AND exchange reliability-related information with impacted Reliability Coordinators.
R4	N/A	N/A	N/A	The Reliability Coordinator failed to participate in an agreed upon (at least weekly) conference call or other communication forum with impacted Reliability Coordinators.
R5	N/A	The Reliability Coordinator failed to notify one, but not all, of the impacted Reliability Coordinators upon identification of an Adverse Reliability Impact.	N/A	The Reliability Coordinator failed to notify any impacted Reliability Coordinators upon identification of an Adverse Reliability Impact.
R6	N/A	N/A	N/A	The Reliability Coordinator failed to operate as though the problem existed when the identified Adverse Reliability Impact was not agreed to by the impacted Reliability Coordinators.

Standard IRO-014-2 — Coordination Among Reliability Coordinators

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R7	N/A	N/A	N/A	The Reliability Coordinator with the identified Adverse Reliability Impact failed to develop a mitigation plan when the impacted Reliability Coordinators can not agree that the problem exists.
R8	N/A	N/A	N/A	The impacted Reliability Coordinator failed to implement the mitigation plan developed by the Reliability Coordinator who has the identified Adverse Reliability Impact when the impacted Reliability Coordinators could not agree on a mitigation plan.

E. Regional Differences

None identified.

F. Associated Documents

Version History

Version	Date	Action	Change Tracking
1	August 10, 2005	<ol style="list-style-type: none"> 1. Changed incorrect use of certain hyphens (-) to “en dash (–).” 2. Hyphenated “30-day” when used as adjective. 3. Changed standard header to be consistent with standard “Title.” 4. Initial capped heading “Definitions of Terms Used in Standard.” 5. Added “periods” to items where appropriate. 6. Changed “Timeframe” to “Time Frame” in item D, 1.2. 7. Lower cased all words that are not “defined” terms — drafting team, self-certification. 8. Changed apostrophes to “smart” symbols. 9. Added comma in all word strings “Procedures, Processes, or Plans,” etc. 10. Added hyphens to “Reliability Coordinator-to-Reliability Coordinator” where used as adjective. 11. Removed comma in item 2.1.2. 12. Removed extra spaces between words where appropriate. 	January 20, 2006

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Prerequisite Approvals

- None required

Conforming Changes to Requirements in Already Approved Standards

- IRO-001-2 — Reliability Coordination — Responsibilities and Authorities
- IRO-015-1 — Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 — Coordination of Real-time Activities between Reliability Coordinators

Revision Summary

The Reliability Coordination SDT (RC SDT) revised the standard and is proposing retiring two requirements (R3 and R4). New requirements were brought into this standard from IRO-015-1 (R1-R2) and IRO-016-1 (R1 and its sub requirements). Changes were made to eliminate redundancies between standards (existing and proposed), eliminate administrative items, align with NERCs Rules of Procedure and to address issues in FERC Order 693.

Functions that Must Comply with the Requirements in the Standard:

- Reliability Coordinator

Effective Dates

In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after Board of Trustees approval.

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-2</p> <p>R7. The Reliability Coordinator shall have clear, comprehensive coordination agreements with adjacent Reliability Coordinators to ensure that System Operating Limit or Interconnection Reliability Operating Limit violation mitigation requiring actions in adjacent Reliability Coordinator Areas are coordinated.</p>	<p>IRO-014-2</p> <p>R1. For conditions or activities that impact other Reliability Coordinator Areas, each Reliability Coordinator shall have Operating Procedures, Processes, or Plans for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: <i>[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]</i></p> <p>1.1. Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.</p> <p>1.2. Energy and capacity shortages.</p> <p>1.3. Planned or unplanned outage information.</p> <p>1.4. Control of voltage, including the coordination of reactive resources for voltage control.</p> <p>1.5. Coordination of information exchange to support reliability assessments.</p> <p>1.6. Authority to act to prevent and mitigate conditions which could cause Adverse Reliability Impacts to other Reliability Coordinator Areas.</p>
<p>Notes: The RC SDT proposes retiring R7 as it is redundant with IRO-014, R1.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R1. The Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: <i>[Violation Risk Factor: Lower]</i></p> <p>R1.1.1 Communications and notifications, including the conditions¹ under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators. [Violation Risk Factor: Medium]</p> <p>R1.1.2 Energy and capacity shortages. [Violation Risk Factor: Medium]</p> <p>R1.1.3 Planned or unplanned outage information. [Violation Risk Factor: Medium]</p> <p>R1.1.4 Voltage control, including the coordination of reactive resources for voltage control. [Violation Risk Factor: Medium]</p> <p>R1.1.5 Coordination of information exchange to support reliability assessments. [Violation Risk Factor: Lower]</p> <p>R1.1.6 Authority to act to prevent and mitigate instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas. [Violation Risk Factor: Lower]</p>	<p>IRO-14-2</p> <p>R1. For conditions or activities that impact other Reliability Coordinator Areas, each Reliability Coordinator shall have Operating Procedures, Processes, or Plans for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability. - These Operating Procedures, Processes, or Plans shall collectively address the following: <i>[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]</i></p> <p>1.1 Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators</p> <p>1.2 Energy and capacity shortages.</p> <p>1.3 Planned or unplanned outage information.</p> <p>1.4 Control of voltage, including the coordination of reactive resources for voltage control.</p> <p>1.5 Coordination of information exchange to support reliability assessments.</p> <p>1.6 Authority to act to prevent and mitigate instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas.</p>

¹ Examples of conditions when one Reliability Coordinator may need to notify another Reliability Coordinator may include (but aren't limited to) sabotage events, Interconnection Reliability Operating Limit violations, voltage reductions, insufficient resources, arming of special protection systems, etc.

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Notes: Revise R1 as shown and delete the footnote.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R2. Each Reliability Coordinator’s Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be:</p> <p>R2.1. Agreed to by all the Reliability Coordinators required to take the indicated action(s).</p> <p>R2.2. Distributed to all Reliability Coordinators that are required to take the indicated action(s).</p>	<p>IRO-014-2</p> <p>R2. Each Reliability Coordinator’s Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be: <i>[Violation Risk Factor: Lower] [Time Horizon: Same Day Operations and Long-term Planning]</i></p> <p>2.1 Agreed to by all the Reliability Coordinators required to take the indicated action(s).</p> <p>2.2 Distributed to all Reliability Coordinators that are required to take the indicated action(s).</p>
<p>Notes: The RC SDT added a Time Horizon to the requirement and eliminated the VRFs that were applied to the subrequirements.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R3. A Reliability Coordinator's Operating Procedures, Processes, or Plans developed to support a Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan shall include:</p> <p>R3.1. A reference to the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.</p> <p>R3.2. The agreed-upon actions from the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.</p>	<p>None – Retire the requirement</p>
<p>Notes: This requirement is administrative in nature describing the contents of the plans and should not be in a standard. The RC SDT proposes retiring R3 and its subrequirements and recommends converting these good utility practices into a guideline document for use in developing the operating procedures, processes or plans.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R4. Each of the Operating Procedures, Processes, and Plans addressed in Reliability Standard IRO-014 Requirement 1 and Requirement 3 shall:</p> <p>R4.1. Include version control number or date.</p> <p>R4.2. Include a distribution list.</p> <p>R4.3. Be reviewed, at least once every three years, and updated if needed</p>	<p>None – retire the requirement.</p>
<p>Notes: This requirement is administrative in nature describing the contents of the plans and should not be in a standard. The RC SDT proposes retiring R4 and its subrequirements and recommends converting these good utility practices into a guideline document for use in developing the operating procedures, processes or plans.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-015-1</p> <p>R1. The Reliability Coordinator shall follow its Operating Procedures, Processes, or Plans for making notifications and exchanging reliability-related information with other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 The Reliability Coordinator shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas. <i>[Violation Risk Factor: Medium]</i></p> <p>R2. The Reliability Coordinator shall participate in agreed upon conference calls and other communication forums with adjacent Reliability Coordinators. <i>[Violation Risk Factor: Lower]</i></p> <p>R2.1 The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly. <i>[Violation Risk Factor: Lower]</i></p> <p>R3. The Reliability Coordinator shall provide reliability-related information as requested by other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-014-2</p> <p>R3. For conditions or activities that impact other Reliability Coordinator Areas, each Reliability Coordinator shall make notifications and exchange reliability-related information with impacted Reliability Coordinators using its predefined Operating Procedures, Processes, or Plans for conditions that may impact other Reliability Coordinator Areas or other means to accomplish the notifications and exchange of reliability-related information. <i>[Violation Risk Factor: Medium]</i> [Time Horizon: Real-time Operations and Operations Planning]</p> <p>R4. Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly, and other communication forums with impacted Reliability Coordinators. <i>[Violation Risk Factor: Lower]</i> <i>[Time Horizon: Real-time Operations]</i></p>
<p>The RC SDT recommends retiring Standard IRO-015 and moving Requirements R1 and R2 to IRO-014-2 and revising as shown.</p> <p>The RC SDT proposes retiring R3 (as shown in the left column) as it is redundant with proposed R5 above. Reliability Coordinators already have several requirements aimed at providing data or information to other Reliability Coordinators in support of Reliability Coordinator responsibilities. For example, Reliability Coordinators provide reliability-related information to other Reliability Coordinators as part of IRO-010-1, R3 – they share information as they try to confirm the existence of operating issues as part of IRO-014-2 R5, etc.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-016-1</p> <p>R1. The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2 If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.). <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2.1 If time permits, this re-evaluation shall be done before taking corrective actions. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2.2 If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.3 If the involved Reliability Coordinators cannot agree on the solution, the more conservative solution shall be implemented. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-014-2</p> <p>R5. Each Reliability Coordinator, upon identification of an Adverse Reliability Impact, shall notify all impacted Reliability Coordinators. <i>[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>R6. Each impacted Reliability Coordinator shall operate as though the problem exists when the identified Adverse Reliability Impact cannot be agreed to by the impacted Reliability Coordinators <i>[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>R7. The Reliability Coordinator with the identified Adverse Reliability Impact shall develop a mitigation plan when the impacted Reliability Coordinators can not agree that the problem exists. <i>[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>R8. Each impacted Reliability Coordinator shall implement the mitigation plan developed by the Reliability Coordinator who has the identified Adverse Reliability Impact when the impacted Reliability Coordinators can not agree on a mitigation plan unless such actions would violate safety, equipment, or regulatory or statutory requirements. <i>[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p>
<p>Notes: IRO-014-2 R5 and R6 are revised versions of IRO-016-1, R1 and its subrequirements which were moved to this standard. The RC SDT removed the wording relating to the “most conservative solution” because it can not be measured. We are proposing to use the mitigation plan of the RC who is experiencing the issue in cases where an agreed to mitigation plan can not be developed. Note that stakeholders proposed revisions to these requirements, and the RC SDT subdivided the requirements to add more clarity.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Prerequisite Approvals

- None required

Conforming Changes to Requirements in Already Approved Standards

- IRO-001-2 — Reliability Coordination — Responsibilities and Authorities
- IRO-015-1 — Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 — Coordination of Real-time Activities between Reliability Coordinators

Revision Summary

—The Reliability Coordination SDT (RC SDT) revised the standard and is proposing retiring two requirements (R3 and R4). New requirements were brought into this standard from IRO-015-1 (R1-R2) and IRO-016-1 (R1 and its sub requirements). Changes were made to eliminate redundancies between standards (existing and proposed), eliminate administrative items, align with NERCs Rules of Procedure and to address issues in FERC Order 693.

Functions that Must Comply with the Requirements in the Standard:

- Reliability Coordinator

Effective Dates

~~To be determined.~~

In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after Board of Trustees approval.

[Violation Risk Factor: Lower]</p>	<p>IRO-14-2</p> <p>R1. <u>For conditions or activities that impact other Reliability Coordinator Areas,</u> The Each Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with impacted with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators. <u>These Operating Procedures, Processes, or Plans shall collectively address the following:</u> [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]</p> <p>R1.1 These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: [Violation Risk Factor: Lower]</p> <p>R1.1.1 Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators. [Violation Risk Factor: Medium]</p> <p>R1.1.2 Energy and capacity shortages. [Violation Risk Factor: Medium]</p> <p>R1.1.3 Planned or unplanned outage information. [Violation Risk Factor: Medium]</p> <p>R1.1.4 <u>Control of V</u>voltage control, including the coordination of reactive resources for voltage control. [Violation Risk Factor: Medium]</p> <p>R1.1.5 Coordination of information exchange to support reliability assessments. [Violation Risk Factor: Lower]</p> <p>R1.1.6 Authority to act to prevent and mitigate instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas. [Violation Risk Factor: Lower]</p>
<p>Notes: Revise R1 as shown and delete the footnote.</p>	

¹ Examples of conditions when one Reliability Coordinator may need to notify another Reliability Coordinator may include (but aren't limited to) sabotage events, Interconnection Reliability Operating Limit violations, voltage reductions, insufficient resources, arming of special protection systems, etc.

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R2. Each Reliability Coordinator's Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be:</p> <p>R2.1. Agreed to by all the Reliability Coordinators required to take the indicated action(s).</p> <p>R2.2. Distributed to all Reliability Coordinators that are required to take the indicated action(s).</p>	<p>IRO-014-2</p> <p>R2. Each Reliability Coordinator's Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be: [<i>Violation Risk Factor: Lower</i>] [<i>Time Horizon: <u>Same Day</u>, Real-time Operations <u>Planning</u> and Operations-<u>Long-term</u> Planning</i>]</p> <p>R2.1 Agreed to by all the Reliability Coordinators required to take the indicated action(s). [<i>Violation Risk Factor: Lower</i>]</p> <p>R2.2 Distributed to all Reliability Coordinators that are required to take the indicated action(s). [<i>Violation Risk Factor: Lower</i>]</p>
<p>Notes: The RC SDT added a Time Horizon to the requirement and eliminated the VRFs that were applied to the subrequirements.</p>	

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R3. A Reliability Coordinator's Operating Procedures, Processes, or Plans developed to support a Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan shall include:</p> <p>R3.1. A reference to the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.</p> <p>R3.2. The agreed-upon actions from the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.</p>	<p>None – Retire the requirement</p>
<p>Notes: This requirement is administrative in nature describing the contents of the plans and should not be in a standard. The RC SDT proposes retiring R3 and its subrequirements and recommends converting these good utility practices into a guideline document for use in developing the operating procedures, processes or plans.</p>	

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R4. Each of the Operating Procedures, Processes, and Plans addressed in Reliability Standard IRO-014 Requirement 1 and Requirement 3 shall:</p> <p>R4.1. Include version control number or date.</p> <p>R4.2. Include a distribution list.</p> <p>R4.3. Be reviewed, at least once every three years, and updated if needed</p>	<p>None – retire the requirement.</p>
<p>Notes: This requirement is administrative in nature describing the contents of the plans and should not be in a standard. The RC SDT proposes retiring R4 and its subrequirements and recommends converting these good utility practices into a guideline document for use in developing the operating procedures, processes or plans.</p>	

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-015-1</p> <p>R1. The Reliability Coordinator shall follow its Operating Procedures, Processes, or Plans for making notifications and exchanging reliability-related information with other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 The Reliability Coordinator shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas. <i>[Violation Risk Factor: Medium]</i></p> <p>R2. The Reliability Coordinator shall participate in agreed upon conference calls and other communication forums with adjacent Reliability Coordinators. <i>[Violation Risk Factor: Lower]</i></p> <p>R2.1 The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly. <i>[Violation Risk Factor: Lower]</i></p> <p>R3. The Reliability Coordinator shall provide reliability-related information as requested by other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-014-2</p> <p>R5R3. <u>For conditions or activities that impact other Reliability Coordinator Areas</u>, The Each Reliability Coordinator shall make notifications and exchange reliability-related information with impacted Reliability Coordinators using its predefined Operating Procedures, Processes, or Plans for conditions that may impact other Reliability Coordinator Areas or other means to accomplish the notifications and exchange of reliability-related information. <i>[Violation Risk Factor: Medium]</i> <u>[[Time Horizon: Real-time Operations and Operations Planning]</u></p> <p>R6R4. The Each Reliability Coordinator shall participate in agreed upon conference calls, <u>at least weekly</u>, and other communication forums with impacted adjacent Reliability Coordinators. <i>[Violation Risk Factor: Lower]</i> <u>[[Time Horizon: Real-time Operations]</u></p> <p>R6.1 The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly. <i>[Violation Risk Factor: Lower]</i></p>
<p>The RC SDT recommends retiring Standard IRO-015 and moving Requirements R1 and R2 to IRO-014-2 and revising as shown.</p> <p>The RC SDT proposes retiring R3 (as shown in the left column) as it is redundant with proposed R5 above. Reliability Coordinators already have several requirements aimed at providing data or information to other Reliability Coordinators in support of Reliability Coordinator responsibilities. For example, Reliability Coordinators provide reliability-related information to other Reliability Coordinators as part of IRO-010-1, R3 – they share information as they try to confirm the existence of operating issues as part of IRO-014-2 R5, etc.</p>	

Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
---------------------------	-------------------------------------

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

IRO-016-1

R1. The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem. *[Violation Risk Factor: Medium]*

R1.1 If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken. *[Violation Risk Factor: Medium]*

R1.2 If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.). *[Violation Risk Factor: Medium]*

R1.2.1 If time permits, this re-evaluation shall be done before taking corrective actions. *[Violation Risk Factor: Medium]*

R1.2.2 If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved. *[Violation Risk Factor: Medium]*

R1.3 If the involved Reliability Coordinators cannot agree on the solution, the **more conservative solution** shall be implemented. *[Violation Risk Factor: Medium]*

IRO-014-2

R5. ~~When an expected or actual reliability issue is detected, the~~Each Reliability Coordinator, ~~upon identification of an Adverse Reliability Impact,~~ shall ~~confirm the existence of the issue with the~~notify all impacted ~~other~~ Reliability Coordinators ~~that are involved.~~ ~~In the event that the issue cannot be confirmed, each RC shall operate as though the problem exists.~~*[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*

R6. ~~When an expected or actual reliability issue exists and the~~Each impacted ~~affected~~ Reliability Coordinators ~~shall operate as though the problem exists when the identified Adverse Reliability Impact cannot be agreed to by the impacted Reliability Coordinators.~~ ~~can not agree on a mitigation plan, all impacted affected Reliability Coordinators shall implement the mitigation plan developed by the Reliability Coordinator who has the reliability issue.~~*[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*

R7. The Reliability Coordinator with the identified Adverse Reliability Impact shall develop a mitigation plan when the impacted Reliability Coordinators can not agree that the problem exists. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*

R8. Each impacted Reliability Coordinator shall implement the mitigation plan developed by the Reliability Coordinator who has the identified Adverse Reliability Impact when the impacted Reliability Coordinators can not agree on a mitigation plan unless such actions would violate safety, equipment, or regulatory or statutory requirements. *[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*

Implementation Plan for IRO-014-2 Coordination Among Reliability Coordinators

Notes: IRO-014-2 R5 and R6 are revised versions of IRO-016-1, R1 and its subrequirements which were moved to this standard. The RC SDT removed the wording relating to the “most conservative solution” because it can not be measured. We are proposing to use the mitigation plan of the RC who is experiencing the issue in cases where an agreed to mitigation plan can not be developed. [Note that stakeholders proposed revisions to these requirements, and the RC SDT subdivided the requirements to add more clarity.](#)

Unofficial Comment Form for Reliability Coordination – Project 2006-06

Please **DO NOT** use this form. Please use the [electronic comment form](#) at the link below to submit comments on the proposed revisions to the standards for Project 2006-06 — Reliability Coordination. Comments must be submitted by **February 3, 2010**. If you have questions please contact Stephen Crutchfield at stephen.crutchfield@nerc.net or by telephone at 609-651-9455.

http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

Background Information:

The Reliability Coordination Standards Drafting Team (RC SDT) was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; and 3) revising the group of standards based on FERC Order 693.

During the course of the project, the NERC standards staff revised the Reliability Standards Development Plan and noted several areas of overlapping scope between certain projects. The original SAR for Project 2006-06 called for revisions to PER-004 — Reliability Coordination – Staffing and PRC-001 — System Protection Coordination. Based on scope overlap, it was determined that PER-004 and PRC-001 would best be served by moving the proposed work to Project 2006-01: System Personnel Training and Project 2007-06: System Protection, respectively.

The RC SDT proposed revisions to the set of standards under the project in August and September 2008. The RC SDT made revisions to the set of standards based on stakeholder feedback and the results of the IROL Standards Drafting Team work. Since the inception of this project, the IROL Standards Drafting Team has proposed, successfully balloted and obtained NERC Board of Trustees approval for three new Standards which included revisions to other IRO standards. With the approval of the IROL set of standards, certain requirements were retired from other IRO standards (see below summaries for specific examples under the RC SDT project).

1. Do you agree with the proposed definition of Interpersonal Communication (COM-001-2)? If not, please explain in the comment area.

- Yes
- No

Comments:

2. Do you agree with the proposed definition of Alternative Interpersonal Communication (COM-001-2)? If not, please explain in the comment area.

- Yes
- No

Comments:

3. Do you agree with the revisions made to Requirement 1 in COM-001-2 as shown in the posted Standard and Implementation Plan? If not, please explain in the comment area.

- Yes
- No

Comments:

4. Do you agree with the definition of Reliability Directive (COM-002-2)? If not, please explain in the comment area.

- Yes
- No

Comments:

5. Do you agree with the revisions to the Requirements in COM-002-3 as shown in the posted Standard and Implementation Plan? If not, please explain in the comment area.

- Yes
- No

Comments:

6. Do you agree with the use of the defined term "Reliability Directive" in revisions to the Requirements in IRO-001-2 as shown in the posted Standard and Implementation Plan? If not, please explain in the comment area.

- Yes
- No

Comments:

7. Do you agree with the revisions to the Requirements in IRO-014-2 as shown in the posted Standard and Implementation Plan? If not, please explain in the comment area.

Standards Announcement

Comment Period Open

January 4–February 3, 2010

Now available at: http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

Project 2006-06: Reliability Coordination

The Reliability Coordination Standards Drafting Team is seeking comments on the following standards and associated implementation plans **until 8 p.m. EST on February 3, 2010**:

- COM-001-2 — Communications
- COM-002-3 — Communications and Coordination
- IRO-001-2 — Reliability Coordination – Responsibilities and Authorities
- IRO-014-2 — Coordination Among Reliability Coordinators

This is the third comment period for the proposed standards and implementation plans. The drafting team has made revisions to the documents based on stakeholder feedback. Explanations of the changes are included in the comment form. The drafting team has also posted its consideration of industry comments received during the previous comment period.

Instructions

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Lauren Koller at Lauren.Koller@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page:

http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

Next Steps

The drafting team will draft and post responses to comments received during this period. The drafting team will also determine whether to post the standards for an additional comment period or seek approval from the Standards Committee to proceed to balloting.

Project Background

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; and 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team, and two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to scope overlap.

Applicability of Standards in Project

Reliability Coordinator
Balancing Authority

Purchasing Selling Entity
Transmission Service Provider
Transmission Operator
Distribution Provider
Generator Operator
Load Serving Entity

Proposed Glossary of Terms Changes

New terms:

Reliability Directive
Interpersonal Communication
Alternative Interpersonal Communication

Modified term:

Adverse Reliability Impact

Standards Development Process

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

TPL-001-2 Draft 5 is much better than Draft 4. There is still one significant concern, that I do not believe the drafting team adequately addressed. It is unclear as to what "Planning Assessment results" and "results of its Planning Assessment" entail. The Draft 5 response that "Planning Assessment" is a defined term does not fully address this concern. "Planning Assessment results" or "results of its Planning Assessment" is not necessarily the same thing as "Planning Assessment". As written, "Planning Assessment results" or "results of its Planning Assessment" could be anything from a single sentence, to a few brief high level

paragraphs, to a detailed and technically complete Planning Assessment. The Standard needs to more clearly state what is required in the report to other entities. Based on the drafting team response in Draft 4, it seems that replacement of "Planning Assessment results" or "results of its Planning Assessment" with the term "Planning Assessment" or "its Planning Assessment" would be appropriate. Violation Severity Levels: R8 The failure to provide documented responses to documented comments to "Planning Assessment results" is deemed to be a higher severity level than failing to distribute "results of its Planning Assessment". Failure to distribute denies functional entities an opportunity to comment, and could prevent coordinated planning, and thus should be deemed to be more severe than failing to provide documented responses to documented comments.

<p>Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay13 protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay13 protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”. In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No12” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.”</p>
No
<p>Measure M6 is too vague. It is unclear how to identify the conditions of Cascading, voltage instability, or uncontrolled islanding. The Glossary of Terms defines Cascading as “The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.” Does the loss of system elements have to extend beyond the Control Area to be considered “Cascading”? Is there a Megawatt threshold that must be satisfied? Is there a time duration involved? Also, “cascading outages” needs to be defined. In addition, “voltage instability” and “uncontrolled islanding” should both be defined.</p>
Yes

Phuong Tran
Lakeland Electric

Yes
Shouldn't the "Implementation Plan for TPL-001-1" document be for TPL-001-2? Also, "TPL-001-1" is referenced throughout the document.
No
"the latest" is not needed from the second sentence of R1, since the sentence already ended with "...shall represent projected System conditions". R1 Part 1.1.2 Suggest adding this clarification at the end "... six months during the period under study". This language addition helps clarify the point that if an outage occurs during the summer and the entity's system peak occurs in the winter, then the system peak Load study case (model) does not have to include this particular outage.
No
Please consider removing R.2.6.2
No
A "measurable change in performance" can be interpreted as not meeting one of the performance requirements as specified in Table 1 in order for the condition to be selected as a sensitivity. This will cause utilities to perform sensitivity analysis for all system conditions listed in R2.1.4 to determine which one fails to meet one of the performance requirements in Table 1, as one may not be able to tell performance impact until after the studies are performed. Suggested change: "...one of the following conditions by a sufficient amount...system conditions that may demonstrate a measurable change in system response."
Yes
No
Please consider removing R2.6.2. The "any material change" language can cause utilities perform studies due to material changes outside of and remote to its system.
Yes
The performance requirements of Table 1 do not allow the loss of non-consequential load for single and multiple contingency events. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Having a provision at the regional level that a PA or TP can have a certain amount of non-consequential load loss designed or planned in to its system that would be reasonable if it is acceptable to the RE and does not have an adverse impact on the remaining BES. In lieu of such a RE provision, providing a quantitative cap in non-consequential load loss such as 100 MW may be rationale compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. It is our understanding that footnote 9 is under consideration as part of Project 2010-11 and should be noted as such for clarification.
No
please consider remove "the latest" from M1
No
The requirement to distribute the Planning Assessment should be more flexible and allow for making the Planning Assessment available, such that those entities that desire the

information can have it readily available. R8 should be modified as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.

PNM

Yes

We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent "[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models". As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response".

Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay13 protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay13 protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No12" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet

this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

Group

NERC Staff

Mallory Huggins

Yes

NERC staff supports the change to allow Corrective Action Plans to include tripping of Non-Consequential Load and curtailment of Firm Transmission Service for 7 years. This seems long, but staff understands the stakeholder concern that it could take that long to plan, site, and construct facilities required for compliance with the standard.

Yes

NERC staff supports the revisions to the definition of Year One. However, we believe an associated change should be made where this term is used in part 2.1.1 of Requirement 2 which requires modeling of "System peak Load for either Year One or year two, and for year five." It seems the new definition of Year One would negate the need to refer to year two. NERC staff recommends that part 2.1.1 be changed to "System peak Load for Year One and for year five."

No

NERC staff suggests that the added sentence in R1 be deleted and "Normal System" in Table 1 be replaced with "No unplanned Element outages." We have a problem with R1 establishing "normal system condition." "Normal" is not defined, but the system condition that most people would define as "normal" is the System operating within its limits. There are no checks required on the projected system conditions to guarantee "operation within limits." Staff realizes that if this were the case, the categories tested would all pass their respective tests. (In other words, the category tests may define operating limits that in turn define "normal" from a planning perspective.) Thus, the added sentence in R1 should be deleted. In Table 1, the use of the term "Normal System" in the column "Initial System Condition" really means "No unplanned Element outages." All Elements that do not have a planned outage are assumed in-service (for transmission Elements) or available for dispatch (for generators). Contrast the term "Normal System" with categories P3 and P6, which have the loss of an Element (which is unplanned) followed by the loss of a second Element (also unplanned). "Normal System" should be replaced with "No unplanned Element outages."

Yes

NERC staff supports the use of qualified past studies for the Near Term horizon.
Yes
NERC staff supports removing the phrase “not already included in the studies” from the parts 2.1.4 and 2.4.3 of Requirement R2. We believe that the requirement is more clear and less subject to interpretation without this phrase.
No
NERC staff understands why the SDT has inserted the word “expected” before “dynamic behavior of Loads,” but we have concerns with this addition. We understand that a PC or TP that models the best current industry understanding of load behavior should not need to worry about compliance if that model does not match actual load response for all possible system conditions. However, we are concerned that this change to part 2.4.1 of Requirement R2 may be too accommodating. If a PC or TP has unrealistic expectations about load behavior, would this permit the use of unrealistic models? While we have struggled to develop an alternative proposal, we hope that the SDT will identify a way to address this concern.
Yes
NERC staff supports inserting the word “material” in the reference to assessing the impact of proposed generation. We have some concern that this change leaves this part of the requirement open to interpretation, but we also understand the need to permit some degree of engineering judgment to be applied. It would not be appropriate to require that every potential generation addition be included in the assessment where some proposed additions may by inspection be deemed to be immaterial due to size and/or interconnection location.
Yes
NERC staff supports the changes to the header notes in Table 1.
NERC staff is concerned with P5 and footnote 9 and thus cannot support these changes in their entirety. First, a revision to the Draft 4 definition of P5 should be used in lieu of the current Draft 5 version: “Loss of multiple elements caused by the Fault clearing consistent with failure of a single Protection System while clearing a fault on one of the following: . . .” After reviewing the P5 contingency throughout various drafts of this standard, along with existing Table 1 for TPL-001 through TPL-004, NERC staff’s primary concern is that this most recent version is going in the wrong direction by becoming too limiting regarding which Protection System component failures are covered. Draft 5 is an improvement because it removes the reference to loss of multiple elements in Draft 4 (which defined P5 as “Loss of multiple elements caused by the failure of a single Protection System while clearing a fault on one of the following: . . .”). Draft 5 takes a step backward, however, by referring to Delayed Fault Clearing. The advantage of not referring to Delayed Fault Clearing is that for cases where redundant protection systems are provided, the fault clearing may not be delayed even when a single Protection System failure occurs. Ideally, NERC staff believes that P5 should refer to “failure of any component of a Protection System,” but NERC staff recognizes that we cannot get there until the term Protection System is redefined and Project 2009-07—Reliability of Protection Systems is underway. Until that change is possible, NERC staff encourages the SDT to use the revised version of P5 proposed above. A second concern is with footnote 9, which is used numerous times in Table 1. System adjustments may be used in two different settings: the first is to address the aftermath of a particular Contingency; the second is to prepare for the next Contingency. Staff suggests that the current footnote 9 have this language added: “Post-Contingency Ccurtailment of Firm Transmission Service to address the simulated contingency, when coupled with” Footnote 9 is used in the column labeled “Interruption of Firm Transmission Service Allowed” whenever a “No” is provided. The footnote 9 in this column has to do with System adjustments that address the aftermath of the Contingency

that is being simulated. Therefore, no footnote 9 appears appropriate for category P0 (No Contingency). The reference in footnote 9 to no load loss and staying within applicable Facility rating, including those on a neighboring system, is sufficient for addressing the aftermath of the Contingency being simulated. To address next Contingency, an additional footnote is needed in the "Initial System Condition" column for category P3 and category P6. The following is suggested: "System adjustments to prepare for the next Contingency must be completed within 30 minutes." Footnote 9 is used in the column labeled "Initial System Condition" for category P3 and category P6, and these two categories define the loss of an Element "followed by System adjustments" and then followed by the loss of a second Element. It is unclear whether the intent in footnote 9 in these two cases is meant to address the same issue referenced above (i.e. the aftermath of the Contingency being simulated) or whether it is intended to address the next Contingency. Thus, both situations need to be addressed using the suggestions indicated above.

Yes

NERC staff supports the changes to the Measures.

We appreciate the effort of the standard drafting team and the changes reflected in the current draft of the TPL-001-1 standard. The changes are improvements that should move the standard towards greater industry consensus. The extended Implementation Plan aligns with suggestions in FE's prior ballot comments. We support the Implementation Plan change made by the team.

Yes

The change in the Year One definition provides greater flexibility for the industry and also addresses a prior FE comment during the 1st ballot. We appreciate the team's careful consideration of the industry feedback and support the change.

Yes

Yes

Yes

Yes

Yes

Yes

Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay (footnote 13) protecting the Faulted element to operate as designed". To the extent fully redundant relaying exists with no expected delay in Fault Clearing its understood that the P5 event would not be a concern for the redundant system design. The drafting team has taken appropriate steps within the TPL standard to focus on relaying failures to provide clarity in what is required for P5 planning event.

Yes
We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”.
Yes
Yes
No
I like that you have requirements for qualifying past studies, but Part 2.6.2 is confusing. Please change Part 2.6.2 to read something like: “For steady state, short circuit or Stability analysis: no material changes have occurred to the System represented in the study or, if material changes have occurred, a technical rationale can be provided to explain that the changes do not impact the performance results in the study area.”
Yes
Yes
For consistency, use the qualifier “expected” in the second sentence of Part 2.4.1 also, such that it reads “...represents the overall expected dynamic behavior...”
Yes
I like the flexibility you give the PC and TP to define what ‘material’ means in their ‘documentation to support the technical rationale for determining material changes.’ In Part 2.5 this rationale will decide whether or not any Long-Term Stability studies are required for the Planning Assessment. And in Part 2.6.2 this rationale will be a factor in qualifying a past study.
Yes
I like the flexibility you give the PC and TP in Requirements R3 and R4 to develop their rationale for the Contingencies they select for evaluation.
No. Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure

of a relay13 protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay13 protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No12" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue). In Table 1 - Planning Events - Suggest changing the description for Events P2-3, P2-4, P4 and P4-6 to use the term 'Bus-tie Breaker' or 'non-Bus-tie Breaker' as applicable. In Table 1 - Extreme Events - Stability - Items 2a-2d, do you mean 'Protection System failure' here, or do you want to change to 'relay failure' to be consistent with changes in P5?

The definition does not adequately address normal (pre-contingency) operating procedures or system configurations. Language should be added to the requirement (perhaps as R1.1.7) to include normal operating procedures or system configurations in place prior to any contingency occurring.

Yes

Yes
Yes
Yes
Comments: We wish to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations regardless of whether high-speed reclosing is used on the faulted line. We suggest the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP." We wish to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.

Allowing the use of past studies in lieu of new studies for part or all of an assessment when the underlying system hasn't changed in a significant change if very prudent. However the wording in 2.6.2 of "unless a technical rationale can be provided to demonstrate that System changes do not impact the performance results in the study area" is of concern. By this wording is it intended that the planner must demonstrate that every material change has no impact? In essence doing more work to prove that a study isn't required then the study would take? Or that the planner must essentially have a technical rationale (overarching) for determining when a material change is "material enough" to impact system performance?
No
What is meant by "measurable change in performance"? Is this a measure that the sensitivty should move the system from meeting the performance requirements to not meeting the performance requirements? Or just a measurable change in system response, IE the loading was 45% on this corridor but is now 76%.
Yes

No
I agree with what I think is the intent. The word "Material" is meant to allow for changes in model to occur that are "small" relative to the TP/PC. For example the 400 MW generator that might be built in 10 years by another utility over a hundred miles, several dozen buses and generators away to not force new study work. However as written in 2.5 it requires you to define what a material change is, and could be applied to mean every change must be identified and explained rather than an overarching rationale that would only have you looking for changes that meet the material criteria. But then in 2.6.2 the word material is used with no obligation to explain what material is, only to explain if a material change would not impact the results in a study area. I recommend leaving the term material, but setting a requirement, measure, or definition that requires the TP/PC to define what they consider material specific to their system and circumstance. Since this will by the hetroegenous nature of the grid be different for each it may not be reasonable to pre-define what is realibale. Just as was done with many items in the ATC (MOD) standards, require that it be documented and questions on that rationale be answered. If a specific level of technical oversight is desired, consider requiring that description to be on file with the regional entity and approved by their planning committee. I think the team is heading in a good direction, it's just how the words will be applied that concern me. This may be a case where an Example or two would go a long way towards providing guidance to entities and auditors.
Yes
I am assuming you mean the header notes on the performance table
I generally agree with the direction the team has gone. Footnote 9 should also be highlighted as being part of the project 2010-11 discussion just as footnote 12 is.
Yes
No
R8 should require that the PC and TP make available it's planning assessment results when requested, rather than requiring the preemptive transmittal. There is no reliability purpose served by providing unsolicited information.

Kasia Mihalchuk
Manitoba Hydro
Yes
No
The last two sentences "System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads. An aqgreqate System Load model which

represents the overall dynamic behavior of the Load is acceptable." belong in the MOD standards. They are not required in TPL-001-2.

No

Adding the word "material" does not clarify Part 2.5. The word "material" can be interpreted in many ways and is subjective. In order to have a consistent approach by all TPs, the drafting team should add a definition of the term "material". One TP may consider a new 200 MW unit as not being material because there are several larger units in the TPs system.

Yes

In point g, violations are noted in terms of post-Contingency voltage deviations rather than post-Contingency voltage limits. This may lead to confusion, as some utilities evaluate performance based on a post-Contingency voltage deviation criterion while other utilities evaluate performance based on post-Contingency voltage limits. This same comment applies to Requirement R5. Suggested rewording for point g: System steady state voltages and post-Contingency voltages or voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner. Suggested rewording for the first sentence in Requirement R5: Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltages or voltage deviations, and the transient voltage response for its System. Note 12 states that an outstanding issue related to non-consequential load loss is being discussed. This will create a lot of uncertainty. Manitoba Hydro could not support this standard unless the resolution of Note B is known.

Requirement R1 Part 1.1 and following states "System models shall represent:... 1.1.5. Known commitments for firm Transmission Service and Interchange. It was commented during a previous posting that 1.1.5 should be reworded to read: Known commitments for Firm Transmission Service, and, additionally, other types of transactions provided they have been demonstrated to not violate existing reliability constraints. The response was that "The SDT believes that the defined term 'Interchange' covers other transfers as described in your comment. No change made." It is agreed that known Interchanges should be modeled. However, it is imperative that existing reliability constraints not be violated in the process. That is, Interchange relating to economic transactions should not drive planning studies. Reliability related investments should not be driven by congestion related to economic transactions incorporated into planning models. Following is a preferred/revised wording: • 1.1.5. Known commitments for firm Transmission Service and Interchange. Interchange is meant to refer to energy transactions other than firm Transmission Service. While rigorous planning studies have been conducted to permit the uninterrupted implementation of firm Transmission Service without jeopardizing the reliable operation of the Interconnected System, other types of energy transaction only take place whenever system conditions permit them. They are usually of very short duration relative to planning assessment periods (usually spanning for a few hours to a few days) and deemed highly interruptible subject to reliability issues that may arise during operation of the system. In other words, the term Interchange refers to economic transactions that are permitted when the system is secure and there are reasonable reliability margins to effect dispatch changes to lower operating costs. As such, Interchange should not be reflected in system representation meant to assess system reliability in adherence to reliability criteria delineated in documents such as TPL-001.
No
The definition of Year One could be eliminated, and its wording used in place of Year One within the text of the requirement. The proposed definition has now added ambiguity with respect to "year two" and "year five" which are not defined. Year two could be deleted and R.2.1.1 modified as follows: System peak Load representing a point in time 12-24 months and another point in time 48-65 months into the future from the time the study is initiated. Define Year Five as the twelve month period 4 to 6 calendar years from the date of the Planning Assessment.
Yes
No
The revisions made to Requirement R2 Part 2.1 appear to resolve the concern that past studies could not be used to comply with the short-term steady state study requirements. This revision must be carried through to other sections (R2.2, 2.2.1). However, the

language of Requirement R2 Part 2.2 still seems to suggest that current annual studies are always required for the long-term steady state assessment to be compliant. This may have been an oversight, for consistency Requirement R2 Part 2.2 should be modified to similarly read as Requirement R2, Part 2.1. Regarding R2.2, the language should be consistent with 2.1. For example, use "current or qualified past studies" instead of "the following annual current study". Revisions made to Requirement R2.1.5 have made it worse than was originally drafted. This would require the PC & TP to study (meaning performing a technical analysis) of the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6). R2.7 requires that Corrective Action Plans are included in each Planning Assessment and states "Such actions may include..." followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list, and also suggest revising to "Such actions may include but not be limited to:".

No

Part 2.1.4, requires an entity to vary one or more conditions to demonstrate a change in performance. If the cases were initially stressed, this may force an entity to simulate conditions with less severe stresses. At this point, there is limited to no value to this additional workload. Having a requirement to test at least one sensitivity as a blanket requirement may not be informative by itself and is more unclear since sensitivities are being required on an undefined base set of conditions. If an entity does a case with a stressed set of assumptions, is it necessary to do a non-stressed case? Additionally, our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies "only" if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. If not, a suggested revision to Requirement 2.7.2 as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis. In general, the scope of this requirement is too broad and non-specific, and only results in undue study burden. Is it necessary for sensitivity analysis to be included in requirements since in accordance with good engineering practices a conservative approach should be used in studies? The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions as commented in issue #3. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.

No

There is insufficient information and experience regarding dynamic load modeling. It may also be included as a "sensitivity" analysis in 3.2, rather than requiring and expecting accurate representation of a dynamic load model. If this requirement is kept, a modeling standard must be written that is specific to dynamic loads. Change belongs in a modeling standard, not in TPL-001.

Yes

No

Header note (i) in the first Table 1 (p. 10) could imply that voltage-varying load shall not be used to meet steady state performance requirements. Steady state load models in use include voltage-varying loads. The explicit representation of (voltage-dependent) load

models is perfectly consistent with the requirements defined in R1 (which calls for a comprehensive representation of system components and their expected operating status in the planning assessment period) and the impetus to the creation of more specific load models in dynamic assessments found Requirement 2.4 of this draft of TPL-001-2. It is a known that depressed voltage conditions cause certain system elements to perform below their rated capacity. For example, capacitors provide less voltage support and voltage controlling transformers are impeded by their finite tap range to direct VAR flow into areas affected by low voltage conditions. Certain load types, on the other hand, provide a self-compensating relief to depressed voltage by naturally decreasing demand in a manner proportional to their characteristics, without operator intervention. Choosing to negate the voltage-dependence of one of these system elements (load, in our case) results in an inaccurate system representation that, in turn, may lead to erroneous assessments of the reliability state of the interconnected system and, potentially, to the implementation of unwarranted system upgrades. This note should be revised to only reference loads which are disconnected due to voltage.

To support the change to P5, other items need to also be modified. In Table 1 - Steady State & Stability Performance Extreme Events (p. 12), in the Stability Section, the language should be made similar to wording in P5. Protection System should be removed and replaced with the words "relay failure". This change should be made for 2a through 2d: 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. Note 11 (p. 14) needs clarification as shown: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less. There are two tables labeled "Table 1". Suggest that the extreme events table be renamed "Table 2".

Yes

No

Requirement 8 is an administrative burden to TPs and PCs that adds no value to Bulk Power System reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Should the VSLs for Requirement 8 remain, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. If Requirement 8 and 8.1 are retained, they should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response and there should be a limit on the comment period as follows: If a recipient of the planning assessment final results provides documented comments on the results within 90 days of receipt, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. Other comments not addressed by this Comment Form as follows: Section 3.3 - The last sentence of 3.3.1 should be removed. This is addressed in PRC-023. Line ratings are addressed in PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded."

Section 4.3 - High speed reclosing is not defined, and to help eliminate any confusion that it may introduce into the standard it will be worthwhile for the SDT to define this term. Several specific examples from previous comments on sensitivity analysis and guidance for base case assumptions: The requirements for sensitivity analysis already address issues going beyond what is expected to meet reliability requirements. Requiring extreme event analysis is requiring two layers of event analysis beyond what is required and there is no requirement for corrective action if anything is identified. The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions. As for allowing con-consequential load loss for Categories P1 through P5, suggest approval at the Regional level, with a concept of allowing it in a "local area" that does not impact BPS reliability. All references to 300 kV in document should be replaced with EHV (for example in the Introduction, Section 5). The first phrase of Note 3 on p. 14 should be revised as follows: "Bulk Electric System (BES) level references include extra-high voltage (EHV) Facilities defined as those representing the backbone of the System, generally at voltage greater than 300 kV, and high voltage (HV) Facilities defined as those not representing the backbone of the System, as determined by the Planning Coordinator and approved by Regional Entity."

Individual

Martin Bauer

US Bureau of Reclamation

Yes

With exception of the definitions.

No

The language implies a requirement. The language "Year One must include the forecasted peak Load period for one of the following two calendar years" is a requirement and not a statement of clarification. If the definition is that "Year One" can also be the period used for forecast peak load, then it should be stated so. It is suggested that either the language in the definition is modified or the language is deleted from the definition and moved to the body of the standard.

Yes

No

The question is misleading in that R2 also include current studies. The overall structure of the standard could be greatly improved if the standard were segmented into Near Term and Long Term with sub segments for each specific type of analysis to be performed. Second, the standard does not use consistent terms. The Planning Assessment is to include Near Term and Long Term portions which must have steady state analysis, short circuit analysis, and stability analysis (ref. R2). Requirement R 2.1 introduces sensitivity analysis for the Near Term portion, and then refers to the Planning Analysis which is in reality both Near Term and Long Term portions. That implies that sensitivity analysis must be required for both? The standard repeats the requirement for annual stability studies in 2.4 which was already a requirement for Planning Assessments. The requirement 2.1.5 is one the most problematic requirements in this standard. This requirement implies that an entity must have spare equipment and a strategy to employ it. That is beyond the scope of the Energy Policy Act 2005. Spare equipment is not on-line and does not contribute to the reliability of the existing system. The Energy Policy Act of 2005 specifically prohibits the requirement to enhance or modify the system. The use, application, or requirement to have spare equipment violates that prohibition. This section should be removed. In addition, this requirement suffers from an ability to implement. In the first case, the requirement is

invoked if the spare equipment strategy could result in unavailability of transmission equipment. How is that determined? There is no nexus to that determination. The unavailability may have already occurred once the transmission equipment has failed. The only way to avoid unavailability if the transmission equipment that fails has a hot stand-by with automatic fail-over. The presence or not of a suitable replacement will still result in unavailability by virtue of the failure of the first piece of transmission equipment. Next problem, who will second guess the owner of the replacement. Where is the requirement to make the replacement strategy available? The standard should focus on system performance with existing equipment to meet current and future loads.

No

Sensitivity analysis is not included in R2. This gets back to the structure of the standard. There should a clear indication of the studies that are to be included in the Near-Term and Long-Term portions of the Planning Assessments.

No

Not included in R2. See response to Question 3.2

No

The term "material" is arbitrary. It is suggested that a specific value be used to trigger the assessment.

No

The language implies that the responsible entity may choose to not distribute it if it feels the entity making the request does not have a "reliability related need". It is not clear why that distinction is being made?

Group

Exelon Transmission Planning

Eric Mortenson

Yes

Yes

Yes

Yes

Yes

No

There is not an industry consensus around best practices for modeling the dynamic behavior or characteristics of load. It is premature to make this a requirement in an enforceable standard which would be held to this degree of subjective auditing.

No

The term 'material changes' is subjective. It is very difficult to determine a base case to study combinations of generator additions on a changing transmission network in the 6 to 10 year time period to be used for dynamic simulations. Dynamic studies should be performed whenever new generator interconnections are proposed and it is at that time

where meaningful calculations can be performed. The long term six to ten year out dynamic studies for groupings of potential units should be done at a high level, if at all.

Yes

Comments: The term 'HV' in the performance table should be defined as 'Bulk Electric System elements up to 300 kV, not simply all elements 'below 300 kV'. Footnote 12 should be clarified to specifically state the requirements before voting takes place. The performance criteria should be based on the voltage level of the element experiencing stress due to the contingency, not based on the voltage level of the outaged element. It does not seem to make sense that the loss of a 500 kV bus would not allow for any non-consequential load shedding unless the bus contained a 500 to 230 kV transformer, in which case additional load shedding would be allowed. If outages on a 230 kV system, such as bus fault with stuck breaker, were to cause overloads on a 500 kV network it is acceptable to shed load, but if the outages were on the 500 kV system originally it would not be acceptable to shed additional load. It seems as if it should be the severity of the situation and the elements involved that would dictate allowable remedial actions and not the initial cause of the disturbance. If, for example, there was a 500 kV contingency outage that caused problems on the 230 kV system there would be a problem that may require load shedding on the 230 kV system. If there were a 230 kV contingency or series of contingencies that caused overloads on the 500 kV system, it would be more difficult to find enough lower voltage load to shed to bring the 500 kV system back to applicable ratings or conditions. The inability to shed non-consequential load could theoretically be resolved by hanging a small EHV / HV transformer on a particular bus, or by tapping a EHV line with an auto transformer.

Yes
CenterPoint Energy appreciates the effort put forth by the SDT in revising the performance table. The current draft of P5 is preferable to previous versions.
Individual
Tim Ponseti, VP
TVA Transmission Planning & Compliance
Yes
TVA supports the change from five years to seven years for the implementation plan period.
Yes
TVA supports the change in the Year One definition - but would suggest that the word "started" should be changed to "completed" since a Planning Assessment may be started in one calendar year and finished in the next calendar year.
Yes
TVA is concerned about footnote 12 (known as footnote b in existing TPL standards). TVA believes that utilities should be given some freedom in dropping local load in response to N-1 events as long as overall BES reliability is not impacted. Otherwise significant capital improvements will be required that will have no overall reliability gain for the Bulk Electric System. TVA does agree with the revisions made specifically to the P5 event. TVA wishes to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.
Yes
Yes
Additional TVA comments: TVA wishes to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations. Does high speed reclosing occur in less than 60 cycles or 60 seconds? If a utility does not have reclosing on a transmission line - then must the utility still perform stability studies assuming that there is reclosing? TVA suggests the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP." In R4.1.1, TVA is concerned that no generating unit shall pull out of synchronism in a local area only (thus

not impacting the overall reliability of the BES) for Planning Event P1, while the standard does allow generator runback/tripping for the same event. Thus the generating unit may be tripped by a special protection scheme - but may not be tripped by an out of step relay. TVA believes that out of step relaying should be allowed for this unit tripping as long as this does not affect the overall reliability of the BES.

Yes

We agree with this change. We further suggest that this change and the additional wording: "or in those jurisdictions where no regulatory approval is required on the first day of the first calendar quarter, 84 months after Board of Trustees adoption" be added to P. 3 of the standard that starts with "For 84 calendar months..." to be totally consistent.

We wish to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations regardless of whether high-speed reclosing is used on the faulted line. We suggest the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP." Also, we wish to make a comment on footnote #13 of Table 1. 13. Applies to any of the following relay functions or types: pilot (#85), distance (#21), differential (#87), current (#50, 51, & 67), voltage (#27 & 59), directional (#32 & 67), and associated tripping (#86 & 94) relays.

<p>We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on various requirements not identified in the questions below; therefore, we have included our comments here:</p> <p>Requirement and 2.6 and 2.6.1: A study that is five years old is very likely to be out of date. The entity's BES may have not changed much in five years but the entity cannot be certain whether or not their neighbor's system may have changed. Changes outside the immediate entity's system can impact results of studies within their system. Suggest that two years is a maximum that past studies should be allowed. Requirement 3.4.1 and 4.4.1 require PCs and TPs to coordinate with adjacent PCs and TPs to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list. Please clarify whether this means that a PC or TP must coordinate with others to identify contingencies on other Systems that the PC or TP must now include on their Contingency list to simulate and address any performance violations on their own System, or does it mean that the PC or TP must coordinate with others to identify contingencies on their System that the PC or TP must now include on their Contingency list to simulate and address any performance violations on other Systems. In either case, the standard does not seem to clearly state what must be done, or whose responsibility it is to mitigate, if a contingency in one System causes a performance violation in another System. Requirement R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent "[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models". As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response".</p>
No
<p>We recognize that the drafting team made changes to the definition of Year One based on industry comments. However, we believe that the revised language could allow for a situation where an entity could use its next season's operating study as its Year One planning study. For example, if the entity does its study in the fall of 2011, the proposed definition would allow the entity to use its summer 2012 operating study as its Year One study. This is a very short period to address any issued identified. Suggest working into the requirement that Planning Studies must look out at least 12 months beyond when the study is performed. This would still allow for the provision in the current definition example ("if a</p>

Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013) because the entity would be able to use their 2013 Load period, but it would prevent the entity from using the 2012 Load period if they started the assessment late in 2011.

Yes

Yes

Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay13 protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay13 protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”. In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No12” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.” Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

Yes
No
Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: 8.1 If a recipient of the planning assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. For a Planning Coordinator (PC) who distributes the Planning Assessment to many different entities (to adjacent PCs, TPs, and other functional entities), a concern regarding the Requirement R8 VSL is that it is overly restrictive to apply a violation for failing to distribute the results of its Planning Assessment to only one PC, TP, or functional entity (and to apply a High VSL for failing to distribute to more than one entity), particularly since an entity's contact is subject to change over time, and since Measure M8 allows for publicly posting the results of its Planning Assessment to its website. Should the SDT decide to include the VSLs for Requirement 8, would recommend revising to use a percentage approach rather than applying a violation to a Planning Coordinator who fails to provide the results of its Planning Assessment to one PC, TP, or other functional entity (or applying a High VSL for failing to distribute to more than one entity.) Recommend applying a similar percentage approach to the VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1) to be considered for the TPL-001-2 R8 VSLs. For example, • Lower VSL: The responsible entity failed to provide the Planning Assessment final results to 5% or less of the required entities. • Moderate VSL: The responsible entity failed to provide the Planning Assessment final results to more than 5% up to (and including) 10% of the required entities. • High VSL: The responsible entity failed to provide the Planning Assessment final results to more than 10% up to (and including) 15% of the required entities. • Severe VSL: The responsible entity failed to provide the Planning Assessment final results to more than 15% of the required entities OR [the existing language for the Severe VSL]. Explanation: The VSLs were modified for consistency with other standards and VSLs. Reference: Link to VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1): http://www.nerc.com/docs/standards/sar/Staff_Proposed_VSLs_2010July27.pdf

The definition of Year One is now too flexible and does not meet the intent of the standard. For example, our system peak is generally in January of the year. If I perform TPL studies in November 2011, studying the peak in January 2012 is acceptable according to the new definition. This is only two months from the date of the study. The intent of the TPL standard should be that entities must study and plan for inadequacies found in the studies. A one- or two-month lead time is not adequate to address any problems identified. Year One should be the year containing the first peak 12 months or more from the current date. Otherwise, TPL studies become merely seasonal operational studies, not planning studies. Alternative Language: "For the Planning Assessment started in a given year, Year One should contain the first system peak that occurs twelve months or more after the date of the Planning Assessment."
Yes
Table 1, P5 does not recognize the existence of redundant (or backup) relays. These are an integral part of the protection system design and should be considered in analysis of SLG faults. The TPL standard should encourage redundant, fail-safe systems, not ignore them. In Table 1, P2 and P3, we have a concern about not allowing non-consequential load loss. Project 2010-11 is deciding on this issue, but is not completed (see footnote 12). Should the standard become effective before this project is completed, no non-consequential load loss would be allowed, requiring many transmission additions and reconfigurations. Please change the "NO" in the last column to "YES" until the completion of Project 2010-11.

No

The definition of Year One could be deleted and used in place of Year One within the text of the requirement. The proposed definition has now added ambiguity with respect to "year two" and "year five" which are not defined. Year two could be deleted and R.2.1.1 modified as follows: System peak Load representing a point in time 12-24 months and another point in time 48-65 months into the future from the time the study is initiated.

No

R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be approved. Duration of known outages should be increased from six months to one year; R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.

No

We can agree with R2.1 however with respect to R2.2 Language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study."

No

Part 2.1.4, requires an entity to vary one or more conditions to demonstrate a change in performance. If the cases were initially stressed, this may force an entity to simulate conditions with less severe stresses. At this point, there is limited to no value to this additional workload. Having a requirement to test at least one sensitivity as a blanket requirement may not be informative by itself and is more unclear since sensitivities are being required on an undefined base set of conditions. Additionally, our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies "only" if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. Requirement 2.7.2 should be revised as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis.

Yes

Yes

Yes
We are supportive of the change to P5. However, in making this modification, other items need to also be changed. In Table 1 – Stability, the language should be made similar to wording in P5. Protection System should be removed and replaced with the words “relay failure”. This change should be made for 2a through 2d: 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. We also believe that Note 11 needs clarifying wording as shown below: "Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less"
Yes
Yes
Requirement 8 and 8.1, should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response and there should be a limit on the comment period as follows: If a recipient of the planning assessment final results provides documented comments on the results within 90 days of receipt, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. We have other comments not addressed by this Comment Form as follows - Sections 2.7, 3.3, 4.3 and overall. R2.7 requires that Corrective Action Plans are included in each Planning Assessment and states “Such actions may include...” followed by a list of actions. Runback/tripping of HVDC should be added to the list. Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove “Tripping of Transmission elements where relay loadability limits are exceeded.” Section 4.3 - High speed reclosing needs to be defined.

We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”.

Yes
No. Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay ¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay ¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”. In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No ¹² ” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.” Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

Year One should be used within the text of the requirement. Do not have a definition for Year One.

No

For R1 Ambiguity regarding base case assumptions, in combination with lack of clarity and clear direction of purpose regarding the sensitivity analysis, undermines the objectives of the standard; R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be approved. Duration of known outages should be increased from six months to one year; R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.

No

We can agree with R2.1 however with respect to R2.2 Language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study".

No

If an entity does a stressed set of assumptions do they always need to do a non-stressed case?

Yes

Yes

Yes

In Table 1 – Stability, Make language similar to wording in P5. "Protection System" should be removed and replaced with the words "relay failure". This would avoid future interpretation issues about the intent of this requirement (as we understand it) to exclude more severe though less likely failures such as battery systems. This change should be made for 2a through 2d on page 12). In Note 11 (page 14) ADD the wording shown in

"quotes" below: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for "a total of" 1 mile or less.

Yes

Yes

General Comment: We have other comments not addressed by this Comment Form as follows - Section 3.3, Section 4.3 and overall Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded." Section 4.3 - High speed reclosing is not defined. Overall - ISO New England and New England Transmission Owners have previously made comments which have not been addressed in the current version of the proposed standard. Support for the standard can at most be limited without addressing comments. We have previously commented on sensitivity analysis and guidance for base case assumptions. Also, extreme event analysis should not be mandated in this standard as no corrective action is required.

Yes. The SERC DRS supports the revisions.
Yes
Yes
We wish to make a comment on R4.3.1: it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations regardless of whether high-speed reclosing is used on the faulted line. We suggest the following wording be used to replace the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied." We wish to make a comment on the stability extreme event table: Changes were made in planning event P5 to narrow the focus to specific relay failures. The same changes are needed for stability extreme event 2a, 2b, 2c, and 2d.

Yes

No
For measurements M3 and M4, there is some question as to what is to be provided as evidence of a study. Would the study results alone provide sufficient evidence, or does the entire powerflow, stability, or short circuit effort need to be documented in a formal study report? There are no measures for the creation and coordination of contingency lists that are to be developed in R3.4, R3.5, R4.4, and R4.5. Are these contingency lists required to be a documented part of the study?
No
The sharing issues of requirement R8 are still not clear, therefore the R8 VSL is not clear. It is not clear if the intent of the SDT is for the PC to share the assessments with PCs and TPs are to share the assessments with TPs, or whether the intent is for the TP to share its assessments with its PC. Will posting the assessment to a secure web-site meet the intent of the requirement? Although the comment form is not designed to allow for such, we need to comment on R4.3.1: As written, it appears that this requires stability simulations of both successful and unsuccessful high-speed reclosing for all contingency simulations, regardless of whether high-speed reclosing is actually implemented. A suggested wording change for the first bullet: "Successful high-speed reclosing and unsuccessful high-speed reclosing onto a fault, where such reclosing is applied, and where such additional simulations are deemed appropriate by the PC or TP." Another comment needs to be made regarding the stability extreme event table: Changes were made in planning event P5 to concentrate on specific relay failures. The same changes need to be made for stability extreme events 2a, 2b, 2c, and 2d. The proposed standard will significantly increase the amount of work required to develop more detailed and complex system models, to perform and document the engineering studies to meet the performance requirements, and to develop the assessments necessary for compliance. All of these increased engineering activities are perceived to provide marginal benefit to the reliability of the bulk electric system, but will require significant increases in manpower across the industry. Further, the manpower is presently not available to develop these more detailed models and to perform these studies with any reasonable assuredness. It will be a continuing challenge to the industry to obtain and keep the engineering talent needed to perform these compliance activities for such marginal benefits.

Yes
We propose the following changes and questions: R1 – We offer the minor suggestion of replacing the wording of "maintain System models within their respective areas" with "maintain System models of elements that are interconnected to any portion of the BES that is owned or operated by the TP or PC". This wording would avoid the ambiguity that can occur when a BA that is associated primarily with one TP declares ownership of a bus in another TP's geographic area, but expects its primary TP to maintain the BA's model data for the remote generation or load. R1.1.2 – We request the SDT opinion on how two individual outages should be modeled if they are both in excess of six months duration and they overlap by less than six months. Should the overlapping condition only be modeled if the condition is expected to last more than six months?
Yes
R2.1.3 – We offer the minor suggestion of revising R2.1.3 to state, "Known outages of generation or Transmission Facilities with a duration of at least six months be simulated along with P1 events for the System peak or Off-Peak conditions when the outages are scheduled to occur." We interpret that the requirement should only call for the simulation of individual outages with duration of six months or more and not imply the simulation of sequential (back-to-back) outages where each individual outage is less than six months, but the composite duration of the back-to-back outages is more than six months. We also interpret that if two or more known outages with duration of at least six months are overlapping, then the overlapping outage condition would only be simulated for the conditions when the overlapping outages are scheduled to occur if the duration of the overlapping condition is at least six months. R2.1.5 – We offer a major suggestion regarding the phrase "could result in the unavailability of major transmission equipment" because this phrase is ambiguous and not defined. So, there is a significant risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. We proposed adding that the TP and PC "shall provide documentation to support the technical rationale for defining unavailability of major transmission equipment" similar to R2.5.

No
<p>R2.1.4 & R2.4.3 – We offer a major suggestion regarding the terms of ‘credible’ and ‘measurable change’ because these terms are ambiguous and not defined. So, there is a significant risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. We proposed adding that the TP and PC “shall provide documentation to support the technical rationale for determining the range of credible conditions and measurable change in performance” similar to R2.5. R2.1.4 & R2.4.3 bullet items – We offer the minor suggestion that the number and description of the bullet items in R2.1.4 match the bullet points in R2.4.3. Otherwise, please explain the reasons for any differences between the bullet items in R2.1.4 and R2.4.3. R2.1.4 bullet #2 & # 5 – We suggest that the wording in bullet #2 be changed to “Expected transfers and other generation dispatch scenarios”. This modification would put the transfer and dispatch element, which are complementary, together in the same bullet item, rather than grouping the ‘generation dispatch’ (operating level) element together with the generation capacity elements in bullet item #5. R2.1.4 bullet #7 – We offer the minor suggestion that the term “planned” be replaced with “known” to be consistent with R1.1.2 and R2.1.3. Besides the term “planned outage” has a specific meaning in the Reliability Standards that are specific to the Operating horizon. R2.7.2 – With regard to “include actions to resolve performance deficiencies identified in multiple sensitivity studies”, we do not think that mitigation plans should be required for deficiencies found in multiple sensitivity studies because the conditions in some sensitivity studies are more extreme and less likely than base case conditions. It’s impractical to require corrective actions for longer term horizon sensitivities due to how fast the electric grid changes. We believe sensitivity analyses are valuable to improving the development of mitigation plans to address base case performance limit concerns. Some of the sensitivity study conditions are not credible or plausible enough to warrant the implementation of mitigation measures. What is the interpretation of multiple sensitivity studies - more than one or a majority of the number that were studied?</p>
Yes
Yes
Yes
<p>We offer the major suggestion that Requirements not be created in the Performance Table and be absent from the Requirement section. Requirements should only be referred to in the Performance Table after they already exist in the Requirement section. a. Notes “f” and “g” under “Steady State Only” section in the Table 1 header create requirements (e.g. use the verb, “shall”) that do not appear in the Requirements section. We suggest adding R3.3.5, which could read, “Applicable System Operating Limits for the planning horizon shall not be exceeded.” [After R3.3.5 is added, Notes “f” and “g” should be revised and refer to R3.3.5.]. b. Note “i” under “Steady State Only” section in the Table 1 header creates a requirement (e.g. use the verb, “shall”) that does not appear in the Requirements section. We suggest adding R3.3.6, which could read, “The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state voltage requirements.” [After R3.3.6 is added, Note “d” should be revised to refer to R3.3.6. c. Note “j” under the “Stability Only” section in the Table 1 header creates a requirement (e.g. use the verb, “shall”) that does not appear in the Requirements section. We suggest adding R4.1.4, which could read, “Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner”. [After R4.1.4 is added, Note “j” should be revised to refer to R4.1.4.]</p>
We offer the major suggestion that the P3 Category performance criteria be modified to

apply only to the loss of two generators. The SDT properly recognizes that generator outages are significantly more probable than line or transformer outages and should be "higher" in the category list. However given the clearly higher probability of generator outages, the probability of the loss of two generators is clearly higher than the loss of a generator and line or the loss of a generator and transformer. Therefore, if the loss of two generators is in the P3 category, then the loss of a generator and line or transformer should be clearly "lower" in the category list. We suggest the listing of: the loss of a generator and some other element (e.g. transmission circuit, transformer, shunt device, and single pole of DC line) be moved to a lower event category, such as the P6 Category by adding "1. Generator" to the listing in the Initial System Condition (Loss of . . .) column. Item 2.a in the Extreme Events, Steady State section – Clarify the meaning of the loss of multiple circuits in Item 2.a by using wording similar to P7. We suggest this text: "a. Loss of three or more circuits that share a common structure." Footnote 6 – Further clarify the applicable shunt devices in Footnote 6 with this suggested text: "6. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters."

Yes

Yes

Other Comments: 1. How are backup relays handled (TPL-002-0, R1.3.10 & TPL-001-2 R1 & P5)? What does FERC construe as normal system for a protection system. The TPL-001-2 R1 & P5, this standard doesn't appear to address primary protection and how this handled. 2. Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: "Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard." 3. R2.1.5 – We propose replacing the term 'major Transmission' with "BES" because BES is a well defined term, while the term, 'major Transmission', is not. 4. Add R2.3.1 – We suggest the addition of a R2.3.1 requirement to emulate the distinction between the requirement to perform a short circuit assessment and conduct required studies or analysis to support the assessment (e.g. R2.1/R2.1.1 and R2.2/R2.2.1). We propose wording such as, "Perform an analysis for at least one year in the Near Term Transmission Planning Horizon." This requirement would set an expectation that an analysis should be conducted to at least one or more years in the near-term planning horizon, rather than imply that an analysis of all five years in the near-term planning horizon must be conducted. 5. R2.7.4 – We suggest that the wording of R2.7.4 be the same as R.2.8.2. Otherwise, we propose that R2.7.4 and R2.8.2 be revised with wording like, ". . . implementation status of identified Corrective Action Plans for System Facilities and Operating Procedures." to clarify that the identified system facilities and operating procedures refer only to those that were in the previous year's Corrective Action Plans. 6. R3.3.1 – The term of 'controls' is ambiguous and not defined, unlike the term, 'Protection Systems', which is defined. Therefore, we suggest that this item be defined or more clearly described to avoid the risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. 7. R3.3.1, bullet #1 - We suggest qualifying which generating units to consider and which voltage limits to simulate with revised wording like, "Trip generating units that are connected to the BES when actual or assumed minimum generator steady state or ride through voltage limits are known and simulations show voltages may fall below the voltage limit. If assumed voltage limits are used, then they should be included in the assessment". The requirement should not apply to all relevant generating units until one of the MOD standards requires all Generator Owners to provide their minimum generating unit voltage limits to the TP and PC. If the wording of

R3.3.1 bullet #1 must be different from its counterpart, R4.3.1 bullet #2, then please explain the reasons for any differences. 8. R3.4.1 – Compliance with the requirement “to coordinate” is problematic and non-measurable We suggest replacing it with the requirement “to communicate”. 9. R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability). Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact be required? 10. R4.1.1 – We suggest that there should be some qualification of which generating units are referred to in this requirement. We propose that the requirement say, “No generating unit connected to the BES shall pull out of synchronism.” For example, some utilities include smaller generation units that are connected at voltages below 100 kV and even down to distribution voltage in their base cases. 11. R4.1.2 – We propose that the wording of this requirement be revised to reflect the same BES qualification of the generating unit that we noted in R4.1.1 above. 12. R4.3.1 – This requirement refers to high speed reclosing and we presume that this is special high speed reclosing that is completed in several cycles, rather than the normal high speed reclosing that is completed in a number of seconds. We recommend that the term high speed reclosing be more clearly defined for this sub-requirement. 13. R5 – This requirement should remove the criterion item, “post-Contingency voltage deviation”, because this criterion is not used widely enough in the industry to be well established criterion. 14. R8 – This requirement should be revised to limit the need to provide the Planning Assessment as follows “adjacent Planning Coordinators and adjacent Transmission Planners and to any registered functional entity...” This suggestion is added to the requirement to clarify that the word adjacent also applies to Transmission Planners and to clarify that the functional entity must be registered in order for the entity to be applicable to the requirement.

The first bullet item in Section 3.3.1 should be the same as the second bullet in Section 4.3.1. The wording is somewhat confusing in both. Also, the wording as proposed does not recognize that a high voltage limit could also be violated. Edits to the item as shown below are suggested. Tripping of generators where simulations show generation bus voltages or high side generation step up (GSU) voltages are outside known limits, or assumed to be outside generator steady state limits, or have reached the generator ride through voltage limit. Include in the assessment any assumptions made.

Yes
No
The third bullet of 4.3.1 requires the addition of relay models for stability studies. This type of analysis is performed today by scripting the tripping of multiple lines due to breaker failure events. The inclusion of relay models into the stability study will result in added complexity and an over reliance on relay models for system stability assessment. The stability assessment should assess stability resulting from the operation of relays as opposed to reliance on a relay model for proper system representations. Assurance of the proper operation of relays results from the analysis performed to set relays not from stability studies. From Section 4.3.1: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models." Section 4.5 requires that "The rationale for those Contingencies selected for evaluation shall be available as supporting information." This will have to be developed. Requirement R5 requires the establishment of criteria for transient voltage response of the system. This seems unnecessary given the proposed changes to Table 1. The proposed changes to table 1 seem to make clear the type of system response that is allowable through its specification of what is allowable in terms of interruptions to Firm Transmission and Non-Consequential loads. R5 states: "Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level."
An important footnote to Table 1 is omitted from this proposed revision. This omission prevents adequate evaluation of the footnote. Footnote 12 in Table 1 is no longer applied to P2.1, P2.2, P2.3, P4, and P5. The footnote states: "Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here." The footnote should be removed from the proposed revision until Project 2010-11 is concluded.

Yes

In Table 1 – Stability, Make language similar to wording in P5. Protection System should be removed and replaced with the words relay failure. This change should be made for 2a through 2d: 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker10 or a relay failure resulting in Delayed Fault Clearing. In Note 11 change wording as shown below: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less

Yes

Yes

Other Comments: Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded." Section 4.3 - High speed reclosing is not defined. We have previously commented on sensitivity analysis and guidance for base case assumptions. Also, extreme event analysis should not be mandated in this standard as no corrective action is required.

We propose the following changes and questions: R1 – We offer the minor suggestion of replacing the wording of "maintain System models within their respective areas" with "maintain System models of elements that are interconnected to any portion of the BES

that is owned or operated by the TP or PC". This wording would avoid the ambiguity that can occur when a BA that is associated primarily with one TP declares ownership of a bus in another TP's geographic area, but expects its primary TP to maintain the BA's model data for the remote generation or load. R1.1.2 – We request a SDT opinion on how two individual outages should be modeled if they are both in excess of six months duration and they overlap by less than six months. Should the overlapping condition only be modeled if the condition is expected to last more than six months?

No

R2.1.3 – We offer the minor suggestion of revising R2.1.3 to state, "Known outages of generation or Transmission Facilities with a duration of at least six months be simulated along with P1 events for the System peak or Off-Peak conditions when the outages are scheduled to occur." We interpret that the requirement should only call for the simulation of individual outages with duration of six months or more and not imply the simulation of sequential (back-to-back) outages where each individual outage is less than six months, but the composite duration of the back-to-back outages is more than six months. We also interpret that if two or more known outages with duration of at least six months are overlapping, then the overlapping outage condition would only be simulated for the conditions when the overlapping outages are scheduled to occur if the duration of the overlapping condition is at least six months.

No

R2.1.4 & R2.4.3 – We offer a major suggestion regarding the terms of 'credible' and 'measurable change' because these terms are ambiguous and not defined. So, there is a significant risk of different and possibly contradictory interpretations by TPs, PCs, and auditors. We proposed adding that the TP and PC "shall provide documentation to support the technical rationale for determining the range of credible conditions and measurable change in performance" similar to R2.5. R2.1.4 & R2.4.3 bullet items – We offer the minor suggestion that the number and description of the bullet items in R2.1.4 match the bullet points in R2.4.3. Otherwise, please explain the reasons for any differences between the bullet items in R2.1.4 and R2.4.3. R2.1.4 bullet #7 – We offer the minor suggestion that the term "planned" be replaced with "known" to be consistent with R1.1.2 and R2.1.3. Besides the term "planned outage" has a specific meaning in the Reliability Standards that are specific to the Operating horizon. R2.7.2 – With regard to "include actions to resolve performance deficiencies identified in multiple sensitivity studies", we do not think that mitigation plans should be required for deficiencies found in multiple sensitivity studies because the conditions in sensitivity studies are more extreme and less likely than base case conditions. Some sensitivity study conditions are not credible or plausible enough to warrant the implementation of mitigation measures. What is the SDT interpretation of multiple studies - more than one or a majority of the sensitivities that were studied?

Yes

Yes

No

We offer the major suggestion that Requirements not be created in the Performance Table and be absent from the Requirement section. Requirements should only be referred to in the Performance Table after they already exist in the Requirement section. (a.) Notes "f" and "g" under "Steady State Only" section in the Table 1 header create requirements (e.g. use the verb, "shall") that do not appear in the Requirements section. We suggest adding R3.3.5, which could read, "Applicable System Operating Limits for the planning horizon shall not be exceeded." [After R3.3.5 is added, Note "a" should be revised and refer to

R3.3.5.]. (b.) Note "i" under "Steady State Only" section in the Table 1 header creates a requirement (e.g. use the verb, "shall") that does not appear in the Requirements section. We suggest adding R3.3.6, which could read, "The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment associated with an event shall not be used to steady state voltage requirements." [After R3.3.6 is added, Note "i" should be revised to refer to R3.3.6.]. (c.) Note "j" under the "Stability Only" section in the Table 1 header creates a requirement (e.g. use the verb, "shall") that does not appear in the Requirements section. We suggest adding R4.1.4, which could read, "Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner". [After R4.1.4 is added, Note "j" should be revised to refer to R4.1.4.]

We offer the major suggestion that the P3 Category performance criteria be modified to apply only to the loss of two generators. The SDT properly recognizes that generator outages are significantly more probable than line or transformer outages and should be "higher" in the category list. However given the clearly higher probability of generator outages, the probability of the loss of two generators is clearly higher than the loss of a generator and line or the loss of a generator and transformer. Therefore, if the loss of two generators is in the P3 category, then the loss of a generator and line or transformer should be clearly "lower" in the category list. We suggest the listing of: the loss of a generator and some other element (e.g. transmission circuit, transformer, shunt device, and single pole of DC line) be moved to a lower event category, such as the P6 Category by adding "1. Generator" to the listing in the Initial System Condition (Loss of . . .) column. We offer the minor suggestion that Item 2.a in the Extreme Events, Steady State section – Clarify the meaning of the loss of multiple circuits in Item 2.a by using wording similar to P7. We suggest this text: "a. Loss of three or more circuits that share a common structure." We offer the minor suggestion that Footnote 6 – Further clarify the applicable shunt devices in Footnote 6 with this suggested text: "6. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters." ATC has significant concerns with Q3.2 (R2.1.4 & R2.4.3), Q4 (Table requirements) and Q5 (P3 scope), as noted above. In addition, ATC offers the following suggestions to promote proper Reliability Standard quality and content. (1.) Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: "Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard." (2.) R2.1.5 – We propose replacing the term 'major Transmission' with "BES" because BES is a well defined term, while the term 'major Transmission' is not. (3.) Add R2.3.1 – We suggest the addition of a R2.3.1 requirement to emulate the distinction between the requirement to perform a short circuit assessment and conduct required studies or analysis to support the assessment (e.g. R2.1/R2.1.1 and R2.2/R2.2.1). We propose wording such as, "Perform an analysis for at least one year in the Near Term Transmission Planning Horizon." This requirement would set an expectation that an analysis should be conducted to at least one or more years in the near-term planning horizon, rather than imply that an analysis of all five years in the near-term planning horizon must be conducted. (4.) R2.7.4 – We suggest that the wording of R2.7.4 be the same as R.2.8.2. Otherwise, we propose that R2.7.4 and R2.8.2 be revised with wording like, ". . . implementation status of identified Corrective Action Plans for System Facilities and Operating Procedures." to clarify that the identified system facilities and operating procedures refer only to those that were in the previous year's Corrective Action Plans. (5.) R3.3.1 – The term of 'controls' is ambiguous and not defined, unlike the term, 'Protection Systems', which is defined. Therefore, we suggest that this item be defined or more clearly described to avoid the risk of different and possibly contradictory

interpretations by TPs, PCs, and auditors. (6.) R3.3., bullet #1 - We suggest qualifying which generating units to consider and which voltage limits to simulate with revised wording like, "Trip generating units that are connected to the BES when actual or assumed minimum generator steady state or ride through voltage limits are known and simulations show voltages may fall below the voltage limit. If assumed voltage limits are used, then they should be included in the assessment". The requirement should not apply to all relevant generating units until one of the MOD standards requires all Generator Owners to provide their minimum generating unit voltage limits to the TP and PC. If the wording of R3.3.1, bullet #1 must be different from its counterpart, R4.3.1, then please explain the reasons for any differences. (7.) R3.4.1 - Compliance with the requirement "to coordinate" is problematic and non-measurable. We suggest replacing it with the requirement "to communicate". (8.) R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability). Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact be required? (9.) R4.1.1 - We suggest that there should be some qualification of which generating units are referred to in this requirement. We propose that the requirement say, "No generating unit connected to the BES shall pull out of synchronism." For example, some utilities include smaller generation units that are connected at voltages below 100 kV and even down to distribution voltage in their base cases. (10.) R4.1.2 - We propose that the wording of this requirement be revised to reflect the same BES qualification of the generating unit that we noted in R4.1.1 above. (11.) R4.3.1 - This requirement refers to high speed reclosing and we presume that this is special high speed reclosing that is completed in several cycles, rather than the normal high speed reclosing that is completed in a number of seconds. We recommend that the term high speed reclosing be more clearly defined for this sub-requirement. (12.) R5 - We propose removing the criteria item, "post-Contingency voltage deviation", because this criterion has not been developed and used widely enough in the industry to be introduced into the standards. (13.) R7 - Revise part of the requirement text to read, ". . . identify each entity's individual and joint responsibilities . . ." to provide better clarity. Perhaps this requirement should be listed at the beginning of the Requirements section, instead being mentioned near the end of this section. (14.) Change the forward referencing to backward referencing. We agree with R2.6, R3.1, R3.5, R4.1, and 4.2. However, we suggest that the requirements be ordered so that all of the references refer back to earlier text, rather later text to be consistent with the rest of this standard and other referencing in this standard (e.g. R2.1.3, R2.1.4, R2.4.3, R3, R3.3, R3.5, R4, R4.3, R4.4, R4.5), as well as other standards.

Comments: The Year One definition is somewhat clearer now, but there is still some ambiguity. We recommend the removal of the term "Year One, year two, and year five" from R2.1.1. and deletion of the Year One definition (definitions are not required for year two and year five, for instance). The Year One concept can be integrated into the definition of Near-Term Transmission Planning Horizon, which we suggest changing to "The period beginning with the first year following the operating horizon, as determined by the Transmission Planner or Planning Coordinator, through the fifth year." Then, rather than say "Year One, year two, and year five", we can use the phrase "at least one of the first two years of the Near-Term Transmission Planning Horizon, and the fifth year". This will require corresponding changes in R2.1.1 and R2.1.2.
No
We suggest changing the added sentence to "This establishes the Category P0, No Contingency, Initial System Conditions in Table 1."
No
2.1.5 – Change "shall be performed for" to "shall have been performed for."
Yes
No
Rather than specifically call out induction motor loads, we recommend changing the second sentence to "Stability analysis shall include models that represent the expected dynamic

behavior of system elements that could impact the study area.”

Yes

Yes

Table 1, P5 does not seem to account for redundant relays in the Protection System to mitigate potential relay failure. We recommend changing the “Event” to “Delayed Fault Clearing due to the failure of a relay to operate as designed, if that is the only relay protecting the Faulted element, for one of the following:” In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No12” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.” Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue). Second, we are unclear why voltage relays are included in footnote 13 and think they can be removed. Third, in the Extreme Events – Stability section of Table 1, items 2a-2d “Protection System failure” should be changed to “relay failure” to be consistent with Table 1, Category P5.

Yes

Yes

None regarding R8. The following comments refer to parts of the proposed standard for which no questions are asked. R4, Part 4.1.2: The response to our previous comment indicated that our description was for a system Stability issue. R4 is addressing system Stability and we believe the comment still applies and that it was not answered in the response. We have two issues with 4.1.2: Sometimes out-of-step (loss of generator synchronism) is better mitigated through islanding by tripping transmission rather than by tripping generators; the second point is that the ability of present modeling programs does not include the capability to model all types of impedance relays and their associated OOS blocking and tripping capabilities that are available. R4, Part 4.3.1: The third bullet implies that all impedance relays (and perhaps others) will need to be modeled in the stability databases. We question whether the existing simulation programs can accommodate this large magnitude of data inclusion and whether there is any benefit to BES reliability. Certainly using generic models rather than actual models would be of no benefit. We recommend changing the third bullet to “Evaluation of Protection System behavior when transient power swings are detected or predicted to have impedance characteristics that

may approach relay operating characteristics.”

No
While the definition of Year One addresses the time span this year occupies, it does not address when that time span begins. The example which was added to the definition suggests that Year One begins twelve months from the start of the Planning Assessment, but it does not appear to be specifically stated. The following language is recommended: "The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing, beginning twelve months from the planned completion date of the Planning Assessment."
No
Consider removing "...the latest..." from R1 and changing R1.1.2 to state "...six months during the period of study."
No
No, the phrase any material changes used in requirement R.2.6.2 will effectively cause all Planning Authorities to run all studies every year regardless of minor changes in the model. The overwhelming majority of PAs use a 10 year set of planning models developed annually by Regions or Subregions. These annual sets of planning models will always have some changes. The annual study requirement is especially problematic for Stability and Short circuit studies that require much more engineering time to complete and are much less likely to have results impacted by minor model changes such as different load forecasts. Uncertainty with audit review of technical rationale documentation will serve to focus Transmission Planning engineering resources on short term compliance to an extent that is counter productive. Please consider removing R.2.6.2
No
It is recommended that the phrase "...measureable change in performance..." be changed to "...measurable change in system response..." A change in performance is unclear, and could suggest that a sensitivity study is valid only if the System is stressed to the point that it no longer performs within the criteria established by Table 1. In addition, it is recommended that the following text appear after the last sentence of 2.4.3: "The condition or conditions to be varied shall be left to the discretion of the Transmission Planner or Planning Coordinator, provided they are selected from the list below."
Yes
Yes
Yes
The performance requirements of Table 1 do not allow the loss of non-consequential load for single and multiple contingency events. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss

represents a poor cost/benefit or quality of life tradeoff. Having a provision at the regional level that a PA or TP can have a certain amount of non-consequential load loss designed or planned in to its system that would be reasonable if it is acceptable to the RE and does not have an adverse impact on the remaining BES. In lieu of such a RE provision, providing a quantitative cap in non-consequential load loss such as 100 MW may be rationale compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. It is our understanding that footnote 9 is under consideration as part of Project 2010-11 and should be noted as such for clarification.

No

Consider removing "the latest" from M1.

No

The requirement to distribute the Planning Assessment should be more flexible and allow for making the Planning Assessment available, such that those entities that desire the information can have it readily available. R8 should be modified as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.

Group

E.ON U.S.

Brent.Ingebrigtsen@eon-us.com

Comments: 2.2.1. A current study assessing expected System peak Load conditions for one of the years in the Long-Term Transmission Planning Horizon and the rationale for why that year was selected. E.ON U.S. believes the scope of the 'current study' should be defined. It is not clear whether the scope is the same as outlined in section 2.1.

No

In the statement: "the Planning Coordinator and Transmission Planner shall coordinate with adjacent Planning Coordinators and Transmission Planners to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list." E.ON U.S. believes that the use of the pronoun "their" in the quoted section above is confusing. "Their" could be read as applying to the adjacent Planning Coordinators and not to the Planning Coordinator to whom the standard applies. E.ON U.S. recommends that the word "their" should be changed to "the Planning Coordinator's and Transmission Planner's" in order to make it clear.

E.ON U.S. believes that Table 1 should be formatted to avoid having the tables split by page breakers. In addition, tables spanning across multiple pages should have headers at the top of each page.

No
We have concerns for including induction motor representations in the load models without any study or bench-marking activities to meet the requirements of R2.4.1. This information should be supplied by the LSE as part of the MOD standard. We understand that the proposed standard will accept an aggregate system load model which represents the overall dynamic behavior of the load to relieve the burden of trying to develop specific induction motor load representation at each load bus. However this modeled system response will be considerably different compared to the actual system response which will open up the industry to unwarranted scrutiny and possible compliance violation investigations.

Yes
We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R3 or R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent "[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models". As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: "Tripping of Transmission lines and transformers where transient swings cause Protection

System operation based on known Protection System response". Section 3.4.1 and 4.4.1 require PCs and TPs to coordinate with adjacent PCs and TPs to ensure that Contingencies on adjacent Systems which may impact their Systems are included in the Contingency list. Please clarify whether this means 1) that a PC or TP must coordinate with others to identify contingencies on other Systems that the PC or TP must now include on their Contingency list to simulate and address any performance violations on their own System, or 2) that the PC or TP must coordinate with others to identify contingencies on their System that this PC or TP must now include on their Contingency list to simulate and address any performance violations on the other Systems. In either case, the standard does not seem to clearly state what must be done, or whose responsibility it is to develop the corrective action plan, if a contingency in one System causes a performance violation in another System.

We recognize that the drafting team made changes to the definition of Year One based on industry comments. However, we believe that the revised language could allow for a situation where an entity could use its next season's operating study as its Year One planning study. For example, if the entity does its study in the fall of 2011, the proposed definition would allow the entity to use its summer 2012 operating study as its Year One study. This is a very short period to address any issued identified. Suggest working into the requirement that Planning Studies must look out at least 12 months beyond when the study is performed. This would still allow for the provision in the current definition example ("if a Planning Assessment was started in 2011, then Year One must include the forecasted peak Load period for either 2012 or 2013) because the entity would be able to use their 2013 Load period, but it would prevent the entity from using the 2012 Load period if they started the assessment late in 2011.

Yes

Yes

Yes

Yes

Yes

PG&E does not support the performance table, as currently revised. Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No¹²" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The

unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

Group

Florida Reliability Coordinating Council, Inc - Transmission Working Group

Richard BEcker

Yes

No

No, because it is worded to be dependent upon when an assessment is started rather than when the assessment is completed and valid. Assessments don't typically include a "start date". An assessment completed on a calendar date should include (be valid for) the forecasted peak load for a timeframe that begins no more than 24 months from the date that the assessment was completed.

No

No, Since "the latest" data may become available after the study is complete, a planner may not be able to ever complete a study. Please consider removing "the latest" from the second sentence.

No

No, Please consider removing R.2.6.2. The overwhelming majority of PAs use a 10 year set of planning models developed annually by Regions or Subregions. These annual sets of planning models will always have some changes. The annual study requirement is especially problematic for Stability and Short circuit studies that require much more engineering time to complete and are much less likely to have results impacted by minor model changes such as different load forecasts. Uncertainty with audit review of technical rationale documentation will serve to focus Transmission Planning engineering resources on short term compliance to an extent that is counter productive.

No

This change does not clarify the required sensitivity analysis. A measureable change in performance is unclear? Instead of a measurable change in performance, a measureable change in contingency response of the Bulk Electric System would be more appropriate. A change in performance implies not meeting one of the performance requirements as specified in Table 1.

Yes

No
This change does not clarify material. Material should be quantified somehow. We recommend changing the phrase "material generation additions or changes" to "generation in the vicinity with additions of changes larger than 200 MW".
Yes
We support the changes to the performance tables.
Footnote 12 performance requirements of Table 1 should allow the loss of non-consequential load for all contingency categories except for P0. The disallowance of load loss does not provide any real benefit to the reliability of the BES and is an unnecessary overreach into local quality of service issues that are best addressed by State, Provincial or Municipal authorities. There may be circumstances such as high local transmission costs or local opposition to transmission construction where prohibition of non-consequential load loss represents a poor cost/benefit or quality of life tradeoff. Having a provision at the regional level that a PA or TP can have a certain amount of non-consequential load loss designed or planned in to its system that would be reasonable if it is acceptable to the RE and does not have an adverse impact on the remaining BES. In lieu of such a RE provision, providing a quantitative cap in non-consequential load loss such as 100 MW may be rationale compromise in the goal of limiting load loss for the more probable outage events. Our preference would be to retain the capability of limited non-consequential load loss. Footnote 9 should also be under consideration as part of Project 2010-11 and should be noted as such for clarification.
No
It appears that there is a disagreement between R8 and M8, regarding public posting. We Agree with M8 posting option.
No
The requirement to distribute the Planning Assessment should be more flexible and allow for making the Planning Assessment available, such that those entities that desire the information can have it readily available. R8 should be modified to replace distribute with "make available:", so the new requirement would read as follows: Each Planning Coordinator and Transmission Planner shall make available its Planning Assessment results to adjacent Planning Coordinators and Transmission Planners and to any functional entity that indicates a reliability related need for the Planning Assessment results.
Individual
Michael R. Lombardi
Northeast Utilities
Yes
No
NU does not support the revised definition of Year One as we believe it leads to confusion. Our suggestion is that Year One should be the Peak Load Year after the study is initiated. The subsequent years should be counted from Year One (e.g., a study that is started in year 2010 with peak load in 2011 will have Year One as 2011 and Year Two as 2012, etc.).
No
NU believes that the Normal System Conditions as stated in Requirement R1 should establish the base case conditions to be used for the assessment studies. More guidelines for developing base cases should be addressed in the requirements. What the statement in Requirement R1 lacks is the manner of creating generation dispatches and the level of interface flows (level of stress), which are central to any base case to be used to assess the

reliability of the electric power network. Depending upon how the base case dispatches and the level of interface flows are created, a study may reveal reliability violations in the power system. This is a weakness of the existing TPL standards. NU, however, will support the idea of developing regional guidelines in regard to the nature of the base cases to be used for the NERC reliability studies. Comment on Requirement R1.1, Part 1.1.2: With respect to known outages NU requests that the six month duration listed by the requirement should be changed to one year duration. Requirement R1.1 Part 1.1.6: The phrase "required for Load" should be deleted as this confuses the issue [since resources may also be used for export to other areas and not just internal load].

No

The revisions made to Requirement R2 Part 2.1 appear to resolve the concern that past studies could not be used to comply with the short-term steady state study requirements. However, the language of Requirement R2 Part 2.2 still seems to suggest that current annual studies are always required for the long-term steady state assessment to be compliant. This may have been an oversight, for consistency Requirement R2 Part 2.2 should be modified to similarly read as Requirement R2, Part 2.1.

No

The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions as commented in Question #3. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.

Yes

Yes

Yes

Checked "No" NU agrees with the changes that have been made to the language of P5. However, for Table 1 (Steady State and Stability Performance Extreme Events) – Stability, the wording "Protection Systems failure" should be changed to "relay failure" similarly to the change in P5. This change should be made for items 2a through 2d.

Yes

Yes

No comments on Question 7. Other Comments: As detailed below, NU has other comments that are not addressed by this Comment Form as follows – Section 3.3, Section 4.3, Non-Consequential Load Loss as referenced in the events Table 1 and studies using extreme event contingencies. Section 3.3 – NU believes that the last sentence of Part 3.3.1 should be removed since this is handled by PRC-023. Line ratings are addressed by PRC-023 which requires coordination with the Reliability Coordinator. NU suggests the removal of the following sentence: "Tripping of Transmission elements where relay loadability limits are exceeded." Section 4.3 - High speed reclosing is not defined and to help eliminate any confusion that it may introduce into the standard it will be worthwhile for the SDT to define this term. Non-Consequential Load Loss – Depending upon the resolution of "Project 2010-11, TPL Table 1, Footnote b" NU may have additional comments regarding this issue. Studies Using Extreme Event Contingencies: The requirements for sensitivity analysis already address issues going beyond what is expected to meet the reliability requirements of the standard. Therefore, requiring extreme event analysis is requiring two layers of event analysis beyond what is required and there is no requirement for corrective action if a concern is identified.

Requirement R1 Part 1.1 and following states "System models shall represent:... 1.1.5. Known commitments for firm Transmission Service and Interchange. It was commented during a previous posting that 1.1.5 should be reworded to read: Known commitments for Firm Transmission Service, and, additionally, other types of transactions provided they have been demonstrated to not violate existing reliability constraints. The response was that "The SDT believes that the defined term 'Interchange' covers other transfers as described in your comment. No change made." It is agreed that known Interchange should be modeled. However, it is imperative that existing reliability constraints not be violated in the process. That is, Interchange relating to economic transactions should not drive planning studies. Reliability-related investments should not be driven by congestion related to economic transactions incorporated into planning models. Con Edison's Preferred approach: • 1.1.5. Known commitments for firm Transmission Service and Interchange. Interchange is meant to refer to energy transactions other than firm Transmission Service. While rigorous planning studies have been conducted to permit the uninterrupted implementation of firm Transmission Service without jeopardizing the reliable operation of the Interconnected System, other types of energy transaction only take place whenever system conditions permit them. They are usually of very short duration relative to planning assessment periods (usually spanning for a few hours to a few days) and deemed highly interruptible subject to reliability issues that may arise during operation of the system. In other words, the term Interchange refers to economic transactions that are permitted when the system is secure and there are reasonable reliability margins to effect dispatch changes to lower operating costs. As such, Interchange should not be reflected in system representation meant to assess system reliability in adherence to reliability criteria delineated in documents such as TPL-001.

There is insufficient information and experience regarding dynamic load modeling. It may also be included as a "sensitivity" analysis in 3.2, rather than requiring and expecting accurate representation of a dynamic load model. If this requirement is kept, a modeling standard should be written that is specific to dynamic loads. This change belongs in a modeling standard, not in TPL-001.
Yes
No
• Header note (i) in the first Table 1 (p. 10) The explicit representation of (voltage-dependent) load models is perfectly consistent with the requirements defined in R1 (which calls for a comprehensive representation of system components and their expected operating status in the planning assessment period) and the impetus to the creation of

more specific load models in dynamic assessments found Requirement 2.4 of this draft of TPL-001-2. It is a known that depressed voltage conditions cause certain system elements to perform below their rated capacity. For example, capacitors provide less voltage support and voltage controlling transformers are impeded by their finite tap range to direct VAR flow into areas affected by low voltage conditions. Certain load types, on the other hand, provide a self-compensating relief to depressed voltage by naturally decreasing demand in a manner proportional to their characteristics, without operator intervention. Choosing to negate the voltage-dependence of one of these system elements (load, in this case) results in an inaccurate system representation that, in turn, may lead to erroneous assessments of the reliability state of the interconnected system and, potentially, to the implementation of unwarranted system upgrades.

Spencer Tacke

Modesto Irrigation District

Yes

We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: “Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response”.

No

The definition as it is in the current standards is fine. The new proposed definition is unclear.

Yes

Yes

No

This new requirement will expand the scope of the study work beyond a reasonable extent.

Yes

Yes

Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay13 protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay13 protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”. In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No12” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote “b”. This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.” Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

NBSO
Yes
No
To avoid confusion, the formal definition for Year One should be eliminated and wording used to describe Year One be placed within the appropriate requirement. For example, R2.1.1 could be re-written to state: System peak Load representing a point in time 12-24 months and another point in time 48-65 months into the future from the time the study is initiated.
No
R1 should have some language to state that base case assumptions should be made such that they appropriately stress the system to be tested and are in accordance with good engineering practice.
No
NBSO agrees with the language for R2.1, but the language with R2.2 should be changed to be consistent with R2.1. NBSO disagrees with the revisions to R2.1.5. Requiring PAs to study instead of assess the possible unavailability of equipment with a lead time of a year or more will result in significant demand on resources with little impact on system reliability. NBSO also questions what additional value such studies will bring in addition to the N-1-1 requirements (P6).
No
Base case assumptions should be made such that they appropriately stress the system to be tested and are in accordance with good engineering practice. If the base cases are already stressed, the requirement to study sensitivity cases may result in the study of less severe conditions, and thus require additional time and resources while providing little additional value to the overall assessment.
No
By implication, the response of induction motor load would need to be considered when modeling the expected dynamic behaviour of loads that could impact the study area. NBSO suggests re-wording parts of R2.4.1 as follows: System peak load levels shall include a model which represents the expected dynamic behaviour of loads that could impact the study area. An aggregate system load model which represents the overall expected dynamic behaviour of load is acceptable.
Yes
Yes

For consistency, 'Protection System' should be replaced with 'relay' on Table 1 (p12) Stability Section, items 2a-2d.
Yes
Yes
NBSO suggests considering rewording the VSL so that they address the failure to distribute the final results of planning assessments.

Yes
No
The added clarification to the definition of Year One serves to remove most ambiguity with respect to Year One. However, the revision has added further ambiguity to the terms "year two" and "year five" which are not defined. For the Planning Assessment started in a given calendar year, the first year that is studied must include the forecasted peak Load period for one of the following two calendar years. An additional Near-term study must be performed that is four calendar years beyond the first year that is studied. We recommend defining Year Five as the twelve month period 4 to 6 calendar years from the date of the Planning Assessment. We further recommend revising R2.1.1 as follows: "System peak Load for Year One and for Year Five." Alternatively, the definition of Year One could be eliminated and described within the text of the requirements.
No
For R1 Ambiguity regarding base case assumptions, in combination with lack of clarity and clear direction of purpose regarding the sensitivity analysis, undermines the objectives of the standard; R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be approved. Duration of known outages should be increased from six months to one year; R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.
No
We completely agree with the revision to R2.1, but this revision must be carried through to other sections (R2.2, 2.2.1) and R2.2 language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study". Revisions made to Requirement R2.1.5 have made it worse than as originally drafted. This would require the PC & TP to study, or in other words perform technical analysis of, the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6).
No
These sensitivities need to be considered if not already included in the base case assumptions.
No
We have not determined a need to model dynamic loads, and therefore have not benchmarked any such models. We recommend that prior to this requirement being in place, a modeling standard should exist that is specific to dynamic loads.

Yes
No
Header note (i) in the first Table 1 could imply that voltage-varying load shall not be used to meet steady state performance requirements. NYISO steady state load models include voltage-varying loads. This note should be revised to only reference loads which are disconnected due to voltage.
In Table 1 – Stability, Make language similar to wording in P5. Protection System should be removed and replaced with the words relay failure. This change should be made for 2a through 2d: 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker ¹⁰ or a relay failure resulting in Delayed Fault Clearing. In Note 11 change wording as shown below to include the words “a total of”: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less
Yes
No
Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Furthermore, the requirement lacks a specified time frame to receive comments, thereby implying that TPs and PCs would be required to reply to comments forever following the finalization of a Planning Assessment. The NYISO proposes a limit of six months. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results within 180 calendar days of the issuance of those final results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. We also have other comments not addressed by this Comment Form as follows – Section 2.7, Section 3.3, Section 4.3, and overall: Section 2.7 requires that Corrective Action Plans are included in each Planning Assessment and states “Such actions may include...” followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list. Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove “Tripping of Transmission elements where relay loadability limits are exceeded.” Section 4.3 - High speed reclosing is not defined. Overall – We have previously made comments which have not been addressed in the current version of the proposed standard. Support for the standard can at most be limited without addressing comments. We have previously commented on sensitivity analysis and guidance for base case assumptions. Also, extreme event analysis should not be mandated in this standard as no corrective action is required. The requirements for sensitivity analysis already address issues going beyond what is expected to meet reliability requirements. Requiring extreme event analysis is requiring two layers of event analysis beyond what is required, and there is no

requirement for corrective action if anything is identified. The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.

Group

Western Area Power Administration

Brandy A. Dunn

Yes

The whole bullet point section in the Effective Date section referring to Corrective Action Plans could be deleted and instead captured by Requirement R2.7.3. A seven year grace period is probably not favorable to FERC, and a better solution could be developed to meet industry needs. In R2.7.3, a possible example of "beyond the control of the Transmission Planner" could be that the physics of a significant percentage of induction motors in low inertia air-conditioning loads would tend to pull out for certain N-1 events. This may in significant part occur because such motors may have nearly no dynamic stability margin to withstand such N-1 events as close-in 3-phase faults with normal clearing during peak load conditions. So until the Transmission Planner has been able to institute changes in the industry to address the basic physics of such loads, this Requirement 2.7.3 would permit the use of such "Non-Consequential" Load Loss and curtailment of Firm Transmission Service. In this example, it may take longer than a seven year time period to fix the problem. On the other hand, some examples of Non-Consequential Load Loss could perhaps be mitigated in a shorter timeframe. Provided that an entity has a good technical justification and defined margin for "Non-Consequential" Load Loss or curtailment of Firm Transfers, then it may be acceptable. Requirement R2.7.3 seems to move in this direction. Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent "[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models". As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response".

Yes

Yes, this clarification helps. The drafting team could also define "year five".

No

It's difficult to tell whether Requirement R1 is intended to require only one base case or whether it was intended to require creation of separate models for each possible N-0 condition ("normal system condition") under a variety of stressing scenarios. The inserted language does not seem to provide additional clarity. Suggested language may be "This establishes the initial 'Normal System' condition corresponding to category P0 in Table 1." Also, in Requirement R1.1.5, how are the Firm Transmission Service commitments supposed to be modeled in Power Flow Cases? Are they just to be modeled as loads, generation, and control area interchanges? Suppose a POR or POD is not at a generator or load bus. What selection of generation and load would represent the projected system conditions for this Firm Transmission Service commitment?

No

R 2.1.5: The issue in this Requirement is studied in the Operations next-day; next-week; next-month studies required under the TOP Standards; and are also covered by processes such as the Operational Transfer Capability Policy Committee (OTCPC) seasonal study process within the WECC. It would be quite onerous to run a complete power flow simulation on separate base cases for each transformer (or other equipment with long lead time) initially out of service. The revision in language from "Planning Assessment" to "studies" does not clarify that a power flow simulation is not necessarily required for each situation. A valid assessment could include other methods such as using sound technical reasoning to relate the initial out-of-service condition to a condition that has already been studied. This condition may have taken place in previous operational studies. The language in the standard could be improved to make this clarification – perhaps reference R2.6. Additionally, this Requirement still needs further clarification. Currently the scope of equipment applicable to the requirement could be misinterpreted as larger than that contemplated by FERC. The standard as written seems to say that the responsible entity needs to study the spare equipment strategy for all "major transmission equipment" with long lead times. In the directive to include this requirement, FERC used the term "critical facilities". In the NOPR to Order No. 693 they stated, "Critical facilities are those facilities that impact IROLs and deliverability of generation to firm load" (P1081). In Order No. 693 FERC also said, "if an entity's spare equipment strategy for the permanent loss of a transformer is to use a 'hot spare' or to relocate a transformer from another location in a timely manner, the outage of the transformer need not be assessed under peak system conditions" (P1725). Finally, the drafting team could clarify if this requirement applies to radial branches (such as generator step-ups or step-down to load). Such branches may be construed as "critical facilities" but the impediment to deliverability of generation to firm load is consequential to the initial outage.

Yes

In Requirement 2.1.4, "Sensitivity Analysis". How much change does it take in any of the modeling assumptions (load, generation, voltage support, topology, etc.) to significantly stress the system within a range of credible condition? As this Requirement relates to R2.7, Would it be necessary to have Corrective Action Plan(s) if needed to meet all the Sensitivity Cases? How many Sensitivities before must have Corrective Action Plan? Also – why is it essential to use the qualifier "annual" for "current studies" in Part 2.1? Can a study be considered current if it is conducted less frequently than once per year? Note that Parts 2.3, 2.4 and 2.5 do not use the "annual" qualifier, nor does Requirement R2. Recommend deleting this apparently non-essential qualifier in both R2.1 and R2.2. We are unable to appreciate why the wording in Part 2.3 is not consistent with that in Part 2.1, 2.2, 2.4 or 2.5. Note that the semantics of the wording "... (steady state / stability) analysis shall be assessed annually..." can be interpreted to be much different than the semantics of the Part 2.3 wording "The short circuit analysis... shall be conducted annually ...". The former requires the analysis to be *assessed* annually but 2.3 requires the analysis to be *conducted* annually without explicitly requiring it be assessed -- is the usage of "conducted" instead of "assessed" consistent with the intent? In Part 2.6.2, the intent is awkwardly conveyed within the phrase "...the System represented in the study shall not include any material changes unless...". In the context of a *past* study, how can the System represented possibly include any material changes (that would have presumably occurred after the study)? Suggest modifying Part 2.6.2 to read "For steady state, short circuit or Stability analysis: no material changes have occurred in the System represented in the study or, if material changes have occurred, a technical rationale shall be provided to explain why they do not significantly impact the study results."

Yes

Yes
<p>The drafting team could provide guidance on what is "material". In Part 2.5, should "annually" be inserted after "shall be assessed" to make it consistent with Parts 2.1, 2.2, 2.3 and 2.4? If the omission is intentional in 2.5, please explain why.</p>
Yes
<p>Following is a suggested re-ordering of header notes to replace of the three categories concept – same information: a. Applicable Facility Ratings shall not be exceeded. The System shall remain stable. Cascading and uncontrolled islanding shall not occur. b. Planning event P0 is applicable to steady state only. c. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event except P0. d. The response of voltage sensitive Load including Load that is disconnected from the System by end-user equipment as a consequence of any event shall not be used to meet steady state performance requirements. e. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits established by the Planning Coordinator and Transmission Planner. f. Transient voltage response shall be within acceptable limits as established by the Planning Coordinator and Transmission Planner. g. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings. h. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event. Simulate Normal Clearing unless otherwise specified.</p>
<p>In footnotes 9 and 12, two critical issues are being addressed in large part via these "clarifying" footnotes. These are curtailment of "Firm Transmission Service" (which seems primarily to be a contract/scheduling issue) and the loss of "Non-Consequential Load." Perhaps these issues should receive more attention in the actual requirements. In P5 the term "Protection System" was removed and replaced with "relay". How are protection system elements other than relays accounted for? In studying a multiple contingency event with a communication system or control circuitry failure would it be necessary demonstrate P1 performance levels? These details could become critical as industry deals with issues such as FERC's interpretation of TPL-002-0 Requirement R1.3.10 (RM10-6-000). In Table 1 – Extreme Events – Stability – Items 2a-2d, change "Protection System failure" to "relay failure" to be consistent with changes in P5. Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". Footnote 13 – Delete "voltage (#27, #59)" since the under/over voltage relays are not called upon to provide the primary protection for fault clearing on Transmission elements. Suggest modifying Event P4 description to be more consistent with Event P5 description by including Delayed Fault Clearing in the description in lieu of "Loss of multiple elements". Suggested Event P4 description is: "Delayed Fault Clearing caused by a stuck non Bus-tie Breaker attempting to clear a fault on one of the following:" In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No12" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet</p>

this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

Yes
No
The primary concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required by varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies "only" if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. Alternatively, Requirement 2.7.2 could be revised as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis. If a Planning Coordinator includes Corrective Action Plans to resolve performance deficiencies identified in multiple sensitivity analysis, the Planning Coordinator shall provide documentation to support those Plans.
Yes
Yes
However, the requirement infers that a subjective judgment from a compliance auditor will be required.
Yes
Yes
No
(AESO is not a party to the following comments since its VSLs are set by the Alberta regulatory authority.) Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: 8.1 If a recipient of the planning assessment final results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. For a Planning Coordinator (PC) who distributes the Planning Assessment to many different entities (to adjacent PCs, TPs, and other functional entities), a concern regarding the Requirement R8 VSL is that it is overly restrictive to apply a violation for failing to distribute the results of its Planning Assessment to only one PC, TP, or functional entity (and to apply a High VSL for failing to distribute to more than one entity), particularly since an entity's contact is subject to change over time, and since Measure M8 allows for

publicly posting the results of its Planning Assessment to its website. Should the SDT decide to include the VSLs for Requirement 8, we would recommend revising to use a percentage approach rather than applying a violation to a Planning Coordinator who fails to provide the results of its Planning Assessment to one PC, TP, or other functional entity (or applying a High VSL for failing to distribute to more than one entity.) Recommend applying a similar percentage approach to the VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1) to be considered for the TPL-001-2 R8 VSLs. For example, • Lower VSL: The responsible entity failed to provide the Planning Assessment final results to 5% or less of the required entities. • Moderate VSL: The responsible entity failed to provide the Planning Assessment final results to more than 5% up to (and including) 10% of the required entities. • High VSL: The responsible entity failed to provide the Planning Assessment final results to more than 10% up to (and including) 15% of the required entities. • Severe VSL: The responsible entity failed to provide the Planning Assessment final results to more than 15% of the required entities OR [the existing language for the Severe VSL]. Explanation: The VSLs were modified for consistency with other standards and VSLs. Reference: Link to VSLs drafted by NERC Staff for Project #2007-23 VSLs (e.g., for FAC-013-1): http://www.nerc.com/docs/standards/sar/Staff_Proposed_VSLs_2010July27.pdf

Yes

No

The added clarification to the definition of Year One serves to remove most ambiguity with respect to Year One. However, the revision has added further ambiguity to the terms "year two" and "year five" which are not defined. For the Planning Assessment started in a given calendar year, the first year that is studied must include the forecasted peak Load period for one of the following two calendar years. An additional Near-term study must be performed that is four calendar years beyond the first year that is studied. We recommend defining Year Five as the twelve month period 4 to 6 calendar years from the date of the Planning Assessment. We further recommend revising R2.1.1 as follows: "System peak Load for Year One and for Year Five." Alternatively, the definition of Year One could be eliminated and described within the text of the requirements.

No

For R1 Ambiguity regarding base case assumptions, in combination with lack of clarity and clear direction of purpose regarding the sensitivity analysis, undermines the objectives of the standard; R1.1 Part 1.1.2. With respect to known outages, there needs to be greater flexibility in the standards (e.g. more tolerance to non-consequential load shedding or limitations to the contingencies that need to be considered (e.g. P0, P1, & P2)). Regional allowances for load shedding under this condition should be approved. Duration of known outages should be increased from six months to one year; R1.1 Part 1.1.6 Delete "required for Load". Resources may also be used for export to other areas, not just internal load.

No

We completely agree with the revision to R2.1, but this revision must be carried through to other sections (R2.2, 2.2.1) and R2.2 language should be consistent with 2.1 for example - use "current or qualified past studies" instead of "the following annual current study". Revisions made to Requirement R2.1.5 have made it worse than as originally drafted. This would require the PC & TP to study, or in other words perform technical analysis of, the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require

significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6).

No

These sensitivities need to be considered if not already included in the base case assumptions.

No

We have not determined a need to model dynamic loads, and therefore have not benchmarked any such models. We recommend that prior to this requirement being in place, a modeling standard should exist that is specific to dynamic loads.

Yes

No

Header note (i) in the first Table 1 could imply that voltage-varying load shall not be used to meet steady state performance requirements. NYISO steady state load models include voltage-varying loads. This note should be revised to only reference loads which are disconnected due to voltage.

In Table 1 – Stability, Make language similar to wording in P5. Protection System should be removed and replaced with the words relay failure. This change should be made for 2a through 2d: 2. Local or wide area events affecting the Transmission System such as: a. 3Ø fault on generator with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. b. 3Ø fault on Transmission circuit with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. c. 3Ø fault on transformer with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. d. 3Ø fault on bus section with stuck breaker¹⁰ or a relay failure resulting in Delayed Fault Clearing. In Note 11 change wording as shown below to include the words “a total of”: Excludes circuits that share a common structure (Planning event P7, Extreme event steady state 2a) or common Right-of-Way (Extreme event, steady state 2b) for a total of 1 mile or less

Yes

No

Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Furthermore, the requirement lacks a specified time frame to receive comments, thereby implying that TPs and PCs would be required to reply to comments forever following the finalization of a Planning Assessment. The NYISO proposes a limit of six months. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results within 180 calendar days of the issuance of those final results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments. We also have other comments not addressed by this Comment Form as follows – Section 2.7, Section 3.3, Section 4.3, and overall: Section 2.7 requires that Corrective Action Plans are included in each Planning Assessment and states “Such actions may include...” followed by a list of actions. Restricting allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list. Section 3.3 - We feel that the last sentence of 3.3.1 should be removed. This is handled by PRC-023. Line ratings are

addressed by PRC-023. PRC-023 requires coordination with the Reliability Coordinator. Remove "Tripping of Transmission elements where relay loadability limits are exceeded." Section 4.3 - High speed reclosing is not defined. Overall – We have previously made comments which have not been addressed in the current version of the proposed standard. Support for the standard can at most be limited without addressing comments. We have previously commented on sensitivity analysis and guidance for base case assumptions. Also, extreme event analysis should not be mandated in this standard as no corrective action is required. The requirements for sensitivity analysis already address issues going beyond what is expected to meet reliability requirements. Requiring extreme event analysis is requiring two layers of event analysis beyond what is required, and there is no requirement for corrective action if anything is identified. The standard is referring to requirements for sensitivity and other issues without a reference to base assumptions. The standard must describe base assumptions. To define a sensitivity condition, NERC must define base assumptions.

Yes

Yes

Yes

No

While PE does not disagree with the basic premise of 2.1, PE disagrees with the language to the extent that 2.1 is qualified by language in 2.6 and 2.6.2. The issue of managing modeling of case data is already adequately handled in MOD Standards. Furthermore, PE does not feel that the term "material" can be defined with any mutually agreed-upon boundaries, and could be construed to require any and all Transmission Planners and/or Planning Authorities to make multiple revisions of base cases each year. PE therefore appeals to the SDT to remove the language referring to R2 Part 2.6.2 and furthermore appeals for the deletion of R2.6.2. Furthermore, PE appeals to the SDT to modify R2.6.1 to say "For steady state, short circuit, or Stability analysis: the study shall be five calendar years old or less, unless a technical rationale can be provided to demonstrate the validity of the results of any studies older than five years or any studies using cases containing major modeling differences from other submitted studies."

No

PE does not have concerns in general with either 2.1.4 or 2.4.3. PE does, however, disagree with the wording at the end of the main paragraph of 2.4.3. Whether or not analysis qualifies as sensitivity analysis should not be predicated upon the end results; rather, it should be based upon major case modeling differences. PE therefore recommends that the phrase "...that demonstrate a measurable change in performance" be removed so that the last sentence in the main paragraph read "...by a sufficient amount to stress the System within a range of credible conditions."

Yes

No

PE agrees in general with the changes made to R2.5. PE disagrees, however, with the language stipulating that current and past studies be qualified by the language in R2.6 Part

2.6.2 (see notes for Question 3.1 regarding recommending changes with regard to R2.6.2).

Yes

PE assumes the term "header notes" is referring to the "Planning Performance Events" at the top of Table 1. If this is the case, PE has no concerns with the present language.

PE remains concerned with the present draft of TPL-001-2 regarding the presence or absence of footnotes in particular events. PE believes that, for all events in Table 1 except P0, any "No" designation in the "Non-Consequential Load Loss allowed" column should have Footnote 12 appended to it. Several events do append footnote 12 to a "No" answer, but several do not. PE does not see why certain events should be denied the use of Footnote 12 as long as Footnote 12 is worded in a manner such that the BES will not be adversely affected. PE has additional concerns regarding two Footnotes. Footnote 9 contains language regarding firm transmission service that is very similar to language presently under review in NERC Project 2010-11. PE feels that Footnote 9 should have had a statement at the end similar to that of Footnote 12, such as "Note: Firm Transmission Service is being decided in Project 2010-11. When that project is finalized, the resolution will be copied into Footnote 9." Without such a statement, PE cannot understand why the Firm Transmission language in footnote (b) under Project 2010-11 is being reviewed, while it is apparently no longer being reviewed in Project 2006-02. Footnote 12 contains the following language as a place holder: "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here." PE has filed substantial comments on the footnote (b) issue in previous drafts, pointing out that disallowance of curtailment of non-consequential load is a local load issue and not a BES concern. PE therefore cannot make any positive determination as to whether the draft Standard, TPL-001-2, and its associated Table 1, will be a viable Standard until the language in Footnote 12 is resolved via Project 2010-11. Given the potential for unresolved and confusing issues regarding the parallel development of Project 2006-02 and 2010-11, PE encourages NERC to resolve all issues within Project 2010-11 before taking the draft Standard TPL-001-2 to ballot in Project 2006-02.

Please clarify R1.1.2 to state "Known outage(s) of generation or Transmission Facility(ies) during the Planning Horizon with a duration of of at least six months."

Yes

Yes

Yes

Yes
It should be noted that if there is more generation proposed in an area than there load and export capability, all proposed material generation additions would not be represented. Determining what future generation additions to include in the Long-Term Transmission Planning Horizon may be based on a non-technical rationale rather than a technical rationale.
Yes
Table 1, P5 currently requires the study of “[d]elayed Fault Clearing due to the failure of a relay ¹³ protecting the Faulted element to operate as designed”. As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: “Single failure of a protection relay ¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following”. In Table 1, P2 and P3, the last column “Non-Consequential Load Loss Allowed” where the requirement “No ¹² ” appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore the proposed footnote 12 should include a provision to default to the existing footnote “b” in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, “Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.”

Previous Comment unaddressed: Requirement 2.1.5: Including the spare equipment strategy will be difficult for a PC that doesn’t own or manage the transmission equipment or the strategies. This requirement should only be applicable to TP. Furthermore, R7 should be deleted and the responsibilities of each entity should be explicitly stated within the specific requirements.
No
The stress test requirements should be deleted. The purpose of this proposed Standard is to establish planning performance standards that support reliable operation. This is

achieved by imposing performance requirements relative to specific conditions and contingencies. Compliance with the performance metrics within these boundaries is presumably indicative of a reliable system. It is unclear what value is added by stress testing the system in accordance with undefined, vague parameters, as required by Requirements 2.1.4 and 2.4.3. The criteria in the relevant requirements that govern the stress testing are defined by the following ambiguous phrase: 1) "by a sufficient amount"; 2) "range of credible conditions"; and 3) "measurable change of performance". Application of these criteria introduces uncertainty for both the regulated community and the relevant compliance enforcement authorities, which, in turn, creates audit risks for regulated entities. Furthermore, there is no reliability value because the stress test requirements do not establish objective criteria and do not prescribe any actions based on the stress test results. Reliability Standards should set specific obligations that are readily discernible and achievable on a consistent basis. The existing Standard does this by setting specific performance obligations relative to specific conditions and contingencies. Conversely, the stress test requirements introduce ambiguity and uncertainty with no reliability benefit; the only apparent effect is unnecessary audit liability risk for regulated entities. Accordingly, ERCOT believes that these requirements should be deleted.

No

ERCOT ISO suggests adding "best available" as a descriptor to load models. Distribution Providers (DPs)/Load Serving Entities (LSEs) are the appropriate NERC functional entities to provide dynamic load data. Accordingly, Planning Coordinators (PCs) and Transmission Planners (TPs) must rely on those entities for that data. Despite reliance on DPs/LSEs for this data, the Standard proposes to impose an obligation on PCs and TPs to include a load model representative of "expected" dynamic behavior. Simply put, PCs and TPs do not have this information and should not be subject to compliance liability risk for an issue that is beyond their control. This change will still accomplish the goal of reflecting dynamic data in the relevant models, while mitigating PC/TP compliance risk by basing their compliance on information that is within their control – i.e. the "best available" information. Based on this change, the language should read - "System peak Load levels shall include best available Load models which represent the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads". This language is also a more accurate reflection of the Consideration of Comments by the Standard Drafting Team after the March 2010 comment period. To address this issue in the most appropriate manner, the Standard should be revised to establish an appropriate process for collection, reporting and use of dynamic data based on assigning obligations to the appropriate functional entities. In essence, DPs/LSEs should be required to collect the data and report it to TPs. Because TP models are the basis for PC models, the dynamic data will be included in PC models as part of the process. However, DPs and TPs should still only be required to use the "best available" data. Continued use of this language will mitigate the liability risk associated with a requirement related to data that is within the control of a third party. Even under a construct where DPs/LSEs are required to collect and report dynamic data, there is no guarantee they will do so and PCs/TPs should not be held accountable in those circumstances. Accordingly, PC/TP compliance risk will be mitigated by use of a "best available" standard.

Yes

Yes

Yes

Yes

ADDITIONAL COMMENTS: Short circuit analysis (R2.3 and R2.8) should only be applicable to TPs. Fault duty issues are typically local in nature and it would be an overlap for PCs to perform this same analysis done by the local Transmission Planner. Furthermore, R7 should be deleted and the responsibilities of each entity should be explicitly stated within the specific requirements. Previous Comment Unaddressed : Requirement 2.6.2: Reads as if a change is being made to an existing study. It is confusing. Possibly restate: "2.6.2 For steady state, short circuit, or stability analysis: previous studies can be used only if a material change to the system has not occurred or if a change that did occur does not impact the study area." R4.1.2 – Planning Coordinators do not perform protection coordination nor do they have access to the relay settings information required to do this analysis. This requirement should apply to Transmission Planners only because they perform system protection. The substantive scope of the standard is relative to Long-Term Transmission Planning Horizon and Near-Term Transmission Planning Horizon. The Purpose section is described in terms of the "planning horizon" generally. It may be worthwhile aligning the two to mitigate the potential for any confusion. ERCOT proposes the following revisions to the Purpose section: 3.Purpose: Establish Transmission system planning performance requirements within the relevant planning horizon (i.e. Long-Term or Near-Term) to develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies. In addition, the "Time Horizon" for the Standard is "Long-Term Planning". Obviously, this necessarily encompasses both Long-Term and Near-Term Transmission Planning Horizons. However, the scope of the Long-Term Planning time horizon is not readily apparent. ERCOT recommends appropriate revisions that clearly define the applicable time horizons.

Tucson Electric Power Company

Yes

We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We have included additional comments here since we were not able to find a place to include comments on the following: Requirement R4; Requirement, Parts 2.1.5, 2.3, and 2.8; Requirement 3, Part 3.3.2; and Requirement 4, Parts 4.3.1 and Part 4.3.2 Requirement 2, Part 2.1.5: The spare equipment strategy does not improve reliability performance. If an outage of a long lead time piece of equipment occurs, the system should still be able to operate in a reliable manner that meets the performance measures of Categories P3 and P6. If an entity cannot meet its performance requirements under this standard, a capital project is indicated. Spare equipment being available would not mitigate this need it only increases expenses until the item is needed. Requirement 2, Parts 2.3 and 2.8: Short circuit fault duty is a localized phenomena that is mainly impacted by the addition of new generation or transmission facilities. Due to proprietary concerns of generation and transmission interconnection requests, short circuit studies are performed in forums outside the annual Planning Assessment. Normally, these studies will be conducted before the projects can be included in regional base cases. As such, short circuit analysis should not be included in this Standard since it would provided limited benefit. Requirement 3, Part 3.3.2 and Requirement 4, Part 4.3.2 Steady state response of dynamic control devices should also be included in the Part 3.3.2. and the list of possible devices included should be removed from Part 3.3.2 and 4.3.2. Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent "[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models". As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual

relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate dynamics model files that would add little or no benefit. Please change this bullet to read: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response".

No

A seasonal reference should be included in the example. Alternative language beginning with the second sentence: For the Planning Assessment started in a given calendar year, Year One must include the forecasted peak load period for the forecasted peak load season that is between 12 and 24 months into the future from the current season. For example, if a Planning Assessment was started in 2011 prior to the forecasted peak season, then Year One must include the forecasted peak load for 2012. If the Planning Assessment was started in 2011 during or after the forecasted peak season, then Year One must include the forecasted peak load for 2013.

No

Proposed changes 1.1.1 Existing Facilities that will not be changed before the study year 1.1.3 New planned Facilities and planned changes to existing facilities

Yes

No

TEP agrees with removing the phrase "not already included in the studies." However, TEP does not understand the purpose of sensitivity studies. TEP is concerned that imposing additional sensitivity studies could lead to requirements that exceed the proposed standards. TEP recommends removing sensitivity analysis from the standard.

Yes

No

If a material change (generator addition/retirement, new generator models based on unit testing, or transmission line or non-distribution transformer addition) is not planned for the longer-term planning horizon, do the longer-term stability studies need to be performed? TEP's agreement/disagreement with Part 2.4.1 is dependent on the response to this question. If the answer is the studies do not need to be performed, then TEP supports these changes.

Yes

Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay¹³ protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay¹³ protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No¹²" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is

clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue). Non-Consequential Load Loss and curtailment of Firm Transmission Service should be allowed for loss of EHV BES elements for Category P4 and P5 events.

Gregory Campoli

New York Independent System Operator

Yes

No

The added clarification to the definition of Year One serves to remove most ambiguity with respect to Year One. However, the revision has added further ambiguity to the terms "year two" and "year five" which are not defined. NYISO recommends defining Year Five as the twelve month period 4 to 6 calendar years from the date of the Planning Assessment. NYISO further recommends revising R2.1.1 as follows: "System peak Load for Year One and for Year Five." Alternatively, the definition of Year One could be eliminated and described within the text of the requirements.

Yes

No

NYISO completely agrees with the revision to R2.1, but this revision must be carried through to other sections (R2.2, 2.2.1). Revisions made to Requirement R2.1.5 have made it worse than as originally drafted. This would require the PC & TP to study, or in other words perform technical analysis of, the impact and probability of the possible unavailability of any piece of equipment with a lead time of one year or more. Such an evaluation of spare equipment strategies would require significant additional resources and data, but provide no benefit to system reliability, as it is redundant to the existing N-1-1 contingency requirement (P6). R2.7 requires that Corrective Action Plans are included in each Planning Assessment and states "Such actions may include..." followed by a list of actions. Restricting

allowable actions, and excluding runback/tripping of HVDC would have a direct impact on multiple existing facilities in New York and would adversely impact the reliability planning of the NYCA. Runback/tripping of HVDC must be added to the list.

No

Our concern involves wording under 2.1.4 and 2.4.3 that sensitivities are required varying one or more conditions. Subsequently, in requirement 2.7.2 corrective action plans need to be developed to resolve performance deficiencies "only" if identified in multiple conditions or require a rationalization why no corrective action plan is necessary. Multiple conditions sensitivities under 2.1.4 and 2.4.3 are necessary to satisfy requirement 2.7.2. Requirement 2.7.2 adds ambiguity and should be removed. Requirement 2.7.2 should be revised as follows: 2.7.2. Corrective Action Plans are not required for performance deficiencies identified in a sensitivity analysis.

No

The NYISO, along with many other systems, has not determined a need to model dynamic loads, and therefore has not benchmarked any such models. The NYISO recommends that prior to this requirement being in place, a modeling standard should exist that is specific to dynamic loads.

Yes

No

Header note (i) in the first Table 1 could imply that voltage-varying load shall not be used to meet steady state performance requirements. NYISO steady state load models include voltage-varying loads. This note should be revised to only reference loads which are disconnected due to voltage.

There are two tables labeled "Table 1". The extreme events table should be renamed "Table 2".

Yes

No

Requirement 8 is an administrative burden to TPs and PCs that adds no value to reliability. PCs should be including TPs, neighboring PCs and interested parties in its planning processes when developing the Planning Assessments. Therefore, the inclusion of a set of VSLs for Requirement 8 is unnecessary. Furthermore, the requirement lacks a specified time frame to receive comments, thereby implying that TPs and PCs would be required to reply to comments forever following the finalization of a Planning Assessment. The NYISO proposes a limit of six months. Should the SDT decide to leave the VSLs for Requirement 8, Requirement 8.1 should be revised to reflect that comments only to the final Assessment (not drafts developed during a process) need a response as follows: If a recipient of the planning assessment final results provides documented comments on the results within 180 calendar days of the issuance of those final results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to such recipient within 90 calendar days of receipt of those comments.

Sandra Shaffer

Yes

Yes

Yes
Under Category P2 (Single Contingency) and Normal System Conditions, the performance table indicates that, for both HV and EHV, interruption of firm transmission service and non-consequential load loss are not allowed following the opening of a line section without a fault. This section of the performance table should distinguish between EHV and HV – performance requirements following the opening of a line section without a fault should be the same as those for a bus section fault. As with the bus section fault, interruption of firm transmission service and non-consequential load loss should be allowed for HV.
Yes
No
The language for Requirement R8 is ambiguous with regard to which adjacent entities must request in writing the results of the Planning Assessment. The language should be clarified to read: "Upon request made in writing, each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators, adjacent Transmission Planners, and any other functional entity that has a reliability related need." The Requirement R8 VSL language should also be revised accordingly.

We disagree with the Implementation Plan and we suggest changes as follows: - The title should read "Implementation Plan for TPL-001-2" - With regards to the Prerequisite Approvals, NERC project #2010-11 still in progress (Table 1, Footnote 'b') must be implemented before this current TPL-001-2 standard gets implemented. However, while the 2010-11 NERC project does not define any of the new terms such as consequential / non-consequential load, the footnote 'b' cannot be just copied into the new standard (see TPL-001-2 standard Table 1, note 12). Note 'b' may further change to reflect the verbiage in the TPL-001-2 standard. - Not sure what is the intent of the last paragraph. While the proposed changes to Table 1, footnote 'b' are quite precise, are we still open a door to those entities that will continue to trip Non-Consequential Load and curtail Firm Transmission Service? If no penalties for such practices while the proposed standard allows a sufficient time frame to correct any deficiencies, then what is the point to all the effort behind the development of a new TPL standard?
No
The definition it seem both incomplete and exhaustive: - If taken out of the planning

assessment context, the definition is missing the matter that is supposed to identify. We suggest changing the first sentence such as "The first twelve month period to which the functional entity is responsible for the assessment of Transmission System Planning performance." - While it will be a burdensome task to define each year that follows Year One, the definition of Year One may include a sentence that define the rule for the following years such as "All of the twelve months period following Year One shall commence immediately after the end of the preceding twelve months period." - The definition should not include examples.

No

The Time Horizon should be for both Near-Term and Long-Term Planning.

Yes

No

The requirements are extremely burdensome. We recommend changing the last sentence of 2.1.4 requirement by removing "by a sufficient amount to stress the System within a range of credible conditions that demonstrate a measurable change in performance:" because there are instances where listed conditions may not result in measurable changes in performance (Ex. An increase in load in a well built system may not cause any measurable changes in performance because there is sufficient transmission capacity to serve the load).

No

We disagree with the content of this requirement based on several facts: - We believe that the dynamic behavior of the load cannot be accurately estimated beyond current time. We are concern about the effort required to ascertain the dynamic response of the load - The requirement references "Loads that could impact the study area" without specifying how an entity will identify these loads. Perhaps the standard should provide guidelines to determine which loads would impact the study area.

No

We are not sure what will be included in these "material generation additions or changes". Perhaps the standard should provide guidelines to determine what are these material changes or additions?

There are concerns over the FERC outstanding March order on TPL and how FERC interprets "normal" or base case conditions and "assuming" an entities primary protection system is out of service and must rely on its backup protection system to operate. This concept combined with the new tables cannot be perpetuated.

Yes
Yes
R2.1.4 bullet #7 – Replace the adjective “planned” with “known” for consistency with R1.1.2 and R2.1.3. R2.3 Replace “conducted” with “assess” for consistency with R1.1.2 and R2.1.3. R2.4 Replace “current or past studies as qualified” with “current or qualified past studies as indicated” for consistency with R2
No
MidAmerican questions if the widespread use of composite load models really provides significant benefits to additional dynamic analyses over generic load conversion assumptions which have been historically used. The use of composite load models may result in more precise individual load models, but no more accurate dynamic simulations. This poorly worded requirement should be deleted in its entirety as providing additional burden without any additional reliability benefits. If the composite load model requirement must be kept, it should be modified to include the following bolded text: “...System peak Load levels shall include a Load model which represents the expected dynamic behavior of Loads that could impact the study area, considering the behavior of induction motor Loads, but without requiring a detailed load survey be conducted...”
Yes
No
The reference to BES should be placed back into Note a in the header above table 1.
Voting "no" - Footnote 6 – Further clarify the applicable shunt devices in Footnote 6 with this suggested text: 6. Requirements which are applicable to shunt devices, also apply to FACTS devices that are connected to ground, but not instrument voltage transformers or surge arresters
No
Revise measures to be consistent with requirements. 1. R6 Delete “any”. The use of the word any in standards should not be allowed. 2. Revise the Planning Assessment definition to more explicitly apply to the BES and the TPL-001 requirements. We suggest text of: “Planning Assessment: Documented evaluation of future Transmission System performance and Corrective Action Plans to remedy identified deficiencies in the BES from the steady state and stability performance requirements set forth in the TPL-001 standard.” 3. R2.1.5 – We propose replacing the term ‘major Transmission’ with “BES” because BES is a well defined term, while the term, ‘major Transmission’, is not. 4. Add R2.3.1 – We suggest the addition of a R2.3.1 requirement to emulate the distinction between the requirement to perform a short circuit assessment and conduct required studies or analysis to support the assessment (e.g. R2.1/R2.1.1 and R2.2/R2.2.1). We propose wording such as, “Perform an analysis for at least one year in the Near Term Transmission Planning Horizon.” This requirement would set an expectation that an analysis should be conducted to at least one or more years in the near-term planning horizon, rather than imply that an analysis of all five years in the near-term planning horizon must be conducted. 5. R2.7.2 – Delete 2.7.2. With regard to “include actions to resolve performance deficiencies identified in multiple sensitivity studies”, mitigation plans should not be required for deficiencies found in multiple sensitivity studies because the conditions in some sensitivity studies are more extreme and less likely than base case conditions. Some of the sensitivity study conditions are not credible. 6. R2.7.4 – We suggest that the wording of R2.7.4 be the same as R.2.8.2. 7. R3.5 - We interpret that R3.5 requires the TP and PC to conduct an evaluation of possible actions to reduce the likelihood or impact of extreme events, which produce the more severe impacts, if cascading outages may occur. Does the drafting team intend for

the TP and PC to fulfill this requirement for at least one event in each of the five categories (i.e. 3 steady state and 2 stability) or in each of the 21 categories/sub-categories (i.e. 14 steady state and 7 stability). Also, if the resulting cascading outages do not result in any overloads, under-voltages, voltage collapse, or loss of generator synchronization, then should the evaluation of possible actions to reduce likelihood or impact be required? 8. R4.1.1 – We suggest that there should be some qualification of which generating units are referred to in this requirement. We propose that the requirement say, “No generating unit with a Point of Interconnection connected to the BES shall pull out of synchronism.” For example, some utilities include smaller generation units that are connected at voltages below 100 kV and even down to distribution voltage in their base cases. 9. R4.1.2 – We propose that the wording of this requirement be revised to reflect the same BES qualification of the generating unit that we noted in R4.1.1 above. 10. R4.3.1 – This requirement refers to high speed reclosing and we presume that this is special high speed reclosing that is completed in several cycles, rather than the normal high speed reclosing that is completed in a number of seconds. We recommend that the term high speed reclosing be more clearly defined for this sub-requirement. 11. R.4.3.2 – We suggest qualifying which generating units to consider and which voltage limits to simulate with revised wording like, “Trip generating units that are connected to the BES when actual or assumed minimum generator transient voltage limits are known and simulations show voltages may fall below the voltage limit. If assumed voltage limits are used, then they should be included in the assessment”. The requirement should not apply to all relevant generating units until one of the MOD standards requires all Generator Owners to provide their minimum generating unit voltage limits to the TP and PC. If the wording of R4.3.2 must be different from its counterpart, R3.3.2, then please explain the reasons for any differences. 12. R5 – This requirement should allow the applicable entity (such as the TOP / TO) to define a “Post-Contingency Voltage Deviation” as this criteria is not used widely enough in the industry to be a well established criteria. 13. Revise R8 to limit the need to provide the Planning Assessment as follows “adjacent Planning Coordinators and adjacent Transmission Planners and to any registered functional entity...” 14. Data Retention for R3, R5, R6, & R7 - The MRO NSRS proposes that the wording in these elements be revised to change “All” to “The”. The word “All” is unnecessary and could encourage over-the-top compliance monitoring and enforcement. The revised data retention would read as follows: “The studies performed in support....”

We commend the SDT for its work to continue the improvement on the proposed TPL-001-1. We were not able to find a place to include comment on Requirement R4; therefore, we have included our comments here: Section R4.3.1, bullet point 3 requires the stability analyses to include the impact of subsequent “[t]ripping of Transmission lines and transformers where transient swings cause Protection System operation based on generic or actual relay models”. As written, this bullet could be interpreted as requiring the inclusion of these relay models in stability data bases. We do not have generic or actual relay models in our dynamics data bases for tripping line faults on lines and transformers represented. We represent actual relay response and tripping times of relays, communications, and breakers to faults in tripping transmission lines and transformers. Requiring the inclusion of generic or actual relay models for all relays that can trip lines and transformers would add a large burden to the development and maintenance of accurate

dynamics model files that would add little or no benefit. Please change this bullet to read: "Tripping of Transmission lines and transformers where transient swings cause Protection System operation based on known Protection System response".

Yes

Yes

Yes

Yes

Yes

Yes

Table 1, P5 currently requires the study of "[d]elayed Fault Clearing due to the failure of a relay13 protecting the Faulted element to operate as designed". As written, this requirement does not recognize the use of redundant relays for primary protection. In some cases side by side relays are used to provide primary fault tripping if one relay fails to operate. Per the requirement as stated, the redundant relay would provide no value in meeting this requirement. Please revise to acknowledge backup relays: "Single failure of a protection relay13 protecting the Faulted element to operate as designed, resulting in backup relay actions or Delayed Fault Clearing, for one of the following". In Table 1, P2 and P3, the last column "Non-Consequential Load Loss Allowed" where the requirement "No12" appears, and in footnote 12, the standard as proposed does not allow for any Non-Consequential Load Loss. When the Non-Consequential Load Loss (footnote b) issue is clarified in Project 2010-11 this requirement may be changed. Therefore, if this proposed Standard is enforced before Project 2010-11 is completed, entities will be required to meet this No Non-Consequential Load Loss requirement without the exception allowed in the existing TPL-002-0, footnote "b". This will require immediate redesigns to meet this particular requirement. The unintended consequence could be that operators of local systems that are currently networked may opt to begin operation as radial systems, and future designs for local systems may be radial, at any voltage level. We suggest that the proposed footnote 12 include a provision to default to the existing footnote "b" in TPL-002-0 until Project 2010-11 is decided. Please revise footnote 12 to read, "Note: Non-Consequential Load Loss is being decided in Project 2010-11. When that project is finalized, the resolution will be copied here. In the interim, planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers." Timing of this project and project 2010-11 is critical. It would be very difficult to vote to approve the proposed TPL-001-2 prior to knowing the outcome of Project 2010-11 (footnote b issue).

Why is Footnote 12 used for some occurrences of the word "No" in the last column of Table 1 but not other occurrences of the word "No"?

Consideration of Comments on Reliability Coordination (Project 2006-06)

The Reliability Coordination Standard Drafting Team thanks all commenters who submitted comments on the proposed revisions to the standards for Project 2006-06 — Reliability Coordination. These standards were posted for a 45-day public comment period from January 4, 2010 through February 18, 2010. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 42 sets of comments, including comments from more than 150 different people from over 50 companies representing all of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

Summary Consideration:

Stakeholders had three general concerns with the definition of Interpersonal Communications.

- 1) The definition of Interpersonal Communication to be ambiguous in terms of distinguishing between verbal communications and data transfers; The SDT believes that Webster's definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange.

The RCSDT believes that data communication is covered under IRO-010, R3 which states:

Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)

- 2) The definition should also clarify that the communication is between individuals in different entities or physical locations; The SDT believes that the revised Requirements of COM-001-2 satisfy this concern.

- 3) Use of the term "method" may imply a communication style; The RCSDT changed "method" to "medium" in definition.

Several stakeholders indicated that a definition of Alternative Interpersonal Communications was not needed. The RCSDT disagrees because there is an important part of the definition of "Alternative Interpersonal Communications" that distinguishes it from simply being an alternative "Interpersonal Communications". The proposed definition contains the words: "which does not utilize the same infrastructure (medium)". Also, some stakeholders had concerns with the usage of "normal". The RCSDT does not propose defining "Normal" Interpersonal Communications and has removed it from the definition. Based on the consensus of stakeholders, we have revised the two definitions to:

Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.

Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.

Stakeholders pointed out that COM-001, R1 was a compound requirement and suggested creating separate requirements. Stakeholders also suggested revising the VRF to "Medium" as it does not meet the guidelines for a "High" VRF. The intent of R1 was three-fold.

- 1 Identify (have) an Alternative Interpersonal Communication capability**
- 2 Test that capability periodically and**
- 3 If the test failed, fix it or identify another Alternative Communications Capability.**

Based on comments received, we have revised R1 (now R9) to eliminate the compound requirement and therefore created more specific requirements to delineate Interpersonal and Alternative Interpersonal Communication, and applicable entity responsibility. The VRF is changed to "Medium."

The RCSDT also made extensive revisions to COM-001 to provide explicit Interpersonal Communications and Alternative Interpersonal Communications capabilities based on the relationships between various entities. The RCSDT believes that the proposed requirements meet the reliability objectives of the standard as well as the FERC Order 693 directives.

The comments received regarding the definition of Reliability Directive (for COM-002 and IRO-001) ranged from the being "too open-ended" (PPL) to not "flexible" enough (Public Service Enterprise Group Companies). The SDT expected and viewed these as attempting to reach middle ground.

There were also value added comments such as removing the unnecessary and redundant terms "actual or expected" from the definition, which the SDT agrees with. The definition was revised to:

A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency.

A number of commenter's expressed a concern about the definition not including three-part communication, clearly identifying a Reliability Directive at the time of issue, and applying to verbal communications. The SDT believes responsibilities should not be imbedded in a definition and, as drafted, the requirements of COM-002 with the proposed definition of Reliability Directive fully address the identification and verbal concerns.

The bulk of the comments received on COM-002 regarded the VSL for R3. The SDT agreed with suggestions for the VSLs and has deleted the Severe VSL and moved the High VSL to Severe. We believe that there are two possible actions within the requirement and failure to perform either warrants a Severe VSL.

Several commenter's expressed concern about three-part communication. The SDT believes that the requirements as drafted, with the issue, repeat back, and acknowledgement of a Reliability Directive, three-part communication is covered.

There was one commenter suggesting the addition of the DP to the applicability. The RCSdT notes that, per the Functional Model, a DP may “direct” an LSE to communicate requests for voluntary load curtailment and not reliability situations: Item 9 on page 47 of version 5 of the Functional Model: “Directs Load-Serving Entities to communicate requests for voluntary load curtailment.” Furthermore, The RCSdT will forward this comment to the FMWG for their consideration in revising the language.

The comments regarding the use of Reliability Directive in IRO-001 ranged from small entities being excluded to whether regulatory or statutory requirements covers NERC standards. The SDT addressed these by noting registration is not in the SDT scope and NERC’s general council should be contacted for regulatory issues.

A few commenter’s expressed concern with the VSL for R2 and one suggested the words “per Requirement 2,” should be added. The SDT believes the phrase “per Requirement 2” is not necessary as a VSL is only applied AFTER a compliance violation is determined.

Value added comments such as a concern of the use of the word “threat” as it can be defined as cyber-related and suggested replacing “Operating Personnel” with “System Operator” were also made. The SDT concurred and removed the word “threat” and replaced it with “condition” and also made the revision to System Operator.

There were numerous comments regarding the definition of Reliability Directive with multiple wording suggestions. While slightly out of scope for question six, the SDT expected and viewed these as attempting to reach middle ground.

Some commenter’s expressed concern over clarify that the RC has three separate actions. The RC can act, direct others to act, or issue Reliability Directives. The SDT modified R1 to read: “Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts”

Note: Based on discussions with FERC Staff, the SDT agreed to make the following changes:

IRO-001-2 Requirements R4, R5 and associated Measures and VSLs are moved to IRO-005-4

IRO-001-2 Requirements R6, R7 and associated Measures and VSLs are moved to IRO-002-2

Several commenters made suggestions regarding IRO-014, R2. The original requirement was designed to accomplish in one requirement what is proposed by the commenters as three procedural requirements. R2 is worded to focus on defining what a “compliant plan” is. In the current requirement a “proposed plan” is not the same as a “compliant plan”.

The SDT viewed what the commenters are suggesting as follows:

- The initiating RC would submit its “proposed plan” to the other RCs
- The receiving RCs would provide the initiating RC with their responses indicating whether or not they agree with the proposed roles/actions offered by the initiating RC

- If one or more RCs do not agree with the roles/actions, then the initiating RC would be required to offer an alternative proposal (and go back to the first bullet)
- When all RCs acknowledge that the proposed roles/actions in the revised "proposed plan" are acceptable, then and only then would the "proposed plan" become a "compliant plan"

A closer reading of the current R2 would show the current R2 accomplishes the exact same result but does so without interjecting the need for documenting the intervening processes. The SDT does not see the need to document why each proposal was or was not accepted; nor does the SDT see the need to document the negotiations that are involved in getting to "an agreed to plan". For example the comments' subrequirement to show the RC submitted its plan would require a paper trail for the request; followed by a paper trail for the responses, followed by more paperwork if the RCs are not in agreement. In the end, the only action that matters (in both the SDT version and in the commenters alternative version) is a plan that works, and a plan that if others are involved must have their concurrence that those others will participate.

R2 does not impose a requirement to get agreements; what R2 does is to require that a "compliant plan" be developed. A proposed plan does not solve problems. That proposed plan is NOT compliant with R2 if it only assumes that other RC will effect the actions in the proposal; neither is it compliant if the proposed actions are not acceptable to the other RCs who are required to act. To be compliant the initiating RC must either have the concurrence (i.e. agreement) of the other RCs for their respective part(s) in the proposed plans OR the plan must not include those RCs.

R2 says to be compliant the other RC must agree with the "proposed plan" before that "proposed plan" is acceptable as a "compliant plan". Having a plan that requires someone else to do an action, but that other entity will not effect that action, will not resolve the problem at hand. Further having documentation that someone refuses to participate in the proposed plan does nothing to solve the problem at hand.

In general, the RC SDT feels that the concept of a Reliability Directive is an important tool for RC, BA and TOP to maintain reliability and that the revisions are consistent with the applicable parts of the directives in FERC Order 693. The work of the RC SDT along with the OCPD SDT and the RTO SDT, as currently recognized, will cover the original intent of COM-002 and still provide a "defense in depth strategy" as suggested by commenters. Consensus appears to have been achieved with respect to the definition of Reliability Directive and the requirements that the RC SDT have developed for COM-002. This will further the efforts of the OCPD SDT in achieving stakeholder consensus for their proposed requirements in COM-003. The intent of this DT is to preserve a method for RCs, BAs and TOPs to make the determination of "what actions are required" and clearly communicate the importance to the receiver at a heightened method to normal day-to-day operational communications. The trigger of "Reliability Directive" by the issuer highlights these actions as needed to maintain BES reliability and shall be carried out as directed (unless such actions would violate safety, equipment, regulatory or statutory requirement per the language of the requirement) and all parties to the conversation need to be very cognizant of the system conditions that are requiring actions. The DT has attempted to craft clear and specific language that support BES reliability and hopes that this work can

support and enhance the development of the OPCP SDT. The RCSDT has also attempted to eliminate redundancy and ambiguity while not creating any reliability gaps. Several comments were received on the RC's ability to "act". The RC must "act" (ie. do something, "to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts". This may include analysis, coordination of cooperative actions or the issuance of "Reliability Directives". "Act" does not imply solely the manipulation of BES elements.

RC control of "analysis tools" is critical to maintaining the wide area view. Control by the RC over the tools is imperative and beyond administrative, since it is intended to prevent planned reliability tool outages without the consent or knowledge of operating personnel. Although the DT agrees with the premise that many other requirements may be violated by ineffective communications, the intent of the requirement is to ensure there are effective communications methods in place for communicating BES activity across entities. Effective communication are a cornerstone of BES reliability and the intent of the requirement is to prevent the violation of other more significant performance type standard requirements due to ineffective communications before they impact the BES. Failure of the RC to control outages of analysis tools was mentioned as a contributing factor in the 2003 blackout.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

¹ The appeals process is in the Reliability Standards Development Procedures: <http://www.nerc.com/standards/newstandardsprocess.html>.

- 1 Do you agree with the proposed definition of Interpersonal Communication (COM-001-2)? If not, please explain in the comment area.

Summary Consideration: Stakeholders had three general concerns with the definition of Interpersonal Communications.

- 1) **The definition of Interpersonal Communication to be ambiguous in terms of distinguishing between verbal communications and data transfers; The SDT believes that Webster’s definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange.**

The RCSDT believes that data communication is covered under IRO-010, R3 which states:

Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)

- 2) **The definition should also clarify that the communication is between individuals in different entities or physical locations; The SDT believes that the revised Requirements of COM-001-2 satisfy this concern.**
- 3) **Use of the term “method” may imply a communication style; changed “method” to “medium” in definition.**

Organization	Yes or No	Question 1 Comment
Calpine Corporation		
North Carolina Municipal Power Agency #1		
Public Service Enterprise Group Companies		
We Energies		

Organization	Yes or No	Question 1 Comment
Operating Personnel Communications Protocols SDT		No comment
CECD	No	CECD agrees that the term should be very broad and allow a registered entity to establish appropriate communication tools, devices, processes or systems to suit their operation. However, there is a need to include the term "normal" interpersonal communication methods based on the definition of alternative interpersonal communication.
<p>Response: The RCSDT thanks you for your comment. RCSDT does not propose defining “Normal” Interpersonal Communications and has removed it from the alternative definition and included “...used for day-to-day operation.” Based on the consensus of stakeholders, we have revised the two definitions to:</p> <p>Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p> <p>Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.</p>		
ITC Holdings	No	Comments: As written, the definition could be interpreted to include data communications. Suggest modifying the definition to “Any method that allows two or more individuals to verbally interact, consult, or exchange information.” Interpersonal Communication to operate the BES must be timely and non voice communication cannot be relied upon to be timely in all situations.
<p>Response: The RCSDT thanks you for your comment. The intent of this definition is to exclude data, but not preclude e-mail, text, etc.</p> <p>The RCSDT believes that data communication is covered under IRO-010, R3 which states:</p> <p>Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p>		
NERC	No	Comments: NERC staff believes the definition is unnecessary. “Interpersonal” is a common term and this definition provides no additional clarity. In addition, COM-001 should maintain the current coverage of voice and data. The requirements should address both primary and alternative/backup capabilities for voice and data. Approved standards including TOP-005-1.1 and IRO-010-1, as well as several others under development rely on the communication capabilities specified in COM-001. By limiting the focus of COM-001-

Organization	Yes or No	Question 1 Comment
		2 to this definition of Interpersonal Communication, there will no longer be an obligation to ensure that data telecommunication paths between entities are adequate and reliable.
<p>Response: The RCSDT thanks you for your comment. The RCSDT and the industry disagree with NERC staff’s assessment. A strong industry request to clarify “facilities” led to the definition of interpersonal communication which has been modified to:</p> <p>Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p> <p>Primary communication is inferred when reference to alternative is made. Moreover, the primary capability is used/tested on a daily basis.</p> <p>The RCSDT contends that IRO-010 covers the requirement for data and information that includes a requirement for providing specified data when automated Real-Time system operating data is unavailable.</p>		
Exelon	No	Definition is vague and subject to interpretation. Requirement should be to have primary and backup capabilities. Disagree that a definition is required.
<p>Response: The RCSDT thanks you for your comment. The RCSDT and the industry disagree. A strong industry demand to clarify “facilities” led to the definition of interpersonal communication which has been modified to:</p> <p>Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p> <p>Primary communication is inferred when reference to alternative is made. Moreover, the primary capability is used/tested on a daily basis.</p>		
Southern Company Services	No	If there is going to be an alternative definition, than this should be a definition for Normal Interpersonal Communication.
<p>Response: The RCSDT thanks you for your comment. Primary communication is inferred when reference to alternative is made. Moreover, the primary capability is used/tested on a daily basis.</p>		
Ameren	No	In previous postings, the drafting team confirmed that they intended for COM-001-2 to apply only to verbal communication systems and not data. However, the phrase “or exchange information.” could still imply data (information). We suggest that the team should explicitly exclude data in definition.
Midwest ISO Standards Collaborators	No	In previous postings, the drafting team confirmed that they intended for COM-001-2 to apply only to verbal communication systems. We believe this definition had inadvertently brought data back into the standard. Specifically, we are concerned about “or exchange information.” Data can be considered information and thus some may now interpret SCADA and ICCP being included. We suggest the definition would be sufficient with the “or exchange information” redacted and would avoid this confusion.

Organization	Yes or No	Question 1 Comment
<p>Response: The RCSDT thanks you for your comment. The SDT believes that Webster’s definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange.</p> <p>The RCSDT believes that data communication is covered under IRO-010, R3 which states:</p> <p>Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p>		
<p>NERC Standards Review Subcommittee</p>	<p>No</p>	<p>In previous postings, the drafting team confirmed that they intended for COM-001-2 to apply only to verbal communication systems. We believe this definition had inadvertently brought data back into the standard. Specifically, we are concerned about “or exchange information.” Data can be considered information and thus some may now interpret SCADA and ICCP being included. To avoid this confusion, we suggest the definition would be sufficient with the “or exchange information” redacted.</p> <p>We believe the proposed definition for the term “Interpersonal Communication” is too broad and ambiguous. We recommend the following instead: “Verbal Communication between two or more registered entities (not within the same organization) to exchange reliability-related information.” The inclusion of this term “registered entities” removes the ambiguity which we believe is contained in the proposed definition. In addition, the inclusion of the phrase “not within the same organization” clarifies that the focus of definition is to address communication between different registered entities.</p>
<p>Response: The RCSDT thanks you for your comment. The SDT believes that Webster’s definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange.</p> <p>The RCSDT believes that data communication is covered under IRO-010, R3 which states:</p> <p>Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p> <p>Also, the SDT believes that the revised Requirements of COM-001-2 satisfy your ambiguity concern.</p>		
<p>Southwest Power Pool</p>	<p>No</p>	<p>It appears as if the following two definitions have the same meaning: COM-001-2 Interpersonal Communication: Any method that allows two or more individuals to interact, consult, or exchange information. COM-003 -1 Interoperability Communication - Communication between two or more entities to exchange reliability-related information to be used by the entities to change the state or status of an element or facility of</p>

Organization	Yes or No	Question 1 Comment
		<p>the Bulk Electric System. SPP recommends changing the word “method” to medium in Interpersonal Communication. For Alternative Interpersonal Communication, that definition uses the term “infrastructure (medium)” as in type of equipment used. These terms should use consistent words if they are referring to the same thing.</p>
<p>Response: The RCSDT thanks you for your comment. We concur and have revised the two definitions to: Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information. Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.</p>		
Duke Energy	No	<p>Need to revise this definition to clarify that Interpersonal Communication is the primary method of communication, and that it is limited to verbal or written communications (not data such as SCADA data), and that it is limited to real-time operations (time horizon is Real-time Operations). Suggested wording: Interpersonal Communication: The primary verbal or written method that allows two or more individuals to interact, consult, or exchange information for real-time operations.</p>
<p>Response: The RCSDT thanks you for your comment. . The SDT believes that Webster’s definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange.</p> <p>The RCSDT believes that data communication is covered under IRO-010, R3 which states:</p> <p>Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p> <p>The RCSDT does not believe “primary” is needed because “primary” communication is inferred when reference to “alternative” is made.</p>		
PPL	No	<p>The definition should be clarified to state that it is interpersonal communications between functional entities and not interpersonal communications within the functional entity that the standard is addressing.</p>
<p>Response: The RCSDT thanks you for your comment. The SDT believes that the revised Requirements of COM-001-2 satisfy your concern</p>		
Hydro-Québec TransEnergie (HQT)	No	<p>The definition should be worded to be more explicit, such as: When two or more individuals interact, consult, or exchange information.</p>

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	The definition should be worded to be more explicit, such as: When two or more individuals interact, consult, or exchange information.
<p>Response: The RCSDT thanks you for your comment. We concur and have revised the definition to: Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p>		
Electric Market Policy	No	The SDT has proposed a definition that is meant to limit the standard to two-way person-to-person communication between functional entities. However, as written the definition can also be viewed as so open-ended as to apply to pens and papers used by system operators to show another system operator in the same control room some operational data. The proposed standard does further constrain the application to “real-time operation information”, but may be better served to explicitly constrain the definition to functional-entity-to-functional entity. It is these media that the standard means to address.
<p>Response: The RCSDT thanks you for your comment. The SDT believes that the revised Requirements of COM-001-2 satisfy your concern</p>		
Bonneville Power Administration	No	The term, ‘interpersonal communication’ as defined by common usage and Webster’s Dictionary is sufficient for the work at hand. To provide an additional definition via the NERC Standards Development Process unnecessarily adds to an already convoluted task and provides no further benefit to the user of this proposed standard.
<p>Response: The RCSDT thanks you for your comment. The RCSDT and the industry disagree. A strong industry request to clarify “facilities” led to the definition of interpersonal communication which has been modified to: Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p>		
Northeast Utilities	No	The use of “Any method” as the start of the definition of Interpersonal Communication is too board a qualifier. In normal interpersonal communications only 5 to 10% of the total communication is verbal while 90 to 95% is non-verbal. As it is not the intent of this standard to address non-verbal communications the use of “Any method” should be eliminated from the definition and more specific terms that clearly convey the intent of the standard should be used.

Organization	Yes or No	Question 1 Comment
<p>Response: The RCSDT thanks you for your comment. We concur and have modified the definition to: Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p>		
FirstEnergy	No	<p>This definition should be revised as follows to ensure clarity of scope by excluding electronic data exchange and for consistency with the proposed requirements: "Interpersonal Communication Capability: Any method that allows two or more individuals to interact, consult, or exchange real-time Bulk Electric System operating information using verbal communication equipment."</p>
<p>Response: The RCSDT thanks you for your comment. We agree in principle; however, the SDT believes that Webster’s definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange.</p> <p>The RCSDT believes that data communication is covered under IRO-010, R3 which states:</p> <p>Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p>		
Manitoba Hydro	No	<p>When “Interpersonal Communication” is added to the NERC Glossary without the obvious reference to COM-001-2 which is “To ensure that operating entities have adequate Interpersonal capabilities” could and does infer that the definition means “protocol or forum of speaking, interacting or exchanging” information. The suggested definition does not immediately indicate the normal medium of communications, such a land line, mobile, radio, electronic, etc. A suggested definition: Interpersonal Communication: The normal mediums that carry messages, verbal or electronic, between two or more entities, internal or external, for the operation of the Interconnected Bulk Electric System.</p>
<p>Response: The RCSDT thanks you for your comment. We agree in principle and have modified the definition to: Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information. The SDT believes that the revised Requirements of COM-001-2 satisfy your concern of communication between entities.</p>		

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 1 Comment
American Electric Power	Yes	
American Transmission Company	Yes	
Central Lincoln	Yes	
E.ON U.S.	Yes	
Florida Municipal Power Agency and Some Members	Yes	
Independent Electricity System Operator	Yes	
IRC Standards Review Committee	Yes	
ISO New England Inc	Yes	
OC Standards Review Group	Yes	
PacifiCorp	Yes	
Pepco Holdings, Inc	Yes	
PNGC Power (15 member utilities)	Yes	
Puget Sound Energy	No	<p>The proposed definition for this term addresses a method of communication, but not the communication itself. As a result, the defined term is incomplete as proposed. Recommend the addition of the word “capability” so that the defined term is “Interpersonal Communication Capability”. The addition of this word to the term is also consistent with the use of the term in the proposed standard language, where Interpersonal Communication is consistently used in conjunction with the words “capability” or “capabilities”.</p>

Organization	Yes or No	Question 1 Comment
		<p>Response: The RCSDT thanks you for your comment. We agree in principle and have modified the definition which replaces “method” with “medium”:</p> <p>Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p> <p>The RCSDT believes the definition itself infers “capability.”</p>
South Carolina Electric and Gas	Yes	
US Bureau of Reclamation	Yes	
Western Area Power Administration	Yes	
Western Electricity Coordinating Council	Yes	
Xcel Energy	Yes	
ERCOT ISO	No	<ol style="list-style-type: none"> 1) ERCOT ISO considers the definition of Interpersonal Communication to be ambiguous in terms of distinguishing between verbal communications and data transfers; the definition should specify that it applies to verbal communication systems. 2) The definition should also clarify that the communication is between individuals in different physical locations to mitigate any potential for application to communications between employees of the same company communicating to each other in person at the same physical location – e.g. a control center. 3) Additionally, use of the term “method” could imply a communication style (e.g. 3-part communications) as opposed to mode. It should be clear that the Standard only applies to modes of communication. Examples should be provided (e.g. phone, email, etc.) to clarify the scope.
<p>Response: The RCSDT thanks you for your comment.</p> <ol style="list-style-type: none"> 1. The definition of Interpersonal Communication to be ambiguous in terms of distinguishing between verbal communications and data transfers; the SDT believes that Webster’s definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange. <p>The RCSDT believes that data communication is covered under IRO-010, R3 which states:</p>		

Organization	Yes or No	Question 1 Comment
		<p>Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p> <ol style="list-style-type: none"> 2. The SDT believes that the revised Requirements of COM-001-2 satisfy your concern of communication in different physical locations. 3. The RCSDT concurs and revised the definition, Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.

2 Do you agree with the proposed definition of Alternative Interpersonal Communication (COM-001-2)? If not, please explain in the comment area.

Summary Consideration: Several stakeholders indicated that a definition of Alternative Interpersonal Communications was not needed. The RCSDT disagrees because there is an important part of the definition of “Alternative Interpersonal Communications” that distinguishes it from simply being an alternative “Interpersonal Communications”. The proposed definition contains the words: “which does not utilize the same infrastructure (medium)”. Also, some stakeholders had concerns with the usage of “normal”. The RCSDT does not propose defining “Normal” Interpersonal Communications and has removed it from the definition. Based on the consensus of stakeholders, we have revised the two definitions to:

Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.

Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.

Organization	Yes or No	Question 2 Comment
Calpine Corporation		
North Carolina Municipal Power Agency #1		
Public Service Enterprise Group Companies		
We Energies		
Operating Personnel Communications Protocols SDT		No Comment

Organization	Yes or No	Question 2 Comment
Manitoba Hydro	No	<p>“Alternative Interpersonal Communication” also when added to the NERC Glossary without the obvious reference to COM-001-2 which is “To ensure that operating entities have adequate Interpersonal capabilities” could and does infer that the definition means “ other protocols or forums of speaking, interacting or exchanging” information. The suggested definition does not immediately indicate the backup or alternate mediums of communications, such a redundant land lines, Satellite phones, battery or diesel back up electronics, etc. A suggested definition: Alternative Interpersonal Communication: Backup or alternate mediums that during planned or failure of normal medium systems, that can carry messages, verbal or electronic, between two or more entities, internal or external, for the operation of the Interconnected Bulk Electric System.</p>
<p>Response: The RCSDT thanks you for your comment. We have revised the definition to: Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation. The RCSDT believes “medium” stands alone in the definition and needs no descriptors.</p>		
Exelon	No	Disagree that a definition is required.
<p>Response: The RCSDT thanks you for your comment. The RCSDT disagrees because there is an important part of the definition of “Alternative Interpersonal Communications” that distinguishes it from simply being an alternative “Interpersonal Communications”. The proposed definition contains the words: “which does not utilize the same infrastructure (medium)”.</p>		
Western Electricity Coordinating Council	No	Do not need an alternate definition
<p>Response: The RCSDT thanks you for your comment. The RCSDT disagrees because there is an important part of the definition of “Alternative Interpersonal Communications” that distinguishes it from simply being an alternative “Interpersonal Communications”. The proposed definition contains the words: “which does not utilize the same infrastructure (medium)”.</p>		
Southern Company Services	No	Interpersonal Communication includes any method. If this includes all possibilities why is an additional definition needed?
<p>Response: The RCSDT thanks you for your comment. The RCSDT revised the definition as: Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information. The RCSDT believes that an important part of the definition of “Alternative Interpersonal Communications” that distinguishes it from simply being an</p>		

Organization	Yes or No	Question 2 Comment
<p>alternative “Interpersonal Communications” are the words: “which does not utilize the same infrastructure (medium)”.</p>		
Duke Energy	No	<p>Need to revise this definition to clarify that Alternative Interpersonal Communication is the identified substitute method for the Interpersonal Communication method. Suggested wording: Alternative Interpersonal Communication: The identified verbal or written method that is able to serve as the substitute for and is redundant to Interpersonal Communication and does not utilize the same infrastructure (medium) as Interpersonal Communication.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT does not believe that the definition should be revised as suggested as “Alternative” is clear when the requirements are viewed.</p>		
Southwest Power Pool	No	<p>Replace Alternative Interpersonal Communication definition with: Backup Interpersonal Communication: Any method that is able to serve as a substitute for and is redundant to the primary normal Interpersonal Communication and does not utilize the same infrastructure (medium) as the primary normal Interpersonal Communications. Consistent terms should be used across standards if they are referring to the same thing.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT feels that the use of “Alternative” is appropriate and provides flexibility within this standard. The RCSDT does not believe that the definition should be revised as suggested as “Alternative” is clear when the requirements are viewed. There is sufficient stakeholder support to retain “Alternative”.</p>		
NERC	No	<p>See response to Question 1.</p>
<p>Response: The RCSDT thanks you for your comment. Please see response to Question 1.</p>		
E.ON U.S.	No	<p>Suggested edit to definition: Alternative Interpersonal Communication: A Interpersonal Communication method that is able to serve as a substitute for and is functionally redundant to the normal Interpersonal Communication method but does not utilize the same infrastructure (medium) as the normal Interpersonal Communication method. The intent of the edit is to clarify that the entity must to have identified one (1) normal Interpersonal Communication and one (1) Alternative Intercommunication method.</p>
<p>Response: The RCSDT thanks you for your comment. A definition can not impose requirements that are not explicitly stated in the standard. The suggested edit is not necessary as the requirements define what an entity must do to be compliant. The RCSDT has also removed the words “and is redundant to” from the definition based on other stakeholders comments.</p>		

Organization	Yes or No	Question 2 Comment
Bonneville Power Administration	No	The proposed definition adds value for the user of this proposed standard by adding the ideas of the alternate mode of communications being both independent and redundant to normal communications. However, this having been said, the term chosen by the SDT, the term 'Alternative Interpersonal Communication' appears to focus attention on the wrong aspect of what's being discussed. Since the definition focuses on an alternative mode or 'method' of communicating, clarity would be added if the SDT changed the term to be defined to either 'Alternative Mode of Communication' or 'Alternative Method of Communication.' The use of the word 'interpersonal' would be optional, but not necessary.
<p>Response: The RCSDT thanks you for your comment. To clarify our intent, the RCSDT changed “method” to “medium” in the definition. The proposed definition is:</p> <p>Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.</p>		
Hydro-Québec TransEnergie (HQT)	No	The proposed definition of Alternative Interpersonal Communication is equally ambiguous as the aforementioned definition of Interpersonal Communication. A precise definition of Interpersonal Communication and “Normal” Interpersonal Communication is required before an agreed upon definition of Alternative Interpersonal Communication can be reached.
Northeast Power Coordinating Council	No	The proposed definition of Alternative Interpersonal Communication is equally ambiguous as the aforementioned definition of Interpersonal Communication. A precise definition of Interpersonal Communication and “Normal” Interpersonal Communication is required before an agreed upon definition of Alternative Interpersonal Communication can be reached.
Northeast Utilities	No	The proposed definition of Alternative Interpersonal Communication is equally ambiguous as the aforementioned definition of Interpersonal Communication. A precise definition of Interpersonal Communication and “Normal” Interpersonal Communication is required before an agreed upon definition of Alternative Interpersonal Communication can be reached.
<p>Response: The RCSDT thanks you for your comment. The RCSDT does not propose defining “Normal” Interpersonal Communications and has removed it from the definition. Based on the consensus of stakeholders, we have revised the two definitions to:</p> <p>Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p> <p>Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same</p>		

Organization	Yes or No	Question 2 Comment
infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.		
FirstEnergy	No	The word "normal" in the proposed definition adds some ambiguity to the definition. This definition should be revised as follows to ensure clarity of scope by excluding electronic data exchange and for consistency with the proposed requirements: Alternative Interpersonal Communication Capability: Any verbal communication equipment that is able to serve as a substitute for and is redundant to Interpersonal Communication equipment used during day-to-day operations and does not utilize the same infrastructure as the Interpersonal Communication equipment.
<p>Response: The RCSDT thanks you for your comment. The RCSDT does not propose defining “Normal” Interpersonal Communications and have removed it from the definition. Based on the consensus of stakeholders, we have revised the two definitions to:</p> <p>Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p> <p>Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.</p>

Xcel Energy	Yes	
American Transmission Company	Yes	However, clarity is needed for the word “infrastructure (medium)”. ATC’s interpretation is that satellite phones, cell phones, radio and land lines are all different mediums.
<p>Response: The RCSDT thanks you for your comment. The RCSDT agrees that the types of communication that you list are all different media which could be used as a form of Alternative Interpersonal Communications.</p>		
ITC Holdings	Yes	None
NERC Standards Review Subcommittee	Yes	Please clarify. We believe the proposed definition for the term “Interpersonal Communication” is too broad and ambiguous. We recommend the following instead: “Verbal Communication between two or more registered entities (not within the same organization) to exchange reliability-related information.” The inclusion of this term “registered entities” removes the ambiguity which we believe is contained in the proposed definition. In addition, the inclusion of the phrase “not within the same organization” clarifies that the focus of definition is to address communication between different registered entities.
<p>Response: The RCSDT thanks you for your comment. The SDT believes that Webster’s definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange.</p> <p>The RCSDT believes that data communication is covered under IRO-010, R3 which states:</p> <p>Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p> <p>The SDT believes that the revised Requirements of COM-001-2 satisfy your concern of communication in different physical locations.</p>		
Electric Market Policy	Yes	Subject to adequate resolution of comments provided for Question 1
<p>Response: The RCSDT thanks you for your comment. Please see response to question 1 comments.</p>		
ERCOT ISO	No	Although this definition indirectly clarifies the intent of the definition of Interpersonal Communication by noting that communication mediums/infrastructure are at issue, it does not specify verbal or data communication, and needs to be clarified accordingly; ERCOT notes clarification of Interpersonal Communication (IC) on this issue will indirectly clarify this point with respect to the Alternative IC definition.

Organization	Yes or No	Question 2 Comment
		<p>Furthermore, ERCOT ISO considers the definition of Alternative Interpersonal Communication unnecessary. The Standard could simply say an entity must have multiple (at least two) ICs, one of which is primary and others that serve as back-ups. This would eliminate the need for yet another defined term susceptible to conflicting interpretations.</p> <p>In additions, calling the Alternative Interpersonal Communication a substitute and redundant also seems contradictory, or at least confusing in terms of timing. Redundant implies that the entity has two means that are applied at the same time. Substitute seems to mean that the entity have a back-up that only has to be used when the primary isn't used.</p> <p>Also, if Interpersonal Communication is intended to be verbal communication, what are considered acceptable alternates (i.e.: fax, email, etc)? Examples here would be helpful. Is it sufficient to have redundant/substitute means of verbal communication (i.e.: satellite phones, cell phones, etc.). ERCOT ISO believes non-verbal proxies for verbal communications should be eligible ICs – e.g. email.</p> <p>As noted above, ERCOT ISO believes the most efficient way to approach this is to eliminate the use of Alternative Interpersonal Communication and have the standard require that entities have to have at least two means of Interpersonal Communication.</p>
<p>Response: The RCSDT thanks you for your comment.</p> <p>. The SDT believes that Webster’s definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange.</p> <p>The RCSDT believes that data communication is covered under IRO-010, R3 which states:</p> <p>Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p> <p>The RCSDT disagrees that the definition is not needed because there is an important part of the definition of “Alternative Interpersonal Communications” that distinguishes it from simply being an alternative “Interpersonal Communications”. The proposed definition contains the words: “which does not utilize the same infrastructure (medium)”.</p> <p>We concur and have removed the “redundant” portion of the definition.</p> <p>Interpersonal Communication can include voice and text; examples are satellite phones, cell phones, radio and land lines. We have revised the proposed definitions to add clarity:</p> <p>Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information.</p>		

Organization	Yes or No	Question 2 Comment
Alternative Interpersonal Communication: Any Interpersonal Communication that is able to serve as a substitute for, and does not utilize the same infrastructure (medium) as, Interpersonal Communication used for day-to-day operation.		

3 Do you agree with the revisions made to Requirement 1 in COM-001-2 as shown in the posted Standard and Implementation Plan? If not, please explain in the comment area.

Summary Consideration: Stakeholders pointed out that R1 was a compound requirement and suggested creating separate requirements. Stakeholders also suggested revising the VRF to “Medium” as it does not meet the guidelines for a “High” VRF. The intent of R1 was three-fold.

- 4 Identify (have) an Alternative Interpersonal Communication capability
- 5 Test that capability periodically and
- 6 If the test failed, fix it or identify another Alternative Communications Capability.

Based on comments received, we have revised R1, now R9, to eliminate the compound requirement and therefore created more specific requirements to delineate Interpersonal and Alternative Interpersonal Communication, and applicable entity responsibility. The VRF is changed to “Medium.”

Requirement R1 is now R9; R2 is now R10; R3 is now R11; R4 is now R7 and R8.

Calpine Corporation		
North Carolina Municipal Power Agency #1		
Operating Personnel Communications Protocols SDT		No Comment
American Electric Power	No	AEP is concerned with the use of a sixty minute window without having a broadcast methodology in place to support the required notifications. As mentioned in other comments, perhaps RCIS could be modified to help support communications and the confirmation of such communications.
<p>Response: The RCSDT thanks you for your comment. Having a failure of the Alternative Interpersonal Communications per R1 does not indicate that the Interpersonal Communications used in day-to-day operations is out of service. It is expected that the Interpersonal Communications used in day-to-day operations is indeed operational to make the notifications required in R3 regarding alternative failure.</p>		

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 3 Comment
We Energies	No	An Alternative Personnel Communications (APC) is intended for use at a Primary Control Center for real-time voice communications. That needs to be clear in the definitions and standards. The time to either restore or recognize that the Alternative Communications cannot be re-established should be aligned with proposed EOP-008 which allows 2 hours. This should also apply to COM-001 R2 which would give an hour past the 2 hours that the APC is unavailable to contact impacted parties. Along with conforming changes to measures and the like...
<p>Response: The RCSDT thanks you for your comment. The Alternative Interpersonal Communications capability is intended for use as an alternative for the Interpersonal Communications capability, regardless of whether the normal capability continues to be available or regardless of the location, be it a primary control center or a back-up facility. R1, now R9, includes “...If the test is unsuccessful, the entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communications within 2 hours.”</p>		
ITC Holdings	No	Comments: The intent of the 60 minute requirement is unclear. As written, the 60 minute requirement could be interpreted to apply to the initiation of restoration or, alternatively, to the completion of restoration. If the latter is the intent, then effectively 3 voice communication mediums would be required to ensure compliance which we believe is not warranted. Suggest modifying the requirement to “If the test is unsuccessful, the entity shall take action within 60 minutes to initiate restoration of the identified alternative or...”. In addition, we would suggest separating R1 into two requirements. From an audit perspective, there are two discrete actions being identified: quarterly testing and initiating repairs.
<p>Response: The RCSDT thanks you for your comment. We concur with your comment and have changed the requirement R1, now R9, to state “...If the test is unsuccessful, the entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communications within 2 hours.” The SDT believes that R1, now R9, has a discreet relationship with successful and unsuccessful tests and therefore should remain as one requirement for clarity.</p>		
Public Service Enterprise Group Companies	No	Initiating actions within the hour should be specified, rather than taking action. It could take longer than an hour to take (complete) action that resolves the issue.
<p>Response: The RCSDT thanks you for your comment. We concur with your comment and have changed the requirement to state “...If the test is unsuccessful, the entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communications within 2 hours.”</p>		
Southern Company Services	No	It is quite possible for entities to interpret this requirement as not applicable if they include all of there communications as interpersonal communication.
<p>Response: The RCSDT thanks you for your comment. The requirement states that an entity will “designate” an Alternative Interpersonal</p>		

Organization	Yes or No	Question 3 Comment
<p>Communications capability. To do so, the entity would not be able to declare all communications as Interpersonal Communications.</p>		
FirstEnergy	No	<p>It should be clear that this requirement applies only to BES information. The requirement should be revised as follows to improve clarity: Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall identify and test, on a quarterly basis, its Alternative Interpersonal Communications capability used for communicating real-time Bulk Electric System operating information.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT does not believe that adding BES to the requirement adds any clarity as NERC standards apply to the BES.</p>		
Duke Energy	No	<ul style="list-style-type: none"> o Need to clarify who the RC, TOP and BA are required to have Interpersonal Communications and Alternative Interpersonal Communications capability with (i.e., each other and the DP and GOP). We believe that R4 is redundant to R1, and the entities in R4 could be added to R1, and R4 deleted. Also make conforming changes to the Measures, Data Retention and VSLs. o Need to clarify that that the requirement is to take action to restore the Alternative Interpersonal Communications capability, or take action to identify a substitute within 60 minutes, (not actually restore or identify a substitute within 60 minutes - which may not be possible). Also need to revise the Measure and the Lower VSL to conform with this clarification to the requirement o Need to strike the phrase “used for communicating real-time operating information”, because this should be included in the definition of Interpersonal Communication, as we propose in Comment #1 above, and it would be redundant to also include it in R1. o The VRF for R1 should be Medium instead of High, because this is a quarterly test of the alternative capability - doesn’t meet the criteria for a High VRF. o Need to clarify in Requirement R2 that the 60 minute clock for notifications BEGINS when you KNOW you have a failure that has lasted for 30 or more minutes. o Strike the word “normal” in Requirement R2, because the definition of Interpersonal Communications as proposed above already includes the word “primary”.
<p>Response: The RCSDT thanks you for your comment.</p> <ul style="list-style-type: none"> o To provide better clarity the SDT created more specific requirements to delineate Interpersonal and Alternative Interpersonal Communication, and applicable entity responsibility. o The RCSDT has revised the requirement R1, now R9, to state “...If the test is unsuccessful, the entity shall initiate action to repair or designate a replacement Alternative Interpersonal Communications within 2 hours.” The Measure and VSL for R1, now R9, reflect the revision 		

Organization	Yes or No	Question 3 Comment
		<ul style="list-style-type: none"> ○ The definition was not revised to include the phrase “used for communicating real-time operating information” since the Time Horizon is designated as Real-time Operations. ○ VRF: The RCSDT agrees and has revised the VRF to “Medium.” ○ R2 now R10: The RCSDT believes the requirement as written satisfies your request. The “detection” of failure is the beginning. ○ “Normal”: The RCSDT revised R2, now R10, and deleted “normal.”
Exelon	No	<p>R1. It is not possible to test without identifying, “identify and” is not required. Suggest the requirement say: The applicable entities shall have primary and backup communication capabilities used for communicating real-time operating information. The entities shall test and demonstrate system capabilities on a quarterly basis. Telling someone to “take action” if they identify a failure in their systems is unnecessary. It must be presumed that an entity will “take action”; otherwise they will be non-compliant with the standard. Allowing an entity to “identify a substitute” in lieu of taking action to restore within 60 minutes points to the difficulties inherent in writing prescriptive requirements. The drafting team recognizes all entities may not be able to restore their capabilities within 60 minutes and therefore provides an alternative. The 60 minute requirement becomes a guideline, not a requirement under these conditions it is left to auditors to evaluate the technical and business case that an entity makes for why they can not make the 60 minute deadline.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT has revised requirements of COM-001, R1 is now R9, to require an entity to “designate” an Alternative Interpersonal Communication capability rather than to “identify”. The RCSDT agrees with you that an entity must identify something in order to be able to designate it or to test it. An Alternative Interpersonal Communication capability is an alternative regardless of whether one is considering the primary location or a back-up facility. Back-up tends to indicate that it would only be used in the case of the loss of some other primary capability; that is not the intent. The intent is that an alternative is to be designated and periodically tested to verify its continued availability and functionality. The alternative capability may or may not be used in normal operations activities. The SDT changed “take action” to “initiate action” in the requirement and believes the verbiage is needed to identify the start of timing to satisfy “...repair or designate a replacement Alternative Interpersonal Communications within 2 hours.</p>		
Manitoba Hydro	No	<p>R1. Removal of “develop a mitigation plan” and replacing with “take action within 60 minutes” has been done, this improves the Requirement.</p> <p>R2. As suggested in a previous SAR, the time line should be delineated further, “if the ICC will not be in service within 30 minutes, the impacted entities shall be notified within 60 minutes of the detection of the failure”.</p> <p>R3. The addition of “dictated by law or otherwise” disclaimers defogs the requirement for Canadian entities that have varying laws, mandates and obligations: Canada’s basic definition of “Official bilingualism” was</p>

Organization	Yes or No	Question 3 Comment
		found as follows: <ul style="list-style-type: none"> o The federal government must conduct its business and provide services in both official languages English and French. o The law encourages or mandates lower tiers of government such as provinces, territories and municipalities to provide services in both official languages. o The law places obligations on private sectors to provide access to services in both official languages, including that products be labeled in both English and French. o The government provides support to sectors to encourage and promote the use of one or the other of the two official languages, for instance English speaking minorities in Quebec and French Speaking minorities in other provinces. o New Brunswick is the only official bilingual province and Quebec is officially unilingual (French only).
<p>Response: The RCSDT thanks you for your comment. Thank you for your affirmations with respect to R1 and R3. With respect to R2 (now R10), it is the intent of the RCSDT to have notifications performed for outages of 30 minutes or longer within 60 minutes</p>		
E.ON U.S.	No	Requiring a 60 minute response to a problem with the Alternative Interpersonal Communication method which is only tested quarterly doesn't seem reasonable. One (or more) entities may need to involve IT/telecom personnel or order parts or material to resolve the problem or agree to the substitute Alternative Interpersonal Communication method. A 48 hour response requirement would be more appropriate.
<p>Response: The RCSDT thanks you for your comment. Requirement R1, now R9, has been revised to clarify the intent for the entity to "initiate actions to repair or designate a replacement Alternative Interpersonal Communications within 2 hours."</p>		
Puget Sound Energy	Yes	
CECD	No	The requirement to identify an alternative interpersonal communication method within 60 minutes should only apply if the registered entity only has a single alternative interpersonal communication method in place.
<p>Response: The RCSDT thanks you for your comment. Requirement R1, now R9, has been revised to clarify the intent for the entity to "initiate actions to repair or designate a replacement Alternative Interpersonal Communications within 2 hours."</p>		
NERC	No	There is a disparity in the timing requirements listed in COM-001. If it is important that a known communication path interruption be restored in 60 minutes, why would it be necessary to check a path quarterly only? The drafting team should consider proposing that no concurrent outage of primary and alternative/backup paths can exceed 5 minutes for voice paths. Additionally, NERC staff believes that data path concerns still need to be addressed. As written, there is no requirement coverage for ensuring that data telecommunication paths between entities are adequate and reliable.
<p>Response: The RCSDT thanks you for your comment. The requirement R1, now R9, does not state that a communication path be restored in 60</p>		

Organization	Yes or No	Question 3 Comment
<p>minutes but “...shall initiate action to repair or designate a replacement Alternative Interpersonal Communication within 2 hours.” The SDT believes that it is not feasible to propose that concurrent outages of a primary or backup communication cannot exceed 5 minutes. The SDT believes that IRO-010-1 Requirement R1 and specifically R1.4, adopted by the NERC BOT, address your concerns regarding data paths.</p>		
Southwest Power Pool	No	<p>This standard does want the RC, TOP, and BA to report in R2 if Interpersonal Communication goes down within 60mins to report it. However, we cannot find a specific requirement that subjects the RC, TOP, and BA to have Interpersonal Communication in the first place.</p>
<ul style="list-style-type: none"> ○ Response: The RCSDT thanks you for your comment. To provide better clarity the SDT created more specific requirements to delineate Interpersonal and Alternative Interpersonal Communication, and applicable entity responsibility. 		
Hydro-Québec TransEnergie (HQT)	No	<p>We agree with the revisions made to R1 to remove the requirement for developing a mitigation plan but have a concern with “...shall take action within 60 minutes to restore the identified alternative or identify a substitute Alternative Interpersonal Communication Capability”. This can be interpreted to mean completing the repair within 60 minutes, and hence can present a difficulty for the responsible entity if the spare parts to facilitate a repair or if a new piece of equipment cannot be obtained within that time frame. More time is needed to fully repair or replace the lost capability. A suggested rewording is “shall initiate action within 60 minutes to restore....” Alternatively, the requirement can be revised to require the identification of a substitute Alternative Interpersonal Communication means within the 60 minute time frame.</p>
Independent Electricity System Operator	No	<p>We agree with the revisions made to R1 to remove the requirement for developing a mitigation plan but have a concern with “...shall take action within 60 minutes to restore the identified alternative or identify a substitute Alternative Interpersonal Communication Capability”. This can be interpreted to mean completing the repair within 60 minutes, and hence can present a difficulty for the responsible entity if the spare parts to facilitate a repair or if a new piece of equipment cannot be obtained within that time frame. Organization	Yes or No	Question 3 Comment
		restore..." Alternatively, the requirement can be revised to require the identification of a substitute Alternative Interpersonal Communication means within the 60 minute time frame.
<p>Response: The RCSDT thanks you for your comment. The RCSDT agrees and has revised R1, now R9, to clarify the intent for the entity to “intiate actions to repair or designate a replacement Alternative Interpersonal Communications within 2 hours.”</p>		
Western Electricity Coordinating Council	No	We do not need the definition for alternate, when the definition for interpersonal communication states all methods of communications. What we think the drafting team is getting at is that we need to test our back up communication systems.
<p>Response: The RCSDT thanks you for your comment. The RCSDT has revised R1, now R9, and R2, now R10, to clarify that an Alternative Interpersonal Communication capability be designated and that alternative capability to be tested at least monthly to verify an alternative is available should the capability normally used be lost. If the test of the Alternative Interpersonal Communication capability is failed, then the entity must initiate actions within 60 minutes. The RCSDT has intentionally avoided the concept of back-up because back-up could be mistakenly believed to apply only in back-up facilities or in the case of loss of some unnecessarily designated primary capability.</p>		
Midwest ISO Standards Collaborators	No	We mostly agree with the revisions and thank the drafting team for modifying the requirement to remove the need for a mitigation plan per our comments from the last posting. However, we do believe that introduction of a requirement to fix the Alternate Interpersonal Communication within 60 minutes could be a compliance problem. Our issue is with the time requirement. For example, our stakeholders have experienced situations with certain communications systems in which a part had to be shipped overnight to fix the communication system. While we still don’t believe a mitigation plan is necessary in this case, we are concerned that ordering the part may not be viewed as taking action. Please confirm that SDT believes that the 60 minutes applies to beginning to repair the Alternative Interpersonal Communication and not to full restoration of the Alternative Interpersonal Communication. Further, please confirm that identification of a substitute Alternative Interpersonal Communication could simply mean relying on an already existing and identified secondary or tertiary Alternative Interpersonal Communication? Similar to our concern identified in Q1, we are concerned about the clause “used for communicating real-time operating information.” We believe data could be drawn into the requirement with this clause. Redacting the clause from the requirement will clarify that the requirement applies to only verbal communications.
NERC Standards Review Subcommittee	No	We mostly agree with the revisions and thank the drafting team for modifying the requirement to remove the need for a mitigation plan per our comments from the last posting. However, we do believe that introduction of a requirement to fix the Alternate Interpersonal Communication within 60 minutes could be a compliance problem. Our issue is with the time requirement. <p>Response: The RCSDT thanks you for your comment. R1, now R9, has been revised to clarify the intent for the entity to “intiate actions to repair or designate a replacement Alternative Interpersonal Communications within 2 hours.” The verbiage, “used for communicating real-time operating information” is redacted as you suggest. The SDT believes that Alternative Interpersonal Communication is clearly defined.</p>		
Ameren	No	<p>We mostly agree with the revisions. However, we believe that introduction of a requirement to fix the Alternate Interpersonal Communication (AIC) within 60 minutes could be a compliance problem. The issue is with the time requirement. It seems illogical to only test the AIC every 90 days but have to replace the capability in 60 minutes when the IC means is working, It seems more reasonable to have the 60 minutes apply when both are out.</p> <p>Similar to our concern expressed in response to Q1 above, we are concerned about the phrase “used for communicating real-time operating information.”, which could also imply data. We suggest that the team should remove this phrase from the requirement to clarify that the requirement applies to only verbal communications.</p>
<p>Response: The RCSDT thanks you for your comment. R1, now R9, has been revised to clarify the intent for the entity to “intiate actions to repair or designate a replacement Alternative Interpersonal Communications within 2 hours.” Verbiage “used for communicating real-time operating information” is redacted.</p>		
OC Standards Review Group	No	<p>We suggest changing “its” in the first sentence to “their respective” such that the sentence will read, “Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall identify and test, on a quarterly basis, “their respective”” We also suggest that the risk factor should be “Medium”</p>
<p>Response: The RCSDT thanks you for your comment. The SDT believes that “its” shows appropriate ownership for each respective entity. The risk factor is revised to “Medium” as suggested.</p>		
IRC Standards Review	No	<p>We thank the drafting team for modifying the requirement to remove the need for a mitigation plan per our comments from the last posting. However, we do believe that introduction of a requirement to fix the</p>

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 3 Comment
Committee		<p>Alternate Interpersonal Communication within 60 minutes could be a compliance problem. Our issue is with the time requirement. It is possible that a communications system may require a part that is currently not available. The requirement should be simply to initiate action to repair the system or to have another Alternate Interpersonal Communication system available. Further, please confirm that identification of a substitute Alternative Interpersonal Communication could simply mean relying on an already existing and identified secondary or tertiary Alternative Interpersonal Communication? To resolve these issues, we suggest the wording be revised to “shall initiate action within 60 minutes to restore....” Alternatively, the requirement can be revised to require the identification of a substitute Alternative Interpersonal Communication means within the 60 minute time frame.</p>
ISO New England Inc	No	<p>We thank the drafting team for modifying the requirement to remove the need for a mitigation plan per our comments from the last posting. However, we do believe that introduction of a requirement to fix the Alternate Interpersonal Communication within 60 minutes could be a compliance problem. Our issue is with the time requirement. It is possible that a communications system may require a part that is currently not available. The requirement should be simply to initiate action to repair the system or to have another Alternate Interpersonal Communication system available. Further, please confirm that identification of a substitute Alternative Interpersonal Communication could simply mean relying on an already existing and identified secondary or tertiary Alternative Interpersonal Communication? To resolve these issues, we suggest the wording be revised to “shall initiate action within 60 minutes to restore....” Alternatively, the requirement can be revised to require the identification of a substitute Alternative Interpersonal Communication means within the 60 minute time frame.</p>
<p>Response: The RCSDT thanks you for your comment. R1, now R9, has been revised to clarify the intent for the entity to “initiate actions to repair or designate a replacement Alternative Interpersonal Communications within 2 hours.” The SDT believes that Alternative Interpersonal Communication is clearly defined.</p>		
Pepco Holdings, Inc	No	<p>Why is a requirement for alternate communications given a VRF of High while a requirement (R2) for normal communications given a VRF of Medium?</p>
<p>Response: The RCSDT thanks you for your comment. The VRF for R1, now R9, has been revised to “Medium.”</p>

PacifiCorp	Yes	
PNGC Power (15 member utilities)	Yes	
PPL	Yes	
South Carolina Electric and Gas	Yes	
US Bureau of Reclamation	Yes	
Western Area Power Administration	Yes	
Xcel Energy	Yes	
American Transmission Company	Yes	If the “infrastructure” is defined as we have noted in question 2, then we support the revisions to this Requirement.
Response: The RCSDT thanks you for your comment.		
Electric Market Policy	Yes	Subject to adequate resolution of comments provided for Question 1
Response: The RCSDT thanks you for your comment. Please see response to question1.		
ERCOT ISO	No	To follow on the concern noted in Question 1, ERCOT ISO requests that the scope of Interpersonal Communication be clarified. Without specifically limiting Alternative Interpersonal Communication to verbal communications, ERCOT ISO considers this requirement to be too broad in that it could potentially encompass all types of data exchanges and the means for such exchanges.

Organization	Yes or No	Question 3 Comment
		<p>ERCOT ISO also has concerns regarding the intent of the 60 minute requirement. Is noting the failure and identified remedy within 60 minutes sufficient? If not, it may take significantly longer to acquire new equipment or parts to address a problem thereby making compliance with the 60-minute timeframe practically impossible. ERCOT ISO recommends that the 60 minute requirement be replaced with “as soon as practical/possible” to provide the flexibility necessary to cover those types of situations. ERCOT recognizes that the requirement gives the entity the option of restoring the means within 60-minutes or identifying another alternative, but to the extent an entity only has two options available and/or identified, the 60-minute restoration option would practically be the only option. With respect to the third option (i.e. the option if the first “alternative” fails), the requirement does not state any need to test that communication option. It only requires the entity to identify the additional alternative. If the intent is that the second alternative needs to be tested, that should be clarified. If the intent is merely to identify it and then test it on the next quarterly schedule, that should also be clarified./</p> <p>Also, the need to “identify” the Alternative ICs for the quarterly test seems pointless. The Alternative ICs would already be identified; presumably the entity would have established these means in advance of having to test them. It seems like a pointless exercise to “identify” means already identified. The requirement should impose an obligation to establish ICs and Alternative ICs, and the testing of those should be an independent requirement.</p> <p>With respect to R2, ERCOT recommends clarifying the scope of “impacted entities”. ERCOT ISO believes that the scope should be left to the discretion of the RC/TOP/BA, or that it should be expressly limited to the entities that were the subject of the failed communication.</p> <p>For R3, ERCOT ISO recommends deleting the pre-condition language related to “inter entity” BES “reliability communications”. This introduces confusion as to the scope and timing of communications under this requirement, especially where other standards are subject to Reliability Directives. For example, is a reliability communication a Reliability Directive? If not, what constitutes a reliability communication? The requirement should simply state that English is required for communications from the relevant functional entities.</p> <p>Finally, the risk factor seems inappropriate for the requirement. This is a testing requirement, not real time. The entity has 60 minutes to correct any issues or have a third option already identified and ready to deploy. This requirement does not seem to indicate the need for a high risk factor.</p>
<p>Response: The RCSDT thanks you for your comment. R1 is now R9; R2 is now R10; R3 is now R11; R4 is now R7 and R8.</p> <p>The SDT believes that Webster’s definition of Interpersonal: (being, relating to, or involving relations between persons) clarifies the exclusion of media dedicated to Telemetry or other data exchange and, SDT believes that data communication is covered under IRO-010, R3 which states:</p> <p>Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission</p>		

Organization	Yes or No	Question 3 Comment
		<p>Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p> <p>The SDT believes that the revised Requirements of COM-001-2 now satisfy your concern regarding R1, R2 and R3.</p>

4 Do you agree with the definition of Reliability Directive (COM-002-2)? If not, please explain in the comment area.

Summary Consideration:

The comments received regarding the definition of Reliability Directive ranged from the being “to open-ended” (PPL) to not “flexible” enough (Public Service Enterprise Group Companies). The SDT expected and viewed these as attempting to reach middle ground.

There were also value added comments such as removing the unnecessary and redundant terms “actual or expected” from the definition, which the SDT agrees with.

A number of commenter’s expressed a concern about the definition not including three-part communication, clearly identifying a Reliability Directive at the time of issue, and applying to verbal communications. While valid concerns, the SDT believes responsibilities should not be imbedded in a definition and, as drafted, the requirements of COM-002 fully address the identification and verbal concerns.

While outside of the scope of question four, one commenter suggested assigning the COM standard project to either the OPCPRC or RCSDT projects. The SDT explained the close coordination and collaboration between the two projects.

Organization	Yes or No	Question 4 Comment
Calpine Corporation		
North Carolina Municipal Power Agency #1		
Operating Personnel Communications Protocols SDT		The OPCP SDT received NERC staff comments to our proposed draft of COM-003-1. In those comments NERC staff proposed the term “Operating Communication”, defined as “communication with the intent to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.” The OPCP SDT is accepting this proposed term in the next version of COM-003-1 for posting. Per agreement reached during the November 17, 2009 joint meeting of the OPCP, RC and RTO SDTs in Charlotte, NC,

Organization	Yes or No	Question 4 Comment
		<p>pending the outcome of the industry evaluation of your proposed “Reliability Directive” term, the OPCP SDT will incorporate the term into COM-003-1 Requirement R?. The OPCP SDT recommends adding the Transmission Owner to the entities that may issue a Reliability Directive because in many cases (e.g., PJM) Transmission Owners “operate” the transmission system from local control centers.</p> <p>The OPCP SDT points out however that the RC SDT have not adhered to scope coordination efforts between our projects. At the outset of both SDT’s work, the OPCP project would focus upon Requirement R2 of COM-002-2 and the RC SDT would focus on Requirement R1 of COM-002-2.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT does not believe that the Transmission Owner should be added to the definition as this would be inconsistent with the Functional Model and the registration process.</p> <p>Regarding the scope issue: The RCSDT received strong consensus comments on our first posting to make revisions to the original R2. The RCSDT began making these revisions in response to stakeholder comments.</p>		
American Electric Power	No	<p>AEP would recommend that the words "actual or expected" be removed from the definition as unnecessary and redundant. Since, Emergency: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System, then an "expected emergency" is by definition the same as an emergency. If you already have an 'expected' emergency that causes intervention of some sort, then you are already in and "emergency." Therefore, you are either in an emergency condition or not in an emergency condition.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT agrees with your comment and we have struck “actual or expected” from the proposed definition.</p>		
Southwest Power Pool	No	<p>By NERC’s Functional Model the RC, BA, TOP, and DP issues directives. (DP to LSE)Reliability Directive - A communication initiated by a RC, TOP, BA or DP where action by the recipient is necessary to address an actual or expected Emergency.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT notes that, per the Functional Model, a DP may “direct” an LSE to communicate requests for voluntary load curtailment and not reliability situations:</p> <p>Item 9 on page 47 of version 5 of the Functional Model: “Directs Load-Serving Entities to communicate requests for voluntary load curtailment.”</p> <p>The RCSDT will forward this comment to the FMWG for their consideration in revising the language.</p>		
Public Service Enterprise Group	No	<p>It is reasonable to require the directing entity to identify which of its communications is a Reliability Directive</p>

Organization	Yes or No	Question 4 Comment
Companies		either when first communicated or if questioned by the recipient. Flexibility is the key.
<p>Response: The RCSDT thanks you for your comment. The SDT agrees it might be reasonable however, it is not appropriate to imbed requirements in definitions.</p>		
<p>Also please see Requirement R1 of COM-002-3 (When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient.) If the RC, BA, and TOP comply with R1 there is no need for the recipient to question if it is Reliability Directive.</p>		
NERC	No	<p>NERC staff proposed the term “Operating Communication” in our comments to Project 2007-02 Operating Personnel Communications Protocols. Operating Communication would be defined as “communication with the intent to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.” This captures all communication that affects BES reliability, not just communication between function entities and Reliability Coordinators. If the proposed COM-003 is adopted with the definition of “Operating Communication” and the corresponding three-part communication requirements, this term “Reliability Directive” is not needed in the COM standard family. However because we cannot pre-judge the outcome of the changes proposed in Project 2007-02, we must view the proposal here on its own merits. The proposal herein limits the scope of coverage to emergency situations, a regression from the current coverage in FERC-approved COM-002 and eliminates a key component of the defense in depth strategy the standards as a body attempt to provide.</p> <p>Furthermore, we believe that COM-002 is outside the scope of Project 2006-06 Reliability Coordination and should properly be addressed by Project 2007-02 Operating Personnel Communications Protocols. The fact that two teams are addressing aspects of the same standard and requirements is confusing and because the projects are not linked, there is a real potential to be disjointed if one or the other project modifies its approach. This could create a gap in reliability coverage. One team should be the primary “owner” of this issue. Analysis of past Bulk Electric System reliability events has shown that the lack of three-part communication has been a contributing factor to adverse reliability issues. We believe it is absolutely imperative that standards concerning all verbal instructions to change or maintain the state of a BES element must involve three-part communication in order to provide defense-in-depth and reduce human error in these events.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that we are addressing the Blackout Recommendation #26 regarding “tighten communications protocols, especially during alert and emergency situations”. Our contention is that we have made a good faith effort at addressing the scope of our SAR and feel that this current position has been validated by stakeholder comments and the NERC Standards Committee (see November 17, 2009 meeting of RCSDT, OPCPSDT and RTOSDT concerning this issue). We understand the concerns expressed above and fully support proceeding with the efforts of the OPCP SDT at improving all communications protocols.</p> <p>However, the RCSDT recognizes that the scope of our proposed revisions to COM-002 is limited to Emergency situations only. The RCSDT feels that</p>		

Organization	Yes or No	Question 4 Comment
<p>the concept of a Reliability Directive is an important tool for RC, BA and TOP to maintain reliability and that the revisions are consistent with parts of the directives in FERC Order 693. The work of the RCSDT along with the OPCPSDT, as currently recognized, will cover the original intent of COM-002 and still provide a “defense in depth strategy”. Stakeholder requests and consensus appears to have been achieved with respect to the definition of Reliability Directive and the requirements that the RCSDT have developed for COM-002. This will further the efforts of the OCPC SDT in achieving stakeholder consensus for their proposed requirements in COM-003.</p>		
Western Electricity Coordinating Council	No	<p>No, we think IRO 001 R3 covers this more effectively and may be expanded to include transmission operators and balancing authorities. “The Reliability Coordinator shall have clear decision-making authority to act and to direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. These actions shall be taken without delay, but no longer than 30 minutes.”</p>
<p>Response: The RCSDT thanks you for your comment. The revised IRO-001, R3 is to establish the authority of the RC to act or issue Reliability Directives. It does not identify the protocols under which a Reliability Directive needs to be issued, acknowledged and carried out. This is handled through the proposed definition as well as the requirements of COM-002.</p>		
Manitoba Hydro	No	<p>Reliability Directive is more clearly defined in the FRCC website: “Reliability Directives are used during times of emergency or in situations where reliability may be an issue. A Reliability Directive is usually issued to control or prevent emergency situations. ”Extrapolated from proposed and FRCC: Reliability Directive: An instruction initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority that is used during emergencies or reliability issue which will be used to prevent, control or resolve the situation. This definition makes it clear that it is for reliability issues (Thus Reliability Directive) and clarifies better that this is to be used to control or prevent emergency situations. The existing proposed definition doesn’t fully infer this. With the addition of this glossary term, so should the addition of a definition for Operational Directive (though not used in this requirement). The new items would further compliment and assist each other in the understanding of the two new Glossary terms. From the FRCC website: “Operational Directives are issued by System Operators when it is necessary to perform a critical function on the BPS, i.e., to manipulate or change the status of a BES element such as a circuit breaker or substation disconnects. For example, Balancing Authorities often issue Operational Directives to Generator Operators to raise or lower the MW or MVAR output of generators during the course of balancing load and generation on the BPS. Transmission Operators often issue Operational Directives to substation operators to change the status of voltage control devices or clearing BPS substation equipment or transmission lines for routine maintenance, etc”. Extrapolated from proposed and FRCC: Operational Directive: An instruction initiated by a Transmission Operator or Balancing Authority that is used to perform planned or routine critical functions on the Bulk Power System.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that our proposed definition of Reliability Directive along with the existing</p>		

Organization	Yes or No	Question 4 Comment
<p>definition of Emergency address all of the concepts that you suggest.</p> <p>The comments regarding Operational Directive are more suited to the work of the OPCP SDT as they are developing requirements along this line. We will forward your comment to that team for their consideration.</p>		
Midwest ISO Standards Collaborators	No	<p>The combination of the COM-002-3 standard and the definition of Reliability directive do not clearly specify that the communication is verbal and between only two responsible entities. Otherwise, the communication could be considered a blast call, written correspondence or conversation between operators within the same responsible entity. We believe that the Reliability Directive definition should be: “A verbal communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority to another responsible entity where action by the recipient is necessary to address an actual or expected emergency and the RC, TOP or BA operator clearly identifies in the communication that this is a Reliability Directive.”</p>
NERC Standards Review Subcommittee	No	<p>The combination of the COM-002-3 standard and the definition of Reliability directive do not clearly specify that the communication is verbal and between only two responsible entities. Otherwise, the communication could be considered a blast call, written correspondence or conversation between operators within the same responsible entity. We believe that the Reliability Directive definition should be: “A verbal communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority to another registered entity where action by the recipient is necessary to address an actual or expected emergency and the RC, TOP or BA operator clearly identifies in the communication that this is a Reliability Directive.”</p>
<p>Response: The RCSDT thanks you for your comment. First issue: verbal communication: The intent of the definition is to not preclude text or other forms of communication for issuing Reliability Directives. However, entities are still obligated to comply with the requirements of COM-002.</p> <p>Second issue: “to another registered entity”: The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Adding this verbiage is not appropriate.</p> <p>Third issue: By adding “clearly identifies in the communication that this is a Reliability Directive”, we would have added a requirement to the definition. This is better included in the requirements rather than the definition.</p>		
We Energies	No	<p>The measures of COM-002-3 imply verbal one-to one communication which needs to be clear within the definition. Recommend replacing “A communication” with the draft defined term “Interpersonal Communication” assuming it gets approved.</p>
<p>Response: The RCSDT thanks you for your comment. The intent of the definition and requirements of COM-002 is to not preclude text or other forms of communication to issue Reliability Directives. However, entities are still obligated to comply with the requirements of COM-002. Interpersonal Communications is a medium rather than a protocol or message.</p>		

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 4 Comment
PPL	No	The proposed definition is too open-ended especially since this definition will be used in other standards. Limiting the application of the standard to announced Reliability Directives in the definition itself will ensure only announced Reliability Directives are covered by this standard and other standards.
<p>Response: The RCSDT thanks you for your comment. Including the language that you suggest would impose a requirement within the definition. Potential use of the definition in other requirements would have to be reconciled with COM-002 requirements through the standard development process.</p>		
E.ON U.S.	No	The term “Interoperability Communication” has been proposed and defined in COM-003 (Project 2007-02), but, the term and definition have not been finalized. Is a “Reliability Directive” communication different from, a subset of, or related to Interoperability Communication? The definition of Reliability Directive should recognize and clarify the linkage to Interoperability Communication.
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that we are addressing the Blackout Recommendation #26 regarding “tighten communications protocols, especially during alert and emergency situations” in our proposed definition and requirements for COM-002. The RCSDT feels that the concept of a Reliability Directive is unique and an important tool for the RC, BA and TOP to maintain reliability. The proposed definition and revisions to COM-002 are consistent with parts of the directives in FERC Order 693. The work of the RCSDT and the OPCPSDT (Project 2007-02) compliment each other and will be coordinated.</p>		
Southern Company Services	No	This definition is not needed with the way that the requirements of the standard are written. This definition used with the definition of Emergency could be interpreted to include such routine operations as turning on capacitor banks and next day planning. Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority to an entity inside their Reliability, Transmission, or Balancing Areas where action outside of normal operating practices by the recipient is necessary to address an actual or expected Emergency or when an action is identified as a reliability directive.
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that the proposed definition of Reliability Directive, along with the existing definition of Emergency, provides the heightened awareness that is the goal of the standard and it comports with the directives of Order 693.</p>		
Ameren	No	We believe that a reference in the question is to COM-002-3 and not -2. The definition of Reliability directive is not clear to indicate that it only applies to verbal communications. We suggest the definition should be: “A verbal communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority to another responsible entity where action by the recipient is necessary to address an actual or expected emergency and the RC, TOP or BA operator clearly identifies in the communication that this is a Reliability Directive.”

Organization	Yes or No	Question 4 Comment
<p>Response: The RCSDT thanks you for your comment. The question does reference COM-002-3 as suggested. First issue: verbal communication: The intent of the definition is to not preclude text or other forms of communication for issuing Reliability Directives. However, entities are still obligated to comply with the requirements of COM-002.</p> <p>Second issue: “to another registered entity”: The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Adding this verbiage is not appropriate.</p> <p>Third issue: By adding “clearly identifies in the communication that this is a Reliability Directive”, we would have added a requirement to the definition. This is better included in the requirements rather than the definition.</p>		
Hydro-Québec TransEnergie (HQT)	No	We believe that the Reliability Directive definition as defined in COM-002-3 should be: “A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an actual or expected emergency and the RC, TOP or BA operator clearly identifies in the communication that this is a Reliability Directive.”
Northeast Power Coordinating Council	No	We believe that the Reliability Directive definition as defined in COM-002-3 should be: “A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an actual or expected emergency and the RC, TOP or BA operator clearly identifies in the communication that this is a Reliability Directive.”
IRC Standards Review Committee	No	We believe that the Reliability Directive definition should be: “A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an actual or expected emergency and the RC, TOP or BA operator clearly identifies in the communication that this is a Reliability Directive.”
ISO New England Inc	No	We believe that the Reliability Directive definition should be: “A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an actual or expected emergency and the RC, TOP or BA operator clearly identifies in the communication that this is a Reliability Directive.”
<p>Response: The RCSDT thanks you for your comment. First issue: verbal communication: The intent of the definition is to not preclude text or other forms of communication for issuing Reliability Directives. However, entities are still obligated to comply with the requirements of COM-002.</p> <p>Second issue: “to another registered entity”: The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Adding this verbiage is not appropriate.</p> <p>Third issue: By adding “clearly identifies in the communication that this is a Reliability Directive”, we would have added a requirement to the</p>		

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 4 Comment
<p>definition. This is better included in the requirements rather than the definition.</p>		
FirstEnergy	No	<p>We believe that this standard should be either handed to the OPCPSDT (Project 2007-02) or the OPCPSDT should hand over the COM-003-1 standard to this RCSDT (Project 2006-06); and then COM-002 and COM-003 should be merged. For further explanation of our suggestions, see our comments in Question #8.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT feels that the concept of a Reliability Directive is an important tool for RC, BA and TOP to maintain reliability and that the revisions are consistent with parts of the directives in FERC Order 693. The work of the RCSDT along with the OPCPSDT, as currently recognized, will cover the original intent of COM-002 and still provide a “defense in depth strategy” as suggested by the NERC comment. Stakeholder requests and consensus appears to have been achieved with respect to the definition of Reliability Directive and the requirements that the RCSDT have developed for COM-002. This will further the efforts of the OCPC SDT in achieving stakeholder consensus for their proposed requirements in COM-003. Merging of the two standards is a work in progress and will ultimately be decided by stakeholder consensus.</p>		
Independent Electricity System Operator	No	<p>We suggest the Reliability Directive definition be modified as follows to further clarify the communication protocol: “A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority and made clear by the initiating entity that this is a Reliability Directive which requires action by the recipient to address an actual or expected Emergency.”</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that your suggested revision would impose a requirement within the definition.</p>		
Duke Energy	No	<p>We think that Requirement R1 should be folded into the definition, and R1 deleted. Also delete the Measure and VSL. Suggested rewording of the definition: Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority, and identified as a Reliability Directive to the recipient, where action by the recipient is necessary to address an actual or expected Emergency.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that your suggested revision would impose a requirement within the definition.</p>

Organization	Yes or No	Question 4 Comment
Administration		Emergency.”
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that your proposed revision does not materially add clarity to the proposed definition. Stakeholders generally concur with our proposed definition.</p>		
Electric Market Policy	Yes	<p>While I technically agree with the definition, I think it should be expanded to state that a directive that meets this definition must be clearly identified as such by the issuing BA, RC or TOP. In other words, action is mandatory on the recipient’s part only if the issuing party clearly states “this is a Reliability Directive”. In many organized markets, participants (particularly LSE, GOP and PSE) are required to follow instructions only if an Emergency is declared. This concept has historically been used throughout this industry although such use may have been implicit.</p>
<p>Response: The RCSDT thanks you for your comment. Your concerns are covered by the requirement R1 of COM-002 which states:</p> <p>R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient.</p> <p>A requirement can not be imposed by a definition.</p>		
ERCOT ISO	No	<p>ERCOT ISO is concerned about defining Reliability Directive in terms of “expected” emergencies. Obviously all relevant entities will operate to avoid emergency situations. However, the term “expected” is vague and ambiguous, and, as such, is open to subjective interpretation thereby creating uncertainty for regulated entities. The definition should put entities on clear notice as to when they have to comply with the relevant requirements. The only way to provide that certainty is to establish a clear, identifiable trigger. To accomplish this, the definition should be limited to actual emergencies. Actual emergencies are specifically defined, not subjective, and lend themselves to demonstration of compliance in an audit. The definition of Emergency lends itself to alignment with specific circumstances that clearly indicate to a regulated entity that it must use Reliability Directives and follow the rules that apply to such directives – “expected emergencies” do not.</p> <p>The requirement should also be revised to clarify that Reliability Directives only apply to communications between separate entities in distinct locations and do not apply to employees of the same company communicating in person in the same location – e.g. a control center.</p>
<p>Response: The RCSDT thanks you for your comment. We have removed the words “actual or expected” from the definition. The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Face-to-face communication of Reliability Directives are subject to the requirements of COM-002 and can be measured for COM-002 by allowing Operator Logs as possible evidence to support compliance.</p>		

5 Do you agree with the revisions to the Requirements in COM-002-3 as shown in the posted Standard and Implementation Plan? If not, please explain in the comment area.

Summary Consideration: The bulk of the comments were about the VSL. The SDT agreed and has deleted the Severe VSL and moved the High VSL to Severe. We believe that there are two possible actions within the requirement and failure to perform either warrants a Severe VSL

Several commenters’s expressed concern about three-part communication. The SDT believes that as drafted with the issue, repeat back, and acknowledgement three-part communication is covered.

There was one commenter suggesting the addition of the DP to the applicability The RCSDT notes that, per the Functional Model, a DP may “direct” an LSE to communicate requests for voluntary load curtailment and not reliability situations: Item 9 on page 47 of version 5 of the Functional Model: “Directs Load-Serving Entities to communicate requests for voluntary load curtailment.” Furthermore, The RCSDT will forward this comment to the FMWG for their consideration in revising the language.

While outside of the scope of question five, one commenter suggested assigning the COM standard project to either the OPCPRC or RCSDT projects. The SDT explained the close coordination and collaboration between the two projects.

Organization	Yes or No	Question 5 Comment
Operating Personnel Communications Protocols SDT		<p>The OPCP SDT offers the following Requirements language that addresses a Three-Part Communication Protocol. (It is comprised of two primary Requirements and contains a footnote):</p> <p>R_. Each Reliability Coordinator, Balancing Authority, Transmission Operator, and Transmission Owner that issues a Reliability Directive during verbal Operating Communications shall employ three-part Communication Protocol to ensure that the receiving party has repeated the communication, and shall verbally confirm the communication to be correct or reinitiate the communication until a correct response is given by the recipient. An exception is allowed for Reliability Directives that are issued via “All-Call”, during which the initiator shall ensure that all the receiving parties have positively acknowledged receipt of message rather than verbally repeating the message. [Violation Risk Factor: High][Time Horizon: Real-time Operations]</p> <p>R_. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity, Distribution Provider and Purchasing-Selling Entity that receives a Reliability Directive during verbal Operating Communications shall employ three-part communication protocol [footnote 1] to repeat the communication back to the initiator and await verbal confirmation from the initiator. An exception is allowed for the recipient of an “All-Call” Reliability Directive to acknowledge receipt of the message and is responsible to contact initiator if message is not understood rather than verbally repeating the message. [Violation Risk Factor: High][Time Horizon: Real time]</p> <p>Footnote 1: A Communication Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly (not necessarily verbatim) to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct by the party who initiated the communication.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that we are addressing the Blackout Recommendation #26 regarding “tighten communications protocols, especially during alert and emergency situations” in our proposed definition and requirements for COM-002. We have not precluded issuance of Reliability Directives by non-verbal means and the requirements of proposed COM-002 would apply. Respecting the importance of Reliability Directives during Emergency situations, the RCSDT does not believe that exceptions to the clear, concise three part communications indicated in COM-002 are appropriate regardless of the medium used to communicate. In addition, the current format of the requirements provides more effective way to measure compliance.</p>		
Ameren	No	(1) As stated in #4 above, the definition of Reliability Directive is not clear. (2) The VSLs for R3 appear to have some redundancy. (3) Also in R3, the phrase regarding R2 should be changed to “(as described in R2, above)”
<p>Response: The RCSDT thanks you for your comment.</p> <p>1) Please see response to question 4.</p>		

Organization	Yes or No	Question 5 Comment
<p>2) The RCSDT concurs. We have deleted the Severe VSL and moved the High VSL to the Severe category.</p> <p>3) We have revised the phrase to be consistent with the verbiage in R2 as follows: “per Requirement R2” which meets the intent of your comment “as described”.</p>		
Southwest Power Pool	No	<p>1) By NERC’s Functional Model the RC, BA, TOP, and DP issues directives. (DP to LSE)COM-002-3 R2... the recipient of a Reliability Directive issued per Requirement R1, shall repeat the intent of the Reliability Directive back to the issuer of the Reliability Directive.</p> <p>2) COM-003-1 R5... shall use Three-part Communications when issuing a directive during verbal Interoperability Communications. Implementation Plan for COM-002-3 states R2 will stay, for COM-003-1 states that COM_002-3 R2 will go away. The two requirements don’t agree with each other, COM-002-3 R2 wants the Intent repeated back, where COM-003-1 R5 per the Three-part Communication definition “...the information is repeated back correctly to the party that initiated the communication”.</p>
<p>Response: The RCSDT thanks you for your comment. 1) The RCSDT notes that, per the Functional Model, a DP may “direct” an LSE to communicate requests for voluntary load curtailment and not reliability situations:</p> <p>Item 9 on page 47 of version 5 of the Functional Model: “Directs Load-Serving Entities to communicate requests for voluntary load curtailment.”</p> <p>The RCSDT will forward this comment to the FMWG for their consideration in revising the language.</p> <p>2) The RCSDT believes that we are addressing the Blackout Recommendation #26 regarding “tighten communications protocols, especially during alert and emergency situations” in our proposed definition and requirements for COM-002. The RCSDT feels that the concept of a Reliability Directive is an important tool for RC, BA and TOP to maintain reliability and that the revisions are consistent with parts of the directives in FERC Order 693. The work of the RCSDT along with the OPCPSDT, as currently recognized, will cover the original intent of COM-002 and still provide a “defense in depth strategy” as suggested by the NERC comment. Stakeholder requests and consensus appears to have been achieved with respect to the definition of Reliability Directive and the requirements that the RCSDT have developed for COM-002. This will further the efforts of the OCPC SDT in achieving stakeholder consensus for their proposed requirements in COM-003. Merging of the two standards is a work in progress and will ultimately be decided by stakeholder consensus.</p>		
Central Lincoln	No	<p>Consider the following example. Director calls Directee. Telephone is answered by the Directee’s receptionist. Director states that he has a Reliability Directive, and proceeds to deliver it. Receptionist manages to parrot the directive, but has no clue what is being asked. Director confirms receptionist has parroted the directive accurately. Both parties have met the requirements (avoiding a high risk, severe violation), but the three way conversation only wasted the time of both parties and delayed the performance of the directive. The Director should be required to attempt to reach someone with the authority and understanding needed to carry out the</p>

Organization	Yes or No	Question 5 Comment
		directive.
<p>Response: The RCSDT thanks you for your comment. The requirements of the standard do not consider how staffing at a particular functional entity is achieved. This is covered in the PER standards. It is incumbent on the registered entity to comply with the requirements of the COM-002 standard as well as all other requirements, some of which will likely be violated in the example above.</p>		
CECD	No	<p>For R3, the drafting team should clarify that if a directive is reissued due to a misunderstanding the receiving party should repeat the reissued directive so that the RC, BA or TOP can verify that the directive is understood correctly.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that this situation is covered by R2.</p>		
Duke Energy	No	<ul style="list-style-type: none"> o It is not clear whether Requirements R2 and R3 are intended to apply to other than verbal Reliability Directives. We have difficulty envisioning how “repeat back” and “acknowledge the response” would be expected to work with electronic communications. o Delete the phrase “issued per Requirement R1” from R2, since R1 should be deleted per our Comment #4 above. o Revise R3 as follows, to conform to our proposed revised definition in Comment #4 above: “Each Reliability Coordinator, Transmission Operator, and Balancing Authority that initiates a Reliability Directive shall acknowledge the response from the recipient as correct, or reissue the Reliability Directive to resolve any misunderstandings.” o We believe that only 2 VSLs are appropriate for R3. <ul style="list-style-type: none"> o Lower - The responsible entity issued a Reliability Directive, but did not acknowledge that the recipient repeated the intent of the Reliability Directive correctly. o Severe - The responsible entity issued a Reliability Directive and failed to reissue the Reliability Directive to resolve any misunderstandings when the intent of the Reliability Directive was not repeated correctly by the recipient.
<p>Response: The RCSDT thanks you for your comment. The requirements of COM-002 do not preclude non-verbal issuance of directives. It is incumbent on the entity to ensure compliance with the requirements</p> <p>R2: We have not retired R1 (see response to Q4) and therefore do not feel this is an appropriate revision.</p> <p>R3: See response to question 4. The RCSDT believes that R3 is appropriate as written.</p> <p>VSL: The RCSDT has deleted the Severe VSL and moved the High VSL to Severe. We believe that there are two possible actions within the</p>		

Organization	Yes or No	Question 5 Comment
requirement and failure to perform either warrants a Severe VSL.		
Exelon	No	Please clarify R2 to 'repeat back' a Directive; the definition of Directive does not distinguish between verbal and other methods of communication. Is an electronic response to a verbal or non-verbal Directive allowed?
Response: The RCSDT thanks you for your comment. The requirements of COM-002 do not preclude non-verbal issuance of directives. It is incumbent on the entity to ensure compliance with the requirements.		
Manitoba Hydro	No	R2 requires "recipient to repeat back" and R3 requires "RC, TOP, BA to acknowledge". This procedure is NOT identified as Three Part Communication which in fact is. Three Part Communication should be a common theme for all entities, including RC's. So why not use the same or similar Requirement as used in COM-002-2 R2 Three-Part Communication.
Response: The RCSDT thanks you for your comment. The concept of three part communication is in existing COM-002-2, R2 and a definition for the term is being proposed by the OCPD SDT. The RCSDT feels that the concept of a Reliability Directive is a unique and important tool for RC, BA and TOP to maintain reliability that is separate from that effort. The requirements of COM-002 are explicit for Reliability Directives and are consistent with parts of the directives in FERC Order 693. Stakeholder requests and consensus appears to have been achieved with respect to the definition of Reliability Directive and the requirements that the RCSDT have developed for COM-002. This will further the efforts of the OCPD SDT in achieving stakeholder consensus for their proposed requirements in COM-003. Merging of the two standards is a work in progress and will ultimately be decided by stakeholder consensus.		
E.ON U.S.	No	See comment to question 8.
Response: The RCSDT thanks you for your comment. Please see response to question 8.		
NERC	No	See response to Question 4.
Response: The RCSDT thanks you for your comment. Please see response to question 4.		
PPL	No	Suggest removing Purchasing-Selling Entity from the standard as a PSE does not receive Reliability Directives from a BA, RC, or TOP.
Response: The RCSDT thanks you for your comment. Prior stakeholder comments (during previous postings of this standard) indicated that PSE should be an applicable entity.		

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 5 Comment
Independent Electricity System Operator	No	The High and Severe VSLs for R3 appear to be the same. We suggest to remove the High VSL and change the Severe VSL to: "The responsible entity issued a Reliability Directive, but did not acknowledge that the recipient in R2 repeated the intent of the Reliability Directive correctly OR resolve any misunderstandings when the intent of the Reliability Directive was not repeated correctly by the recipient."
<p>Response: The RCSDT thanks you for your comment. We have deleted the Severe VSL and moved the High VSL to the Severe category. We believe this meets the intent of your comment.</p>		
South Carolina Electric and Gas	No	The SDT needs to evaluate the redundancy associated with COM-003-1 Req 5 and COM-002-3 Req 2&3.
<p>Response: The RCSDT thanks you for your comment. The RSDT does not believe that there is redundancy between the standards. COM-002 relates only to Reliability Directives while COM-003 deals with other forms of communication.</p>		
Hydro-Québec TransEnergie (HQT)	No	The VSLs for R3 appear to have some redundancy. The Severe VSL and the second condition in the High VSL appear to be similar or the same. We suggest remove the High VSL, and revise the Severe VSL to:"The responsible entity issued a Reliability Directive, but did not acknowledge that the recipient in R2 repeated the intent of the Reliability Directive correctly OR resolve any misunderstandings when the intent of the Reliability Directive was not repeated correctly by the recipient."
Northeast Power Coordinating Council	No	The VSLs for R3 appear to have some redundancy. The Severe VSL and the second condition in the High VSL appear to be similar or the same. Suggest removing the High VSL, and revise the Severe VSL to:"The responsible entity issued a Reliability Directive, but did not acknowledge that the recipient in R2 repeated the intent of the Reliability Directive correctly OR resolve any misunderstandings when the intent of the Reliability Directive was not repeated correctly by the recipient."
<p>Response: The RCSDT thanks you for your comment. We have deleted the Severe VSL and moved the High VSL to the Severe category. We believe this meets the intent of your comment.</p>		
PNGC Power (15 member utilities)	No	There is a chance that a reliability directive given to a smaller entity will be taken by a receptionist or answering service. Requirement R2 should be more specific about contacting an operational authority directly to relay reliability directives.
<p>Response: The RCSDT thanks you for your comment. The requirements of the standard do not consider how staffing at a particular functional entity is achieved. This is covered in the PER standards. It is incumbent on the registered entity to comply with the requirements of the COM-002 standard as well as all other requirements, some of which will likely be violated in the example above.</p>		

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 5 Comment
Midwest ISO Standards Collaborators	No	<p>We agree with most of this standard and the apparent intent. However, there are some specific issues. For instance, measurement of compliance to R1 could be challenging. As the VSL is written, it would appear the compliance auditor could judge if a Reliability Directive should have been issued. The VSL language that is problematic is “The responsible entity that required actions to be executed”. Who determines that actions were required? One could argue that failure to identify a communication as a Reliability Directive means that actions weren’t required but it is doubtful the compliance authorities would take this approach. Thus, there would appear to be great judgment left to the compliance auditor in determining if a Reliability Directive should have been issued. The combination of the COM-002-3 standard and the definition of Reliability directive do not clearly specify that the communication is verbal and between only two responsible entities. Otherwise, the communication could be considered a blast call, written correspondence or conversation between operators within the same responsible entity. We have offered proposed modifications to the definition of Reliability Directive in Q5 to solve this issue. Alternatively, the issue could be addressed by modifying the requirements. The VSLs for R3 appear to have some redundancy. The Severe VSL and the second condition in the High VSL appear to be similar or the same.</p>
NERC Standards Review Subcommittee	No	<p>We agree with most of this standard and the apparent intent. However, there are some specific issues. Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 5 Comment
Pepco Holdings, Inc	Yes	
Southern Company Services	Yes	
US Bureau of Reclamation	Yes	
Western Area Power Administration	Yes	
Western Electricity Coordinating Council	Yes	
Puget Sound Energy	No	Under the current proposed language of R2, it appears possible that a recipient of a Reliability Directive not identified as such may still be held responsible for failing to comply with R2, because the word “per” has several meanings. While those meanings do include “in accordance with”, it would be clearer to simply use that phrase. As a result, recommend the replacement of the phrase “issued per” with “identified as such in accordance with”.
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that the suggested revision does not provide additional clarity to the requirements.</p>		
ITC Holdings	Yes	None
Northeast Utilities	Yes	Support the intent of the changes. However, it is unclear if the mechanics of R1 require the initiator to actually state “This is a Reliability Directive ...”.
<p>Response: The RCSDT thanks you for your comment. The RCSDT intends for such a statement to be made. Using that exact verbiage in a requirement is too prescriptive and we leave the exact language up to the issuer as long as they identify it as a Reliability Directive.</p>		
American Electric Power	Yes	Why is the term “three part communications” not used in this set of requirements?
<p>Response: The RCSDT thanks you for your comment. While the requirements embody three part communications, the RCSDT believes it is clearer to have explicit requirements for each part of the process that requires a specific action.</p>		
ERCOT ISO	No	R1: ERCOT ISO recommends that the requirement be revised to simply state that the entity has to identify

Organization	Yes or No	Question 5 Comment
		<p>when it is a reliability directive, such that it reads as follows:</p> <p>R1. When applicable, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p> <p>The deleted language introduces subjectivity and is unnecessary. The use of the defined term implicitly determines when Reliability Directives are issued and it is unnecessary to impose the condition precedent of identifying an action as Reliability Directive. This is unnecessary and just creates confusion.</p> <p>R2: ERCOT ISO recommends removal of “the intent” such that it reads as follows:</p> <p>R2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat the Reliability Directive back to the issuer of the Reliability Directive. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p> <p>ERCOT ISO believes using “intent” in this requirement was intended to mitigate the practical fact that it is difficult to repeat, verbatim, a directive. However, use of the word intent could introduce confusion. A directive will require certain actions to accomplish a specific purpose or to solve a specific problem. Thus, the intent of a directive has two components to the intent; the first is the specific actions to be taken and the second is the underlying reason for those actions. The recipient will obviously be privy to the former, but perhaps not the latter. To remove any ambiguity as to whether intent means the actions or the issue to be solved by such actions, the word should be removed. ERCOT believes there is little risk that an auditor will issue a violation if a repeated directive is not verbatim, but reflects the actions to be taken pursuant to the directive.</p> <p>Further, ERCOT ISO recommends working closely with the Operating Personnel Communication Protocol SDT to address all-calls as exceptions. It is practically unreasonable to require multiple recipients on the same communication to repeat the directive back. In fact, it is counterproductive because the time it takes to do that would delay the recipients from taking the needed reliability action(s). ERCOT recommends the following language to address “all-calls”:</p> <p>(COM-003) R2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive shall repeat the Reliability Directive back to the issuer of the Reliability Directive. An exception is allowed for Reliability Directives that are issued via “All-Call” communications. For All-Calls, the entity issuing the directive shall require recipients to acknowledge receipt of message.</p>

Organization	Yes or No	Question 5 Comment
		<p>R3: ERCOT ISO recommends that R3 be combined with R2. Regardless of whether it is combined with R2, the identification precondition should be removed such that the requirement reads as follows:</p> <p>R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues a Reliability Directive shall acknowledge the response from the recipient of the Reliability Directive in R2 as correct or reissue the Reliability Directive to resolve any misunderstandings. <i>[Violation Risk Factor: High][Time Horizon: Real-Time]</i></p> <p>The identification pre-condition is unnecessary – again, the defined term is self-executing in terms of situational application. Imposition of this superfluous language merely creates the potential for confusion.</p> <p>M1: ERCOT ISO recommends removing “required actions to be taken” language for the same reason this pre-condition does not make sense in the requirement, as described above.</p> <p>M3: ERCOT ISO recommends that “Directive” be replaced with “Reliability Directive” because Directive is not the full defined term.</p>
<p>Response: The RCSDT thanks you for your comment.</p> <p>R1: The RCSDT believes that the requirement, as written is clear and disagrees that it introduces subjectivity. COM-002 does not provide guidance on when to issue a Reliability Directive, only that, when they issue Reliability Directives, they comply with the requirements of COM-002. We feel that adding the phrase “When applicable” adds subjectivity to the requirement.</p> <p>R2: Without the words “the intent”, the requirement could be interpreted to mean a verbatim repeat of the Reliability Directive. The RCSDT does not intend for this to be the case and believes that the requirement, as written, is clear and provides sufficient flexibility to meet the requirement. The requirements of COM-002 do not preclude non-verbal (e.g. “all calls”) issuance of directives regardless of the medium. It is incumbent on the entity to ensure compliance with the requirements. The RCSDT feels that the concept of a Reliability Directive is an important tool for RC, BA and TOP to maintain reliability and that the revisions are consistent with parts of the directives in FERC Order 693. The work of the RCSDT along with the OPCSDT, as currently recognized, will cover the original intent of COM-002 and still provide a “defense in depth strategy” as suggested by the NERC comment.</p> <p>R3: The RCSDT believes that the steps in R2 and R3 are separate and distinct actions that require separate requirements. Otherwise, we would have compound requirements. We concur with your suggested edit to R3.</p> <p>M1; We did not make the revision to R1 and therefore M1 is sufficient as written.</p> <p>M3: We have revised M3 as suggested and to conform to revised R3.</p>		

6 Do you agree with the use of the defined term “Reliability Directive” in revisions to the Requirements in IRO-001-2 as shown in the posted Standard and Implementation Plan? If not, please explain in the comment area.

Summary Consideration: The comments regarding question six ranged from small entities being excluded to if regulatory or statutory requirements covers NERC standards. The SDT addressed these by noting registration is not in the SDT scope and NERC’s general council should be contacted for regulatory issues.

A few commenter’s expressed concern with the VSL for R2 and one suggested the words “per Requirement 2,” should be added. The SDT believes the phrase “per Requirement 2” is not necessary as a VSL is only applied AFTER a compliance violation is determined.

Value added comments such as a concern of the use of the word “threat” as it can be defined as cyber-related and suggested replacing “Operating Personnel” with “System Operator” were also made. The SDT concurred and removed the word “threat” and replaced it with “condition” and also made the revision to System Operator.

There were numerous comments regarding the definition of Reliability Directive with multiple wording suggestions. While slightly out of scope for question six, the SDT expected and viewed these as attempting to reach middle ground.

Some commenter’s expressed concern over clarify that the RC has three separate actions. The RC can act, direct others to act, or issue Reliability Directives. The SDT modified R1 to read: “ Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts.”

Note: Based on discussions with FERC staff, the SDT agreed to make the following changes:

IRO-001-2 Requirements R4, R5 and associated Measures and VSLs are moved to IRO-005-4

IRO-001-2 Requirements R6, R7 and associated Measures and VSLs are moved to IRO-002-2

Organization	Yes or No	Question 6 Comment
Calpine Corporation		

Organization	Yes or No	Question 6 Comment
Public Service Enterprise Group Companies		
Operating Personnel Communications Protocols SDT		No Comment
FirstEnergy	No	Although we agree that a clear definition of Reliability Directive should be included in IRO-001-2, the definition should be revised per our comments in Question #8.
Response: The RCSDT thanks you for your comment. Please see response to question 8.		
North Carolina Municipal Power Agency #1	No	For IRO-001-2, the VSL for R2 should retain the words "per Requirement 2," because the requirement itself provides for exceptions to when it is permissible for a directive not to be followed. Requirement 3 then addresses the required action an entity must take in a case where these exceptions apply. Without these words, it appears that a VSL of "Severe" may be assigned if a directive isn't followed under any circumstances.
Response: The RCSDT thanks you for your comment. The phrase "per Requirement 2" is not necessary as a VSL is only applied AFTER a compliance violation is determined. The requirement provides the exceptions and compliance will be judged based on this.		
NERC	No	<p>In principle, NERC staff disagrees with the necessity of defining a term "Reliability Directive." However, the principle involved in the standard is valid. The standard needs to ensure that if the Reliability Coordinator directs an entity to take action that results in an adverse reliability impact, that entity has a chance to raise valid objection to that action.</p> <p>Additional clarification is needed to determine if regulatory or statutory requirements covers NERC standards. One possible solution would be to modify R3 from "its inability to perform" to "its inability or concern to perform."</p> <p>Furthermore, in R4 and R5 the RC is expected to identify "threats" and notify all impacted parties. We have concerns that "threat" can be defined as cyber-related. Was the standard intended to cover all anticipated threats, or just transmission/operating issues?</p> <p>R6 Since Operating Personnel is not a NERC defined term, we suggest replacing "Operating Personnel" with "System Operator."</p>
Response: The RCSDT thanks you for your comment.		

Organization	Yes or No	Question 6 Comment
<p>“Concern”: We believe that your concern is covered by the “unless such actions would violate safety, equipment, or regulatory or statutory requirements” statement in R2.</p> <p>Regulatory: The RCSDT suggests that NERC staff seek input from NERC’s General Counsel in regards to this issue.</p> <p>R4 and R5: The word threat was not intended to be cyber related. The CIP standards cover cyber “threats”. To that end, we have removed the word “threat” and replaced it with “condition”. R4, R5 and associated Measures and VSLs are moved to IRO-005-4.</p> <p>R6: We concur and have made this revision.</p>		
OC Standards Review Group	No	<p>In R1, we suggest adding “direct” in the sentence to read: “Each Reliability Coordinator shall act, “direct” or issue Reliability Directives....” During adverse reliability impact events, system operators should not be bound by a cumbersome three part communications regime that could prevent prompt responses to the event. The suggested change would allow for non reliability directives to be issued to correct adverse reliability impacts.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT agrees in principle with adding “direct” to the requirement. In addition, the requirements of COM-002 should be complied with, especially in such situations. We have revised R1 to state: Each Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. To address comments received on R1, we have also revised the Purpose Statement to: To establish the capability and authority of Reliability Coordinators to direct other entities to prevent Adverse Reliability Impacts to the Bulk Electric System</p> <p>Conforming revisions to M1 and the VSLs for R1 were also made.</p>		
Southern Company Services	No	<p>Including the requirement of issuing directives every time an action is required by an entity assumes that entities cannot work in a spirit of cooperation to maintain the reliability of the Bulk Electric System.</p>
<p>Response: The RCSDT thanks you for your comment. To address your concern, we have revised R1 to state: “Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts.</p> <p>To address comments received on R1, we have also revised the Purpose Statement to: To establish the capability and authority of Reliability Coordinators to direct other entities to prevent Adverse Reliability Impacts to the Bulk Electric System</p>		

Organization	Yes or No	Question 6 Comment
We Energies	No	<p>IRO-001-2 R1 opens the door for determining if the RC should have issued a Reliability Directive to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts which goes beyond the intention of Emergency. The RC should have any and all options to achieve the required actions, one of which is a Reliability Directive. Agreed if the RC issues a Reliability Directive it needs to be followed or notified why it can't be followed. In IRO-009"the Reliability Coordinator shall have one or more Operating Processes, Procedures, or Plans that identify actions it shall take or actions it shall direct others to take (up to and including load shedding) to mitigate the magnitude and duration of" Recommend "Each Reliability Coordinator, in it's sole discretion, shall take action independently or by others or issue Reliability Directives for actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts. "In addition the measures assume the RC only works through others, and others only act under Directive from the RC and do not allow for operational data to be used to show action was taken like SCADA logs, or system parameter records for any entity.</p> <p>The Data Retention is excessive, RC, BA, TOP are on a 3 yr audit cycle, others on a 6yr cycle this is way too long, recommend one full calendar year plus the current year.</p>
<p>Response: The RCSDT thanks you for your comment. To address your concern, we have revised R1 to state: Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts.</p> <p>To address comments received on R1, we have also revised the Purpose Statement to: To establish the capability and authority of Reliability Coordinators to direct other entities to prevent Adverse Reliability Impacts to the Bulk Electric System</p> <ul style="list-style-type: none"> o We have revised the data retention section to: The Reliability Coordinator shall retain its evidence for 90 days for Requirements R1 and Measures M1. o The Transmission Operator, Balancing Authority, Generator Operator, Distribution Provider, Transmission Service Provider, Purchasing-Selling Entity or Load Serving Entity shall retain its evidence for 90 days for Requirements R2 and R3, Measures M2 and M3. 		

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 6 Comment
American Electric Power	No	Please refer to our response to question #4.
Hydro-Québec TransEnergie (HQT)	No	Please see our proposed wording change under Q4.
Independent Electricity System Operator	No	Please see our proposed wording change under Q4.
IRC Standards Review Committee	No	Please see our proposed wording change under Q4.
Northeast Power Coordinating Council	No	Please see our proposed wording change under Question 4.
Response: The RCSDT thanks you for your comment. Please see response to Question 4.		
E.ON U.S.	No	See comments to question 4 and question 8.
Response: The RCSDT thanks you for your comment. Please see response to Question 4 and Question 8.		
Ameren	No	See response to #4.
Electric Market Policy	No	See response to Q4
Response: The RCSDT thanks you for your comment. Please see response to Question 4.		
PNGC Power (15 member utilities)	No	Small non 24/7 entities in WECC should be excluded from these requirements. Not doing so will create a financial burden for little discernable effect.
Response: The RCSDT thanks you for your comment. It is beyond the scope of the RCSDT to determine registration or compliance issues.		
Manitoba Hydro	No	The use of this definition in this requirement appears appropriate at this time, but the definition of Reliability Directive issue remain the same as identified on Question 4 of this document.

Organization	Yes or No	Question 6 Comment
Response: The RCSDT thanks you for your comment. Please see response to question 4.		
Central Lincoln	No	These requirements should be waived in the WECC region, where the RC has stated they will not be interacting with most of the registered entities. http://www.bpa.gov/corporate/business/reliability/Docs/2007/PNSC_RE_Data_Letter_2_070723.pdf
Response: The RCSDT thanks you for your comment. It is beyond the scope of the RCSDT to determine registration or compliance issues.		
US Bureau of Reclamation	No	This change is problematic in that any automatic protective element operation that trips a BES element could be construed to be an Adverse Reliability Impact. The modification eliminated the phrase “that affects a widespread area of the Interconnection” which clarified the scope of “uncontrolled separation”. We would need the definition to be adjusted to delete “uncontrolled separation” as it is included in the definition of Cascading.
Response: The RCSDT thanks you for your comment. We concur with your comment and have removed “uncontrolled separation” from the proposed definition revision.		
ISO New England Inc	No	We believe that the Reliability Directive definition should be: “A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an actual or expected emergency and the RC, TOP or BA operator clearly identifies in the communication that this is a Reliability Directive.”
Response: The RCSDT thanks you for your comment. The RCSDT believes that your suggested revision would impose a requirement within the definition.		
Western Electricity Coordinating Council	No	We do not agree with the definition (see above question 4) but it does clear up when a directive is required.
Response: The RCSDT thanks you for your comment. Please see response to question 4.		
Midwest ISO Standards Collaborators	No	We largely agree with the use of the Reliability Directive term but have some suggested some refinements in the previous questions to the definition and requirements.
NERC Standards Review Subcommittee	No	We largely agree with the use of the Reliability Directive term but have some suggested some refinements in the previous questions to the definition and requirements.

Organization	Yes or No	Question 6 Comment
<p>Response: The RCSDT thanks you for your comment. Please see responses to questions 4 and 5.</p>		
<p>Duke Energy</p>	<p>No</p>	<p>We propose a revised definition of the term “Reliability Directive” in our Comment #4 above. Requirement R1 should be reworded to clarify that the RC has three separate actions. The RC can act, direct others to act, or issue Reliability Directives. Requirements R2 and R3 should be revised to include the fact that the listed entities must comply with RC directions as well as Reliability Directives, or inform the RC of their inability to comply. Measures and VSLs should also be revised accordingly.</p>
<p>Response: The RCSDT thanks you for your comment.</p> <p>Definition: Please see response to question 4 with respect to the definition.</p> <p>R1: To address your comment as well as the comments of other stakeholders, we have revised R1 to state: Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts..</p> <p>We have also revised the Purpose Statement to: To establish the capability and authority of Reliability Coordinators to direct other entities to prevent Adverse Reliability Impacts to the Bulk Electric System</p> <p>Conforming revisions to M1 and the VSLs for R1 were also made.</p> <p>R2 and R3: The RCSDT believes that revised R2 and R3 now satisfy your requested revision.</p>

Pepco Holdings, Inc	Yes	Requirement R1 should recognize the RC's option to "direct others to act"
<p>Response: The RCSDT thanks you for your comment. R1: To address your comment as well as the comments of other stakeholders, we have revised R1 to state: Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts.</p> <p>We have also revised the Purpose Statement to: To establish the capability and authority of Reliability Coordinators to direct other entities to prevent Adverse Reliability Impacts to the Bulk Electric System</p> <p>Conforming revisions to M1 and the VSLs for R1 were also made.</p>		
ERCOT ISO	No	As an initial matter, ERCOT ISO disagrees with the definition of Reliability Directive - See response to Question 4.

Organization	Yes or No	Question 6 Comment
		<p>With respect to the use of Reliability Directive in IRO-001-2, ERCOT ISO does not necessarily take issue with using the term in this context. However, by doing so, the Drafting Team should consider whether doing so effectively defines Emergency in terms of the specific conditions that define Adverse Reliability Impact (i.e. instability, uncontrolled separation or cascading), because Reliability Directives, by definition, are only issued during emergencies, and pursuant to R1 of IRO-001-2, the relevant entities issue a Reliability Directive for instances that result in Adverse Reliability Impacts. Accordingly, use of Reliability Directive in this Standard may effectively revise the definition of Emergency (although it is arguable that the relevant specific conditions are clearly Emergency conditions), and ERCOT ISO questions whether this is appropriate. It may be advisable to not use the term here or to revise the definition to explicitly include these conditions.</p> <p>In addition, ERCOT ISO recommends the following non-substantive revisions to R1, R2 and R3.</p> <p style="text-align: center;"><u>R1</u></p> <p style="text-align: center;">SDT PROPOSED LANGUAGE</p> <p>R1. Each Reliability Coordinator shall act or issue Reliability Directives for actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts. <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations and Same Day Operations]</i></p> <p style="text-align: center;">ERCOT PROPOSED LANGUAGE</p> <p>R1. Each Reliability Coordinator shall act to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts. RC actions pursuant to this requirement may include the issuance of Reliability Directives to Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area. <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations and Same Day Operations]</i></p> <p style="text-align: center;"><u>R2</u></p> <p style="text-align: center;">SDT PROPOSED LANGUAGE</p> <p>R2. Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity shall comply with its Reliability Coordinator's Reliability Directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations and Same Day Operations]</i></p>

Organization	Yes or No	Question 6 Comment
		<p style="text-align: center;">ERCOT PROPOSED LANGUAGE</p> <p>R2. Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity shall comply with Reliability Directives issued pursuant to R1 unless such actions would violate safety, equipment, or regulatory or statutory requirements. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations and Same Day Operations]</i></p> <p style="text-align: center;"><u>R3</u></p> <p style="text-align: center;">SDT PROPOSED LANGUAGE</p> <p>R3. Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity shall inform its Reliability Coordinator upon recognition of its inability to perform an issued Reliability Directive. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations and Same Day Operations]</i></p> <p style="text-align: center;">ERCOT PROPOSED LANGUAGE</p> <p>R3. Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity shall inform its Reliability Coordinator if it cannot perform a Reliability Directive because it would violate safety, equipment, or regulatory or statutory requirements. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations and Same Day Operations]</i></p>
<p>Response: The RCSDT thanks you for your comment. Please see responses to your comments on questions 4 and 5.</p> <p>Definitions: An Emergency is a system condition or event. Adverse Reliability Impact is the result of an Emergency or some other condition or event.</p> <p>To address your comment as well as the comments of other stakeholders, we have revised R1 to state: Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts.</p> <p>We have also revised the Purpose Statement to: To establish the capability and authority of Reliability Coordinators to direct other entities to prevent Adverse Reliability Impacts to the Bulk Electric System</p> <p>Conforming revisions to M1 and the VSLs for R1 were also made.</p> <p>R1, R2, R3: The RCSDT thanks you for your suggested revisions to R1, R2 and R3. Revised wording best reflects stakeholder consensus. The RCSDT developed wording of the requirements provides clear direction for actions of applicable entities and to provide clarity regarding compliance.</p>		

Do you agree with the revisions to the Requirements in IRO-014-2 as shown in the posted Standard and Implementation Plan? If not, please explain in the comment area.

Summary Consideration: Several commenters made suggestions regarding R2. The original requirement was designed to accomplish in one requirement what is proposed by the commenters as three procedural requirements. R2 is worded to focus on defining what a “compliant plan” is. In the current requirement a “proposed plan” is not the same as a “compliant plan”.

The SDT viewed what the commenters are suggesting as follows:

- The initiating RC would submit its “proposed plan” to the other RCs
- The receiving RCs would provide the initiating RC with their responses indicating whether or not they agree with the proposed roles/actions offered by the initiating RC
- If one or more RCs do not agree with the roles/actions, then the initiating RC would be required to offer an alternative proposal (and go back to the first bullet)
- When all RCs acknowledge that the proposed roles/actions in the revised “proposed plan” are acceptable, then and only then would the “proposed plan” become a “compliant plan”

A closer reading of the current R2 would show the current R2 accomplishes the exact same result but does so without interjecting the need for documenting the intervening processes. The SDT does not see the need to document why each proposal was or was not accepted; nor does the SDT see the need to document the negotiations that are involved in getting to “an agreed to plan”. For example the comments’ subrequirement to show the RC submitted its plan would require a paper trail for the request; followed by a paper trail for the responses, followed by more paperwork if the RCs are not in agreement. In the end, the only action that matters (in both the SDT version and in the commenters alternative version) is a plan that works, and a plan that if others are involved must have their concurrence that those others will participate.

R2 does not impose a requirement to get agreements; what R2 does is to require that a “compliant plan” be developed. A proposed plan does not solve problems. That proposed plan is NOT compliant with R2 if it only assumes that other RC will effect the actions in the proposal; neither is it compliant if the proposed actions are not acceptable to the other RCs who are required to act. To be compliant the initiating RC must either have the concurrence (i.e. agreement) of the other RCs for their respective part(s) in the proposed plans OR the plan must not include those RCs.

R2 says to be compliant the other RC must agree with the “proposed plan” before that “proposed plan” is acceptable as a “compliant plan”. Having a plan that requires someone else to do an action, but that other entity will not effect that action, will not resolve the problem at hand. Further having documentation that someone refuses to participate in the proposed plan does nothing to solve the problem at hand.

Organization	Yes or No	Question 7 Comment
documentation that someone refuses to participate in the proposed plan does nothing to solve the problem at hand.		
Midwest ISO Standards Collaborators	No	<p>R2 appropriately requires the RC experiencing the Adverse Reliability Impact to distribute its Operating Procedure, Process or Plan to other RCs required to take action. However, it inappropriately places the burden on the same RC to obtain the agreement of impacted RCs. No RC can be forced to agree. Rather R2 should remove the bullet to require agreement from the impacted RC and a new requirement should be written to require the impacted RC to acknowledge the Operating Procedure, Process or Plan with agreement or disagreement. In the event of disagreement, a reliability or legal reason or failure to implement comparable actions should be given as the reason for not agreeing with the Operating Process, Procedure or Plan. This contributes to reliability by forcing the impacted RC to take action if the action is reasonable. There is an extra “or” in the R8 clause: “unless such actions would violate safety, equipment, or regulatory or statutory requirements”.</p> <p>IRO-014-2 R2 VSLs differentiate violations based on whether the plans, processes, and procedures were distributed or agreed to. How can another RC agree to them if it has not received them? Because it is unlikely that an RC will make notifications without exchanging reliability information or vice versa for IRO-014-2 R3, we suggest a more appropriate delineation for the VSLs would be based on the number of other impacted RCs that were not informed. IRO-014-2 R4 VSLs should be defined based upon the number of conference calls the RC does not participate in. R4 requires each RC to participate in “agreed upon conference calls”. Because the statement “conference calls” is plural, VSLs need to be set based on the aggregate of calls not participated in. Failure to assign VSLs in this way is equivalent to setting the requirement to “agreed upon conference call” and causes the VSLs to be in violation guideline 3 that the Commission established in their June 2008 Order on VSLs. Guideline 3 states that the VSL must be consistent with the requirement and cannot “redefine or undermine the requirement”. Clearly, these VSLs do. R5’s Severe VSL is redundant with the Moderate VSL. Failure to notify one RC meets both VSLs since Severe uses the word any. Based on the SDT’s response to our comment from the last time, we believe instead of any they mean “no impacted”. Unfortunately, “any impacted” could be one or two or higher. If it is one, it matches the Moderate VSL. The VSL for R8 needs to include the “unless such actions would violate safety, equipment, regulatory or statutory requirement” clause.</p> <p>In R1, should “Operating Procedures, Processes, or Plans” be “Operating Procedures, Operating Processes, or Operating Plans” to comport with the definitions in the NERC Glossary of Terms. We believe “Operating” is implied on “Processes” and “Plans” but believe it is more appropriate to make the meaning explicit with this modification since we are dealing with formal definitions.</p>

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 7 Comment
NERC Standards Review Subcommittee	No	<p>R2 appropriately requires the RC experiencing the Adverse Reliability Impact to distribute its Operating Procedure, Process or Plan to other RCs required to take action. However, it inappropriately places the burden on the same RC to obtain the agreement of impacted RCs. No RC can be forced to agree. Rather R2 should remove the bullet to require agreement from the impacted RC and a new requirement should be written to require the impacted RC to acknowledge the Operating Procedure, Process or Plan with agreement or disagreement. In the event of disagreement, a reliability or legal reason or failure to implement comparable actions should be given as the reason for not agreeing with the Operating Process, Procedure or Plan. This contributes to reliability by forcing the impacted RC to take action if the action is reasonable. There is an extra “or” in the R8 clause: “unless such actions would violate safety, equipment, or regulatory or statutory requirements”.</p> <p>IRO-014-2 R2 VSLs differentiate violations based on whether the plans, processes, and procedures were distributed or agreed to. How can another RC agree to them if it has not received them? Because it is unlikely that an RC will make notifications without exchanging reliability information or vice versa for IRO-014-2 R3, we suggest a more appropriate delineation for the VSLs would be based on the number of other impacted RCs that were not informed. IRO-014-2 R4 VSLs should be defined based upon the number of conference calls the RC does not participate in. R4 requires each RC to participate in “agreed upon conference calls”. Because the statement “conference calls” is plural, VSLs need to be set based on the aggregate of calls not participated in. Failure to assign VSLs in this way is equivalent to setting the requirement to “agreed upon conference call” and causes the VSLs to be in violation guideline 3 that the Commission established in their June 2008 Order on VSLs. Independent Electricity System Operator	No	<p>R2 appropriately requires the RC experiencing the Adverse Reliability Impact to distribute its Operating Procedure, Process or Plan to other RCs required to take action. However, Subrequirements R2.1 places a burden to the initiating RC for actions over which it may not have any control, viz. agreeing to the procedures, process or plan by the receiving RCs that are required to take actions. We believe there should be requirements for: a. The initiating RC to seek agreements by the other RCs that are required to take actions; b. The receiving RCs to indicate agreement, or otherwise with a reason; and; c. The initiating RC to revise the procedures, process or plan. These requirements would place the needed responsibilities to the appropriate entities. If the SDT agrees with revising R2 as suggested, then other requirements that may be affected by this change may need to be revised accordingly. There is an extra “or” in the R8 clause: “unless such</p>

Organization	Yes or No	Question 7 Comment
		<p>actions would violate safety, equipment, or regulatory or statutory requirements”.</p> <p>IRO-014-2 R2 VSLs differentiate violations based on whether the plans, processes, and procedures were distributed or agreed to. If an intended RC never received the plans, processes and procedures, it would not be aware of the need to agree to them. Hence, if the plans, etc. were not distributed, then the initiating RC will be assigned a Moderate VSL but never any higher VSLs even if no agreements were received (since no other RCs had received the plans to begin with). We suggest the SDT to consider rearranging the VSLs and in accordance with any changes to R2 reflecting our suggested changes summarized under Q7. Because it is unlikely that an RC will make notifications without exchanging reliability information or vice versa for IRO-014-2 R3, we suggest a more appropriate delineation for the VSLs would be based on the number of other impacted RCs that were not informed.</p> <p>IRO-014-2 R4 VSLs should be defined based upon the number of conference calls the RC does not participate in. R4 requires each RC to participate in “agreed upon conference calls”. Because the statement “conference calls” is plural, VSLs need to be set based on the aggregate of calls not participated in. Failure to assign VSLs in this way is equivalent to setting the requirement to “agreed upon conference call” and causes the VSLs to be in violation guideline 3 that the Commission established in their June 2008 Order on VSLs. Guideline 3 states that the VSL must be consistent with the requirement and cannot “redefine or undermine the requirement”. Clearly, these VSLs do.</p> <p>The VSL for R8 needs to include the “unless such actions would violate safety, equipment, regulatory or statutory requirement” clause.</p>
<p>Response: The RCSDT thanks you for your comment. The original requirement was designed to accomplish in one requirement what is proposed by the commenters as three procedural requirements. R2 is worded to focus on defining what a “compliant plan” is. In the current requirement a “proposed plan” is not the same as a “compliant plan”.</p> <p>The SDT viewed what the commenters are suggesting as follows:</p> <ul style="list-style-type: none"> • The initiating RC would submit its “proposed plan” to the other RCs • The receiving RCs would provide the initiating RC with their responses indicating whether or not they agree with the proposed roles/actions offered by the initiating RC • If one or more RCs do not agree with the roles/actions, then the initiating RC would be required to offer an alternative proposal (and go back to the first bullet) • When all RCs acknowledge that the proposed roles/actions in the revised “proposed plan” are acceptable, then and only then would the “proposed plan” become a “compliant plan” <p>A closer reading of the current R2 would show the the current R2 accomplish the exact same result but does so without interjecting the need for</p>		

Organization	Yes or No	Question 7 Comment
<p>documenting the intervening processes. The SDT does not see the need to document why each proposal was or was not accepted; nor does the SDT see the need for document the negotiations that are involved in getting to “an agreed to plan”. For example the comments’ subrequirement to show the RC submitted its plan would require a paper trail for the request; followed by a paper trail for the responses, followed by more paperwork if the RCs are not in agreement. In the end, the only action that matters (in both the SDT version and in the commenters alternative version) is a plan that works, and a plan that if others are involved must have their concurrence that those others will participate.</p> <p>R2 does not impose a requirement to get agreements; what R2 does is to require that a “compliant plan” be developed. A proposed plan does not solve problems. That proposed plan is NOT compliant with R2 if it only assumes that other RC will effect the actions in the proposal; neither is it compliant if the proposed actions are not acceptable to the other RCs who are required to act. To be compliant the initiating RC must either have the concurrence (i.e. agreement) of the other RCs for their respective part(s) in the proposed plans OR the plan must not include those RCs.</p> <p>R2 says to be compliant the other RC must agree with the “proposed plan” before that “proposed plan” is acceptable as a “compliant plan”. Having a plan that requires someone else to do an action, but that other entity will not effect that action, will not resolve the problem at hand. Further having documentation that someone refuses to participate in the proposed plan does nothing to solve the problem at hand.</p> <p>IRO-014 VSLs: R2: The VSLs are differentiated as you suggest.</p> <p>R3: The RCSDT does not believe that is the correct delineation of the requirement which requires notification of each impacted RC. What if there is only one and there was no notification?</p> <p>R4: The RCSDT contends that the requirement specifies participation in all agreed upon calls. If the RC misses an agreed upon call, it has failed to meet the requirement.</p> <p>R5: The RCSDT disagrees. If there is only one impacted RC and no notification is made, it should be a Severe violation.</p> <p>R8: The phrase does not need to be in the VSL. If a plan was not implemented due to safety reasons, then the requirement was not violated and the VSL would not be considered.</p> <p>R1: We have revised the requirement per your suggestion to R1, R2 and R3.</p>		
Electric Market Policy	No	<p>Agree with most. However, the language proposed for use in IRO-014-2 @ R5 and R6 needs clarity. There needs to be a way to determine who is required to do what depending upon whether the party is a) Reliability Coordinator who has the identified Adverse Reliability Impact) An impacted affected Reliability Coordinator. Suggest revising so that these read similar to R7 and R8.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT does not understand your comment. We believe that the requirements are clear as written as to what each entity must do.</p>		

Consideration of Comments on Draft Standards for Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 7 Comment
Western Area Power Administration	No	Comments: In R1 & R2, the first sentence is redundant. The phrase which was added “For conditions or activities that impact other RC Areas...” should be removed.
Response: The RCSDT thanks you for your comment. The SDT agrees and has made the suggested revision.		
OC Standards Review Group	No	In R1.6, we suggest adding “BES” before “conditions” such that the sentence reads: “Authority to act to prevent and mitigate “BES” conditions.....”
<p>Response: The RCSDT thanks you for your comment. The SDT disagrees. Adverse Reliability Impact is defined as follows:</p> <p><i>The impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection.</i></p> <p>If a condition will cause interconnection “cascading, instability, ...” the RC should be mandated to act whether or not the initiating condition is part of the BES.</p>		
Florida Municipal Power Agency and Some Members	No	In requirements R7 and R8, the term mitigation plan is used. Since mitigation plan has another specific meaning (e.g., a mitigation plan for non-compliance with a standard), FMPA suggests using a different term with the same meaning, e.g., ameliorative plan, alleviation plan, abatement plan, to help avoid confusion.
Response: The RCSDT thanks you for your comment. The SDT disagrees. Lower case “mitigation” is a proper English word		
NERC	No	NERC staff believes that the original language in IRO-016-1 was clearer than the proposed requirements R5 through R8. Additionally, we believe that this standard is already covered in the certification process. We recommend that this standard, with the exception of R4, be retired and the certification process be revisited to ensure that IRO-016-1 R1 is covered. Furthermore, operating guidelines should be developed to address the content of R5 through R8.
<p>Response: The RCSDT thanks you for your comment. The RCSDT is not clear how requirements to make notifications, develop and implement mitigations plans belong in the certification process. We are also unclear what constitutes an operating guideline. Based on this, we will retain the requirements in IRO-014 as supported through the stakeholder process. Requirements R5 through R8 were brought into IRO-014 from IRO-016 as you state. These requirements were revised to eliminate compound requirements. The RCSDT feels that requirements are clear as written and stakeholder comments indicate consensus has been achieved.</p>		
Duke Energy	No	R1.6 - We believe that the word “system” should be added before the word “conditions” to provide additional

Organization	Yes or No	Question 7 Comment
		clarity.
Response: The RCSDT thanks you for your comment. We agree and have made the suggested edit.		
US Bureau of Reclamation	No	We would suggest that the language should indicate the plans need to address “neighboring RC areas” to limit the scope of the plans for "other RC areas" and not try to cover the whole NERC footprint.
Response: The RCSDT thanks you for your comment. The requirements deal with those RC that are seen to have an impact on a problem. To the extent that one RC expects another RC to be part of a solution, the requirement allows the initiating RC to “propose” a plan of actions and to seek help. If the other RC disagrees with the proposal, the latter RC would not give agreement.		
Bonneville Power Administration	Yes	
Central Lincoln	Yes	
FirstEnergy	Yes	
Pepco Holdings, Inc	Yes	
PNGC Power (15 member utilities)	Yes	
PPL	Yes	
South Carolina Electric and Gas	Yes	
Southern Company Services	Yes	
Southwest Power Pool	Yes	
Western Electricity Coordinating Council	Yes	
Xcel Energy	Yes	

Organization	Yes or No	Question 7 Comment
ITC Holdings	Yes	None
American Electric Power	Yes	The use of “. . . act and/or issue . . .” may be more descriptive in Requirement 1 rather than “. . . act or issue . . .”
Response: The RCSDT thanks you for your comment.		
ERCOT ISO	No	<p>ERCOT ISO would like to add clarification to the Purpose statement and the following requirements (1-4) to alleviate potential interpretation issues. The remaining requirements in IRO-014 are adequately addressed with respect to “within the Interconnection” if the Adverse Reliability Impact term is modified as identified above in response to Question All the recommendations tie together.</p> <p>Purpose: To ensure that each Reliability Coordinator’s operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas “within its Interconnection” and to preserve the reliability benefits of interconnected operations.</p> <p>R1. For conditions or activities that impact other Reliability Coordinator Areas “within its Interconnection”, each Reliability Coordinator shall have Operating Procedures, Processes, or Plans for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following:</p> <p>R2. Each Reliability Coordinator’s Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators “within its Interconnection” to take action (e.g., make notifications, exchange information, or coordinate actions) shall be:</p> <p>R3. For conditions or activities that impact other Reliability Coordinator Areas “within its Interconnection”, each Reliability Coordinator shall make notifications and exchange reliability-related information with impacted Reliability Coordinators using its predefined Operating Procedures, Processes, or Plans for conditions that may impact other Reliability Coordinator Areas or other means to accomplish the notifications and exchange of reliability-related information.</p> <p>R4. Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly, and other communication forums with impacted Reliability Coordinators “within its Interconnection”.</p> <p>Additionally, ERCOT ISO recommends that the weekly minimum be eliminated and such meeting should be pursuant to an “agreed upon schedule” at the discretion of the Reliability Coordinators. The language notes “impacted” Reliability Coordinators. The “impacted” implies that it is relative to a discrete incident or time period, which is consistent with the purpose of the standard. Accordingly, it is unclear on the need for and</p>

Organization	Yes or No	Question 7 Comment
		<p>unbounded ongoing meeting obligation.</p> <p>ERCOT ISO also suggests changing the R4 VSL to allow lower VSL for missing an occasional meeting. The VSL can be elevated based on the number of missed calls or meetings. Severe would seem to be more appropriate if the entity refused to participate or calls were not initiated at all.</p> <p>Furthermore, with respect to R4, It is not clear what value this requirement adds generally. The requirement is related to “impacted” RCs. This implies that the meetings are relative to discrete incidents/time periods, which is consistent with the purpose of the standard. Accordingly, given the apparent temporary, incident specific nature of an “impacted” entity, it doesn’t make sense to impose an unbounded ongoing meeting obligation. Furthermore, the establishment of the general procedures governs the objective actions impacted RCs will take for all situations. If there is an incident where an RC is “impacted”, it will manage the situation by application of the established objective procedures – that is the intent of having those procedures in place under the standard. Accordingly, it is questionable whether the weekly meeting obligation is necessary or serves any purpose. At a minimum, the weekly meeting obligation should be eliminated and such meeting should be pursuant to an “agreed upon schedule” to give discretion to the RCs.</p> <p>Finally, with respect to R1 – 1.6, in order to provide certainty to the regulated community, ERCOT ISO does not support the change to the condition precedent for action under the requirement from actual to potential Adverse Reliability Impacts. Defining an obligation in terms of “potential” situations is vague and ambiguous. This should generally be avoided because it creates ambiguity and uncertainty for both the regulated entity and regulator.</p>
<p>Response: The RCSDT thanks you for your comment.</p> <p>R1-R3: The SDT disagrees. If an RC does not have any other impacted RCs, then no operating processes, procedures or plans would be necessary. This would mean the R1-R3 would not apply to that RC.</p> <p>R4 and VSL- The RCSDT has revised R4 to add the words “within the same Interconnection” to the end of R4. We have revised the VSL accordingly. The RCSDT contends that the requirement specifies participation in all agreed upon calls. If the RC misses an agreed upon call, it has failed to meet the requirement.</p> <p>R1.6 – This refers to studying various system conditions and developing operating processes, plans or procedures to address them. If an entity has run a study and determined that there is an impact on another RC, then a process/plan/procedure should be developed and agree to in order to address the issue.</p>		

7 Do you have any other comment, not expressed in questions above, for the RC SDT?

Summary Consideration: The RC SDT thanks all commenters for their review of these proposed revisions and has incorporated many of the comments in the next revision of these requirements. In general, the RC SDT feels that the concept of a Reliability Directive is an important tool for RC, BA and TOP to maintain reliability and that the revisions are consistent with the applicable parts of the directives in FERC Order 693. The work of the RC SDT along with the OCPD SDT and the RTO SDT, as currently recognized, will cover the original intent of COM-002 and still provide a “defense in depth strategy” as suggested by commenters. Consensus appears to have been achieved with respect to the definition of Reliability Directive and the requirements that the RC SDT have developed for COM-002. This will further the efforts of the OCPD SDT in achieving stakeholder consensus for their proposed requirements in COM-003. The intent of this DT is to preserve a method for RCs, BAs and TOPs to make the determination of “what actions are required” and clearly communicate the importance to the receiver at a heightened method to normal day-to-day operational communications. The trigger of “Reliability Directive” by the issuer highlights these actions as needed to maintain BES reliability and shall be carried out as directed (unless such actions would violate safety, equipment, regulatory or statutory requirement per the language of the requirement) and all parties to the conversation need to be very cognizant of the system conditions that are requiring actions. The DT has attempted to craft clear and specific language that support BES reliability and hopes that this work can support and enhance the development of the OCPD SDT. The DT has also attempted to eliminate redundancy and ambiguity while not creating any reliability gaps. Several comments were received on the RC’s ability to “act”. The RC must “act” (ie. do something, “to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts”. This may include analysis, coordination of cooperative actions or the issuance of “Reliability Directives”. “Act” does not imply solely the manipulation of BES elements.

Several comments on VSL language were received. We have attempted to clarify intent and have revised some in response to comments.

Several comments were received that reference a “performance based initiative” endorsed by the NERC BOT. The DT appreciates this new initiative, and to the extent possible, requirements proposed by this DT reflect that desire. [We have had no official instruction nor direction regarding this initiative in relation to this project.]

RC control of “analysis tools” is critical to maintaining the wide area view. Control by the RC over the tools is imperative and beyond administrative, since it is intended to prevent planned reliability tool outages without the consent or knowledge of operating personnel. Although the DT agrees with the premise that many other requirements may be violated by ineffective communications, the intent of the requirement is to ensure there are effective communications methods in place for communicating BES activity across entities. Effective communication are a cornerstone of BES reliability and the intent of the requirement is to prevent the violation of other more significant performance type standard requirements due to ineffective communications before they

impact the BES. Failure of the RC to control outages of analysis tools was mentioned as a contributing factor in the 2003 blackout.

Overall, it is the intent of the DT to make the requirements flexible and adaptive to new technologies and methods as directed in order 693 and ensure that no matter how many forms of interpersonal communications are available. An entity can select a functional alternative to meet the intent of the requirement. The 60 minute timeframe appears reasonable based on industry comments. The term Interconnection is appropriate as it is.

Effective communications rely on an effective hierarchy. It is crucial for a host TOP or BA to have effective communications with GOs attached to their systems so that BES operations can be coordinated. Much like RCs must be able to communicate effectively with the systems within its footprint, effective communications allows BAs/TOPs to disseminate Interconnection information to DPs/GOPs that are impacted by system conditions outside of their operating visibility. The RCS DT has relied on the authority hierarchy (RC/ BA/ TOP / DP) to ensure accountability with the current performance type requirements, while not over-burdening the standards with prescriptive administrative-type requirements.

Organization	Question 8 Comment

Western Area Power Administration	
Western Electricity Coordinating Council	
CECD	<p>(1). The 60 minute timeframe should be lengthened if normal interpersonal communication paths are in service. Furthermore, the requirement to take corrective action or identify an alternative interpersonal communication method within 60 minutes should only apply if the registered entity only has a single alternative interpersonal communication method in place.</p> <p>(2). For COM-001 Requirement 4: The use of the term "Interconnection" seems inappropriate when describing communications between the DP/GOP and its BA/TOP and should be deleted. The NERC glossary of terms defines this as any one of the three major electric system networks in North America: Eastern, Western, and ERCOT. The requirement to be able to exchange operating information should be subject to the limitation as requested by the BA or TOP.</p>
<p>Response: The RCSDT thanks you for your comment. 1) It is the intent of the DT to make the requirement flexible and adaptive to new technologies and methods as directed in order 693 and ensure that no matter how many forms of interpersonal communications are available. An entity can select a functional alternative to meet the intent of the requirement. The timeframe has been revised to 2 hours. 2) We concur and have removed "Interconnection" from the requirement.</p>	
Hydro-Québec TransEnergie (HQT)	<p>(i) For IRO-001-2 R1, "act" should be removed. The RC can't act but can only issue Reliability Directives per the functional model.</p> <p>(ii) The NERC BOT recently approved pursuing the Results/Performance Based standards development activity. Based on this recent decision, the BOT has signaled their intent to remove administrative types of requirements from all standards. The IRO-001-2 R6 for the RC to have the authority to veto outages of their analysis tools and the COM-001-2 R3 requirement to use the English language are clearly not results or performance based, but rather administrative. If an operator used non-English, where it has not been agreed to or subject to law, to issue a Reliability Directive they will not be able to satisfy three-part communications in COM-002-3 in addition to many other standards and requirements they could not comply with. Even if an RC has veto authority over analysis tools, failure to exercise it would render the authority meaningless. Furthermore, the RC would not be able to meet other requirements and standards such as operating within IROL because they would not be able to assess the system appropriately.</p>
<p>Response: The RCSDT thanks you for your comments.</p> <p>a. The RC must "act" (ie. do something "to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts". This may include analysis, coordinate cooperative actions or issue "Reliability Directives".</p>	

Organization	Question 8 Comment
<p>b.</p>	<p>R6 is beyond administrative; it is intended to prevent planned reliability tool outages with the consent or knowledge of operating personnel. Although the DT agrees with the premise that many other requirements may be violated by ineffective communications, the intent of the requirement is to ensure there are effective communications methods in place for communicating BES activity across entities. Effective communication is a cornerstone of BES reliability and the intent of the requirement is to prevent the violation of other more significant performance type standard requirements due to ineffective communications before they impact the BES.</p>
<p>Midwest ISO Standards Collaborators</p>	<p>1) For IRO-001-2 R1, “act” should be removed. The RC can’t act but can only issue Reliability Directives per the functional model.</p> <p>2) IRO-001-2 R4 and R5 Severe VSLs need to have “any or” removed. The VSL should only apply for three or more and “any or” conflicts with this.COM-001-2 R2 Severe VSL conflicts with other VSLs. Specifically, the use of the word “any” in the Severe VSL is problematic. Notifying one entity at 65 minutes fits both the Lower VSL and Severe VSL as well. We suggest deleting the first portion of the Severe VSL that reads, “The responsible entity failed to notify any impacted entities of the failure of its normal Interpersonal Communications capabilities within 60 minutes.”</p> <p>3) The NERC BOT recently approved the pursuing the Results/Performance Based standards development activity. Based on this recent decision, we believe the BOT has signaled their intent to remove administrative types of requirements from all standards. The IRO-001-2 R6 for the RC to have the authority to veto outages of their analysis tools and the COM-001-2 R3 requirement to use the English language are clearly not result or performance based but rather administrative. If an operator used Portuguese to issue a Reliability Directive they will not be able to satisfy three-part communications in COM-002-3 in addition to many other standards and requirements they could not comply with. Even if an RC has veto authority over analysis tools, failure to exercise it would render the authority meaningless. Furthermore, the RC would not be able to meet a host of other requirements and standards such as operating within IROL because they would not be able to assess the system appropriately.</p>
<p>Response: The RCSDT thanks you for your comments.</p> <p>1) The RC must “act” (ie. do something “to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts”. This may include analysis, coordinate cooperative actions or issue “Reliability Directives”.</p> <p>2) The VSL language is intended to accommodate scenarios where only one entity is impacted or several entities are impacted. “The Reliability Coordinator failed to notify any or more than three impacted Transmission Operators, Balancing Authorities...” and provide the same measurability level.</p> <p>3) R6 is beyond administrative; it is intended to prevent planned reliability tool outages without the consent or knowledge of operating personnel. Although the DT agrees with the premise that many other requirements may be violated by ineffective communications, the intent of the requirement is to ensure there are effective communications methods in place for communicating BES activity across entities. Effective communication is a cornerstone of BES reliability and the intent of the requirement is to prevent the violation of other more significant performance type standard</p>	

Organization	Question 8 Comment
<p>requirements due to ineffective communications before they impact the BES.</p>	
<p>Northeast Power Coordinating Council</p>	<p>(i) For IRO-001-2 R1, “act” should be removed. The RC can’t act but can only issue Reliability Directives as per the functional model.</p> <p>(ii) The NERC BOT recently approved pursuing the Results/Performance Based standards development activity. Based on this recent decision, the BOT has signaled their intent to remove administrative types of requirements from all standards. The IRO-001-2 R6 requirement for the RC to have the authority to veto outages of their analysis tools and the COM-001-2 R3 requirement to use the English language are clearly not results or performance based, but rather administrative. If an operator used non-English to issue a Reliability Directive they will not be able to satisfy three-part communications in COM-002-3, in addition to many other standards and requirements they could not comply with. Even if an RC has veto authority over analysis tools, failure to exercise it would render the authority meaningless. Furthermore, the RC would not be able to meet other requirements and standards such as operating within an IROL because they would not be able to assess the system appropriately.</p>
<p>Response: The RCS DT thanks you for your comments.</p> <p>I) The RC must “act” (ie. do something “to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts”. This may include analysis, coordinate cooperative actions or issue “Reliability Directives”.</p> <p>II) R6 is beyond administrative; it is intended to prevent planned reliability tool outages without the consent or knowledge of operating personnel. Although the DT agrees with the premise that many other requirements may be violated by ineffective communications, the intent of the requirement is to ensure there are effective communications methods in place for communicating BES activity. Effective communication is a cornerstone of BES reliability and the intent of the requirement is to prevent the violation of other more significant performance type standard requirements due to ineffective communications before they impact the BES.</p>	
<p>Independent Electricity System Operator</p>	<p>(i) For IRO-001-2 R1, “act” should be removed. The RC can’t act but can only issue Reliability Directives per the functional model.</p> <p>(ii) The NERC BOT recently approved pursuing the Results/Performance Based standards development activity. Organization	Question 8 Comment
	<p>(iii) COM-001-2 R2 Severe VSL conflicts with other VSLs. Specifically, the condition of failing to notify any impacted entities within 60 minutes means that no entities received a notification within 60 minutes. But how about they all received this in 65 minutes? Would this be the same condition as the Low VSL? And if they all received this in 75 minutes, the condition would be the same as the Moderate VSL. We suggest the SDT to review and revise these VSLs to eliminate the duplication/ambiguity.</p>
<p>Response: The RCSDT thanks you for your comments.</p> <ul style="list-style-type: none"> I) The RC must “act” (ie. do something “to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts”. This may include analysis, coordinate cooperative actions or issue “Reliability Directives”. II) R6 is beyond administrative; it is intended to prevent planned reliability tool outages without the consent or knowledge of operating personnel. Although the DT agrees with the premise that many other requirements may be violated by ineffective communications, the intent of the requirement is to ensure there are effective communications methods in place for communicating BES activity. Effective communication is a cornerstone of BES reliability and the intent of the requirement is to prevent the violation of other more significant performance type standard requirements due to ineffective communications before they impact the BES. III) The DT did not consider R1 and R2 to be parallel requirements, and consequently did not attempt to force parallelism between the VSLs for R1 and R2. The only failure that is severe in this context is the failure to test the Alternative Interpersonal Communications capability on at least a quarterly basis. 	
<p>IRC Standards Review Committee</p>	<p>(i) IRO-001-2 R4 and R5 Severe VSLs need to have “any or” removed. The VSL should only apply for three or more and “any or” conflicts with this.</p> <p>(ii) For IRO-001-2 R1, “act” should be removed. The RC can’t act but can only issue Reliability Directives per the functional model.</p> <p>(iii) COM-001-2 R2 Severe VSL conflicts with other VSLs. Specifically, the condition of failing to notify any impacted entities within 60 minutes means that no entities received a notification within 60 minutes. But how about they all received this in 65 minutes? Would this be the same condition as the Low VSL? And if they all received this in 75 minutes, the condition would be the same as the Moderate VSL. We suggest the SDT to review and revise these VSLs to eliminate the duplication/ambiguity.</p> <p>(iv) The NERC BOT recently approved the pursuing the Results/Performance Based standards development activity. Based on this recent decision, we believe the BOT has signaled their intent to remove administrative types of requirements from all standards. The IRO-001-2 R6 for the RC to have the authority to veto outages of their analysis tools and the COM-001-2 R3 requirement to use the English language are clearly not result or performance based but rather administrative. Even if an RC has veto authority over analysis tools, failure to exercise it would render the authority meaningless. Furthermore, the RC would not</p>

Organization	Question 8 Comment
	<p>be able to meet a host of other requirements and standards such as operating within IROL because they would not be able to assess the system appropriately.</p> <p>(v) The VSLs for COM-002-3 R3 appear to have some redundancy. The Severe VSL and the second condition in the High VSL appear to be similar or the same.</p> <p>(vi) Measurement of compliance to COM-002-3 R1 could be challenging. As the VSL is written, it would appear the compliance auditor could judge if a Reliability Directive should have been issued. The VSL language that is problematic is “The responsible entity that required actions to be executed”. Please remove: “required actions to be executed as...”. Who determines that actions were required? One could argue that failure to identify a communication as a Reliability Directive means that actions weren’t required but it is doubtful the compliance authorities would take this approach. Thus, there would appear to be great judgment left to the compliance auditor in determining if a Reliability Directive should have been issued.</p> <p>(vii) IRO-014-2 R2 VSLs differentiate violations based on whether the plans, processes, and procedures were distributed or agreed to. If an intended RC never received the plans, processes and procedures, it would be aware of the need to agree to them. Hence, if the plans, etc. were not distributed, then the initiating RC will be assigned a Moderate VSL but never any higher VSLs even if no agreements were received (since no other RCs had received the plans to begin with). We suggest the SDT to consider rearranging the VSLs and in accordance with any changes to R2 reflecting our suggested changes summarized under Q7.</p> <p>(viii) Because it is unlikely that an RC will make notifications without exchanging reliability information or vice versa for IRO-014-2 R3, we suggest a more appropriate delineation for the VSLs would be based on the number of other impacted RCs that were not informed.</p> <p>(ix) IRO-014-2 R4 VSLs should be defined based upon the number of conference calls the RC does not participate in. R4 requires each RC to participate in “agreed upon conference calls”. Because the statement “conference calls” is plural, VSLs need to be set based on the aggregate of calls not participated in. Failure to assign VSLs in this way is equivalent to setting the requirement to “agreed upon conference call” and causes the VSLs to be in violation guideline 3 that the Commission established in their June 2008 Order on VSLs. Guideline 3 states that the VSL must be consistent with the requirement and cannot “redefine or undermine the requirement”. Clearly, these VSLs do.</p> <p>(x) IRO-014-2 R5’s Severe VSL is redundant with the Moderate VSL. Failure to notify one RC meets both VSLs since Severe uses the word any. Based on the SDT’s response to our comment from the last time, we believe instead of any they mean “no impacted”. Unfortunately, “any impacted” could be one or two or higher. If it is one, it matches the Moderate VSL.</p> <p>(xi) The VSL for IRO-014-2 R8 needs to include the “unless such actions would violate safety, equipment, regulatory or statutory requirement” clause.</p>

Organization	Question 8 Comment
	<p>Response: The RCS DT thanks you for your comments.</p> <p>I) The VSL language is intended to accommodate scenarios where only one entity is impacted or several entities are impacted. “The Reliability Coordinator failed to notify any or more than three impacted Transmission Operators, Balancing Authorities...” and provide the same measurability level.</p> <p>II) The RC must “act” (ie. do something “to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts”. This may include analysis, coordinate cooperative actions or issue “Reliability Directives”.</p> <p>III) The DT does not agree. The Severe VSL has “any impacted entities”, meaning that no entity was notified within 60 minutes. This is intentional. The Lower, Moderate and High VSLs address individual entities that may not have met the standard of 60 minutes.</p> <p>IV) R6 is beyond administrative, it is intended to prevent planned reliability tool outages without the consent or knowledge of operating personnel. Although the DT agrees with the premise that many other requirements may be violated by ineffective communications, the intent of the requirement is to ensure there are effective communications methods in place for communicating BES activity across entities. Effective communication are a cornerstone of BES reliability and the intent of the requirement is to prevent the violation of other more significant performance type standard requirements due to ineffective communications before they impact the BES.</p> <p>V) The VSLs were set to be flexible in measuring cases where an 1) acknowledgement is not made at all to a correctly repeated directive and 2) an acknowledgement is not made at all AND a directive repeated incorrectly was not corrected.</p> <p>VI) The intent of the DT is to allow the issuing entity to make the determination of “what actions are required” to clearly communicate the importance to the receiver. The word “required actions to be executed” are integral to the requirement and cannot be removed to meet the intent. In other words, the trigger of “Reliability Directive” by the issuer highlights these actions as needed to maintain BES reliability and should be carried out as directed (unless such actions would violate safety, equipment, regulatory or statutory requirement etc) and all parties to the conversation need to be very cognizant of the system conditions that are requiring actions. The DT has attempted to craft clear and specific language that support BES reliability and cannot pre-judge the behaviors of compliance auditors.</p> <p>VII) The DT agrees and will make clarifying changes.</p> <p>VIII) The DT agrees and will make clarifying changes.</p> <p>IX) The DT feels this is a core RC responsibility and therefore treated this requirement as binary. RCs must be responsive to other RCs that need to discuss BES reliability. However, we agree to change “calls” to “call(s)” in R4, to read as follows:</p> <p>R4. Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly (per Requirement 1, Part 1.7) with other Reliability Coordinators within the same Interconnection. [<i>Violation Risk Factor: Lower</i>][<i>Time Horizon: Real-time Operations</i>]</p> <p>X) The DT disagrees. “Failure to notify any” means that none were notified. If there is only a total of one impacted RC, then the VSL would be Severe.</p> <p>XI) If the action plan could not be implemented for such instances, then there would be no violation of the requirement and the VSL would not apply.</p>
OC Standards Review Group	“The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or

Organization	Question 8 Comment
	its officers.”
Response: The RCSDT thanks you for your comments.	
FirstEnergy	<p>1. We believe that this standard should be either handed to the OPCPSDT (Project 2007-02) or the OPCPSDT should hand over the COM-003-1 standard to this RCSDT (Project 2006-06); and then COM-002 and COM-003 should be merged. Per our comments in Draft 1 of COM-003-1 (OPCPSDT Project 2007-02) we believe that the Reliability Directive definition should be broadened to include communications associated with BES related information (similar to the proposed definition of Interoperability Communication from the OPCPSDT). The following are specifics: a. For better project coordination, since the plan of the OPCPSDT (2007-02) is to eventually incorporate the COM-002-3 requirements into the new COM-003-1 standard, we believe this should be done now by one SDT. b. The definition of Reliability Directive should be broadened to include any actions that affect the BES reliability. We suggest the following change to the term Reliability Directive: "A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where the recipient is directed to change the state or report the status of an Element or Facility of the Bulk Electric System." c. Per our suggestion to broaden the definition of Reliability Directive in "b" above, the proposed definition of Interoperability Communication proposed by the OPCPSDT can be eliminated. d. With respect to the proposed R2 and R3 of COM-002-3 and requirement R5 of COM-003-1 which all which essentially discuss three-part communication, could be combined and covered by COM-002-3. e. R1 of COM-003-1 that requires communication protocols procedures can be covered in COM-002-3.2.</p> <p>Implementation Plan - The proposed timeline for implementing these standards changes is the 1st day of the 1st quarter after applicable regulatory approvals. We believe that since there are numerous changes to and retirement of requirements, this will place a significant compliance burden on industry and warrants more time to adjust compliance evidence and tracking. Furthermore, standard COM-001-2 is adding the Distribution Provider and Generator Operator as applicable entities which will cause these entities to show compliance with a requirement they previously were not responsible for. Therefore, we believe that a minimum of two calendar quarters for implementing these changes is appropriate.</p>
<p>Response: The RC SDT thanks you for your comment. The RC SDT feels that the Reliability Directive is an important tool for RC, BA and TOP to maintain reliability and that the revisions are consistent with parts of the directives in FERC Order 693. The work of the RC SDT along with the OPCP SDT, as currently recognized, will cover the original intent of COM-002 and still provide a “defense in depth strategy” as suggested by the NERC comment. Consensus appears to have been achieved with respect to the definition of Reliability Directive and the requirements that the RC SDT have developed for COM-002. This will further the efforts of the OCPC SDT in achieving stakeholder consensus for their proposed requirements in COM-003. The intent of the DT is to preserve a method for RCs, BAs and TOP to make the determination of “what actions are required” and clearly communicate the importance to the receiver above normal day-to-day operational communications. The trigger of “Reliability Directive” by the issuer highlights these actions as needed to maintain BES reliability and should be carried out as directed (unless such actions would violate safety, equipment, regulatory or statutory requirement per the language of the requirement) and all parties to the conversation need to be very cognizant of the system conditions that are requiring actions. The DT has attempted to craft clear and specific language that support BES reliability and hopes that this work can support and enhance the development of the OPCP SDT.</p>	

Organization	Question 8 Comment
Ameren	1.In COM-001 R2, this “impacted entities’ language is unworkable. Some entities might be impacted because they get information from the RC, i.e indirectly from the entity with the loss. Team should address direct relationships somehow.2.In COM-001,R4, does the team consider the need for this for the AIC?3.The team should note that there is no requirement to even have AIC. Thus R1 would only apply if you have one.
<p>Response: The RCSDT thanks you for your comment. The DT feels that impacted adds clarity to the requirement by limiting the obligation appropriately. Industry consensus appears to support that “impacted” is a reasonable clarification.</p>	
NERC	As stated in the response to Question 1, the scope of COM-001-2 is unclear as to whether it applies to both verbal and data communication. We believe that it should.
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that data communication is covered under IRO-010, R3 which states: Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. (Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</p>	
Central Lincoln	COM-001 M3, M4, COM-002 M2, and IRO-001 M1, and M2 all require evidence of DPs and/or LSEs “which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation. ”While we appreciate the inclusion of “equivalent documentation”, we are unsure what might qualify and who determines what qualifies as equivalent. We still believe COM-001 should not apply to DPs and LSEs, since these entities do not own or operate BES assets. Please consider this stakeholder input as well. While CIP-001 M4 can show that documented communication proves capability for R4, an entity has no way of proving capability if such communications did not take place during the audit period. We are unsure if the SDT realizes that not all of the entities subject to these standards maintain 24/7 dispatch desks. Much effort will go into complying with standards dealing with afterhour’s directives that will never come, because the issuing entity will realize any action requested will not be timely enough and plan accordingly.
<p>Response: The RCSDT thanks you for your comment. DP and LSE were included in this standard per FERC Order 693 Directive. “Equivalent” documentation is included to provide potential alternatives for entities to provide to prove compliance with the requirement. Compliance audit personnel will review all documentation to determine compliance with a requirement.</p>	
Exelon	COM-001-2 R2. Please consider in place of “impacted entities”, substitute “all applicable entities”.
<p>Response: The RCSDT thanks you for your comment. The proposed substitute language has the same net effect as the current language and</p>	

Organization	Question 8 Comment
<p>therefore no change was made.</p>	
<p>ITC Holdings</p>	<p>Comments: IRO-001-2 R4 has an errant comma after the first occurrence of the word “Impacts”. IRO-014-2 R8 should have the first occurrence of the word “or” removed. Also, a new R9 (and associated M9) should be added requiring the RC who cannot agree on the mitigation plan due to safety, equipment, regulatory, or statutory requirements to notify the RC experiencing the Adverse Reliability Impact of the reason for the inability to implement the mitigation plan.</p>
<p>Response: The RCSDT thanks you for your comment. The comma in IRO-001-2 R4 has been removed.</p> <p>The first “or” in IRO-014-2 R8 has been removed.</p> <p>The suggested R9/M9 are unnecessary. Any RC that claims that a mitigation plan would violate safety, equipment, regulatory or statutory requirements would have to document that as part of complying with R8.</p>	
<p>Northeast Utilities</p>	<p>For IRO-001-2, the VSL language for R1, R4, and R5 is not clear. Specifically, for the R1 VSL the text appears to be reversed between High and Severe; and for R4 and R5, please clarify what is meant by “any or more than three”.</p>
<p>Response: The RCSDT thanks you for your comment. The High VSL and Severe VSL language is not reversed. The failure to act to mitigate existing Adverse Reliability Impacts is more negatively-impactful to BES reliability than the failure to prevent future Adverse Reliability Impacts.</p> <p>“Any or more than three” means that if no TOPs or BAs were notified or, in the case of an RC having four or more TOPs and BAs in its area, more than 3 of them were not notified.</p>	
<p>Bonneville Power Administration</p>	<p>In most proposed NERC standards, it seems the tried and true method of writing a requirement is to list the entities required to implement the action, list the required action, and then list any exceptions to the required action. In proposed standard COM-001-2, Requirement R3, the SDT lists the exceptions before the rule. In proposed standard COM-001-2, Measure M1, when it is discussing quarterly testing, it uses the term, “alternative Interpersonal Communications.” The word “alternative” should be capitalized. (Please see our comment on question #2 regarding the overall use of the term ‘Alternative Interpersonal Communications.’) we agree and made the change</p> <p>In proposed standard COM-001-2, Measure M1, after the word, “substitute,” the word “Alternative” should be added in order to use similar language in both Requirement R1 and in Measure M1. (Again, please see my comment on question #2 regarding the overall use of the term ‘Alternative Interpersonal Communications.’) we agree and made the change</p> <p>In proposed standard COM-001-2, Measure M2, it uses the wording “normal communications capabilities.” If our comment on question #1 is acceptable in its entirety, and the SDT decides not to use the term, ‘Interpersonal Communication,’ then the wording of Measure M2 is also acceptable. However, if the SDT decides to continue with their use of that term, then this phrase should be replaced with “normal Interpersonal Communications capabilities” in order to use similar language in both</p>

Organization	Question 8 Comment
	<p>Requirement R2 and in Measure M2. we agree and made the change</p> <p>In proposed standard COM-001-2, VSL for R2, the Lower VSL uses the word “failed” to describe notifying the impacted entities within the tight bounds of a time frame, in this case, “more than 60 minutes but less than or equal to 70 minutes”. According to the given wording, every entity that is fully compliant with this standard would have “failed” to notify the impacted entities within the narrow bounds of the Lower VSL’s time constraint! A similar comment could be made for the Moderate, High and Severe VSL descriptions also. The wording “failed to notify” needs to be taken out and replaced with “notified.” Related to this, in the Moderate VSL, the description of a responsible entity notifying at least one, but not all impacted entities within 60-minutes would tend to negate the Lower VSL. If the SDT were trying to force a responsible entity into making at least one phone call of notification to one of the impacted entities within 60-minutes, the Severe VSL’s description accomplishes this feat all by itself. However, if the SDT were insistent on all impacted entities being notified within 60-minutes or a Moderate VSL will result, then that action makes the Lower VSL rather useless. VSLs are only applied when there is a violation. The time bounds are appropriate for a violation of the requirement</p> <p>In proposed standard COM-002-3, Measure M3, it uses the term “Directive” by itself. It seems appropriate for what is being discussed that the term “Reliability Directive” should have been used. We added Reliability</p> <p>In proposed standard COM-002-3, VSL for R3, the High VSL describes the responsible entity failing to respond appropriately, either by acknowledging the recipient when they repeated the intent correctly or by failing to reissue when the recipient did not repeat the intent correctly. This would seem to take care of the options...either the recipient was correct or they were incorrect, but not both. However, the Severe VSL, by using the word “AND” connects the two thoughts and provides for the recipient to be both correct and incorrect at the same time. Therefore, the Severe VSL seems to contradict itself, while the spirit of the VSL seems to be handled quite nicely by the High VSL by itself. It is therefore suggested that the SDT consider replacing the Severe VSL with the High VSL. The rcsdt believes that the VSLs are appropriate as written</p> <p>In proposed standard IRO-001-2, Measure M3, on the second to the last line, the measure repeats the wording “that it,” making it redundant. We have made the edit</p> <p>In proposed standard IRO-001-2, Data Retention (Part D, Section 1.3), on the first bullet, the word “operator” (following “Generator”) should be capitalized. We have made the edit</p> <p>In proposed standard IRO-001-2, High and Severe VSLs for Requirement R1, we don’t really see the utility of separating the parts of failing to prevent Adverse Reliability Impacts and failing to mitigate the magnitude or duration of such impacts. Maybe the SDT could give some examples, because we would be just as fine combining the two into one VSL and therefore simplifying the VSL part of the standard. VSL drafting guidelines indicate that multiple VSLs should be written for a requirement when feasible. It is feasible for this requirement.</p> <p>In proposed standard IRO-001-2, Severe VSL for Requirement R2, the VSL should include wording to indicate that an</p>

Organization	Question 8 Comment
	<p>exception can be granted to the responsible entity failing to comply with the given Reliability Directive due to safety, equipment, or regulatory or statutory requirements. Otherwise, the responsible entity will be given a Severe VSL every time one of these exceptions comes up. If an entity did not comply with a directive for a safety issue, then the entity did not violate the requirement. The VSL only applies when a requirement is violated.</p> <p>In proposed standard IRO-001-2, Severe VSL for Requirement R4, we are not entirely sure what the SDT was trying to say, but the spirit of the VSL would seem to be captured if the SDT removed the wording “any or” and left the VSL to say in part, “...failed to issue an alert to more than three...”In a related way, for the Severe VSL for Requirement R5, the spirit of the VSL would seem to be captured if the SDT removed the wording “any or” and left the VSL to say in part “...failed to notify more than three...” The intent of the wording is to allow multiple VSLs for the requirement. The word “any” indicates that there were no notifications made when there were less than three notifications to be made.</p>
<p>Response: The RCSDT thanks you for your comment. See responses above.</p>	
<p>Florida Municipal Power Agency and Some Members</p>	<p>IRO-001-2, R5 refers to only transmission problems being mitigated and not to other types of issues that could result in a threat of an Adverse Reliability Impacts, such as a large supply / demand imbalance (capacity or energy Emergency). IRO-001-2, R6 FMPA does not quite understand the requirement, is the intent to allow Operating Personnel the authority to veto planned outages "in" its own analysis tools, rather than "to"?</p>
<p>Response: The RCSDT thanks you for your comment. We have removed the word “transmission” from the requirement.</p> <p>R5: Each Reliability Coordinator that identifies an expected or actual threat with Adverse Reliability Impacts, within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the problem has been mitigated. <i>[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p> <p>Regarding IRO-001-2, R6, the planned outages mentioned are actual outages of the analysis tools themselves, not planned outages of transmission elements. No changes made.</p>	
<p>PPL</p>	<p>No additional comments.</p>
<p>Operating Personnel Communications Protocols SDT</p>	<p>No Comment</p>

Organization	Question 8 Comment
PacifiCorp	No comment.
American Electric Power	Nothing additional at this time.
PNGC Power (15 member utilities)	<p>PNGC (15 members) would like to associate itself with Steve Alexanderson's (Central Lincoln PUD) comments re 2006-06: "COM-001 M3, M4, COM-002 M2, and IRO-001 M1, and M2 all require evidence of DPs and/or LSEs "which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation. "While we appreciate the inclusion of "equivalent documentation", we are unsure what might qualify and who determines what qualifies as equivalent. We still believe COM-001 should not apply to DPs and LSEs, since these entities do not own or operate BES assets. Please consider this stakeholder input as well. While CIP-001 M4 can show that documented communication proves capability for R4, an entity has no way of proving capability if such communications did not take place during the audit period. We are unsure if the SDT realizes that not all of the entities subject to these standards maintain 24/7 dispatch desks. Much effort will go into complying with standards dealing with afterhour's directives that will never come, because the issuing entity will realize any action requested will not be timely enough and plan accordingly."</p>
<p>Response: The RCSDT thanks you for your comment. The DT included DPs and LSEs per FERC Order 693. The DT believes your comment regarding "CIP-001 M4" is actually in reference to COM-001-2 M4". While the DT is concerned that any proposed requirements must be clear and reasonably simple for which to document compliance, in this instance, a simple test phone call at a regular interval would prove capability (assuming it were recorded.)</p>	
Manitoba Hydro	<p>R2 2.1 If these actions are required as real time action, "Agreed to" should be opened up to "Acknowledged by". "Agreed to" in this requirement would be acceptable when there is time for impacted RC to study the other RC plans to determine impact on their system. To further justify this suggestion, R3 says "make notifications . . . with impacted RC". This statement indicates no commitment to the notifications and therefore presumes "acknowledgement".R7. Move this requirement to R2 and label as R2.3. R2 is "Agreed to" and R7 is "Not Agreed to". R8 covers the action required when "Not agreed to"R8. The only suggested addition to this is "When an RC with the identified Adverse Reliability Impact has created and implemented a plan with other affected RC", there should be an R8.1 stating "No RC shall place a burden on other RC's" and or/and an R8.2 stating, that "Reliability will override economics". The addition of these two sub requirements would also enhance R7 by removing all other reasoning that an impacted RC may dwell on to "not agree to".</p>
<p>Response: The RCSDT thanks you for your comment. We assume that this comment is in reference to IRO-014-2. The RCSDT does not agree with your proposed revision. The intent of the requirements is to have the parties agree to the course of action required to maintain reliability.</p>	
Calpine Corporation	Regarding COM-001-2 R4. Many PURPA Qualifying Facilities and tolled Facilities communicate only with a scheduling

Organization	Question 8 Comment
	<p>coordinator or similar entity, not necessarily directly with the Transmission Operator and/or Host Balancing Authority. The standard should be rewritten to clarify that direct communications between these Generator Operators and their Transmission Operator and/or Host Balancing Authority is either not required or that communications through their established paths of communication meets the requirement.</p>
<p>Response: The RCSDT thanks you for your comments. Effective communications rely on an effective hierarchy. It is crucial for a host TOP or BA to have effective communications with GOs attached to their systems so that BES operations can be coordinated, much like RCs must be able to communicate effectively with the system within its footprint. PURPA qualifying facilities can impact BES reliability, and, as such, are included here.</p>	
<p>Duke Energy</p>	<p>Requirement R6 of IRO-001-2 contains the capitalized term “Operating Personnel”. This is not a NERC-defined term and should not be capitalized. As a general comment on new and revised NERC-defined terms, we believe that when such terms are introduced in a project with multiple standards, the terms should be included in the “Definitions of Terms Used in Standard” section of each standard. For example, in this project the term “Adverse Reliability Impact” is revised in IRO-001-2, but while it is also used in IRO-014-2, it no longer appears in the “Definitions of Terms Used in Standard” section of IRO-014-2.</p>
<p>Response: The RCSDT thanks you for your comment and has changed “Operating Personnel” to “System Operator”.</p>	
<p>Southwest Power Pool</p>	<p>SPP has also worked collaboratively with the IRC SRC on the comments submitted by that group on this standard and we fully support those. However, SPP found additional concerns at the last minute which could not be included in the SRC set due to the submittal deadline and has chosen to submit these separately. There are 10 other standards where the word “Directive” is used. Will the term Reliability Directive replace them, or will we get a different definition for Directive, or will both terms be the same?</p>
<p>The RC SDT believes that “directive” is lowercase in the other instances in NERC standards. The RTO SDT, OPCP SDT and RC SDT have attempted to move toward “Reliability Directive” in concert so as to remove the remaining ambiguity from NERC standards.</p> <p>The intent of the DT is to preserve a method for RCs, BAs and TOP to make the determination of “what actions are required” and clearly communicate the importance to the receiver above normal day-to-day operational communications. The trigger of “Reliability Directive” by the issuer highlights these actions as needed to maintain BES reliability and should be carried out as directed (unless such actions would violate safety, equipment, regulatory or statutory requirement per the language of the requirement) and all parties to the conversation need to be very cognizant of the system conditions that are requiring actions. The DT has attempted to craft clear and specific language that support BES reliability and hopes that this work can support and enhance the development of the OPCP SDT and subsequent expansion of the term “Reliability Directive”.</p>	
<p>E.ON U.S.</p>	<p>The definition of Reliability Directive should be incorporated into COM-003-1 with an associated single requirement that requires the use of Three-part Communication during the communication of a Reliability Directive.</p>

Organization	Question 8 Comment
<p>Response: The RCSDT thanks you for your comment. The DT has attempted to craft clear and specific language that support BES reliability and hopes that this work can support and enhance the development of the OPCSDT and subsequent expansion of the term “Reliability Directive”.COM-003 is outside the scope of the RCSDT project.</p>	
Public Service Enterprise Group Companies	The PSEG Companies are generally in agreement with the proposal.
<p>Response: The RCSDT thanks you for your comment.</p>	
Southern Company Services	These standards are more restrictive and prescriptive each time that a revision is issued for comments. It appears that the SDT does not believe that entities operating the Bulk Electric System cannot operate the system in a reliable manner using cooperation between parties.
<p>Response: The RCSDT thanks you for your comment. The DT feels that these standard requirements have been improved to benefit reliability and act as a “backstop” to prevent the breakdown of cooperation between parties and incent effective communications between operators of the BES.</p>	
NERC Standards Review Subcommittee	<ol style="list-style-type: none"> 1) This standard could be boiled down to one requirement and that is to maintain the continuous ability to communicate with other appropriate registered entities regardless of the need for a backup system. 2) For IRO-001-2 R1, “act” should be removed. The RC can’t act but can only issue Reliability Directives per the functional model. 3) IRO-001-2 R4 and R5 Severe VSLs need to have “any or” removed. The VSL should only apply for three or more and “any or” conflicts with this.COM-001-2 R2 Severe VSL conflicts with other VSLs. Specifically, the use of the word “any” in the Severe VSL is problematic. Notifying one entity at 65 minutes fits both the Lower VSL and Severe VSL as well. We suggest deleting the first portion of the Severe VSL that reads, “The responsible entity failed to notify any impacted entities of the failure of its normal Interpersonal Communications capabilities within 60 minutes.” 4) COM-001-2 R2 needs to be coordinated with EOP-008-1 since EOP-008-1 R1.5 is requiring 2 hours. COM-001-2 R1 should be clarified to remove 60 minutes. Perhaps the specific time frame is too administrative and too dependent on the circumstances and doesn’t purport to directly impact reliability of the backup functionality. If a time frame is desired perhaps the registered entity which knows their backup functionality capabilities and their plan to actuate these capabilities could be the best entity to define a reasonable immediate time frame. 5) The NERC BOT recently approved the pursuing the Results/Performance Based standards development activity. Based on this recent decision, we believe the BOT has signaled their intent to remove administrative types of requirements from all standards. The IRO-001-2 R6 for the RC to have the authority to veto outages of their analysis tools and the COM-001-2 R3 requirement to use the English language are clearly not result or performance based but

Organization	Question 8 Comment
	<p>rather administrative. If an operator used Portuguese to issue a Reliability Directive they will not be able to satisfy three-part communications in COM-002-3 in addition to many other standards and requirements they could not comply with. Even if an RC has veto authority over analysis tools, failure to exercise it would render the authority meaningless. Furthermore, the RC would not be able to meet a host of other requirements and standards such as operating within IROL because they would not be able to assess the system appropriately.</p>
<p>Response: The RCSDT thanks you for your comments.</p> <ol style="list-style-type: none"> 1. The DT has attempted to eliminate redundancy and ambiguity while not creating any reliability gaps. As written, the requirements are geared to incent folks to have effective communications in-place at all times while flexible enough to accommodate technology changes and process improvements by the industry. 2. The RC must “act” (ie. do something “to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts”. This may include analysis, coordinate cooperative actions or issue “Reliability Directives”. “Act” does not imply solely the manipulation of BES elements. 3. The VSL language is intended to accommodate scenarios where only one entity is impacted or several entities are impacted. “The Reliability Coordinator failed to notify any or more than three impacted Transmission Operators, Balancing Authorities...” and provide the same measurability level. 4. The RCSDT notes that EOP-008-1 is a proposed standard that has not been approved for enforcement. Also, EOP-008-1 deals with an entire control center where COM-001 deals with Interpersonal Communications capability with another entity. We will retain the original 60 minute timeframe. 5. R6 is beyond administrative, it is intended to prevent planned reliability tool outages without the consent or knowledge of operating personnel. Although the DT agrees with the premise that many other requirements may be violated by ineffective communications, the intent of the requirement is to ensure there are effective communications methods in place for communicating BES activity across entities. Effective communication are a cornerstone of BES reliability and the intent of the requirement is to prevent the violation of other more significant performance type standard requirements due to ineffective communications before they impact the BES. 	
<p>Xcel Energy</p>	<p>We would like to restate our belief that the Standard should explicitly state the requirement for RCs, TOPs and BAs to have both primary and alternate means of communication. To “imply” a required element within a Standard is inconsistent with the NERC Reliability Standards Development Procedure, which states “All mandatory requirements of a reliability standard shall be within an element of the standard.” We would suggest a requirement language that simply states “Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall maintain a means for both primary Interpersonal Communication as well as Alternative Interpersonal Communication used to communication real-time operating information.”</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT has crafted the latest versions (as supported by stakeholder comments) to support reliable communications by better describing how industry communicates and providing flexibility for the adoption of alternative communication media. The RCSDT also tried to minimize over-prescriptive requirements that result in no value to reliability and impose an</p>	

Organization	Question 8 Comment
administrative burden.	
Electric Market Policy	<p>We would like to thank, AND highly commend this SDT for their effort. This is the type of effort that every SDT should strive for. Elimination of requirements that are either redundant or unnecessary, and therefore distract entities, is every bit as important to the standards process as is the creation of new standards where reliability gaps are found. The proliferation of new and revised standards is becoming a concern for many in this industry and many of us feel the effort going into the review and compliance documentation is reducing the focus on monitoring and otherwise insuring that reliable operations can be maintained.</p>
<p>Response: The RCSDT thanks you for your comments and agrees reducing redundancy and ambiguity in the standards improves industry focus and therefore reliability of the BES.</p>	
ERCOT ISO	<p>ERCOT ISO offers the following additional comments:</p> <p><u>COM-001-2</u></p> <ol style="list-style-type: none"> 1) The SDT should consider coordinating their efforts with the OPCP drafting team efforts (COM-003) to ensure consistency across the standards. 2) For R4 – ERCOT ISO recommends considering adding Load-Serving Entity to the applicability due to their role in capacity and energy emergencies. 3) With respect to the Measures, “alternative” needs to be capitalized in M1. Also, if the intent is to include items such as regular phones or data links that are daily use items then Measures should reflect this. 4) ERCOT ISO suggests the following change to the terms Adverse Reliability Impact and Emergency. We think these simple changes will tie all the terms together.
<p>Response: The RC SDT thanks you for your comments.</p> <p>1) The RC SDT feels that the concept of a Reliability Directive is an important tool for RC, BA and TOP to maintain reliability and that the revisions are consistent with parts of the directives in FERC Order 693. The work of the RC SDT along with the OPCP SDT, as currently recognized, will cover the original intent of COM-002 and still provide a “defense in depth strategy” as suggested by the NERC comment. Stakeholder requests and consensus appears to have been achieved with respect to the definition of Reliability Directive and the requirements that the RC SDT have developed for COM-002. This will further the efforts of the OCPC SDT in achieving stakeholder consensus for their proposed requirements in COM-003. 2) The RCSDT has relied on the authority hierarchy (RC/ BA/ TOP / DP) to ensure accountability with the current FM, while not over-prescribing requirements. The RC SDT notes that, per the Functional Model, a DP may “direct” an LSE to communicate <i>requests</i> for voluntary load curtailment and not reliability situations:</p> <p>Item 9 on page 47 of version 5 of the Functional Model: “Directs Load-Serving Entities to communicate requests for voluntary load curtailment.”</p>	

Organization	Question 8 Comment
	<p>The RCSDT will forward this comment to the FMWG for their consideration in revising the language.</p> <p>3) & 4) Please see previous responses to your comments assuming those are the referenced comments.</p>

Standard Authorization Request Form

Title of Proposed Standard:	Supplemental SAR for Project 2006-06 IRO-003-2, Reliability Coordination — Wide-Area View
Request Date:	May 10, 2010
SC Approval Date:	July 14, 2010

SAR Requester Information	SAR Type <i>(Check a box for each one that applies.)</i>	
Name: Stephen Crutchfield	<input type="checkbox"/>	New Standard
Primary Contact: Stephen Crutchfield	<input checked="" type="checkbox"/>	Revision to existing Standard IRO-003-2 Reliability Coordination — Wide-Area View
Telephone: 609-651-9455	<input type="checkbox"/>	Withdrawal of existing Standard
E-mail: Stephen.crutchfield@nerc.net	<input type="checkbox"/>	Urgent Action

<p>Purpose (Describe what the standard action will achieve in support of bulk power system reliability.)</p> <p>The purpose of this request to expand the scope of work for Project 2006-06 Reliability Coordination to address specific directives from FERC Order 693 related to reliability standard IRO-003-2 — Reliability Coordination — Wide-Area View which have not been assigned to any other project.</p>
<p>Industry Need (Provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)</p> <p>The industry need for this request is to ensure that the requirements applicable to the Reliability Coordinator in reliability standard IRO-003-2 — Reliability Coordination — Wide-Area View are clear, measurable, unique and enforceable; and to ensure that this set of requirements is sufficient to maintain reliability of the Bulk Electric System.</p>
<p>Brief Description (Provide a paragraph that describes the scope of this standard action.)</p> <p>The FERC directives from Order 693 associated with reliability standard IRO-003-2 — Reliability Coordination — Wide-Area View are in summary:</p> <ol style="list-style-type: none"> 1. Add measures for each requirement 2. Create criteria to define the term “critical facilities” in a reliability coordinator’s area and its adjacent systems and consider the suggestions of APPA, Entergy, and Xcel when doing so.
<p>Detailed Description (Provide a description of the proposed project with sufficient details for</p>

the standard drafting team to execute the SAR.)

The purpose of this request to expand the scope of work for Project 2006-06 Reliability Coordination to address specific directives from FERC Order 693 related to reliability standard IRO-003-2 — Reliability Coordination — Wide-Area View which have not been assigned to any other project. The directives in FERC Order 693 to be addressed by the standard drafting team for Project 2006-06 Reliability Coordination are detailed in the following paragraphs from the Order:

Paragraph 909. The purpose of IRO-003-2 is for a reliability coordinator to have a wide-area view of its own and adjacent areas to maintain situational awareness. Wide-area view also facilitates a reliability coordinator's ability to calculate SOL and IROL as well as determine potential violations in its own area.

Paragraph 910. In the NOPR, the Commission proposed to approve the Reliability Standard as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission proposed to direct NERC to submit a modification that includes: (1) Measures and Levels of Non-Compliance and (2) criteria to define the term "critical facilities" in a reliability coordinator's area and its adjacent systems.

i. Comments

Paragraph 911. APPA agrees that IRO-003-2 is sufficient for approval as a mandatory and enforceable Reliability Standard. However, APPA suggests that, instead of merely including criteria to define critical facilities as proposed, NERC and each Regional Entity should establish, document, use and make transparent the methodology, data and procedures they use to determine "critical facilities."

Paragraph 912. Entergy agrees with the need for the criteria, but cautions that it must be flexible enough to allow for changing conditions experienced in real-time operations. Xcel notes that the term "critical facilities" is not defined and suggests that the Reliability Standard not be approved until the term is defined.

ii. Commission Determination

Paragraph 913. For the reasons stated in the NOPR the Commission approves proposed Reliability Standard IRO-003-2 as mandatory and enforceable. NERC's November 2006 revision to the Reliability Standard satisfies the proposal to include Measures and Levels of Non-Compliance.

Paragraph 914. Further, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, we adopt in the Final Rule the proposal to direct that the ERO develop a modification to the Reliability Standard through the Reliability Standards development process to create criteria to define the term "critical facilities" in a reliability coordinator's area and its adjacent systems. In developing the required modification, the ERO should consider the suggestions of APPA, Entergy and Xcel.

Standards Authorization Request Form

Reliability Functions

The Standard will Apply to the Following Functions <i>(Check box for each one that applies.)</i>		
<input type="checkbox"/>	Reliability Assurer	Monitors and evaluates the activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the bulk power system within a Reliability Assurer Area and adjacent areas.
<input checked="" type="checkbox"/>	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
<input type="checkbox"/>	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
<input type="checkbox"/>	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
<input type="checkbox"/>	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
<input type="checkbox"/>	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within its portion of the Planning Coordinator's Area.
<input type="checkbox"/>	Transmission Owner	Owns and maintains transmission facilities.
<input type="checkbox"/>	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
<input type="checkbox"/>	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within the Transmission Planner Area.
<input type="checkbox"/>	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
<input type="checkbox"/>	Distribution Provider	Delivers electrical energy to the End-use customer.
<input type="checkbox"/>	Generator Owner	Owns and maintains generation facilities.
<input type="checkbox"/>	Generator Operator	Operates generation unit(s) to provide real and reactive power.
<input type="checkbox"/>	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
<input type="checkbox"/>	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Standards Authorization Request Form

Reliability and Market Interface Principles

Applicable Reliability Principles <i>(Check box for all that apply.)</i>	
<input checked="" type="checkbox"/>	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
<input type="checkbox"/>	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
<input type="checkbox"/>	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
<input type="checkbox"/>	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
<input type="checkbox"/>	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
<input type="checkbox"/>	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
<input checked="" type="checkbox"/>	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
<input type="checkbox"/>	8. Bulk power systems shall be protected from malicious physical or cyber attacks.
Does the proposed Standard comply with all of the following Market Interface Principles? <i>(Select 'yes' or 'no' from the drop-down box.)</i>	
1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes	
2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes	
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes	
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Unofficial Comment Form for Project 2006-06 — Reliability Coordination

Please **DO NOT** use this form to submit comments. Please use the [electronic form](#) at the link below to submit comments on the proposed supplemental SAR to address specific directives from FERC Order 693 related to reliability standard IRO-003-2 — Reliability Coordination — Wide-Area View which have not been assigned to any other project. Comments must be submitted by **September 3, 2010**. If you have questions please contact Stephen Crutchfield by email at Stephen.crutchfield@nerc.net or by telephone at 609-651-9455.

http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

Background:

The purpose of this SAR is to expand the scope of work for Project 2006-06 Reliability Coordination to address specific directives from FERC Order 693 related to reliability standard IRO-003-2 (Reliability Coordination — Wide-Area View) which have not been assigned to any other project. The directives in FERC Order 693 to be addressed by the standard drafting team for Project 2006-06 Reliability Coordination are detailed in the following paragraphs from the Order:

Paragraph 909. The purpose of IRO-003-2 is for a reliability coordinator to have a wide-area view of its own and adjacent areas to maintain situational awareness. Wide-area view also facilitates a reliability coordinator's ability to calculate SOL and IROL as well as determine potential violations in its own area.

Paragraph 910. In the NOPR, the Commission proposed to approve the Reliability Standard as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission proposed to direct NERC to submit a modification that includes: (1) Measures and Levels of Non-Compliance and (2) criteria to define the term "critical facilities" in a reliability coordinator's area and its adjacent systems.

i. Comments

Paragraph 911. APPA agrees that IRO-003-2 is sufficient for approval as a mandatory and enforceable Reliability Standard. However, APPA suggests that, instead of merely including criteria to define critical facilities as proposed, NERC and each Regional Entity should establish, document, use and make transparent the methodology, data and procedures they use to determine "critical facilities."

Paragraph 912. Entergy agrees with the need for the criteria, but cautions that it must be flexible enough to allow for changing conditions experienced in real-time operations. Xcel notes that the term "critical facilities" is not defined and suggests that the Reliability Standard not be approved until the term is defined.

ii. Commission Determination

Paragraph 913. For the reasons stated in the NOPR the Commission approves proposed Reliability Standard IRO-003-2 as mandatory and enforceable. NERC's November 2006 revision to the Reliability Standard satisfies the proposal to include Measures and Levels of Non-Compliance.

Paragraph 914. Further, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, we adopt in the Final Rule the proposal to direct that the ERO

develop a modification to the Reliability Standard through the Reliability Standards development process to create criteria to define the term “critical facilities” in a reliability coordinator’s area and its adjacent systems. In developing the required modification, the ERO should consider the suggestions of APPA, Entergy and Xcel.

The SC authorized posting the SAR to expand the scope of the project to address two directives from Order 693 related to IRO-003; authorized adding missing measures to IRO-003, and directed the RC SDT to solicit stakeholder feedback on what ‘critical facilities’ should be monitored in adjacent Reliability Coordinator Areas before drafting a requirement to address this directive.

1. The scope of this SAR is to address FERC directives from Order 693 associated with reliability standard IRO-003-2 — Reliability Coordination — Wide-Area View as follows:
 - Add measures for each requirement
 - Create criteria to define the term “critical facilities” in a reliability coordinator’s area and its adjacent systems and consider the suggestions of APPA, Entergy, and Xcel when doing so.

Do you agree with the proposed scope of the SAR? If not, please explain in the comment area.

Yes

No

Comments:

2. In Paragraph 911 above, “*APPA suggests that, instead of merely including criteria to define critical facilities as proposed, NERC and each Regional Entity should establish, document, use and make transparent the methodology, data and procedures they use to determine “critical facilities.”*” Do you agree with the suggestion by APPA? If not, please explain in the comment area.

Yes

No

Comments:

3. In Paragraph 912 above, “*Entergy agrees with the need for the criteria, but cautions that it must be flexible enough to allow for changing conditions experienced in real-time operations.*” Do you agree with the suggestion by Entergy? If not, please explain in the comment area.

Yes

No

Comments:

4. In Paragraph 912 above, “*Xcel notes that the term “critical facilities” is not defined” and suggests that a definition is necessary.*” Do you agree with the suggestion by Xcel? If not, please explain in the comment area.

Yes

No

Comments:

5. The NERC SC has directed the RC SDT to solicit stakeholder feedback on what 'critical facilities' (relating to R2) should be monitored in adjacent Reliability Coordinator Areas. Please provide your input on this issue in the comment area.

R2. Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.

Comments:

6. If you have any other comments on the SAR that you haven't already provided in response to the previous questions, please provide them here.

Standards Announcement

Formal Comment Period Open

August 4–September 3, 2010

Now available at:

http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

Project 2006-06: Reliability Coordination

The Reliability Coordination Standard Drafting Team is seeking comments on a Supplemental SAR to expand the scope of work under its project to address some directives from Order 693 that are associated with IRO-003-2 — Reliability Coordination — Wide Area View **until 8 p.m. EDT on September 3, 2010.**

Instructions

Please use this [electronic form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Courtney.camburn@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page: http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

Next Steps

The drafting team will post responses to comments received during this period and if stakeholders support the expansion of this project, will use the comments received to propose specific revisions to IRO-003-2.

Project Background

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; and 3) revising the group of standards based on FERC Order 693. During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team, and two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to scope overlap. The expansion of this project to include revisions to IRO-003-2 would address directives from Order 693 that have not been assigned to any active drafting team.

Applicability in IRO-003-2

Reliability Coordinator

Standards Development Process

The [Reliability Standards Development Procedure](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

We do not believe that it is possible to develop a "one size fits all" methodology.
Yes
No
We think that "critical facilities" are self evident within Requirement R2. The word "critical" is unnecessary in this context since the facilities in question are fully described in the parenthetical statement following the word "facilities". Any further definition seems likely to inadvertently limit the set of facilities intended to be covered by this requirement. It is our view that the SDT did not intend this requirement to connect with similar requirements in the Critical Infrastructure Protection standards and that 'critical facilities' is not intended to be the equivalent of Critical Assets. We request that the SDT validate our view.
Each Reliability Coordinator (RC) should know the status of facilities in adjacent RC areas that impact its RC area.
"The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."

Yes
Making sure correct facilities are included in wide area view is important. Would suggest that we not use "critical" but reserve that term for only those facilities that are likely or lead to cascade, wide-area voltage collapse, interconnection instability, et al. What the SAR should describe is Operationally Significant facilities, of which "Critical facilities" would be a subset.
No
APPA's suggestion implies that there is always some analytic way to identify these facilities. As Entergy describes below, operators may need to identify facilities outside of an established rigorous study process. It would be less reliable to limit the number/scope to be covered simply because it didn't fit a rigorous methodology, data, and procedure.

There is a need to develop measures for each requirement, but do not agree with defining the term "Critical Facilities". We do not disagree with the intent; however, we disagree with the need to develop a definition. In general, definitions are applicable and valid within the context of the framework or document to which it applies. For example, a facility if removed from service may be critical for SOL, but not critical for IROL; a facility may be critical for SOL and IROL, but not critical for balancing control; a facility may be critical for SOL and IROL, but not for failing to have its faults cleared properly; a facility may be critical if its cyber access is invaded, but not for SOL or IROL, etc. There are at least several classes of facilities to which we can assign the term "critical", but they are applicable under different conditions: a. A facility is critical for protection system design if a fault not cleared properly can result in adverse impact on the interconnected system; b. A facility is critical for transmission system operation if its removal from service affects SOL and or IROL (requiring a reduction in the SOL or IROL); c. A facility is critical for balancing control if its unavailability or malfunction results in an inability to correct ACE or frequency excursion; d. A facility/device/component is critical if its unavailability or malfunction can result in a protection relay system not able to clear a fault, or initiate the intended corrective actions; e. A facility or asset is critical if cyber invasions or malicious acts can result in major interruptions to interconnected system control or reliability; To define the term "critical facilities" for SOL/IROL, even assuming it is doable for both limits, may not address the other situations listed above. Hence, there will likely need to be a series of defined terms for "critical facilities" for different applications, which is confusing and defeats the purpose of having a definition. Suggest the SAR proponent and/or the SAR DT to consider adopting an alternative approach to address the directive by putting the appropriate words in the affected standard requirements to stipulate the situational awareness requirements without defining the term, thereby addressing FERC's Directive to provide meaning to the term "critical facilities".
No
We do not agree with APPA's proposals, and agree with the need for a set of consistent continent-wide criteria as suggested by Entergy.
Yes
No
Refer to our comments submitted to Question 1.
The use of the phrase "could result in an SOL or IROL violation" is inappropriate. A facility that may be critical to a system's SOL/IROL when taken out of service may require a reduction in the SOL/IROL, but may not cause or result in the concerned system "violating" the SOL/IROL. There is an increasing trend to use the word "exceedance", since within the context of the IRO standards IROL may be temporarily exceeded, but there is no violation unless the magnitude of the exceedance is not corrected within Tv. With respect to what "critical facilities" (relating to R2) should be monitored in adjacent Reliability Coordinator Areas, we suggest the facilities whose status affect an RC area's IROL (or a TOP area's SOL) be put on the monitored list. This is the current approach in NPCC, and provides the triggering mechanism that an assessment be conducted to address the adverse impact of the facility's status on the IROL with adjustments applied as necessary. This list is also used in coordination of facility outage plans and schedules.

Yes
The SDT needs to be clear when defining the term Critical Facilities, so no confusion will arise between what constitutes Critical Facilities versus what constitutes Critical Assets. The deliniation should be that: a) Critical Assets require additional security, so that they will be available/functional whenever needed to operate the BES b)Critical Facilites require additional montioring, so that their availability will be known in case they are needed to mitigate an SOL/IROL violation. Critical Facilities should be defined to include only those assets whose failure could cause or contribute to SOL or IROL violation as stated in the current IRO-003-2 standard. This list of facilities should be considered dynamic as it will change based on the given system confiugration. For example, if a generator ramping up generation is the only operating procedure available to mitigate an IROL, then that generator should be considered a Critical Facility.
Facilities that are specified in an operating procedure that acts as the sole procedure available to mitigate an IROL violation should be monitored in adjacent RC Areas.
Individual
Dan Rochester
Independent Electricity System Operator
No
We agree with the need to develop measures for each requirement, but do not agree with defining the term "Critical Facilities" despite the FERC directive. The IESO is a member of the NPCC Region. The Region has long established a Critical Facility List for facilities which, if removed from service, may affect an adjacent system. In essence, NPCC has a list and the criteria and procedures in place to meet the intent of the FERC directive to enhance awareness not just local to a system but also on a wide-area perspective. We do not disagree with the intent; however, we disagree with the need to develop a definition. In general, definitions are applicable and valid within the context of the

framework or document to which it applies. For example, a facility if removed from service may be critical for SOL but not critical for IROL; a facility may be critical for SOL and IROL but not critical for balancing control; a facility may be critical for SOL and IROL but not for failing to have its faults cleared properly; a facility may be critical if its cyber access is invaded but not for SOL or IROL, etc. There are at least several classes of facilities to which we can assign the term "critical" but they are applicable under different conditions: a. A facility is critical for protection system design if a fault not cleared properly can result in adverse impact on the interconnected system; b. A facility is critical for transmission system operation if its removal from service affects SOL and or IROL (requiring a reduction in the SOL or IROL); c. A facility is critical for balancing control if its unavailability or malfunction results in the inability to correct ACE or frequency excursion; d. A facility/device/component is critical if its unavailability or malfunction can result in the protection relay system not able to clear a fault or initiate the intended corrective actions; e. A facility or asset is critical if cyber invasions or malicious acts can result in major interruptions to interconnected system control or reliability; To define the term Critical Facilities for SOL/IROL, even assuming it is doable for both limits, may not address the other situations listed above. Hence, there will likely need to be a series of defined terms for Critical Facilities for different applications, which is confusing and defeats the purpose of having a definition. We suggest the SAR proponent and/or the SAR DT to consider adopting an alternative approach to address the directive by putting the appropriate words in the affected standards to stipulate the situation awareness requirements without defining the term. For example, we suggest that the SDT consider including in the scope of the SAR revising Requirement R2 of IRO-003-2 to obviate the need for a definition of "critical facilities". In essence, the definition of "critical facilities" is already localized in the requirement as evidenced by the clause "whose failure, degradation or disconnection could result in an SOL or IROL violation." We offer two possible revisions to R2 are as follows: Each Reliability Coordinator shall know the current status of all BES facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives. OR Each Reliability Coordinator shall know the current status of all facilities it deems critical to BES reliability whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall also know the status of any facilities that may be required to assist area restoration objectives.

No

Notwithstanding our comment on the need to have a defined term, we do not agree with APPA's proposal. Within the context of SOL/IROL, since the intent of the directive is to enhance awareness to cover an area wider than a PC or RC or TOP area, chances are the wide-area view may span over more than one Regional Entity's footprint. Facilities that may be critical to system operation (SOL/IROL in this case) know no artificial regional boundary; their status and/or operation can affect systems in other REs' footprint. The industry is moving toward developing continent-wide reliability standards and SOL and IROL are terms used in NERC standards and applicable to all responsible entities across the continent. This together with FERC's intent to (a) eliminate fill-in-the-blank standards and (b) define BPS to remove the different approaches taken by individual REs in defining BES, we do not see the merit of adopting a regional approach to determining critical facilities.

Yes

Again, notwithstanding our comment on the need to develop a definition, facilities that can be critical to SOL/IROL may change depending on the system condition. In Ontario, the IESO develops a list of facilities that are critical for different operating areas. Facilities that are not included in the list are deemed non-critical. However, when a non-critical facility together with another facility, critical or otherwise, is out of service, the non-critical facility may become critical. There are other conditions under which a non-critical facility may become critical. The requirements to address this directive need to have the flexibility to address these situations.

No

Please see our comments under Q1 for the reason of our disagreement.

First of all, we want to point out that "could result in an SOL or IROL violation" is inappropriate. A facility that may be critical to a system's SOL/IROL when taken out of service may require a reduction in the SOL/IROL, but may not cause or result in the concerned system "violating" the SOL/IROL. Further, there is an increasing trend to use the word "exceedance" since within the context of the IRO standards, IROL may be temporarily exceeded but there is no violation unless the magnitude of the exceedance is not corrected within Tv. With respect to what 'critical facilities' (relating to R2) should

be monitored in adjacent Reliability Coordinator Areas, we suggest the facilities whose status affect an RC area's IROL (or a TOP area's SOL) be put on the monitored list. This is the current approach adopted in IESO (and NPCC in general), and provides the triggering mechanism that an assessment be conducted to address the adverse impact of the facility's status on the IROL with adjustments applied as necessary. This list is also used in coordination of facility outage plans and schedules.

We believe that the reliability standard should define the criteria, and the Reliability Coordinator should apply the criteria to determine "critical facilities".

Yes

Yes

With regards to what facilities should be monitored in adjacent RC Areas, strike the word "critical" in R2, because it's not needed and could cause confusion. Also need to strike SOL, and limit the requirement to facilities that could result in an IROL violation. If the RC is required to monitor everything in adjacent areas that "could result in an SOL violation", then the RC would be overwhelmed with far too much information. Each RC and TOP is monitoring its own SOLs, which is sufficient.

The phrase "critical facilities" creates potential confusion with the phrase "Critical Assets" which is used in the CIP standards. Monitoring for situational awareness is different from cyber protection; and we suggest using another term or phrase than "critical facilities".

Individual

Thad Ness

American Electric Power (AEP)

Yes

There should be consideration made to other references to "critical facilities" (i.e. PRC-023 and EOP-008). Should this SAR also consider those in scope? Will the definitions and criteria be the same or different?

No

AEP supports the idea of a widely available and transparent methodology, but we contend that this methodology is better developed at the Reliability Coordinators rather than NERC and the Regional Entities.

Yes

While we agree with the problem statement that conditions change necessitating updates to the list of critical facilities, we do caution that the list of "critical facilities" cannot be overly dynamic without any bounds.

Yes

Please see our comments to item number one above.

It may not be practical for each RC to monitor all adjacent "critical facility", but at a minimum they should be aware of and potentially monitor "critical facilities" at or near the border that could have an impact to IROL facilities.

Southern Company

Andy Tillery

Yes

No
We do not believe that it is possible to develop a "one size fits all" methodology.
Yes
No
We think that "critical facilities" are self evident within Requirement R2. The word "critical" is unnecessary in this context since the facilities in question are fully described in the parenthetical statement following the word "facilities". Any further definition seems likely to inadvertently limit the set of facilities intended to be covered by this requirement. It is our view that the SDT did not intend this requirement to connect with similar requirements in the Critical Infrastructure Protection standards and that 'critical facilities' is not intended to be the equivalent of Critical Asset We request that the SDT validate our view.
Each Reliability Coordinator (RC) should know the status of facilities in adjacent RC areas that impact its RC area.
Individual
Richard Kafka
Pepco Holdings, Inc.
Yes
Yes
It is appropriate for the SDT to consider this suggestion, but it seems more appropriate for PCs or RCs to determine critical facilities.
No
This is unnecessary. Any facility could become "critical" given enough real-time contingencies or outages.
Yes
It is reasonable to consider developing a definition. We suggest ALR be used for guidance.
RCs already are required to coordinate with each other.

MRO's NERC Standards Review Subcommittee
Carol Gerou
No
As stated in the Reliability Standards Development Procedure, "Measures are used to assess performance and outcomes for the purpose of determining compliance with the requirements ". Measures should give a Responsible Entity what types of proof of compliance that can be used, not the only types of proof of compliance that an entity can have as compliance proof. Please take this into consideration when adding measures. Do not agree with the suggestion of defining "critical asset", per se at the NERC level. As noted and stated in FERC Order 693, paragraph 914, FERC directs a criteria to define "critical facilities" and the best way is to define a "methodology" for the responsible entity to follow in determining critical facilities. Recommend that any definition for critical facilities not be included in CIP-002 through CIP-009. The methodology would only be used within this project only. The use of the word "critical" is confusing recommend replacing the word with "important", "vital", "crucial" or "essential" facility.
No
Do not agree with each Region establishing a methodology for defining what a "critical facility" is. There are too many MRRE's (Multiple Region Registered Entities) that would have to comply with up to 8 different Regions. The SDT should address this issue on behalf of NERC only. Through the NERC delegation agreements, Regions are to enforce NERC Standards through consistent enforcement, meaning each Region shall come to the same conclusion as the other, upon review of compliance

evidence. If there are 8 different methodologies, this will never be achieved.
No
System conditions should not play any part of what a "critical facility" is. Changing system conditions are related to section 215 of the Federal Power Act of 2005, where FERC defined the term "reliable operation" means operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements. FERC Order 693, paragraph 914 states in the last sentence that "the ERO should consider the suggestion of APPA, Entergy and Xcel". The NSRS believes the best way is for NERC to publish a methodology requirement within this Standard.
No
Entities should be allowed to determine what facilities are deemed to be critical to their system. As stated by the NERC President, "everything cannot be a priority" and by casting a wide net, a definition of critical facility may bring too many items that are not truthfully, critical to the reliability of the BES. Recommend that the SDT provide a methodology.
Please consider this rewrite. Each Reliability Coordinator shall know the current status of all critical facilities whose failure, degradation or disconnection could result in an SOL or IROL violation. Reliability Coordinators shall provide adjacent RC Areas with information that could lead to an IROL.

While we agree that the FERC directives need to be addressed, we are concerned that this SAR has the potential to go too far and that the directives may not even be fully understood given context of the entire order. For instance, FERC is very clear in paragraph 616 (included below) that adding measures are up to the discretion of NERC. Furthermore, within the SAR paragraph 913 from Order 693 clearly states that NERC has already met the directive for adding measures. "In response to APPA's concern that NERC did not provide a Measure for each Requirement, we reiterate that it is in the ERO's discretion whether each Requirement requires a corresponding Measure. The ERO should

consider this issue through the Reliability Standards development process." We also disagree with the need to create criteria for critical facilities. Rather than create criteria, we believe the drafting team should focus their efforts on the need for a definition. Establishing criteria will result in a prescriptive definition of critical facilities that does not allow flexibility for differences in the characteristics of various RC footprints. Furthermore, it is contrary to the results-based standards development efforts that have been approved by the NERC BOT.

No

We do not agree with APPA's suggestion. Each RC footprint is unique and a one-size all approach is not appropriate. Furthermore, APPA's proposal deviates from NERC's results-based standards efforts as it focuses on how to meet the goal of a requirement and not what needs to be accomplished. APPA's proposal also could create security risks to the Bulk Electric System. Critical facilities should be classified as CEII information and should not be publicly available in general. Thus, it would be questionable to establish a methodology that is too transparent such that the general public could then ascertain what is critical and what is not. This could inadvertently play right into the hands of those wishing to harm our nation.

No

We agree with Entergy regarding the need for flexibility but disagree with the need for a criteria identified in the standard. Including the criteria focuses the standard on how to accomplish reliability goals and moves the standard away from defining what the reliability goal is. Defining universal criteria is diametrically opposed with the need for flexibility.

No

We are not convinced that a definition is needed but do agree that the drafting team should explore the need for a definition. However, the drafting team needs to carefully consider the impact of the definition on other standards. For instance, EOP-008-0 R1.3 includes the term critical facilities and that standard may need to be modified to capitalize the term so that it references that definition. Then again, it may not need to be referenced. The bottom line is that the drafting team simply needs to consider these types of impacts and make appropriate adjustments in other standards as necessary.

Any facilities that could impact the IROL or SOL should be monitored. This would include facilities outside of the RC footprint. However, we caution the drafting team in allowing a RC to define critical facilities in another RC's footprint. Doing this could result in conflicting critical facilities lists. For example, RC A may identify a facility in the RC B footprint that impacts one of its IROLs and call it critical. That same facility in RC B's footprint may not impact any IROLs and SOLs within its own footprint. Thus, RC B deems it not critical. This situation should be avoided.

IRC Standards Review Committee

Ben Li

Yes

We agree with the general scope of the SAR to address the FERC directives, and to consider the specific industry comments mentioned in the Order. However, we are concerned that this SAR has the potential to go too far and that the directives may not be fully understood given context of the entire order. For instance, FERC is very clear in paragraph 616 (included below) that adding measures are up to the discretion of NERC. Furthermore, within the SAR paragraph 913 from Order 693 clearly states that NERC has already met the directive for adding measures. "In response to APPA's concern that NERC did not provide a Measure for each Requirement, we reiterate that it is in the ERO's discretion whether each Requirement requires a corresponding Measure. The ERO should consider this issue through the Reliability Standards development process." We also disagree with the need to create criteria to define the term "critical facilities", and the preconceived notion that this terms needs to be defined to address the FERC directives. Establishing criteria may result in a prescriptive definition of critical facilities that does not allow flexibility for differences in the characteristics of various RC footprints. Furthermore, it is contrary to the results-based standards development efforts that have been approved by the NERC BOT.

No

We do not agree with APPA's suggestion. Each RC footprint is unique and a one-size all approach is

not appropriate. Furthermore, APPA's proposal deviates from NERC's results-based standards concept as the proposal focuses on how to meet the goal of a requirement and not what needs to be accomplished. Further, the industry is moving toward developing continent-wide reliability standards, and SOL and IROL are terms used in NERC standards and are applicable to all responsible entities across the continent. This together with FERC's intent to (a) eliminate fill-in-the-blank standards and (b) define BPS to remove the different approaches taken by individual REs in defining BES, we do not see the merit of adopting a regional approach to determining critical facilities.

No

We agree with Entergy regarding the need for flexibility but disagree with the need for identifying criteria in the standard. Including the criteria focuses the standard on how to accomplish reliability goals and moves the standard away from defining what the reliability goal is. Defining universal criteria is diametrically opposed with the need for flexibility.

No

We disagree with the need to develop a definition. In general, definitions are applicable and valid within the context of the framework or document to which it applies. For example, a facility if removed from service may be critical for SOL but not critical for IROL; a facility may be critical for SOL and IROL but not critical for balancing control; a facility may be critical for SOL and IROL but not for failing to have its faults cleared properly; a facility may be critical if its cyber access is invaded but not for SOL or IROL, etc. There are at least several classes of facilities to which we can assign the term "critical" but they are applicable under different conditions: a. A facility is critical for protection system design if a fault not cleared properly can result in adverse impact on the interconnected system; b. A facility is critical for transmission system operation if its removal from service affects SOL and or IROL (requiring a reduction in the SOL or IROL); c. A facility is critical for balancing control if its unavailability or malfunction results in the inability to correct ACE or frequency excursion; d. A facility/device/component is critical if its unavailability or malfunction can result in the protection relay system not able to clear a fault or initiate the intended corrective actions; e. A facility or asset is critical if cyber invasions or malicious acts can result in major interruptions to interconnected system control or reliability; To define the term Critical Facilities for SOL/IROL, even assuming it is doable for both limits, may not address the other situations listed above. Hence, there will likely need to be a series of defined terms for Critical Facilities for different applications, which is confusing and defeats the purpose of having a definition. We suggest the SAR proponent and/or the SAR DT to consider adopting an alternative approach to address the directive by putting the appropriate words in the affected standards to stipulate the situation awareness requirements without defining the term.

First of all, we want to point out that "could result in an SOL or IROL violation" may be inappropriate. A facility that may be critical to a system's SOL/IROL when taken out of service may require a reduction in the SOL/IROL, but may not cause or result in the concerned system "violating" the SOL/IROL. Further, there is an increasing trend to use the word "exceedance" since within the context of the IRO standards, IROL may be temporarily exceeded but there is no violation unless the magnitude of the exceedance is not corrected within Tv. We agree that facilities in adjacent RC areas which can impact IROLs and/or SOLs in another RC area should be monitored. However, we suggest cautions be exercised in developing standard language that would allow an RC to specify critical facilities in another RC's footprint. Doing this can result in conflicting critical facilities lists. For example, RC A may identify a facility in the RC B footprint that impacts one of its IROLs and call it critical. That same facility in RC B's footprint may not impact any IROLs and SOLs within its own footprint. Thus, RC B deems it not critical. This situation should be avoided. Caution should also be exercised to not overly expand the footprint of an RC. An RC should be able to see the portion of a neighboring RC footprint that has the potential to impact its footprint, although restricting it to only SOL/IROL exceedances/violations may not be sufficient. Likewise an RC needs to be able to see, including analyze, a portion of a neighboring RC footprint to ensure that what it does in its footprint doesn't adversely impact the neighboring RC footprint.

We are not convinced that a definition is needed. The drafting team needs to carefully consider the impact of the definition on other standards. For instance, EOP-008-0 R1.3 includes the term critical facilities and that standard may need to be modified to capitalize the term so that it references that definition. ATC has some additional concerns with the delay on the existing work. We believe that the SDT should not address this issue but focus on its original purpose and goal.

ATC believes that this is an impossible situation to demonstrate compliance. We believe that this effort should be dropped and that the team should focus on its original SAR. No entity should be expected to show on a facility by facility bases (external to its footprint) why it has or has not been included in their model. An entity could be prevented from doing anything if because they will have to show why they included some facilities but also why other facilities were not included. In addition, in a compliance audit if the auditor disagreed with the justification they could still be potentially found non-compliant over a disagreement of the exclusion of a facility. Lastly, even if a entity could do this one time the constant addition or changes in system configuration would make continual justification of facility inclusion could be costly.

ATC believes that this SAR should not be given to this team because it will delay the work of the team.

Western Electricity Coordinating Council

Linda Perez

Yes

We agree that measures should be associated with requirements. The criteria should be flexible but be comprehensive enough to include any facilities that have the potential to impact the BES. Further we suggest that the criteria need to be well defined and consider the likely adverse impact to the BES.

Yes

Our understanding of APPA's comment is that NERC and the RE will make transparent their methodology, make available the data types they used and make available the procedure each registered entity would use to determine their critical facilities. However if APPA's comment means that NERC and the RE will create the critical facilities list, we do not agree.

Yes

We understand and agree that as system conditions change a given facility may become critical and elevated to the critical facility list, but this would be difficult to manage and communicate in real time.

Yes

This is dependent on your ties with the adjacent RC. For example, the Western Interconnection only has DC ties with other RC's.

This may be related to the work that the CSO 706 SDT CIP 002-4 has done on creating a list of criteria for critical assets.

Group

Kansas City Power & Light

Jim Useldinger

Yes

Recommend not using the term "critical facilities" as that may cause confusion with the CIP Standards and "critical assets" and the FAC-003 Standard and "facilities deemed as critical" in the applicability section of FAC-003. Do not want to any designation here to reflect on the facilities identified by other Standards for their specific purposes.

Yes

No

Although it is true that changing operating conditions can result in increasing the importance for transmission facilities, it is not necessary to attempt to classify facilities as critical on a dynamic basis. Alarm processing, processes for establishing flowgates, and contingency analysis applications are sufficient in alerting System Operators to operating conditions that are unfavorable and require mitigating Operator action.

Yes

No other comments.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RCSDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 3, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT began working on revisions to the standards in August 2007. The current posting contains revisions based on stakeholder comments on the second draft. The team is posting for a 30 day pre-ballot review.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on third posting	March 2010
2. Post Standards for pre-ballot period.	January 2011
3. Standards posted for initial and recirculation ballots.	February 2011
4. Standards sent to BOT for approval.	April 2011
5. Standards filed with regulatory authorities.	June 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

The RC SDT proposes modifying the following approved definition:

Adverse Reliability Impact: The impact of an event that results in Bulk Electric System instability or Cascading.

Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency.

This defined term is contained in draft COM-002-2 and IRO-001-2.

As a reference, we have included the existing definition of Emergency:

Emergency: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.

A. Introduction

- 1. Title:** Reliability Coordination – Responsibilities and Authorities
- 2. Number:** IRO-001-2
- 3. Purpose:** To establish the capability and authority of Reliability Coordinators to direct other entities to prevent Adverse Reliability Impacts to the Bulk Electric System.
- 4. Applicability**
 - 4.1.** Reliability Coordinators.
 - 4.2.** Transmission Operators.
 - 4.3.** Balancing Authorities.
 - 4.4.** Generator Operators.
 - 4.5.** Interchange Coordinators.
 - 4.6.** Distribution Providers.
 - 4.7.** Electric Reliability Organization.
- 5. Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

B. Requirements

- R1.** The Electric Reliability Organization ~~Each Regional Reliability Organization, subregion, or interregional coordinating group shall establish~~ certify at least one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within each region and across the regional boundaries. *[Violation Risk Factor: High][Time Horizon: Operations Assessment]*
- R2.** Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. *[Violation Risk Factor: High][Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*
- R3.** Each Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall comply with its Reliability Coordinator’s direction per Requirement R2 unless the direction per Requirement R2 can not be implemented or such actions would violate safety, equipment, regulatory or statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*
- R4.** Each Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall inform its Reliability Coordinator upon recognition of its inability to perform as directed per Requirement R3. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*
- R5.** ~~Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall notify all impacted~~

~~Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]~~

- ~~R6. Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the problem has been mitigated. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]~~
- ~~R7. Each Reliability Coordinator shall provide its System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]~~
- ~~R8. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]~~

Comment [SC1]: These two requirements and associated measures and VSLs are moved to IRO-005-4

Comment [SC2]: These requirements and associated measures and VSLs are moved to IRO-002-2

C. Measures

- M1.** The Electric reliability Organization shall have and provide evidence which may include, but is not limited to, dated documentation indicating that it certified **at least** one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within the region and across the regional boundaries.
- M2.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time stamped voice recordings or dated transcripts of voice recordings, or equivalent documentation, that will be used to determine that it has taken action or directed action, which could have included issuing Reliability Directive(s), to prevent identified events or mitigate the magnitude or duration of actual events that caused Adverse Reliability Impacts within its Reliability Coordinator Area. (R1)
- M3.** Each Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it complied with its Reliability Coordinator's direction(s) per Requirement R1 unless the direction per Requirement R1 could not be implemented or such actions would have violated safety, equipment, regulatory or statutory requirements. In such cases, the Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider shall have and provide copies of the safety, equipment, regulatory or statutory requirements as evidence for not complying with the Reliability Coordinator's direction. (R2)
- M4.** Each Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it informed the Reliability Coordinator of its inability to perform as directed per Requirement R1. (R3)
- M5.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified

~~all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when it identified a real or potential condition with Adverse Reliability Impacts, within its Reliability Coordinator Area. (R4)~~

~~M6. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when a real or potential condition with Adverse Reliability Impacts within its Reliability Coordinator Area had been mitigated. (R5)~~

~~M7. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operator with the authority to approve, deny or cancel planned outages of its own analysis tools. (R6)~~

~~M8. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that that the Reliability Coordinator has procedures in place to mitigate the effects of analysis tool outages. (R7)~~

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, Distribution Provider, or Interchange Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Electric reliability Organization shall retain its evidence for 5 years for Requirement R1 and Measure M1.
- The Reliability Coordinator shall retain its evidence for the most recent 90 days for voice recordings or 12 months for documentation for Requirement R2 and Measure M2.
- The Transmission Operator, Balancing Authority, Generator Operator, Distribution Provider or Interchange Coordinator shall retain its evidence for the

most recent 90 days for voice recordings or 12 months for documentation for Requirements R3 and R4, Measures M3 and M4.

- ~~o The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R6 and R7 and Measures M6 and M7.~~
- o If a Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, Distribution Provider or Interchange Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- o The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Regional Entity failed to ensure that at least one Reliability Coordinator was certified in its region.
R2	N/A	N/A	N/A	The Reliability Coordinator failed to take action or direct actions, which could have included issuing Reliability Directive(s), for actions to be taken to prevent identified events that resulted in Adverse Reliability Impacts. OR The Reliability Coordinator failed to take action or direct actions, which could have included issuing Reliability Directive(s), for actions to be taken to mitigate the magnitude or duration of actual events that resulted in Adverse Reliability Impacts.
R3	N/A	N/A	N/A	The responsible entity did not comply with the Reliability Coordinator's direction per Requirement R1.
R4	N/A	N/A	N/A	The responsible entity failed to inform its Reliability Coordinator upon recognition of the inability to perform as directed per Requirement R1.

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1	April 4, 2007	Approved by FERC — Effective Date	New
2	TBD	Revised per SAR for project 2006-6, reliability Coordination; added VRFs and VSLs as approved from VRF and VSL projects	Revised

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RCSDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.

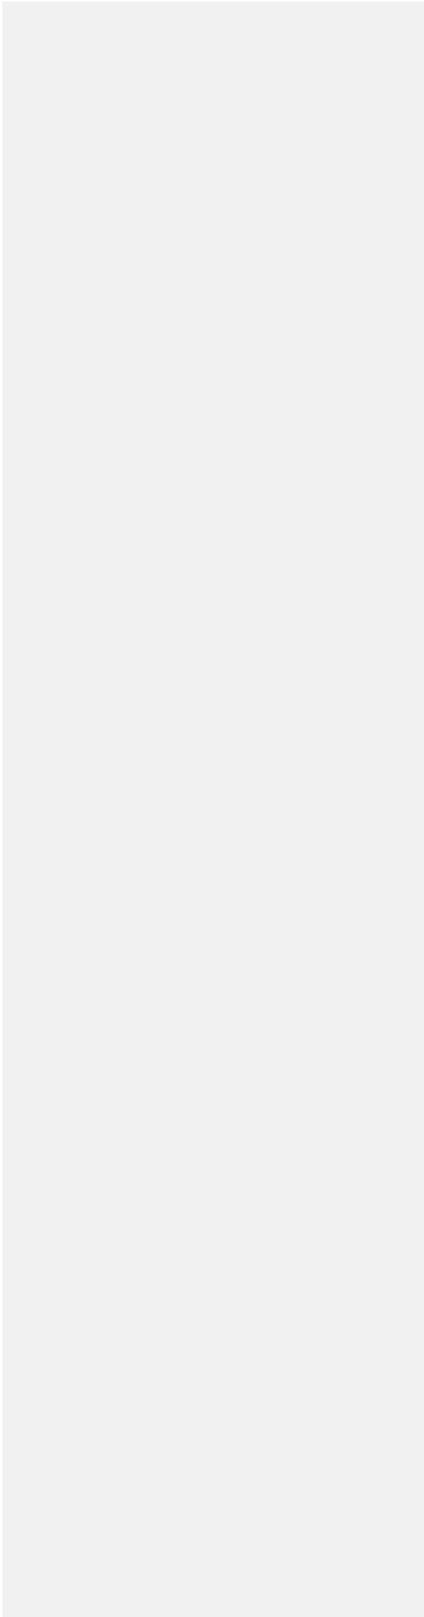

10. Third posting of revised standards on January 4, 2010 with comment period closed on February 3, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT began working on revisions to the standards in August 2007. The current posting contains revisions based on stakeholder comments on the second draft. The team is ~~seeking comments on the revised standards~~ posting for a 30 day pre-ballot review.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on third posting	March 2010
2. Post Standards for pre-ballot period.	April 2010 <u>January 2011</u>
3. Standards posted for initial and recirculation ballots.	May 2010 <u>February 2011</u>
4. Standards sent to BOT for approval.	July 2010 <u>April 2011</u>
5. Standards filed with regulatory authorities.	September 2010 <u>June 2011</u>

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

The RC SDT proposes modifying the following approved definition:

Adverse Reliability Impact: The impact of an event that results in Bulk Electric System instability; ~~uncontrolled separation~~ or Cascading.

Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an ~~actual or expected~~ Emergency.

This defined term is contained in draft COM-002-2 and IRO-001-2.

As a reference, we have included the existing definition of Emergency:

Emergency: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.

A. Introduction

1. **Title:** Reliability Coordination – Responsibilities and Authorities
2. **Number:** IRO-001-2
3. **Purpose:** To establish ~~requirements for issuance~~ the capability and authority of and compliance with Reliability Coordinator Coordinators to direct other entities to prevent Adverse Reliability Directives or notification within the Reliability Coordinator Areas Impacts to the Bulk Electric System.
4. **Applicability**
 - 4.1. Reliability Coordinators.
 - 4.2. Transmission Operators.
 - 4.3. Balancing Authorities.
 - 4.4. Generator Operators.
 - ~~4.5. Transmission Service Providers.~~
 - ~~4.6. Load Serving Entities.~~
 - 4.5. Interchange Coordinators.
 - ~~4.7.4.6.~~ Distribution Providers.
 - ~~4.8. Purchasing Selling Entities.~~
 - 4.7. Electric Reliability Organization.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

B. Requirements

- R1. The Electric Reliability Organization Each Regional Reliability Organization, subregion, or interregional coordinating group shall establish certify at least one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within each region and across the regional boundaries. [Violation Risk Factor: High][Time Horizon: Operations Assessment]
- ~~R1.~~R2. Each Reliability Coordinator shall ~~act or issue~~ take actions or direct actions, which could include issuing Reliability Directives for actions to be taken by, of Transmission Operators, Balancing Authorities, Generator Operators, ~~Transmission Service Providers, Load Serving Entities, Interchange Coordinators and~~ Distribution Providers ~~and Purchasing Selling Entities~~ within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. *[Violation Risk Factor: High][Time Horizon: Real-time Operations ~~and~~, Same Day Operations and Operations Planning]*
- ~~R2.~~R3. Each Transmission Operator, Balancing Authority, Generator Operator, ~~Transmission Service Provider, Load Serving Entity, Interchange Coordinator and~~ Distribution Provider, ~~and Purchasing Selling Entity~~ shall comply with its Reliability Coordinator's Reliability Directives direction per Requirement R2 unless the direction per Requirement R2 can not be implemented or such actions would violate safety, equipment, ~~or~~ regulatory or

statutory requirements. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations and Same Day Operations and Operations Planning]*

~~R3,R4.~~ Each Transmission Operator, Balancing Authority, Generator Operator, ~~Transmission Service Provider, Load Serving Entity, Interchange Coordinator and~~ Distribution Provider, ~~and Purchasing Selling Entity~~ shall inform its Reliability Coordinator upon recognition of its inability to perform ~~an issued Reliability Directive as directed per Requirement R3.~~ *[Violation Risk Factor: High] [Time Horizon: Real-time Operations and Same Day Operations and Operations Planning]*

~~R4,R5.~~ Each Reliability Coordinator that identifies an expected or actual ~~threatecondition~~ with Adverse Reliability Impacts, within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

~~R5,R6.~~ Each Reliability Coordinator that identifies an expected or actual ~~threatecondition~~ with Adverse Reliability Impacts, within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the ~~transmission~~ problem has been mitigated. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

~~R6,R7.~~ Each Reliability Coordinator shall provide its ~~Operating Personnel System Operators~~ with the authority to ~~veto approve, deny or cancel~~ planned outages ~~toof~~ its own analysis tools. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

~~R8.~~ Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

Comment [SC1]: These two requirements and associated measures and VSLs are moved to IRO-005-4

Comment [SC2]: These requirements and associated measures and VSLs are moved to IRO-002-2

C. Measures

~~M1.~~ The Electric reliability Organization shall have and provide evidence which may include, but is not limited to, dated documentation indicating that it certified at least one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within the region and across the regional boundaries.

~~M1-M2.~~ Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time stamped voice recordings or dated transcripts of voice recordings, ~~electronic communications,~~ or equivalent documentation, that will be used to determine that it has ~~acted, or issued~~ taken action or directed action, which could have included issuing Reliability Directive(s), to prevent identified events or mitigate the magnitude or duration of actual events that caused Adverse Reliability Impacts within its Reliability Coordinator Area. (R1)

~~M2-M3.~~ Each Transmission Operator, Balancing Authority, Generator Operator, ~~Transmission Service Provider, Load Serving Entity, Interchange Coordinator and~~ Distribution Provider ~~and Purchasing Selling Entity~~ shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it complied with its Reliability Coordinator's ~~Reliability Directive direction(s) per Requirement R1 unless the direction per Requirement R1 could not be implemented or~~ such actions would have violated safety,

equipment, ~~or~~ regulatory or statutory requirements. In such cases, the Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider shall have and provide copies of the safety, equipment, regulatory or statutory requirements as evidence for not complying with the Reliability Coordinator's direction. (R2)

~~M3.~~M4. Each Transmission Operator, Balancing Authority, Generator Operator, ~~Transmission Service Provider, Load Serving Entity, Interchange Coordinator and Distribution Provider or Purchasing-Selling Entity~~ shall have and provide evidence which may include, but is not limited to dated operator logs, dated records, dated and time stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it ~~that it~~ informed the Reliability Coordinator of its inability to ~~comply with its Reliability Coordinator's issued Reliability Directive(s)~~ perform as directed per Requirement R1. (R3)

~~M4.~~M5. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when it identified a real or potential ~~threatecondition~~ with Adverse Reliability Impacts, within its Reliability Coordinator Area. (R4)

~~M5.~~M6. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when a real or potential ~~threatecondition~~ with Adverse Reliability Impacts within its Reliability Coordinator Area had been mitigated. (R5)

~~M6.~~M7. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its ~~Operating Personnel~~System Operator with the authority to ~~vetoapprove, deny or cancel~~ planned outages of its own analysis tools. (R6)

M8. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that that the Reliability Coordinator has procedures in place to mitigate the effects of analysis tool outages. (R7)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, Distribution Provider, ~~Transmission Service Provider, Purchasing-Selling Entity or Load-Serving Entity or Interchange Coordinator~~ shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Electric reliability Organization shall retain its evidence for 5 years for Requirement R1 and Measure M1.
- The Reliability Coordinator shall retain its evidence for the most recent 90 days for voice recordings or 12 months for documentation for Requirement R2 and Measure M2.
- The Transmission Operator, Balancing Authority, Generator Operator, Distribution Provider, ~~Transmission Service Provider, Purchasing-Selling Entity or Load-Serving Entity or Interchange Coordinator~~ shall retain its evidence for the most recent 90 days for voice recordings or 12 months for documentation for Requirements R3 and R4, Measures M3 and M4.
- ~~The Reliability Coordinator shall retain its current, in force document and any documents in force since for the last compliance audit for applicable current year and previous calendar year for Requirements R6 and R7 and Measures M6 and M7.~~
- If a Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, Distribution Provider, ~~Transmission Service Provider, Purchasing-Selling Entity or Load-Serving Entity or Interchange Coordinator~~ is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	The Reliability Coordinator failed to act or issue Reliability Directive(s) for actions to be taken to prevent Adverse Reliability Impacts. <u>N/A</u>	The Regional Entity failed to ensure that at least one Reliability Coordinator failed to act or issue Reliability Directive(s) for actions to be taken to mitigate the magnitude or duration of Adverse Reliability Impacts was certified in its region.
R2	N/A	N/A	N/A	The responsible entity did not follow the Reliability Coordinator's Reliability Directive.
R3	N/A	N/A	N/A	The responsible entity failed to inform its Reliability Coordinator upon recognition of the inability to perform the issued Reliability Directive.
R4/R2	The Reliability Coordinator who identified an expected or actual threat with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to one, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. <u>N/A</u>	The Reliability Coordinator who identified an expected or actual threat with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to two, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. <u>N/A</u>	The Reliability Coordinator who identified an expected or actual threat with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to three, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. <u>N/A</u>	The Reliability Coordinator who failed to take action or direct actions, which could have included issuing Reliability Directive(s), for actions to be taken to prevent identified an expected or actual threat with events that resulted in Adverse Reliability Impacts within its. <u>OR</u> The Reliability Coordinator Area failed to issue an alert to any or more than three impacted Transmission Operators and

Implementation Plan for IRO-001-2 - Reliability Coordination — Responsibilities and Authorities

Revisions to Defined Terms in the NERC Glossary

The RC SDT proposes modifying the following approved definition:

Adverse Reliability Impact — The impact of an event that results in Bulk Electric System instability or Cascading-

The RC SDT proposes the following new definition:

Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency.

Prerequisite Approvals

- None

Conforming Changes to Requirements in Already Approved Standards

Revision Summary

- The RC SDT revised the standard and is proposing retiring several requirements (R2, R4, R5, R6, R7 and R10). Changes were made to eliminate redundancies between standards (existing and proposed), to align with NERC's Rules of Procedure and to address issues in FERC Order 693.

Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R1. Each Regional Reliability Organization, subregion, or interregional coordinating group shall establish one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within the region and across the regional boundaries. <i>[Violation Risk Factor: High]</i></p>	<p>R1. The Electric Reliability Organization shall certify at least one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within each region and across the regional boundaries. [Violation Risk Factor: High][Time Horizon: Operations Assessment]</p>
<p>Notes:</p> <p>After discussion with NERC legal staff, the above requirement was proposed as a revision to existing R1.</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R2. The Reliability Coordinator shall comply with a regional reliability plan approved by the NERC Operating Committee. <i>[Violation Risk Factor: High]</i></p> <p>R5. The Reliability Coordinator shall list within its reliability plan all entities to which the Reliability Coordinator has delegated required tasks. <i>[Violation Risk Factor: Lower]</i></p>	<p>None – The RC SDT proposes retiring these requirements.</p>
<p>Notes: The RC SDT proposes retiring R2 and R5 as the regional reliability plan is a “how” document that shows how an RC will comply with all other NERC Standards, making this requirement redundant.</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R3. The Reliability Coordinator shall <i>have clear decision-making authority to act and</i> direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities and Purchasing-Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. <i>These actions shall be taken without delay, but no longer than 30 minutes. [Violation Risk Factor: High]</i></p>	<p>IRO-001-2</p> <p>R2. Each Reliability Coordinator shall take actions or direct actions , which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, <i>Distribution Providers</i> and Purchasing-Selling Entities within its Reliability Coordinator Area to <i>prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. [Violation Risk Factor: High][Time Horizon: Real-time Operations and Same Day Operations]</i></p>
<p>Notes:</p> <ul style="list-style-type: none"> • The RC SDT is proposing to remove the blue text in the first sentence. • The RC SDT is proposing that the last sentence of R3 be retired. The timing of RC response to events varies based on system conditions. The specific timing criteria for responses to IROLs are contained in other standards (e.g., TOP-007, R2). ▪ The Distribution Provider was added as an applicable entity per FERC Order 693. 	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R4. Reliability Coordinators that delegate tasks to other entities shall have formal operating agreements with each entity to which tasks are delegated. The Reliability Coordinator shall verify that all delegated tasks are understood, communicated, and addressed within its Reliability Coordinator Area. All responsibilities for complying with NERC and regional standards applicable to Reliability Coordinators shall remain with the Reliability Coordinator. <i>[Violation Risk Factor: Medium]</i></p>	<p>None – retire the requirement</p> <p>RC SDT proposes that original IRO-001-1, R4 is redundant with NERC Rules of Procedure, section 500 and should be retired from the standard. Section 501 states:</p> <p>“The purpose of the compliance registry will be to clearly identify those entities that are responsible for compliance with reliability standards. Organizations listed on the registry will be responsible for knowing the content of and for complying with the NERC reliability standards.”</p> <p>Also, section 507, item 2 addresses written agreements; Joint registration pursuant to written agreement.</p> <p>“Where a JRO and any of its members or related entities agree, in writing, upon a division of compliance responsibility among them for one or more reliability standard(s) applicable to a particular function, and/or for one or more requirements within particular reliability standard(s), both the JRO and such member(s) or related entit(ies) shall register as an organization responsible for that function. The JRO and its member(s) or related entit(ies) must have a written agreement that clearly specifies their respective responsibilities, which shall be submitted as part of the joint registration. Neither NERC nor the regional entity shall be parties to any such agreement between a JRO and its member or related entit(ies), nor shall NERC or the regional entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the joint registration.”</p>
<p>Notes: The RC SDT recommends the retirement of IRO-001-1 R4.</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R6. The Reliability Coordinator shall verify that all delegated tasks are carried out by NERC-certified Reliability Coordinator operating personnel. <i>[Violation Risk Factor: Medium]</i></p>	<p>None – retire requirement because it is redundant with:</p> <p>PER-003-0</p> <p>R1. Each Transmission Operator, Balancing Authority, and Reliability Coordinator shall staff all operating positions that meet both of the following criteria with personnel that are NERC certified for the applicable functions:</p> <p>R1.1. Positions that have the primary responsibility, either directly or through communications with others, for the real-time operation of the interconnected Bulk Electric System.</p> <p>R1.2. Positions directly responsible for complying with NERC standards.</p>
<p>Notes: The RC SDT recommends retiring IRO-001-1 R6 as it is redundant with PER-003-0 R1.</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R7. The Reliability Coordinator shall have clear, comprehensive coordination agreements with adjacent Reliability Coordinators to ensure that System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) violation mitigation requiring actions in adjacent Reliability Coordinator Areas are coordinated. <i>[Violation Risk Factor: High]</i></p>	<p>None – requirement should be retired because it is redundant with:</p> <p>IRO-014-1</p> <p>R1. For conditions or activities that impact other Reliability Coordinator Areas, each Reliability Coordinator shall have Operating Procedures, Processes, or Plans for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: .</p>
<p>Notes: The RC SDT recommends the retirement of IRO-001-1 R7 as this is redundant with IRO-014-1 R1.</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R8: Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall comply with Reliability Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances, the Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, or Purchasing-Selling Entity shall immediately inform the Reliability Coordinator of the inability to perform the directive so that the Reliability Coordinator may implement alternate remedial actions. <i>[Violation Risk Factor: High]</i></p>	<p>IRO-001-2</p> <p>R3. Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity shall comply with its Reliability Coordinator’s direction per Requirement R2 unless the direction per Requirement R2 can not be implemented or such actions would violate safety, equipment, or regulatory or statutory requirements. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations]</i></p> <p>R4. Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider and Purchasing-Selling Entity shall inform its Reliability Coordinator upon recognition of its inability to perform as directed per Requirement R2. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations]</i></p>
<p>Notes: The RC SDT added the Distribution Provider per FERC Order 693 and added the blue text shown in the requirements above. The RC SDT proposes the replacement of IRO-001-1, R8 with two requirements IRO-001-2, R3, and R4. This will add clarity and measurability to the standard. The last part of the second sentence should be removed as it is implicit in R1, which states that the Reliability Coordination will act or direct actions to mitigate issues. Stakeholders indicated issues with the ability to measure compliance with the phrase, “without intentional delay” and this was removed.</p> <p>Relating to First Energy’s comment in FERC Order 693, the requirements address both personnel safety and equipment. There is no reference to a chain of command in the requirements. The standard is written such that decision-making authority rests with the Reliability Coordinator. No further revisions to the standard are required.</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R9. The Reliability Coordinator shall act in the interests of reliability for the overall Reliability Coordinator Area and the Interconnection before the interests of any other entity. <i>[Violation Risk Factor: High]</i></p>	<p>None – retire the requirement as redundant.</p>
<p>Notes: The RC SDT proposes retiring this requirement. All Reliability Coordinator Standard Requirements are developed so that the Reliability Coordinator shall act in the interest of reliability for the RC Area and the Interconnection. Section 6 of the NERC Standard Development Procedure states that NERC develops and maintains Reliability Standards. Equity issues are covered under the Reliability Coordinator Standards of Conduct.</p>	

Functions that Must Comply with the Requirements in the Standards

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Distribution Provider	Transmission Operator	Transmission Service Provider	Purchasing Selling Entity	Generator Operator	Load Serving Entity
IRO-001-2	X	X	X	X	X	X	X	X

Effective Dates

In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

Implementation Plan for IRO-001-2 Reliability Coordination — Responsibilities and Authorities

Implementation Plan for IRO-001-2 - Reliability Coordination — Responsibilities and Authorities

Revisions to Defined Terms in the NERC Glossary

The RC SDT proposes modifying the following approved definition:

Adverse Reliability Impact — The impact of an event that results in Bulk Electric System frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation; or Cascading outages, that affects a widespread area of the Intereconnection.

The RC SDT proposes the following new definition:

Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency.

Prerequisite Approvals

- None

Conforming Changes to Requirements in Already Approved Standards

- IRO-005, R15 is being incorporated into IRO-001-2.

Revision Summary

- The RC SDT revised the standard and is proposing retiring several requirements (~~R1~~, R2, R4, R5, R6, R7 and R10). Changes were made to eliminate redundancies between standards (existing and proposed), to align with NERCs Rules of Procedure and to address issues in FERC Order 693.

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R1. Each Regional Reliability Organization, subregion, or interregional coordinating group shall establish one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within the region and across the regional boundaries. <i>[Violation Risk Factor: High]</i></p>	<p>R1. <u>The Electric Reliability Organization shall certify at least one or more Reliability Coordinators to continuously assess transmission reliability and coordinate emergency operations among the operating entities within each region and across the regional boundaries. [Violation Risk Factor: High][Time Horizon: Operations Assessment]</u></p> <p>None — The RC-SDT proposes retiring this requirement.</p>
<p>Notes:</p> <p><u>After discussion with NERC legal staff, the above requirement was proposed as a revision to existing R1. The RC-SDT proposes that original IRO-001-1, R1 should be retired from the standard and addressed in NERC Rules of Procedure, Section 503, item 2.2: "Regional entities shall verify that all balancing authorities and transmission operators are under the responsibility of a reliability coordinator".</u></p>	

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R2. The Reliability Coordinator shall comply with a regional reliability plan approved by the NERC Operating Committee. <i>[Violation Risk Factor: High]</i></p> <p>R5. The Reliability Coordinator shall list within its reliability plan all entities to which the Reliability Coordinator has delegated required tasks. <i>[Violation Risk Factor: Lower]</i></p>	<p>None – The RC SDT proposes retiring these requirements.</p>
<p>Notes: The RC SDT proposes retiring R2 and R5 as the regional reliability plan is a “how” document that shows how an RC will comply with all other NERC Standards, making this requirement redundant.</p>	

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R3. The Reliability Coordinator shall have clear decision-making authority to act and direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities and Purchasing-Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. These actions shall be taken without delay, but no longer than 30 minutes. [Violation Risk Factor: High]</p>	<p>IRO-001-2</p> <p>R21. The Each Reliability Coordinator shall take actions or direct actions , which could include or issuing Reliability Directives, of direct actions t Formatted: Font color: Red, Strikethrough Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. [Violation Risk Factor: High][Time Horizon: Real-time Operations and Same Day Operations]</p>
<p>Notes:</p> <ul style="list-style-type: none"> • The RC SDT is proposing to remove the blue text in the first sentence. • The RC SDT is proposing that the last sentence of R3 be retired. The timing of RC response to events varies based on system conditions. The specific timing criteria for responses to IROs are contained in other standards (e.g., TOP-007, R2). ▪ The Distribution Provider was added as an applicable entity per FERC Order 693. 	

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R4. Reliability Coordinators that delegate tasks to other entities shall have formal operating agreements with each entity to which tasks are delegated. The Reliability Coordinator shall verify that all delegated tasks are understood, communicated, and addressed within its Reliability Coordinator Area. All responsibilities for complying with NERC and regional standards applicable to Reliability Coordinators shall remain with the Reliability Coordinator. <i>[Violation Risk Factor: Medium]</i></p>	<p>None – retire the requirement</p> <p>RC SDT proposes that original IRO-001-1, R4 is redundant with NERC Rules of Procedure, section 500 and should be retired from the standard. Section 501 states:</p> <p>“The purpose of the compliance registry will be to clearly identify those entities that are responsible for compliance with reliability standards. Organizations listed on the registry will be responsible for knowing the content of and for complying with the NERC reliability standards.”</p> <p>Also, section 507, item 2 addresses written agreements; Joint registration pursuant to written agreement.</p> <p>“Where a JRO and any of its members or related entities agree, in writing, upon a division of compliance responsibility among them for one or more reliability standard(s) applicable to a particular function, and/or for one or more requirements within particular reliability standard(s), both the JRO and such member(s) or related entit(ies) shall register as an organization responsible for that function. The JRO and its member(s) or related entit(ies) must have a written agreement that clearly specifies their respective responsibilities, which shall be submitted as part of the joint registration. Neither NERC nor the regional entity shall be parties to any such agreement between a JRO and its member or related entit(ies), nor shall NERC or the regional entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the joint registration.”</p>
<p>Notes: The RC SDT recommends the retirement of IRO-001-1 R4.</p>	

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R6. The Reliability Coordinator shall verify that all delegated tasks are carried out by NERC-certified Reliability Coordinator operating personnel. <i>[Violation Risk Factor: Medium]</i></p>	<p>None – retire requirement because it is redundant with:</p> <p>PER-003-0</p> <p>R1. Each Transmission Operator, Balancing Authority, and Reliability Coordinator shall staff all operating positions that meet both of the following criteria with personnel that are NERC certified for the applicable functions:</p> <p>R1.1. Positions that have the primary responsibility, either directly or through communications with others, for the real-time operation of the interconnected Bulk Electric System.</p> <p>R1.2. Positions directly responsible for complying with NERC standards.</p>
<p>Notes: The RC SDT recommends retiring IRO-001-1 R6 as it is redundant with PER-003-0 R1.</p>	

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R7. The Reliability Coordinator shall have clear, comprehensive coordination agreements with adjacent Reliability Coordinators to ensure that System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) violation mitigation requiring actions in adjacent Reliability Coordinator Areas are coordinated. <i>[Violation Risk Factor: High]</i></p>	<p>None – requirement should be retired because it is redundant with:</p> <p>IRO-014-1</p> <p>R1. For conditions or activities that impact other Reliability Coordinator Areas, eThe Each Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other impacted Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators.</p>
<p>Notes: The RC SDT recommends the retirement of IRO-001-1 R7 as this is redundant with IRO-014-1 R1.</p>	

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R8: Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall comply with Reliability Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances, the Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, or Purchasing-Selling Entity shall immediately inform the Reliability Coordinator of the inability to perform the directive so that the Reliability Coordinator may implement alternate remedial actions. <i>[Violation Risk Factor: High]</i></p>	<p>IRO-001-2</p> <p>R32. Each Transmission Operators, Balancing Authority, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Provider, and Purchasing-Selling Entity shall act without intentional delay to comply with its Reliability Coordinator's directives unless the direction per Reliability Coordinator directives implemented or such actions would violate regulatory or statutory requirements. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations]</i></p> <p>R43. The Each Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider or and Purchasing-Selling Entity shall immediately confirm the ability to comply with the directive or inform its Reliability Coordinator upon recognition of the its inability to perform as directed per R43. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations]</i></p> <ul style="list-style-type: none"> R4. Each Reliability Coordinator or actual threat with Adverse Reliability Impacts Coordinator Area shall notify, without intentional delay, all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i>
<p>Notes: The RC SDT added the Distribution Provider per FERC Order 693 and added the blue text shown in the requirements above. The RC SDT proposes the replacement of IRO-001-1, R8 with two requirements IRO-001-2, R2, R3, and R4. This will add clarity and measurability to the standard. The last part of the second sentence should be removed as it is implicit in R1, which states that the Reliability Coordination will act or direct actions to mitigate issues. Stakeholders indicated issues with the ability to measure compliance with the phrase, "without intentional delay" and this was removed.</p> <p>Relating to First Energy's comment in FERC Order 693, the requirements address both personnel safety and equipment. There is no reference to a chain of command in the requirements. The standard is written such that decision-making authority rests with the Reliability Coordinator. No further revisions to the standard are required.</p>	

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R9. The Reliability Coordinator shall act in the interests of reliability for the overall Reliability Coordinator Area and the Interconnection before the interests of any other entity. <i>[Violation Risk Factor: High]</i></p>	<p>None – retire the requirement as redundant.</p>
<p>Notes: The RC SDT proposes retiring this requirement. All Reliability Coordinator Standard Requirements are developed so that the Reliability Coordinator shall act in the interest of reliability for the RC Area and the Interconnection. Section 6 of the NERC Standard Development Procedure states that NERC develops and maintains Reliability Standards. Equity issues are covered under the Reliability Coordinator Standards of Conduct.</p>	

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2 (this requirement was incorporated from IRO-005-2)</p> <p>R15. Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated. <i>[Violation Risk Factor: High]</i></p>	<p>IRO-001-2</p> <p><u>R5R4.</u> Each Reliability Coordinator who <u>that identifies a real or potential threat with Adverse Reliability Impacts,</u> within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations]</i></p> <p><u>R5.</u> Each Reliability Coordinator <u>that identifies an expected or actual threat with Adverse Reliability Impacts,</u> within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the transmission problem has been mitigated. <i>[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same-Day Operations and Operations Planning]</i></p>
<p>Notes: This requirement was moved from IRO-005 into IRO-001-2, <u>R5R4</u> and <u>R5</u>.</p>	

Implementation Plan for IRO-001-2
Reliability Coordination — Responsibilities and Authorities

Functions that Must Comply with the Requirements in the Standards

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Distribution Provider	Transmission Operator	Transmission Service Provider	Purchasing Selling Entity	Generator Operator	Load Serving Entity
IRO-001-2	X	X	X	X	X	X	X	X

Effective Dates

~~To be determined.~~ In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval.
In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

← Formatted: Left

A. Introduction

- 1. Title:** Reliability Coordination – Analysis Tools
- 2. Number:** IRO-002-2
- 3. Purpose:** To ensure that Reliability Coordinators provide their System Operators with authority with respect to analysis tool outages and to have procedures to mitigate effects of analysis tool outages.
- 4. Applicability**
 - 4.1.** Reliability Coordinators.
- 5. Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

B. Requirements

- R1.** Each Reliability Coordinator shall provide its System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools. [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time Operations, Same Day Operations and Operations Planning*]
- R2.** Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time Operations, Same Day Operations and Operations Planning*]

C. Measures

- M1.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operator with the authority to approve, deny or cancel planned outages of its own analysis tools. (R1)
- M2.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that that the Reliability Coordinator has procedures in place to mitigate the effects of analysis tool outages. (R2)

D. Compliance

- 1. Compliance Monitoring Process**
 - 1.1. Compliance Enforcement Authority**
 - Regional Entity
 - 1.2. Compliance Monitoring and Enforcement Processes:**
 - Compliance Audits
 - Self-Certifications
 - Spot Checking
 - Compliance Violation Investigations
 - Self-Reporting
 - Complaints

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1 and R2 and Measures M1 and M2.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

Violation Severity Levels R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Reliability Coordinator failed to provide its System Operator with the authority to approve, deny or cancel planned outages of its own analysis tools.
R2	N/A	N/A	N/A	The Reliability Coordinator failed to have a procedure to mitigate the effects of analysis tool outages

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1	April 4, 2007	Regulatory Approval — Effective Date	New
2		Retired R1, R3-8	Revised

A. Introduction

1. **Title:** Reliability Coordination – ~~Facilities~~Analysis Tools
2. **Number:** IRO 002-~~1~~2
3. **Purpose:** ~~Reliability Coordinators need information, tools and other capabilities to perform their responsibilities.~~To ensure that Reliability Coordinators provide their System Operators with authority with respect to analysis tool outages and to have procedures to mitigate effects of analysis tool outages.
4. **Applicability**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** TBD June 4, 2007

B. Requirements

~~**R1.** Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition.~~

The RC SDT proposes retiring R1. The first sentence of this requirement is a basic facility requirement that should be addressed in certification. The second sentence is redundant with PER-004, R1 which requires the RC to be staffed 24x7.

~~**R2.** Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities, or adjacent Reliability Coordinators.~~

The IROL SDT retired R2.

~~**R3.** Each Reliability Coordinator—or its Transmission Operators and Balancing Authorities—shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.~~

The RC SDT proposes retiring R3. The TOP and BA portion of this requirement is redundant with TOP-005, R1. The RC to RC data exchange provisions are covered in IRO-014. The secure network is covered by the NERC Rules of Procedure, Section 1002. This requirement should be retired.

~~**R4.** Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.~~

The RC SDT proposes retiring R4 as it is a basic facility requirement that should be addressed in certification.

~~**R5.** Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating~~

The RC SDT proposes retiring R5 as it is a basic facility requirement that should be addressed in certification.

~~Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.~~

~~**R6.** Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.~~

The RC SDT proposes retiring R6. Real-time monitoring is a supporting activity and is one of several processes used to support operation. It is not practical to measure real-time monitoring nor is this necessary. The real reliability objective is to operate within SOL and IROL, not to monitor.

~~**R7.** Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre and post contingency analysis capabilities (thermal, stability, and voltage), and wide area overview displays.~~

The RC SDT proposes retiring R7 as it is a basic facility requirement that should be addressed in certification.

~~**R8.** Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.~~

The RC SDT proposes retiring R8. Real-time monitoring is a supporting activity and is one of several processes used to support operation. It is not practical to measure real-time monitoring nor is this necessary. The real reliability objective is to operate within SOL and IROL, not to monitor. The second and third sentences are redundant with EOP-008, R1.

R1. Each Reliability Coordinator shall provide its System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools ~~control its Reliability Coordinator analysis tools, including approvals for planned maintenance.~~ *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

~~**R9-R2.**~~ Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

C. Measures

~~**M1.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators, that will be used to confirm that it has communication facilities in accordance with Requirements 1 and 4.~~

~~**M2.** Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a data link facility description document, computer print out, training document, or other equivalent evidence that will be used to confirm that it has data links with~~

~~entities within its Reliability Coordinator Area and with neighboring Reliability Coordinators, as specified in Requirements 1 and 4.~~

- ~~M3. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a letter to Transmission Operators, Balancing Authorities, Transmission Owners, Generator Owners, Generator Operators, and Load Serving Entities, or adjacent Reliability Coordinators, or other equivalent evidence that will be used to confirm that the Reliability Coordinator has requested the data required to support its reliability coordination tasks. (Requirement 2)~~
- ~~M4. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection system communications performance or equivalent evidence to demonstrate that it has real-time monitoring capability of its Reliability Coordinator Area and monitoring capability of its surrounding Reliability Coordinator Areas to identify potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations.~~
- ~~M5. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, documentation from suppliers, operating and planning staff training documents, examples of studies, or other equivalent evidence to show that it has analysis tools in accordance with Requirement 7.~~
- ~~M6. Each Reliability Coordinator shall provide evidence such as equipment specifications, operating procedures, staff records of their involvement in training, or other equivalent evidence to show that it has a backup monitoring facility that can be used to identify and monitor SOLs and IROLs. (Requirement 8)~~
- ~~M7. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operator with the authority to approve, deny or cancel planned outages of its own analysis tools ~~the Reliability Coordinator has the authority to veto planned outages to analysis tools, including final approvals for planned maintenance as specified in Requirement 9 Part 1. (R9)~~~~
- ~~M8. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that that the Reliability Coordinator has procedures in place to mitigate the effects of analysis tool outages. (R10)~~
- ~~M8.M9. Each Reliability Coordinator shall have and provide upon request its current procedures used to mitigate the effects of analysis tool outages as specified in Requirement 9 Part 2.~~

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance ~~Monitoring Responsibility~~Enforcement Authority

~~Regional Reliability Organizations shall be responsible for compliance.~~
Monitoring Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

~~1.2. Compliance Monitoring and Reset Time Frame~~

~~One or more of the following methods will be used to assess compliance:~~

- ~~— Self certification (Conducted annually with submission according to schedule.)~~
- ~~— Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~
- ~~— Periodic Audit (Conducted once every three years according to schedule.)~~
- ~~— Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)~~

~~The Performance Reset Period shall be 12 months from the last finding of non-compliance.~~

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R9 and R10 and Measures M9 and M10. The Reliability Coordinator shall have current in force documents used to show compliance with the Measures.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

~~Each Reliability Coordinator shall have current in force documents used to show compliance with Measures 1 through 8.~~

~~If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.~~

~~Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor.~~

~~The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.~~

1.4. Additional Compliance Information

None.

~~2. Levels of Non-Compliance for a Reliability Coordinator~~

~~2.1. Level 1: Not applicable.~~

~~2.2. Level 2: Did not confirm that the network used for data exchange to other Reliability Coordinators is secure as specified in R3.~~

~~2.3. Level 3: There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:~~

~~2.3.1 Has not requested the data required to support its reliability coordination tasks. (Requirement 2)~~

~~2.3.2 Does not control its Reliability Coordinator analysis tools, including the exercising of final approvals for planned maintenance (R7) or does not have current procedures in place to mitigate the effects of analysis tool outages as specified in R9.~~

~~2.4. Level 4: There shall be a separate Level 4 non-compliance, for every one of the following requirements that is in violation:~~

~~2.4.1 Does not have or could not demonstrate the use of voice communication facilities (or show data links) to one or more Transmission Operators, Generator Operators or Balancing Authorities with authority over Bulk Electrical System equipment or with one or more neighboring Reliability Coordinators. (R1 and R4)~~

~~2.4.2 Does not have real-time monitoring capability of its Reliability Coordinator Area and surrounding Reliability Coordinator Areas as specified in R5.~~

~~1.4.1 Does not have a documented procedure for the use of its backup monitoring facilities. (R8)~~

2.4.3 — Violation Severity Levels

<u>R#</u>	<u>Lower VSL</u>	<u>Moderate VSL</u>	<u>High VSL</u>	<u>Severe VSL</u>
R2	<p>The Reliability Coordinator demonstrated that it</p> <p>1) determined its data requirements and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities or Adjacent Reliability Coordinators with a material impact on the Bulk Electric System in its Reliability Coordination Area but did not request the data from Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities or Adjacent Reliability Coordinators with minimal impact on the Bulk Electric System in its Reliability Coordination Area</p> <p>or</p> <p>2) determined its data</p>	<p>The Reliability Coordinator demonstrated that it determined the majority but not all of its data requirements necessary to support its reliability coordination functions and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities or Adjacent Reliability Coordinators.</p>	<p>The Reliability Coordinator demonstrated that it determined</p> <p>1) some but less than the majority of its data requirements necessary to support its reliability coordination functions and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities or Adjacent Reliability Coordinators</p> <p>Or</p> <p>2) all of its data requirements necessary to support its reliability coordination functions but failed to demonstrate that it requested data from two of its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities or Adjacent Reliability Coordinators.</p>	<p>The Reliability Coordinator failed to demonstrate that it</p> <p>1) determined its data requirements necessary to support its reliability coordination functions and requested that data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities or Adjacent Reliability Coordinators</p> <p>Or</p> <p>2) requested the data from three or more of its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load Serving Entities or Adjacent Reliability Coordinators.</p>

	requirements necessary to perform its reliability functions with the exceptions of data that may be needed for administrative purposes such as data reporting.			
R9	Reliability Coordinator has approval rights for planned outages of analysis tools but does not have approval rights for maintenance on analysis tools. N/A	N/A	N/A	The Reliability Coordinator failed to provide its System Operator with the authority to approve, deny or cancel planned outages of its own analysis tools. Reliability Coordinator approval is not required for planned maintenance or planned outages.
R10	N/A	N/A	N/A	The Reliability Coordinator failed to have a procedure to mitigate the effects of analysis tool outages

- Adoption of IRO-001-2, IRO-007-0, IRO-010-0, COM-001-2

Conforming Changes to Requirements in Already Approved Standards

- None

Coordination with revisions proposed in other standards projects

- The IROL SDT proposes retiring the following requirements when IRO-010 is approved:
R2

Revision Summary

The RCSDT revised the standard and is proposing retiring several requirements (R1, R3, R4, R5, R6, R7 and R8). Changes were made to eliminate redundancies between standards (existing and proposed), align with NERCs Rules of Procedure and to address issues in FERC Order 693.

FERC Order 693 directive for IRO-002:

In addition we direct the ERO to develop a modification to IRO-002-1 through the Reliability Standards development process that requires a minimum set of tools that should be made available to reliability coordinators.

RCSDT response: The development of a minimum set of tools should be addressed through the work of the Real-Time Tools Best Practices Task Force. Their charge was to develop a list of tools required to perform real time operations functions and submit SARs based on their work. As requirements for these tools are developed, appropriate standards projects will be initiated to incorporate the tools within the NERC Organization Registration and Certification Process, and the applicable reliability standards. The RCSDT submits that this directive be addressed in that effort. This action is accommodated by the Standards Development Work Plan.

Implementation Plan for Reliability Coordination Standards

Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-1</p> <p>R1. Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition. <i>[Violation Risk Factor: High]</i></p>	<p>The first sentence of this requirement should be retired because it is a basic facility issue that should be addressed in certification. The second sentence is redundant with PER-004, R1 which requires the RC to be staffed 24x7.</p> <p>PER-004-1</p> <p>R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.</p>
<p>Notes:</p>	
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-1</p> <p>R2. Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p>	<p>None – this requirement should be retired as it is redundant with:</p> <p>IRO-010-1</p> <p>R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. The specification shall include the following: (Violation Risk Factor: Low) (Time Horizon: Operations Planning)</p>
<p>Notes:</p> <ul style="list-style-type: none"> ▪ This requirement is redundant and will be retired upon the adoption of IRO-010-1, R1 {draft standard}. 	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-1</p> <p>R3. Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]</p>	<p>None – retire requirement as it is redundant with: TOP-005-1</p> <p>R1. Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area. (This requirement will be retired upon the implementation of IRO-010-1)</p> <p>IRO-014-1</p> <p>R1. The Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators.</p> <p>R1.1. These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following:</p> <p>R1.1.1. Communications and notifications, including the conditions¹ under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.</p> <p>R1.1.2. Energy and capacity shortages.</p> <p>R1.1.3. Planned or unplanned outage information.</p> <p>R1.1.4. Voltage control, including the coordination of reactive resources for voltage control.</p> <p>R1.1.5. Coordination of information exchange to support reliability assessments.</p> <p>R1.1.6. Authority to act to prevent and mitigate instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas.</p>

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Notes:</p> <ul style="list-style-type: none"> ▪ The “secure network” provisions of R3 are covered under the NERC Rules of Procedure, Section 1002 which states: NERC will provide tools and other support services for the benefit of reliability coordinators and other system operators, including the Area Control Error (ACE) and Frequency Monitoring System, NERC Hotline, Real-time Flows, System Data Exchange (SDX), Reliability Coordinator Information System (RCIS), Transmission Services Information Network (TSIN), Interchange Distribution Calculator (IDC), Interregional Security Network (ISN), and Central Repository for Security Events (CRC). To accomplish this goal, NERC will: <ol style="list-style-type: none"> 1. Maintain the reliability and effectiveness of all mission-critical operating reliability support systems and services; 2. Continue to support maintenance of a transmission provider curtailment report on the CRC site in response to Federal Energy Regulatory Commission Order 605; 3. Investigate and analyze the use of high-speed real-time system measurements, including phasors, in predicting the behavior and performance of the Eastern Interconnection; and 4. Facilitate real-time voice and data exchange services among reliability coordinators (e.g., Hotline, Interregional Security Network, NERCnet, System Data Exchange, etc.). 	
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-1</p> <p>R4. Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection. [Violation Risk Factor: Medium]</p>	<p>None – Retire this requirement.</p> <p>R4 is addressed in COM-001 (Interpersonal Communications capability) and IRO-010 (data).</p>
<p>Notes:</p>	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-1</p> <p><i>R5.</i> Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure. <i>[Violation Risk Factor: High]</i></p> <p><i>R6.</i> Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. <i>[Violation Risk Factor: High]</i></p>	<p>None – Both should be retired based on the notes below.</p>
<p>Notes:</p> <p>R5 is a basic facility requirement that should be addressed in certification.</p> <p>R6: Real-time monitoring is a supporting activity and is only one of several processes used to support operation within SOLs or IROLs. It is not practical to measure real-time monitoring, nor is this necessary. The real reliability objective is to operate within identified parameters, not to monitor.</p>	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-1</p> <p>R7. Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays. <i>[Violation Risk Factor: High]</i></p>	<p>None – Retire this requirement. R7 is a basic facility requirement that should be addressed in certification.</p>
<p>Notes:</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-1</p> <p>R8. Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable. <i>[Violation Risk Factor: High]</i></p>	<p>None – This requirement should be retired because it is redundant with:</p> <p>EOP-008-0</p> <p>R1. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have a plan to continue reliability operations in the event its control center becomes inoperable. The contingency plan must meet the following requirements: The contingency plan shall not rely on data or voice communication from the primary control facility to be viable.</p> <p>R1.2. The plan shall include procedures and responsibilities for providing basic tie line control and procedures and for maintaining the status of all inter-area schedules, such that there is an hourly accounting of all schedules.</p> <p>R1.3. The contingency plan must address monitoring and control of critical transmission facilities, generation control, voltage control, time and frequency control, control of critical substation devices, and logging of significant power system events. The plan shall list the critical facilities.</p> <p>R1.4. The plan shall include procedures and responsibilities for maintaining basic voice communication capabilities with other areas.</p> <p>R1.5. The plan shall include procedures and responsibilities for conducting periodic tests, at least annually, to ensure viability of the plan.</p> <p>R1.6. The plan shall include procedures and responsibilities for providing annual training to ensure that operating personnel are able to implement the contingency plans.</p> <p>R1.7. The plan shall be reviewed and updated annually.</p> <p>R1.8. Interim provisions must be included if it is expected to take more than one hour to implement the contingency plan for loss of primary control facility.</p>

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Notes:</p> <p>Real-time monitoring is a supporting activity and is only one of several processes used to support operation within SOLs or IROLs. It is not practical to measure real-time monitoring, nor is this necessary. The real reliability objective is to operate within SOLs and IROLs, not to monitor.</p> <p>The proposed revisions to EOP-008 require the RC to have specific backup capabilities sufficient to, among other things, provide visualization capabilities that ensure that operating personnel have situational awareness of the BES.</p>	
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-1</p> <p>R9. Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-002-2</p> <p>R1. Each Reliability Coordinator shall provide its System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools control its Reliability Coordinator analysis tools, including approvals for planned maintenance. <i>[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p> <p>R2. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. <i>[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p>

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 3, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT began working on revisions to the standards in August 2007. The current posting contains revisions based on stakeholder comments on the third draft. The team is posting for a 30 day pre-ballot review.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on third posting	March 2010
2. Post Standards for pre-ballot period.	January 2011
3. Standards posted for initial and recirculation ballots.	February 2011
4. Standards sent to BOT for approval.	March 2011
5. Standards filed with regulatory authorities.	June 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-4
3. **Purpose:** To ensure that entities are notified when an expected or actual event with Adverse Reliability Impacts is identified.
4. **Applicability:**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

A. Requirements

- R1. When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*
- R2. The Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the problem has been mitigated. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

B. Measures

- M1. **Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when it identified a real or potential condition with Adverse Reliability Impacts, within its Reliability Coordinator Area.**
(R1)
- M2. **Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when a real or potential condition with Adverse Reliability Impacts within its Reliability Coordinator Area had been mitigated.**
(R2)

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- o The Reliability Coordinator shall retain its evidence for the most recent 90 days for voice recordings or 12 months for other documentation for Requirements R1 and R2 and Measures M1 and M2.
- o If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- o The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records or for the time period specified above, whichever is longer. .

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	<p>The Reliability Coordinator who identified an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to one, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p>	<p>The Reliability Coordinator who identified an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to two, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p>	<p>The Reliability Coordinator who identified an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to three, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p>	<p>The Reliability Coordinator who identified an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to more than three impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p> <p>OR</p> <p>The Reliability Coordinator who identified an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area (in cases where there are less than three impacted entities)..</p>
R2	<p>The Reliability Coordinator failed to notify one, but not all, impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.</p>	<p>The Reliability Coordinator failed to notify two, but not all, impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.</p>	<p>The Reliability Coordinator failed to notify three, but not all, impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.</p>	<p>The Reliability Coordinator failed to notify more than three impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.</p>

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
				<p>OR</p> <p>The Reliability Coordinator failed to notify more all impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated (in cases where there are less than three impacted entities).</p>

D. Regional Differences

None identified.

E. Associated Documents**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	August 28, 2006	Added three items that were inadvertently left out to “Applicability” section: 4.5 Generator Operators. 4.6 Load-Serving Entities. 4.7 Purchasing-Selling Entities.	Errata
1	February 7, 2006	BOT Approval	Revised
1	April 4, 2007	Regulatory Approval — Effective Date	New
2	August 3, 2010	Revised under Project 2006-06	Revised

A. Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-~~41~~
3. **Purpose:** ~~To ensure that entities are notified when an expected or actual event with Adverse Reliability Impacts is identified. The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.~~
4. **Applicability:**
 - ~~4.1. Reliability Coordinators.~~
 - ~~4.2. Balancing Authorities.~~
 - ~~4.3. Transmission Operators.~~
 - ~~4.4. Transmission Service Providers.~~
 - ~~4.5. Generator Operators.~~
 - ~~4.6. Load Serving Entities.~~
 - ~~4.7.4.1. Purchasing-Selling Entities.~~
5. **Effective Date:** ~~In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval June 4, 2007.~~

The RCSDT is proposing to retire or move all requirements in this standard. This will result in retiring IRO-005-1.

Formatted: Width: 11", Height: 8.5"

Formatted: Bullets and Numbering

B. Requirements

- R1.** Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: ~~[Violation Risk Factor: High]~~
 - R1.1.** Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading. ~~[Violation Risk Factor: High]~~

- ~~**R1.2.** Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate System Operating Limits (SOL) or Interconnection Reliability Operating Limits (IROL) violations, including the plan's viability and scope. *[Violation Risk Factor: High]*~~
- ~~**R1.3.** Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope. *[Violation Risk Factor: High]*~~
- ~~**R1.4.** System real and reactive reserves (actual versus required). *[Violation Risk Factor: High]*~~
- ~~**R1.5.** Capacity and energy adequacy conditions. *[Violation Risk Factor: High]*~~
- ~~**R1.6.** Current Area Control Error (ACE) for all its Balancing Authorities. *[Violation Risk Factor: High]*~~
- ~~**R1.7.** Current local or Transmission Loading Relief procedures in effect. *[Violation Risk Factor: High]*~~
- ~~**R1.8.** Planned generation dispatches. *[Violation Risk Factor: High]*~~
- ~~**R1.9.** Planned transmission or generation outages. *[Violation Risk Factor: High]*~~
- ~~**R1.10.** Contingency events. *[Violation Risk Factor: High]*~~
- ~~**R2.** Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection. *[Violation Risk Factor: High]*~~
- ~~**R3.** As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation. *[Violation Risk Factor: High]*~~
- ~~**R4.** Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard (CPS) and Disturbance Control Standard (DCS) requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load Serving Entities. *[Violation Risk Factor: High]*~~

- ~~R5. Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation. [Violation Risk Factor: High]~~
- ~~R6. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans. [Violation Risk Factor: High]~~
- ~~R7. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required. [Violation Risk Factor: High]~~
- ~~R8. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition. [Violation Risk Factor: High]~~
- ~~R9. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next day reliability analysis time frames. [Violation Risk Factor: High]~~
- ~~R10. As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities. [Violation Risk Factor: High]~~
- ~~R11. The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS. [Violation Risk Factor: High]~~
- ~~R12. Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected. [Violation Risk Factor: High]~~

- R13.** ~~Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load Serving Entities, and Purchasing Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load Serving Entities, and Purchasing Selling Entities shall always operate the Bulk Electric System to the most limiting parameter. [Violation Risk Factor: High]~~
- R14.** ~~Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide area view. The Transmission Service Providers shall respect these SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. [Violation Risk Factor: High]~~
- R15.** Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall notify issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]
- R15-R16.** ~~The~~ Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall notify all impacted Transmission Operators and, Balancing Authorities in its Reliability Coordinator Area, when the transmission problem has been mitigated. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]High
- R16-R17.** Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times. [Violation Risk Factor: High]
- R17-R18.** When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide area impacts, both real time and post contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load Serving Entity to return the system to within IROL or SOL. [Violation Risk Factor: High]

Formatted: Bullets and Numbering

C. Measures

M15. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when it identified a real or potential condition with Adverse Reliability Impacts, within its Reliability Coordinator Area. (R15)

Formatted: List Number, Indent: Left: 0.25"

M16. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when a real or potential condition with Adverse Reliability Impacts within its Reliability Coordinator Area had been mitigated. (R16)

Not specified.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 3, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT began working on revisions to the standards in August 2007. The current posting contains revisions based on stakeholder comments on the third draft. The team is posting for a 30 day pre-ballot review.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on third posting	March 2010
2. Post Standards for pre-ballot period.	January 2011
3. Standards posted for initial and recirculation ballots.	February 2011
4. Standards sent to BOT for approval.	March 2011
5. Standards filed with regulatory authorities.	June 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Interpersonal Communication: Any medium~~thod~~ that allows two or more individuals to interact, consult, or exchange information.

Alternative Interpersonal Communication: Any ~~method~~ Interpersonal Communication that is able to serve as a substitute for, ~~and is redundant to normal Interpersonal Communication~~ and does not utilize the same infrastructure (medium) as, ~~normal~~ Interpersonal Communications used for day-to-day operation.

Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-44
3. **Purpose:** To ensure that entities are notified when an expected or actual event with Adverse Reliability Impacts is identified~~The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.~~
4. **Applicability:**
 - 4.1. Reliability Coordinators.
 - 4.2. ~~Balancing Authorities.~~
 - 4.3. ~~Transmission Operators.~~
 - 4.4. ~~Transmission Service Providers.~~
 - 4.5. ~~Generator Operators.~~
 - 4.6. ~~Load Serving Entities.~~
 - 4.7.4.1. ~~Purchasing-Selling Entities.~~
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval June 4, 2007.

The RCSDT is proposing to retire or move all requirements in this standard. This will result in retiring IRO-005-1.

Formatted: Outline numbered + Level: 2 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: 0.65" + Tab after: 1" + Indent at: 1"

Formatted: Bullets and Numbering

B.A. Requirements

- R1.** Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: *[Violation Risk Factor: High]*
1. **R1.1.** ~~Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading. *[Violation Risk Factor: High]*~~
 2. **R1.2.** ~~Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate System Operating Limits (SOL) or Interconnection Reliability Operating Limits (IROL) violations, including the plan's viability and scope. *[Violation Risk Factor: High]*~~
 3. **R1.3.** ~~Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope. *[Violation Risk Factor: High]*~~

Formatted: Bullets and Numbering

Monitoring capability can **not** be objectively measured and is essential to real-time operations – however real-time monitoring is a supportin of several support o paramete should be assessed during certification and should not be a requirement. We propose retiring R1 and its subrequirements.

Formatted: Outline numbered + Level: 2 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: 0.65" + Tab after: 1.2" + Indent at: 1.2", Don't adjust space between Latin and Asian text, Tab stops: Not at 1"

~~4.R1.4.~~ System real and reactive reserves (actual versus required). *[Violation Risk Factor: High]*

~~5.R1.5.~~ Capacity and energy adequacy conditions. *[Violation Risk Factor: High]*

~~6.R1.6.~~ Current Area Control Error (ACE) for all its Balancing Authorities. *[Violation Risk Factor: High]*

~~7.R1.7.~~ Current local or Transmission Loading Relief procedures in effect. *[Violation Risk Factor: High]*

~~8.R1.8.~~ Planned generation dispatches. *[Violation Risk Factor: High]*

~~9.R1.9.~~ Planned transmission or generation outages. *[Violation Risk Factor: High]*

~~10.R1.10.~~ Contingency events. *[Violation Risk Factor: High]*

~~R2.~~ Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Intereconnection. *[Violation Risk Factor: High]*

This requirement (R2) is not measurable (aware) and should be retired because it is redundant with INT-005, R1. The IA is responsible for making interchange information available to all reliability entities including the reliability Coordinator.

~~R3.~~ As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation. *[Violation Risk Factor: High]*

~~This requirement (R3 was retired) is proposed to be retired based on work by the IROL Standards Drafting Team. The RCSDT concurs.~~

~~R4.~~ Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard (CPS) and Disturbance Control Standard (DCS) requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load Serving Entities. *[Violation Risk Factor: High]*

The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. We view these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. We recommend retiring requirement 4.

~~R5.~~ Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation. *[Violation Risk Factor: High]*

~~This requirement (R5 was retired by) is proposed to be retired based on work by the IROL Standards Drafting Team. The RCSDT concurs.~~

The RCSDT retiring this requirement as it is addressed in redundant with proposed IRO-001-2, R1R15 below. A GMD is one of the "expected or actual threats with Adverse Reliability Impacts".

- R6.** Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans. *[Violation Risk Factor: High]*
- R7.** The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required. *[Violation Risk Factor: High]*
- R8.** Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition. *[Violation Risk Factor: High]*
- R9.** The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real-time and next-day reliability analysis time frames. *[Violation Risk Factor: High]*
- R10.** As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities. *[Violation Risk Factor: High]*
- R11.** The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS. *[Violation Risk Factor: High]*
- R12.** Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected. *[Violation Risk Factor: High]*

The RCSDT proposes retiring requirement 7 as it is too vague and can not be measured.

The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. We view these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. We recommend retiring requirement 8. The second sentence is redundant with EOP-002, R4, R6, R7 and R9. This requirement should be retired.

The RCSDT proposes retiring this requirement as it is redundant with TOP-003 and IRO-004 (all requirements) for next day requirements. The RC has the authority to coordinate pending outages in real-time through IRO-001-2, R1 (proposed). The issue of CPS and DCS is covered in EOP-002-2, R6, R7 and R8.

The RCSDT proposes retiring requirement 10 as it is redundant with EOP-002, R7.2 and R8.

The RCSDT proposes retiring requirement 11 as it is redundant with proposed IRO-001-2 R1 and TOP-006-1, R7.

The RCSDT proposes retiring requirement 12 as it is redundant with proposed IRO-010. Also, the scope of project 2007-3 includes enhancing the SPS provisions of TOP-005. IRO-003, R1 indicates that the RC will monitor all items that will impact reliability and SPS's are a part of that.

~~**R13.** Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load Serving Entities, and Purchasing Selling Entities operate to prevent the likelihood that a disturbance, action, or non action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load Serving Entities, and Purchasing Selling Entities shall always operate the Bulk Electric System to the most limiting parameter. *[Violation Risk Factor: High]*~~

The IROL SDT has proposed retiring the first sentence of this requirement as it is redundant with the proposed IRO-009-1. The RCSDT recommends retiring the remaining portion of this requirement as it is a facet of the SOL / IROL methodology required in FAC-010-1, FAC-011-1 and FAC-014-1. 2007-3 includes enhancing the SPS provisions of TOP-005. IRO-003, R1 indicates that the RC will monitor all items that will impact reliability and SPS's are a part of that.

~~**R14.** Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide area view. The Transmission Service Providers shall respect these SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. *[Violation Risk Factor: High]*~~

~~RPer the IROL SDT, requirement 14 was retired by the work of the IROL SDT is redundant with FAC 014, R5.1 and should be retired. The RCSDT concurs.~~

~~**R15.** When the results of an Operational Planning Analysis or Real-time Assessment indicate Each Reliability Coordinator an expected or actual condition with Adverse Reliability Impacts who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, each Reliability Coordinator shall notify issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. *[Violation Risk Factor: High]*
[Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]~~

~~**R15.R16.** The Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall notify all impacted Transmission Operators and, Balancing Authorities in its Reliability Coordinator Area, when the transmission problem has been mitigated. *[Violation Risk Factor: Medium]* *[Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]***High]**~~

Formatted: Bullets and Numbering

~~**R16.R17.** Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times. *[Violation Risk Factor: High]*~~

Requirement 176 was retired is proposed to be retired based on work by the IROL Standards Drafting Team. The RCSDT concurs.

~~**R17.R18.** When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide area impacts, both real-time and post contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the~~

Requirement 187 was retired is proposed to be retired based on work by the IROL Standards Drafting Team. The RCSDT concurs.

~~Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load Serving Entity to return the system to within IROL or SOL. [Violation Risk Factor: High]~~

~~C.B.~~ **Measures**

M1. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when it identified a real or potential condition with Adverse Reliability Impacts, within its Reliability Coordinator Area. (R1)

Formatted: List Number, Indent: Left: 0.25"

M2. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when a real or potential condition with Adverse Reliability Impacts within its Reliability Coordinator Area had been mitigated. (R2)

Not specified.

~~D.C.~~ **Compliance**

Formatted: Bullets and Numbering

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Formatted: Indent: Left: 0.5"

Regional Entity

1.2. Compliance Monitoring and Enforcement Processes:

Formatted: Indent: Left: 0.5"

Compliance Audits

Formatted: Indent: Left: 1"

Self-Certifications

Formatted: Indent: Left: 0.75", First line: 0.25"

Spot Checking

Formatted: Indent: Left: 0.5", First line: 0.5"

Compliance Violation Investigations

Formatted: Indent: Left: 0.75", First line: 0.25"

Self-Reporting

Formatted: Indent: Left: 0.5", First line: 0.5"

Complaints

Formatted: Indent: Left: 0.75", First line: 0.25"

1.3. Data Retention

Formatted: Indent: Left: 0.5"

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- o The Reliability Coordinator shall retain its evidence for the most recent 90 days for voice recordings or 12 months for other documentation for Requirements R1 and R2 and Measures M1 and M2.

o If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

o The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records or for the time period specified above, whichever is longer.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Conforming Changes to Requirements in Already Approved Standards

Revision Summary

- Many of the requirements in this standard will be retired under the IROL SDT work plan. The RCSDT proposes retiring other requirements and revising R15 into two separate requirements..

Implementation Plan for Reliability Coordination Standards

Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p data-bbox="201 472 331 496">IRO-005-2</p> <p data-bbox="201 516 533 540">R1. and sub-requirements</p> <p data-bbox="254 561 1024 651">Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: <i>[Violation Risk Factor: High]</i></p>	<p data-bbox="1083 516 1885 695">Retire R1 and its subrequirements – Monitoring capability can be objectively measured and is essential to real-time operations – however real-time monitoring is a supporting activity and is only one of several processes used to support operation within defined parameters. Monitoring capability should be assessed during certification and not as a requirement.</p>
<p data-bbox="201 732 289 756">Notes:</p> <ul data-bbox="201 776 218 800" style="list-style-type: none">▪	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R2. Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection. [Violation Risk Factor: High]</p>	<p>None – Requirement should be retired as it is redundant with: INT-005-1</p> <p>R1. Prior to the expiration of the time period defined in the Timing Table, Column A, the Interchange Authority shall distribute the Arranged Interchange information for reliability assessment to all reliability entities involved in the interchange.</p> <p>R1.1. When a Balancing Authority or Reliability Coordinator initiates a Curtailment to Confirmed or Implemented Interchange for reliability, the Interchange Authority shall distribute the Arranged Interchange information for reliability assessment only to the Source Balancing Authority and the Sink Balancing Authority.</p>
<p>Notes:</p> <ul style="list-style-type: none"> ▪ The requirement is not measurable (shall be aware) and should be retired because it is redundant with INT-005-1, R1. ▪ The IA is responsible for making interchange information available to all reliability entities including the Reliability Coordinator. ▪ When IRO-010-1 becomes effective, IRO-005-2 R2 should be retired. The e-tag system replaced the need for this requirement. In addition, if the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1 	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R3. As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation. <i>[Violation Risk Factor: High]</i></p>	<ul style="list-style-type: none"> ▪ None – This requirement is to be retired per the IROL team’s implementation plan.
<p>Notes:</p> <ul style="list-style-type: none"> ▪ The IROL Implementation Plan proposes retiring IRO-005-2 R3 when IRO-009-1 becomes effective. IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T_v that is much shorter than 30 minutes. 	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R4. Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard (CPS) and Disturbance Control Standard (DCS) requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities. <i>[Violation Risk Factor: High]</i></p>	<p>None – The RCSDT proposes that this requirement be retired. The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. We view these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. This requirement should be retired.</p> <p>The requirement is also redundant with existing EOP-002-2.</p>

Notes: EOP-002-2

- R1.** Each Balancing Authority and Reliability Coordinator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its respective area and shall exercise specific authority to alleviate capacity and energy emergencies.
- R2.** Each Balancing Authority shall implement its capacity and energy emergency plan, when required and as appropriate, to reduce risks to the interconnected system.
- R3.** A Balancing Authority that is experiencing an operating capacity or energy emergency shall communicate its current and future system conditions to its Reliability Coordinator and neighboring Balancing Authorities.
- R4.** A Balancing Authority anticipating an operating capacity or energy emergency shall perform all actions necessary including bringing on all available generation, postponing equipment maintenance, scheduling interchange purchases in advance, and being prepared to reduce firm load.
- R5.** A deficient Balancing Authority shall only use the assistance provided by the Interconnection’s frequency bias for the time needed to implement corrective actions. The Balancing Authority shall not unilaterally adjust generation in an attempt to return Interconnection frequency to normal beyond that supplied through frequency bias action and Interchange Schedule changes. Such unilateral adjustment may overload transmission facilities.
- R6.** If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. These remedies include, but are not limited to:
- R6.1.** Loading all available generating capacity. **R6.2.** Deploying all available operating reserve.
- R6.3.** Interrupting interruptible load and exports. **R6.4.** Requesting emergency assistance from other Balancing Authorities.
- R6.5.** Declaring an Energy Emergency through its Reliability Coordinator; and
- R6.6.** Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads.
- R7.** Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall:
- R7.1.** Manually shed firm load without delay to return its ACE to zero; and
- R7.2.** Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”
- R8.** A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.” The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.

R9. When a Transmission Service Provider expects to elevate the transmission service priority of an Interchange Transaction from Priority 6 (Network Integration Transmission Service from Non-designated Resources) to Priority 7 (Network Integration Transmission Service from designated Network Resources) as permitted in its transmission tariff (See Attachment 1-IRO-006-0 “Transmission Loading Relief Procedure” for explanation of Transmission Service Priorities):

R9.1. The deficient Load-Serving Entity shall request its Reliability Coordinator to initiate an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0.

R9.2. The Reliability Coordinator shall submit the report to NERC for posting on the NERC Website, noting the expected total MW that may have its transmission service priority changed.

R9.3. The Reliability Coordinator shall use EEA 1 to forecast the change of the priority of transmission service of an Interchange Transaction on the system from Priority 6 to Priority 7.

R9.4. The Reliability Coordinator shall use EEA 2 to announce the change of the priority of transmission service of an Interchange Transaction on the system from Priority 6 to Priority 7.

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R5. Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation. <i>[Violation Risk Factor: High]</i></p>	<p>None – This requirement is to be retired per the IROL team’s implementation plan.</p>
<p>Notes:</p> <ul style="list-style-type: none"> ▪ The IROL Implementation Plan proposes retiring IRO-005-2 R5 when IRO-009-1 becomes effective. IRO-005 R5 can lead the Compliance Enforcement Authority to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits. 	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R6. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.</p>	<p>The RCSDT proposes retiring this requirement as it is addressed in R15 below. A GMD is one of the “expected or actual threats with Adverse Reliability Impacts”.</p> <p>IRO-005-4 (proposed)</p> <p>R15. Each Reliability Coordinator that identifies an expected or actual threat with Adverse Reliability Impacts, within its Reliability Coordinator Area shall notify, all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</p>
<p>Notes:</p> <ul style="list-style-type: none"> ▪ 	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
IRO-005-2 R7. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.	IRO-005-2 (proposed) None - The RCSDT recommends retiring this requirement.
Notes: <ul style="list-style-type: none">The RCSDT proposes that this requirement is too vague and ambiguous to measure. We recommend retiring this requirement.	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
----------------------------------	--

IRO-005-2

R8. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.

IRO-005-2

None –The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. RCSDT views these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. The second sentence is redundant with EOP-002, R4, R6, R7, and R9. This requirement should be retired.

The RCSDT recommends retiring this requirement as it is redundant with:

TOP-006-1, R7

Each Reliability Coordinator, Transmission Operator and Balancing Authority shall monitor system frequency.

EOP-002-2

R4. A Balancing Authority anticipating an operating capacity or energy emergency shall perform all actions necessary including bringing on all available generation, postponing equipment maintenance, scheduling interchange purchases in advance, and being prepared to reduce firm load.

R6. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so.

These remedies include, but are not limited to:

R6.1. Loading all available generating capacity.

R6.2. Deploying all available operating reserve.

R6.3. Interrupting interruptible load and exports.

R6.4. Requesting emergency assistance from other Balancing Authorities.

R6.5. Declaring an Energy Emergency through its Reliability Coordinator; and

R6.6. Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads. November 23, 2010

Implementation Plan for Reliability Coordination Standards

	<p>R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall:</p> <p>R7.1. Manually shed firm load without delay to return its ACE to zero; and</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p>
<p>Notes:</p> <ul style="list-style-type: none">▪	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R9. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p>The RCSDT proposes to retire this requirement from IRO-005.</p> <p>The RCSDT proposes retiring this requirement as it is redundant with TOP-003 and IRO-004 (all requirements) for next day requirements. The RC has the authority to coordinate pending outages in real-time through IRO-001-2, R1 (proposed). The issue of CPS and DCS is covered in EOP-002-2, R6, R7 and R8 (see above).</p>
<p>Notes: TOP-003-0</p> <p>R1. Generator Operators and Transmission Operators shall provide planned outage information.</p> <p>R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p>R1.2. Each Transmission Operator shall provide outage information daily to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. The Reliability Coordinator shall establish the outage reporting requirements.</p> <p>R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p>R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.</p> <p>R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.</p> <p>R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.</p>	

Implementation Plan for Reliability Coordination Standards

IRO-004-1

R1. Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.

R2. Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.

R3. Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.

R4. Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.

R5. Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.

R6. If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.

R7. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.

IRO-001-2, R1 (proposed)

R1. The Reliability Coordinator shall act or direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts. [Violation Risk Factor: High][Time Horizon: Real-time Operations and Same Day Operations]

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R10. As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities. [Violation Risk Factor: High]</p>	<p>None – The RCSDT proposes to retire this requirement as it is redundant with:</p> <p>EOP-002-2</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p> <p>R8. A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.” The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.</p>
<p>Notes:</p>	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R11. The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.</p>	<p>None – The RCSDT recommends retiring this requirement as it is redundant with:</p> <p>IRO-001-2 (proposed)</p> <p>R2. Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p> <p>TOP-006-1, R7 (existing)</p> <p>R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.</p>
<p>Notes:</p>	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R12. Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.</p>	<p>None - The RCSDT recommends retiring this requirement as it is redundant with proposed IRO-010:</p> <p>R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: <i>(Violation Risk Factor: Low) (Time Horizon: Operations Planning)</i></p> <p>R1.1. List of required data and information.</p> <p>R1.2. Mutually agreeable format.</p> <p>R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</p> <p>R1.4. Process for data provision when automated Real-Time system operating data is unavailable.</p> <p>R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. <i>(Violation Risk Factor: Low) (Time Horizon: Operations Planning)</i></p> <p>R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. <i>(Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</i></p>

Implementation Plan for Reliability Coordination Standards

Notes: The RCSDT recommends retiring this requirement as it is redundant with proposed IRO-010, R1 and R3. Also, the scope of project 2007-3 includes enhancing the SPS provisions of TOP-005. IRO-003, R1 indicates the RC will monitor all items that will impact reliability, and SPSs are a part of that.

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R13. Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.</p>	<p>None – The IROL SDT retired the first sentence of this requirement as it is redundant with the proposed IRO-009-1. The RCSDT recommends retiring the remaining portion of this requirement as it is a facet of the SOL / IROL methodology required in FAC-010-1, FAC-011-1 and FAC-014-1.</p>
<p>Notes:</p>	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R14. Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROs within its wide-area view. The Transmission Service Providers shall respect these SOLs or IROs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p>	<p>Per the IROL SDT implementation plan, the first sentence of this requirement should be retired upon the implementation of IRO-009-1.</p> <p>The RC SDT proposes retiring the second sentence of this requirement. The concept of this requirement is more appropriately addressed in the proposed MOD standards under project 2006-7. As written, this requirement is not measureable and unenforceable as a TSP's tariff may supersede the requirement.</p>
<p>Notes:</p>	
Already Approved Standard	Proposed Replacement Requirement(s)

Implementation Plan for Reliability Coordination Standards

IRO-005-2

R15. Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.

- R1. When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator that shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]**
- R2. The Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall g Authorities in its Reliability Coordinator Area when the problem has been mitigated. notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the transmission problem has been mitigated. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]**

Notes:

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R16. Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times. <i>[Violation Risk Factor: High]</i></p> <p>R17. When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL. <i>[Violation Risk Factor: High]</i></p>	<p>IRO-005-2</p> <p>None – The IROL SDT’s Implementation plan proposes retirement of R16 and R17.</p>
<p>Notes: IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</p> <ul style="list-style-type: none"> IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T_v that is much shorter than 30 minutes. Note that the RC does not see all SOLs. 	

Implementation Plan for Reliability Coordination Standards

Functions that Must Comply with the Requirements in the Standards

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator	Load Serving Entity
IRO-005								

Effective Dates

In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

Implementation Plan for Reliability Coordination Standards

Prerequisite Approvals

- ~~IRO-001-2~~
- IRO-007-1
- IRO-008-1
- IRO-009-1
- IRO-010-1

Conforming Changes to Requirements in Already Approved Standards

- ~~IRO-001-2 with respect to R6 and R15~~

Revision Summary

- Many of the requirements in this standard will be retired under the IROL SDT work plan. The RCSDT proposes retiring other requirements and revising moving R6 and R15 into two separate requirements, to IRO-001-2. ~~This will retire or move all requirements in this standard. The RCSDT proposes retiring the standard.~~

-

Implementation Plan for Reliability Coordination Standards

Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R1. and sub-requirements</p> <p>Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: [Violation Risk Factor: High]</p>	<p>Retire R1 and its subrequirements – Monitoring capability can be objectively measured and is essential to real-time operations – however real-time monitoring is a supporting activity and is only one of several processes used to support operation within defined parameters. Monitoring capability should be assessed during certification and not as a requirement.</p>
<p>Notes:</p> <ul style="list-style-type: none">▪	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R2. Each Reliability Coordinator shall be aware of all Interchange Transactions that wheel through, source, or sink in its Reliability Coordinator Area, and make that Interchange Transaction information available to all Reliability Coordinators in the Interconnection. [Violation Risk Factor: High]</p>	<p>None – Requirement should be retired as it is redundant with: INT-005-1</p> <p>R1. Prior to the expiration of the time period defined in the Timing Table, Column A, the Interchange Authority shall distribute the Arranged Interchange information for reliability assessment to all reliability entities involved in the interchange.</p> <p>R1.1. When a Balancing Authority or Reliability Coordinator initiates a Curtailment to Confirmed or Implemented Interchange for reliability, the Interchange Authority shall distribute the Arranged Interchange information for reliability assessment only to the Source Balancing Authority and the Sink Balancing Authority.</p>
<p>Notes:</p> <ul style="list-style-type: none"> ▪ The requirement is not measurable (shall be aware) and should be retired because it is redundant with INT-005-1, R1. ▪ The IA is responsible for making interchange information available to all reliability entities including the Reliability Coordinator. ▪ When IRO-010-1 becomes effective, IRO-005-2 R2 should be retired. The e-tag system replaced the need for this requirement. In addition, if the Reliability Coordinator needs this information, the Reliability Coordinator can add this item to the list of data and information on its data specification under IRO-010 R1 	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R3. As portions of the transmission system approach or exceed SOLs or IROLs, the Reliability Coordinator shall work with its Transmission Operators and Balancing Authorities to evaluate and assess any additional Interchange Schedules that would violate those limits. If a potential or actual IROL violation cannot be avoided through proactive intervention, the Reliability Coordinator shall initiate control actions or emergency procedures to relieve the violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall ensure all resources, including load shedding, are available to address a potential or actual IROL violation. [Violation Risk Factor: High]</p>	<ul style="list-style-type: none"> ▪ None – This requirement is to be retired per the IROL team’s implementation plan.
<p>Notes:</p> <ul style="list-style-type: none"> ▪ The IROL Implementation Plan proposes retiring IRO-005-2 R3 when IRO-009-1 becomes effective. IRO-005 R3 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T_v that is much shorter than 30 minutes. 	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R4. Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard (CPS) and Disturbance Control Standard (DCS) requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities. [Violation Risk Factor: High]</p>	<p>None – The RCSDT proposes that this requirement be retired. The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. We view these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. This requirement should be retired.</p> <p>The requirement is also redundant with existing EOP-002-2.</p>

Implementation Plan for Reliability Coordination Standards

Notes: EOP-002-2

R1. Each Balancing Authority and Reliability Coordinator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its respective area and shall exercise specific authority to alleviate capacity and energy emergencies.

R2. Each Balancing Authority shall implement its capacity and energy emergency plan, when required and as appropriate, to reduce risks to the interconnected system.

R3. A Balancing Authority that is experiencing an operating capacity or energy emergency shall communicate its current and future system conditions to its Reliability Coordinator and neighboring Balancing Authorities.

R4. A Balancing Authority anticipating an operating capacity or energy emergency shall perform all actions necessary including bringing on all available generation, postponing equipment maintenance, scheduling interchange purchases in advance, and being prepared to reduce firm load.

R5. A deficient Balancing Authority shall only use the assistance provided by the Interconnection's frequency bias for the time needed to implement corrective actions. The Balancing Authority shall not unilaterally adjust generation in an attempt to return Interconnection frequency to normal beyond that supplied through frequency bias action and Interchange Schedule changes. Such unilateral adjustment may overload transmission facilities.

R6. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. These remedies include, but are not limited to:

R6.1. Loading all available generating capacity.

R6.2. Deploying all available operating reserve.

R6.3. Interrupting interruptible load and exports.

R6.4. Requesting emergency assistance from other Balancing Authorities.

R6.5. Declaring an Energy Emergency through its Reliability Coordinator; and

R6.6. Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads.

R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall:

R7.1. Manually shed firm load without delay to return its ACE to zero; and

R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 "Energy Emergency Alert Levels."

R8. A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002-0 "Energy Emergency Alert Levels." The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.

Implementation Plan for Reliability Coordination Standards

R9. When a Transmission Service Provider expects to elevate the transmission service priority of an Interchange Transaction from Priority 6 (Network Integration Transmission Service from Non-designated Resources) to Priority 7 (Network Integration Transmission Service from designated Network Resources) as permitted in its transmission tariff (See Attachment 1-IRO-006-0 “Transmission Loading Relief Procedure” for explanation of Transmission Service Priorities):

R9.1. The deficient Load-Serving Entity shall request its Reliability Coordinator to initiate an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0.

R9.2. The Reliability Coordinator shall submit the report to NERC for posting on the NERC Website, noting the expected total MW that may have its transmission service priority changed.

R9.3. The Reliability Coordinator shall use EEA 1 to forecast the change of the priority of transmission service of an Interchange Transaction on the system from Priority 6 to Priority 7.

R9.4. The Reliability Coordinator shall use EEA 2 to announce the change of the priority of transmission service of an Interchange Transaction on the system from Priority 6 to Priority 7.

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R5. Each Reliability Coordinator shall identify the cause of any potential or actual SOL or IROL violations. The Reliability Coordinator shall initiate the control action or emergency procedure to relieve the potential or actual IROL violation without delay, and no longer than 30 minutes. The Reliability Coordinator shall be able to utilize all resources, including load shedding, to address an IROL violation. <i>[Violation Risk Factor: High]</i></p>	<p>None – This requirement is to be retired per the IROL team’s implementation plan.</p>
<p>Notes:</p> <ul style="list-style-type: none"> ▪ The IROL Implementation Plan proposes retiring IRO-005-2 R5 when IRO-009-1 becomes effective. IRO-005 R5 can lead the Compliance Enforcement Authority to believe that the Reliability Coordinator has information to see all SOLs, and this is not always true. Every facility in the Transmission Operator’s area has a System Operating Limit, but the Reliability Coordinator isn’t required to see all these limits and may not have information to determine the cause of instances of exceeding these limits. 	

Implementation Plan for Reliability Coordination Standards

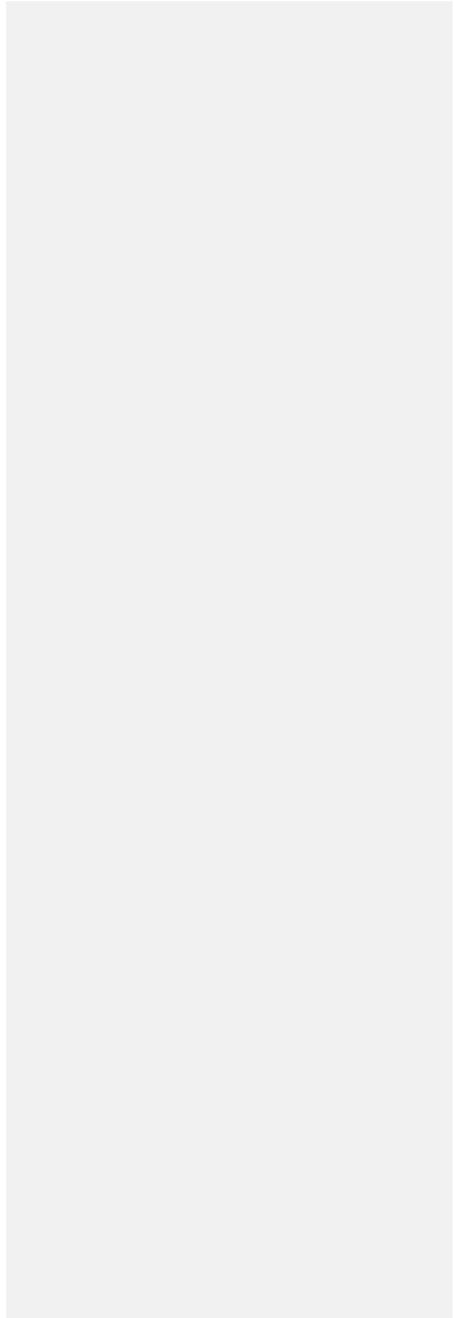

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R6. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.</p>	<p>The RCSDT proposes retiring this requirement as it is addressed in R15 below. retiring this requirement as it is redundant with proposed IRO-001-2, R11. A GMD is one of the “expected or actual threats with Adverse Reliability Impacts”.</p> <p>IRO-005-24-2 (proposed)</p> <p>R15. Each Reliability Coordinator thatwho identifies an expected or actual threat with Adverse Reliability Impacts, within its Reliability Coordinator Area shall notify, without intentional delay, all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. <i>[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p>
<p>Notes:</p> <ul style="list-style-type: none"> ▪ 	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
IRO-005-2 R7. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.	IRO-005-2 (proposed) None - The RCSDT recommends retiring this requirement.
Notes: <ul style="list-style-type: none">The RCSDT proposes that this requirement is too vague and ambiguous to measure. We recommend retiring this requirement.	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
---------------------------	-------------------------------------

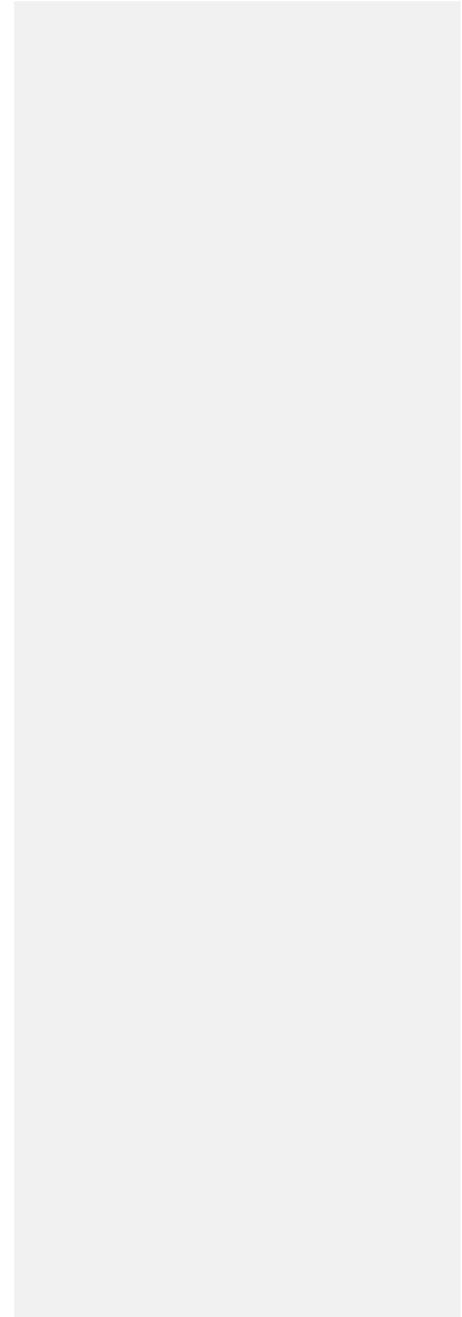

Implementation Plan for Reliability Coordination Standards

<p>IRO-005-2</p> <p>R8. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.</p>	<p>IRO-005-2</p> <p>None –The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. RCSDT views these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. The second sentence is redundant with EOP-002, R4, R6, R7, and R9. This requirement should be retired.</p> <p>The RCSDT recommends retiring this requirement as it is redundant with:</p> <p>TOP-006-1, R7</p> <p>Each Reliability Coordinator, Transmission Operator and Balancing Authority shall monitor system frequency.</p> <p>EOP-002-2</p> <p>R4. A Balancing Authority anticipating an operating capacity or energy emergency shall perform all actions necessary including bringing on all available generation, postponing equipment maintenance, scheduling interchange purchases in advance, and being prepared to reduce firm load.</p> <p>R6. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. These remedies include, but are not limited to:</p> <ul style="list-style-type: none">R6.1. Loading all available generating capacity.R6.2. Deploying all available operating reserve.R6.3. Interrupting interruptible load and exports.R6.4. Requesting emergency assistance from other Balancing Authorities.R6.5. Declaring an Energy Emergency through its Reliability Coordinator; andR6.6. Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads. <p>July 16, 2008 November 23, 2010</p>
---	--

Implementation Plan for Reliability Coordination Standards

	<p>R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall:</p> <p>R7.1. Manually shed firm load without delay to return its ACE to zero; and</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p>
<p>Notes:</p> <ul style="list-style-type: none">▪	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2 R9. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p>The RCSDT proposes to retire this requirement from IRO-005. The RCSDT proposes retiring this requirement as it is redundant with TOP-003 and IRO-004 (all requirements) for next day requirements. The RC has the authority to coordinate pending outages in real-time through IRO-001-2, R1 (proposed). The issue of CPS and DCS is covered in EOP-002-2, R6, R7 and R8 (see above).</p>
<p>Notes: TOP-003-0</p> <p>R1. Generator Operators and Transmission Operators shall provide planned outage information. R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements. R1.2. Each Transmission Operator shall provide outage information daily to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. The Reliability Coordinator shall establish the outage reporting requirements. R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection. R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required. R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas. R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.</p>	

Implementation Plan for Reliability Coordination Standards

IRO-004-1

R1. Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.

R2. Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.

R3. Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.

R4. Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.

R5. Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.

R6. If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.

R7. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.

IRO-001-2, R1 (proposed)

R1. The Reliability Coordinator shall act or direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts.

[Violation Risk Factor: High][Time Horizon: Real-time Operations and Same Day Operations]

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R10. As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities. [Violation Risk Factor: High]</p>	<p>None – The RCSDT proposes to retire this requirement as it is redundant with:</p> <p>EOP-002-2</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p> <p>R8. A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.” The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.</p>
<p>Notes:</p>	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R11. The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.</p>	<p>None – The RCSDT recommends retiring this requirement as it is redundant with:</p> <p>IRO-001-2 (proposed)</p> <p><u>R2. Each Reliability Coordinator shall take actions or direct actions, which could include issuing Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. [Violation Risk Factor: High][Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</u></p> <p>R1. Reliability Coordinator shall act or direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent or mitigate the magnitude or duration of Adverse Reliability Impacts. [Violation Risk Factor: High][Time Horizon: Real-time Operations and Same-Day Operations]</p> <p>TOP-006-1, R7 (existing)</p> <p>R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.</p>
<p>Notes:</p>	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R12. Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.</p>	<p>None - The RCSDT recommends retiring this requirement as it is redundant with proposed IRO-010:</p> <p>R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: (<i>Violation Risk Factor: Low</i>) (<i>Time Horizon: Operations Planning</i>)</p> <p>R1.1. List of required data and information.</p> <p>R1.2. Mutually agreeable format.</p> <p>R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</p> <p>R1.4. Process for data provision when automated Real-Time system operating data is unavailable.</p> <p>R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. (<i>Violation Risk Factor: Low</i>) (<i>Time Horizon: Operations Planning</i>)</p> <p>R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. (<i>Violation Risk Factor:Medium</i>) (<i>Time Horizon: Operations Planning; Same-day Operations; Real-time Operations</i>)</p>

Implementation Plan for Reliability Coordination Standards

Notes: The RCSDT recommends retiring this requirement as it is redundant with proposed IRO-010, R1 and R3. Also, the scope of project 2007-3 includes enhancing the SPS provisions of TOP-005. IRO-003, R1 indicates the RC will monitor all items that will impact reliability, and SPSs are a part of that.

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R13. Each Reliability Coordinator shall ensure that all Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities operate to prevent the likelihood that a disturbance, action, or non-action in its Reliability Coordinator Area will result in a SOL or IROL violation in another area of the Interconnection. In instances where there is a difference in derived limits, the Reliability Coordinator and its Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.</p>	<p>None – The IROL SDT has proposed retiring the first sentence of this requirement as it is redundant with the proposed IRO-009-1. The RCSDT recommends retiring the remaining portion of this requirement as it is a facet of the SOL / IROL methodology required in FAC-010-1, FAC-011-1 and FAC-014-1.</p>
<p>Notes:</p>	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R14. Each Reliability Coordinator shall make known to Transmission Service Providers within its Reliability Coordinator Area, SOLs or IROLs within its wide-area view. The Transmission Service Providers shall respect these SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.</p>	<p>Per the IROL SDT implementation plan, the first sentence of this requirement should be retired upon the implementation of IRO-009-1.</p> <p>The RC SDT proposes retiring the second sentence of this requirement. The concept of this requirement is more appropriately addressed in the proposed MOD standards under project 2006-7. As written, this requirement is not measureable and unenforceable as a TSP's tariff may supersede the requirement.</p>
<p>Notes:</p>	
Already Approved Standard	Proposed Replacement Requirement(s)

Implementation Plan for Reliability Coordination Standards

IRO-005-2

R15. Each Reliability Coordinator who foresees a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area shall issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated.

R1. When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator that shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]

R2. The Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall g Authorities in its Reliability Coordinator Area when the problem has been mitigated. notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the transmission problem has been mitigated. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]

None—this requirement was moved to IRO-001-2

Formatted: Bullets and Numbering

Notes:

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R16. Each Reliability Coordinator shall confirm reliability assessment results and determine the effects within its own and adjacent Reliability Coordinator Areas. The Reliability Coordinator shall discuss options to mitigate potential or actual SOL or IROL violations and take actions as necessary to always act in the best interests of the Interconnection at all times. <i>[Violation Risk Factor: High]</i></p> <p>R17. When an IROL or SOL is exceeded, the Reliability Coordinator shall evaluate the local and wide-area impacts, both real-time and post-contingency, and determine if the actions being taken are appropriate and sufficient to return the system to within IROL in thirty minutes. If the actions being taken are not appropriate or sufficient, the Reliability Coordinator shall direct the Transmission Operator, Balancing Authority, Generator Operator, or Load-Serving Entity to return the system to within IROL or SOL. <i>[Violation Risk Factor: High]</i></p>	<p>IRO-005-2</p> <p>None – The IROL SDT’s Implementation plan proposes retirement of R16 and R17.</p>
<p>Notes: IRO-005 R16 is a mix of requirements and the Missing Measures and Compliance Elements drafting team determined that, as written, R16 is too vague to be measured. The intent of this requirement is duplicated more clearly in IRO-008 and IRO-009.</p> <ul style="list-style-type: none"> ▪ IRO-005 R17 can lead the Reliability Coordinator to believe it has up to 30 minutes to relieve an IROL violation – but some IROLs have a T_v that is much shorter than 30 minutes. Note that the RC does not see all SOLs. 	

Implementation Plan for Reliability Coordination Standards

Functions that Must Comply with the Requirements in the Standards

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator	Load Serving Entity
IRO-005								

Effective Dates

In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.^{FBD}

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 3, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT began working on revisions to the standards in August 2007. The current posting contains revisions based on stakeholder comments on the third draft. The team is posting for a 30 day pre-ballot review.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on third posting	March 2010
2. Post Standards for pre-ballot period.	January 2011
3. Standards posted for initial and recirculation ballots.	February 2011
4. Standards sent to BOT for approval.	April 2011
5. Standards filed with regulatory authorities.	June 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Coordination Among Reliability Coordinators
2. **Number:** IRO-014-2
3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.
4. **Applicability:**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after Board of Trustees approval.

B. Requirements

- R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions that may impact other Reliability Coordinator Areas to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]
 - 1.1. Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.
 - 1.2. Energy and capacity shortages.
 - 1.3. Planned or unplanned outage information.
 - 1.4. Control of voltage, including the coordination of reactive resources.
 - 1.5. Coordination of information exchange to support reliability assessments.
 - 1.6. Authority to act to prevent and mitigate system conditions which could cause Adverse Reliability Impacts to other Reliability Coordinator Areas.
 - 1.7. Weekly conference calls
- R2. Each Reliability Coordinator shall maintain its Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Same Day Operations and Operations Planning*]
 - 2.1. Review and update annually with no more that 15 months between reviews.
 - 2.2. Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.

- 2.3.** Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.
- R3.** Each Reliability Coordinator shall make notifications and exchange reliability-related information with other Reliability Coordinators in accordance with the Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations and Operations Planning]*
- R4.** Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly (per Requirement 1, Part 1.7) with other Reliability Coordinators within the same Interconnection. *[Violation Risk Factor: Lower][Time Horizon: Real-time Operations]*
- R5.** Each Reliability Coordinator, upon identification of an Adverse Reliability Impact, shall notify all other Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R6.** During each instance where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact each impacted Reliability Coordinator shall operate as though the problem exists. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R7.** During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, the Reliability Coordinator that identified the Adverse Reliability Impact shall develop an action plan to resolve the Adverse Reliability Impact. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R8.** When a Reliability Coordinator has identified an Adverse Reliability Impact and the other Reliability Coordinators disagree on an action plan, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*

C. Measures

- M1.** Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Processes, and Operating Plans that require notifications, information exchange or the coordination of actions among impacted Reliability Coordinators for conditions or activities that impact other Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements. (R1)
- M2.** Each Reliability Coordinator shall have dated evidence that the Operating Procedures, Processes, and Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were:
- 2.1** Reviewed and updated annually with no more than 15 months between reviews.

- 2.2** Agreed to, in writing, by all the Reliability Coordinators required to take the indicated action(s).
- 2.3** Distributed within 30 days of an update to all Reliability Coordinators that are required to take the indicated action(s).

This evidence may include, but is not limited to dated documentation with confirmation of receipt, dated notice of acceptance or agreement to take specified actions, or dated electronic communications with confirmation of receipt and acceptance or agreement to take specified actions. (R2)

- M3.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it made notifications and exchanged reliability-related information with impacted Reliability Coordinators in accordance with the Operating Procedures, Processes, or Plans identified in Requirement R1. (R3)
- M4.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it participated in agreed upon (at least weekly) conference calls with other Reliability Coordinators within the same Interconnection. (R4)
- M5.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it, upon identification of an Adverse Reliability Impact, notified impacted Reliability Coordinators. (R5)
- M6.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it operated under the assumption that the Adverse Reliability Impact existed during each instance where Reliability Coordinators disagreed on the existence of an Adverse Reliability Impact. (R6)
- M7.** Each Reliability Coordinator that identified an Adverse Reliability Impact shall have evidence and provide evidence that it developed an action plan during those instances where Reliability Coordinators disagreed on the existence of an Adverse Reliability Impact. This evidence may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation. (R7)
- M8.** Each impacted Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it implemented the action plan developed by the Reliability Coordinator who has the identified the Adverse Reliability Impact when a Reliability Coordinator has identified an Adverse

Reliability Impact and the impacted Reliability Coordinators disagree on an action unless such actions would have violated safety, equipment, or regulatory or statutory requirements. (R8)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Compliance Monitoring Period and Reset Time Frame

Not Applicable

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Reliability Coordinator shall retain its current, in force document and any documents in force since the last compliance audit for Requirements R1, R2, and Measures M1, M2.
- Each Reliability Coordinator shall retain its most recent 12 months of evidence for Requirement R3, R4, R5 and Measure M3, M4, M5.
- Each Reliability Coordinator shall retain 3 calendar years plus current calendar year of evidence for Requirements R6 through R8 and Measures M6 through M8.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant, or for the time period specified above, whichever is longer.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address one of the topical areas identified in Parts 1.1 through 1.7..	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address two of the topical areas identified in Parts 1.1 through 1.7.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address three of the topical areas identified in Parts 1.1 through 1.7.	The Reliability Coordinator failed to have Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability to address three or more of the topical areas identified in Parts 1.1 through 1.7.
R2	N/A	The Reliability Coordinator Operating Procedures, Operating Processes, or Operating Plans identified in R1 but failed to distributed these to all Reliability Coordinators that are required to take action.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in R1 but failed to obtain agreement from all Reliability Coordinators that are required to take action. OR Failed to review and update the Operating Procedures, Operating Processes, and Operating Plans identified in R1 annually.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in R1 but failed to review and update annually and obtain written agreement from all Reliability Coordinators that are required to take action and failed to distribute these to all Reliability Coordinators that are required to take action.
R3	N/A	N/A	The Reliability Coordinator failed to make notifications OR exchange reliability-related information with impacted Reliability Coordinators.	The Reliability Coordinator failed to make notifications AND exchange reliability-related information with impacted Reliability Coordinators.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	N/A	N/A	N/A	The Reliability Coordinator failed to participate in an agreed upon (at least weekly) conference call with impacted Reliability Coordinators within the same Interconnection.
R5	N/A	The Reliability Coordinator failed to notify one, but not all, of the impacted Reliability Coordinators upon identification of an Adverse Reliability Impact.	N/A	<p>The Reliability Coordinator failed to notify more than one impacted Reliability Coordinators upon identification of an Adverse Reliability Impact.</p> <p>OR</p> <p>The Reliability Coordinator failed to notify the impacted Reliability Coordinator (when there is only one impacted Reliability Coordinator) upon identification of an Adverse Reliability Impact.</p>
R6	N/A	N/A	N/A	The Reliability Coordinator failed to operate under the assumption that the Adverse Reliability Impact existed during an instance where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact..

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R7	N/A	N/A	N/A	The Reliability Coordinator that identified the Adverse Reliability Impact failed to develop an action plan to resolve the Adverse Reliability Impact during an instance where Reliability Coordinators disagreed on the existence of an Adverse Reliability Impact.
R8	N/A	N/A	N/A	The Reliability Coordinator failed to implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact when a Reliability Coordinator has identified an Adverse Reliability Impact and the impacted Reliability Coordinators disagree on an action plan

E. Regional Differences

None identified.

F. Associated Documents**Version History**

Version	Date	Action	Change Tracking
1	August 10, 2005	<ol style="list-style-type: none"> 1. Changed incorrect use of certain hyphens (-) to “en dash (-).” 2. Hyphenated “30-day” when used as adjective. 3. Changed standard header to be consistent with standard “Title.” 4. Initial capped heading “Definitions of Terms Used in Standard.” 5. Added “periods” to items where appropriate. 6. Changed “Timeframe” to “Time Frame” in item D, 1.2. 7. Lower cased all words that are not “defined” terms — drafting team, self-certification. 8. Changed apostrophes to “smart” symbols. 9. Added comma in all word strings “Procedures, Processes, or Plans,” etc. 10. Added hyphens to “Reliability Coordinator-to-Reliability Coordinator” where used as adjective. 11. Removed comma in item 2.1.2. 12. Removed extra spaces between words where appropriate. 	January 20, 2006
1	February 7, 2006	Approved by BOT	Revised
1	April 4, 2007	Regulatory Approval — Effective Date	New
2	TBD	Revised per SAR for Project 2006-6, RC SDT	Revised

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.

10. Third posting of revised standards on January 4, 2010 with comment period closed on February 3, 2010.

Proposed Action Plan and Description of Current Draft:

The SDT began working on revisions to the standards in August 2007. The current posting contains revisions based on stakeholder comments on the ~~second~~third draft. The team is ~~seeking comments on the revised standards~~posting for a 30 day pre-ballot review.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments on third posting	March 2010
2. Post Standards for pre-ballot period.	April 2010 <u>January 2011</u>
3. Standards posted for initial and recirculation ballots.	May 2010 <u>February 2011</u>
4. Standards sent to BOT for approval.	July 2010 <u>April 2011</u>

5. Standards filed with regulatory authorities.

~~September 2010~~June 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Coordination Among Reliability Coordinators
2. **Number:** IRO-014-2
3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.
4. **Applicability:**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after Board of Trustees approval.

B. Requirements

- R1. ~~For conditions or activities that impact other Reliability Coordinator Areas,~~ Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions ~~with impacted~~that may impact other Reliability ~~Coordinators~~Coordinator Areas to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: [*Violation Risk Factor: Medium*] [*Time Horizon: ~~Same Day Operations and Operations Planning~~*]
 - 1.1. Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.
 - 1.2. Energy and capacity shortages.
 - 1.3. Planned or unplanned outage information.
 - 1.4. Control of voltage, including the coordination of reactive resources.
 - 1.5. Coordination of information exchange to support reliability assessments.
 - 1.6. Authority to act to prevent and mitigate system conditions which could cause Adverse Reliability Impacts to other Reliability Coordinator Areas.
 - 1.7. Weekly conference calls
- R2. Each Reliability ~~Coordinator's~~Coordinator shall maintain its Operating ~~Procedure,~~ ~~Process~~Procedures, Operating Processes, or Plan that requires one or more other Reliability ~~Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions)~~shall be Operating Plans identified in Requirement R1 as follows:

[Violation Risk Factor: Lower] [Time Horizon: Same Day Operations and Operations Planning]

2.1. Agreed to by all Review and update annually with no more than 15 months between reviews.

~~2.1.2.2.~~ Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.

~~2.2.2.3.~~ ~~Distributed~~ Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.

- R3. ~~For conditions or activities that impact other Reliability Coordinator Areas.~~ Each Reliability Coordinator shall make notifications and exchange reliability-related information with impacted other Reliability Coordinators using its predefined in accordance with the Operating Procedures, Operating Processes, or Operating Plans for conditions that may impact other Reliability Coordinator Areas or other means to accomplish the notifications and exchange of reliability-related information identified in Requirement R1. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations and Operations Planning]*
- R4. Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly, and (per Requirement 1, Part 1.7) with other communication forums with impacted Reliability Coordinators within the same Interconnection. *[Violation Risk Factor: Lower][Time Horizon: Real-time Operations]*
- R5. Each Reliability Coordinator, upon identification of an Adverse Reliability Impact, shall notify all impacted other Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R6. During each instance where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact each impacted Reliability Coordinator shall operate as though the problem exists when the identified Adverse Reliability Impact cannot be agreed to by the impacted Reliability Coordinators. *[Violation Risk Factor: Medium/High] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R7. ~~The~~ During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, the Reliability Coordinator with the that identified the Adverse Reliability Impact shall develop a mitigation action plan when the impacted Reliability Coordinators can not agree that to resolve the problem exists Adverse Reliability Impact. *[Violation Risk Factor: Medium/High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R8. ~~Each impacted~~ When a Reliability Coordinator has identified an Adverse Reliability Impact and the other Reliability Coordinators disagree on an action plan, each Reliability Coordinator shall implement the mitigation action plan developed by the Reliability Coordinator who has the that identified Adverse Reliability Impact when the impacted Adverse Reliability Coordinators can not agree on a mitigation plan Impact unless such actions would violate safety, equipment, or regulatory or statutory

requirements. [Violation Risk Factor: ~~Medium~~High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]

C. Measures

- M1.** Each Reliability Coordinator shall have available the latest approved documented version of ~~its~~ Operating Procedures, Processes, ~~or~~and Operating Plans that require notifications, information exchange or the coordination of actions among impacted Reliability Coordinators for conditions or activities that impact other Reliability Coordinator Areas. This documentation ~~may~~shall include, ~~but is not limited to,~~ dated, current in force documentation with the specified elements. (R1)
- M2.** Each Reliability Coordinator shall have dated evidence that the Operating Procedures, Processes, ~~or~~and Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were:
- 2.1 Reviewed and updated annually with no more than 15 months between reviews.
- ~~2.1.2~~ 2.1.2 Agreed to, in writing, by all the Reliability Coordinators required to take the indicated action(s).
- ~~2.2.3~~ 2.2.3 Distributed within 30 days of an update to all Reliability Coordinators that are required to take the indicated action(s).
- This evidence may include, but is not limited to dated ~~document~~documentation with confirmation of receipt, dated notice of acceptance or agreement to take specified actions, or dated electronic communications with confirmation of receipt and acceptance or agreement to take specified actions. (R2)
- M3.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it made notifications and exchanged reliability-related information with impacted Reliability Coordinators ~~using its predefined in accordance with the~~ Operating Procedures, Processes, or Plans ~~for conditions or activities that impact other Reliability Coordinator Areas or other means to accomplish the notifications and exchange of reliability related information identified in Requirement R1~~. (R3)
- M4.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it participated in agreed upon (at least weekly) conference calls ~~and with~~ other ~~communication forums with impacted~~ Reliability Coordinators within the same Interconnection. (R4)
- M5.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it, upon identification of an Adverse Reliability Impact, notified impacted Reliability Coordinators. (R5)

- M6.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it operated ~~as though~~ under the ~~problem exists when~~ assumption that the ~~identified~~ Adverse Reliability Impact ~~was not agreed to by the impacted~~ existed during each instance where Reliability Coordinators ~~disagreed on the existence of an Adverse Reliability Impact~~. (R6)
- M7.** Each Reliability Coordinator ~~with the~~ that identified an Adverse Reliability Impact shall have evidence and provide evidence that it developed ~~a mitigation~~ an action plan ~~when the impacted during those instances where~~ Reliability Coordinators ~~could not agree that the problem exists~~ disagreed on the existence of an Adverse Reliability Impact. This evidence may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation. (R7)
- M8.** Each impacted Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated and timestamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it implemented the ~~mitigation~~ action plan developed by the Reliability Coordinator who has the identified ~~the~~ Adverse Reliability Impact when a Reliability Coordinator has identified an Adverse Reliability Impact and the impacted Reliability Coordinators ~~can not agree~~ disagree on ~~a mitigation plan~~ an action unless such actions would have violated safety, equipment, or regulatory or statutory requirements. (R8)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Compliance Monitoring Period and Reset Time Frame

Not Applicable

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- o Each Reliability Coordinator shall retain its current, in force document and any documents in force since the last compliance audit for ~~all~~ Requirements R1, R2, and Measures M1, M2.
- o Each Reliability Coordinator shall retain its most recent 12 months of evidence for Requirement R3, R4, R5 and Measure M3, M4, M5.
- o Each Reliability Coordinator shall retain 3 calendar years plus current calendar year of evidence for Requirements R6 through R8 and Measures M6 through M8.
- o If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant, or for the time period specified above, whichever is longer.
- o The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	<p>The Reliability Coordinator has Operating Procedures, <u>Operating Processes</u>, or <u>Operating Plans</u> in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address one or two of the parts of the topical areas identified in Parts 1.1 through 1.7.</p>	<p>The Reliability Coordinator has Operating Procedures, <u>Operating Processes</u>, or <u>Operating Plans</u> in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address three or four <u>two</u> of the part <u>topical areas identified in Parts 1.1 through 1.7.</u></p>	<p>The Reliability Coordinator has Operating Procedures, <u>Operating Processes</u>, or <u>Operating Plans</u> in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address five <u>three</u> of the part <u>topical areas identified in Parts 1.1 through 1.7.</u></p>	<p>The Reliability Coordinator failed to have Operating Procedures, <u>Operating Processes</u>, or <u>Operating Plans</u> in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability -to address three or more of the topical areas identified in Parts 1.1 through 1.7.</p>
R2	N/A	<p>The Reliability Coordinator failed to have evidence that the <u>Operating Procedures, Operating Processes, or Operating Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were identified in R1 but failed to</u> distributed these to all Reliability Coordinators that are required to take action.</p>	<p>The Reliability Coordinator failed to have evidence that the <u>has</u> Operating Procedures, Operating Processes, or Operating Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were agreed to <u>by identified in R1 but failed to obtain agreement from</u> all Reliability Coordinators that are required to take action. <u>OR</u> <u>Failed to review and update the Operating Procedures, Operating Processes, and Operating Plans identified in R1 annually.</u></p>	<p>The Reliability Coordinator failed to have evidence that the <u>has</u> Operating Procedures, Operating Processes, or Operating Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were agreed to <u>by identified in R1 but failed to review and update annually and obtain written agreement from</u> all Reliability Coordinators that are required to take action and were distributed <u>failed to distribute these</u> to all Reliability Coordinators that are required to take action.</p>

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Prerequisite Approvals

- None required

Conforming Changes to Requirements in Already Approved Standards

- IRO-001-2 — Reliability Coordination — Responsibilities and Authorities
- IRO-015-1 — Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 — Coordination of Real-time Activities between Reliability Coordinators

Revision Summary

The Reliability Coordination SDT (RC SDT) revised the standard and is proposing retiring two requirements (R3 and R4). New requirements were brought into this standard from IRO-015-1 (R1-R2) and IRO-016-1 (R1 and its sub requirements). Changes were made to eliminate redundancies between standards (existing and proposed), eliminate administrative items, align with NERCs Rules of Procedure and to address issues in FERC Order 693.

Functions that Must Comply with the Requirements in the Standard

- Reliability Coordinator

Effective Dates

In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after Board of Trustees approval.

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R7. The Reliability Coordinator shall have clear, comprehensive coordination agreements with adjacent Reliability Coordinators to ensure that System Operating Limit or Interconnection Reliability Operating Limit violation mitigation requiring actions in adjacent Reliability Coordinator Areas are coordinated.</p>	<p>IRO-014-2</p> <p>R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: <i>[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]</i></p> <p>1.1. Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.</p> <p>1.2. Energy and capacity shortages.</p> <p>1.3. Planned or unplanned outage information.</p> <p>1.4. Control of voltage, including the coordination of reactive resources for voltage control.</p> <p>1.5. Coordination of information exchange to support reliability assessments.</p> <p>1.6. Authority to act to prevent and mitigate system conditions which could instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas.</p>
<p>Notes: The RC SDT proposes retiring R7 as it is redundant with IRO-014, R1.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R1. The Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: <i>[Violation Risk Factor: Lower]</i></p> <p>R1.1.1 Communications and notifications, including the conditions¹ under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1.2 Energy and capacity shortages. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1.3 Planned or unplanned outage information. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1.4 Voltage control, including the coordination of reactive resources for voltage control. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1.5 Coordination of information exchange to support reliability assessments. <i>[Violation Risk Factor: Lower]</i></p> <p>R1.1.6 Authority to act to prevent and mitigate instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas. <i>[Violation Risk Factor: Lower]</i></p>	<p>IRO-14-2</p> <p>R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: <i>[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]</i></p> <p>1.1 Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.</p> <p>1.2 Energy and capacity shortages.</p> <p>1.3 Planned or unplanned outage information.</p> <p>1.4 Control of voltage, including the coordination of reactive resources for voltage control.</p> <p>1.5 Coordination of information exchange to support reliability assessments.</p> <p>Authority to act to prevent and mitigate system conditions which could cause Adverse Reliability Impacts to other Reliability Coordinator Areas.</p>
<p>Notes: Revise R1 as shown and delete the footnote.</p>	

¹ Examples of conditions when one Reliability Coordinator may need to notify another Reliability Coordinator may include (but aren't limited to) sabotage events, Interconnection Reliability Operating Limit violations, voltage reductions, insufficient resources, arming of special protection systems, etc.

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R2. Each Reliability Coordinator's Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be:</p> <p>R2.1. Agreed to by all the Reliability Coordinators required to take the indicated action(s).</p> <p>R2.2. Distributed to all Reliability Coordinators that are required to take the indicated action(s).</p>	<p>IRO-014-2</p> <p>R2. Each Reliability Coordinator's Operating Procedure, Operating Process, or Operating Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be: [<i>Violation Risk Factor: Lower</i>] [<i>Time Horizon: Same Day Operations Planning and Long-term Planning</i>]</p> <p>2.1 Agreed to by all the Reliability Coordinators required to take the indicated action(s). [<i>Violation Risk Factor: Lower</i>]</p> <p>2.2 Distributed to all Reliability Coordinators that are required to take the indicated action(s). [<i>Violation Risk Factor: Lower</i>]</p>
<p>Notes: The RC SDT added a Time Horizon to the requirement and eliminated the VRFs that were applied to the subrequirements.</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R3. A Reliability Coordinator's Operating Procedures, Processes, or Plans developed to support a Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan shall include:</p> <p>R3.1. A reference to the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.</p> <p>R3.2. The agreed-upon actions from the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.</p>	<p>None – Retire the requirement</p>
<p>Notes: This requirement is administrative in nature describing the contents of the plans and should not be in a standard. The RC SDT proposes retiring R3 and its subrequirements and recommends converting these good utility practices into a guideline document for use in developing the operating procedures, processes or plans.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R4. Each of the Operating Procedures, Processes, and Plans addressed in Reliability Standard IRO-014 Requirement 1 and Requirement 3 shall:</p> <p>R4.1. Include version control number or date.</p> <p>R4.2. Include a distribution list.</p> <p>R4.3. Be reviewed, at least once every three years, and updated if needed</p>	<p>None – retire the requirement.</p>
<p>Notes: This requirement is administrative in nature describing the contents of the plans and should not be in a standard. The RC SDT proposes retiring R4 and its subrequirements and recommends converting these good utility practices into a guideline document for use in developing the operating procedures, processes or plans.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-015-1</p> <p>R1. The Reliability Coordinator shall follow its Operating Procedures, Processes, or Plans for making notifications and exchanging reliability-related information with other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 The Reliability Coordinator shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas. <i>[Violation Risk Factor: Medium]</i></p> <p>R2. The Reliability Coordinator shall participate in agreed upon conference calls and other communication forums with adjacent Reliability Coordinators. <i>[Violation Risk Factor: Lower]</i></p> <p>R2.1 The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly. <i>[Violation Risk Factor: Lower]</i></p> <p>R3. The Reliability Coordinator shall provide reliability-related information as requested by other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-014-2</p> <p>R3. For conditions or activities that impact other Reliability Coordinator Areas, Each Reliability Coordinator shall make notifications and exchange reliability-related information with impacted Reliability Coordinators using its predefined Operating Procedures, Operating Processes, or Operating Plans for conditions that may impact other Reliability Coordinator Areas or other means to accomplish the notifications and exchange of reliability-related information. <i>[Violation Risk Factor: Medium]</i> [Time Horizon: Real-time Operations and Operations Planning]</p> <p>R4. Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly, and other communication forums with Reliability Coordinators within the same Interconnection. <i>[Violation Risk Factor: Lower]</i> [Time Horizon: Real-time Operations]</p>
<p>The RC SDT recommends retiring Standard IRO-015 and moving Requirements R1 and R2 to IRO-014-2 and revising as shown.</p> <p>The RC SDT proposes retiring R3 (as shown in the left column) as it is redundant with proposed R5 above. Reliability Coordinators already have several requirements aimed at providing data or information to other Reliability Coordinators in support of Reliability Coordinator responsibilities. For example, Reliability Coordinators provide reliability-related information to other Reliability Coordinators as part of IRO-010-1, R3 – they share information as they try to confirm the existence of operating issues as part of IRO-014-2 R5, etc.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-016-1</p> <p>R1. The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2 If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.). <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2.1 If time permits, this re-evaluation shall be done before taking corrective actions. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2.2 If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.3 If the involved Reliability Coordinators cannot agree on the solution, the more conservative solution shall be implemented. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-014-2</p> <p>R5. Each Reliability Coordinator, upon identification of an Adverse Reliability Impact, shall notify all impacted Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i> <i>[Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>R6. Each impacted Reliability Coordinator shall operate as though the problem exists when the identified Adverse Reliability Impact cannot be agreed to by the impacted Reliability Coordinators <i>[Violation Risk Factor: High]</i> <i>[Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>R7. The Reliability Coordinator with the identified Adverse Reliability Impact shall develop a mitigation plan when the impacted Reliability Coordinators cannot agree that the problem exists. <i>[Violation Risk Factor: High]</i> <i>[Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>R8. Each impacted Reliability Coordinator shall implement the mitigation plan developed by the Reliability Coordinator who has the identified Adverse Reliability Impact when the impacted Reliability Coordinators cannot agree on a mitigation plan unless such actions would violate safety, equipment, regulatory or statutory requirements. <i>[Violation Risk Factor: High]</i> <i>[Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p>
<p>Notes: IRO-014-2 R5 and R6 are revised versions of IRO-016-1, R1 and its subrequirements which were moved to this standard. The RC SDT removed the wording relating to the “most conservative solution” because it can not be measured. We are proposing to use the mitigation plan of the RC who is experiencing the issue in cases where an agreed to mitigation plan can not be developed. Note that stakeholders proposed revisions to these requirements, and the RC SDT subdivided the requirements to add more clarity.</p>	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
IRO-016-1 R2. The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both.	IRO-014-2 Retire the requirement as it is a measure of Requirement R1.
Notes:	

Implementation Plan for IRO-014-2 — Coordination Among Reliability Coordinators

Prerequisite Approvals

- None required

Conforming Changes to Requirements in Already Approved Standards

- IRO-001-2 — Reliability Coordination — Responsibilities and Authorities
- IRO-015-1 — Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 — Coordination of Real-time Activities between Reliability Coordinators

Revision Summary

The Reliability Coordination SDT (RC SDT) revised the standard and is proposing retiring two requirements (R3 and R4). New requirements were brought into this standard from IRO-015-1 (R1-R2) and IRO-016-1 (R1 and its sub requirements). Changes were made to eliminate redundancies between standards (existing and proposed), eliminate administrative items, align with NERC's Rules of Procedure and to address issues in FERC Order 693.

Functions that Must Comply with the Requirements in the Standard:

- Reliability Coordinator

Effective Dates

~~To be determined.~~

In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after Board of Trustees approval.

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-001-1</p> <p>R7. The Reliability Coordinator shall have clear, comprehensive coordination agreements with adjacent Reliability Coordinators to ensure that System Operating Limit or Interconnection Reliability Operating Limit violation mitigation requiring actions in adjacent Reliability Coordinator Areas are coordinated.</p>	<p>IRO-014-2</p> <p>R1. The Each Reliability Coordinator shall have Operating Procedures, <u>Operating</u> Processes, or <u>Operating</u> Plans for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: <i>[Violation Risk Factor: Medium]</i> <i>[Time Horizon: Same Day Operations and Operations Planning]</i></p> <ol style="list-style-type: none"> 1.1. Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators. 1.2. Energy and capacity shortages. 1.3. Planned or unplanned outage information. 1.4. <u>Control of V</u>voltage control, including the coordination of reactive resources for voltage control. 1.5. Coordination of information exchange to support reliability assessments. 1.6. Authority to act to prevent and mitigate <u>system conditions which could instances of causing</u> Adverse Reliability Impacts to other Reliability Coordinator Areas.
<p>Notes: The RC_SDT proposes retiring R7 as it is redundant with IRO-014, R1.</p>	
Already Approved Standard	Proposed Replacement Requirement(s)

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

IRO-014-1

R1. The Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators. [Violation Risk Factor: Medium]

R1.1 These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: [Violation Risk Factor: Lower]

R1.1.1 Communications and notifications, including the conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators. [Violation Risk Factor: Medium]

R1.1.2 Energy and capacity shortages. [Violation Risk Factor: Medium]

R1.1.3 Planned or unplanned outage information. [Violation Risk Factor: Medium]

R1.1.4 Voltage control, including the coordination of reactive resources for voltage control. [Violation Risk Factor: Medium]

R1.1.5 Coordination of information exchange to support reliability assessments. [Violation Risk Factor: Lower]

R1.1.6 Authority to act to prevent and mitigate instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas. [Violation Risk Factor: Lower]

July 30, 2008; July 10, 2009; December 30, 2009; August 25, 2010; January 18, 2011

IRO-14-2

R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]

1.1 Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.

1.2 Energy and capacity shortages.

1.3 Planned or unplanned outage information.

1.4 Control of voltage, including the coordination of reactive resources for voltage control.

1.5 Coordination of information exchange to support reliability assessments.

Authority to act to prevent and mitigate system conditions which could instances of causing Adverse Reliability Impacts to other Reliability Coordinator Areas. ~~R1. The Each Reliability Coordinator shall have Operating Procedures, Processes, or Plans in place for activities that require notification, exchange of information or coordination of actions with impacted with one or more other Reliability Coordinators to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators. These Operating Procedures, Processes, or Plans shall collectively address the following: [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]~~

R1.1 These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: [Violation Risk Factor: Lower]

R1.1.1 Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators. [Violation Risk Factor: Medium]

R1.1.2 Energy and capacity shortages. [Violation Risk Factor: Medium]

R1.1.3 Planned or unplanned outage information. [Violation Risk Factor: Medium]

R1.1.4 Control of Voltage control, including the coordination of reactive

Coordination Among Reliability Coordinators**

Notes:

Revise R1 as shown and delete the footnote.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R2. Each Reliability Coordinator's Operating Procedure, Process, or Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be:</p> <p>R2.1. Agreed to by all the Reliability Coordinators required to take the indicated action(s).</p> <p>R2.2. Distributed to all Reliability Coordinators that are required to take the indicated action(s).</p>	<p>IRO-014-2</p> <p>R2. Each Reliability Coordinator's Operating Procedure, <u>Operating</u> Process, or <u>Operating</u> Plan that requires one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) shall be: [Violation Risk Factor: Lower] [Time Horizon: Same Day Real-time Operations Planning and Operations-Long-term Planning]</p> <p>R2.1 Agreed to by all the Reliability Coordinators required to take the indicated action(s). [Violation Risk Factor: Lower]</p> <p>R2.2 Distributed to all Reliability Coordinators that are required to take the indicated action(s). [Violation Risk Factor: Lower]</p>
<p>Notes: The RC SDT added a Time Horizon to the requirement and eliminated the VRFs that were applied to the subrequirements.</p>	

Interconnection Reliability Operating Limit violations, voltage reductions, insufficient resources, arming of special protection systems, etc.

July 30, 2008, July 10, 2009, December 30, 2009, August 25, 2010, January 18, 2011

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1</p> <p>R3. A Reliability Coordinator's Operating Procedures, Processes, or Plans developed to support a Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan shall include:</p> <p>R3.1. A reference to the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.</p> <p>R3.2. The agreed-upon actions from the associated Reliability Coordinator-to-Reliability Coordinator Operating Procedure, Process, or Plan.</p>	<p>None – Retire the requirement</p>
<p>Notes: This requirement is administrative in nature describing the contents of the plans and should not be in a standard. The RC SDT proposes retiring R3 and its subrequirements and recommends converting these good utility practices into a guideline document for use in developing the operating procedures, processes or plans.</p>	

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-014-1 R4. Each of the Operating Procedures, Processes, and Plans addressed in Reliability Standard IRO-014 Requirement 1 and Requirement 3 shall: R4.1. Include version control number or date. R4.2. Include a distribution list. R4.3. Be reviewed, at least once every three years, and updated if needed</p>	<p>None – retire the requirement.</p>
<p>Notes: This requirement is administrative in nature describing the contents of the plans and should not be in a standard. The RC SDT proposes retiring R4 and its subrequirements and recommends converting these good utility practices into a guideline document for use in developing the operating procedures, processes or plans.</p>	

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-015-1</p> <p>R1. The Reliability Coordinator shall follow its Operating Procedures, Processes, or Plans for making notifications and exchanging reliability-related information with other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 The Reliability Coordinator shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas. <i>[Violation Risk Factor: Medium]</i></p> <p>R2. The Reliability Coordinator shall participate in agreed upon conference calls and other communication forums with adjacent Reliability Coordinators. <i>[Violation Risk Factor: Lower]</i></p> <p>R2.1 The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly. <i>[Violation Risk Factor: Lower]</i></p> <p>R3. The Reliability Coordinator shall provide reliability-related information as requested by other Reliability Coordinators. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-014-2</p> <p>R5R3. <u>For conditions or activities that impact other Reliability Coordinator Areas</u>, The Each Reliability Coordinator shall make notifications and exchange reliability-related information with impacted Reliability Coordinators using its predefined Operating Procedures, <u>Operating</u> Processes, or <u>Operating</u> Plans for conditions that may impact other Reliability Coordinator Areas or other means to accomplish the notifications and exchange of reliability-related information. <i>[Violation Risk Factor: Medium]</i> <u>[Time Horizon: Real-time Operations and Operations Planning]</u></p> <p>R6R4. The Each Reliability Coordinator shall participate in agreed upon conference calls, <u>at least weekly</u>, and other communication forums with <u>impacted adjacent</u> Reliability Coordinators <u>within the same Interconnection</u>. <i>[Violation Risk Factor: Lower]</i> <u>[Time Horizon: Real-time Operations]</u></p> <p>R6.1 The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly. <i>[Violation Risk Factor: Lower]</i></p>
<p>The RC SDT recommends retiring Standard IRO-015 and moving Requirements R1 and R2 to IRO-014-2 and revising as shown.</p> <p>The RC SDT proposes retiring R3 (as shown in the left column) as it is redundant with proposed R5 above. Reliability Coordinators already have several requirements aimed at providing data or information to other Reliability Coordinators in support of Reliability Coordinator responsibilities. For example, Reliability Coordinators provide reliability-related information to other Reliability Coordinators as part of IRO-010-1, R3 – they share information as they try to confirm the existence of operating issues as part of IRO-014-2 R5, etc.</p>	

Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators

Already Approved Standard	Proposed Replacement Requirement(s)
---------------------------	-------------------------------------

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

<p>IRO-016-1</p> <p>R1. The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2 If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.). <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2.1 If time permits, this re-evaluation shall be done before taking corrective actions. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2.2 If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.3 If the involved Reliability Coordinators cannot agree on the solution, the more conservative solution shall be implemented. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-014-2</p> <p>R5. When an expected or actual reliability issue is detected, theEach Reliability Coordinator, upon identification of an Adverse Reliability Impact, shall confirm the existence of the issue with thenotify all impacted other Reliability Coordinators that are involved. In the event that the issue cannot be confirmed, each RC shall operate as though the problem exists. <i>[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>R6. When an expected or actual reliability issue exists and theEach impacted affected Reliability Coordinators shall operate as though the problem exists when the identified Adverse Reliability Impact cannot be agreed to by the impacted Reliability Coordinators. can not agree on a mitigation plan, all impacted affected Reliability Coordinators shall implement the mitigation plan developed by the Reliability Coordinator who has the reliability issue. <i>[Violation Risk Factor: HighMedium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>▪ R7. The Reliability Coordinator with the identified Adverse Reliability Impact shall develop a mitigation plan when the impacted Reliability Coordinators can not agree that the problem exists. <i>[Violation Risk Factor: HighMedium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>R8. Each impacted Reliability Coordinator shall implement the mitigation plan developed by the Reliability Coordinator who has the identified Adverse Reliability Impact when the impacted Reliability Coordinators can not agree on a mitigation plan unless such actions would violate safety, equipment, regulatory or statutory requirements. <i>[Violation Risk Factor: HighMedium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p>
--	---

Implementation Plan for IRO-014-2 Coordination Among Reliability Coordinators

Notes: IRO-014-2 R5 and R6 are revised versions of IRO-016-1, R1 and its subrequirements which were moved to this standard. The RC SDT removed the wording relating to the “most conservative solution” because it can not be measured. We are proposing to use the mitigation plan of the RC who is experiencing the issue in cases where an agreed to mitigation plan can not be developed. Note that stakeholders proposed revisions to these requirements, and the RC SDT subdivided the requirements to add more clarity.

July 30, 2008 July 10 December 30, 2009 August 25, 2010 January 18, 2011

**Implementation Plan for IRO-014-2
Coordination Among Reliability Coordinators**

<u>Already Approved Standard</u>	<u>Proposed Replacement Requirement(s)</u>
<u>IRO-016-1</u> <u>R2. The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both.</u>	<u>IRO-014-2</u> <u>Retire the requirement as it is a measure of Requirement R1.</u>
<u>Notes:</u>	

A. Introduction

1. **Title:** Notifications and Information Exchange Between Reliability Coordinators
2. **Number:** IRO-015-1
3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.
4. **Applicability:**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** ~~June 4, 2007~~ TBD

B. Requirements

- ~~R1. The Reliability Coordinator shall follow its Operating Procedures, Processes, or Plans for making notifications and exchanging reliability related information with other Reliability Coordinators. *[Violation Risk Factor: Medium]*~~
 - ~~R1.1. The Reliability Coordinator shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas. *[Violation Risk Factor: Medium]*~~
- ~~R2. The Reliability Coordinator shall participate in agreed upon conference calls and other communication forums with adjacent Reliability Coordinators. *[Violation Risk Factor: Lower]*~~
 - ~~R2.1. The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly. *[Violation Risk Factor: Lower]*~~
- ~~R3. The Reliability Coordinator shall provide reliability related information as requested by other Reliability Coordinators. *[Violation Risk Factor: Medium]*~~

The RCSDT recommends retiring Standard IRO-015 and moving all requirements to IRO-014-2.

C. Measures

- M1. The Reliability Coordinator shall have evidence (such as operator logs or other data sources) it has followed its Operating Procedures, Processes, or Plans for notifying other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.
- M2. The Reliability Coordinator shall have evidence (such as operator logs or other data sources) that it participated in agreed upon (at least weekly) conference calls and other communication forums with adjacent Reliability Coordinators.
- M3. The Reliability Coordinator shall have evidence that it provided requested reliability-related information to other Reliability Coordinators.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

1.2. Compliance Monitoring Period and Reset Time Frame

The Performance Reset Period shall be one calendar year.

1.3. Data Retention

The Reliability Coordinator shall keep auditable documentation for a rolling 12 months. The Compliance Monitor shall keep compliance data for a minimum of three years or until the Reliability Coordinator has achieved full compliance — whichever is longer.

1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor shall also use a scheduled on-site review at least once every three years and investigations upon complaint. The Compliance Monitor shall conduct an investigation upon a complaint within 30 days of the alleged infraction's discovery date. The Compliance Monitor shall complete the investigation within 45 days after the start of the investigation. As part of an audit or an investigation, the Compliance Monitor shall interview other Reliability Coordinators within the Interconnection and verify that the Reliability Coordinator being audited or investigated has been making notifications and exchanging reliability-related information according to agreed Operating Procedures, Processes, or Plans.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within five days of a request as part of an investigation upon complaint:

1.4.1 Evidence it has participated in agreed-upon conference calls or other communications forums.

1.4.2 Operating logs or other data sources that document notifications made to other Reliability Coordinators.

2. Levels of Non-Compliance

2.1. Level 1: Did not participate in agreed upon (at least weekly) conference calls and other communication forums with adjacent Reliability Coordinators.

2.2. Level 2: Did not notify other Reliability Coordinators as specified in its Operating Procedures, Processes, or Plans for making notifications but no Adverse Reliability Impacts resulted from the incident.

2.3. Level 3: Did not provide requested reliability-related information to other Reliability Coordinators.

- 2.4. Level 4:** Did not notify other Reliability Coordinators as specified in its Operating Procedures, Processes, or Plans for making notifications and Adverse Reliability Impacts resulted from the incident.

E. Regional Differences

None identified.

<p>Notes:</p>	

Implementation Plan for Reliability Coordination Standards

Functions that Must Comply with the Requirements in the Standards

Standard	Functions that Must Comply With the Requirements						
	Reliability Coordinator	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator
IRO-015	X						

Effective Dates

TBD

A. Introduction

1. **Title:** Coordination of Real-time Activities between Reliability Coordinators
2. **Number:** IRO-016-1
3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.
4. **Applicability:**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** TBD

B. Requirements

~~**R1.** The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem. *[Violation Risk Factor: Medium]*~~

The RCSDT proposes retiring this standard and having the requirements of R1 and its subrequirements moved into IRO-014 as R8 and R9.

~~**R1.1.** If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed upon solution, and notify the involved Reliability Coordinators of the action(s) taken. *[Violation Risk Factor: Medium]*~~

~~**R1.2.** If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.). *[Violation Risk Factor: Medium]*~~

~~**R1.2.1.** If time permits, this re-evaluation shall be done before taking corrective actions. *[Violation Risk Factor: Medium]*~~

~~**R1.2.2.** If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved. *[Violation Risk Factor: Medium]*~~

~~**R1.3.** If the involved Reliability Coordinators cannot agree on the solution, the more conservative solution shall be implemented. *[Violation Risk Factor: Medium]*~~

~~**R2.** The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both. *[Violation Risk Factor: Lower]*~~

Requirement 2 should be retired because it is a measure of performance of R1.

C. Measures

- M1.** The measure will be retired along with the requirement. ~~For each event that requires Reliability Coordinator-to-Reliability Coordinator coordination, each involved Reliability Coordinator shall have evidence (operator logs or other data sources) of the actions taken for either the event or for the disagreement on the problem or for both.~~

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

1.2. Compliance Monitoring Period and Reset Time Frame

The performance reset period shall be one calendar year.

1.3. Data Retention

The Reliability Coordinator shall keep auditable evidence for a rolling 12 months. In addition, entities found non-compliant shall keep information related to the non-compliance until it has been found compliant. The Compliance Monitor shall keep compliance data for a minimum of three years or until the Reliability Coordinator has achieved full compliance, whichever is longer.

1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor shall use a scheduled on-site review at least once every three years. The Compliance Monitor shall conduct an investigation upon a complaint that is received within 30 days of an alleged infraction's discovery date. The Compliance Monitor shall complete the investigation and report back to all involved Reliability Coordinators (the Reliability Coordinator that complained as well as the Reliability Coordinator that was investigated) within 45 days after the start of the investigation. As part of an audit or investigation, the Compliance Monitor shall interview other Reliability Coordinators within the Interconnection and verify that the Reliability Coordinator being audited or investigated has been coordinating actions to prevent or resolve potential, expected, or actual problems that adversely impact the Interconnection.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within five working days of a request as part of an investigation upon complaint:

- 1.4.1** Evidence (operator log or other data source) to show coordination with other Reliability Coordinators.

2. Levels of Non-Compliance

- 2.1. Level 1:** For potential, actual or expected events which required Reliability Coordinator-to-Reliability Coordinator coordination, the Reliability Coordinator did coordinate, but did not have evidence that it coordinated with other Reliability Coordinators.

- 2.2. Level 2:** Not applicable.
- 2.3. Level 3:** Not applicable.
- 2.4. Level 4:** For potential, actual or expected events which required Reliability Coordinator-to-Reliability Coordinator coordination, the Reliability Coordinator did not coordinate with other Reliability Coordinators.

E. Regional Differences

None identified.

F. Associated Documents

Version	Date	Action	Change Tracking
1	August 10, 2005	<ol style="list-style-type: none"> 1. Changed incorrect use of certain hyphens (-) to “en dash (–).” 2. Hyphenated “30-day” when used as adjective. 3. Changed standard header to be consistent with standard “Title.” 4. Initial capped heading “Definitions of Terms Used in Standard.” 5. Added “periods” to items where appropriate. 6. Changed “Timeframe” to “Time Frame” in item D, 1.2. 7. Lower cased all words that are not “defined” terms — drafting team, self-certification. 8. Changed apostrophes to “smart” symbols. 9. Added comma in all word strings “Procedures, Processes, or Plans,” etc. 10. Added hyphens to “Reliability Coordinator-to-Reliability Coordinator” where used as adjective. 11. Removed comma in item 2.1.2. 12. Removed extra spaces between words where appropriate. 	January 20, 2006

Implementation Plan for Reliability Coordination Standards

Implementation Plan Contents:

Prerequisite Approvals	2
Conforming Changes to Requirements in Already Approved Standards.....	2
Revisions or Retirements to Already Approved Standards	3
Effective Dates	7

Prerequisite Approvals

- None required

Conforming Changes to Requirements in Already Approved Standards

- IRO-014-2

Revision Summary

The RCSDT recommends retiring this Standard. The requirements listed in R1 and its sub-requirements were incorporated into IRO-014-2 as new requirements. The RCSDT recommends retiring R2 because it is a measure of performance of R1.

Revisions or Retirements to Already Approved Standards

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.

Already Approved Standard	Proposed Replacement Requirement(s)
----------------------------------	--

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-016-1, R1</p> <p>R1. The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.1 If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2 If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.). <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2.1 If time permits, this re-evaluation shall be done before taking corrective actions. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.2.2 If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved. <i>[Violation Risk Factor: Medium]</i></p> <p>R1.3 If the involved Reliability Coordinators cannot agree on the solution, the more conservative solution shall be implemented. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-014-2</p> <p><i>Proposed R8 and R9 are revised versions of IRO-016-1, R1 and its subrequirements which were moved to this standard. The RCSDT removed the wording relating to the “most conservative solution” because it can not be measured. We are proposing to use the mitigation plan of the RC who is experiencing the issue in cases where an agreed to mitigation plan can not be developed.</i></p> <p>R8. When an expected or actual reliability issue is detected, the Reliability Coordinator shall confirm the existence of the issue with the other Reliability Coordinators that are involved. In the event that the issue cannot be confirmed, each RC shall operate as though the problem exists. <i>[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p> <p>R9. When an expected or actual reliability issue exists and the affected Reliability Coordinators can not agree on a mitigation plan, all affected Reliability Coordinators shall implement the mitigation plan developed by the Reliability Coordinator who has the reliability issue. <i>[Violation Risk Factor: Medium][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]</i></p>
<p>Notes:</p>

Background Information:

Based on comments received on the last posting, the RCSDT has revised the proposed definitions in COM-001-2 as:

Interpersonal Communication: Any medium~~thod~~ that allows two or more individuals to interact, consult, or exchange information.

Alternative Interpersonal Communication: Any ~~method~~ Interpersonal Communication that is able to serve as a substitute for, ~~and is redundant to normal Interpersonal Communication~~ and does not utilize the same infrastructure (medium) as, ~~normal~~ Interpersonal Communications used for day-to-day operation.

The RCSDT believes that these are better, more concise definitions.

The RCSDT reviewed the Interpersonal Communications capability requirements (COM-001) and determined that there were implicit requirements within the requirements. For example, the requirement to identify an Alternative Interpersonal Communications capability implied that an entity had an interpersonal Communication capability. Rather than leave these requirements implicit, the RCSDT explicitly delineated, by entity, the requirements for Interpersonal Communications capability and Alternative Interpersonal Communications capability. These explicit requirements are R1 through R8.

Minor clarifying revisions were made to R2 and R3 of COM-002-2 and the words “actual or expected” were removed from the proposed definition of Adverse Reliability Impacts. The RCSDT believes that these conforming revisions indicate that consensus has been achieved with respect to COM-002-2.

The RCSDT also is seeking stakeholder input with regard to a FERC Order 693 directive to consider Xcel’s comments relating to COM-002. The comment is as follows:

Paragraph 523: “NERC should consider Xcel’s suggestion that the entity taking operating actions should not be held responsible for the delays caused by the reliability coordinator’s assessment and approval. We note that the operating entity has the authority to take emergency actions to protect its system that may circumvent or preempt the reliability coordinator’s approval process under TOP-001-1 Requirement R3 in cases of personnel safety, potential equipment failure or environmental needs.”

The RCSDT agrees with FERC that an entity has the right and obligation to take action to prevent or mitigate emergencies, etc. Footnote 226 of Order 693 discusses TOP-001 requirements:

Footnote 226: TOP-001-1, R1 states in part “Each transmission operator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its area” and R2 states in part “Each transmission operator shall take immediate actions to alleviate operating emergencies”.

The RCSDT believes that these requirements obviate the need to develop additional requirements to address Xcel’s comment.

The RCSDT also met with FERC staff regarding the requirements contained in the proposed IRO-001. A suggestion was made to move some of the proposed requirements to IRO-002

and IRO-005, as these requirements did not meet the purpose of the proposed IRO-001 standard. The proposed IRO-001 standard is the “umbrella” standard that established Reliability Coordinators and their authority. The requirements that were subsequently re-inserted into IRO-002 and IRO-005 pertained to analysis tool outages and Reliability Coordinator notifications respectively.

The drafting team also re-introduced into IRO-001 the requirement for regions to establish Reliability Coordinators. The requirement is now applicable to Regional Entities and calls for the RE to “ensure at least one or more Reliability Coordinators is certified to continuously assess transmission reliability and coordinate emergency operations among the operating entities within the region and across the regional boundaries”. This requirement was originally proposed to be retired, however, after discussion with NERC legal staff the RCSDT proposed to retain the requirement and revise it as shown in the draft.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.

- 1. Do you agree with COM-001 requirements for Interpersonal Communications capability and Alternative Interpersonal Communications capability (R1-R8)? If not, please explain in the comment area below.**

Yes

No

Comments:

- 2. The RCSDT believes that the requirements of TOP-001-1 obviate the need to develop additional requirements to address Xcel’s comment. Do you agree? If not, please explain in the comment area below.**

Yes

No

Comments:

- 3. Do you agree with the revision to IRO-001, R1 for certifying Reliability Coordinators? If not, please explain in the comment area below.**

Yes

No

Comments:

- 4. Do you agree with moving two requirements from IRO-001 back to IRO-002 relating to Analysis Tool outages? If not, please explain in the comment area below.**

Yes

No

Comments:

- 5. Do you agree with moving two requirements from IRO-001 back to IRO-005 relating to Reliability Coordinator notifications? If not, please explain in the comment area below.**

Standards Announcement

Ballot Window Open February 25 – March 7, 2011

Project 2006-06 – Reliability Coordination

Available Friday, February 25th at: <https://standards.nerc.net/CurrentBallots.aspx>

Initial Ballot Window Open February 25th through 8 p.m. on March 7, 2011

An initial ballot for the following standards and associated implementation plans will be **open from 8:00 a.m. on Friday, February 25 through 8:00 p.m. on Monday, March 7, 2011.**

- COM-001-2 – Communications
- COM-002-3 – Communication and Coordination
- IRO-001-2 – Reliability Coordination – Responsibilities and Authorities
- IRO-002-2 – Reliability Coordination – Analysis Tools
- IRO-005-4 – Reliability Coordination – Current Day Operations
- IRO-014-2 – Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators
- IRO-015-1 – Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 – Coordination of Real-time Activities Between Reliability Coordinators

During the initial ballot window, members of the ballot pool associated with this project may log in and submit their votes from the following page: <https://standards.nerc.net/CurrentBallots.aspx>

Background

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; and 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team. Two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to scope overlap. In addition, the scope of Project 2006-06 was expanded to incorporate directives from FERC Order 693 associated with standards IRO-003-2.

For more information review the project Web page:

http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

Next Steps

The comments submitted during the formal comment period and the ballot results will be posted.

Standards Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Ballot Pool Open January 25–February 25, 2011

Formal Comment Period Extended to March 7, 2011

Project 2006-06 – Reliability Coordination

Now available at: <https://standards.nerc.net/BallotPool.aspx>

Ballot Pool Open through 8 a.m. on February 25, 2011

A ballot pool is being formed during the next 30 days. The 45-day formal comment period is open from January 18 – March 7, 2011 with an initial ballot being conducted during the last 10 days of the comment period. Please review the Standards Under Development page for updated dates at:

http://www.nerc.com/filez/standards/Reliability_Standards_Under_Development.html

Registered Ballot Body members may join the ballot pool to be eligible to vote in the upcoming ballot at the following page: <https://standards.nerc.net/BallotPool.aspx>

During the pre-ballot window, members of the ballot pool may communicate with one another by using their “ballot pool list server.” (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list server for this ballot pool is: bp-2006-06_RC_in@nerc.com

Formal 45-day Comment Period Extended through 8 p.m. Eastern on Monday, March 7, 2011 and Additional Documents Posted

Last week the Reliability Coordination drafting team posted its Consideration of Comments and revised drafts of the following standards to incorporate input from comments submitted during the January 4-February 18, 2010 comment period and comments provided by a Quality Review team:

- COM-001-2 – Communications
- COM-002-3 – Communication and Coordination
- IRO-001-2 – Reliability Coordination – Responsibilities and Authorities
- IRO-005-4 – Reliability Coordination – Current Day Operations
- IRO-014-2 – Procedures, Processes, or Plans to Support Coordination Between Reliability Coordinators

Three additional standards were inadvertently omitted from last week’s posting and have now been posted:

- IRO-002-2 – Reliability Coordination – Analysis Tools
- IRO-015-1 – Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 – Coordination of Real-time Activities Between Reliability Coordinators

The Standards Committee has authorized posting the standards and associated implementation plan for a 45-day comment period, with a parallel ballot during the last 10 days of the comment period. **To provide sufficient time for review of the newly posted standards, the comment period has been extended through 8 p.m. Eastern on Monday, March 7, 2011.**

Instructions

Please use this [electronic form](#) to submit comments. For convenience, a Word version of the comment form has been posted on the project page.

Background

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; and 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team. Two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to scope overlap. In addition, the scope of Project 2006-06 was expanded to incorporate directives from FERC Order 693 associated with standards IRO-003-2.

Next Steps

An initial ballot will be conducted during the last 10 days of the comment period. After the ballot, the drafting team will consider all comments (those submitted with a comment form and those submitted with a ballot) and determine whether further revisions to the standards and supporting documents are needed.

Standards Process

Standards Announcement

Project 2006-06 – Reliability Coordination Initial Ballot Results

Now available at: <https://standards.nerc.net/Ballots.aspx>

An initial ballot of the following standards and their associated implementation plans ended on March 7, 2011:

- COM-001-2 – Communications
- COM-002-3 – Communication and Coordination
- IRO-001-2 – Reliability Coordination – Responsibilities and Authorities
- IRO-002-2 – Reliability Coordination – Analysis Tools
- IRO-005-4 – Reliability Coordination – Current Day Operations
- IRO-014-2 – Coordination Among Reliability Coordinators
- IRO-015-1 – Notifications and Information Exchange Between Reliability Coordinators
- IRO-016-1 – Coordination of Real-time Activities Between Reliability Coordinators

Voting statistics are listed below, and the [Ballot Results](#) Web page provides a link to the detailed results:

Quorum: 87.10%

Approval: 49.54%

Background:

The Reliability Coordination Standards Drafting Team was tasked with 1) ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable; 2) ensuring that this set of requirements is sufficient to maintain reliability of the Bulk Electric System; and 3) revising the group of standards based on FERC Order 693.

During the course of this project, the Reliability Coordination Standards Drafting Team incorporated changes due to the work of the IROL Standards Drafting Team. Two standards from the original Standards Authorization Request (PER-004 and PRC-001) were moved to other projects due to scope overlap. In addition, the scope of Project 2006-06 was expanded to incorporate directives from FERC Order 693 associated with standards IRO-003-2.

For more information review the project Web page:

http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

Next Steps

The drafting team will consider all comments (those submitted with a comment form and those submitted with a ballot. Once the team has prepared its response to comments and made any changes to the standards and supporting documents, they will submit the revised documents for quality review prior to a successive ballot. Since a non-binding poll of VRFs and VSLs was not conducted concurrent with the initial ballot that concluded on March 7, 2011, a non-binding poll will be conducted in conjunction with the successive ballot.

Ballot Criteria

Approval requires both (1) a quorum, which is established by at least 75% of the members of the ballot pool submitting either an affirmative vote, a negative vote, or an abstention, and (2) a two-thirds majority of the weighted segment votes cast must be affirmative; the number of votes cast is the sum of affirmative and negative votes, excluding abstentions and non-responses.

Standards Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Ballot Name:	Project 2006-06: Reliability Coordination_in
Ballot Period:	2/25/2011 - 3/7/2011
Ballot Type:	Initial
Total # Votes:	297
Total Ballot Pool:	341
Quorum:	87.10 % The Quorum has been reached
Weighted Segment Vote:	49.54 %
Ballot Results:	The standard will proceed to recirculation ballot.

Summary of Ballot Results									
Segment	Ballot Pool	Segment Weight	Affirmative		Negative		Abstain # Votes	No Vote	
			# Votes	Fraction	# Votes	Fraction			
1 - Segment 1.		88	1	34	0.586	24	0.414	13	17
2 - Segment 2.		11	0.7	3	0.3	4	0.4	3	1
3 - Segment 3.		85	1	35	0.493	36	0.507	7	7
4 - Segment 4.		24	1	9	0.429	12	0.571	2	1
5 - Segment 5.		69	1	33	0.611	21	0.389	8	7

Northeast Power Coordinating Council
Guy Zito
No
<p>It was expressed in the last posting that the definition of Interpersonal Communications might inadvertently include data. The SDT responded that it does not by referring to Interpersonal in the wording of the definition. The word being defined shouldn't be in the definition. However, incorporating "allows two or more individuals to ..." is an option that may solve this problem. The next posting should clarify this. This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities. The sub-requirements should be modified into bulleted lists. Consider striking "to exchange Interconnection and operating information" in R1, R3, R5, R7, and R8. It is redundant to the use of Interpersonal Communications "to interact, consult, or exchange information" in the definition. Consider striking "to exchange Interconnection and operating information" in R2, R4, R6. It is redundant to the use of Alternative Interpersonal Communications which uses Interpersonal Communications in its definition. Interpersonal Communications includes "to interact, consult, or exchange information" in its definition. For R2, why is Interchange Coordinator excluded? It is included in the Requirement R1 which deals with the Interpersonal Communications. Communications would need to be maintained with the Interchange Coordinator in the event of a failure of the Interpersonal Communications. For R3, affected neighboring Transmission Operators should be included. For R4 and R6, the sub-requirement list is different from the associated Interpersonal Communications requirements R3 and R5 respectively. These should be duplicate. The sub-requirement list for R4 should match R3, and the sub-requirement list for R6 should match R5. In the event of a failure of the Interpersonal Communications, the Transmission Operator and Balancing Authority both would need to maintain communications to the same entities as in the requirement to have Interpersonal Communications. The sub-requirements should be bulleted lists. For R5, why are neighboring Balancing Authorities not included? Additionally, R5 should only read Contact with Interchange Coordinator within the same Interconnection. They need to be able to contact one another to identify discrepancies in scheduling and sources of meter error that could lead to deviations in ACE. Should R2, R4 and R6 be constructed parallel to R1, R3, and R5? In R1, R3 and R5, the requirement is "shall have" while in R2, R4, and R6, the requirement is "shall designate". Since one is for the Interpersonal Communications and the other is for the Alternative Interpersonal Communications, the same wording should be used. R2.2 and R1.2 should not be limited to Reliability Coordinators in the same Interconnection only. Modify "within the same Interconnection" to "within the same Interconnection, and, as appropriate, between asynchronously connected RCs which are not precluded by law from scheduling interchange energy (for schedule changes, curtailments, etc.)" since reliability coordination may be required among the RCs on both sides of an Interconnection boundary. The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal Communications with. FERC specified their general preference for graduated in paragraph 27 of their June 19, 2008 order on VSLs. The second half of the Severe VSL for R9 is almost a duplicate of the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.</p>
No
If the requirement were going to remain. but the Project 2007-03 Real-Time Operations SDT proposed to retire that

requirement during their last posting. There needs to be better coordination with that SDT.
No
The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES are covered under a Reliability Coordinator. In R2, should “of” be “to”? Reliability Directives are issued to TOPs, BA, etc. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.
Yes
No
R1 states “When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.” The word “notify” should be stuck.
The SDT did not address all concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving as the Transmission Operator or Balancing Authority. It should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, standards should be made clear that the Reliability Directive is directed to another company. In place of requiring an operator, in real-time, to state “this is a Reliability Directive,” there should be an allowance for an entity to develop procedures indicating, in advance, their expectations for three-part communications to their sub-operating entities. Therefore, we suggest modifying R1 to be “When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action, either verbally, when the communication is issued, or in advance through documented procedures, as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time.]” Also, the definition of Emergency as currently cited in these draft Standards and included in the existing NERC Glossary should be modified to include the NERC Glossary term Adverse Reliability Impact to make the Standards more crisp, clear and enforceable. Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation that indicates requirements are being move to this standard. Delete the text box. Strike IRO-014-2 Part 1.7. There is no need to have a weekly conference to discuss every Operating Procedure, Operating Process and Operating Plan. As this requirement is written, a conference call would be necessary for each. Furthermore, IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update. Requirement R2 in IRO-001 contains the words “which could include issuing Reliability Directives”, but Reliability Directives are not referenced anywhere else in the standard. This inclusion seems unnecessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. These words should be removed. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary.

COM-001 General question/comment. The reference to infrastructure should be removed and just keep the word “medium”. Here's why What communication medium (infrastructure) does not use satellite at some point unless entities are within a close geographical proximity? How likely is it to have 2 different mediums? • Local phone and fax hard-wire likely. • Long distance phone and fax – satellite • Cell phone – satellite • Internet – satellite • Radio – antenna The reason for mentioning this is, if all we have is satellite then the reference to infrastructure should be removed and just keep the word “medium”.

IRO-001-2 as proposed does not include the PSE in the applicability, nor does it require the PSE to respond to a directive. However, COM-002 requires them to repeat the directive back... If the directive is that important to repeat back should they not have to act upon the directive? I think the PSE should be included in IRO-001-2 this standard as they represent and direct generation facility deployment in many cases. Including the PSE in COM-001 may be a good idea too, just for the situations listed above.

See Q 6 below.
The stated purpose of COM-002 is: "To ensure emergency communications between operating personnel are effective." As written, the standard fails to meet this purpose because the three requirements only deal with communications at the entity level. There is no requirement for the directing entity to even try to reach operating personnel at the receiving entity. The directing entity may follow all the requirements of this standard by following R1 and R3 with the receiving entity's receptionist, answering service, janitor, night watchman, etc. The receiving entity only needs to meet R2, parroting the directive. Again this could be accomplished by anyone with no assurance the directive reaches the operating personnel who can implement it. When we stated a similar objection during the last comment period, The SDT's answer suggested this was a PER staffing issue, but none of the PER requirements even apply to DP/LSE directive recipients. We suggest the entity issuing the directive should be required to make an attempt to get it to those who are competent to understand and implement the directive. This is not a staffing, training, or credentials issue; it is a performance issue that falls squarely within the stated purpose of this standard. COM-001 R10 presents a paradoxical situation to an entity attempting to comply. Consider an interpersonal communication capability failure that lasts longer than 60 minutes past initial detection. At or before 60 minutes, the affected entity is expected to notify impacted entities. If it has no interpersonal communication capability, how shall it make this notification? And if the entity does manage to make such a notification, it has thereby proven that it does have interpersonal communication capability making such notification unnecessary. We again ask the SDT to consider that not all the entities in the applicability sections of COM-001 and 002 have 24/7 dispatch centers. These are typically smaller entities that were required to register because they exceed 25 MW or were asked in the past to voluntarily provide UFLS. They do not and do not need to continuously communicate with TOPs, BAs, RCs, etc; and a "reliability directive" is a theoretical thing that has never happened during the memories of thirty year employees. The directive issuing entities simply realize the limitations around the receiving entities and work around them. The financial burden on these small entities and their customers to go to 24/7 dispatch will not have a corresponding reliability benefit. And while the two COM standards do not explicitly state that entities must maintain 24/7 dispatch, when all the requirements and definitions and time horizons are taken together 24/7 continuous competent communication is implied. During the last comment period, the SDT suggested this was a registration issue beyond their control. We submit instead that this is a standard applicability question that the SDT does have control over, since it is right there in Section A.4 of the two COM standards. While we appreciate that the SDT is responding to FERC order 693 to include DPs, we note that FERC also stated: Paragraph 487: "We expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process." Paragraph 6: "A Reliability Standard may take into account the size of the entity that must comply and the costs of implementation" Paragraph 141: "...the Commission clarifies that it did not intend to ... impose new organizational structures..." Paragraph 31: "We emphasize that we are not, at this time, mandating a particular outcome by way of these directives, but we do expect the ERO to respond with an equivalent alternative and adequate support that fully explains how the alternative produces a result that is as effective as or more effective than the Commission's example or directive. We ask the SDT to exclude DPs, LSEs, and PSEs that do not have 24/7 dispatch centers from the applicability of these two standards in order to meet FERC order 693.

<p>EPSA is the trade association for competitive suppliers including both generators and marketers that represent over 700 entities in the NERC compliance registry. As such, the EPSA membership includes members registered as Purchasing Selling Entities (PSE) in each NERC region. Moreover, many of EPSA's members are also registered as LSEs in several regions. In general, EPSA supports the progress made in revising COM-001, COM-002 and IRO-001 in Project 2006-06, particularly the improvements made to the definition of Reliability Directive. However, EPSA also has concerns with some proposed changes to the applicability sections of the revised standards. In addition, EPSA requests that the implementation plans be changed so that they are consistent with the standard. Regarding applicability, EPSA agrees that COM-001 should continue to not apply to Purchasing Selling Entity (PSE) and Load Serving Entity (LSE) functions. However, the implementation plan for COM-001-2 still includes a reference that PSEs and LSEs must comply (page 11 of the implementation plan). Additionally, EPSA supports the removal of LSEs and PSEs from IRO-001-2. Much like the situation with COM-001-2, the implementation plan for IRO-001-2 still includes a reference that LSEs and PSEs must comply (page 11 of the implementation plan). In both the implementation plans for COM-001-2 and IRO-001-2 these references should be removed. For reasons similar to those underlying why COM-001-2 and IRO-001-2 do not apply to PSEs and LSEs, EPSA opposes the addition of PSEs to the COM-002-3 applicability. The purpose of the emergency communications in these standards is "To ensure emergency communications between operating personnel are effective." The removal would recognize that PSEs and LSEs do not play an active role in reliability coordination under this standard since they have no authority, nor ability to assume or perform responsibilities associated with reliability coordination. When a RC, TOP, or BA needs to address an Emergency they do not contact, consult, or direct a PSE to take action to address the Emergency. Reliability is neither improved nor degraded by having these Standards applicable to PSEs or LSEs; therefore, COM-001, COM-002 and IRO-001 need not be applicable to PSEs or LSEs. Thanks to the drafting team members for their effort on revising the Project 2006-06 standards.</p>

1. COM-001-2, 4.4 - Distribution Providers and 4.5, Generation Operators should be highlighted and communicated as a substantive change since entities may not be aware that they are being added to the applicability section of the standard. 2. COM-001-2, R10 - should have the following underlined clarifying text added, shall notify impacted entities within 60 minutes of the detection of a failure "of all primary and alternative " Interpersonal Communications capabilities that lasts 30 minutes or longer. Exelon believes that the intent of R10 is for complete loss of communication ability and should not be applied to facilities that have multiple backups. 3. COM-001-2, M1 thru 9 – Suggest that network diagrams and / or communications schematics be added as suggested evidence. 4. COM-001-2, VSL for R9 – Regarding failure to test the Alternative Interpersonal Communication, the Severity Level does not align with the potential impact to the BES. The Severity Level for simply missing a test should be revised to a High VSL.

No comment - only applicable to RC
Comments: No comment – only applicable to RC
Comments: No comment - only applicable to RC
1. COM-002-2, R2 – Remove the word "recapitulate", feel that "restate or rephrase" is adequate. The word "recapitulate" is not commonly used and is somewhat obscure. 2. COM-002-2, R3 – Suggest using the words "repeat back" rather than "state or respond that" to more clearly identify the expectation with more commonly used language. 3. IRO-001-2, R3 – While we appreciate that the SDT has defined the term "directive" as a much needed definition, IRC-001-2 R.3 now introduces a new term "direction". what is a "direction" and how does it differ from "directive"? If a new

term is going to be introduced it needs to be defined, if the intent was to use the word "directive" then "direction" should be replaced with "directive." 4. IRO-001-2, R4 – Again the term "as directed" is confusing, recommend that the text be changed to align with the term directive, "unable to perform the directive per Requirement R3."

-The current data retention requirement of 90 days is more than adequate. Increasing this period to 12 months would result in a significant amount of work with no benefit to reliability. -Clarification required on the VSL for R9 - there appears to be no difference in the description of the Lower VSL and second part of the Severe VSL following "or". - Clarification required - The existing version of COM-001 M1 indicates that maintenance records for communication facilities may be required but the proposed revision makes no mention of maintenance records. So evidence of maintenance is no longer required?

Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window." Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication." We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.

As drafted, COM-001 is not clear or complete. At this stage in the evolution of compliance with the mandatory Reliability Standards, it is important that any new or revised Reliability Standard clearly articulate all compliance obligations and tasks consistent with Sections 302 (6) and (8) of the NERC Rules of Procedure. Thus, NextEra Energy Inc. (NextEra) has numerous recommended corrections to provide clarity and completeness to COM-001. For example, the requirement to designate an Alternative Interpersonal Communication capability is not clear. Does the designator solely designate for the designator's knowledge or does the designator need to inform the entity on the other end of the connection. In R2, for instance, the Reliability Coordinator must designate, but it is also not clear whether the Reliability Coordinator must inform the Balancing Authorities or Transmission Operators. It is further unclear whether the designation must be documented, or if any informing of the Balancing Authorities or Transmission Operators must be documented. Thus, it is recommended that the drafters decide what was intended regarding the designation and clearly state the requirements. In R9 it states that ". . . on at least a monthly basis." There are two issues to consider here. If the sentence stays, grammatically it should read ". . . on, at least, a monthly basis. . ." However, from a compliance and technical perspective, the term "at least" has no significance and should be deleted. The requirement is to test on a monthly basis – the phrase "at least" only introduces ambiguity and implies that the party should consider every two or three weeks. If the drafting team believes a best practice is less than a month, there are other NERC educational tools to explain a best practice. In R10, it states ". . . shall notify the impacted entity . . ." It would be clearer to state: ". . . shall notify the impacted Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider or Generator Operator . . ."
No
As stated in response to number 1, Reliability Standards are to be clear and complete. If a Transmission Operator is not responsible for a delay caused by a Reliability Coordinator, the Standard should specifically state that the Transmission Operator does not need to wait for an assessment or approval of a Reliability Coordinator to take actions pursuant to TOP-001-1 R3. Since the Reliability Coordinator is atop the reliability higherachy, such a statement provides clarity and completeness to understanding a Transmission Operators rights. Thus, TOP-001-1 R3 should be revised to lead with: "Without any obligation to first seek and obtain an assessment or approval from its Reliability Coordinator, each Transmission Operator . . ."
At this stage in evolution of compliance with the mandatory Reliability Standards, it is important that any new or revised Reliability Standard clearly articulate all compliance obligations and tasks consistent with Sections 302 (6) and (8) of the NERC Rules of Procedure. COM-002, IRO-001, IRO-002 and IRO-014 do not meet this threshold. Thus, NextEra has numerous recommended corrections to provide clarity and completeness to these Reliability Standards. COM-002 R1 The addition of defined terms for Reliability Directive and Emergency is a very good approach that helps provides clarity. Hence, it is also be appropriate to make the language in the requirement as clear as possible, and not add other implied or unexplained notions. Also, at times, in those regions with markets, it is not always clear whether a requirement to curtail for reliability reasons is being issued pursuant to market rules or from the Reliability Coordinator or Transmission Operator under the Reliability Standards. Therefore, it is also appropriate that the Reliability Coordinator, Transmission Operator, Balancing Authority be required to identify themselves; and if they fail to identify themselves or fail to use the term Reliability Directive, the registered entity receiving the flawed issuance should not be consider in violation of a Reliability Standard for failing to act. Accordingly, R1 would be clearer and have the same intent, if it stated as follows: "A Reliability Coordinator, Transmission Operator or Balancing Authority have the authority to issue an oral or written Reliability Directive as authorized in [list the specific Reliability Standard requirements such as IRO-001 R8 and TOP-001 R3]. The issuance of an oral of written Reliability Directive, by a Reliability Coordinator, Transmission Operator or Balancing Authority shall: (1) use the term 'Reliability Directive;' and (2) identify the issuer of the Reliability Directive as a Reliability Coordinator, Transmission Operator or Balancing Authority. If a Reliability Coordinator, Transmission Operator or Balancing Authority issues an oral or writtern directive without using the term "Reliability Directive" or failing to indentify itself as a Reliability Coordinator, Transmission Operator or Balancing Authority, the registered entity receiving the directive cannot be considered in violation for its failure to act." IRO-001 The definition of Adverse Reliability Impacts uses the term "instability." It is important that this term be technically defined in the same way "Cascading" is defined, otherwise the new requirement is not adding clarity; rather, it is maintaining the ambiguous term "instability" that will likely lead to confusion and debate. R1 Similar to the comments set forth with respect to COM-001 (question #1), the term "at least" should be deleted from R1 – it serves no useful purpose from a technical or compliance perspective; instead, it will add unnecessary ambiguity to the requirement. R2, as drafted, states: "Each Reliability Coordinator shall take actions or direct actions, which could include issuing oral or written Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. " This long sentence has several significant grammatical errors that result in the reader not being able to discern the meaning of the requirement. It also

unnecessarily adds verbiage that detracts from its primary focus. It is, therefore, recommended that R2 be revised as follows: "Each Reliability Coordinator shall take all necessary actions to prevent identified Emergencies or Adverse Reliability Impacts. These Reliability Coordinator actions shall include, to the extent necessary, the issuing of oral or written Reliability Directives to Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers located within its Reliability Coordinator Area. " R3, as drafted, is confusing and inconsistent with R2, and, thus, R3 should be revised to read as follows: "Upon receipt of a Reliability Directive issued pursuant to R2, a Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall comply with the Reliability Directive, unless compliance would violate safety, equipment, regulatory or statutory requirements. In the event that a Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider determines that compliance with a Reliability Directive would violate safety, equipment, regulatory or statutory requirements, the Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider shall, within 10 minutes after the determination, inform the Reliability Coordinator of its inability to comply." IRO-002 R1 and R2, as written, are confusing. It is recommended that R1 and R2 be combined to read as follows: "Pursuant to a written procedure to mitigate the impact of a Reliability Coordinator's analysis tool outage, a Reliability Coordinator's System Operator shall also have the authority to approve, deny or cancel a planned outage for its analysis tool." IRO-014 It is unclear why the terms Operating Procedure, Operating Process or Operating Plan needs to be plural, as currently written in the Standard. Hence, it is recommended that these terms be made singular, otherwise a violation may be inferred for not having more than one Procedure, Process or Plan. 1.1 Insert the word "applicable" before "Reliability Coordinator." 2.1, as written, is confusing. Recommend that 2.1 read as follows: "Review and update, if an update is necessary, on an annual basis. Annual basis means the review shall be within one month plus or minus that date of the last review." R3 This requirement uses a very vague term "reliability-related information," which, also, does not track the language used in R1 -- "information." It is recommended that R1 and R3 use the same terms and read " . . . information, as defined by the Reliability Coordinator, . . ." R4 As stated above, "at least" does not add value, and, therefore, should be deleted. R5, as written, is confusing. The recommended fix is to delete "all other" and replace with "impacted".

COM-001-2 does not specify the amount of time a DP has to reestablish the Interpersonal Communication Capability after the capability fails before it is assessed non-compliance for not having the communication. Is an entity non-compliant the minute the communication capability is unavailable If so, then to be compliant a tertiary (or secondary capability for DP) must be installed by the entity. Something similar was discussed with EOP-008 R3: "To avoid requiring a tertiary facility, a backup facility is not required during: • Planned outages of the primary or backup facilities of two weeks or less • Unplanned outages of the primary or backup facilities" UI suggests the drafting team incorporate something similar. The VSL for R7 is severe only and states: "The Distribution Provider failed to have Interpersonal Communications capability with one or more of the entities listed in Parts 7.1 or 7.2." I believe there should be a time component to the VSL and the VSL staged. For example, failure to have communication established for less than 60 minutes would be Lower, anything over 1 hour severe Also needed is a phrase to state when the violation begins. Does the violation begin when the loss of Communication Capability is detected or when it occurred? In other words, does the violation start when the operator attempts to use the phone and it is not functional, or did it occur when the phone line functionality failed but was not yet detected because no attempt to use the phone was made. So the VSL for R7 would follow a format of: "The Distribution Provider failed to have Interpersonal Communication Capability with one or more entities listed in Parts 7.1 or 7.2 for a continual 60 minutes period as measured from the time the ICC failure was detected". An alternative remedy is to alter the language of R7 to allow for unplanned outage. NERC does not have a Reliability Requirement for a DP to staff a control room 24/7. COM-0001 can be interpreted to imply that a DP needs to be staffed 24/7 to facilitate interpersonal communications. If NERC wants to extend the requirement for a 24/7 staffed

operating position at the DP then the appropriate method is thru a SAR to PER-002. COM-001 R7 should have a sub-requirement added recognizing that DP's are not required to staff 24/7 and many do not staff overnight. UI suggests adding R7.3: DP's will notify their TOP and/or BA when it is not staffing an operating desk. R7: Should address the instance if the DP is not required to have communication with the BA, because the BA communicates thru the TOP.

Yes

Yes

Yes

Comments: 1. COM-002 R2 seems awkwardly worded. R2. Each [Entity] that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message has been confirmed. " R2 as it is written says the repeat is confirming the accuracy of the message itself. I think it is agreed that the repeat back in R2 is to allow the issuer of the Directive to confirm that the message was received accurately understood by the recipient. I suggest: R2. Each [Entity] that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details to allow the Issuer to confirm that the directive recipient accurately understands the Directive" 2. The VSL for R2 is severe and states "The responsible entity that was the recipient of a Reliability Directive failed to repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message was confirmed." The purpose of the R2 repeat-back is to allow the Issuer verify the message was accurately received. This VSL penalizes the responsible entity for not accurately receiving the message. The VSL should penalize the refusal of the registered entity to repeat back the message not for receiving the message incorrectly. Suggested rewording: "The responsible entity that was the recipient of a Reliability Directive failed to repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message can be evaluated by the entity issuing the Reliability Directive" 3. United Illuminating does agree with the definition of Reliability Directive and Emergency.

We are providing the following comments for the Standards Drafting Team to consider. 1) Consider changing R1 to 'Each RC shall have the capability for Interpersonal Communications with the following entities to exchange

Interconnection and operating information...’ for clarity as Interpersonal Communications and capability are both nouns. 2) We feel changing the applicability of the standard is important to the accuracy of the standard. The purpose of COM-002 is ‘To ensure emergency communications between operating personnel are effective’. Since operating personnel are covered by the applicability of RC, BA, TOP and GOP, we suggest the applicability to TSP, LSE, and PSE be removed from COM-002-3. 3) Additionally, we would like to bring to the attention of the Standards Drafting Team, that the implementation plan for COM-001-2 and IRO-001-2 still includes TSP, LSE, and PSE although the revised standard does not include these entities in the Applicability Section. For COM-001-2 refer to the implementation plan, page 1. For IRO-001-2 refer to the implementation plan for new R2, new R3, new R4 and the chart on the last page. Thank you for your consideration in addressing these comments.

Individual
Paul Kerr
Shell Energy North America (US), L.P.

The introduction of the definition of “Reliability Directive” and its connection to the definition of “Emergency” within this Project brings much needed clarity for the sector and will promote consistency between Regional Entities and within the audits of Registered Entities. Shell Energy supports the removal of Purchasing Selling Entities as a function to which IRO-001 applies. This removal recognizes that PSEs do not play a role in reliability coordination under this standard since they have no authorities and no abilities to assume or perform responsibilities associated with reliability coordination. This conclusion is reinforced by the adoption of the defined term “Reliability Directive”. Where a RC, TOP, or BA needs to address an Emergency they do not contact, consult, or direct a PSE to take action that would address the Emergency. Rather, where the PSE is a user of the grid to perform or execute transactions, it is subject to the actions of these other entities that have the authority to stop, curtail, or alter the submitted transactions of the PSE in a way that aids in resolving the problem. With the fitting adoption of “Reliability Directive” into COM-002 as well, Shell Energy does not believe it is necessary or appropriate for the applicability of this standard to include Purchasing Selling Entities, as is contained in the current draft proposal. This standard does not apply to PSEs today, however, during the progression of Project 2006-06 this applicability was added to an early draft version that preceded the discussions and clarification that comes from the definition of a Reliability Directive in the standard. Shell Energy does not support the inclusion of PSEs in the current draft version of COM-002, and feels that it should be removed. The purpose of this standard is, “To ensure Emergency communications between operating personnel are effective” and relates directly to the capabilities and authorities established for the RC, TOP, or BA that requires actions to be taken by a recipient of a Reliability Directive. As noted previously, PSEs are acted upon by the entities with the necessary authority, and are not in a role that would initiate or fulfil the required actions. As additional matters related to the clarification and cleanup of the standards in this project, the implementation plans for both IRO-001 and COM-001 erroneously contain references to PSEs in the sections “Functions that Must Comply with the Requirements”. These references need to be removed.

The applicability of COM-001 and COM-002 appear to be at odds with each other. The requirements may need to be re-written so that they are in sync.

Yes
No

This is out of scope with the standard, as it is currently addressed through the NERC certification process that the NERC reliability coordinators are subject to.

The language used in COM-002-3 R2 including “with enough details that the accuracy of the message has been confirmed” is subjective and ambiguous. IRO-001 R2, R3, and R4 have replaced “Directives” with the word direction in lower case (while it appears that “Directives” is a subset of “directions”). We believe that this muddies the waters and could bring numerous conversations and dialog into scope unnecessarily. The end result is that the RC has the right to issue and use “Directives” and anything short of this could just be communications. For example, a number of entities that are Reliability Coordinators also facilitate energy markets. There are many communications related to markets that probably should be out of scope with respect to the standards. Furthermore, it might not be clear what role (eg Reliability Coordinator, market operator, etc) the staff at these entities are fulfilling.

Com-001-2 implementation plan lists that this is applicable to PSE's and LSE's however, PSE's and LSE's were removed from the actual standard. The implementation plan should be revised.
IRO Com-002-3 standard continues to include PSE. PSE's do not play an active role and have no authority or ability to perform reliability coordination. PSE's should be removed from the standard. -001-2 references PSE's in the implementation for R2, R3, R4 and "Functions that must comply with the requirements in this standard" table. PSE's were removed from the standard and should be removed from the implementation plan.

The monthly testing requirement for Alternative Interpersonal Communications is overly burdensome without any evidence to support that it is necessary to insure reliability. We believe that an entity will take necessary steps to insure the Alternative Interpersonal Communications is functioning properly, especially if it experiences problems with its Interpersonal Communications, it. We can support quarterly testing as we believe it strikes a reasonable balance.
Yes
We do not agree with the addition of weekly conference calls as required in R4. We believe that RCs should schedule calls as needed but do not agree that a weekly scheduled call improves reliability.

Each sub-requirement should not have an "R" in front of the number in order to be consistent with NERC's August 10, 2009 filing at FERC on this subject. Requirement R3 and R4 should include adjacent TOPs as a sub-requirement. Requirements R5 and R6 should include adjacent BAs as a sub-requirement. "to exchange Interconnection and operating information" should be deleted from requirements R1 through R8 as it is redundant with the definition of Interpersonal Communications The last page of the Implementation Plan includes LSEs, PSE, and TSPs as being responsible entities under this standard, yet the standard does not include them. Please correct the implementation plan.
No
Top-001-1, Requirement R3, which is what the SDT appears to be using as its justification for not adding a requirement here is proposed to be deleted by the RTO-SDT on Project 2007-03.

No
We think you are attempting to create a requirement similar to BAL-005, R1. That language copied here is clear and concise - All generation, transmission, and load operating within an Interconnection must be included within the metered boundaries of a Balancing Authority Area.
Yes
Yes
Please remove the yellow box on page 1 indicating this standard will be retired.
Reliability Directives may be issued by blast calls from Reliability Coordinators. It is inefficient and may be a hindrance to reliability to require 3-part communications in these instances. There are several organizations registered as BAs, RCs and TOPs. It is not uncommon for those entities to be distributed across multiple desks in the same control room without regard to how an entity is registered. Thus, a single System Operator may perform functions that are categorized under two or more of those functional entities. The drafting team should clarify that under no circumstances should that System Operator be required to issue a Reliability Directive to himself. This is a corporate governance issue. In IRO-014, R1, delete sub-requirement 1.7. The requirement for weekly conference calls related to operating procedures is duplicative to R4 and could be burdensome while adding very little value under certain circumstances. In IRO-014, R4, delete the phrase "(per Requirement 1, Part 1.7)" as a conforming change. In IRO-014, Requirements R6-R8 allow at least the theoretical possibility that an RC may determine an Adverse Reliability Impact in another RC's area that the other RC neither can see nor believes that any action should be taken. R7 puts the burden on the first RC to develop a plan that it cannot implement because it has no agreement with the BAs and TOPs in the other RC area. As such, this requirement is unenforceable. Please review all the implementation plans to be sure the applicable entities match those in the standards. "The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."

<p>1) LG&E/KU suggests that the definitions and related Reliability Standards be edited to provide a clearer understanding of what is required. When used in the requirements of COM-001, the proposed definitions for Interpersonal Communication and Alternative Interpersonal Communication read improperly (i.e., a “medium capability”). This may cause confusion as to what is required by the Applicable entities. Any further use of these terms may cause greater confusion. Suggested Alternative: Interpersonal Communication: Any instance where two or more individuals interact, consult, or exchange information. The definition of “Alternative Interpersonal Communication” would not have to be changed since it is dependent upon the definition of “Interpersonal Communication.” The change of the definitions of Interpersonal Communication and Alternative Interpersonal Communication shifts their focus to the communication itself—the event. This makes the Requirements themselves much clearer since the Requirements focus on the need that entities have the capabilities—the medium. It appears the SDT’s intent is to ensure that the event takes place by requiring that the medium for those events are in place. This is much clearer if there is a distinction between the two (the event and the medium) than if they have similar definitions (a medium and a “medium capability”). 2) LG&E/KU question the consistency of the Applicability sections as they pertain to the TSP, LSE and PSE functions between COM-001 and COM-002. The deletion of the TSP, LSE and PSE from COM-001 is supported, but if these entities are not required to establish Interpersonal Communication (or Alternative Interpersonal Communication) capability with reliability entities (RC, BA, TOP), should they still be required to follow the reliability directive process of COM-002? If the probability of issuing a Reliability Directive to a TSP, LSE or PSE is so low that Interpersonal Communications capabilities with reliability entities is not justified under COM-001, why are the TSP, LSE and PSE still held to the 3 way communication requirements of COM-002? Suggest the Applicability of COM-002 to TSP, LSE and PSE and associated requirements be deleted.</p>

<p>We expressed in the last posting that we felt the definition of Interpersonal Communications might inadvertently include data. The SDT responded that it does not by referring to Interpersonal in the name of the definition. Clearly, you can’t refer to the word you are defining in order to define it. However, it is possible “allows two or more individuals to ...” may solve this problem. Clarity should be sought in the next posting, if possible. This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities. We request the sub-requirements be modified into bulleted lists. Consider striking “to exchange Interconnection and operating information” in R1, R3, R5, R7, and R8. It is redundant to the use of Interpersonal Communications “to interact, consult, or exchange information” in the definition. Consider striking “to exchange Interconnection and operating information” in R2, R4, R6. It is redundant to the use of Alternative Interpersonal Communications which uses Interpersonal Communications in its definition. Interpersonal Communications includes “to interact, consult, or exchange information” in its definition. For R2, why is Interchange Coordinator excluded? It is included in the Requirement R1 which deals with the Interpersonal Communications. Communications would need to be maintained with the Interchange Coordinator in the event of a failure of the Interpersonal Communications. For R3, affected neighboring Transmission Operators should be included. For R4 and R6, the sub-requirement list is different than for than for the associated Interpersonal Communications requirements R3 and R5 respectively. We believe these should be duplicate. That is the sub-requirement list for R4 should match R3 and the R6 should match R5. In the event of a failure of the Interpersonal Communications, the Transmission Operator and Balancing Authority both would need to maintain communications to the same entities as in the requirement to have Interpersonal Communications. Again, we would suggest replacing sub-requirements with bulleted lists. For R5, why are neighboring Balancing Authorities not included? Additionally R5 should only read Contact with Interchange Coordinator within same Interconnection. They certainly need to be able to contact one another to identify discrepancies in scheduling and sources of meter error that could lead to deviations in ACE. Should R2, R4 and R6 be constructed parallel to R1, R3, and R5? In R1, R3 and R5, the requirement is “shall have” while in R2, R4, and R6, the requirement is “shall designate”. Since one is for the Interpersonal Communications and the other is for the Alternative Interpersonal Communications, it seems the same wording should be used. We do not believe R2.2 and R1.2 should be limited to Reliability Coordinators in the same Interconnection only. We suggest modifying “within the same Interconnection” to “within the same Interconnection, and, as appropriate, between a-synchronously connected RCs which are not precluded by law from scheduling interchange energy (for schedule changes, curtailments, etc.)” since reliability coordination may be required among the RCs on both sides of an Interconnection boundary. The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal Communications. FERC specified their general preference for gradated in paragraph 27 of their June 19, 2008 order on VSLs. The second half of the Severe VSL for R9 is almost a duplicate to the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.</p>
No

It might if the requirement were going to remain but the Project 2007-03 Real-Time Operations SDT proposed to retire that requirement during their last posting. We believe there needs to be better coordination with that SDT.
No
The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator. In R2, should “of” be “to”? Reliability Directives are issued to TOPs, BA, etc. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.
Yes
Yes
R1 states “When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.” The word “notify” should be stuck.
The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company. We believe that, in place of requiring an operator, in real-time, to state “this is a Reliability Directive,” there should be an allowance for an entity to develop procedures indicating, in advance, their expectations of three-part to their sub-operating entities. Therefore, we suggest modifying R1 to be “When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action, either verbally, when the communication is issued, or in advance through documented procedures, as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time.]” Also, we believe that the definition of Emergency, as currently cited in these draft Standards and included in the existing NERC Glossary should be modified to include the NERC Glossary term Adverse Reliability Impact to make the Standards more crisp, clear and enforceable. Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box. IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update. In the definition of Reliability Directive, we suggest changing “to address an Emergency” to “to address a reliability constraint or a declared Emergency”. Further, Requirement R2 in IRO-001 contains the words “which could include issuing Reliability Directives” but Reliability Directives are not referenced anywhere else in the standard. This inclusion seems unnecessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. We suggest that these words be removed. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary.

Suggested minor revision to the definition of Reliability Directive as follows (change in caps) A communication, IDENTIFIED AS A RELIABILITY DIRECTIVE, initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency. Clearly identifying a

communication as a Reliability Directive provides immediate information to the recipient as the the nature of the communications.

A. R5.5 states a BA shall have Interpersonal Communications with each Interchange Coordinator within its BA area and adjacent Interchange Coordinators. NERC Registry Criteria (v5) uses the term "Interchange Authority" not Interchange Coordinator, please clarify. B. Upon review of the NERC Compliance Registry, there are only 56 BA's that are also registered as an IA but 138 total BA's within the registry. R5.5 is not clearly written because many BA's do not have an IA within their BA area. Though a BA will use an IA to schedule interchange, a possible rewrite of R5.5 may be "Each Interchange Authority that the BA actively uses to arrange Interchange". C. R10 states that the RC, TOP, BA, DP and GOP shall notify "impacted entities" within 60 minutes... Please clarify if the SDT means the entities within the applicability section or is this to be determined by the entity. A possible rewrite may be; "Each RC shall notify TOP's, BA's, and IA's within its RC area along with adjacent RC's within the same Interconnection". This break down would need to be required for each affected entity and would provide clarity to the industry. D. We do not agree with a DP and GOP need to be held to the same level of compliance as a RC, BA or TOP. FERC Order 693 (paragraph 487) directed the DP and GOP to be included in this standard by stating;" We expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process". A DP and GOP may not be staffed 24 hours a day like a BA or TOP and the SDT did not take this into consideration. E. We understand that the DP and GOP need a means of communicating with their BA and TOP (R7 and R8) but would this not be the same Interpersonal Communications capability that as stated in R3 and R5 for the TOP and BA? Example: If the BA uses a phone line as their Interpersonal Communication medium to contact the DP wouldn't the DP also use the same medium to communicate with their BA? Yes, there could be different mediums but 99% of the time it will be the same medium. F. R10 could mean that if there is a logging system that detects an Interpersonal Communication failure, then all applicable entities will need to monitor that monitoring device. Since this requirement applies to all applicable entities, and Interpersonal Communication mediums will most likely be the same, there will always be two entities found non compliant if the 60 minute threshold is passed.
No
A. Agree that a receiving entity should not be held accountable until such time that they are required to take such action. B. It might if the requirement were going to remain but the Project 2007-03 ("Real-Time Operations SDT") proposed to retire that requirement during their last posting. This needs to be coordinated with that SDT.
No
A. R1, As written it is unclear what level of certification this will entail? Presently written within the NERC Reliability Standards, responsibility is given to RC's to manage the reliability of their areas. Recommend deleting this requirement. The ERO has pushed back in other Standards to having a responsibility for any NERC Requirements, since they are not a user, owner, or operator of the BES (see EOP-004-2). If this does move forward and an RC is certified by the ERO and then the RC is found non-compliant by a Regional Entity, for an associated certified item, will the ERO be held responsible, too? If the SDT selects to keep R1, there are some issues with how the requirement is written. The requirement places emphasis on regions and regional boundaries when no emphasis should be placed there. There are multiple Reliability Coordinators the span multiple regions. The language "to continuously assess transmission reliability" should be changed to "to continuously assess Bulk Electric System reliability" to reflect on what the standards are enforceable. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator. B. In R2, should "of" be "to". Reliability Directives are issued to TOPs, BA, etc. C. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.

Yes
Yes
<p>A. COM-002-3, R2 As stated in FERC Order 693, section 512, it is essential that RCs, BA's and TOP's have communications with DPs. R2 also applies to TSPs, LSEs and PSEs. There is no directive for this and it is going to be almost impossible to communicate with a DP since DPs are usually not operated 24 hours per day as like a RC, TOP, or BA. Many DPs have answering services that will relay a message once they receive it and then pass it along to someone. An answering company could repeat the directive word for word but this will not add to any reliability level. The SDT should reconsider the applicability section of this Standard to only apply to a RC, TOP and BA for the issuance of a Reliability Directive. BA's should have the responsibility to have an Interpersonal Communication medium with DPs in their BA area per COM-001-2. B. IRO-002-2, R1, Recommend that "System Operators" be replaced with "system operators" since NERC has defined System Operator to be an individual at a control center (BA, TOP, GOP, or RC). The lower cased system operator will only point to the RC system operator that will have this R1 authority. C. The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company. D. We also are concerned about the need to conduct three-part communications for a Reliability Directive issued through a blast call. Under these circumstances, the need for immediate action of multiple parties may require a blast call and there may not be time for all parties to complete three-part communications before initiating actions. Thus, we believe blast calls should be treated separately and that should be made clear. E. COM-002-3 R2 needs to be rewritten as it is too verbose. The point is for the recipient of the original message to get the issuer to confirm that the message was understood. We suggest rewording R2 to "Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive." Once the receiver has completed this requirement, the ball is in the issuer's court per Requirement R3. No additional words are necessary in the requirement. F. Per COM-002-3 R1, who decides that actions need to be issued as a Reliability Directive? Shouldn't it be the responsible entity? Thus, can we assume that if the responsible entity does not identify a communication as a Reliability Directive that it is not a Reliability Directive per the requirement? After all, why would an entity require actions but not issue a Reliability Directive. Following this logic, the VSL for R1 would never apply. Would a compliance auditor second guess if an action required a Reliability Directive? G. Because the Project 2007-03 ("Real-Time Operations SDT") proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. H. There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box. I. Please strike part IRO-014-2 Part 1.7. There is no need to have a weekly conference to discuss every Operating Procedure, Operating Process and Operating Plan. As this requirement is written, a conference call would be necessary for each. Furthermore, IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update. J. IRO-014-2 R4 is overly broad and would require Reliability Coordinators that will not impact one another to participate on conference calls with one another without any reliability benefit. The issue is created by the addition of the clause "within the same Interconnection" to the requirement. ISO-NE, FRCC, Midwest ISO, and SPP are all in the same Interconnection. It is hard to fathom there being reliability benefit to SPP and ISO-NE conversing weekly or Midwest ISO and FRCC conversing weekly. We suggest limiting the requirement to adjacent Reliability Coordinators. K. For IRO-014-2 R5, we suggest replacing "other" with "impacted" to limit the notification of Adverse Reliability Impacts to only those Reliability Coordinators that need to know. Because the definition of Adverse Reliability Impact includes "Bulk Electric System instability or Cascading", it is possible that the cascading of 138 kV lines serving a load pocket or generator outlet stability issues could require a Reliability Coordinator to notify all other Reliability Coordinators regardless of impact. This would include Reliability Coordinators outside of the Interconnection with the problem. It would also include Reliability Coordinators that are not impacted. For instance, an issue in New England that would not pose a threat outside the northeast would require ISO-NE to notify SPP and FRCC and Reliability Coordinators in the Western Interconnection. There is no reliability benefit to this notification. L. IRO-014-2 R6-R8 are problematic and need to be refined to make clear that the Reliability Coordinators shall operate to the most conservative limit. It should not require a Reliability Coordinator that disagrees with an action plan to implement the action plan. The Reliability Coordinator will</p>

be disagreeing with the action plan for a reliability reasons. Assuming they are correct, the requirement to implement said action plan will actually put the Interconnection at greater risk. These requirements inappropriately attempt to codify the debate and analysis that occurs between and within Reliability Coordinators when there are differing results in reliability analysis. This is part of the problem with having a Wide Area view that results in Reliability Coordinators having a view into other Reliability Coordinator Area. Their results and conclusions may be different. There should be a hierarchical structure for whose results should be used. It should be the Reliability Coordinator with primary responsibility unless the other Reliability Coordinator has evidence to demonstrate that the Reliability Coordinator with primary responsibility is incorrect. What this should do is, to trigger both to review their models and data to assess the problem. None of this needs to be codified in the standards though. M. In the definition of Reliability Directive, we suggest changing "to address an Emergency" to "to address a declared Emergency". This would help limit second guessing for a situation where a System Operator took action because he truly believed he was in an Emergency but after the fact analysis demonstrates there really was not an Emergency. N. The drafting team should expand its rationale for deleting IRO-002-1 R3. Currently, TOP-005 R1 is referenced. The project 2007-03 ("Real-Time Operations SDT") proposed to retire TOP-005-2 R1 in its most recent posting. O. We disagree with deleting IRO-002-1 R5 and R7 which establishes tools and monitoring capabilities. There should be basic tool requirements established for Reliability Coordinators. The project 2009-02 ("Real-time Reliability Monitoring and Analysis Capabilities") will be addressing these issues in more detail. Thus, it does not make sense to delete these requirements until that drafting team completes its task.

No

It is not clear from the definition of Interpersonal Communications if certain communications "mediums" such as email, instant messaging, etc. are included. Furthermore, the Measures for these requirements all include "electronic communications" as acceptable evidence. If the drafting team does not intend these mediums be included, then it should be clarified in the definition. We suggest the following wording of the definition: Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information. This interaction consists of verbal, spoken words exchanged in Real-time.

Yes

Yes

Yes

Yes

FirstEnergy offers the following additional comments: 1. The effective dates of the standards indicate an effective date of the first day of the first calendar quarter following regulatory approval. The changes to these standards will require changes to existing compliance evidence, as well as the creation of compliance evidence for some entities such as the Generator Operator which is a new applicable entity in COM-001. Therefore, to give entities ample time to get their compliance evidence in place, we suggest the effective state "the first day of the second quarter after regulatory approval". 2. With regard to the requirements for Alternative Interpersonal Communications, we question why the Generator Operator or Distribution Provider is not required to have backup communication. It would be difficult for a Reliability Coordinator, for instance, to contact a Generator Operator whose primary communications have been disabled if that entity does not have a backup. We suggest that the drafting team consider adding the GOP and DP as applicable entities requiring alternative communications.

No

We expressed in the last posting that we felt the definition of Interpersonal Communications might inadvertently include data. The drafting team responded that it does not by referring to Interpersonal in the name of the definition. Clearly, you can't refer the word you are defining to define it. However, it is possible "allows two or more individuals to ..." may solve this problem. What are the drafting team's thoughts on this issue? This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities. Consider striking "to exchange Interconnection and operating information" in R1, R3, R5, R7, and R8. It is redundant to the use of Interpersonal Communications "to interact, consult, or exchange information" in the definition. Consider striking "to exchange Interconnection and operating information" in R2, R4, R6. It is redundant to the use of Alternative Interpersonal Communications which uses Interpersonal Communications in its definition. Interpersonal Communications includes "to interact, consult, or exchange information" in its definition. For R2. why is Interchange Coordinator excluded? It is included in the Requirement R1 which deals

with the Interpersonal Communications. Communications would need to be maintained with the Interchange Coordinator in the event of a failure of the Interpersonal Communications. For R3, neighboring Transmission Operators should be included. For R4 and R6, the sub-requirement list is different than for than for the associated Interpersonal Communications requirements R3 and R5 respectively. They should be duplicate. That is the sub-requirement list for R4 should match R3 and the R6 should match R5. In the event of a failure of the Interpersonal Communications, the Transmission Operator and Balancing Authority both would need to maintain communications to the same entities as in the requirement to have Interpersonal Communications. For R5, why are neighboring Balancing Authorities not included? They certainly need to be able to contact one another to identify discrepancies in scheduling and sources of meter error that could lead to deviations in ACE. Should R2, R4 and R6 be constructed parallel to R1, R3, and R5? In R1, R3 and R5, the requirement is "shall have" while in R2, R4, and R6, the requirement is "shall designate". Since one is for the Interpersonal Communications and the other is for the Alternative Interpersonal Communications, it seems the same wording should be used. Should R2.2 and R1.2 be limited to Reliability Coordinators in the same Interconnection only? The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal Communications. FERC specified their general preference for gradated in paragraph 27 of their June 19, 2008 order on VSLs. The second half of the Severe VSL for R9 is almost duplicate to the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.

No

It might if the requirement were going to remain but the Project 2007-03 Real-Time Operations SDT proposed to retire that requirement during their last posting. This needs to be coordinated with that SDT.

No

In general, we are not opposed to the concept of the ERO certifying the Reliability Coordinators; however, there are some issues with how the requirement is written. The requirement places emphasis on regions and regional boundaries when no emphasis should be placed there. There are multiple Reliability Coordinators that span multiple regions. The language "to continuously assess transmission reliability" should be changed to "to continuously assess Bulk Electric System reliability" to reflect on what the standards are enforceable. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator Area. In R2, should "of" be "to". Reliability Directives are issued to TOPs, BA, etc. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.

Yes

Yes

The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company. We also are concerned about the need to conduct three-part communications for a Reliability Directive issued through a blast call. Under these circumstances, the need for immediate action of multiple parties may require a blast call and there may not be time for all parties to complete three-part communications before initiating actions. Thus, we believe blast calls should be treated separately and that should be made clear. COM-002-3 R2 needs to be rewritten as it is too verbose. The point is for the recipient of the original message to get the issuer to confirm that the message was understood. We suggest rewording R2 to "Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive." Once the receiver has completed this requirement, the ball is in the issuer's court per Requirement R3. No additional words are necessary in the requirement. Per COM-002-3 R1, who decides that actions need to be issued as a Reliability Directive? Shouldn't it be the responsible entity? Thus, can we assume that if the responsible entity does not identify a communication as a Reliability Directive that it is not a Reliability Directive per the requirement? After all, why would an entity require actions but not issue a Reliability Directive. Following this logic, the VSL for R1 would never apply. Would a compliance auditor second guess if an action required a Reliability Directive? Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. There is a

text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box. Comments: Standard COM-001-2 R10. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, and Generator Operator shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer. Comment: It is not clear whether the notification requirements identified in R10 apply to failure of ALL available Interpersonal Communications

or ANY Interpersonal Communications. We suggest that the existence of functioning Alternative Interpersonal Communications precludes the requirement for notification of impacted entities. D. Compliance 1. Compliance Monitoring Process 1.3 Data Retention Each Generator Operator shall keep the most recent twelve months of historical data (evidence) for Requirements R8 and R10, Measures M8 and M10. Comment: The data retention requirements specified for the Generator Operator in Para. 1.3 (above) are not consistent with the 3-year audit interval for the GOP. Question: When audited on this Standard is the expectation that the GOP will have 12 months of evidence or 36 months of evidence? Standard COM-002-3 R2. Each Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message has been confirmed. Comment: The term "Reliability Directive" is currently not defined in the NERC Glossary of Terms. However, in the Implementation Plan for COM-002-3 the RC SDT proposes a definition for Reliability Directive. It is implied in the standard that the Reliability Directive is issued as a voice command which precludes the use of our preferred method of Interpersonal Communication. However, this is not definitively stated in either the standard or the proposed definition. I think this needs to be made clearer if the Reliability Directive must be issued as a voice command. D. Compliance 1. Compliance Monitoring Process 1.3 Data Retention The Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity shall retain evidence of Requirement 2, Measure 2 for the most recent 3 months. Comment: The data retention requirements specified for the Generator Operator in Para. 1.3 (above) are not consistent with the 3-year audit interval for the GOP/PSE. Question: When audited on this Standard is the expectation that the GOP and PSE will have 3 months of evidence or 36 months of evidence?

No

Comments: I see no connection between XCEL's comment on COM-001-1. The requirements of COM-001-1 require the RCs, TOPs, and BAs to have a primary interpersonal communications method and to designate an alternative. I believe that if the requirements for the entity to have both primary and alternative methods of interpersonal communications this objection could be cleared. For example, R2 Each Reliability Coordinator shall designate have an Alternative Interpersonal Communications capability with the following entities to exchange Interconnection and operating information

No

Comments: This would allow NERC to designate one entity to be the Reliability Coordinator for an entire interconnection or the entire continent. This would reduce the Regional Reliability Organizations to compliance entities.

Yes

Yes

Comments: It appears that the requirements for entities designated in the IRO standards to have tools to access and/or monitor the system have been moved to pending standards that are not enforceable. It seems that if the newest revisions of the IRO standards are not implemented as a group there will be either missing requirements or duplicate requirements in the IRO standards.

• We question how far the definition of Alternative Interpersonal Communication goes in requiring separate infrastructure from Interpersonal Communication. For example, wireless communications sometime utilize fiber optic networks. • We question why the requirements state that entities must "have" Interpersonal Communications capability, but must "designate" Alternative Interpersonal Communications capability? • R1.2 and R2.2 – Why is this limited to the same interconnection? • R3 – need to add neighboring TOPs. • R5 – need to add adjacent BAs. • Interchange Coordinator – Add IC to the Applicability Section, and add a requirement that the IC have Interpersonal Communication capability with its BA and adjacent BAs. • Requirements to "designate" Alternative Interpersonal Communication should carry a "Medium" VRF instead of "High", because they are a backup capability. The word "designate" carries the connotation that these are documentation requirements. • R9 requires a monthly test of Alternative Interpersonal Communications capability. This was quarterly in the last draft. We question how these requirements for "Alternative Interpersonal Communications" capability are related to requirements for "backup functionality" in EOP-008-1, which requires an annual test of backup functionality. Clarity on the relationship between "Interpersonal Communications", "Alternative Interpersonal Communications", "primary control center functionality" and "backup control center functionality" would be appreciated. • R11 – is this requirement being moved to COM-003? • Data Retention – Is data retention really going to be just 12 months? Most auditors seem to be asking for everything since the last audit.

No

Requirements of TOP-001-1 are being revised under Project 2007-03, which may not continue to adequately address Xcel's concern.

No
How is NERC going to certify the RCs? Also, we believe the word "all" should be inserted after the word "among", so that it's clear that all generation, transmission and load must be included.
Yes
Yes
<p>• COM-002-3 contains the proposed definition "Reliability Directive". We continue to believe Requirement R1 should be deleted and that this definition should contain the phrase "identified as a Reliability Directive to the recipient". Otherwise, compliance controversies will arise when auditors second-guess the RC, TOP or BA's judgment regarding whether or not an abnormal system condition met the definition of "Emergency", and warranted a "Reliability Directive" with 3-part communication. A conforming change will need to be made to R2, since it refers to R1. This change in the definition of "Reliability Directive" is also needed because this term is used in other standards such as IRO-001-2, and without repeating a similar requirement to COM-002-3 requirement R1 in IRO-001-2, there is potential for confusion. • We disagree with the VSL for COM-002-3. This is clearly a requirement with two possible compliance failures: Failure to acknowledge a correct repeat-back, and failure to resolve an incorrect repeat-back. These failures have dramatically different consequences, which the drafting team should recognize via a graduated VSL. We think that the failure to acknowledge should either be "Lower" or "Medium". • Requirement R2 of IRO-001-2 is unclear and should be reworded as follows: "Each Reliability Coordinator shall take actions or direct actions (which could include issuing Reliability Directives to Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area) to either prevent identified events that could result in an Adverse Reliability Impact, or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts." • Various changes have been made to the defined term "Adverse Reliability Impact" as this project has progressed. We believe the latest change should not be made, and the Phrase "uncontrolled separation" should be reinserted in the definition, because that phrase is part of the Epect 2005 legislation definition of "reliable operation". Here is the text from the legislation: "The term 'reliable operation' means operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements."</p>

SPP Standards Development
Robert Rhodes
No
We would suggest that the applicability of COM-001-2 be expanded to that listed in COM-002-3. How can the directives to be issued in COM-002 be delivered and confirmed without having Interpersonal Communications capability? All of the functional entities listed in R1.1 should also be listed in R2.1. Similarly the sub-requirements of R3 should also be applied to R4. The same holds true for R5 and R6. If the SDT intends to exclude data communications from Interpersonal Communications and Alternative Interpersonal Communications, we suggest the SDT be more specific in the definition to specifically exclude data communications in the definition. It is not readily apparent that these terms do not apply to data communications and without a clarification, confusion exists.
Yes
In fact, we believe that R1, R2 and R5 more specifically put that requirement on the TOP. The TOP doesn't have to wait for the RC and any directive that may be associated with R3 prior to taking action to mitigate an emergency condition.
No
Is this more of a registry question than a standards issue? While we agree that there needs to be a requirement somewhere that establishes the need for Reliability Coordinators, isn't there also a similar need for other functional entities such as Transmission Operators, Balancing Authorities, etc? Should these be captured in standards or in the certification/registration process?
Yes
Yes
IRO-001-2, R2 implies that the RC could interrupt the normal chain of command from the TOP and/or BA to their respective GOPs, ICs and DPs thereby circumventing the coordinating process that currently exists. In fact, these entities may not even know their RCs nor be able to identify them and as such any directive from the RC may not be implemented in a timely manner. We would like to see a qualifier on this requirement that does not remove the normal coordination role from the TOP with his DP, etc. We would suggest that "with enough details that the accuracy of the message has been confirmed" be deleted from COM-002-3, R2. We would suggest the use of the term "instruction" and its derivatives rather than 'direct' in IRO-001-2. R2. R3 and R4. Delete 'issue an alert to' in IRO-005-4. R1. There are

yellow boxes in IRO-005-4, redline versions, which indicate that this standard is being retired, but it isn't because two requirements from IRO-001 are being returned to this standard.

The definition of "Interpersonal Communications" is overly broad and does not address the functional needs of reliability coordination. The definition should be limited to systems utilized for essential reliability functions. While the Purpose statement in the standard does address this intent, the explicit inclusion in the definition removes all ambiguity. Further, the definition of "Alternative Interpersonal Communications" without corresponding explicit definition of Primary Interpersonal Communications may lead to confusion and unnecessary duplication of efforts in testing and maintenance.

No

TOP-001 is in the process of being substantially modified by Project 2007-03. These changes may conflict with the matter addressed by Xcel's comment. Thus, Xcel's concern should be addressed independently but in the context of the TOP-001-2 revisions proposed by Project 2007-03.

Yes

CWLP generally concurs with and supports comments previously submitted by the SERC Operating Committee where those comments are not in conflict with the specific comments above.

Each sub-requirement should not have an "R" in front of the number in order to be consistent with NERC's August 10, 2009 filing at FERC on this subject. Requirement R3 and R4 should include adjacent TOPs as a sub-requirement. Requirements R5 and R6 should include adjacent BAs as a sub-requirement. "to exchange Interconnection and operating information" should be deleted from requirements R1 through R8 as it is redundant with the definition of Interpersonal Communications. The last page of the Implementation Plan includes LSEs, PSE, and TSPs as being responsible entities under this standard, yet the standard does not include them. Please correct the implementation plan.
No
Top-001-1, Requirement R3, which is what the SDT appears to be using as its justification for not adding a requirement here is proposed to be deleted by the RTO-SDT on Project 2007-03.
No
We think you are attempting to create a requirement similar to BAL-005, R1. That language copied here is clear and concise - All generation, transmission, and load operating within an Interconnection must be included within the metered boundaries of a Balancing Authority Area.
Yes
Yes
Reliability Directives may be issued by blast calls from Reliability Coordinators. It is inefficient and may be a hindrance to reliability to require 3-part communications in these instances. There are several organizations registered as BAs, RCs and TOPs. It is not uncommon for those entities to be distributed across multiple desks in the same control room without regard to how an entity is registered. Thus, a single System Operator may perform functions that are categorized under two or more of those functional entities. The drafting team should clarify that under no circumstances should that System Operator be required to issue a Reliability Directive to himself. This is a corporate governance issue. In IRO-014, R1, delete sub-requirement 1.7. The requirement for weekly conference calls related to operating procedures is duplicative to R4 and could be burdensome while adding very little value under certain circumstances. In IRO-014, R4, delete the phrase "(per Requirement 1, Part 1.7)" as a conforming change. In IRO-014, Requirements R6-R8 allow at least the theoretical possibility that an RC may determine an Adverse Reliability Impact in another RC's area that the other RC neither can see nor believes that any action should be taken. R7 puts the burden on the first RC to develop a plan that it cannot implement because it has no agreement with the BAs and TOPs in the other RC area. As such, this requirement is unenforceable. Please review all the implementation plans to be sure the applicable entities match those in the standards.

(1) NERC filed with FERC on August 10, 2009 indicating that it would discontinue the use of sub-requirements in standards. All draft standards posted since have the format of Part Numbers within each main Requirement. Please revise the standards in this project accordingly. (2) Having defined the terms Interpersonal Communication and Alternative Interpersonal Communication, the phrase "to exchange Interconnection and operating information" in a number of requirements is redundant and can be removed. Further, for R1, we suggest removing the phrase "within the same Interconnection since there RCs between two Interconnections still need to communication with each other for reliability coordination (e.g. curtailment of interchange transactions crossing Interconnection boundary, as stipulated in IRO-006)". (3) R2: Suggest to add Purchasing-Selling Entity and Interchange Authority (INT-004 and INT-005 have requirements for communication between the RC and the PSE and IA), and remove the phrase "within the same Interconnection since there RCs between two Interconnections still need to communication with each other for reliability coordination (e.g. curtailment of interchange transactions crossing Interconnection boundary, as stipulated in IRO-006)". (4) R3: Suggest to add adjacent Transmission Operator and Purchasing-Selling Entity (the latter needed for meeting INT-004 requirements). (5) The list of entities in R4 and R6 is different from those in R3 and R5. They should be the same for having Alternative Interpersonal Communication capability. (6) R5: Suggest to add adjacent Balancing Authority as adjoining BAs need to communication with each to check schedules and other balancing information. (7)

There are a number of parts in Requirements R1 to R8 each of which must be complied with. However, the VSLs for R1 to R8 are binary which do not provide any distinction in partial failure of each of these requirements. We suggest the SDT to apply the VSL guideline and re-establish the various levels of violation severity for these requirements.

No

TOP-001 is being revised and some of the requirements that fulfill this need may have been removed. We suggest the SDT check with the latest draft version of TOP-001 and coordinate with the Real-time Operation SDT to ensure there are not gaps.

No

1. R2: The word "of" before Transmission Operators should be "to". 2. The VSL for R1 should be revised to replace Regional Entities with ERO.

Yes

Yes

1. IRO-001: Reliability Directive: We do not agree with the proposed definition since it addresses Emergencies only. There are situations where a Reliability Directive is issued such that the directed action must be taken by the receiving entity to address a reliability constraint or any condition on the BES which if left unattended could, in the judgment of the issuing entity, lead to an Emergency. These conditions themselves do not constitute an Emergency which is defined as "Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System." There could be no abnormal condition but the actions must nevertheless be taken promptly to prevent the bulk electric system from entering into an abnormal condition. We therefore suggest the term Reliability Directive be revised to: Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address a reliability constraint or an Emergency. 2. IRO-001, Requirement R2: This requirement contains the words "which could include issuing Reliability Directives" which is not referenced anywhere else in the standard. We do not think this inclusion is necessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. We suggest to remove these words. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of "which could include issuing Reliability Directives" in IRO-001 is unnecessary. We suggest replacing "identified events" with "anticipated events". This requirement also lists Interchange Coordinators as one of the recipients of Reliability Directives which is not consistent with the implementation plan. 3. IRO-014: R4 as written creates unnecessary requirements for an RC to participate in conference calls for issues that may not affect the RC itself. We suggest to reinstate the original word "impacted" as opposed to "other", and remove the words "within the same Interconnection" since such calls and coordination may be required for RCs on both side of the Interconnection boundary. Same change suggested for R5, i.e. replace "other" with "impacted". 4. If an entity provides Interpersonal Communication for day-to-day communication using two different media, e.g. radio and telephone, the proposed definition of Alternative Interpersonal Communication suggests that it would not be possible for one medium to be used as the Alternative Interpersonal Communication for the other since the two media are both used every day. 5. COM-001-2 R10 suggests that the responsible entity must wait for at least 30 minutes before notifying other entities of the failure of its Interpersonal Communication capability. We recommend changing "that lasts 30 minutes" to "that lasts or is expected to last 30 minutes". This allows responsible entities to start notifying other entities earlier. 6. In IRO-005-4 R1: Delete "notify".

Xcel Energy

No

We feel that either the definitions, or the requirements, should make it clear whether data is included.

No

We are concerned that the drafting team may not have understood Xcel Energy's comments and FERC's directive in Order 693. FERC had asked that NERC consider Xcel Energy's suggestion. This consideration does not necessarily equate to the development of additional requirements, however that may be the solution. We recognize that R1 and R2 of TOP-001-1 give the TOP authority to take immediate actions necessary to alleviate operating emergencies. We were concerned with the potential situation where the RC's directive (R3 of IRO-001-2) may conflict with actions the TOP has ALREADY taken. In this situation, we do not feel the TOP should be held at fault for the actions it took prior to the RC's directive. (R3 of IRO-001-2 is currently in effect under TOP-001-1 R3.) Additionally, R1 and R2 of TOP-001-1 have been removed from the latest draft of version 2. So, if TOP-001-2 and IRO-001-2 are approved as drafted, it would appear that all rights and protections of the TOP to take immediate actions will be removed and our initial issue, as detailed in Order 693, still exists.

These requirements require TOP's, BA's, and GOP's to establish alternative means of "interpersonal" communications with other BA's, GOP's, and BA's respectively without regard to the reliability impact each TOP, BA or GOP has on the interconnection. Why would it be necessary for a TOP with one 161kv transmission line or a BA with 100 MW of total load, or one GOP with a 30MW unit to realize additional costs when the facilities they operate have little reliability impact? In addition, most RC's have established satellite telephone systems as back-up communication with TOP's. RC's may have to establish additional communication systems with BA's as these requirements impose to avoid Standards of Conduct issues. R9 – considering the reliability of communication systems, a 2 hour response to a problem with the alternative means of communication is over sensitive. Allowing for sometime in an operating shift would be more in line, such as 8 hours.
Yes
There are more requirements that are being removed in the IRO standards than are currently proposed. It would be helpful if the SDT would consider a mapping of each requirement that is being eliminated and whether the requirement is duplicated elsewhere, moved elsewhere and where, or is deemed not needed would be helpful in judging if the changes are appropriate. Without this mapping it is difficult to fully support all the proposed changes to all these Standards.

<p>It was expressed in the last posting that the definition of Interpersonal Communications might inadvertently include data. The SDT responded that it does not by referring to Interpersonal in the wording of the definition. The word being defined shouldn't be in the definition. However, incorporating "allows two or more individuals to ..." is an option that may solve this problem. The next posting should clarify this. This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities. The sub-requirements should be modified into bulleted lists. Consider striking "to exchange Interconnection and operating information" in R1, R3, R5, R7, and R8. It is redundant to the use of Interpersonal Communications "to interact, consult, or exchange information" in the definition. Consider striking "to exchange Interconnection and operating information" in R2, R4, R6. It is redundant to the use of Alternative Interpersonal Communications which uses Interpersonal Communications in its definition. Interpersonal Communications includes "to interact, consult, or exchange information" in its definition. For R2, why is Interchange Coordinator excluded? It is included in the Requirement R1 which deals with the Interpersonal Communications. Communications would need to be maintained with the Interchange Coordinator in the event of a failure of the Interpersonal Communications. For R3, affected neighboring Transmission Operators should be included. For R4 and R6, the sub-requirement list is different from the associated Interpersonal Communications requirements R3 and R5 respectively. These should be duplicate. The sub-requirement list for R4 should match R3, and the sub-requirement list for R6 should match R5. In the event of a failure of the Interpersonal Communications, the Transmission Operator and Balancing Authority both would need to maintain communications to the same entities as in the requirement to have Interpersonal Communications. The sub-requirements should be bulleted lists. For R5, why are neighboring Balancing Authorities not included? Additionally, R5 should only read Contact with Interchange Coordinator within the same Interconnection. They need to be able to contact one another to identify discrepancies in scheduling and sources of meter error that could lead to deviations in ACE. Should R2, R4 and R6 be constructed parallel to R1, R3, and R5? In R1, R3 and R5, the requirement is "shall have" while in R2, R4, and R6, the requirement is "shall designate". Since one is for the Interpersonal Communications and the other is for the Alternative Interpersonal Communications, the same wording should be used. R2.2 and R1.2 should not be limited to Reliability Coordinators in the same Interconnection only. Modify "within the same Interconnection" to "within the same Interconnection, and, as appropriate, between asynchronously connected RCs which are not precluded by law from scheduling interchange energy (for schedule changes, curtailments, etc.)" since reliability coordination may be required among the RCs on both sides of an Interconnection boundary. The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal Communications with. FERC specified their general preference for graduated in paragraph 27 of their June 19, 2008 order on VSLs. The second half of the Severe VSL for R9 is almost a duplicate of the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.</p>
No
If the requirement were going to remain. but the Project 2007-03 Real-Time Operations SDT proposed to retire that

requirement during their last posting. There needs to be better coordination with that SDT.
No
The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES are covered under a Reliability Coordinator. In R2, should “of” be “to”? Reliability Directives are issued to TOPs, BA, etc. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.
Yes
No
R1 states “When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.” The word “notify” should be stuck.
The SDT did not address all concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving as the Transmission Operator or Balancing Authority. It should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, standards should be made clear that the Reliability Directive is directed to another company. In place of requiring an operator, in real-time, to state “this is a Reliability Directive,” there should be an allowance for an entity to develop procedures indicating, in advance, their expectations for three-part communications to their sub-operating entities. Therefore, we suggest modifying R1 to be “When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action, either verbally, when the communication is issued, or in advance through documented procedures, as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time.]” Also, the definition of Emergency as currently cited in these draft Standards and included in the existing NERC Glossary should be modified to include the NERC Glossary term Adverse Reliability Impact to make the Standards more crisp, clear and enforceable. Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation that indicates requirements are being move to this standard. Delete the text box. Strike IRO-014-2 Part 1.7. There is no need to have a weekly conference to discuss every Operating Procedure, Operating Process and Operating Plan. As this requirement is written, a conference call would be necessary for each. Furthermore, IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update. Requirement R2 in IRO-001 contains the words “which could include issuing Reliability Directives”, but Reliability Directives are not referenced anywhere else in the standard. This inclusion seems unnecessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. These words should be removed. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary.

COM-001 General question/comment. The reference to infrastructure should be removed and just keep the word “medium”. Here's why What communication medium (infrastructure) does not use satellite at some point unless entities are within a close geographical proximity? How likely is it to have 2 different mediums? • Local phone and fax hard-wire likely. • Long distance phone and fax – satellite • Cell phone – satellite • Internet – satellite • Radio – antenna The reason for mentioning this is, if all we have is satellite then the reference to infrastructure should be removed and just keep the word “medium”.

IRO-001-2 as proposed does not include the PSE in the applicability, nor does it require the PSE to respond to a directive. However, COM-002 requires them to repeat the directive back... If the directive is that important to repeat back should they not have to act upon the directive? I think the PSE should be included in IRO-001-2 this standard as they represent and direct generation facility deployment in many cases. Including the PSE in COM-001 may be a good idea too, just for the situations listed above.

See Q 6 below.
The stated purpose of COM-002 is: "To ensure emergency communications between operating personnel are effective." As written, the standard fails to meet this purpose because the three requirements only deal with communications at the entity level. There is no requirement for the directing entity to even try to reach operating personnel at the receiving entity. The directing entity may follow all the requirements of this standard by following R1 and R3 with the receiving entity's receptionist, answering service, janitor, night watchman, etc. The receiving entity only needs to meet R2, parroting the directive. Again this could be accomplished by anyone with no assurance the directive reaches the operating personnel who can implement it. When we stated a similar objection during the last comment period, The SDT's answer suggested this was a PER staffing issue, but none of the PER requirements even apply to DP/LSE directive recipients. We suggest the entity issuing the directive should be required to make an attempt to get it to those who are competent to understand and implement the directive. This is not a staffing, training, or credentials issue; it is a performance issue that falls squarely within the stated purpose of this standard. COM-001 R10 presents a paradoxical situation to an entity attempting to comply. Consider an interpersonal communication capability failure that lasts longer than 60 minutes past initial detection. At or before 60 minutes, the affected entity is expected to notify impacted entities. If it has no interpersonal communication capability, how shall it make this notification? And if the entity does manage to make such a notification, it has thereby proven that it does have interpersonal communication capability making such notification unnecessary. We again ask the SDT to consider that not all the entities in the applicability sections of COM-001 and 002 have 24/7 dispatch centers. These are typically smaller entities that were required to register because they exceed 25 MW or were asked in the past to voluntarily provide UFLS. They do not and do not need to continuously communicate with TOPs, BAs, RCs, etc; and a "reliability directive" is a theoretical thing that has never happened during the memories of thirty year employees. The directive issuing entities simply realize the limitations around the receiving entities and work around them. The financial burden on these small entities and their customers to go to 24/7 dispatch will not have a corresponding reliability benefit. And while the two COM standards do not explicitly state that entities must maintain 24/7 dispatch, when all the requirements and definitions and time horizons are taken together 24/7 continuous competent communication is implied. During the last comment period, the SDT suggested this was a registration issue beyond their control. We submit instead that this is a standard applicability question that the SDT does have control over, since it is right there in Section A.4 of the two COM standards. While we appreciate that the SDT is responding to FERC order 693 to include DPs, we note that FERC also stated: Paragraph 487: "We expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process." Paragraph 6: "A Reliability Standard may take into account the size of the entity that must comply and the costs of implementation" Paragraph 141: "...the Commission clarifies that it did not intend to ... impose new organizational structures..." Paragraph 31: "We emphasize that we are not, at this time, mandating a particular outcome by way of these directives, but we do expect the ERO to respond with an equivalent alternative and adequate support that fully explains how the alternative produces a result that is as effective as or more effective than the Commission's example or directive. We ask the SDT to exclude DPs, LSEs, and PSEs that do not have 24/7 dispatch centers from the applicability of these two standards in order to meet FERC order 693.

Competitive Suppliers
Jack Cashin

<p>EPSA is the trade association for competitive suppliers including both generators and marketers that represent over 700 entities in the NERC compliance registry. As such, the EPSA membership includes members registered as Purchasing Selling Entities (PSE) in each NERC region. Moreover, many of EPSA's members are also registered as LSEs in several regions. In general, EPSA supports the progress made in revising COM-001, COM-002 and IRO-001 in Project 2006-06, particularly the improvements made to the definition of Reliability Directive. However, EPSA also has concerns with some proposed changes to the applicability sections of the revised standards. In addition, EPSA requests that the implementation plans be changed so that they are consistent with the standard. Regarding applicability, EPSA agrees that COM-001 should continue to not apply to Purchasing Selling Entity (PSE) and Load Serving Entity (LSE) functions. However, the implementation plan for COM-001-2 still includes a reference that PSEs and LSEs must comply (page 11 of the implementation plan). Additionally, EPSA supports the removal of LSEs and PSEs from IRO-001-2. Much like the situation with COM-001-2, the implementation plan for IRO-001-2 still includes a reference that LSEs and PSEs must comply (page 11 of the implementation plan). In both the implementation plans for COM-001-2 and IRO-001-2 these references should be removed. For reasons similar to those underlying why COM-001-2 and IRO-001-2 do not apply to PSEs and LSEs, EPSA opposes the addition of PSEs to the COM-002-3 applicability. The purpose of the emergency communications in these standards is "To ensure emergency communications between operating personnel are effective." The removal would recognize that PSEs and LSEs do not play an active role in reliability coordination under this standard since they have no authority, nor ability to assume or perform responsibilities associated with reliability coordination. When a RC, TOP, or BA needs to address an Emergency they do not contact, consult, or direct a PSE to take action to address the Emergency. Reliability is neither improved nor degraded by having these Standards applicable to PSEs or LSEs; therefore, COM-001, COM-002 and IRO-001 need not be applicable to PSEs or LSEs. Thanks to the drafting team members for their effort on revising the Project 2006-06 standards.</p>

1. COM-001-2, 4.4 - Distribution Providers and 4.5, Generation Operators should be highlighted and communicated as a substantive change since entities may not be aware that they are being added to the applicability section of the standard. 2. COM-001-2, R10 - should have the following underlined clarifying text added, shall notify impacted entities within 60 minutes of the detection of a failure "of all primary and alternative " Interpersonal Communications capabilities that lasts 30 minutes or longer. Exelon believes that the intent of R10 is for complete loss of communication ability and should not be applied to facilities that have multiple backups. 3. COM-001-2, M1 thru 9 – Suggest that network diagrams and / or communications schematics be added as suggested evidence. 4. COM-001-2, VSL for R9 – Regarding failure to test the Alternative Interpersonal Communication, the Severity Level does not align with the potential impact to the BES. The Severity Level for simply missing a test should be revised to a High VSL.
Yes
No comment - only applicable to RC
Comments: No comment – only applicable to RC
Comments: No comment - only applicable to RC
1. COM-002-2, R2 – Remove the word "recapitulate", feel that "restate or rephrase" is adequate. The word "recapitulate" is not commonly used and is somewhat obscure. 2. COM-002-2, R3 – Suggest using the words "repeat back" rather than "state or respond that" to more clearly identify the expectation with more commonly used language. 3. IRO-001-2, R3 – While we appreciate that the SDT has defined the term "directive" as a much needed definition, IRC-001-2 R.3 now introduces a new term "direction". what is a "direction" and how does it differ from "directive"? If a new

term is going to be introduced it needs to be defined, if the intent was to use the word "directive" then "direction" should be replaced with "directive." 4. IRO-001-2, R4 – Again the term "as directed" is confusing, recommend that the text be changed to align with the term directive, "unable to perform the directive per Requirement R3."

-The current data retention requirement of 90 days is more than adequate. Increasing this period to 12 months would result in a significant amount of work with no benefit to reliability. -Clarification required on the VSL for R9 - there appears to be no difference in the description of the Lower VSL and second part of the Severe VSL following "or". - Clarification required - The existing version of COM-001 M1 indicates that maintenance records for communication facilities may be required but the proposed revision makes no mention of maintenance records. So evidence of maintenance is no longer required?

Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window." Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication." We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.

As drafted, COM-001 is not clear or complete. At this stage in the evolution of compliance with the mandatory Reliability Standards, it is important that any new or revised Reliability Standard clearly articulate all compliance obligations and tasks consistent with Sections 302 (6) and (8) of the NERC Rules of Procedure. Thus, NextEra Energy Inc. (NextEra) has numerous recommended corrections to provide clarity and completeness to COM-001. For example, the requirement to designate an Alternative Interpersonal Communication capability is not clear. Does the designator solely designate for the designator's knowledge or does the designator need to inform the entity on the other end of the connection. In R2, for instance, the Reliability Coordinator must designate, but it is also not clear whether the Reliability Coordinator must inform the Balancing Authorities or Transmission Operators. It is further unclear whether the designation must be documented, or if any informing of the Balancing Authorities or Transmission Operators must be documented. Thus, it is recommended that the drafters decide what was intended regarding the designation and clearly state the requirements. In R9 it states that ". . . on at least a monthly basis." There are two issues to consider here. If the sentence stays, grammatically it should read ". . . on, at least, a monthly basis. . ." However, from a compliance and technical perspective, the term "at least" has no significance and should be deleted. The requirement is to test on a monthly basis – the phrase "at least" only introduces ambiguity and implies that the party should consider every two or three weeks. If the drafting team believes a best practice is less than a month, there are other NERC educational tools to explain a best practice. In R10, it states ". . . shall notify the impacted entity . . ." It would be clearer to state: ". . . shall notify the impacted Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider or Generator Operator . . ."
No
As stated in response to number 1, Reliability Standards are to be clear and complete. If a Transmission Operator is not responsible for a delay caused by a Reliability Coordinator, the Standard should specifically state that the Transmission Operator does not need to wait for an assessment or approval of a Reliability Coordinator to take actions pursuant to TOP-001-1 R3. Since the Reliability Coordinator is atop the reliability higherachy, such a statement provides clarity and completeness to understanding a Transmission Operators rights. Thus, TOP-001-1 R3 should be revised to lead with: "Without any obligation to first seek and obtain an assessment or approval from its Reliability Coordinator, each Transmission Operator . . ."
At this stage in evolution of compliance with the mandatory Reliability Standards, it is important that any new or revised Reliability Standard clearly articulate all compliance obligations and tasks consistent with Sections 302 (6) and (8) of the NERC Rules of Procedure. COM-002, IRO-001, IRO-002 and IRO-014 do not meet this threshold. Thus, NextEra has numerous recommended corrections to provide clarity and completeness to these Reliability Standards. COM-002 R1 The addition of defined terms for Reliability Directive and Emergency is a very good approach that helps provides clarity. Hence, it is also be appropriate to make the language in the requirement as clear as possible, and not add other implied or unexplained notions. Also, at times, in those regions with markets, it is not always clear whether a requirement to curtail for reliability reasons is being issued pursuant to market rules or from the Reliability Coordinator or Transmission Operator under the Reliability Standards. Therefore, it is also appropriate that the Reliability Coordinator, Transmission Operator, Balancing Authority be required to identify themselves; and if they fail to identify themselves or fail to use the term Reliability Directive, the registered entity receiving the flawed issuance should not be consider in violation of a Reliability Standard for failing to act. Accordingly, R1 would be clearer and have the same intent, if it stated as follows: "A Reliability Coordinator, Transmission Operator or Balancing Authority have the authority to issue an oral or written Reliability Directive as authorized in [list the specific Reliability Standard requirements such as IRO-001 R8 and TOP-001 R3]. The issuance of an oral of written Reliability Directive, by a Reliability Coordinator, Transmission Operator or Balancing Authority shall: (1) use the term 'Reliability Directive;' and (2) identify the issuer of the Reliability Directive as a Reliability Coordinator, Transmission Operator or Balancing Authority. If a Reliability Coordinator, Transmission Operator or Balancing Authority issues an oral or writtern directive without using the term "Reliability Directive" or failing to indentify itself as a Reliability Coordinator, Transmission Operator or Balancing Authority, the registered entity receiving the directive cannot be considered in violation for its failure to act." IRO-001 The definition of Adverse Reliability Impacts uses the term "instability." It is important that this term be technically defined in the same way "Cascading" is defined, otherwise the new requirement is not adding clarity; rather, it is maintaining the ambiguous term "instability" that will likely lead to confusion and debate. R1 Similar to the comments set forth with respect to COM-001 (question #1), the term "at least" should be deleted from R1 – it serves no useful purpose from a technical or compliance perspective; instead, it will add unnecessary ambiguity to the requirement. R2, as drafted, states: "Each Reliability Coordinator shall take actions or direct actions, which could include issuing oral or written Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. " This long sentence has several significant grammatical errors that result in the reader not being able to discern the meaning of the requirement. It also

unnecessarily adds verbiage that detracts from its primary focus. It is, therefore, recommended that R2 be revised as follows: "Each Reliability Coordinator shall take all necessary actions to prevent identified Emergencies or Adverse Reliability Impacts. These Reliability Coordinator actions shall include, to the extent necessary, the issuing of oral or written Reliability Directives to Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers located within its Reliability Coordinator Area. " R3, as drafted, is confusing and inconsistent with R2, and, thus, R3 should be revised to read as follows: "Upon receipt of a Reliability Directive issued pursuant to R2, a Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall comply with the Reliability Directive, unless compliance would violate safety, equipment, regulatory or statutory requirements. In the event that a Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider determines that compliance with a Reliability Directive would violate safety, equipment, regulatory or statutory requirements, the Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider shall, within 10 minutes after the determination, inform the Reliability Coordinator of its inability to comply." IRO-002 R1 and R2, as written, are confusing. It is recommended that R1 and R2 be combined to read as follows: "Pursuant to a written procedure to mitigate the impact of a Reliability Coordinator's analysis tool outage, a Reliability Coordinator's System Operator shall also have the authority to approve, deny or cancel a planned outage for its analysis tool." IRO-014 It is unclear why the terms Operating Procedure, Operating Process or Operating Plan needs to be plural, as currently written in the Standard. Hence, it is recommended that these terms be made singular, otherwise a violation may be inferred for not having more than one Procedure, Process or Plan. 1.1 Insert the word "applicable" before "Reliability Coordinator." 2.1, as written, is confusing. Recommend that 2.1 read as follows: "Review and update, if an update is necessary, on an annual basis. Annual basis means the review shall be within one month plus or minus that date of the last review." R3 This requirement uses a very vague term "reliability-related information," which, also, does not track the language used in R1 -- "information." It is recommended that R1 and R3 use the same terms and read " . . . information, as defined by the Reliability Coordinator, . . ." R4 As stated above, "at least" does not add value, and, therefore, should be deleted. R5, as written, is confusing. The recommended fix is to delete "all other" and replace with "impacted".

COM-001-2 does not specify the amount of time a DP has to reestablish the Interpersonal Communication Capability after the capability fails before it is assessed non-compliance for not having the communication. Is an entity non-compliant the minute the communication capability is unavailable If so, then to be compliant a tertiary (or secondary capability for DP) must be installed by the entity. Something similar was discussed with EOP-008 R3: "To avoid requiring a tertiary facility, a backup facility is not required during: • Planned outages of the primary or backup facilities of two weeks or less • Unplanned outages of the primary or backup facilities" UI suggests the drafting team incorporate something similar. The VSL for R7 is severe only and states: "The Distribution Provider failed to have Interpersonal Communications capability with one or more of the entities listed in Parts 7.1 or 7.2." I believe there should be a time component to the VSL and the VSL staged. For example, failure to have communication established for less than 60 minutes would be Lower, anything over 1 hour severe Also needed is a phrase to state when the violation begins. Does the violation begin when the loss of Communication Capability is detected or when it occurred? In other words, does the violation start when the operator attempts to use the phone and it is not functional, or did it occur when the phone line functionality failed but was not yet detected because no attempt to use the phone was made. So the VSL for R7 would follow a format of: "The Distribution Provider failed to have Interpersonal Communication Capability with one or more entities listed in Parts 7.1 or 7.2 for a continual 60 minutes period as measured from the time the ICC failure was detected". An alternative remedy is to alter the language of R7 to allow for unplanned outage. NERC does not have a Reliability Requirement for a DP to staff a control room 24/7. COM-0001 can be interpreted to imply that a DP needs to be staffed 24/7 to facilitate interpersonal communications. If NERC wants to extend the requirement for a 24/7 staffed

operating position at the DP then the appropriate method is thru a SAR to PER-002. COM-001 R7 should have a sub-requirement added recognizing that DP's are not required to staff 24/7 and many do not staff overnight. UI suggests adding R7.3: DP's will notify their TOP and/or BA when it is not staffing an operating desk. R7: Should address the instance if the DP is not required to have communication with the BA, because the BA communicates thru the TOP.

Yes

Yes

Yes

Comments: 1. COM-002 R2 seems awkwardly worded. R2. Each [Entity] that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message has been confirmed. " R2 as it is written says the repeat is confirming the accuracy of the message itself. I think it is agreed that the repeat back in R2 is to allow the issuer of the Directive to confirm that the message was received accurately understood by the recipient. I suggest: R2. Each [Entity] that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details to allow the Issuer to confirm that the directive recipient accurately understands the Directive" 2. The VSL for R2 is severe and states "The responsible entity that was the recipient of a Reliability Directive failed to repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message was confirmed." The purpose of the R2 repeat-back is to allow the Issuer verify the message was accurately received. This VSL penalizes the responsible entity for not accurately receiving the message. The VSL should penalize the refusal of the registered entity to repeat back the message not for receiving the message incorrectly. Suggested rewording: "The responsible entity that was the recipient of a Reliability Directive failed to repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message can be evaluated by the entity issuing the Reliability Directive" 3. United Illuminating does agree with the definition of Reliability Directive and Emergency.

We are providing the following comments for the Standards Drafting Team to consider. 1) Consider changing R1 to 'Each RC shall have the capability for Interpersonal Communications with the following entities to exchange

Interconnection and operating information...’ for clarity as Interpersonal Communications and capability are both nouns. 2) We feel changing the applicability of the standard is important to the accuracy of the standard. The purpose of COM-002 is ‘To ensure emergency communications between operating personnel are effective’. Since operating personnel are covered by the applicability of RC, BA, TOP and GOP, we suggest the applicability to TSP, LSE, and PSE be removed from COM-002-3. 3) Additionally, we would like to bring to the attention of the Standards Drafting Team, that the implementation plan for COM-001-2 and IRO-001-2 still includes TSP, LSE, and PSE although the revised standard does not include these entities in the Applicability Section. For COM-001-2 refer to the implementation plan, page 1. For IRO-001-2 refer to the implementation plan for new R2, new R3, new R4 and the chart on the last page. Thank you for your consideration in addressing these comments.

Paul Kerr
Shell Energy North America (US), L.P.

The introduction of the definition of “Reliability Directive” and its connection to the definition of “Emergency” within this Project brings much needed clarity for the sector and will promote consistency between Regional Entities and within the audits of Registered Entities. Shell Energy supports the removal of Purchasing Selling Entities as a function to which IRO-001 applies. This removal recognizes that PSEs do not play a role in reliability coordination under this standard since they have no authorities and no abilities to assume or perform responsibilities associated with reliability coordination. This conclusion is reinforced by the adoption of the defined term “Reliability Directive”. Where a RC, TOP, or BA needs to address an Emergency they do not contact, consult, or direct a PSE to take action that would address the Emergency. Rather, where the PSE is a user of the grid to perform or execute transactions, it is subject to the actions of these other entities that have the authority to stop, curtail, or alter the submitted transactions of the PSE in a way that aids in resolving the problem. With the fitting adoption of “Reliability Directive” into COM-002 as well, Shell Energy does not believe it is necessary or appropriate for the applicability of this standard to include Purchasing Selling Entities, as is contained in the current draft proposal. This standard does not apply to PSEs today, however, during the progression of Project 2006-06 this applicability was added to an early draft version that preceded the discussions and clarification that comes from the definition of a Reliability Directive in the standard. Shell Energy does not support the inclusion of PSEs in the current draft version of COM-002, and feels that it should be removed. The purpose of this standard is, “To ensure Emergency communications between operating personnel are effective” and relates directly to the capabilities and authorities established for the RC, TOP, or BA that requires actions to be taken by a recipient of a Reliability Directive. As noted previously, PSEs are acted upon by the entities with the necessary authority, and are not in a role that would initiate or fulfil the required actions. As additional matters related to the clarification and cleanup of the standards in this project, the implementation plans for both IRO-001 and COM-001 erroneously contain references to PSEs in the sections “Functions that Must Comply with the Requirements”. These references need to be removed.

The applicability of COM-001 and COM-002 appear to be at odds with each other. The requirements may need to be re-written so that they are in sync.

Yes
No

This is out of scope with the standard, as it is currently addressed through the NERC certification process that the NERC reliability coordinators are subject to.

The language used in COM-002-3 R2 including “with enough details that the accuracy of the message has been confirmed” is subjective and ambiguous. IRO-001 R2, R3, and R4 have replaced “Directives” with the word direction in lower case (while it appears that “Directives” is a subset of “directions”). We believe that this muddies the waters and could bring numerous conversations and dialog into scope unnecessarily. The end result is that the RC has the right to issue and use “Directives” and anything short of this could just be communications. For example, a number of entities that are Reliability Coordinators also facilitate energy markets. There are many communications related to markets that probably should be out of scope with respect to the standards. Furthermore, it might not be clear what role (eg Reliability Coordinator, market operator, etc) the staff at these entities are fulfilling.

Com-001-2 implementation plan lists that this is applicable to PSE's and LSE's however, PSE's and LSE's were removed from the actual standard. The implementation plan should be revised.
IRO Com-002-3 standard continues to include PSE. PSE's do not play an active role and have no authority or ability to perform reliability coordination. PSE's should be removed from the standard. -001-2 references PSE's in the implementation for R2, R3, R4 and "Functions that must comply with the requirements in this standard" table. PSE's were removed from the standard and should be removed from the implementation plan.

The monthly testing requirement for Alternative Interpersonal Communications is overly burdensome without any evidence to support that it is necessary to insure reliability. We believe that an entity will take necessary steps to insure the Alternative Interpersonal Communications is functioning properly, especially if it experiences problems with its Interpersonal Communications, it. We can support quarterly testing as we believe it strikes a reasonable balance.
Yes
We do not agree with the addition of weekly conference calls as required in R4. We believe that RCs should schedule calls as needed but do not agree that a weekly scheduled call improves reliability.

Each sub-requirement should not have an "R" in front of the number in order to be consistent with NERC's August 10, 2009 filing at FERC on this subject. Requirement R3 and R4 should include adjacent TOPs as a sub-requirement. Requirements R5 and R6 should include adjacent BAs as a sub-requirement. "to exchange Interconnection and operating information" should be deleted from requirements R1 through R8 as it is redundant with the definition of Interpersonal Communications The last page of the Implementation Plan includes LSEs, PSE, and TSPs as being responsible entities under this standard, yet the standard does not include them. Please correct the implementation plan.
No
Top-001-1, Requirement R3, which is what the SDT appears to be using as its justification for not adding a requirement here is proposed to be deleted by the RTO-SDT on Project 2007-03.

No
We think you are attempting to create a requirement similar to BAL-005, R1. That language copied here is clear and concise - All generation, transmission, and load operating within an Interconnection must be included within the metered boundaries of a Balancing Authority Area.
Yes
Yes
Please remove the yellow box on page 1 indicating this standard will be retired.
Reliability Directives may be issued by blast calls from Reliability Coordinators. It is inefficient and may be a hindrance to reliability to require 3-part communications in these instances. There are several organizations registered as BAs, RCs and TOPs. It is not uncommon for those entities to be distributed across multiple desks in the same control room without regard to how an entity is registered. Thus, a single System Operator may perform functions that are categorized under two or more of those functional entities. The drafting team should clarify that under no circumstances should that System Operator be required to issue a Reliability Directive to himself. This is a corporate governance issue. In IRO-014, R1, delete sub-requirement 1.7. The requirement for weekly conference calls related to operating procedures is duplicative to R4 and could be burdensome while adding very little value under certain circumstances. In IRO-014, R4, delete the phrase "(per Requirement 1, Part 1.7)" as a conforming change. In IRO-014, Requirements R6-R8 allow at least the theoretical possibility that an RC may determine an Adverse Reliability Impact in another RC's area that the other RC neither can see nor believes that any action should be taken. R7 puts the burden on the first RC to develop a plan that it cannot implement because it has no agreement with the BAs and TOPs in the other RC area. As such, this requirement is unenforceable. Please review all the implementation plans to be sure the applicable entities match those in the standards. "The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."

<p>1) LG&E/KU suggests that the definitions and related Reliability Standards be edited to provide a clearer understanding of what is required. When used in the requirements of COM-001, the proposed definitions for Interpersonal Communication and Alternative Interpersonal Communication read improperly (i.e., a “medium capability”). This may cause confusion as to what is required by the Applicable entities. Any further use of these terms may cause greater confusion. Suggested Alternative: Interpersonal Communication: Any instance where two or more individuals interact, consult, or exchange information. The definition of “Alternative Interpersonal Communication” would not have to be changed since it is dependent upon the definition of “Interpersonal Communication.” The change of the definitions of Interpersonal Communication and Alternative Interpersonal Communication shifts their focus to the communication itself—the event. This makes the Requirements themselves much clearer since the Requirements focus on the need that entities have the capabilities—the medium. It appears the SDT’s intent is to ensure that the event takes place by requiring that the medium for those events are in place. This is much clearer if there is a distinction between the two (the event and the medium) than if they have similar definitions (a medium and a “medium capability”). 2) LG&E/KU question the consistency of the Applicability sections as they pertain to the TSP, LSE and PSE functions between COM-001 and COM-002. The deletion of the TSP, LSE and PSE from COM-001 is supported, but if these entities are not required to establish Interpersonal Communication (or Alternative Interpersonal Communication) capability with reliability entities (RC, BA, TOP), should they still be required to follow the reliability directive process of COM-002? If the probability of issuing a Reliability Directive to a TSP, LSE or PSE is so low that Interpersonal Communications capabilities with reliability entities is not justified under COM-001, why are the TSP, LSE and PSE still held to the 3 way communication requirements of COM-002? Suggest the Applicability of COM-002 to TSP, LSE and PSE and associated requirements be deleted.</p>

<p>We expressed in the last posting that we felt the definition of Interpersonal Communications might inadvertently include data. The SDT responded that it does not by referring to Interpersonal in the name of the definition. Clearly, you can’t refer to the word you are defining in order to define it. However, it is possible “allows two or more individuals to ...” may solve this problem. Clarity should be sought in the next posting, if possible. This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities. We request the sub-requirements be modified into bulleted lists. Consider striking “to exchange Interconnection and operating information” in R1, R3, R5, R7, and R8. It is redundant to the use of Interpersonal Communications “to interact, consult, or exchange information” in the definition. Consider striking “to exchange Interconnection and operating information” in R2, R4, R6. It is redundant to the use of Alternative Interpersonal Communications which uses Interpersonal Communications in its definition. Interpersonal Communications includes “to interact, consult, or exchange information” in its definition. For R2, why is Interchange Coordinator excluded? It is included in the Requirement R1 which deals with the Interpersonal Communications. Communications would need to be maintained with the Interchange Coordinator in the event of a failure of the Interpersonal Communications. For R3, affected neighboring Transmission Operators should be included. For R4 and R6, the sub-requirement list is different than for than for the associated Interpersonal Communications requirements R3 and R5 respectively. We believe these should be duplicate. That is the sub-requirement list for R4 should match R3 and the R6 should match R5. In the event of a failure of the Interpersonal Communications, the Transmission Operator and Balancing Authority both would need to maintain communications to the same entities as in the requirement to have Interpersonal Communications. Again, we would suggest replacing sub-requirements with bulleted lists. For R5, why are neighboring Balancing Authorities not included? Additionally R5 should only read Contact with Interchange Coordinator within same Interconnection. They certainly need to be able to contact one another to identify discrepancies in scheduling and sources of meter error that could lead to deviations in ACE. Should R2, R4 and R6 be constructed parallel to R1, R3, and R5? In R1, R3 and R5, the requirement is “shall have” while in R2, R4, and R6, the requirement is “shall designate”. Since one is for the Interpersonal Communications and the other is for the Alternative Interpersonal Communications, it seems the same wording should be used. We do not believe R2.2 and R1.2 should be limited to Reliability Coordinators in the same Interconnection only. We suggest modifying “within the same Interconnection” to “within the same Interconnection, and, as appropriate, between a-synchronously connected RCs which are not precluded by law from scheduling interchange energy (for schedule changes, curtailments, etc.)” since reliability coordination may be required among the RCs on both sides of an Interconnection boundary. The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal Communications. FERC specified their general preference for gradated in paragraph 27 of their June 19, 2008 order on VSLs. The second half of the Severe VSL for R9 is almost a duplicate to the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.</p>
No

It might if the requirement were going to remain but the Project 2007-03 Real-Time Operations SDT proposed to retire that requirement during their last posting. We believe there needs to be better coordination with that SDT.
No
The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator. In R2, should “of” be “to”? Reliability Directives are issued to TOPs, BA, etc. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.
Yes
Yes
R1 states “When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.” The word “notify” should be stuck.
The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company. We believe that, in place of requiring an operator, in real-time, to state “this is a Reliability Directive,” there should be an allowance for an entity to develop procedures indicating, in advance, their expectations of three-part to their sub-operating entities. Therefore, we suggest modifying R1 to be “When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action, either verbally, when the communication is issued, or in advance through documented procedures, as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time.]” Also, we believe that the definition of Emergency, as currently cited in these draft Standards and included in the existing NERC Glossary should be modified to include the NERC Glossary term Adverse Reliability Impact to make the Standards more crisp, clear and enforceable. Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box. IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update. In the definition of Reliability Directive, we suggest changing “to address an Emergency” to “to address a reliability constraint or a declared Emergency”. Further, Requirement R2 in IRO-001 contains the words “which could include issuing Reliability Directives” but Reliability Directives are not referenced anywhere else in the standard. This inclusion seems unnecessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. We suggest that these words be removed. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary.

We suggest modifying “within the same Interconnection” to “within the same Interconnection, and, as appropriate, between a-synchronously connected RCs which are not precluded by law from scheduling interchange energy (for schedule changes, curtailments, etc.)” since reliability coordination may be required among the RCs on both sides of an Interconnection boundary. The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal Communications. FERC specified their general preference for graduated in paragraph 27 of their June 19, 2008 order on VSLs. The second half of the Severe VSL for R9 is almost a duplicate to the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.

No

It might if the requirement were going to remain but the Project 2007-03 Real-Time Operations SDT proposed to retire that requirement during their last posting. We believe there needs to be better coordination with that SDT.

No

The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator. In R2, should “of” be “to”? Reliability Directives are issued to TOPs, BA, etc. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.

Yes

Yes

R1 states “When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.” The word “notify” should be struck.

The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company. We believe that, in place of requiring an operator, in real-time, to state “this is a Reliability Directive,” there should be an allowance for an entity to develop procedures indicating, in advance, their expectations of three-part to their sub-operating entities. Therefore, we suggest modifying R1 to be “When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action, either verbally, when the communication is issued, or in advance through documented procedures, as a Reliability Directive to the recipient. [Violation Risk Factor: High] [Time Horizon:

Real-Time.]" Also, we believe that the definition of Emergency, as currently cited in these draft Standards and included in the existing NERC Glossary should be modified to include the NERC Glossary term Adverse Reliability Impact to make the Standards more crisp, clear and enforceable. Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box. IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update. In the definition of Reliability Directive, we suggest changing "to address an Emergency" to "to address a reliability constraint or a declared Emergency". Further, Requirement R2 in IRO-001 contains the words "which could include issuing Reliability Directives" but Reliability Directives are not referenced anywhere else in the standard. This inclusion seems unnecessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. We suggest that these words be removed. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of "which could include issuing Reliability Directives" in IRO-001 is unnecessary.

ERCOT ISO

No

We expressed in the last posting that we felt the definition of Interpersonal Communications might inadvertently include data. The SDT responded that it does not by referring to Interpersonal in the name of the definition. Clearly, you can't refer to the word you are defining in order to define it. However, it is possible "allows two or more individuals to ..." may solve this problem. Clarity should be sought in the next posting, if possible. This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities. We request the sub-requirements be modified into bulleted lists. Consider striking "to exchange Interconnection and operating information" in R1, R3, R5, R7, and R8. It is redundant to the use of Interpersonal Communications "to interact, consult, or exchange information" in the definition. Consider striking "to exchange Interconnection and operating information" in R2, R4, R6. It is redundant to the use of Alternative Interpersonal Communications which uses Interpersonal Communications in its definition. Interpersonal Communications includes "to interact, consult, or exchange information" in its definition. For R2, why is Interchange Coordinator excluded? It is included in the Requirement R1 which deals with the Interpersonal Communications. Communications would need to be maintained with the Interchange Coordinator in the event of a failure of the Interpersonal Communications. For R3, affected neighboring Transmission Operators should be included. For R4 and R6, the sub-requirement list is different than for than for the associated Interpersonal Communications requirements R3 and R5 respectively. We believe these should be duplicate. That is the sub-requirement list for R4 should match R3 and the R6 should match R5. In the event of a failure of the Interpersonal Communications, the Transmission Operator and Balancing Authority both would need to maintain communications to the same entities as in the requirement to have Interpersonal Communications. Again, we would suggest replacing sub-requirements with bulleted lists. For R5, why are neighboring Balancing Authorities not included? Additionally R5 should only read Contact with Interchange Coordinator within same Interconnection. They certainly need to be able to contact one another to identify discrepancies in scheduling and sources of meter error that could lead to deviations in ACE. Should R2, R4 and R6 be constructed parallel to R1, R3, and R5? In R1, R3 and R5, the requirement is "shall have" while in R2, R4, and R6, the requirement is "shall designate". Since one is for the Interpersonal Communications and the other is for the Alternative Interpersonal Communications, it seems the same wording should be used. We do not believe R2.2 and R1.2 should be limited to Reliability Coordinators in the same Interconnection only. We suggest modifying "within the same Interconnection" to "within the same Interconnection, and, as appropriate, between a-synchronously connected RCs which are not precluded by law from scheduling interchange energy (for schedule changes, curtailments, etc.)" since reliability coordination may be required among the RCs on both sides of an Interconnection boundary. The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal Communications. Suggested minor revision to the definition of Reliability Directive as follows (change in caps) A communication, IDENTIFIED AS A RELIABILITY DIRECTIVE, initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency. Clearly identifying a

communication as a Reliability Directive provides immediate information to the recipient as the the nature of the communications.

No
A. R5.5 states a BA shall have Interpersonal Communications with each Interchange Coordinator within its BA area and adjacent Interchange Coordinators. NERC Registry Criteria (v5) uses the term "Interchange Authority" not Interchange Coordinator, please clarify. B. Upon review of the NERC Compliance Registry, there are only 56 BA's that are also registered as an IA but 138 total BA's within the registry. R5.5 is not clearly written because many BA's do not have an IA within their BA area. Though a BA will use an IA to schedule interchange, a possible rewrite of R5.5 may be "Each Interchange Authority that the BA actively uses to arrange Interchange". C. R10 states that the RC, TOP, BA, DP and GOP shall notify "impacted entities" within 60 minutes... Please clarify if the SDT means the entities within the applicability section or is this to be determined by the entity. A possible rewrite may be; "Each RC shall notify TOP's, BA's, and IA's within its RC area along with adjacent RC's within the same Interconnection". This break down would need to be required for each affected entity and would provide clarity to the industry. D. We do not agree with a DP and GOP need to be held to the same level of compliance as a RC, BA or TOP. FERC Order 693 (paragraph 487) directed the DP and GOP to be included in this standard by stating;" We expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process". A DP and GOP may not be staffed 24 hours a day like a BA or TOP and the SDT did not take this into consideration. E. We understand that the DP and GOP need a means of communicating with their BA and TOP (R7 and R8) but would this not be the same Interpersonal Communications capability that as stated in R3 and R5 for the TOP and BA? Example: If the BA uses a phone line as their Interpersonal Communication medium to contact the DP wouldn't the DP also use the same medium to communicate with their BA? Yes, there could be different mediums but 99% of the time it will be the same medium. F. R10 could mean that if there is a logging system that detects an Interpersonal Communication failure, then all applicable entities will need to monitor that monitoring device. Since this requirement applies to all applicable entities, and Interpersonal Communication mediums will most likely be the same, there will always be two entities found non compliant if the 60 minute threshold is passed.
No
A. Agree that a receiving entity should not be held accountable until such time that they are required to take such action. B. It might if the requirement were going to remain but the Project 2007-03 ("Real-Time Operations SDT") proposed to retire that requirement during their last posting. This needs to be coordinated with that SDT.
No
A. R1, As written it is unclear what level of certification this will entail? Presently written within the NERC Reliability Standards, responsibility is given to RC's to manage the reliability of their areas. Recommend deleting this requirement. The ERO has pushed back in other Standards to having a responsibility for any NERC Requirements, since they are not a user, owner, or operator of the BES (see EOP-004-2). If this does move forward and an RC is certified by the ERO and then the RC is found non-compliant by a Regional Entity, for an associated certified item, will the ERO be held responsible, too? If the SDT selects to keep R1, there are some issues with how the requirement is written. The requirement places emphasis on regions and regional boundaries when no emphasis should be placed there. There are multiple Reliability Coordinators the span multiple regions. The language "to continuously assess transmission reliability" should be changed to "to continuously assess Bulk Electric System reliability" to reflect on what the standards are enforceable. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator. B. In R2, should "of" be "to". Reliability Directives are issued to TOPs, BA, etc. C. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.

Yes
Yes
<p>A. COM-002-3, R2 As stated in FERC Order 693, section 512, it is essential that RCs, BA's and TOP's have communications with DPs. R2 also applies to TSPs, LSEs and PSEs. There is no directive for this and it is going to be almost impossible to communicate with a DP since DPs are usually not operated 24 hours per day as like a RC, TOP, or BA. Many DPs have answering services that will relay a message once they receive it and then pass it along to someone. An answering company could repeat the directive word for word but this will not add to any reliability level. The SDT should reconsider the applicability section of this Standard to only apply to a RC, TOP and BA for the issuance of a Reliability Directive. BA's should have the responsibility to have an Interpersonal Communication medium with DPs in their BA area per COM-001-2. B. IRO-002-2, R1, Recommend that "System Operators" be replaced with "system operators" since NERC has defined System Operator to be an individual at a control center (BA, TOP, GOP, or RC). The lower cased system operator will only point to the RC system operator that will have this R1 authority. C. The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company. D. We also are concerned about the need to conduct three-part communications for a Reliability Directive issued through a blast call. Under these circumstances, the need for immediate action of multiple parties may require a blast call and there may not be time for all parties to complete three-part communications before initiating actions. Thus, we believe blast calls should be treated separately and that should be made clear. E. COM-002-3 R2 needs to be rewritten as it is too verbose. The point is for the recipient of the original message to get the issuer to confirm that the message was understood. We suggest rewording R2 to "Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive." Once the receiver has completed this requirement, the ball is in the issuer's court per Requirement R3. No additional words are necessary in the requirement. F. Per COM-002-3 R1, who decides that actions need to be issued as a Reliability Directive? Shouldn't it be the responsible entity? Thus, can we assume that if the responsible entity does not identify a communication as a Reliability Directive that it is not a Reliability Directive per the requirement? After all, why would an entity require actions but not issue a Reliability Directive. Following this logic, the VSL for R1 would never apply. Would a compliance auditor second guess if an action required a Reliability Directive? G. Because the Project 2007-03 ("Real-Time Operations SDT") proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. H. There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box. I. Please strike part IRO-014-2 Part 1.7. There is no need to have a weekly conference to discuss every Operating Procedure, Operating Process and Operating Plan. As this requirement is written, a conference call would be necessary for each. Furthermore, IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update. J. IRO-014-2 R4 is overly broad and would require Reliability Coordinators that will not impact one another to participate on conference calls with one another without any reliability benefit. The issue is created by the addition of the clause "within the same Interconnection" to the requirement. ISO-NE, FRCC, Midwest ISO, and SPP are all in the same Interconnection. It is hard to fathom there being reliability benefit to SPP and ISO-NE conversing weekly or Midwest ISO and FRCC conversing weekly. We suggest limiting the requirement to adjacent Reliability Coordinators. K. For IRO-014-2 R5, we suggest replacing "other" with "impacted" to limit the notification of Adverse Reliability Impacts to only those Reliability Coordinators that need to know. Because the definition of Adverse Reliability Impact includes "Bulk Electric System instability or Cascading", it is possible that the cascading of 138 kV lines serving a load pocket or generator outlet stability issues could require a Reliability Coordinator to notify all other Reliability Coordinators regardless of impact. This would include Reliability Coordinators outside of the Interconnection with the problem. It would also include Reliability Coordinators that are not impacted. For instance, an issue in New England that would not pose a threat outside the northeast would require ISO-NE to notify SPP and FRCC and Reliability Coordinators in the Western Interconnection. There is no reliability benefit to this notification. L. IRO-014-2 R6-R8 are problematic and need to be refined to make clear that the Reliability Coordinators shall operate to the most conservative limit. It should not require a Reliability Coordinator that disagrees with an action plan to implement the action plan. The Reliability Coordinator will</p>

be disagreeing with the action plan for a reliability reasons. Assuming they are correct, the requirement to implement said action plan will actually put the Interconnection at greater risk. These requirements inappropriately attempt to codify the debate and analysis that occurs between and within Reliability Coordinators when there are differing results in reliability analysis. This is part of the problem with having a Wide Area view that results in Reliability Coordinators having a view into other Reliability Coordinator Area. Their results and conclusions may be different. There should be a hierarchical structure for whose results should be used. It should be the Reliability Coordinator with primary responsibility unless the other Reliability Coordinator has evidence to demonstrate that the Reliability Coordinator with primary responsibility is incorrect. What this should do is, to trigger both to review their models and data to assess the problem. None of this needs to be codified in the standards though. M. In the definition of Reliability Directive, we suggest changing "to address an Emergency" to "to address a declared Emergency". This would help limit second guessing for a situation where a System Operator took action because he truly believed he was in an Emergency but after the fact analysis demonstrates there really was not an Emergency. N. The drafting team should expand its rationale for deleting IRO-002-1 R3. Currently, TOP-005 R1 is referenced. The project 2007-03 ("Real-Time Operations SDT") proposed to retire TOP-005-2 R1 in its most recent posting. O. We disagree with deleting IRO-002-1 R5 and R7 which establishes tools and monitoring capabilities. There should be basic tool requirements established for Reliability Coordinators. The project 2009-02 ("Real-time Reliability Monitoring and Analysis Capabilities") will be addressing these issues in more detail. Thus, it does not make sense to delete these requirements until that drafting team completes its task.

Group

FirstEnergy

Sam Ciccone

No

It is not clear from the definition of Interpersonal Communications if certain communications "mediums" such as email, instant messaging, etc. are included. Furthermore, the Measures for these requirements all include "electronic communications" as acceptable evidence. If the drafting team does not intend these mediums be included, then it should be clarified in the definition. We suggest the following wording of the definition: Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information. This interaction consists of verbal, spoken words exchanged in Real-time.

Yes

Yes

Yes

Yes

FirstEnergy offers the following additional comments: 1. The effective dates of the standards indicate an effective date of the first day of the first calendar quarter following regulatory approval. The changes to these standards will require changes to existing compliance evidence, as well as the creation of compliance evidence for some entities such as the Generator Operator which is a new applicable entity in COM-001. Therefore, to give entities ample time to get their compliance evidence in place, we suggest the effective state "the first day of the second quarter after regulatory approval". 2. With regard to the requirements for Alternative Interpersonal Communications, we question why the Generator Operator or Distribution Provider is not required to have backup communication. It would be difficult for a Reliability Coordinator, for instance, to contact a Generator Operator whose primary communications have been disabled if that entity does not have a backup. We suggest that the drafting team consider adding the GOP and DP as applicable entities requiring alternative communications.

We expressed in the last posting that we felt the definition of Interpersonal Communications might inadvertently include data. The drafting team responded that it does not by referring to Interpersonal in the name of the definition. Clearly, you can't refer the word you are defining to define it. However, it is possible "allows two or more individuals to ..." may solve this problem. What are the drafting team's thoughts on this issue? This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities. Consider striking "to exchange Interconnection and operating information" in R1, R3, R5, R7, and R8. It is redundant to the use of Interpersonal Communications "to interact, consult, or exchange information" in the definition. Consider striking "to exchange Interconnection and operating information" in R2, R4, R6. It is redundant to the use of Alternative Interpersonal Communications which uses Interpersonal Communications in its definition. Interpersonal Communications includes "to interact, consult, or exchange information" in its definition. For R2. why is Interchange Coordinator excluded? It is included in the Requirement R1 which deals

with the Interpersonal Communications. Communications would need to be maintained with the Interchange Coordinator in the event of a failure of the Interpersonal Communications. For R3, neighboring Transmission Operators should be included. For R4 and R6, the sub-requirement list is different than for than for the associated Interpersonal Communications requirements R3 and R5 respectively. They should be duplicate. That is the sub-requirement list for R4 should match R3 and the R6 should match R5. In the event of a failure of the Interpersonal Communications, the Transmission Operator and Balancing Authority both would need to maintain communications to the same entities as in the requirement to have Interpersonal Communications. For R5, why are neighboring Balancing Authorities not included? They certainly need to be able to contact one another to identify discrepancies in scheduling and sources of meter error that could lead to deviations in ACE. Should R2, R4 and R6 be constructed parallel to R1, R3, and R5? In R1, R3 and R5, the requirement is "shall have" while in R2, R4, and R6, the requirement is "shall designate". Since one is for the Interpersonal Communications and the other is for the Alternative Interpersonal Communications, it seems the same wording should be used. Should R2.2 and R1.2 be limited to Reliability Coordinators in the same Interconnection only? The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal Communications. FERC specified their general preference for gradated in paragraph 27 of their June 19, 2008 order on VSLs. The second half of the Severe VSL for R9 is almost duplicate to the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.

No

It might if the requirement were going to remain but the Project 2007-03 Real-Time Operations SDT proposed to retire that requirement during their last posting. This needs to be coordinated with that SDT.

No

In general, we are not opposed to the concept of the ERO certifying the Reliability Coordinators; however, there are some issues with how the requirement is written. The requirement places emphasis on regions and regional boundaries when no emphasis should be placed there. There are multiple Reliability Coordinators that span multiple regions. The language "to continuously assess transmission reliability" should be changed to "to continuously assess Bulk Electric System reliability" to reflect on what the standards are enforceable. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator Area. In R2, should "of" be "to". Reliability Directives are issued to TOPs, BA, etc. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.

Yes

Yes

The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company. We also are concerned about the need to conduct three-part communications for a Reliability Directive issued through a blast call. Under these circumstances, the need for immediate action of multiple parties may require a blast call and there may not be time for all parties to complete three-part communications before initiating actions. Thus, we believe blast calls should be treated separately and that should be made clear. COM-002-3 R2 needs to be rewritten as it is too verbose. The point is for the recipient of the original message to get the issuer to confirm that the message was understood. We suggest rewording R2 to "Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive." Once the receiver has completed this requirement, the ball is in the issuer's court per Requirement R3. No additional words are necessary in the requirement. Per COM-002-3 R1, who decides that actions need to be issued as a Reliability Directive? Shouldn't it be the responsible entity? Thus, can we assume that if the responsible entity does not identify a communication as a Reliability Directive that it is not a Reliability Directive per the requirement? After all, why would an entity require actions but not issue a Reliability Directive. Following this logic, the VSL for R1 would never apply. Would a compliance auditor second guess if an action required a Reliability Directive? Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. There is a

text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box. Please strike part IRO-014-2 Part 1.7. There is no need to have a weekly conference to discuss every Operating Procedure, Operating Process and Operating Plan. As this requirement is written, a conference call would be necessary for each. Furthermore, IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update. IRO-014-2 R4 is overly broad and would require Reliability Coordinators that will not impact one another to participate on conference calls with one another without any reliability benefit. The issue is created by the addition of the clause "within the same Interconnection" to the requirement. ISO-NE, FRCC, Midwest ISO, and SPP are all in the same Interconnection. It is hard to fathom there being reliability benefit to SPP and ISO-NE conversing weekly or Midwest ISO and FRCC conversing weekly. We suggest limiting the requirement to adjacent Reliability Coordinators. For IRO-014-2 R5, we suggest replacing "other" with "impacted" to limit the notification of Adverse Reliability Impacts to only those Reliability Coordinators that need to know. Because the definition of Adverse Reliability Impact includes "Bulk Electric System instability or Cascading", it is possible that the cascading of 138 kV lines serving a load pocket or generator outlet stability issues could require a Reliability Coordinator to notify all other Reliability Coordinators regardless of impact. This would include Reliability Coordinators outside of the Interconnection with the problem. It would also include Reliability Coordinators that are not impacted. For instance, an issue in New England that would not pose a threat outside the northeast would require ISO-NE to notify SPP and FRCC and Reliability Coordinators in the Western Interconnection. There is no reliability benefit to this notification. IRO-014-2 R6-R8 are problematic and need to be refined to make clear that the Reliability Coordinators shall operate to the most conservative limit. It should not require a Reliability Coordinator that disagrees with an action plan to implement the action plan. The Reliability Coordinator will be disagreeing with the action plan for reliability reasons. Assuming they are correct, the requirement to implement said action plan will actually put the Interconnection at greater risk. These requirements inappropriately attempt to codify the debate and analysis that occurs between and within Reliability Coordinators when there are differing results in reliability analysis. This is part of the problem with having a Wide Area view that results in Reliability Coordinators having a view into other Reliability Coordinator Areas. Their results and conclusions may be different. There should be a hierarchical structure for whose results should be used. It should be the Reliability Coordinator with primary responsibility unless the other Reliability Coordinator has evidence to demonstrate that the Reliability Coordinator with primary responsibility is incorrect. What this should do is to trigger both to review their models and data to assess the problem. None of this needs to be codified in the standards though. In the definition of Reliability Directive, we suggest changing "to address an Emergency" to "to address a declared Emergency". This would help limit second guessing for a situation where a System Operator took action because he truly believed he was an Emergency but after the fact analysis demonstrates there really was not an Emergency. The drafting team should expand its rationale for deleting IRO-002-1 R3. Currently, TOP-005 R1 is referenced. The Real-Time Operations drafting team proposed to retire TOP-005-2 R1 in its most recent posting. We disagree with deleting IRO-002-1 R5 and R7 which establish tools and monitoring capabilities. There should be basic tools requirements established for Reliability Coordinators. Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities will be addressing these issues in more detail. Thus, it does not make sense to delete these requirements until that drafting team completes its task.

Comments: Standard COM-001-2 R10. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, and Generator Operator shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer. Comment: It is not clear whether the notification requirements identified in R10 apply to failure of ALL available Interpersonal Communications

or ANY Interpersonal Communications. We suggest that the existence of functioning Alternative Interpersonal Communications precludes the requirement for notification of impacted entities. D. Compliance 1. Compliance Monitoring Process 1.3 Data Retention Each Generator Operator shall keep the most recent twelve months of historical data (evidence) for Requirements R8 and R10, Measures M8 and M10. Comment: The data retention requirements specified for the Generator Operator in Para. 1.3 (above) are not consistent with the 3-year audit interval for the GOP. Question: When audited on this Standard is the expectation that the GOP will have 12 months of evidence or 36 months of evidence? Standard COM-002-3 R2. Each Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message has been confirmed. Comment: The term "Reliability Directive" is currently not defined in the NERC Glossary of Terms. However, in the Implementation Plan for COM-002-3 the RC SDT proposes a definition for Reliability Directive. It is implied in the standard that the Reliability Directive is issued as a voice command which precludes the use of our preferred method of Interpersonal Communication. However, this is not definitively stated in either the standard or the proposed definition. I think this needs to be made clearer if the Reliability Directive must be issued as a voice command. D. Compliance 1. Compliance Monitoring Process 1.3 Data Retention The Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity shall retain evidence of Requirement 2, Measure 2 for the most recent 3 months. Comment: The data retention requirements specified for the Generator Operator in Para. 1.3 (above) are not consistent with the 3-year audit interval for the GOP/PSE. Question: When audited on this Standard is the expectation that the GOP and PSE will have 3 months of evidence or 36 months of evidence?

No

Comments: I see no connection between XCEL's comment on COM-001-1. The requirements of COM-001-1 require the RCs, TOPs, and BAs to have a primary interpersonal communications method and to designate an alternative. I believe that if the requirements for the entity to have both primary and alternative methods of interpersonal communications this objection could be cleared. For example, R2 Each Reliability Coordinator shall designate have an Alternative Interpersonal Communications capability with the following entities to exchange Interconnection and operating information

No

Comments: This would allow NERC to designate one entity to be the Reliability Coordinator for an entire interconnection or the entire continent. This would reduce the Regional Reliability Organizations to compliance entities.

Yes

Yes

Comments: It appears that the requirements for entities designated in the IRO standards to have tools to access and/or monitor the system have been moved to pending standards that are not enforceable. It seems that if the newest revisions of the IRO standards are not implemented as a group there will be either missing requirements or duplicate requirements in the IRO standards.

• We question how far the definition of Alternative Interpersonal Communication goes in requiring separate infrastructure from Interpersonal Communication. For example, wireless communications sometime utilize fiber optic networks. • We question why the requirements state that entities must "have" Interpersonal Communications capability, but must "designate" Alternative Interpersonal Communications capability? • R1.2 and R2.2 – Why is this limited to the same interconnection? • R3 – need to add neighboring TOPs. • R5 – need to add adjacent BAs. • Interchange Coordinator – Add IC to the Applicability Section, and add a requirement that the IC have Interpersonal Communication capability with its BA and adjacent BAs. • Requirements to "designate" Alternative Interpersonal Communication should carry a "Medium" VRF instead of "High", because they are a backup capability. The word "designate" carries the connotation that these are documentation requirements. • R9 requires a monthly test of Alternative Interpersonal Communications capability. This was quarterly in the last draft. We question how these requirements for "Alternative Interpersonal Communications" capability are related to requirements for "backup functionality" in EOP-008-1, which requires an annual test of backup functionality. Clarity on the relationship between "Interpersonal Communications", "Alternative Interpersonal Communications", "primary control center functionality" and "backup control center functionality" would be appreciated. • R11 – is this requirement being moved to COM-003? • Data Retention – Is data retention really going to be just 12 months? Most auditors seem to be asking for everything since the last audit.

No

Requirements of TOP-001-1 are being revised under Project 2007-03, which may not continue to adequately address Xcel's concern.

No
How is NERC going to certify the RCs? Also, we believe the word "all" should be inserted after the word "among", so that it's clear that all generation, transmission and load must be included.
Yes
Yes
<p>• COM-002-3 contains the proposed definition "Reliability Directive". We continue to believe Requirement R1 should be deleted and that this definition should contain the phrase "identified as a Reliability Directive to the recipient". Otherwise, compliance controversies will arise when auditors second-guess the RC, TOP or BA's judgment regarding whether or not an abnormal system condition met the definition of "Emergency", and warranted a "Reliability Directive" with 3-part communication. A conforming change will need to be made to R2, since it refers to R1. This change in the definition of "Reliability Directive" is also needed because this term is used in other standards such as IRO-001-2, and without repeating a similar requirement to COM-002-3 requirement R1 in IRO-001-2, there is potential for confusion. • We disagree with the VSL for COM-002-3. This is clearly a requirement with two possible compliance failures: Failure to acknowledge a correct repeat-back, and failure to resolve an incorrect repeat-back. These failures have dramatically different consequences, which the drafting team should recognize via a graduated VSL. We think that the failure to acknowledge should either be "Lower" or "Medium". • Requirement R2 of IRO-001-2 is unclear and should be reworded as follows: "Each Reliability Coordinator shall take actions or direct actions (which could include issuing Reliability Directives to Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area) to either prevent identified events that could result in an Adverse Reliability Impact, or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts." • Various changes have been made to the defined term "Adverse Reliability Impact" as this project has progressed. We believe the latest change should not be made, and the Phrase "uncontrolled separation" should be reinserted in the definition, because that phrase is part of the Epect 2005 legislation definition of "reliable operation". Here is the text from the legislation: "The term 'reliable operation' means operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements."</p>

No
We would suggest that the applicability of COM-001-2 be expanded to that listed in COM-002-3. How can the directives to be issued in COM-002 be delivered and confirmed without having Interpersonal Communications capability? All of the functional entities listed in R1.1 should also be listed in R2.1. Similarly the sub-requirements of R3 should also be applied to R4. The same holds true for R5 and R6. If the SDT intends to exclude data communications from Interpersonal Communications and Alternative Interpersonal Communications, we suggest the SDT be more specific in the definition to specifically exclude data communications in the definition. It is not readily apparent that these terms do not apply to data communications and without a clarification, confusion exists.
Yes
In fact, we believe that R1, R2 and R5 more specifically put that requirement on the TOP. The TOP doesn't have to wait for the RC and any directive that may be associated with R3 prior to taking action to mitigate an emergency condition.
No
Is this more of a registry question than a standards issue? While we agree that there needs to be a requirement somewhere that establishes the need for Reliability Coordinators, isn't there also a similar need for other functional entities such as Transmission Operators, Balancing Authorities, etc? Should these be captured in standards or in the certification/registration process?
Yes
Yes
IRO-001-2, R2 implies that the RC could interrupt the normal chain of command from the TOP and/or BA to their respective GOPs, ICs and DPs thereby circumventing the coordinating process that currently exists. In fact, these entities may not even know their RCs nor be able to identify them and as such any directive from the RC may not be implemented in a timely manner. We would like to see a qualifier on this requirement that does not remove the normal coordination role from the TOP with his DP, etc. We would suggest that "with enough details that the accuracy of the message has been confirmed" be deleted from COM-002-3, R2. We would suggest the use of the term "instruction" and its derivatives rather than 'direct' in IRO-001-2. R2. R3 and R4. Delete 'issue an alert to' in IRO-005-4. R1. There are

yellow boxes in IRO-005-4, redline versions, which indicate that this standard is being retired, but it isn't because two requirements from IRO-001 are being returned to this standard.

Based on the drafting teams response that the definition of Interpersonal"clarifies the exclusion of media dedicated to Telemetry or other data exchange,the term Interpersonal Communication should be replaced with verbal communication capabilities. The term Alternative Interpersonal Communication should be replaced with alternative verbal communication capability that is able to serve as a substitute for and does not utilize the same infrastructure (medium) as verbal communications capabilities used for day-to-day operations.

Yes

Yes

Yes

1. COM-002 R2 states that "the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message has been confirmed." Recommend a change to "the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the desired outcome of the message is clear". 2. IRO-001 R2 states "Each Reliability Coordinator shall take actions or direct actions which could include issuing Reliability Directives of Transmission Operators," Recommend a change to "Each Reliability Coordinator shall take actions or direct actions which could include issuing Reliability Directives [See COM-002] to Transmission Operators, ..." 3. IRO-001 R4 states entities "shall inform its Reliability Coordinator upon recognition of its inability to perform as directed per Requirement R3." Recommend a change to, entities "shall inform its Reliability Coordinator upon recognition of its inability to perform as directed."

The definition of "Interpersonal Communications" is overly broad and does not address the functional needs of reliability coordination. The definition should be limited to systems utilized for essential reliability functions. While the Purpose statement in the standard does address this intent, the explicit inclusion in the definition removes all ambiguity. Further, the definition of "Alternative Interpersonal Communications" without corresponding explicit definition of Primary Interpersonal Communications may lead to confusion and unnecessary duplication of efforts in testing and maintenance.

No

TOP-001 is in the process of being substantially modified by Project 2007-03. These changes may conflict with the matter addressed by Xcel's comment. Thus, Xcel's concern should be addressed independently but in the context of the TOP-001-2 revisions proposed by Project 2007-03.

Yes

CWLP generally concurs with and supports comments previously submitted by the SERC Operating Committee where those comments are not in conflict with the specific comments above.

No
Each sub-requirement should not have an "R" in front of the number in order to be consistent with NERC's August 10, 2009 filing at FERC on this subject. Requirement R3 and R4 should include adjacent TOPs as a sub-requirement. Requirements R5 and R6 should include adjacent BAs as a sub-requirement. "to exchange Interconnection and operating information" should be deleted from requirements R1 through R8 as it is redundant with the definition of Interpersonal Communications The last page of the Implementation Plan includes LSEs, PSE, and TSPs as being responsible entities under this standard, yet the standard does not include them. Please correct the implementation plan.
No
Top-001-1, Requirement R3, which is what the SDT appears to be using as its justification for not adding a requirement here is proposed to be deleted by the RTO-SDT on Project 2007-03.
No
We think you are attempting to create a requirement similar to BAL-005, R1. That language copied here is clear and concise - All generation, transmission, and load operating within an Interconnection must be included within the metered boundaries of a Balancing Authority Area.
Yes
Yes
Reliability Directives may be issued by blast calls from Reliability Coordinators. It is inefficient and may be a hindrance to reliability to require 3-part communications in these instances. There are several organizations registered as BAs, RCs and TOPs. It is not uncommon for those entities to be distributed across multiple desks in the same control room without regard to how an entity is registered. Thus, a single System Operator may perform functions that are categorized under two or more of those functional entities. The drafting team should clarify that under no circumstances should that System Operator be required to issue a Reliability Directive to himself. This is a corporate governance issue. In IRO-014, R1, delete sub-requirement 1.7. The requirement for weekly conference calls related to operating procedures is duplicative to R4 and could be burdensome while adding very little value under certain circumstances. In IRO-014, R4, delete the phrase "(per Requirement 1, Part 1.7)" as a conforming change. In IRO-014, Requirements R6-R8 allow at least the theoretical possibility that an RC may determine an Adverse Reliability Impact in another RC's area that the other RC neither can see nor believes that any action should be taken. R7 puts the burden on the first RC to develop a plan that it cannot implement because it has no agreement with the BAs and TOPs in the other RC area. As such, this requirement is unenforceable. Please review all the implementation plans to be sure the applicable entities match those in the standards.

(1) NERC filed with FERC on August 10, 2009 indicating that it would discontinue the use of sub-requirements in standards. All draft standards posted since have the format of Part Numbers within each main Requirement. Please revise the standards in this project accordingly. (2) Having defined the terms Interpersonal Communication and Alternative Interpersonal Communication, the phrase "to exchange Interconnection and operating information" in a number of requirements is redundant and can be removed. Further, for R1, we suggest removing the phrase "within the same Interconnection since there RCs between two Interconnections still need to communication with each other for reliability coordination (e.g. curtailment of interchange transactions crossing Interconnection boundary, as stipulated in IRO-006). (3) R2: Suggest to add Purchasing-Selling Entity and Interchange Authority (INT-004 and INT-005 have requirements for communication between the RC and the PSE and IA), and remove the phrase "within the same Interconnection since there RCs between two Interconnections still need to communication with each other for reliability coordination (e.g. curtailment of interchange transactions crossing Interconnection boundary, as stipulated in IRO-006). (4) R3: Suggest to add adjacent Transmission Operator and Purchasing-Selling Entity (the latter needed for meeting INT-004 requirements). (5) The list of entities in R4 and R6 is different from those in R3 and R5. They should be the same for having Alternative Interpersonal Communication capability. (6) R5: Suggest to add adjacent Balancing Authority as adjoining BAs need to communication with each to check schedules and other balancing information. (7)

There are a number of parts in Requirements R1 to R8 each of which must be complied with. However, the VSLs for R1 to R8 are binary which do not provide any distinction in partial failure of each of these requirements. We suggest the SDT to apply the VSL guideline and re-establish the various levels of violation severity for these requirements.

No

TOP-001 is being revised and some of the requirements that fulfill this need may have been removed. We suggest the SDT check with the latest draft version of TOP-001 and coordinate with the Real-time Operation SDT to ensure there are not gaps.

No

1. R2: The word "of" before Transmission Operators should be "to". 2. The VSL for R1 should be revised to replace Regional Entities with ERO.

Yes

Yes

1. IRO-001: Reliability Directive: We do not agree with the proposed definition since it addresses Emergencies only. There are situations where a Reliability Directive is issued such that the directed action must be taken by the receiving entity to address a reliability constraint or any condition on the BES which if left unattended could, in the judgment of the issuing entity, lead to an Emergency. These conditions themselves do not constitute an Emergency which is defined as "Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System." There could be no abnormal condition but the actions must nevertheless be taken promptly to prevent the bulk electric system from entering into an abnormal condition. We therefore suggest the term Reliability Directive be revised to: Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address a reliability constraint or an Emergency. 2. IRO-001, Requirement R2: This requirement contains the words "which could include issuing Reliability Directives" which is not referenced anywhere else in the standard. We do not think this inclusion is necessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. We suggest to remove these words. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of "which could include issuing Reliability Directives" in IRO-001 is unnecessary. We suggest replacing "identified events" with "anticipated events". This requirement also lists Interchange Coordinators as one of the recipients of Reliability Directives which is not consistent with the implementation plan. 3. IRO-014: R4 as written creates unnecessary requirements for an RC to participate in conference calls for issues that may not affect the RC itself. We suggest to reinstate the original word "impacted" as opposed to "other", and remove the words "within the same Interconnection" since such calls and coordination may be required for RCs on both side of the Interconnection boundary. Same change suggested for R5, i.e. replace "other" with "impacted". 4. If an entity provides Interpersonal Communication for day-to-day communication using two different media, e.g. radio and telephone, the proposed definition of Alternative Interpersonal Communication suggests that it would not be possible for one medium to be used as the Alternative Interpersonal Communication for the other since the two media are both used every day. 5. COM-001-2 R10 suggests that the responsible entity must wait for at least 30 minutes before notifying other entities of the failure of its Interpersonal Communication capability. We recommend changing "that lasts 30 minutes" to "that lasts or is expected to last 30 minutes". This allows responsible entities to start notifying other entities earlier. 6. In IRO-005-4 R1: Delete "notify".

Individual

Alice Ireland

Xcel Energy

No

We feel that either the definitions, or the requirements, should make it clear whether data is included.

No

We are concerned that the drafting team may not have understood Xcel Energy's comments and FERC's directive in Order 693. FERC had asked that NERC consider Xcel Energy's suggestion. This consideration does not necessarily equate to the development of additional requirements, however that may be the solution. We recognize that R1 and R2 of TOP-001-1 give the TOP authority to take immediate actions necessary to alleviate operating emergencies. We were concerned with the potential situation where the RC's directive (R3 of IRO-001-2) may conflict with actions the TOP has ALREADY taken. In this situation, we do not feel the TOP should be held at fault for the actions it took prior to the RC's directive. (R3 of IRO-001-2 is currently in effect under TOP-001-1 R3.) Additionally, R1 and R2 of TOP-001-1 have been removed from the latest draft of version 2. So, if TOP-001-2 and IRO-001-2 are approved as drafted, it would appear that all rights and protections of the TOP to take immediate actions will be removed and our initial issue, as detailed in Order 693, still exists.

Group
Kansas City Power & Light
Michael Gammon
No
These requirements require TOP's, BA's, and GOP's to establish alternative means of "interpersonal" communications with other BA's, GOP's, and BA's respectively without regard to the reliability impact each TOP, BA or GOP has on the interconnection. Why would it be necessary for a TOP with one 161kv transmission line or a BA with 100 MW of total load, or one GOP with a 30MW unit to realize additional costs when the facilities they operate have little reliability impact? In addition, most RC's have established satellite telephone systems as back-up communication with TOP's. RC's may have to establish additional communication systems with BA's as these requirements impose to avoid Standards of Conduct issues. R9 – considering the reliability of communication systems, a 2 hour response to a problem with the alternative means of communication is over sensitive. Allowing for sometime in an operating shift would be more in line, such as 8 hours.
Yes
There are more requirements that are being removed in the IRO standards than are currently proposed. It would be helpful if the SDT would consider a mapping of each requirement that is being eliminated and whether the requirement is duplicated elsewhere, moved elsewhere and where, or is deemed not needed would be helpful in judging if the changes are appropriate. Without this mapping it is difficult to fully support all the proposed changes to all these Standards.

Consideration of Comments on Initial Ballot — Reliability Coordination (Project 2006-06)
Date of Initial Ballot: February 25 – March 7, 2011

If you feel that the drafting team overlooked your comments, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

Summary Consideration:

The RCSDT thanks all stakeholders for their comments. Many stakeholders provided comments suggesting revisions to the standards. Many of these suggestions were incorporated into the standards. As a result of the revisions, the RCSDT is moving COM-001-2, COM-002-3 and IRO-001-2 to a successive ballot. The RCSDT made a few clarifying edits to the remaining standards based on stakeholder comments. Therefore, IRO-002-3, IRO-005-4 and IRO-014-2 are being moved to recirculation ballot. Because of this approach, the SDT will be proposing an interim change to IRO-001: the elimination of Requirement R7, as it is duplicative of one of the requirements in IRO-014-2.

For the COM-001 standard, several commenters had suggestions for improvements to the requirement language and applicability. The RCSDT believes the standard correctly and adequately requires each applicable entity that would have capability to receive Interconnection and operating information to have Interpersonal Communications and Alternative Interpersonal Communications to be used when the Interpersonal Communication is not available. The RCSDT has addressed the applicability of the standards and implementation plans by aligning COM-001-2, and COM-002-3 to include the same entities and by removing LSE, PSE and TSP from the COM standards.

Many comments were concerned about both the medium (e.g. cellular, satellite, etc.) and media (e.g. voice, email, etc.) used for Interpersonal Communications. The current language avoids being prescriptive and allows each entity to determine what is suitable. Interpersonal Communication and Alternative Interpersonal Communication is between the applicable entities which may include multiple locations (e.g. a primary and back-up control center).

The RCSDT added the following Requirement Parts at the suggestion of stakeholders:

- 3.5 Adjacent Transmission Operators synchronously connected within the same Interconnection
- 4.3 Adjacent Transmission Operators synchronously connected within the same Interconnection
- 5.6 Adjacent Balancing Authorities
- 6.3 Adjacent Balancing Authorities

The RCSDT agrees with the many industry comments and removed the phrase "to exchange Interconnection and operating information" in requirements R1 through R8. This removal clarifies that the intent of this capability is NOT for the exchange of data.

A few commenters also expressed concerns about the frequency of testing Alternative Interpersonal Communications capability. The RCSDT believes that the proposed testing frequency is supported by the majority of stakeholders and is not overly burdensome.

¹ The appeals process is in the Reliability Standards Development Procedure: http://www.nerc.com/files/RSDP_V6_1_12Mar07.pdf.

Several commenters suggested that VSLs should be written based on the percent of entities rather than by an occurrence of a violation. VSLs must be written on a violation occurrence basis in accordance with FERC guidelines. The requirements specify which entities must be included in communications capabilities. If a single entity is missing, this is a violation of the requirement. According to VSL guidelines, if missing any part of the requirement could have the same reliability outcome as missing the entire requirement, the requirement is binary and the VSL must be severe.

A new requirement was added to COM-001 for clarity regarding responsibilities of the Distribution Provider and the Generator Operator when either entity experiences a failure of its Interpersonal Communication capability:

R11. Each Distribution Provider and Generator Operator that experiences a failure of any of its Interpersonal Communication capabilities shall consult with its Transmission Operator or Balancing Authority as applicable to determine a mutually agreeable time to restore the Interpersonal Communication capability. [Violation Risk Factor: Medium][Time Horizon: Real-time Operations]

This requirement requires collaboration between entities to restore a failed communications capability.

The RCSDT asked stakeholders if they believed that the requirements of TOP-001-1 obviate the need to develop additional requirements to address Xcel's comment as directed in FERC Order 693. The original justification that the RCSDT posited for not adding a requirement to directly address Xcel Energy's comments in paragraph 516 and FERC's related recommendation in paragraph 523 was that TOP-001-1 R3 was considered to address this concern. Since that time, the RTO SDT has proposed to retire TOP-001-1 R3. However, NERC has since retired IRO-004-1 R3 and R5 along with IRO-005-3 R5. Because these are retired, there are no longer any requirements that would force a TOP to wait for a delayed RC response during an emergency. Therefore the question is resolved, albeit differently than it was proposed to be resolved in this posting. If an RC were to give a Reliability Directive to a TOP that the TOP considered "would violate safety, equipment, regulatory, or statutory requirements," the TOP may respond to the RC that it cannot comply.

Stakeholders were asked if they agree with the revision to IRO-001, R1 for certifying Reliability Coordinators. Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.

A significant revision to IRO-001-2 was made by removing the Interchange Coordinator from the standard. The RCSDT made this revision because the Balancing Function is responsible for implementing interchange (see NERC Reliability Functional Model, version 5, page 32, item 7) and to operate the Balancing Authority Area to maintain load-interchange-generation balance (item 3). The RCSDT asked stakeholders if they agree with moving two requirements from IRO-001 back to IRO-002 relating to Analysis Tool outages. All stakeholders that responded agreed and there were no comments received.

The RCSDT asked stakeholders if they agree with moving two requirements from IRO-001 back to IRO-005 relating to Reliability Coordinator notifications. Several commenters noted a typographical error in R1 which was corrected to read:

When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify ~~issue an alert to~~ all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]"

One commenter also asked that an errant yellow text box be removed from Page 1, which was also done.

The RCSDT received a number of comments regarding the applicability of COM-001, and COM-002. The RCSDT agrees with these comments and has removed PSE and LSE from the COM-001-2 implementation plan. The RCSDT also addressed minor issues involving typos, formatting and style.

The RCSDT received comments suggesting clarification of COM-002-3. The RCSDT intends the communication of Reliability Directives to be person-to-person and in such a manner that the Reliability Directive is understood and not necessarily repeated verbatim. COM-002-3 is not intended to be prescriptive on how the Reliability Directive is issued. Spoken or written communications are valid methods (i.e. using the telephone, radio, electronic texting, email, etc.). The purpose of COM-002-3 is to ensure emergency communications between operating personnel are effective. There is no proxy requirement for 24/7 operating personnel regarding small entities. Only “capability” as provided for in COM-001-2 is applicable. The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation. As envisioned, communications protocols would be addressed in the COM-003 standard being developed in Project 2007-02.

Some commenters suggested revisions to IRO-014, requirement R8 to conform to similar requirements R6 and R7. The RCSDT made the suggested revision by re-ordering R8:

R8. During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements. [Violation Risk Factor: High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]

IRO-014-2, requirement R4 is applicable to those Reliability Coordinators engaged in activities related to requirement R1 and part 1.7. It is unlikely that Reliability Coordinators geographically and electrically distant from one another will have mutually agreed upon operating procedures (per requirement R1), and therefore requirement R4 would not be applicable. The RCSDT believes IRO-014-2, requirement R4 (which requires weekly communication) provides reasonable contact and flexibility – and this requirement is in effect today.

The RCSDT coordinated the use of the NERC Glossary term “Adverse Reliability Impact” with the Real-Time Operations team and continues the practice of informing all RCs of Adverse Reliability Impacts in requirement R5.

The RCSDT has revised IRO-014-2, requirements R6-R8 to clarify that when one RC identified a problem and presents an action plan for another RC, the second RC is obligated to implement the action plan. The RCSDT will forward the concern about RC's identifying themselves and the receiver to establish authority to the Project 2007-02, Operating Personnel Communications Protocols SDT. The Project 2007-02 team is developing a standard that includes requirements for use of specific communications protocols.

Kenneth Goldsmith	Alliant Energy Corp. Services, Inc.	4	Negative	<p>While most of the changes recommended in the standards are acceptable to us, we do not believe multiple standards should be included in one ballot. You might ask for comments as a group, but each standard should be balloted separately.</p> <p>Response: The SDT has discussed this recommendation and has changed the way that these standards are being posting for ballot. Thank you for your suggestion.</p> <p>COM-001 R10 needs to be clarified that the "impacted entities" are within the same interconnection/area. It is not necessary to contact all entities as could be interpreted by the standard as currently written. We believe there may be differing levels of communication requirements, especially as it relates to smaller entities registered as DP's or LSE's that are not staffed 24 hours per day. We agree there is some responsibility of everyone to have some level of communications, the question is to what level.</p> <p>Response: R10 specifies only “impacted entities.” That phrase is used to limit the scope of the requirement. If an entity has a failure of its Interpersonal Communications capability with only one entity, then <i>that</i> entity is the “impacted entity” and they should be notified of the failure.</p>

Joseph S. Stonecipher	Beaches Energy Services	1	Negative	<p>From the last posting to this posting, for COM-002-3 R2, the phrase "the accuracy of the message has been confirmed" was added to the second step of three part communication. "Accuracy" is not the correct term here. "Understanding" is a better term. It would seem that "accuracy" is a term to be used in R3, the third part of the 3-part communication so that the issuer of the directive ensures the accuracy of the recipients understanding.</p> <p>I suggest changing COM-002-3 R2 to read:</p> <p>Each Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details to clearly communicate the recipient's understanding of the Reliability Directive.</p> <p>The term "accuracy" can be interpreted as requiring the recipient to second-guess the Reliability Directive of the RC to ensure the accuracy of the RC's directive in the first place. Under tight time constraints of Emergencies, this is not practical. We are sure that was not the intent of the drafting team.</p> <p>Response: The SDT, in drafting the proposed language, did indeed discuss using the word "understanding" rather than accuracy. However, the SDT was not able to identify a feasible measure for "understanding". A recipient can judge whether the response is accurate when compared with the communications issued, but cannot judge the understanding of anyone, even though the responder may have accurately responded.</p> <p>For IRO-001-2, I don't see a need for R1. Doesn't the ERO already have that authority to establish RC's through the registration process, and to certify system operators through the PER standards?</p> <p>Response: Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>IRO-014-2 R5, "impacted" was replaced with "other". Wouldn't it be better to at</p>

Voter	Entity	Segment	Vote	Comment
				<p>least limit the notification to within the same interconnection? Or is R5 truly to identify all NERC registered RC's?</p> <p>Response: This requirement continues the current practice of informing all RCs of Adverse Reliability Impacts (ARIs). Due to the nature of an ARI, this requirement is typically implemented as an RCIS message or a hotline call to all RCs. This is intended to make all RCs aware of ARIs and support situational awareness.</p> <p>More minor comments / suggestions for improvement: IRO-002 R2 can be improved by replacing "prevent identified events" with "prevent anticipated events". "Anticipated" aligns better with contingency analysis than "identified"</p> <p>Response: The SDT believes the commenter intended to be commenting upon IRO-001-2 R2 rather than IRO-002-2 R2. The SDT did indeed consider using the word "anticipated" rather than identified. However, the SDT believes that a decision cannot be made regarding whether to anticipate an event unless it is first identified through some method of assessment. Contingency analysis certainly can be one valid form useful in assessment. Since anything identified by such an assessment must be considered, the SDT believes the requirement should apply to what is identified, rather than the subjective decision of whether to expect or anticipate that which has been identified</p> <p>IRO-005-4 R1 and R2 can be improved by replacing "expected" with "anticipated". Contingencies are not necessarily "expected"; however, we do "anticipate" them.</p> <p>Response: The SDT agrees, and has revised the requirements per your suggestion.</p>
<p>Response: The RCSDT thanks you for your comment.</p>				
Bud Tracy	Blachly-Lane Electric Co-op	3	Negative	<p>Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a</p>

Voter	Entity	Segment	Vote	Comment
				<p>small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window."</p> <p>Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication." We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.</p>

Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support. The requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard, and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is, "to ensure emergency communications between operating personnel are effective." It's not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a method of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical that they have a means of communication - in many cases this may be via a receptionist or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this

Voter	Entity	Segment	Vote	Comment
return call would not be timely enough, then the issuer would determine a different mitigation plan.

Steve Alexanderson	Central Lincoln PUD	3	Negative	<p>The stated purpose of COM-002 is: "To ensure emergency communications between operating personnel are effective." As written, the standard fails to meet this purpose because the three requirements only deal with communications at the entity level. There is no requirement for the directing entity to even try to reach operating personnel at the receiving entity. The directing entity may follow all the requirements of this standard by following R1 and R3 with the receiving entity's receptionist, answering service, janitor, night watchman, etc. The receiving entity only needs to meet R2, parroting the directive. Again this could be accomplished by anyone with no assurance the directive reaches the operating personnel who can implement it. When we stated a similar objection during the last comment period, The SDT's answer suggested this was a PER staffing issue, but none of the PER requirements even apply to DP/LSE directive recipients. We suggest the entity issuing the directive should be required to make an attempt to get it to those who are competent to understand and implement the directive. This is not a staffing, training, or credentials issue; it is a performance issue that falls squarely within the stated purpose of this standard. COM-001 R10 presents a paradoxical situation to an entity attempting to comply. Consider an interpersonal communication capability</p>

Voter	Entity	Segment	Vote	Comment
				<p>failure that lasts longer than 60 minutes past initial detection. At or before 60 minutes, the affected entity is expected to notify impacted entities. If it has no interpersonal communication capability, how shall it make this notification? And if the entity does manage to make such a notification, it has thereby proven that it does have interpersonal communication capability making such notification unnecessary. We again ask the SDT to consider that not all the entities in the applicability sections of COM-001 and 002 have 24/7 dispatch centers. These are typically smaller entities that were required to register because they exceed 25 MW or were asked in the past to voluntarily provide UFLS. They do not and do not need to continuously communicate with TOPs, BAs, RCs, etc; and a “reliability directive” is a theoretical thing that has never happened during the memories of thirty year employees. The directive issuing entities simply realize the limitations around the receiving entities and work around them. The financial burden on these small entities and their customers to go to 24/7 dispatch will not have a corresponding reliability benefit. And while the two COM standards do not explicitly state that entities must maintain 24/7 dispatch, when all the requirements and definitions and time horizons are taken together 24/7 continuous competent communication is implied. During the last comment period, the SDT suggested this was a registration issue beyond their control. We submit instead that this is a standard applicability question that the SDT does have control over, since it is right there in Section A.4 of the two COM standards. While we appreciate that the SDT is responding to FERC order 693 to include DPs, we note that FERC also stated: Paragraph 487: “We expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process.” Paragraph 6: “A Reliability Standard may take into account the size of the entity that must comply and the costs of implementation” Paragraph 141: “...the Commission clarifies that it did not intend to ... impose new organizational structures...” Paragraph 31: “We emphasize that we are not, at this time, mandating a particular outcome by way of these directives, but we do expect the ERO to respond with an equivalent alternative and adequate support that fully explains how the alternative produces a result that is as effective as or more effective that the Commission’s example or directive. We ask the SDT to exclude DPs, LSEs, and PSEs that do not have 24/7 dispatch centers from the applicability of these two standards in order to meet FERC order 693.</p>

These are typically smaller entities that were required to register because they exceed 25 MW or were asked in the past to voluntarily provide UFLS. They do not and do not need to continuously communicate with TOPs, BAs, RCs, etc; and a "reliability directive" is a theoretical thing that has never happened during the memories of thirty year employees. The directive issuing entities simply realize the limitations around the receiving entities and work around them. The financial burden on these small entities and their customers to go to 24/7 dispatch will not have a corresponding reliability benefit. And while the two COM standards do not explicitly state that entities must maintain 24/7 dispatch, when all the requirements and definitions and time horizons are taken together 24/7 continuous competent communication is</p>

				<p>implied. During the last comment period, the SDT suggested this was a registration issue beyond their control. We submit instead that this is a standard applicability question that the SDT does have control over, since it is right there in Section A.4 of the two COM standards. While we appreciate that the SDT is responding to FERC order 693 to include DPs, we note that FERC also stated: Paragraph 487: "We expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process." Paragraph 6: "A Reliability Standard may take into account the size of the entity that must comply and the costs of implementation" Paragraph 141: "...the Commission clarifies that it did not intend to ... impose new organizational structures..." Paragraph 31: "We emphasize that we are not, at this time, mandating a particular outcome by way of these directives, but we do expect the ERO to respond with an equivalent alternative and adequate support that fully explains how the alternative produces a result that is as effective as or more effective than the Commission's example or directive. We ask the SDT to exclude DPs, LSEs, and PSEs that do not have 24/7 dispatch centers from the applicability of these two standards in order to meet FERC order 693.</p>
<p>Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support. The requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard, and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is, "to ensure emergency communications between operating personnel are <u>effective</u>." It's not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a <u>method</u> of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical that they have a means of communication - in many cases this may be via a receptionist or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.</p>				
Gregg R Griffin	City of Green Cove Springs	3	Negative	<p>From the last posting to this posting, for COM-002-3 R2, the phrase "the accuracy of the message has been confirmed" was added to the second step of three part communication. "Accuracy" is not the correct term here. "Understanding" is a better term. It would seem that "accuracy" is a term to be used in R3, the third part of the 3-part communication so that the issuer of the directive ensures the accuracy of the recipients understanding. FMPA suggests changing COM-002-3 R2 to read: Each Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details to clearly communicate the recipient's understanding of the Reliability Directive.. The term "accuracy" can be interpreted as requiring the recipient to second-guess</p>

				<p>the Reliability Directive of the RC to enure the accuracy of the RC's directive in the first place. Under tight time constraints of Emergencies, this is not practical. We are sure that was not the intent of the drafting team.</p> <p>Response: The SDT, in drafting the proposed language, did indeed discuss using the word "understanding" rather than accuracy. However, the SDT was not able to identify a feasible measure for "understanding". A recipient can judge whether the response is accurate when compared with the communications issued, but cannot judge the understanding of anyone, even though the responder may have accurately responded.</p> <p>For IRO-001-2, FMPA does not see a need for R1. Doesn't the ERO already have that authority to establish RC's through the registration process, and to certify system operators through the PER standards?</p> <p>Response: Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>IRO-014-2 R5, "impacted" was replaced with "other". Wouldn't it be better to at least limit the notification to within the same interconnection? Or is R5 truly to identify all NERC registered RC's?</p> <p>Response: This requirement continues the current practice of informing all RCs of Adverse Reliability Impacts (ARIs). Due to the nature of an ARI, this requirement is typically implemented as an RCIS message or a hotline call to all RC's. This is intended to make all RCs aware of ARIs and support situational awareness.</p> <p>More minor comments / suggestions for improvement: IRO-002 R2 can be improved by replacing "prevent identified events" with "prevent anticipated events". "Anticipated" aligns better with contingency analysis than "identified"</p> <p>Response: The SDT believes the commenter intended to be commenting upon IRO-001-2 R2 rather than IRO-002-2 R2. The SDT did indeed consider using the word "anticipated" rather than identified. However, the SDT believes that a decision cannot be made regarding whether to anticipate an event unless it is first identified through some method of assessment. Contingency analysis certainly can be one valid form useful in assessment. Since anything identified by such an assessment must be considered, the SDT believes the requirement should apply to what is</p>

John Allen	City Utilities of Springfield, Missouri	4	Negative	See comments from the SPP Standards Development group.
<p>Response: The RCSDT thanks you for your comment. Please see response to those comments.</p>				
Shaun Anders	City Water, Light & Power of Springfield	1	Negative	The definition of "Interpersonal Communications" is overly broad and does not address the functional needs of reliability coordination. The definition should be limited to systems utilized for essential reliability functions. While the Purpose statement in the standard does address this intent, the explicit inclusion in the definition removes all ambiguity. Further, the definition of "Alternative Interpersonal Communications" without corresponding explicit definition of Primary Interpersonal Communications may lead to confusion and unnecessary duplication of efforts in

				testing and maintenance.
<p>Response: The RCSDT thanks you for your comment. The certification of an entity as a functional entity by the ERO through its certification process will not take place unless the entity has the needed communications capabilities. If the entity cannot perform, it will not be registered. Once an entity is certified as a functional entity, then that entity must comply with all requirements applicable to that functional entity. These standard revisions establish clear requirements for alternative interpersonal communications capability which may or may not be part of the entity certification process. Taken together, the certification process and the Reliability Standards clearly establish the requirements for both normal interpersonal communications capability and alternative interpersonal communications capability.</p> <p>The RCSDT has revised the applicability of COM-001, and COM-002 such that they contain the same functional entities. These are: RC, TOP, BA, GOP, and DP.</p>				
Dave Hagen	Clearwater Power Co.	3	Negative	<p>Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window." Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities</p>

				that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication." We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.
<p>Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support. The requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard, and the standard is designed not to impose needless communications requirements. Bruce Krawczyk	ComEd	3	Negative	Exelon is voting negative based on our previously submitted comments.
<p>Response: The RCSDT thanks you for your comment. Please see the response to those comments.</p>				
Christopher L de Graffenried	Consolidated Edison Co. of New York	1	Abstain	<p>o COM-002 assumes, but does not require, voice logs. This needs to be fixed. Otherwise the documentation could just be a paper log 'check box' entry which says "Yes, we used 3-part." This is not adequate, verifiable documentation for entity audits.</p> <p>Response: The standards establish "what" is required, not "how" to do it. The Measures identify methods which are examples of evidence that may be provided to demonstrate compliance, but requirements cannot be established in the measures. Further, valid requirements should not be established that preclude improvements that may arise through technological innovations or other equally effective alternatives. The state of the art at present would seem to indicate that the most prevalent evidence would likely come from a form of voice recordings or transcripts.</p>

				<p>o COM-002 only requires the entity maintain this documentation 3 months. This short retention time period expires long before most auditors check on the entity. So, why bother? This also needs to be fixed or clarified.</p> <p>Response: The retention time was established using the NERC Data Retention Guidelines and to recognize that vast amount of data which would have to be retained to present evidence. In addition, any event under investigation has likely been accompanied by a requirement to “freeze” data retention and keep all relevant information and date for a specified timeframe surrounding the event.</p>
<p>Response: The RCSDT thanks you for your comment.</p>

Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication." We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.</p>
--	--	--	--	--

Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support. The requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard, and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is, "to ensure emergency communications between operating personnel are effective." It's not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a method of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical

that they have a means of communication - in many cases this may be via a receptionist or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.

Henry Ernst-Jr	Duke Energy Carolina	3	Negative	<p>o We question how far the definition of Alternative Interpersonal Communication goes in requiring separate infrastructure from Interpersonal Communication. For example, wireless communications sometime utilize fiber optic networks.</p> <p>Response: The definition requires the use of different infrastructure (medium) than the Interpersonal Communication used for day to day operations. The RCSDT does not believe it is appropriate to be prescriptive with respect to the specific medium employed. This is intended to apply to assets and access to media that is under your control. For example, the way cell phone signals are routed are not under your control.</p> <p>o We question why the requirements state that entities must “have” Interpersonal Communications capability, but must “designate” Alternative Interpersonal Communications capability?</p> <p>Response: Many entities have multiple Alternative Interpersonal Communication capabilities. Large entities may have a second land line, cell phone, satellite phone, etc. The purpose of “designating” the Alternative is so that other entities know which one is in use and is a reliable means of communications. Allowing them to designate which one they want to employ allows for flexibility in which one they use for AIC.</p> <p>o R1.2 and R2.2 - Why is this limited to the same interconnection?</p> <p>Response: The phrase “within the same interconnection” is added for the case of ERCOT which has only DC tie lines with the Eastern Interconnection and has minimal interchange.</p> <p>o R3 - need to add neighboring TOPs.</p> <p>Response: Agreed. The standard has been modified as suggested.</p> <p>o R5 - need to add adjacent BAs.</p> <p>Response: Agreed. The standard has been modified as suggested.</p> <p>o Interchange Coordinator - Add IC to the Applicability Section, and add a requirement that the IC have Interpersonal Communication capability with its BA and adjacent BAs.</p> <p>Response: We eliminated the Interchange Coordinator from COM-001-2 based</p>
----------------	----------------------	---	----------	---

				<p>on stakeholder feedback.</p> <p>o Requirements to “designate” Alternative Interpersonal Communication should carry a “Medium” VRF instead of “High”, because they are a backup capability. The word “designate” carries the connotation that these are documentation requirements.</p> <p>Response: While the requirement is phrased to focus on the documentation, the reliability objective is that the entity has an alternative communication capability with those functional entities most critical to its real-time operations.</p> <p>o R9 requires a monthly test of Alternative Interpersonal Communications capability. This was quarterly in the last draft. We question how these requirements for “Alternative Interpersonal Communications” capability are related to requirements for “backup functionality” in EOP-008-1, which requires an annual test of backup functionality. Clarity on the relationship between “Interpersonal Communications”, “Alternative Interpersonal Communications”, “primary control center functionality” and “backup control center functionality” would be appreciated.</p> <p>Response: Interpersonal Communication and Alternative Interpersonal Communication are not related to EOP-008. The provision to test may be performed through day to day use of the capability.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>				
George S. Carruba	East Kentucky Power Coop.	1	Negative	As currently written, IRO-014 could be interpreted that if a RC identifies an adverse reliability impact in another RC and the other RC does not agree with the findings, the RC who identified the adverse reliability impact would be responsible for creating a mitigation plan to address the issue. This may not be possible if the identifying RC does not have agreements in place with the TOPs/BAs in the other RC area.
<p>Response: The RCSDT thanks you for your comment. IRO-014-2 requirement R6, requires all RCs to operate as if the problem exists even when they disagree with the RC that identified the problem. Even if there is a disagreement between RCs, R8 still requires that all RCs comply with the action plan developed by the RC that identified the adverse reliability impact unless compliance with the action plan would violate safety, equipment, regulatory or statutory requirements. As envisioned, the TOPs and BAs would receive operating instructions from their own RC, not from the RC in another Reliability Coordinator Area.</p>				
Sally Witt	East Kentucky Power Coop.	3	Negative	As currently written it could be interpreted that if an RC identifies an Adverse reliability Impact in another RC Area and they do not agree with the findings, the

				RC who identified the adverse reliability Impact would be responsible for creating a mitigation plan to address the issue. This may not be feasible if the identifying RC does not have agreements in place with TOPs/BAs in the other RC Area.
<p>Response: The RCSDT thanks you for your comment. IRO-014-2 requirement R6, requires all RCs to operate as if the problem exists even when they disagree with the RC that identified the problem. Even if there is a disagreement between RCs, R8 still requires that all RCs comply with the action plan developed by the RC that identified the adverse reliability impact unless compliance with the action plan would violate safety, equipment, regulatory or statutory requirements. As envisioned, the TOPs and BAs would receive operating instructions from their own RC, not from the RC in another Reliability Coordinator Area.</p>				
John R Cashin	Electric Power Supply Association	5	Affirmative	I will be submitting comments in the regular form tomorrow.
<p>Response: The RCSDT thanks you for your comment. Please see response to those comments.</p>				
Chuck B Manning	Electric Reliability Council of Texas, Inc.	2	Negative	We agree with the comments submitted by the IRC SRC and we have submitted those same comments.
<p>Response: The RCSDT thanks you for your comment. Please see response to those comments.</p>				
Martin Kaufman	ExxonMobil Research and Engineering	5	Negative	The Measurement 2 of COM-002-3 has the potential to create numerous violations without any reliability impact to the Bulk Electric System. Specifically, for those facilities without voice recording equipment, the requirement to record in an operator log that the BA/GOP/TOP/TSP repeated the intent of a directive back to the RC provides no benefit to the reliability of the BES and adds a situation where an entity can be found non-compliant by an RE with zero impact to the reliability of the BES. In response to a directive from an RC, it's important for the reliability of the BES for a facility to identify an instruction as a directive, resolve whether the facility can comply with the directive, and inform the RC when it could not comply with the directive. Documentation requirements should reflect these three items.
<p>Response: The RCSDT thanks you for your comment. Based on comments from other stakeholders, the SDT has removed the TSP, LSE and PSE from responsibility for any of the requirements in COM-002. As envisioned, in an emergency the RC would issue most Reliability Directives to its BAs and TOPs, and there may be times when the RC bypasses its TOPs and BAs and issues a Reliability Directive to its DPs</p>				

and GOPS. The RC would not, however, issue a Reliability Directive to TSPs, LSEs, or PSEs.

Note that M2 only requires that the recipient document that it repeated the reliability directive. Collectively, the three measures do what you have proposed – they require that the applicable entities document that the three parts of the communication took place – original issuance; accurate repeat; confirmation. Operating logs are offered as one form of acceptable evidence – but other types of evidence could also be used to demonstrate compliance.

Bryan Case	Fall River Rural Electric Cooperative	3	Negative	<p>Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window." Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of</p>

Frank Gaffney	Florida Municipal	4	Negative	From the last posting to this posting, for COM-002-3 R2, the phrase "the accuracy of the message has been confirmed" was added to the second step of three part

	Power Agency		<p>communication. "Accuracy" is not the correct term here. "Understanding" is a better term. It would seem that "accuracy" is a term to be used in R3, the third part of the 3-part communication so that the issuer of the directive ensures the accuracy of the recipients understanding. FMPA suggests changing COM-002-3 R2 to read: Each Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details to clearly communicate the recipient's understanding of the Reliability Directive. The term "accuracy" can be interpreted as requiring the recipient to second-guess the Reliability Directive of the RC to ensure the accuracy of the RC's directive in the first place. Under tight time constraints of Emergencies, this is not practical. We assume that was not the intent of the drafting team.</p> <p>Response: The SDT, in drafting the proposed language, did indeed discuss using the word "understanding" rather than accuracy. However, the SDT was not able to identify a feasible measure for "understanding". A recipient can judge whether the response is accurate when compared with the communications issued, but cannot judge the understanding of anyone, even though the responder may have accurately responded.</p> <p>For IRO-001-2, FMPA does not see a need for R1. Doesn't the ERO already have that authority to establish RC's through the registration process, and to certify system operators through the PER standards?</p> <p>Response: Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>IRO-014-2 R5, "impacted" was replaced with "other". Wouldn't it be better to at least limit the notification to within the same interconnection? Or is R5 truly to identify all NERC registered RC's?</p> <p>Response: This requirement continues the current practice of informing all RCs of Adverse Reliability Impacts (ARIs). Due to the nature of an ARI, this requirement is typically implemented as an RCIS message or a hotline call to all RC's. This is intended to make all RCs aware of ARIs and support situational awareness.</p> <p>More minor comments / suggestions for improvement: IRO-002 R2 can be</p>
--	--------------	--	--

				<p>improved by replacing "prevent identified events" with "prevent anticipated events". "Anticipated" aligns better with contingency analysis than "identified"</p> <p>Response: The SDT believes the commenter intended to be commenting upon IRO-001-2 R2 rather than IRO-002-2 R2. The SDT did indeed consider using the word "anticipated" rather than identified. However, the SDT believes that a decision cannot be made regarding whether to anticipate an event unless it is first identified through some method of assessment. Contingency analysis certainly can be one valid form useful in assessment. Since anything identified by such an assessment must be considered, the SDT believes the requirement should apply to what is identified, rather than the subjective decision of whether to expect or anticipate that which has been identified.</p> <p>IRO-005-4 R1 and R2 can be improved by replacing "expected" with "anticipated". Contingencies are not necessarily "expected"; however, we do "anticipate" them.</p> <p>Response: The SDT agrees and have revised the requirements per your suggestion.</p>
<p>Response: The RCSDT thanks you for your comment.</p>				
Thomas E Washburn	Florida Municipal Power Pool	6	Negative	<p>From the last posting to this posting, for COM-002-3 R2, the phrase "the accuracy of the message has been confirmed" was added to the second step of three part communication. --	--	--	---

				suggestion.
Response: The RCSDT thanks you for your comment.				
Silvia P. Mitchell	Florida Power & Light Co.	6	Negative	<p>8) Question 1</p> <p>1. Do you agree with COM-001 requirements for Interpersonal Communications capability and Alternative Interpersonal Communications capability (R1-R8)? If not, please explain in the comment area below. No</p> <p>9) Question 1 Comments: As drafted, COM-001 is not clear or complete. At this stage in the evolution of compliance with the mandatory Reliability Standards, it is important that any new or revised Reliability Standard clearly articulate all compliance obligations and tasks consistent with Sections 302 (6) and (8) of the NERC Rules of Procedure. Thus, NextEra Energy Inc. (NextEra) has numerous recommended corrections to provide clarity and completeness to COM-001. For example, the requirement to designate an Alternative Interpersonal Communication capability is not clear. Does the designator solely designate for the designator's knowledge or does the designator need to inform the entity on the other end of the connection.</p> <p>In R2, for instance, the Reliability Coordinator must designate, but it is also not clear whether the Reliability Coordinator must inform the Balancing Authorities or Transmission Operators. It is further unclear whether the designation must be documented, or if any informing of the Balancing Authorities or Transmission Operators must be documented. Thus, it is recommended that the drafters decide what was intended regarding the designation and clearly state the requirements.</p> <p>In R9 it states that “. . . on at least a monthly basis.” There are two issues to consider here. If the sentence stays, grammatically it should read “. . . on, at least, a monthly basis. . .” However, from a compliance and technical perspective, the term “at least” has no significance and should be deleted. The requirement is to test on a monthly basis - the phrase “at least” only introduces ambiguity and implies that the party should consider every two or three weeks. If the drafting team believes a best practice is less than a month, there are other NERC educational tools to explain a best practice.</p> <p>In R10, it states “. . . shall notify the impacted entity . . .” It would be clearer to state: “. . . shall notify the impacted Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider or Generator Operator . . .” Page 6</p>

			<p>Response: The Requirement R2 is for the RC to designate an AIC and inform the other entity (BA, TOP, etc.) as to what that AIC is. The Measure M2 provides examples of the types of evidence which may be used to prove compliance with the requirement.</p> <p>The RCSDT believes that stakeholders are satisfied with the wording of the requirements of this standard. The phrase “at least” was included to relay the intent – that the monthly requirement is a minimum, and some entities may wish to perform this more frequently. It does not add any compliance obligation to perform this activity more frequently than specified.</p> <p>For R10, the RCSDT believes that the existing language is sufficiently clear.</p> <p>10) Question 2 2. The RCSDT believes that the requirements of TOP-001-1 obviate the need to develop additional requirements to address Xcel’s comment. Do you agree? If not, please explain in the comment area below. No</p> <p>11) Question 2 Comments: As stated in response to number 1, Reliability Standards are to be clear and complete. If a Transmission Operator is not responsible for a delay caused by a Reliability Coordinator, the Standard should specifically state that the Transmission Operator does not need to wait for an assessment or approval of a Reliability Coordinator to take actions pursuant to TOP-001-1 R3. Since the Reliability Coordinator is atop the reliability higherachy, such a statement provides clarity and completeness to understanding a Transmission Operators rights. Thus, TOP-001-1 R3 should be revised to lead with: “Without any obligation to first seek and obtain an assessment or approval from its Reliability Coordinator, each Transmission Operator” Page 10</p> <p>Response: The SDT thanks you for your comment. The RTO SDT proposes to retire TOP-001-1 R3. However, since NERC has retired IRO-004-1 R3 and R5 along with IRO-005-3 R5 , there are no longer any requirements that would force a TOP to wait for a delayed RC response during an emergency, therefore the question is resolved, albeit differently than it was proposed to be resolved in this posting. If an RC were to give a Reliability Directive to a TOP that the TOP considered “would violate safety, equipment, regulatory, or statutory requirements”, the TOP may respond to the RC that it cannot comply.</p> <p>12) Question 6 Comments: At this stage in evolution of compliance with the mandatory Reliability Standards, it is important that any new or revised Reliability Standard clearly articulate all compliance obligations and tasks consistent with Sections 302 (6) and (8) of the NERC Rules of Procedure. COM-002, IRO-001, IRO-002 and IRO-014 do not meet this threshold. Thus, NextEra has numerous recommended corrections to provide clarity and completeness to these Reliability</p>
--	--	--	--

			<p>Standards. COM-002 R1 The addition of defined terms for Reliability Directive and Emergency is a very good approach that helps provides clarity. Hence, it is also be appropriate to make the language in the requirement as clear as possible, and not add other implied or unexplained notions. Also, at times, in those regions with markets, it is not always clear whether a requirement to curtail for reliability reasons is being issued pursuant to market rules or from the Reliability Coordinator or Transmission Operator under the Reliability Standards. Therefore, it is also appropriate that the Reliability Coordinator, Transmission Operator, Balancing Authority be required to identify themselves;, and if they fail to identify themselves or fail to use the term Reliability Directive, the registered entity receiving the flawed issuance should not be consider in violation of a Reliability Standard for failing to act. Accordingly, R1 would be clearer and have the same intent, if it stated as follows: “A Reliability Coordinator, Transmission Operator or Balancing Authority have the authority to issue an oral or written Reliability Directive as authorized in [list the specific Reliability Standard requirements such as IRO-001 R8 and TOP-001 R3]. The issuance of an oral of written Reliability Directive, by a Reliability Coordinator, Transmission Operator or Balancing Authority shall: (1) use the term ‘Reliability Directive;’ and (2) identify the issuer of the Reliability Directive as a Reliability Coordinator, Transmission Operator or Balancing Authority. If a Reliability Coordinator, Transmission Operator or Balancing Authority issues an oral or writtern directive without using the term “Reliability Directive” or failing to indentify itself as a Reliability Coordinator, Transmission Operator or Balancing Authority, the registered entity receiving the directive cannot be considered in violation for its failure to act.”</p> <p>Response: There is a new standard under development (COM-003) that is addressing a broader range of communications protocols, and has proposed a requirement for the Reliability Coordinator to announce his/her title when issuing alerts and other types of announcements.</p> <p>IRO-001 The definition of Adverse Reliability Impacts uses the term “instability.” It is important that this term be technically defined in the same way “Cascading” is defined, otherwise the new requirement is not adding clarity; rather, it is maintaining the ambiguous term “instability” that will likely lead to confusion and debate.</p> <p>Response: The term, ‘instability’ is already used in many reliability standards.</p> <p>R1 Similar to the comments set forth with respect to COM-001 (question #1), the term “at least” should be deleted from R1 - it serves no useful purpose from a technical or compliance perspective; instead, it will add unnecessary ambiguity to the requirement.</p> <p>Response: The phrase, “at least” was included to relay the intent – that the monthly requirement is a minimum, and some entities may wish to perform this</p>
--	--	--	--

				<p>more frequently. It does not add any compliance obligation to perform this activity more frequently than specified.</p> <p>R2, as drafted, states: “Each Reliability Coordinator shall take actions or direct actions, which could include issuing oral or written Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. “ This long sentence has several significant grammatical errors that result in the reader not being able to discern the meaning of the requirement. It also unnecessarily adds verbiage that detracts from its primary focus. It is, therefore, recommended that R2 be revised as follows: “Each Reliability Coordinator shall take all necessary actions to prevent identified Emergencies or Adverse Reliability Impacts. These Reliability Coordinator actions shall include, to the extent necessary, the issuing of oral or written Reliability Directives to Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers located within its Reliability Coordinator Area. “</p> <p>Response: The SDT has considered the alternative language proposed and finds that the— the phrase, ‘all necessary action’ is ambiguous. Who would decide that ‘all necessary action’ had been taken?</p> <p>R3, as drafted, is confusing and inconsistent with R2, and, thus, R3 should be revised to read as follows: “Upon receipt of a Reliability Directive issued pursuant to R2, a Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall comply with the Reliability Directive, unless compliance would violate safety, equipment, regulatory or statutory requirements. In the event that a Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider determines that compliance with a Reliability Directive would violate safety, equipment, regulatory or statutory requirements, the Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider shall, within 10 minutes after the determination, inform the Reliability Coordinator of its inability to comply.”</p> <p>Response: The team adopted the intent of part of this suggestion by replacing the word, ‘per’ with, ‘in accordance with’. The team elected not to add a time constraint because the proposed time constraint implies that it would be acceptable to delay up to 10 minutes before notifying the RC – and in some instances this time delay</p>
--	--	--	--	---

				<p>could result in and adverse impact to reliability.</p> <p>IRO-002R1 and R2, as written, are confusing. It is recommended that R1 and R2 be combined to read as follows: “Pursuant to a written procedure to mitigate the impact of a Reliability Coordinator’s analysis tool outage, a Reliability Coordinator’s System Operator shall also have the authority to approve, deny or cancel a planned outage for its analysis tool.”</p> <p>Response: The drafting team believes that the language in the proposed standard is clear as written. No reason has been provided for merging the two requirements, and the benefit of merging the requirements is not clear.</p> <p>IRO-014 It is unclear why the terms Operating Procedure, Operating Process or Operating Plan needs to be plural, as currently written in the Standard. Hence, it is recommended that these terms be made singular, otherwise a violation may be inferred for not having more than one Procedure, Process or Plan.</p> <p>Response: The range of activities that must be addressed by the documents is expected to require more than one document, thus the use of the plural versions of these terms.</p> <p>Insert the word “applicable” before “Reliability Coordinator.”</p> <p>Response: The benefit of adding the word ‘applicable’ is not clear.</p> <p>2.1, as written, is confusing. Recommend that 2.1 read as follows:”Review and update, if an update is necessary, on an annual basis. Annual basis means the review shall be within one month plus or minus that date of the last review.”</p> <p>Response: The 15 month interval was recommended by the compliance program as the outer bound to recommend in standards that use the term, “annual” or “annually.”</p> <p>There is a compliance bulletin on this issue.</p> <p>R3 This requirement uses a very vague term “reliability-related information,” which, also, does not track the language used in R1 -- “information.” It is recommended that R1 and R3 use the same terms and read “ . . . information, as defined by the Reliability Coordinator, . . . “</p> <p>Response: Requirement R1 is not open-ended – it identifies information needed for Interconnection reliability. R3 points to the information identified by complying with R1. The intent was to limit the scope to areas needed for reliability. RCs may want other information for reasons not related to reliability, and that information is outside the scope of this standard.</p> <p>R4 As stated above, “at least” does not add value, and, therefore, should be</p>
--	--	--	--	---

				<p>deleted.</p> <p>Response: The phrase, “at least” was included to relay the intent – that the monthly requirement is a minimum, and some entities may wish to perform this more frequently. It does not add any compliance obligation to perform this activity more frequently than specified.</p> <p>R5, as written, is confusing. The recommended fix is to delete “all other” and replace with “impacted”.</p> <p>Response: The SDT did intend that all other RCs be notified. This requirement continues the current practice of informing all RCs of Adverse Reliability Impacts (ARIs). Due to the nature of an ARI, this requirement is typically implemented as an RCIS message or a hotline call to all RC’s. This is intended to make all RCs aware of ARIs and support situational awareness.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>				
Thomas W. Richards	Fort Pierce Utilities Authority	4	Negative	<p>From the last posting to this posting, for COM-002-3 R2, the phrase "the accuracy of the message has been confirmed" was added to the second step of three part communication. "Accuracy" is not the correct term here. "Understanding" is a better term. It would seem that "accuracy" is a term to be used in R3, the third part of the 3-part communication so that the issuer of the directive ensures the accuracy of the recipients understanding. FPUA suggests changing COM-002-3 R2 to read: Each Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details to clearly communicate the recipient's understanding of the Reliability Directive.. The term "accuracy" can be interpreted as requiring the recipient to second-guess the Reliability Directive of the RC to enure the accuracy of the RC's directive in the first place. Under tight time constraints of Emergencies, this is not practical. We are sure that was not the intent of the drafting team.</p> <p>Response: The RCSDT revised the requirement as follows to remove the “accuracy’ language:</p> <p>R2. Each Balancing Authority, Transmission Operator, Generator</p>

				<p>Operator, and Distribution Provider that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive.</p> <p>For IRO-001-2, FPUA does not see a need for R1. Doesn't the ERO already have that authority to establish RC's through the registration process, and to certify system operators through the PER standards?</p> <p>Response: Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>IRO-014-2 R5, "impacted" was replaced with "other". Wouldn't it be better to at least limit the notification to within the same interconnection? Or is R5 truly to identify all NERC registered RC's?</p> <p>Response: This requirement continues the current practice of informing all RCs of ARIs. Due to the nature of an ARI, this requirement is typically implemented as an RCIS message or a hotline call to all RC's. This is intended to make all RCs aware of ARIs and support situational awareness.</p> <p>More minor comments / suggestions for improvement: IRO-002 R2 can be improved by replacing "prevent identified events" with "prevent anticipated events". "Anticipated" aligns better with contingency analysis than "identified"</p> <p>IRO-005-4 R1 and R2 can be improved by replacing "expected" with "anticipated". Contingencies are not necessarily "expected"; however, we do "anticipate" them.</p> <p>Response: The SDT believes the commenter intended to be commenting upon IRO-001-2 R2 rather than IRO-002-2 R2. The SDT has revised the requirements per your suggestion.</p>
<p>Response: Thank you for your comments. Please see responses above.</p>				
Anthony L Wilson	Georgia Power Company	3	Affirmative	Please see comments
<p>Response: The RCSDT thanks you for your comment. Please see response to posting comments for the SERC OC Standards Review Group; the RCSDT did not specifically find comments from Georgia Power Company and believes comments were included within this group.</p>				

Gordon Pietsch	Great River Energy	1	Negative	<p>Reliability Directive: It is our opinion the definition as currently written is too subjective and may cause a compliance auditor to question the grounds under which one of applicable entities declared the directive. We believe that revising the definition to state “to address a declared emergency...” will remove the subjectivity.</p> <p>Requirements for using three-part communication: It is our opinion that the standard needs language that clearly states that during a Blast Call three-part communication is not required. Blast Calls are used when information needs to be disseminated quickly to a large number of entities. Strictly enforcing the use of three-part communication under these circumstances has the potential to be more harmful to reliability than helpful.</p>
<p>Response: The RCSDT thanks you for your comment.</p> <p>Reliability Directive: The RCSDT believes the proposed standard requirement addresses your requested revision. “R1...shall identify the action as a Reliability Directive...” is addressing a declared emergency.</p> <p>R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient.</p> <p>As a reference, we have included the existing definition of Emergency:</p> <p>Emergency: Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.</p> <p>The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation. As envisioned, communications protocols would be addressed in the COM-003 standard being developed in Project 2007-02.</p>				
Shaun Jensen	Idaho Power Company	3	Negative	<p>It appears there is much concern with the wording, particularly in R2, as well as parties having issues with intermingled definitions. It is recommended to reword this, and ensure the VSL accurately reflects a direct definition that all entities all clear and certain on.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT is not sure of which standard requirement is being referenced.</p>				
Bob C. Thomas	Illinois Municipal Electric Agency	4	Negative	<p>IMEA appreciates the SDT's efforts to date. We are basing our negative vote on ballot pool communications that have addressed points that need further refinement before the proposed revisions to these reliability standards are affirmed. IMEA supports, in particular, comments submitted by the Midwest ISO and the SERC OC</p>

				Standards Review Group.
<p>Response: The RCSDT thanks you for your comments. Please see responses to Midwest ISO and SERC OC Standards Review Group.</p>				
Kim Warren	Independent Electricity System Operator	2	Negative	<p>While we support the general direction of these standards development actions, we do have a number of concerns which cumulatively lead us to advocate a NEGATIVE vote. These include:</p> <p>(1) The phrase “within the same Interconnection” in COM-001-2 R1, limits the coordination activities to RCs, TOPs and BAs that can be detrimental to reliability. We recommend removing this phrase.</p> <p>Response: The RCSDT does not agree that the phrase “within the same interconnection” limits coordination between entities. The purpose of the phrase is to place a bound on which adjacent entity an RC must have Interpersonal Communication (e.g., an EI RC does not need communication with WI RCs). The phrase “within the same interconnection” is added for the case of ERCOT which has only DC tie lines with the Eastern Interconnection and has minimal interchange.</p> <p>(2) We believe the Interchange Coordinator and Purchasing-Selling Entity also need to have adequate communication capabilities with other entities but they are not included in the applicability section of COM-001-2.</p> <p>Response: We disagree that the IC and PSE need to be an applicable entity. To maintain reliability does not require communication with these entities. The applicability of COM-001, COM-002 and IRO-001 were revised to include the same reliability entities: RC, TOP, BA, DP and GOP. LSE, PSE and TSP were removed from the applicability of these standards per stakeholder suggestion.</p> <p>(3) The proposed definition of Reliability Directive addresses Emergency condition only. There are situations where a Reliability Directive is issued such that the directed action must be taken by the receiving entity to address a reliability constraint, which by itself does not constitute an Emergency. We suggest the term Reliability Directive be revised to: “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address a reliability constraint or an Emergency.”</p> <p>Response: The RCSDT believes that your comment concerns “directives” or “instructions” for normal operational activities rather than a Reliability Directive. There is no requirement preventing an entity from issuing either directives or</p>

				<p>instructions for the situations you mention. The intent of creating a Reliability Directive definition is to ensure that communications is tightened during Emergencies (per blackout report). When an RC issues a Reliability Directive, the RC has made a deliberate decision to formally end collaboration and require specific action(s). In addition, the Operating Personnel Communication Protocols SDT is addressing your concern about instances that are not considered an emergency. As envisioned, communications protocols requiring additional applications for use of three-part communications would be addressed in the COM-003 standard being developed in Project 2007-02.</p> <p>(4) Requirement R9 of COM-001-2 needs to be clarified. As written the requirement seems open ended once action to repair of a failed Alternative Interpersonal Communication is initiated within 2 hours but not completed within that time. It is not clear whether there is an expectation on the responsible entity to designate a replacement Alternative Interpersonal Communication if repairs cannot be completed within that period.</p> <p>Response: The requirement is saying that if the test fails you must initiate action for repair or designate a replacement alternative within two hours. There is no requirement for a tertiary capability nor is there a requirement for a repair deadline.</p> <p>We have also submitted additional comments in response to the request for comments.</p> <p>Response: Please see responses to other comments</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>				
Michael Moltane	International Transmission Company Holdings Corp	1	Negative	<p>ITC votes negative for the reasons detailed in the MISO-submitted comment form related to this Project (ITC signed onto the MISO comments). While this standard revision moves in the right direction, we believe at least one additional iteration will be needed to correct the concerns indicated in the comment form.</p>
<p>Response: The RCSDT thanks you for your comments. Please see responses to Midwest ISO.</p>				
Kathleen Goodman	ISO New England, Inc.	2	Negative	<p>Although ISO-NE believes these Standard represent a great improvement, we are voting against because we believe they would be improved by the comments that we have offered. We would gladly modify our vote in the Affirmative if our comments are considered in the next ballot.</p>

Response: The RCSDT thanks you for your comment. Please see response to those comments.				
Charles Locke	Kansas City Power & Light Co.	3	Negative	These requirements impose alternative means of communication on TOP's, BA's and GOP's regardless of the impact the entity may have on maintaining interconnection reliability. In addition, there are many IRO requirements that are proposed to be eliminated that do not appear to be considered in other places.
Response: The RCSDT thanks you for your comments. We cannot delineate entity impact on reliability and respond only regarding entity registration with NERC.				
Scott Heidtbrink	Kansas City Power & Light Co.	5	Negative	These requirements impose alternative means of communication on TOP's, BA's and GOP's regardless of the impact the entity may have on maintaining interconnection reliability. In addition, there are many IRO requirements that are proposed to be eliminated that do not appear to be considered in other places.
Response: The RCSDT thanks you for your comments. We cannot delineate entity impact on reliability and respond only regarding entity registration with NERC.				
Jessica L Klinghoffer	Kansas City Power & Light Co.	6	Negative	These requirements impose alternative means of communication on TOP's, BA's and GOP's regardless of the impact the entity may have on maintaining interconnection reliability. In addition, there are many IRO requirements that are proposed to be eliminated that do not appear to be considered in other places.
Response: The RCSDT thanks you for your comments. We cannot delineate entity impact on reliability and respond only regarding entity registration with NERC.				
Jim M Howard	Lakeland Electric	5	Negative	<p>From the last posting to this posting, for COM-002-3 R2, the phrase "the accuracy of the message has been confirmed" was added to the second step of three part communication. Why was this added? - "Accuracy" is not the correct term here. Suggest changing COM-002-3 R2 to read: Each Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details to clearly communicate the recipient's understanding of the Reliability Directive.</p> <p>Response: The SDT, in drafting the proposed language, did indeed discuss using the word "understanding" rather than accuracy. However, the SDT was not able to</p>

				<p>identify a feasible measure for “understanding”. A recipient can judge whether the response is accurate when compared with the communications issued, but cannot judge the understanding of anyone, even though the responder may have accurately responded.</p> <p>The term "accuracy" can be interpreted as requiring the recipient to second-guess the Reliability Directive of the RC to ensure the accuracy of the RC's directive in the first place. Under tight time constraints of Emergencies, this is not practical. We are sure that was not the intent of the drafting team.</p> <p>Response: Several commenters expressed concern about the use of the word, ‘accuracy’ and the team revised the requirement to remove this word.</p>
<p>Response: The RCSDT thanks you for your comment.</p>				
Paul Shipps	Lakeland Electric	6	Negative	<p>The phrase "the accuracy of the message has been confirmed" was added to the second step of three part communication. "Accuracy" is not the correct term here. "Understanding" is a better term. The term "accuracy" is a term to be used in R3, the third part of the 3-part communication, so that the issuer of the directive ensures the accuracy of the recipients understanding.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT has removed that phrase from the requirement as it was difficult to measure and many stakeholders had concerns with the language.</p>				
Rick Crinklaw	Lane Electric Cooperative, Inc.	3	Negative	<p>Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the</p>

				<p>language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window." Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication." We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.</p>
<p>Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support. The requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard, and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is, "to ensure emergency communications between operating personnel are <u>effective</u>." It's not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a <u>method</u> of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical that they have a means of communication - in many cases this may be via a receptionist or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.</p>

It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this

return call would not be timely enough, then the issuer would determine a different mitigation plan.

Bruce Merrill	Lincoln Electric System	3	Negative	For NERC Reliability Standard COM-001-2, LES believes that interpersonal communication is the act of communicating and that the requirements specify normal and redundant facilities for Interpersonal Communication. As such, LES recommends the definition for “Interpersonal Communication” be changed to “Any act where two or more individuals communicate, interact, consult or exchange information, including listening or reading”. Additionally, for NERC Reliability Standard IRO-001-2, LES recommends replacing the word “certify” in R1 and M1 with “assign”. As currently written it is unclear what the certification of the Reliability Coordinator will entail and how it will be established by the ERO.
---------------	-------------------------	---	----------	---

Response: The RCS DT thanks you for your comment. We specifically included “medium” to distinguish a source or vehicle of communication instead of a “personal” reference.

NERC has an established certification procedure for all registered entities and “certify” is in line with NERC’s process.

Dennis Florum	Lincoln Electric System	5	Negative	For NERC Reliability Standard COM-001-2, LES believes that interpersonal communication is the act of communicating and that the requirements specify normal and redundant facilities for Interpersonal Communication. Jason L Marshall	Midwest ISO, Inc.	2	Negative	<p>We thank the drafting team for their efforts on this project to improve the reliability coordination standards. The quality of the standards continues to improve over previous postings. While the drafting team is definitely moving the standards in the right direction, we believe we have not reached the point of diminishing returns and that there are several issues that the drafting team still needs to address.</p> <p>1 This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities.</p> <p>Response: The sub-requirements are an old format. The standard was updated to the new template, and sub-requirements are now Parts.</p> <p>2 In general, we are not opposed to the concept of the ERO certifying the Reliability Coordinators; however, there are some issues with how the requirement IRO-001-2 R1 is written. The requirement places emphasis on regions and regional boundaries when no emphasis should be placed there. There are multiple Reliability Coordinators that span multiple regions. The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect on what the standards are enforceable. The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES are covered under a Reliability Coordinator Area.</p>

				<p>Response: Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>3 The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company.</p> <p>Response: COM-002 does not preclude text or other forms of communication for issuing Reliability Directives. However, entities still must comply with the requirements of COM-002. Further, the RCSDT believes it to be equally imperative that each NERC registered function hold the authority to issue Reliability Directives, and the ability to receive Reliability Directives, whether those Reliability Directives are issued to subordinate registered functions within a vertically integrated utility, or to registered entities that are corporately separate. The RCSDT believes the following response to draft 3 comments still holds true:</p> <p>“The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Face-to-face communication of Reliability Directives are subject to the requirements of COM-002 and can be measured for COM-002 by allowing Operator Logs as possible evidence to support compliance”.</p> <p>The use of operator logs to memorialize and provide evidence of compliance is applicable to those Reliability Directives issued and received within the same control room or operations center. The RCSDT believes that any Registered Entity or person operating as such must understand the intent of the issued Reliability Directive, and that the issuer of the Reliability Directive believe that the Reliability</p>
--	--	--	--	--

			<p>Directive was correctly received.</p> <p>4 We also are concerned about the need to conduct three-part communications for a Reliability Directive issued through a blast call. Under these circumstances, the need for immediate action of multiple parties may require a blast call and there may not be time for all parties to complete three-part communications before initiating actions. Thus, we believe blast calls should be treated separately and that should be made clear.</p> <p>Response: The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. However the essence of accurately implementing Reliability Directives is accomplished by use of 3-part communications. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation. As envisioned, communications protocols requiring for issuing alerts will be addressed in the COM-003 standard being developed in Project 2007-02.</p> <p>5 COM-002-3 R2 needs to be rewritten as it is too verbose. The point is for the recipient of the original message to get the issuer to confirm that the message was understood. We suggest rewording R2 to “Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive.” Once the receiver has completed this requirement, the ball is in the issuer’s court per Requirement R3. No additional words are necessary in the requirement.</p> <p>Response: The RCSDT agrees and has revised the requirement as you suggest.</p> <p>6 Please strike part IRO-014-2 Part 1.7. There is no need to have a weekly conference to discuss every Operating Procedure, Operating Process and Operating Plan. As this requirement is written, a conference call would be necessary for each. Furthermore, IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update.</p> <p>Response: The intent of R1 is for Reliability Coordinators to coordinate specific activities with other impacted Reliability Coordinators. These activities are listed as Parts. Further the RCSDT believes that it is prudent that Reliability Coordinators talk at least once a week to verify viability of mutual plans, procedures or processes. The relation of IRO-14-2 PART 1.7 to R4 is that PART 1.7 requires</p>
--	--	--	--

			<p>having a conference call, R4 requires participation by all impacted Reliability Coordinators. As such, neither replaces the other.</p> <p>7 IRO-014-2 R4 is overly broad and would require Reliability Coordinators that will not impact one another to participate on conference calls with one another without any reliability benefit. The issue is created by the addition of the clause “within the same Interconnection” to the requirement. ISO-NE, FRCC, Midwest ISO, and SPP are all in the same Interconnection. It is hard to fathom there being reliability benefit to SPP and ISO-NE conversing weekly or Midwest ISO and FRCC conversing weekly. We suggest limiting the requirement to adjacent Reliability Coordinators.</p> <p>Response: IRO-14-2 R4 is applicable to those Reliability Coordinators engaged in activities related to R1 and subsequently PART 1.7. It is unlikely that Reliability Coordinators whom are geographically and electrically distant will have mutually agreed upon operating procedures; therefore requirement R4 would not apply.</p> <p>8 For IRO-014-2 R5, we suggest replacing “other” with “impacted” to limit the notification of Adverse Reliability Impacts to only those Reliability Coordinators that need to know. Because the definition of Adverse Reliability Impact includes “Bulk Electric System instability or Cascading”, it is possible that the cascading of 138 kV lines serving a load pocket or generator outlet stability issues could require a Reliability Coordinator to notify all other Reliability Coordinators regardless of impact. This would include Reliability Coordinators outside of the Interconnection with the problem. It would also include Reliability Coordinators that are not impacted. For instance, an issue in New England that would not pose a threat outside the northeast would require ISO-NE to notify SPP and FRCC and Reliability Coordinators in the Western Interconnection. There is no reliability benefit to this notification.</p> <p>Response: This requirement continues the current practice of informing all RCs of ARIs. Due to the nature of an ARI, this requirement is typically implemented as an RCIS message or a hotline call to all RC’s. This is intended to make all RCs aware of ARIs and support situational awareness.</p> <p>9 IRO-014-2 R6-R8 are problematic and need to be refined to make clear that the Reliability Coordinators shall operate to the most conservative limit. It should not require a Reliability Coordinator that disagrees with an action plan to implement the action plan. The Reliability Coordinator will be disagreeing with the action plan for reliability reasons. Assuming they are correct, the requirement to implement said action plan will actually put the Interconnection at greater risk. These requirements inappropriately attempt to codify the debate and analysis that occurs between and within Reliability Coordinators when there are differing results in reliability analysis. This is part of the problem with having a Wide Area view that results in Reliability Coordinators having a view into other Reliability Coordinator Areas. Their results</p>
--	--	--	---

			<p>and conclusions may be different. There should be a hierarchical structure for whose results should be used. It should be the Reliability Coordinator with primary responsibility unless the other Reliability Coordinator has evidence to demonstrate that the Reliability Coordinator with primary responsibility is incorrect. What this should do is to trigger both to review their models and data to assess the problem. None of this needs to be codified in the standards though.</p> <p>Response: Requirements R6-R8 are translated from IRO-016-1, Requirement R1. If an RC sees a problem and another does not see the same problem, then there may be an issue with someone's model or processes or procedures. The RC's are supposed to have coordinated Operating Plans, Processes or Procedures to operate reliably. R6-R8 are only applicable if one of the two (or more) RCs do not see that a problem exists. It would be a detriment to reliability for both RCs to take no action. RCs are required to coordinate actions under existing IRO-016-1, R1. If one RC identifies a problem and provides an action plan to another RC to mitigate the problem, the second RC is obligated under R8 to implement it. We have revised the R8 to clarify this intent.</p> <p style="padding-left: 40px;">IRO-014-2, Revised R8. During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements.</p> <p>10 In the definition of Reliability Directive, we suggest changing "to address an Emergency" to "to address a declared Emergency". This would help limit second guessing for a situation where a System Operator took action because he truly believed he was in an Emergency but after the fact analysis demonstrates there really was not an Emergency.</p> <p>Response: The RCSDT believes that modifying Reliability Directive by including "declared Emergency" would add an unnecessary step in mitigation of the Emergency.</p> <p>11 We disagree with deleting IRO-002-1 R5 and R7 which establish tools and monitoring capabilities. There should be basic tools requirements established for Reliability Coordinators. Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities will be addressing these issues in more detail. Thus, it does not make sense to delete these requirements until that dra</p> <p>Response: Each RC has been certified to continue operations as an RC or been certified prior to beginning operations as an RC. The minimum set of tools and capabilities for an RC are "checked off" during the certification process. The</p>
--	--	--	--

				reliability objective of R5 and R7 is to perform analyses to ensure reliability of the BES by specifying capability rather than mandating specific tools. The analysis provisions of R5 and R7 are covered under IRO-008-1, Requirements R1 (perform Operational Planning Analysis) and R2 (perform Real-time Analysis). It is anticipated that Project 2009-02 team will address this issue more fully.

John S Bos	Muscatine Power & Water	3	Negative	<p>1 In the COM-001 requirements, MP&W does not agree that a Distribution Provider and a Generator Operator need to be held to the same level of responsibility as a Reliability Coordinator, Balancing Authority, or Transmission Operator. In FERC Order 693 (paragraph 487), FERC directed the Distribution Provider and Generator Operator to be incorporated in this standard by stating:” We expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process.” A Distribution Provider and Generator Operator may not be staffed 24 hours a day like a Balancing Authority or Transmission Operator; nevertheless, the Standards Drafting Team did not consider this.</p> <p>Response: There is no requirement that requires identical communications systems. The requirement is to have “a” communication capability. Regarding 24/7 support, the requirement is to have communications capability. The type of media used is not specified. For a small DP, an on-call system could suffice. The RCSDT also recognizes the FERC directive and has not included GOPs and DPs in the requirements for Alternative Interpersonal Communications capability.</p> <p>2 MP&W does not agree with the revision of IRO-001 with the statement included</p>

				<p>for certifying Reliability Coordinators. As written, it is ambiguous as far as what level of certification this would involve.</p> <p>Response: Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>3 MP&W disagrees with COM-002-3 R2. As stated in FERC Order 693 (paragraph 512) it is essential that Reliability Coordinators, Balancing Authorities, and Transmission Operators have communications with Distribution Providers. Requirement 2 also applies to Transmission Service Providers, Load-Serving Entities and Purchasing and Selling Entities. As stated above, it is going to be unattainable to communicate with a Distribution Provider since most Distribution Providers are usually not operated 24 hours per day like Reliability Coordinators, Balancing Authorities, and Transmission Operators. Many Distribution Providers have answering services that will relay a message once they receive it and then pass it along to someone. An answering service could repeat the directive back, word for word, but this would not add any level of reliability. The Standards Drafting Team should reconsider the applicability section of this Standard to apply to only Reliability Coordinators, Balancing Authorities, and Transmission Operators for the issuance of a Reliability Directive.</p> <p>Response: There is no requirement for 24/7 support. The requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard, and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is, "to ensure emergency communications between operating personnel are <u>effective</u>." It's not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a <u>method</u> of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical that they have a means of communication - in many cases this may be via a receptionist or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.</p>
<p>Response: The RCSDT thanks you for your comments. Please see responses above.</p>

Gregory Campoli	New York Independent System Operator	2	Abstain	<p>The NYISO agrees that these revised standards are an improvement from the current version. However we believe that the comments submitted by the IRC and NPCC are required to make them acceptable as the new set of standards. We will have an opportunity to revise our vote on the second ballot based on the consideration given to the comments submitted.</p>
<p>Response: The RCSDT thanks you for your comment. See IRC and NPCC comments.</p>				
Michael Schiavone	Niagara Mohawk (National Grid Company)	3	Affirmative	<p>IRO-001 R1 The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be.</p> <p>Response: Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>IRO-001 R2 Should “of” be “to”? Reliability Directives are issued to TOPs, BA, etc.</p> <p>Response: The requirement was rewritten for clarity as follows:</p> <p>R2. Each Reliability Coordinator shall take actions or direct actions (which could include issuing Reliability Directives) by Transmission Operators, Balancing Authorities, Generator Operators, and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts.</p> <p>IRO-001 R2 Contains the words “which could include issuing Reliability Directives”, but Reliability Directives are not referenced anywhere else in the standard. This inclusion seems unnecessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the</p>

				<p>magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. These words should be removed. Note that COM-002 will stipulate the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary.</p> <p>Response: R2 requires the Reliability Coordinator to act. These actions could include Reliability Directives in the case of an Emergency. However, issuing Reliability Directives might not always be necessary, as the Reliability Coordinator may be acting proactively well in advance of an emergency. R2 promotes this proactive approach, but reserves the use of Reliability Directives for circumstances that require its use. During the vetting of the prior version of this requirement, some stakeholders expressed concern that the word, “action,” if not clarified, could lead some people to believe that the Reliability Coordinator must be the entity to perform the actual operation.</p> <p>COM-002 In place of requiring an operator, in real-time, to state “this is a Reliability Directive,” there should be an allowance for an entity to develop procedures indicating, in advance, their expectations of three-part to their sub-operating entities. Modify R1 to be “When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action, either verbally, when the communication is issued, or in advance through documented procedures, as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time.]”</p> <p>Response: Your proposed edit does not meet the reliability intent of the requirement. The RCSDT believes that it is important to state that the Reliability Directive is being issued to convey that action by the recipient is required. An RC could issue a Reliability Directive to implement an agreed upon procedure whereby the three part communication would not list each step of the procedure individually, but would include implementation of the entire procedure. As envisioned, communications protocols such as the procedure you’ve proposed will be addressed in the COM-003 standard being developed in Project 2007-02.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>				
Jon Shelby	Northern Lights Inc.	3	Negative	<p>Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability</p>

				<p>directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window." Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication." We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.</p>
--	--	--	--	--

Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support. The requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard, and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is, "to ensure emergency communications between operating personnel are effective." It's not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a method of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical

that they have a means of communication - in many cases this may be via a receptionist or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.

Douglas Hohlbaugh	Ohio Edison Company	4	Affirmative	FirstEnergy supports the proposed standards and would appreciate consideration of our comments submitted through the formal comment period.

Response: The RCSDT thanks you for your comment. Your comments have been considered, Please see the Consideration of Comments document for FirstEnergy.

Ray Ellis	Okanogan County Electric Cooperative, Inc.	3	Negative	<p>Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window." Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Brenda L Truhe	PPL Electric Utilities Corp.	1	Negative	Comments were submitted as part of a group via the comment form. Thank you for your work on the standard.
<p>Response: The RCSDT thanks you for your comment. Your other comments have been considered. Please see the Consideration of Comments document.</p>				
Mark A Heimbach	PPL EnergyPlus LLC	6	Negative	<p>Comments: We thank the Standards Drafting Team for the improvements made in the revisions to COM-001 and COM-002. The revision appropriately clarifies the standard. We are providing the following comments for the Standards Drafting Team to consider.</p> <p>1) Consider changing R1 to 'Each RC shall have the capability for Interpersonal Communications with the following entities to exchange Interconnection and</p>

				<p>operating information...' for clarity as Interpersonal Communications and capability are both nouns.</p> <p>Response: Thank you for your suggestion to modify the sentence structure into a noun phrase. However the RCSDT believes the current form is unambiguous.</p> <p>2) We feel changing the applicability of the standard is important to the accuracy of the standard. The purpose of COM-002 is 'To ensure emergency communications between operating personnel are effective'. Since operating personnel are covered by the applicability of RC, BA, TOP and GOP, we suggest the applicability to TSP, LSE, and PSE be removed from COM-002-3.</p> <p>Response: The SDT agrees. The applicability of COM-002 has been revised. COM-001, and COM-002 are now applicable to the RC, TOP, BA, GOP and DP only.</p> <p>3) Additionally, we would like to bring to the attention of the Standards Drafting Team, that the implementation plan for COM-001-2 and IRO-001-2 still includes TSP, LSE, and PSE although the revised standard does not include these entities in the Applicability Section. For COM-001-2 refer to the implementation plan, page 11. For IRO-001-2 refer to the implementation plan for new R2, new R3, new R4 and the chart on the last page. Thank you for your consideration in addressing these comments.</p> <p>Response: The RCSDT has revised the implementation plans appropriately to address your comment.</p>
<p>Response: The RCSDT thanks you for your comments. .</p>

<p>Response: The RCSDT thanks you for your comments.</p>				
John T Sturgeon	Progress Energy	6	Negative	<p>COM-001-2 R10 states that "Each Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider and Generator Operator shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that last 30 minutes or longer". The standard states that the RC, TOP, BA shall designate an Alternative Interpersonal Communication capability but does not require the same of the DP and GOP. Compliance by the DP and GOP with R10 would be jeopardized while still being compliant with the rest of the standard by having only the Interpersonal Communications capability.</p> <p>Response: The DP or GOP has access to additional Interpersonal Communications, in all likelihood, to make notifications for failure. There is not a requirement for an alternative, but it is likely that someone could use a cell phone to make the notification. The RCSDT is proposing to add Part 7.3 and 8.3 to the requirements as follows:</p> <p>7.3 Each Distribution Provider that experiences a failure of its Interpersonal Communication capabilities shall consult with their Transmission Operator or Balancing Authority to determine a mutually agreeable time to restore its Interpersonal Communication capability.</p> <p>8.3 Each Generator Operator that experiences a failure of its Interpersonal Communication capabilities shall consult with their Transmission Operator or Balancing Authority to determine a mutually</p>

				<p>agreeable time to restore its Interpersonal Communication capability.</p> <p>The phrase “within” used in R3-R6 does not take into account that there are electrically adjacent BAs/TOPs who are not “within” each other’s area.</p> <p>Response: The requirements are dealing with entities within the Area or entities that operate Facilities located within the Area. We have also added the following to R3:</p> <p style="padding-left: 40px;">Adjacent Transmission Operators synchronously connected within the same Interconnection.</p> <p>The SDT also added, ‘adjacent Balancing Authorities’ to Requirements R4, R5 and R6.</p>
<p>Response: The RCSDT thanks you for your comment.</p>				
Peter Dolan	PSEG Energy Resources & Trade LLC	6	Negative	<p>Com-001-2 implementation plan lists that this is applicable to PSE’s and LSE’s however, PSE’s and LSE’s were removed from the actual standard. The implementation plan should be revised. Com-002-3 standard continues to include PSE. PSE’s do not play an active role in operating the BES and have no authority or ability to perform reliability coordination related tasks as may be directed by a RC. PSE’s should be removed from the standard.</p> <p>IRO-001-2 references PSE’s in the implementation for R2, R3, R4 and “Functions that must comply with the requirements in this standard” table. The RCSDT has revised the implementation plans appropriately to address your comment.

Steven Grega	Public Utility District No. 1 of Lewis County	5	Negative	These changes do not recognize that many small utilities do not have 24-hour dispatch, do not have SCADA systems or do not man generation plants 24-hours a day. Specific exception should be written into the standards to provide relief for small GO, GOP, LSE and DP. The standard changes need to address notifications if personnel are only available on a on-call basis.
--------------	---	---	----------	--

Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support. The requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard, and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is, "to ensure emergency communications between operating personnel are effective." It's not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a method of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical that they have a means of communication - in many cases this may be via a receptionist or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.

Heber Carpenter	Raft River Rural Electric Cooperative	3	Negative	Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window." Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due
-----------------	---------------------------------------	---	----------	--

				<p>to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication." We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.</p>
<p>Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support. The requirement is to have communications capability. Carter B. Edge	SERC Reliability Corporation	10	Negative	<p>If the following issues are addressed in the standards revisions I should be able to cast an affirmative vote:</p> <p>COM-001-2</p> <ul style="list-style-type: none"> o Each sub-requirement should not have an “R” in front of the number in order to be consistent with NERC’s August 10, 2009 filing at FERC on this subject. Response: The SDT agrees. This has been corrected. o Requirement R3 and R4 should include adjacent TOPs as a sub-requirement. Response: The SDT agrees. The SDT modified R3 and R4 to add adjacent TOPs o Requirements R5 and R6 should include adjacent BAs as a sub-requirement. Response: The SDT added adjacent Balancing Authorities to Requirements R4, R5 and R6. o “to exchange Interconnection and operating information” should be deleted from requirements R1 through R8 as it is redundant with the definition of Interpersonal Communications Response: The SDT agrees. The SDT adopted this suggestion and deleted this phrase. o The last page of the Implementation Plan includes LSEs, PSE, and TSPs as being responsible entities under this standard, yet the standard does not include them. Please correct the implementation plan. Response: The implementation plan was corrected as proposed. <p>TOP-001-1,</p> <ul style="list-style-type: none"> o Requirement R3, which is what the SDT appears to be using as its justification for not adding a requirement here is proposed to be deleted by the RTO-SDT on Project 2007-03. IRO-001-2 R2-R4 deal with complying with directives or instruction and is the justification for retiring TOP-001, R3. <p>IRO-001-2</p> <ul style="list-style-type: none"> o I’m unclear on the language of R1. I think you are attempting to create a
----------------	------------------------------	----	----------	---

			<p>requirement similar to BAL-005, R1 where all generation, transmission, and load operating within an Interconnection must be included within the metered boundaries of a Balancing Authority Area. If that is the case, suggested language could be "All Balancing Areas and Transmission Operators must be under the authority of a Reliability Coordinator certified by the ERO to continuously assess transmission reliability and coordinate emergency operations within each region and across the regional boundaries"</p> <p>Response: Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>o Please remove the yellow box on page 1 indicating this standard will be retired.</p> <p>Response: The SDT agrees, and has made the change.</p> <p>Additional comments:</p> <p>o Reliability Directives may be issued by blast calls from Reliability Coordinators. It is inefficient and may be a hindrance to reliability to require 3-part communications in these instances.</p> <p>Response: The RCSDT agrees that the use of Blast Call's to issue Reliability Directives, in mass, is efficient and effective. However the essence of accurately implementing Reliability Directives is accomplished by use of 3-part communications. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation. As envisioned, communications protocols such as the procedure you've proposed will be addressed in the COM-003 standard being developed in Project 2007-02.</p> <p>o There are several organizations registered as BAs, RCs and TOPs. It is not uncommon for those entities to be distributed across multiple desks in the same control room without regard to how an entity is registered. Thus, a single System Operator may perform functions that are categorized under two or more of those functional entities. The drafting team should clarify that under no circumstances should that System Operator be required to issue a Reliability Directive to himself. This is a corporate governance issue.</p> <p>Response: COM-002 does not preclude text or other forms of communication for issuing Reliability Directives. However, entities still must comply with the requirements of COM-002. Further, the RCSDT believes it to be equally imperative that each NERC registered function hold the authority to issue</p>
--	--	--	---

			<p>Reliability Directives, and the ability to receive Reliability Directives, whether those Reliability Directives are issued to subordinate registered functions within a vertically integrated utility, or to registered entities that are corporately separate. The RCSDT believes the following response to draft 3 comments still holds true:</p> <p style="padding-left: 40px;">“The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Face-to-face communication of Reliability Directives are subject to the requirements of COM-002 and can be measured for COM-002 by allowing Operator Logs as possible evidence to support compliance.”</p> <p>The use of operator logs to memorialize and provide evidence of compliance is directly specific to those Reliability Directives issued and received within the same control room or operations center. The RCSDT believes that any Registered Entity or person operating as such must understand the intent of the issued Reliability Directive, and that the issuer of the Reliability Directive believe that the Reliability Directive was correctly received. COM-002 should not be construed to mean that an individual serving in two functions be required to issue a Reliability Directive to himself, but rather it is expected that such an individual would appropriately address the reliability issues as required by the function they are serving and its subsequent responsibilities.</p> <p>o In IRO-014, R1, delete sub-requirement 1.7. The requirement for weekly conference calls related to operating procedures is duplicative to R4 and could be burdensome while adding very little value under certain circumstances.</p> <p>R1, Part 1.7 indicates that the Operating Plan, process or Procedure is to include how the entity will accomplish these calls. R4 requires the entity to actually perform them.</p> <p>Response: The intent of R1 is for Reliability Coordinators to coordinate specific activities with other impacted Reliability Coordinators. These activities are listed as Parts. Part 1.7 is requires you to have a procedure relating to weekly conference calls while R4 requires participation in weekly calls. Further the RCSDT believes that it is prudent that Reliability Coordinators talk at least once a week to verify viability of mutual plans, procedures or processes.</p> <p>o In IRO-014, R4, delete the phrase “(per Requirement 1, Part 1.7)” as a conforming change.</p> <p>Response: The intent of R1 is for Reliability Coordinators to coordinate specific activities with other impacted Reliability Coordinators, these activities are listed as sub requirements. Part 1.7 is requires you to have a procedure relating to weekly</p>
--	--	--	--

				<p>conference calls while R4 requires participation in weekly calls. Further the RCSDT believes that it is prudent that Reliability Coordinators talk at least once a week to verify viability of mutual plans, procedures or processes.</p> <p>o I believe that the intent of IRO-014, Requirements R6-R8 is to require conservative operation by all affected Reliability Coordinators if any Reliability Coordinator detects an Adverse Reliability Impact. It could be read to allow at least the theoretical possibility that an RC may determine an Adverse Reliability Impact in another RC's area that the other RC neither can see nor believes that any action should be taken. R7 puts the burden on the first RC to develop a plan that it cannot implement because it has no agreement with the BAs and TOPs in the other RC area and thus could be ineffective. Alternately, it could be read that the identifying RC must take action in its own area to mitigate the Adverse Reliability Impact identified in another area much like the "general prudential rule" in the Coast Guard's Rules of the Road where regardless of what the rules state if action can be taken to avoid a collision at sea, that action must be taken. Please clarify.</p> <p>Response: Requirements R6-R8 are translated from IRO-016-1, Requirement R1. If an RC sees a problem and another does not see the same problem, then there may be an issue with someone's model or processes or procedures. The RC's are supposed to have coordinated Operating Plans, Processes or Procedures to operate reliably. R6-R8 are only applicable if one of the two (or more) RCs do not see that a problem exists. It would be a detriment to reliability for both RCs to take no action. RCs are required to coordinate actions under existing IRO-016-1, R1. If one RC identifies a problem and provides an action plan to another RC to mitigate the problem, the second RC is obligated under R8 to implement it. We have revised the R8 to clarify this intent.</p> <p>IRO-014-2, Revised R8. During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact , each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements.</p> <p>o Please review all the implementation plans to be sure the applicable entities match those in the standards.</p> <p>Response: The Implementation Plans have been modified to address this concern.</p>
--	--	--	--	---

Response: The RCSDT thanks you for your comment. Please see responses above.

Paul Benjamin Kerr	Shell Energy North America (US), L.P.	6	Affirmative	<p>The introduction of the definition of “Reliability Directive” and its connection to the definition of “Emergency” within this Project brings much needed clarity for the sector and will promote consistency between Regional Entities and within the audits of Registered Entities. Shell Energy supports the removal of Purchasing Selling Entities as a function to which IRO-001 applies. This removal recognizes that PSEs do not play a role in reliability coordination under this standard since they have no authorities and no abilities to assume or perform responsibilities associated with reliability coordination. This conclusion is reinforced by the adoption of the defined term “Reliability Directive”. Where a RC, TOP, or BA needs to address an Emergency they do not contact, consult, or direct a PSE to take action that would address the Emergency. Rather, where the PSE is a user of the grid to perform or execute transactions, it is subject to the actions of these other entities that have the authority to stop, curtail, or alter the submitted transactions of the PSE in a way that aids in resolving the problem. With the fitting adoption of “Reliability Directive” into COM-002 as well, Shell Energy does not believe it is necessary or appropriate for the applicability of this standard to include Purchasing Selling Entities, as is contained in the current draft proposal. This standard does not apply to PSEs today, however, during the progression of Project 2006-06 this applicability was added to an early draft version that preceded the discussions and clarification that comes from the definition of a Reliability Directive in the standard. Shell Energy does not support the inclusion of PSEs in the current draft version of COM-002, and feels that it should be removed. The purpose of this standard is, “To ensure Emergency communications between operating personnel are effective” and relates directly to the capabilities and authorities established for the RC, TOP, or BA that requires actions to be taken by a recipient of a Reliability Directive. As noted previously, PSEs are acted upon by the entities with the necessary authority, and are not in a role that would initiate or fulfil the required actions. As additional matters related to the clarification and cleanup of the standards in this project, the implementation plans for both IRO-001 and COM-001 erroneously contain references to PSEs in the sections “Functions that Must Comply with the Requirements”. These references need to be removed.</p>
--------------------	---------------------------------------	---	-------------	---

Response: The RCSDT thanks you for your comment. The applicability of COM-001, and COM-002 were revised to be consistent and only include the RC, TOP, BA, DP and GOP. The Implementation Plans have been corrected.

Robert A Schaffeld	Southern Company	1	Affirmative	Please see comments
--------------------	------------------	---	-------------	---------------------

	Services, Inc.			
<p>Response: The RCSDT thanks you for your comment. Please see response to those comments.</p>				
Ronald L Donahey	Tampa Electric Co.	3	Negative	Our only disagreement is with the use of the term "Reliability" in defining a directive.
<p>Response: The RCSDT thanks you for your comment. The term "Reliability Directive" was chosen to specifically delineate between other types of directives, such as market directives. It is imperative that reliability standards relate to reliability concerns.</p>				
Steve Eldrige	Umatilla Electric Cooperative	3	Negative	<p>Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window." Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities</p>

				that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication." We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.
<p>Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support. The requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard, and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is, "to ensure emergency communications between operating personnel are <u>effective</u>." It's not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a <u>method</u> of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical that they have a means of communication - in many cases this may be via a receptionist or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.</p>				
Jonathan Appelbaum	United Illuminating Co.	1	Negative	<p>See UI Comment form, In General:</p> <p>1. COM-001-2 does not specify the amount of time a DP has to reestablish the Interpersonal Communication Capability after the capability fails before it is assessed non-compliance for not having the communication.</p> <p>Response: The DP or GOP has access to additional Interpersonal Communications, in all likelihood, to make notifications for failure. There is not a requirement for an alternative, but it is highly unlikely that someone couldn't use their cell phone to make the notification. The RCSDT is proposing to add Part 7.3 and 8.3 to the requirements as follows:</p> <p>7.3 Each Distribution Provider that experiences a failure of its Interpersonal Communication capabilities shall consult with their Transmission Operator or Balancing Authority to determine a mutually agreeable time to restore its Interpersonal Communication capability.</p> <p>8.3 Each Generator Operator that experiences a failure of its Interpersonal Communication capabilities shall consult with their Transmission Operator or Balancing Authority to determine a mutually agreeable time to restore its Interpersonal Communication capability.</p>

				<p>2. VSL for R7 should have a time component</p> <p>Response: The VSL represents a single violation of the requirement. For this requirement, the DP must have Interpersonal Communication with its TOP and BA. The VSL was revised to remove “or more” to conform to the requirement. Because the Requirement does not have a time component, the SDT cannot add a time component to the VSL – this would violate one of the FERC Guidelines for setting VSLs.</p> <p>3. R7 should address the instance if the DP is not required to have communication with the BA, because the BA communicates thru the TOP.</p> <p>Response: The RCSDT believes that Interpersonal Communication between the DP and its BA and the TOP is required for reliability.</p> <p>4. COM-002 R2 seems awkwardly worded. R2 as it is written says the repeat is confirming the accuracy of the message itself. I think it is agreed that the repeat back in R2 is to allow the issuer of the Directive to confirm that the message was received accurately understood by the recipient.</p> <p>Response: The RCSDT has revised the requirement and has removed “with enough details that the accuracy of the message was confirmed” from the requirement.</p> <p>5. The VSL for Com-002 R2 is severe and states "The responsible entity that was the recipient of a Reliability Directive failed to repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message was confirmed." The purpose of the R2 repeat-back is to allow the Issuer verify the message was accurately received. This VSL penalizes the responsible entity for not accurately receiving the message. The VSL should penalize the refusal of the registered entity to repeat back the message not for receiving the message incorrectly.</p> <p>Response: The RCSDT agrees and has removed “with enough details that the accuracy of the message was confirmed” from the VSL.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>				
Allen Klassen	Westar Energy	1	Negative	The new definition of Alternative Interpersonal Communication in COM-001 appears to rule out the use of redundant systems that happen to be used daily, which might be done to ensure that they function when needed.

Response: The RCSDT thanks you for your comment. The intent of Alternative Interpersonal Communication (AIC) is to make sure there is an alternative in case the Interpersonal Communication fails. If you have two, you may designate one as the AIC regardless of how often you use it.

Forrest Brock	Western Farmers Electric Coop.	1	Negative	<p>COM-001 - Definition of Interpersonal Communication needs more clarification. For example, would this include data exchanged via ICCP? Examples of what constitutes "Interconnection and operating information" would help as much "information" can be interpreted as fitting into this - or not.</p> <p>Response: Interpersonal Communication does not include data exchange.</p> <p>Severe VSL for R9 - second part after the "OR" is a virtual repetition of the wording in the Lower VSL for R9.</p> <p>Response: The Severe VSL was revised to remove "within 2 hours". It now reads:</p> <p style="padding-left: 40px;">"The responsible entity tested the Alternative Interpersonal Communications capability and identified a problem but didn't initiate action to repair or designate a replacement Alternative Interpersonal Communications."</p> <p>COM-003 - R3 contains a typographical or grammar error. "...Reliability Directive as per Requirement R2 IS correct..." not AS correct...</p> <p>Response: Assuming you meant COM-002-3, the SDT agrees and has made the correction.</p>
---------------	--------------------------------	---	----------	--

Response: The RCSDT thanks you for your comment. Please see responses above.

Anthony Jankowski	Wisconsin Energy Corp.	4	Affirmative	Please correct the clean version of IRO-005 R1 to match the red-line.
-------------------	------------------------	---	-------------	---

Response: The RCSDT thanks you for your comment. We have made the corrections.

Michael Ibold	Xcel Energy, Inc.	3	Affirmative	While we appreciate the drafting team's efforts to clarify the multiple effective dates, we feel it is still daunting and complex, which leaves too much room for miscalculation. We recommend that NERC and/or the drafting team publish what the actual effective dates are, as soon as FERC (and again when the other regulatory authorities) have approved it. This could either be done in the effective
---------------	-------------------	---	-------------	---

				date section of the standard itself, or as a stand-alone reference document posted along with the standard on NERC's website.
Response: The RCSDT thanks you for your comment. We will pass your comment on the NERC Standards Process Manager for consideration.				
James A Maenner		8	Negative	In comments (Reliability Coordination - Project 2006-06) Midwest ISO raised a number of issues that need to be addressed prior to passage of these standards.
Response: The RCSDT thanks you for your comment. Please see responses to comments made by MISO on the initial ballot as well as the regular comment form.				

END OF REPORT

Consideration of Comments on Reliability Coordination — Project 2006-06

The Reliability Coordination Drafting Team thanks all commenters who submitted comments on the proposed revisions to COM-001-2, IRO-001-2, IRO-002-2 and IRO-005-4. These standards were posted for a 30-day public comment period from February 25, 2011 through March 7, 2011. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 41 sets of comments, including comments from more than 168 different people from approximately 112 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

http://www.nerc.com/filez/standards/Reliability_Coordination_Project_2006-6.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Herb Schrayshuen, at 609-452-8060 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.¹

Summary Consideration:

The RCSDT thanks all stakeholders for their comments. Many stakeholders provided comments suggesting revisions to the standards. Many of these suggestions were incorporated into the standards. As a result of the revisions, the RCSDT is moving COM-001-2, COM-002-3 and IRO-001-2 to a successive ballot. The RCSDT made a few clarifying edits to the remaining standards based on stakeholder comments. Therefore, IRO-002-3, IRO-005-4 and IRO-014-2 are being moved to recirculation ballot. Because of this approach, the SDT will be proposing an interim change to IRO-001: the elimination of Requirement R7, as it is duplicative of one of the requirements in IRO-014-2.

For the COM-001 standard, several commenters had suggestions for improvements to the requirement language and applicability. The RCSDT believes the standard correctly and adequately requires each applicable entity that would have capability to receive Interconnection and operating information to have Interpersonal Communications and Alternative Interpersonal Communications to be used when the Interpersonal Communication is not available. The RCSDT has addressed the applicability of the standards and implementation plans by aligning COM-001-2, and COM-002-3 to include the same entities and by removing LSE, PSE and TSP from the COM standards.

Many comments were concerned about both the medium (e.g. cellular, satellite, etc.) and media (e.g. voice, email, etc.) used for Interpersonal Communications. The current language avoids being prescriptive and allows each entity to determine what is suitable. Interpersonal Communication and Alternative Interpersonal Communication is between the applicable entities which may include multiple locations (e.g. a primary and back-up control center).

The RCSDT added the following Requirement Parts at the suggestion of stakeholders:

- 3.5 Adjacent Transmission Operators synchronously connected within the same Interconnection
- 4.3 Adjacent Transmission Operators synchronously connected within the same Interconnection
- 5.6 Adjacent Balancing Authorities
- 6.3 Adjacent Balancing Authorities

The RCSDT agrees with the many industry comments and removed the phrase "to exchange Interconnection and operating information" in requirements R1 through R8. This removal clarifies that the intent of this capability is NOT for the exchange of data.

¹ The appeals process is in the Reliability Standards Development Procedures:
<http://www.nerc.com/standards/newstandardsprocess.html>.

A few commenters also expressed concerns about the frequency of testing Alternative Interpersonal Communications capability. The RCSDT believes that the proposed testing frequency is supported by the majority of stakeholders and is not overly burdensome.

Several commenters suggested that VSLs should be written based on the percent of entities rather than by an occurrence of a violation. VSLs must be written on a violation occurrence basis in accordance with FERC guidelines. The requirements specify which entities must be included in communications capabilities. If a single entity is missing, this is a violation of the requirement. According to VSL guidelines, if missing any part of the requirement could have the same reliability outcome as missing the entire requirement, the requirement is binary and the VSL must be severe.

A new requirement was added to COM-001 for clarity regarding responsibilities of the Distribution Provider and the Generator Operator when either entity experiences a failure of its Interpersonal Communication capability:

R11. Each Distribution Provider and Generator Operator that experiences a failure of any of its Interpersonal Communication capabilities shall consult with its Transmission Operator or Balancing Authority as applicable to determine a mutually agreeable time to restore the Interpersonal Communication capability. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations]*

This requirement requires collaboration between entities to restore a failed communications capability.

The RCSDT asked stakeholders if they believed that the requirements of TOP-001-1 obviate the need to develop additional requirements to address Xcel's comment as directed in FERC Order 693. The original justification that the RCSDT posited for not adding a requirement to directly address Xcel Energy's comments in paragraph 516 and FERC's related recommendation in paragraph 523 was that TOP-001-1 R3 was considered to address this concern. Since that time, the RTO SDT has proposed to retire TOP-001-1 R3. However, NERC has since retired IRO-004-1 R3 and R5 along with IRO-005-3 R5. Because these are retired, there are no longer any requirements that would force a TOP to wait for a delayed RC response during an emergency. Therefore the question is resolved, albeit differently than it was proposed to be resolved in this posting. If an RC were to give a Reliability Directive to a TOP that the TOP considered "would violate safety, equipment, regulatory, or statutory requirements," the TOP may respond to the RC that it cannot comply.

Stakeholders were asked if they agree with the revision to IRO-001, R1 for certifying Reliability Coordinators. Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.

A significant revision to IRO-001-2 was made by removing the Interchange Coordinator from the standard. The RCSDT made this revision because the Balancing Function is responsible for implementing interchange (see NERC Reliability Functional Model, version 5, page 32, item 7) and to operate the Balancing Authority Area to maintain load-interchange-generation balance (item 3).

The RCSDT asked stakeholders if they agree with moving two requirements from IRO-001 back to IRO-002 relating to Analysis Tool outages. All stakeholders that responded agreed and there were no comments received.

The RCSDT asked stakeholders if they agree with moving two requirements from IRO-001 back to IRO-005 relating to Reliability Coordinator notifications. Several commenters noted a typographical error in R1 which was corrected to read:

When the results of an Operational Planning Analysis or Real-time Assessment indicate an expected or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify ~~issue an alert to~~ all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

One commenter also asked that an errant yellow text box be removed from Page 1, which was also done.

The RCSDT received a number of comments regarding the applicability of COM-001, and COM-002. The RCSDT agrees with these comments and has removed PSE and LSE from the COM-001-2 implementation plan. The RCSDT also addressed minor issues involving typos, formatting and style.

The RCSDT received comments suggesting clarification of COM-002-3. The RCSDT intends the communication of Reliability Directives to be person-to-person and in such a manner that the Reliability Directive is understood and not necessarily repeated verbatim. COM-002-3 is not intended to be prescriptive on how the Reliability Directive is issued. Spoken or written communications are valid methods (i.e. using the telephone, radio, electronic texting, email, etc.). The purpose of COM-002-3 is to ensure emergency communications between operating personnel are effective. There is no proxy requirement for 24/7 operating personnel regarding small entities. Only “capability” as provided for in COM-001-2 is applicable. The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation. As envisioned, communications protocols would be addressed in the COM-003 standard being developed in Project 2007-02.

Some commenters suggested revisions to IRO-014, requirement R8 to conform to similar requirements R6 and R7. The RCSDT made the suggested revision by re-ordering R8:

R8. During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements. [Violation Risk Factor: High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]

IRO-014-2, requirement R4 is applicable to those Reliability Coordinators engaged in activities related to requirement R1 and part 1.7. It is unlikely that Reliability Coordinators geographically and electrically distant from one another will have mutually agreed upon operating procedures (per requirement R1), and therefore requirement R4 would not be applicable. The RCSDT believes IRO-014-2, requirement R4 (which requires weekly communication) provides reasonable contact and flexibility – and this requirement is in effect today.

The RCSDT coordinated the use of the NERC Glossary term “Adverse Reliability Impact” with the Real-Time Operations team and continues the practice of informing all RCs of Adverse Reliability Impacts in requirement R5.

The RCSDT has revised IRO-014-2, requirements R6-R8 to clarify that when one RC identified a problem and presents an action plan for another RC, the second RC is obligated to implement the action plan. The RCSDT will forward the concern about RC's identifying themselves and the receiver to establish authority to the Project 2007-02, Operating Personnel Communications Protocols SDT. The Project 2007-02 team is developing a standard that includes requirements for use of specific communications protocols.

Index to Questions, Comments, and Responses

1. Do you agree with COM-001 requirements for Interpersonal Communications capability and Alternative Interpersonal Communications capability (R1-R8)? If not, please explain in the comment area below.	14
2. The RCSDT believes that the requirements of TOP-001-1 obviate the need to develop additional requirements to address Xcel’s comment. Do you agree? If not, please explain in the comment area below.....	39
3. Do you agree with the revision to IRO-001, R1 for certifying Reliability Coordinators? If not, please explain in the comment area below.	45
4. Do you agree with moving two requirements from IRO-001 back to IRO-002 relating to Analysis Tool outages? If not, please explain in the comment area below.	51
5. Do you agree with moving two requirements from IRO-001 back to IRO-005 relating to Reliability Coordinator notifications? If not, please explain in the comment area below.	55
6. Do you have any other comment, not expressed in questions above, for the RC SDT?	58

Consideration of Comments on Reliability Coordination — Project 2006-06

The Industry Segments are:

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

1. Do you agree with COM-001 requirements for Interpersonal Communications capability and Alternative Interpersonal Communications capability (R1-R8)? If not, please explain in the comment area below.

Summary Consideration:

For the COM-001 standard, several commenters had suggestions for improvements to the requirement language and applicability. The RCSDT believes the standard correctly and adequately requires each applicable entity that would have capability to receive Interconnection and operating information to have Interpersonal Communications and Alternative Interpersonal Communications to be used when the Interpersonal Communication is not available. The RCSDT has addressed the applicability of the standards and implementation plans by aligning COM-001-2, and COM-002-3 to include the same entities and by removing LSE, PSE and TSP from the COM standards.

Many comments were concerned about both the medium (e.g. cellular, satellite, etc.) and media (e.g. voice, email, etc.) used for Interpersonal Communications. The current language avoids being prescriptive and allows each entity to determine what is suitable. Interpersonal Communication and Alternative Interpersonal Communication is between the applicable entities which may include multiple locations (e.g. a primary and back-up control center).

The RCSDT added the following Requirement Parts at the suggestion of stakeholders:

3.5 Adjacent Transmission Operators synchronously connected within the same Interconnection

4.3 Adjacent Transmission Operators synchronously connected within the same Interconnection

5.6 Adjacent Balancing Authorities

6.3 Adjacent Balancing Authorities

The RCSDT agrees with the many industry comments and removed the phrase "to exchange Interconnection and operating information" in requirements R1 through R8. This removal clarifies that the intent of this capability is NOT for the exchange of data.

A few commenters also expressed concerns about the frequency of testing Alternative Interpersonal Communications capability. The RCSDT believes that the proposed testing frequency is supported by the majority of stakeholders and is not overly burdensome.

Several commenters suggested that VSLs should be written based on the percent of entities rather than by an occurrence of a violation. VSLs must be written on a violation occurrence basis in accordance with FERC guidelines. The requirements specify which entities must be included in communications capabilities. If a single entity is missing, this is a violation of the requirement. According to VSL guidelines, if missing any part of the requirement could have the same reliability outcome as missing the entire requirement, the requirement is binary and the VSL must be severe.

A new requirement was added for clarity regarding responsibilities of the Distribution Provider and the Generator Operator when either entity experiences a failure of its Interpersonal Communication capability:

R11. Each Distribution Provider and Generator Operator that experiences a failure of any of its Interpersonal Communication capabilities shall consult with its Transmission Operator or Balancing Authority as applicable to determine a mutually agreeable time to restore the Interpersonal Communication capability. [*Violation Risk Factor: Medium*][*Time Horizon: Real-time Operations*]

This requirement requires collaboration between entities to restore a failed communications capability.

Organization	Yes or No	Question 1 Comment
ERCOT ISO	No	<p>We expressed in the last posting that we felt the definition of Interpersonal Communications might inadvertently include data. The SDT responded that it does not by referring to Interpersonal in the name of the definition. Clearly, you cannot refer to the word you are defining in order to define it. However, it is possible “allows two or more individuals to ...” may solve this problem. Clarity should be sought in the next posting, if possible. This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities. We request the sub-requirements be modified into bulleted lists. Consider striking “to exchange Interconnection and operating information” in R1, R3, R5, R7, and R8. It is redundant to the use of Interpersonal Communications “to interact, consult, or exchange information” in the definition. Consider striking “to exchange Interconnection and operating information” in R2, R4, R6. It is redundant to the use of Alternative Interpersonal Communications which uses Interpersonal Communications in its definition. Interpersonal Communications includes “to interact, consult, or exchange information” in its definition. For R2, why is Interchange Coordinator excluded? It is included in the Requirement R1 which deals with the Interpersonal Communications. Communications would need to be maintained with the Interchange Coordinator in the event of a failure of the Interpersonal Communications. For R3, affected neighboring Transmission Operators should be included. For R4 and R6, the sub-requirement list is different than for than for the associated Interpersonal Communications requirements R3 and R5 respectively. We believe these should be duplicate. That is the sub-requirement list for R4 should match R3 and the R6 should match R5. In the event of a failure of the Interpersonal Communications, the Transmission Operator and Balancing Authority both would need to maintain communications to the same entities as in the requirement to have Interpersonal Communications. Again, we would suggest replacing sub-requirements with bulleted lists. For R5, why are neighboring Balancing Authorities not included? Additionally R5 should only read Contact with Interchange Coordinator within same Interconnection. They certainly need to be able to contact one another to identify discrepancies in scheduling and sources of meter error that could lead to deviations in ACE. Should R2, R4 and R6 be constructed parallel to R1, R3, and R5? In R1, R3 and R5, the requirement is “shall have” while in R2, R4, and R6, the requirement is “shall designate”. Since one is for the Interpersonal Communications and the other is for the Alternative Interpersonal Communications, it seems the same wording should be used. We do not believe R2.2 and R1.2 should be limited to Reliability Coordinators in the same Interconnection only. We suggest modifying “within the same Interconnection” to “within the same Interconnection, and, as appropriate, between a-synchronously connected RCs which are not precluded by law from scheduling interchange energy (for schedule changes, curtailments, etc.)” since reliability coordination may be required among the RCs on both sides of an Interconnection boundary. The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal</p>

Organization	Yes or No	Question 1 Comment
		<p>Communications. FERC specified their general preference for gradated in paragraph 27 of their June 19, 2008 order on VSLs. The second half of the Severe VSL for R9 is almost a duplicate to the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.</p>

		<p>Alternative Interpersonal Communications. FERC specified their general preference for gradated in paragraph 27 of their June 19, 2008 order on VSLs. The second half of the Severe VSL for R9 is almost duplicate to the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.</p>
<p>Northeast Power Coordinating Council</p>	<p>No</p>	<p>It was expressed in the last posting that the definition of Interpersonal Communications might inadvertently include data. The SDT responded that it does not by referring to Interpersonal in the wording of the definition. The word being defined shouldn't be in the definition. However, incorporating "allows two or more individuals to ..." is an option that may solve this problem. The next posting should clarify this.</p> <p>Response: The RCSDT has clarified in previous responses to comments that the requirements of COM-001 do not apply to data. The current proposed definition of Interpersonal Communications includes the phrase "allows two or more individuals to...". In an effort to make this more clear, the RCSDT has revised Requirements R1-R8 to remove the phrase "to exchange Interconnection and operating information" as you and others have suggested. This will provide the needed clarity for stakeholders that COM-001 does not include "data exchange."</p> <p>This standard does not comport with the informational filing that NERC submitted to FERC on August 10, 2009 regarding its discontinued use of sub-requirements in standards development activities. The sub-requirements should be modified into bulleted lists.</p> <p>Response: The information filing did not propose to eliminate the use of numbered items altogether, but proposed changing the manner in which they were numbered. Bulleted lists are used to indicate sets of options; numbered lists are used when each of the listed items are required.</p> <p>Consider striking "to exchange Interconnection and operating information" in R1, R3, R5, R7, and R8. It is redundant to the use of Interpersonal Communications "to interact, consult, or exchange information" in the definition.</p> <p>Response: The RCSDT agrees and we have removed the phrase "to exchange Interconnection and operating information" from R1-R8. This helps clarify the intent that the capability is NOT for data exchange as data is covered under the provisions of the recently approved IRO-010-1a.</p> <p>Consider striking "to exchange Interconnection and operating information" in R2, R4, R6. It is redundant to the use of Alternative Interpersonal Communications which uses Interpersonal Communications in its definition. Interpersonal Communications includes "to interact, consult, or exchange information" in its definition.</p> <p>Response: The RCSDT agrees and we have removed the phrase "to exchange Interconnection and</p>

Organization	Yes or No	Question 1 Comment
		<p>operating information from R1-R8. This helps clarify the intent that the capability is NOT for data exchange as data is covered under the provisions of the recently approved IRO-010-1a.</p> <p>For R2, why is Interchange Coordinator excluded? It is included in the Requirement R1 which deals with the Interpersonal Communications. Communications would need to be maintained with the Interchange Coordinator in the event of a failure of the Interpersonal Communications.</p> <p>Response: R1 is dealing with the “normal” communications. R2 deals with the default reliability needs. The normal communications include Interchange Coordinators because they are part of the administration of Interchange. The SDT predicated R2 on being in an unusual situation in which only the basic reliability functions were needed. In such times, the Interchange Function is seen as sacrificial because the BA itself could operate reliably (not necessarily efficiently) by simply dealing with it is adjacent BAs and “scheduling” interchange on a BA to BA basis (as opposed to a PSE to PSE basis). The Interchange Coordinator is only needed to ensure all of the commercial arrangements are validated by all parties. In stressed conditions those checkouts can be by-passed and dealt with after-the-fact. That <u>does not mean</u> that when an entity goes to backup is expected to bypass the Interchange Coordinator. The requirement R2 merely focused on the worst case situation.</p> <p>This requirement is not meant to define the alternate backup system; it is merely mandating the lowest mandatory requirements on the backup system. For example during the Y2K operations backup systems included satellite phones which did not cover all entities involved in normal operations. The SDT wrote the requirements to assure that such an event would not cause all RCs, BAs and TOPs to be non-compliant.</p> <p>For R3, affected neighboring Transmission Operators should be included.</p> <p>Response: The SDT has included the following Part 3.5 of Requirement R3:</p> <p style="padding-left: 40px;">3.5 Adjacent Transmission Operators synchronously connected within the same Interconnection</p> <p>For R4 and R6, the sub-requirement list is different from the associated Interpersonal Communications requirements R3 and R5 respectively. These should be duplicate. The sub-requirement list for R4 should match R3, and the sub-requirement list for R6 should match R5. In the event of a failure of the Interpersonal Communications, the Transmission Operator and Balancing Authority both would need to maintain communications to the same entities as in the requirement to have Interpersonal Communications.</p> <p>Response: The SDT has included the following Part 4.3 of Requirement R4:</p> <p style="padding-left: 40px;">4.3 Adjacent Transmission Operators synchronously connected within the same Interconnection</p> <p>The SDT has included the following Part 6.3 of Requirement R6:</p> <p style="padding-left: 40px;">6.3 Adjacent Balancing Authorities</p>

Organization	Yes or No	Question 1 Comment
		<p>The RCSDT asserts the standard meets FERC Order 693 regarding DP and GOP entities by requiring these entities to have Interpersonal Communication capability. Not requiring DP and GOP entities to have Alternative Interpersonal Communication capability meets FERC’s intention as stated here: “We (FERC) clarify that the NOPR did not propose to require redundancy on generator operators’ or distribution providers’ telecommunication facilities...” (Order 693, RM06-16-000, Paragraph 487).</p> <p>The sub-requirements should be bulleted lists.</p> <p>Response: Bulleted lists are used to indicate sets of options; numbered lists are used when each of the listed items are required.</p> <p>For R5, why are neighboring Balancing Authorities not included?</p> <p>Response: The SDT has included the following Part 5.6 of Requirement R5:</p> <p style="padding-left: 40px;">5.6 Adjacent Balancing Authorities</p> <p>Note that this is a defined term in the glossary: “A Balancing Authority Area that is interconnected (to) another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.”</p> <p>Additionally, R5 should only read Contact with Interchange Coordinator within the same Interconnection. They need to be able to contact one another to identify discrepancies in scheduling and sources of meter error that could lead to deviations in ACE.</p> <p>Response: The RCSDT has removed the Interchange Coordinator from the standard (R1 and R5) as the BA is responsible for the reliability implications of Interchange. The reliability relationship lies between BA’s.</p> <p>Should R2, R4 and R6 be constructed parallel to R1, R3, and R5? In R1, R3 and R5, the requirement is “shall have” while in R2, R4, and R6, the requirement is “shall designate”. Since one is for the Interpersonal Communications and the other is for the Alternative Interpersonal Communications, the same wording should be used.</p> <p>Response: The SDT inserted the different terminology because there may be more than one type backup system, Some entities have land lines; cell phones; satellite phones; voice over internet; and/or teleconferencing. The language is intended to provide flexibility to allow entities to have one or more types of backup while designating one for Alternative Interpersonal Communications.</p> <p>R2.2 and R1.2 should not be limited to Reliability Coordinators in the same Interconnection only. Modify “within the same Interconnection” to “within the same Interconnection, and, as appropriate, between a-synchronously connected RCs which are not precluded by law from scheduling interchange energy (for schedule changes, curtailments, etc.)” since reliability coordination may be required among the RCs on both sides of an Interconnection boundary.</p>

Organization	Yes or No	Question 1 Comment
		<p>Response: The requirement proposed by NPCC is predicated on “as appropriate.” Such subjective phrases cannot be used in a standard. The issue of asynchronous entities is not germane to the requirement but the requirement does not preclude additional coordination to meet the specifics of ERCOT, HQ and WECC. A regional variance may be an option for you to consider.</p> <p>The VSLs for R1 through R8 should be expanded to include multiple levels based on the number of entities that the functional entity does not have Interpersonal Communications or Alternative Interpersonal Communications with. FERC specified their general preference for gradated in paragraph 27 of their June 19, 2008 order on VSLs.</p> <p>Response: Each entity listed in Requirements R1-R8 is required to meet the contents with respect to each other entity listed in the requirement. Failure to have the capability with a single entity is a single violation of the requirement. For example, if an RC has 5 BA’s within it Area and fails to have Interpersonal Communications with two of them, then the RC has violated the requirement twice. The VSLs are written to address each violation of the Requirement. We have removed the words “or more” from the VSLs.</p> <p>The second half of the Severe VSL for R9 is almost a duplicate of the Lower VSL. There are some small changes in the wording but both situations deal with the case where there is a problem that has been identified with the Interpersonal Communications system and it takes more than two hours to initiate repair.</p> <p>Response: The R9 Severe VSL was revised to remove “within 2 hours”. It now reads:</p> <p style="padding-left: 40px;">“The responsible entity tested the Alternative Interpersonal Communications capability and identified a problem but didn’t initiate action to repair or designate a replacement Alternative Interpersonal Communications.”</p>
<p>Response: The RCSdT thanks you for your comment. Please see responses embedded above.</p>		
PNGC Power member owners	No	<p>Thank you for the opportunity to comment and for your hard work on this project: While we agree that effective Interpersonal Communications capability are integral to reliability, many Distribution Providers (DP) are small entities that do not maintain a 24-7 dispatch desk capable of receiving or responding to emergency reliability directives in a timely manner. It is our belief that some of the proposals in this project could unnecessarily force small entities to make investments that will not enhance reliability. Many DPs rely on answering services to address customer-service issues during non-business hours. On-call personnel are contacted in the event of an outage or emergency and crews are dispatched as appropriate. It is difficult to envision a BA or TOP issuing an Emergency Reliability Directive to a small entity (25 MW or so) which would require these smaller entities to comply with COM-001. Order 693 directs the inclusions of DPs in the COM-001-2 standard but it is our belief that the Commission offered language that GOs and DPs need not have redundant communications, training unrelated to normal/emergency operations, and that telecommunications</p>

Organization	Yes or No	Question 1 Comment
		<p>requirements for entities will vary according to their function. We believe those intentions should be reflected in the language of this standard. We would suggest adding wording such as in the applicability section, "Distribution Providers who maintain a 24-7 control centers with the ability to manually shed load of at least 100 MW within a 15-minute operational window."Also, a note that smaller, rural entities can be dependent on a phone system provider that will not allow for backup communications. Should the communication line(s) be dependent on one main phone trunk line, the failure due to an issue on this main line will make it impossible to notify anyone of its failure short of physically traveling to an area where phone service is available. For some rural areas, this will exceed the one hour time limit to report the communication outage. Forcing smaller entities to acquire satellite phone service to mitigate for a phone outage is a high price to pay when no reliability improvement will be achieved. Suggested change could be: "... shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer where alternate forms of communication are available within a 15 minute access time. Should alternate forms of communication not be available within the 15 minute access time, then upon reestablishment of Communication capabilities impacted entities will be notified of the past loss and current status of Communication."We've heard many representatives from FERC and NERC indicate that the standards development process has led the industry to take action in many cases for the sake of compliance while not necessarily enhancing reliability. As has been stated many times, the process should be about improving reliability, not about complying with standards. Unnecessarily including smaller entities that will NEVER receive an emergency reliability directive might be an example of the former.</p>
<p>Response: The RCSDT thanks you for your comment. There is no requirement for 24/7 support, the requirement is to have communications capability. The type of system (i.e. On-Call) is not prescribed in the standard and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is "To ensure emergency communications between operating personnel are <u>effective</u>." It is not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a <u>method</u> of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical that they have a means of communication, in many cases this may be via a receptionist, or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.</p>		
PPL	Yes	
PSEG	No	Com-001-2 implementation plan lists that this is applicable to PSE's and LSE's however, PSE's and LSE's were removed from the actual standard. The implementation plan should be revised.
<p>Response: The RCSDT thanks you for your comment. We have revised as you suggested.</p>		
Dominion	No	The monthly testing requirement for Alternative Interpersonal Communications is overly burdensome without any evidence to support that it is necessary to insure reliability. We believe that an entity will take necessary

Organization	Yes or No	Question 1 Comment
		<p>steps to insure the Alternative Interpersonal Communications is functioning properly, especially if it experiences problems with its Interpersonal Communications, it. We can support quarterly testing as we believe it strikes a reasonable balance.</p>
<p>Response: The RCSDT thanks you for your comment. The drafting team has not received a large number of comments that suggest that the frequency of the testing is burdensome and believes that the testing could occur in the normal course of daily activities. Therefore, the SDT believes the frequency of testing will not be burdensome.</p>		
<p>South Carolina Electric and Gas</p>	<p>No</p>	<p>Each sub-requirement should not have an “R” in front of the number in order to be consistent with NERC’s August 10, 2009 filing at FERC on this subject. Requirement R3 and R4 should include adjacent TOPs as a sub-requirement. Requirements R5 and R6 should include adjacent BAs as a sub-requirement. ”to exchange Interconnection and operating information” should be deleted from requirements R1 through R8 as it is redundant with the definition of Interpersonal Communications. The last page of the Implementation Plan includes LSEs, PSE, and TSPs as being responsible entities under this standard, yet the standard does not include them. Please correct the implementation plan.</p>
<p>SERC OC Standards Review Group</p>	<p>No</p>	<p>Each sub-requirement should not have an “R” in front of the number in order to be consistent with NERC’s August 10, 2009 filing at FERC on this subject.</p> <p>Response: The RCSDT agrees and this change has been made.</p> <p>Requirement R3 and R4 should include adjacent TOPs as a sub-requirement.</p> <p>Response: The SDT has included the following Part 3.5 of Requirement R3 and 4.3 of R4: Adjacent Transmission Operators synchronously connected within the same Interconnection</p> <p>Requirements R5 and R6 should include adjacent BAs as a sub-requirement.</p> <p>Response: The SDT has included the following Part 5.6 of Requirement R5 and Part 6.3 of R6: Adjacent Balancing Authorities</p> <p>Note that this is a defined term in the glossary: “A Balancing Authority Area that is interconnected to another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.”</p> <p>”to exchange Interconnection and operating information” should be deleted from requirements R1 through R8 as it is redundant with the definition of Interpersonal Communications.</p> <p>Response: The RCSDT agrees and we have removed the phrase “to exchange Interconnection and operating information from R1-R8.</p>

Organization	Yes or No	Question 1 Comment
		<p>The last page of the Implementation Plan includes LSEs, PSE, and TSPs as being responsible entities under this standard, yet the standard does not include them. Please correct the implementation plan.</p> <p>Response: The RCSDT agrees and we have made the revision.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
<p>MRO's NERC Standards Review Subcommittee</p>	<p>No</p>	<p>A. R5.5 states a BA shall have Interpersonal Communications with each Interchange Coordinator within its BA area and adjacent Interchange Coordinators. NERC Registry Criteria (v5) uses the term “Interchange Authority” not Interchange Coordinator, please clarify.</p> <p>Response: The RCSDT has removed the Interchange Coordinator from the standard based on stakeholder feedback.</p> <p>B. Upon review of the NERC Compliance Registry, there are only 56 BA’s that are also registered as an IA but 138 total BA’s within the registry. R5.5 is not clearly written because many BA’s do not have an IA within their BA area. Though a BA will use an IA to schedule interchange, a possible rewrite of R5.5 may be “Each Interchange Authority that the BA actively uses to arrange Interchange”.</p> <p>Response: The RCSDT has removed the Interchange Coordinator from the standard based on stakeholder feedback.</p> <p>C. R10 states that the RC, TOP, BA, DP and GOP shall notify “impacted entities” within 60 minutes... Please clarify if the SDT means the entities within the applicability section or is this to be determined by the entity. A possible rewrite may be; “Each RC shall notify TOP’s, BA’s, and IA’s within its RC area along with adjacent RC’s within the same Interconnection”. This break down would need to be required for each affected entity and would provide clarity to the industry.</p> <p>Response: R10 specifies only “impacted entities”. That phrase is used to limit the scope of the requirement. If an entity has a failure of its Interpersonal Communications capability with only one entity, then <i>that</i> entity is the “impacted entity” and they should be notified of the failure.</p> <p>D. We do not agree with a DP and GOP need to be held to the same level of compliance as a RC, BA or TOP. FERC Order 693 (paragraph 487) directed the DP and GOP to be included in this standard by stating:” We expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process”. A DP and GOP may not be staffed 24 hours a day like a BA or TOP and the SDT did not take this into consideration.</p> <p>Response: There is no requirement that requires identical communications systems. The requirement is to have “a” communication capability. The RCSDT asserts the standard meets FERC Order 693 regarding DP and GOP entities by requiring these entities to have Interpersonal Communication capability. Not requiring DP</p>

Organization	Yes or No	Question 1 Comment
		<p>and GOP entities to have Alternative Interpersonal Communication capability meets FERC's intention as stated here: "We (FERC) clarify that the NOPR did not propose to require redundancy on generator operators' or distribution providers' telecommunication facilities..." (Order 693, RM06-16-000, Paragraph 487). A new requirement was also added concerning the failure of a DP or GOP Interpersonal Communications capability:</p> <p style="text-align: center;">R11 Each Distribution Provider and Generator Operator that experiences a failure of any of its Interpersonal Communication capabilities shall consult with its Transmission Operator or Balancing Authority as applicable to determine a mutually agreeable time to restore the Interpersonal Communication capability. <i>[Violation Risk Factor: Medium][Time Horizon: Real-time Operations]</i></p> <p>E. We understand that the DP and GOP need a means of communicating with their BA and TOP (R7 and R8) but would this not be the same Interpersonal Communications capability that as stated in R3 and R5 for the TOP and BA? Example: If the BA uses a phone line as their Interpersonal Communication medium to contact the DP wouldn't the DP also use the same medium to communicate with their BA? Yes, there could be different mediums but 99% of the time it will be the same medium.</p> <p>Response: The RCSDT agrees with your assumption; however a reciprocal requirement is necessary. Without R7 and R8, there would be no requirement for the DP or GOP.</p> <p>F. R10 could mean that if there is a logging system that detects an Interpersonal Communication failure, then all applicable entities will need to monitor that monitoring device. Since this requirement applies to all applicable entities, and Interpersonal Communication mediums will most likely be the same, there will always be two entities found non compliant if the 60 minute threshold is passed.</p> <p>Response: There is no requirement to monitor or log Interpersonal Communications capability, only to test. R10 requires the entity to notify the impacted entities upon a failed test or the detection of a failure.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
FirstEnergy	No	<p>It is not clear from the definition of Interpersonal Communications if certain communications "mediums" such as email, instant messaging, etc. are included.</p> <p>Response: The requirements are for communications between two or more persons. Mediums are not listed to avoid being prescriptive in the requirement. The measures provide examples of mediums.</p> <p>Furthermore, the Measures for these requirements all include "electronic communications" as acceptable evidence. If the drafting team does not intend these mediums be included, then it should be clarified in the</p>

Organization	Yes or No	Question 1 Comment
		<p>definition. We suggest the following wording of the definition: Interpersonal Communication: Any medium that allows two or more individuals to interact, consult, or exchange information. This interaction consists of verbal, spoken words exchanged in Real-time.</p> <p>Response: The use of verbal communication only is not the intent of the requirement. Written communication is also an acceptable form of Interpersonal Communication.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
SPP Standards Development	No	<p>We would suggest that the applicability of COM-001-2 be expanded to that listed in COM-002-3. How can the directives to be issued in COM-002 be delivered and confirmed without having Interpersonal Communications capability?</p> <p>Response: The RCSDT has revised the applicability of COM-001 and COM-002 such that they contain the same functional entities. These are: RC, TOP, BA, GOP, and DP.</p> <p>All of the functional entities listed in R1.1 should also be listed in R2.1. Similarly the sub-requirements of R3 should also be applied to R4. The same holds true for R5 and R6.</p> <p>Response: The requirements for Alternative Interpersonal Communications are different than for Interpersonal Communications. There is not necessarily a reliability need to have redundant capability with each and every entity such as DP and GOP.</p> <p>If the SDT intends to exclude data communications from Interpersonal Communications and Alternative Interpersonal Communications, we suggest the SDT be more specific in the definition to specifically exclude data communications in the definition. It is not readily apparent that these terms do not apply to data communications and without a clarification, confusion exists.</p> <p>Consider</p> <p>Response: The RCSDT agrees and have removed the phrase “to exchange Interconnection and operating information from R1-R8. This helps clarify the intent that the capability is NOT for data exchange, as data is covered under the provisions of the recently approved IRO-010-1a.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
Kansas City Power & Light	No	<p>These requirements require TOP’s, BA’s, and GOP’s to establish alternative means of “interpersonal” communications with other BA’s, GOP’s, and BA’s respectively without regard to the reliability impact each TOP, BA or GOP has on the interconnection. Why would it be necessary for a TOP with one 161kv transmission line or a BA with 100 MW of total load, or one GOP with a 30MW unit to realize additional costs</p>

Organization	Yes or No	Question 1 Comment
		<p>when the facilities they operate have little reliability impact?</p> <p>Response: The RCSDT believes that any NERC Registered Entity capable of issuing or receiving a directive is an applicable party to COM-001.</p> <p>In addition, most RC's have established satellite telephone systems as back-up communication with TOP's. RC's may have to establish additional communication systems with BA's as these requirements impose to avoid Standards of Conduct issues.</p> <p>Response: It is unclear how this scenario would present Standards of Conduct issues for communication between reliability entities. The requirements pertain to reliability functions, not commercial functions or the way in which entities are structured internally.</p> <p>R9 - considering the reliability of communication systems, a 2 hour response to a problem with the alternative means of communication is over sensitive. Allowing for sometime in an operating shift would be more in line, such as 8 hours.</p> <p>Response: The requirement is to initiate action within 2 hours, not complete it. The two hour time reference aligns with the timing shown in EOP-008 for back-up facilities.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
Competitive Suppliers		
Exelon	No	<p>1. COM-001-2, 4.4 - Distribution Providers and 4.5, Generation Operators should be highlighted and communicated as a substantive change since entities may not be aware that they are being added to the applicability section of the standard.</p> <p>Response: These revisions were done based on FERC Order 693 directives. They have been widely distributed in redline form. NERC will ensure that the change in applicability is highlighted in the announcement of the next posting.</p> <p>2. COM-001-2, R10 - should have the following underlined clarifying text added, shall notify impacted entities within 60 minutes of the detection of a failure “of all primary and alternative “ Interpersonal Communications capabilities that lasts 30 minutes or longer. Exelon believes that the intent of R10 is for complete loss of communication ability and should not be applied to facilities that have multiple backups.</p> <p>Response: The RCSDT developed R10 based on R3 of COM-001-1. The intent is to ensure that entities know not to use the primary and to use the alternative.</p> <p>3. COM-001-2, M1 thru 9 - Suggest that network diagrams and / or communications schematics be added as</p>

Organization	Yes or No	Question 1 Comment
		<p>suggested evidence.</p> <p>Response: The measure only provides examples of the types of evidence that may be used for compliance and the list is not all inclusive. The term "...evidence that could include, but is not limited to..." addresses your suggestion.</p> <p>4. COM-001-2, VSL for R9 - Regarding failure to test the Alternative Interpersonal Communication, the Severity Level does not align with the potential impact to the BES. The Severity Level for simply missing a test should be revised to a High VSL.</p> <p>Response: The VSL does not relate to risk to the BES (this is covered in the Violation Risk Factor). The VSL only indicates how badly an entity missed the mark with respect to the requirement. A Severe VSL is appropriate.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
PacifiCorp	Yes	
Arizona Public Service Company	Yes	
Southern Company	No	<p>Comments: Standard COM-001-2R10. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider, and Generator Operator shall notify impacted entities within 60 minutes of the detection of a failure of its Interpersonal Communications capabilities that lasts 30 minutes or longer. Comment: It is not clear whether the notification requirements identified in R10 apply to failure of ALL available Interpersonal Communications or ANY Interpersonal Communications. We suggest that the existence of functioning Alternative Interpersonal Communications precludes the requirement for notification of impacted entities.</p> <p>Response: The intent of R10 is to ensure that entities know not to use the primary and to use the alternative. Notification is required for the failure of the primary capability.</p> <p>D. Compliance 1. Compliance Monitoring Process 1.3 Data Retention Each Generator Operator shall keep the most recent twelve months of historical data (evidence) for Requirements R8 and R10, Measures M8 and M10. Comment: The data retention requirements specified for the Generator Operator in Para. 1.3 (above) are not consistent with the 3-year audit interval for the GOP. Question: When audited on this Standard is the expectation that the GOP will have 12 months of evidence or 36 months of evidence?</p> <p>Response: The Data Retention section of the standard conforms to the NERC guidelines. The RCSDT has also added the following to the data retention section:</p>

Organization	Yes or No	Question 1 Comment
		<p>The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.</p> <p>Standard COM-002-3R2. Each Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message has been confirmed. Comment: The term “Reliability Directive” is currently not defined in the NERC Glossary of Terms. However, in the Implementation Plan for COM-002-3 the RC SDT proposes a definition for Reliability Directive. It is implied in the standard that the Reliability Directive is issued as a voice command which precludes the use of our preferred method of Interpersonal Communication. However, this is not definitively stated in either the standard or the proposed definition. I think this needs to be made clearer if the Reliability Directive must be issued as a voice command.</p> <p>Response: The RCSDT disagrees with your assumption that the requirement implies that a Reliability Directive must be issued verbally. In a previous version of the draft standard, the RCSDT had included “verbal” issuance of directives. This was removed to allow the use of other than voice capability to issue a Reliability Directive.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
<p>Green Country Energy, Green Country Operating Services</p>	<p>No</p>	<p>COM-001 General question/comment. The reference to infrastructure should be removed and just keep the word “medium”. Here's why: What communication medium (infrastructure) does not use satellite at some point unless entities are within a close geographical proximity? How likely is it to have 2 different mediums? o Local phone and fax hard-wire likely. o Long distance phone and fax - satellite o Cell phone - satellite o Internet - satellite o Radio - antenna The reason for mentioning this is, if all we have is satellite then the reference to infrastructure should be removed and just keep the word “medium”.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT believes that the language of the definition is clearer with the existing verbiage.</p>		
<p>Central Lincoln</p>	<p>No</p>	<p>See Q 6 below.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses to Q6.</p>		

Organization	Yes or No	Question 1 Comment
Lakeland Electric	Yes	
Manitoba Hydro	Yes	
NextEra Energy, Inc.	No	<p>As drafted, COM-001 is not clear or complete. At this stage in the evolution of compliance with the mandatory Reliability Standards, it is important that any new or revised Reliability Standard clearly articulate all compliance obligations and tasks consistent with Sections 302 (6) and (8) of the NERC Rules of Procedure. Thus, NextEra Energy Inc. (NextEra) has numerous recommended corrections to provide clarity and completeness to COM-001. For example, the requirement to designate an Alternative Interpersonal Communication capability is not clear. Does the designator solely designate for the designator’s knowledge or does the designator need to inform the entity on the other end of the connection. In R2, for instance, the Reliability Coordinator must designate, but it is also not clear whether the Reliability Coordinator must inform the Balancing Authorities or Transmission Operators. It is further unclear whether the designation must be documented, or if any informing of the Balancing Authorities or Transmission Operators must be documented. Thus, it is recommended that the drafters decide what was intended regarding the designation and clearly state the requirements.</p> <p>Response: The Requirement R2 is for the RC to designate an Alternative Interpersonal Communication and inform the other entity (BA, TOP, etc.) as to what that Alternative Interpersonal Communication is. The Measure M2 provides examples of the types of evidence which may be used to prove compliance with the requirement.</p> <p>In R9 it states that “. . . on at least a monthly basis.” There are two issues to consider here. If the sentence stays, grammatically it should read “. . . on, at least, a monthly basis. . . However, from a compliance and technical perspective, the term “at least” has no significance and should be deleted. The requirement is to test on a monthly basis - the phrase “at least” only introduces ambiguity and implies that the party should consider every two or three weeks. If the drafting team believes a best practice is less than a month, there are other NERC educational tools to explain a best practice.</p> <p>Response: The RCSDT used this term to allow more frequent testing to be performed.</p> <p>In R10, it states “. . . shall notify the impacted entity . . .” It would be clearer to state: “. . . shall notify the impacted Reliability Coordinator, Transmission Operator, Balancing Authority, Distribution Provider or Generator Operator . . .”</p> <p>Response: The RCSDT believes your suggestion adds unnecessary verbiage to the requirement and does not provide additional clarity.</p>

Organization	Yes or No	Question 1 Comment
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
<p>United Illuminating Company</p>	<p>No</p>	<p>COM-001-2 does not specify the amount of time a DP has to reestablish the Interpersonal Communication Capability after the capability fails before it is assessed non-compliance for not having the communication. Is an entity non-compliant the minute the communication capability is unavailable? If so, then to be compliant a tertiary (or secondary capability for DP) must be installed by the entity. Something similar was discussed with EOP-008 R3: "To avoid requiring a tertiary facility, a backup facility is not required during: o Planned outages of the primary or backup facilities of two weeks or less o Unplanned outages of the primary or backup facilities". UI suggests the drafting team incorporate something similar.</p> <p>Response: The RCSDT is proposing a new requirement to address your concerns for the DP. We have included the GOP as well:</p> <p style="padding-left: 40px;">R11. Each Distribution Provider and Generator Operator that experiences a failure of any of its Interpersonal Communication capabilities shall consult with their Transmission Operator or Balancing Authority as applicable to determine a mutually agreeable time to restore the Interpersonal Communication capability. <i>[Violation Risk Factor: Medium][Time Horizon: Real-time Operations]</i></p> <p>The VSL for R7 is severe only and states: "The Distribution Provider failed to have Interpersonal Communications capability with one or more of the entities listed in Parts 7.1 or 7.2." I believe there should be a time component to the VSL and the VSL staged. For example, failure to have communication established for less than 60 minutes would be Lower, anything over 1 hour severe. Also needed is a phrase to state when the violation begins. Does the violation begin when the loss of Communication Capability is detected or when it occurred? In other words, does the violation start when the operator attempts to use the phone and it is not functional, or did it occur when the phone line functionality failed but was not yet detected because no attempt to use the phone was made. So the VSL for R7 would follow a format of: "The Distribution Provider failed to have Interpersonal Communication Capability with one or more entities listed in Parts 7.1 or 7.2 for a continual 60 minutes period as measured from the time the ICC failure was detected". An alternative remedy is to alter the language of R7 to allow for unplanned outage.</p> <p>Response: The VSL represents a single violation of the requirement. For this requirement, the DP must have Interpersonal Communication with its TOP and BA. The VSL was revised to remove "or more" to conform to the requirement.</p> <p>NERC does not have a Reliability Requirement for a DP to staff a control room 24/7. COM-0001 can be interpreted to imply that a DP needs to be staffed 24/7 to facilitate interpersonal communications. If NERC wants to extend the requirement for a 24/7 staffed operating position at the DP then the appropriate method is</p>

Organization	Yes or No	Question 1 Comment
		<p>thru a SAR to PER-002.</p> <p>Response: COM-001 is not intended to imply a 24/7 requirement.</p> <p>COM-001 R7 should have a sub-requirement added recognizing that DP's are not required to staff 24/7 and many do not staff overnight. UI suggests adding R7.3: DP's will notify their TOP and/or BA when it is not staffing an operating desk.</p> <p>Response: While the SDT does not disagree this would be good practice, other methods of addressing this situation (e.g., having an answering service, an on –call staff, or something similar) would be valid as well. The SDT does not believe it would be appropriate to limit this to only one method.</p> <p>R7: Should address the instance if the DP is not required to have communication with the BA, because the BA communicates thru the TOP.</p> <p>Response: The intent of the standard is that the DP will have communication with their BA. Ti is not prescriptive as to how that communication will be implemented.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
American Electric Power	No	<p>The applicability of COM-001 and COM-002 appear to be at odds with each other. The requirements may need to be re-written so that they are in sync.</p>
<p>Response: The RCSDT thanks you for your comment. The RCSDT has made revisions to COM-001 and COM-002 such that the applicability is compatible.</p>		
Pepco Holdings Inc	Yes	
American Transmission Company	Yes	<p>ATC agrees with the understanding that the line of demarcation is up to the point where ATC owns the equipment.</p>
<p>Response: The RCSDT thanks you for your comment.</p>		
WECC	Yes	
BGE	Yes	<p>BGE has no additional comments.</p>
Constellation Energy Commodities Group	Yes	

Organization	Yes or No	Question 1 Comment
Duke Energy	No	<p>o We question how far the definition of Alternative Interpersonal Communication goes in requiring separate infrastructure from Interpersonal Communication. For example, wireless communications sometime utilize fiber optic networks.</p> <p>Response: The definition requires the use of different infrastructure (medium) than the Interpersonal Communication used for day to day ops. The RCSDT cannot be prescriptive regarding the specific medium to be employed. This is intended to apply to assets and access to media that is within the control of the entity responsible for complying with the Requirement. For example, the way cell phone signals are routed is not within your control.</p> <p>o We question why the requirements state that entities must “have” Interpersonal Communications capability, but must “designate” Alternative Interpersonal Communications capability?</p> <p>Response: Many entities have multiple Alternative Interpersonal Communication capabilities. Allowing them to designate which one they want to employ allows for flexibility in which one they use for AIC.</p> <p>o R1.2 and R2.2 - Why is this limited to the same interconnection?</p> <p>Response: The phrase “within the same interconnection” is added for the case of ERCOT, which has only DC tie lines with the Eastern Interconnection and has minimal interchange.</p> <p>o R3 - need to add neighboring TOPs.</p> <p>Response: Agreed.</p> <p>o R5 - need to add adjacent BAs.</p> <p>Response: Agreed.</p> <p>o Interchange Coordinator - Add IC to the Applicability Section, and add a requirement that the IC have Interpersonal Communication capability with its BA and adjacent BAs.</p> <p>Response: The RCSDT has eliminated the Interchange Coordinator from COM-001-2 based on other stakeholder comments..</p> <p>o Requirements to “designate” Alternative Interpersonal Communication should carry a “Medium” VRF instead of “High”, because they are a backup capability. The word “designate” carries the connotation that these are documentation requirements.</p> <p>Response: The requirement to designate is for the entity to have an Alternative Interpersonal Communications capability and to designate what that is. In many cases, an entity will have multiple</p>

Organization	Yes or No	Question 1 Comment
		<p>alternatives and neighboring entities need to know how to contact them in case of a failure of the primary. If an entity does not designate its AIC, in an emergency it may not be able to issue or comply with directions or instructions which could directly contribute to BES instability, separation, or cascading failure.” The VRF should remain as high.</p> <p>o R9 requires a monthly test of Alternative Interpersonal Communications capability. This was quarterly in the last draft. We question how these requirements for “Alternative Interpersonal Communications” capability are related to requirements for “backup functionality” in EOP-008-1, which requires an annual test of backup functionality. Clarity on the relationship between “Interpersonal Communications”, “Alternative Interpersonal Communications”, “primary control center functionality” and “backup control center functionality” would be appreciated.</p> <p>Response: Interpersonal Communication and Alternative Interpersonal Communication should be in both the primary and back up control center. IC and AIC are between entities as well. These capabilities are in the primary and back up control centers. The requirement applies to the primary control center. EOP-008 applies to the back up control center. An entity may test its AIC in the normal course of daily activities.</p> <p>o R11 - is this requirement being moved to COM-003?</p> <p>Response: The OPCP SDT is vetting this requirement and it will be in COM-003.</p> <p>o Data Retention - Is data retention really going to be just 12 months? Most auditors seem to be asking for everything since the last audit.</p> <p>Response: The Data Retention section of the standard conforms to the NERC guidelines. The RCSDT has also added the following to the data retention section:</p> <p style="padding-left: 40px;">The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.</p>
<p>Response: The RCSDT thanks you for your comment. Please see responses above.</p>		
CECD	No	<p>Based on the drafting teams response that the definition of Interpersonal" clarifies the exclusion of media dedicated to Telemetry or other data exchange, the term Interpersonal Communication should be replaced with verbal communication capabilities. The term Alternative Interpersonal Communication should be replaced with alternative verbal communication capability that is able to serve as a substitute for and does not</p>

Organization	Yes or No	Question 1 Comment
		utilize the same infrastructure (medium) as verbal communications capabilities used for day-to-day operations.
<p>Response: The RCSDT thanks you for your comment. The RCSDT wrote the definitions to include verbal as well as written communication, and the Measures provide examples of person to person communications.</p>		
Indeck Energy Services	No	
City of Springfield, IL - City Water Light and Power (CWLP)	No	<p>The definition of “Interpersonal Communications” is overly broad and does not address the functional needs of reliability coordination. The definition should be limited to systems utilized for essential reliability functions. While the Purpose statement in the standard does address this intent, the explicit inclusion in the definition removes all ambiguity. Further, the definition of “Alternative Interpersonal Communications” without corresponding explicit definition of Primary Interpersonal Communications may lead to confusion and unnecessary duplication of efforts in testing and maintenance.</p>
<p>Response: The RCSDT thanks you for your comment. The overall mission of reliability standards is for entities to address essential reliability functions.</p>		
Independent Electricity System Operator	No	<p>(1) NERC filed with FERC on August 10, 2009 indicating that it would discontinue the use of sub-requirements in standards. All draft standards posted since have the format of Part Numbers within each main Requirement. Please revise the standards in this project accordingly.</p> <p>Response: The RCSDT agrees and this revision will be made.</p> <p>(2) Having defined the terms Interpersonal Communication and Alternative Interpersonal Communication, the phrase “to exchange Interconnection and operating information” in a number of requirements is redundant and can be removed. Further, for R1, we suggest removing the phrase “within the same Interconnection since there RCs between two Interconnections still need to communication with each other for reliability coordination (e.g. curtailment of interchange transactions crossing Interconnection boundary, as stipulated in IRO-006).</p> <p>Response: The RCSDT agrees and have removed the phrase “to exchange Interconnection and operating information” from R1-R8. This helps clarify the intent that the capability is NOT for data exchange, as data is covered under the provisions of the recently approved IRO-010-1a.</p> <p>The phrase “within the same interconnection” is added for the case of ERCOT which has only DC tie lines with the Eastern Interconnection and has minimal interchange.</p> <p>(3) R2: Suggest to add Purchasing-Selling Entity and Interchange Authority (INT-004 and INT-005 have requirements for communication between the RC and the PSE and IA), and remove the phrase “within the</p>

Organization	Yes or No	Question 1 Comment
		<p>same Interconnection since there RCs between two Interconnections still need to communication with each other for reliability coordination (e.g. curtailment of interchange transactions crossing Interconnection boundary, as stipulated in IRO-006).</p> <p>Response: The applicability of COM-001 and COM-002 were revised to include the same reliability entities: RC, TOP, BA, DP and GOP. LSE, PSE and TSP were removed from the applicability of these standards per stakeholder suggestion.</p> <p>The phrase “within the same interconnection” is added for the case of ERCOT which has only DC tie lines with the Eastern Interconnection and has minimal interchange.</p> <p>(4) R3: Suggest to add adjacent Transmission Operator and Purchasing-Selling Entity (the latter needed for meeting INT-004 requirements).</p> <p>Response: The SDT has included the following Part 3.5 of Requirement R3:</p> <p style="padding-left: 40px;">3.5 Adjacent Transmission Operators synchronously connected within the same Interconnection</p> <p>The applicability of COM-001 and COM-002 were revised to include the same reliability entities: RC, TOP, BA, DP and GOP. LSE, PSE and TSP were removed from the applicability of these standards per stakeholder suggestion.</p> <p>(5) The list of entities in R4 and R6 is different from those in R3 and R5. They should be the same for having Alternative Interpersonal Communication capability.</p> <p>Response: The RCSdT asserts the standard meets FERC Order 693 regarding DP and GOP entities by requiring these entities to have Interpersonal Communication capability. Additionally requiring DP and GOP entities to have Alternative Interpersonal Communication capability only imposes more cost on smaller DP and GOP entities that have little or no risk impact to the bulk electric system.</p> <p>(6) R5: Suggest to add adjacent Balancing Authority as adjoining BAs need to communication with each to check schedules and other balancing information.</p> <p>Response: The SDT has included the following Part 5.6 of Requirement R5:</p> <p style="padding-left: 40px;">5.6 Adjacent Balancing Authorities</p> <p>Note that this is a defined term in the glossary: “A Balancing Authority Area that is interconnected (to) another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.”</p> <p>(7) There are a number of parts in Requirements R1 to R8 each of which must be complied with. However, the VSLs for R1 to R8 are binary which do not provide any distinction in partial failure of each of these requirements. We suggest the SDT to apply the VSL guideline and re-establish the various levels of violation</p>

Organization	Yes or No	Question 1 Comment
		severity for these requirements. Response: Each entity listed in Requirements R1-R8 is required to meet the contents with respect to each other entity listed in the requirement. Failure to have the capability with a single entity is a single violation of the requirement. For example, if an RC has 5 BA's within it Area and fails to have Interpersonal Communications with two of them, then the RC has violated the requirement twice. The VSLs are written to address each violation of the Requirement. We have removed the words "or more" from the VSLs.
Response: The RCSDT thanks you for your comment. Please see responses above.		
Bonneville Power Administration	Yes	
Xcel Energy	No	We feel that either the definitions, or the requirements, should make it clear whether data is included.
Response: The RCSDT thanks you for your comment. The SDT has made modifications to attempt to make this as clear as possible.		

2. The RCSDT believes that the requirements of TOP-001-1 obviate the need to develop additional requirements to address Xcel’s comment. Do you agree? If not, please explain in the comment area below.

Summary Consideration:

The original justification that the RCSDT posited for not adding a requirement to directly address Xcel Energy’s comments in paragraph 516 and FERC’s related recommendation in paragraph 523 was that TOP-001-1 R3 was considered to address this concern. Since that time, the RTO SDT has proposed to retire TOP-001-1 R3. However, FERC has since retired IRO-004-1 R3 and R5 along with IRO-005-3 R5. Because these are retired, there are no longer any requirements that would force a TOP to wait for a delayed RC response during an emergency, therefore the question is resolved, albeit differently than it was proposed to be resolved in this posting. If an RC were to give a Reliability Directive to a TOP that the TOP considered “would violate safety, equipment, regulatory, or statutory requirements,” the TOP may respond to the RC that it cannot comply.

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	If the requirement were going to remain, but the Project 2007-03 Real-Time Operations SDT proposed to retire that requirement during their last posting. There needs to be better coordination with that SDT.
<p>Response: The RCSDT thanks you for your comment. The RTO SDT proposes to retire TOP-001-1 R3. However, since NERC has retired IRO-004-1 R3 and R5 along with IRO-005-3 R5 , there are no longer any requirements that would force a TOP to wait for a delayed RC response during an emergency, therefore the question is resolved, albeit differently than it was proposed to be resolved in this posting. If an RC were to give a Reliability Directive to a TOP that the TOP considered “would violate safety, equipment, regulatory, or statutory requirement,” the TOP may respond to the RC that it cannot comply.</p>		
Bonneville Power Administration	Yes	
PPL	Yes	
Dominion	Yes	
SERC OC Standards Review Group	No	Top-001-1, Requirement R3, which is what the SDT appears to be using as its justification for not adding a requirement here is proposed to be deleted by the RTO-SDT on Project 2007-03.
<p>Response: The SDT thanks you for your comment. The RTO SDT proposes to retire TOP-001-1 R3. FirstEnergy	Yes	
Midwest ISO Standards Collaborators	No	It might if the requirement were going to remain but the Project 2007-03 Real-Time Operations SDT proposed to retire that requirement during their last posting. This needs to be coordinated with that SDT.
<p>Response: The SDT thanks you for your comment. The RTO SDT proposes to retire TOP-001-1 R3. However, since NERC has retired IRO-004-1 R3 and R5 along with IRO-005-3 R5 , there are no longer any requirements that would force a TOP to wait for a delayed RC response during an emergency, therefore the question is resolved, albeit differently than it was proposed to be resolved in this posting. If an RC were to give a Reliability Directive to a TOP that the TOP considered “would violate safety, equipment, regulatory, or statutory requirement,” the TOP may respond to the RC that it cannot comply.</p>		
SPP Standards Development	Yes	In fact, we believe that R1, R2 and R5 more specifically put that requirement on the TOP. The TOP doesn't have to wait for the RC and any directive that may be associated with R3 prior to taking action to mitigate an emergency condition.
<p>Response: The SDT thanks you for your comment.</p>		

Consideration of Comments on Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 2 Comment
Kansas City Power & Light	Yes	
Exelon	Yes	
PacifiCorp	Yes	
Arizona Public Service Company	Yes	
Southern Company	No	<p>Comments: I see no connection between XCEL's comment on COM-001-1. The requirements of COM-001-1 require the RCs, TOPs, and BAs to have a primary interpersonal communications method and to designate an alternative. I believe that if the requirements for the entity to have both primary and alternative methods of interpersonal communications this objection could be cleared. For example, R2 Each Reliability Coordinator shall designate have an Alternative Interpersonal Communications capability with the following entities to exchange Interconnection and operating information</p>
<p>Response: Thank you for your comment. We agree that there is no connection between Xcel's concern and COM-001-1.</p>		
Green Country Energy, Green Country Operating Services		No Comment
Manitoba Hydro	Yes	
NextEra Energy, Inc.	No	<p>As stated in response to number 1, Reliability Standards are to be clear and complete. If a Transmission Operator is not responsible for a delay caused by a Reliability Coordinator, the Standard should specifically state that the Transmission Operator does not need to wait for an assessment or approval of a Reliability Coordinator to take actions pursuant to TOP-001-1 R3. Since the Reliability Coordinator is atop the reliability hierarchy, such a statement provides clarity and completeness to understanding a Transmission Operators rights. Thus, TOP-001-1 R3 should be revised to lead with: "Without any obligation to first seek and obtain an assessment or approval from its Reliability Coordinator, each Transmission Operator"</p>
<p>Response: The SDT thanks you for your comment. The RTO SDT proposes to retire TOP-001-1 R3. However, since NERC has retired IRO-004-1 R3 and R5 along with IRO-005-3 R5 , there are no longer any requirements that would force a TOP to wait for a delayed RC response during an emergency, therefore the question is resolved, albeit differently than it was proposed to be resolved in this posting. If an RC were to give a Reliability Directive to a TOP that the TOP considered "would violate safety, equipment, regulatory, or statutory requirement," the TOP may respond to the RC that it cannot comply.</p>

Organization	Yes or No	Question 2 Comment
Xcel Energy	No	<p>We are concerned that the drafting team may not have understood Xcel Energy’s comments and FERC’s directive in Order 693. FERC had asked that NERC consider Xcel Energy’s suggestion. This consideration does not necessarily equate to the development of additional requirements, however that may be the solution. We recognize that R1 and R2 of TOP-001-1 give the TOP authority to take immediate actions necessary to alleviate operating emergencies. We were concerned with the potential situation where the RC’s directive (R3 of IRO-001-2) may conflict with actions the TOP has ALREADY taken. In this situation, we do not feel the TOP should be held at fault for the actions it took prior to the RC’s directive. (R3 of IRO-001-2 is currently in effect under TOP-001-1 R3.) Additionally, R1 and R2 of TOP-001-1 have been removed from the latest draft of version 2. So, if TOP-001-2 and IRO-001-2 are approved as drafted, it would appear that all rights and protections of the TOP to take immediate actions will be removed and our initial issue, as detailed in Order 693, still exists.</p>
<p>Response: The SDT thanks you for your comment. The RTO SDT proposes to retire TOP-001-1 R3. However, since NERC has retired IRO-004-1 R3 and R5 along with IRO-005-3 R5 , there are no longer any requirements that would force a TOP to wait for a delayed RC response during an emergency, therefore the question is resolved, albeit differently than it was proposed to be resolved in this posting. If an RC were to give a Reliability Directive to a TOP that the TOP considered “would violate safety, equipment, regulatory, or statutory requirement,” the TOP may respond to the RC that it cannot comply.</p> <p>The SDT appreciates this clarification by Xcel Energy. At any time in the future, Reliability Directives may be received that, based on the best available information at the time, change or reverse operating actions taken in the past, even the immediate past. The TOP is not held at fault for past actions that it took to protect the BES by any current or proposed NERC requirements. As written in TOP-001-2 R1, R3 and R4 as proposed by the RTO SDT, the TOP is not prevented from acting or telling the RC that for specific safety, equipment, regulatory or statutory reasons, it cannot comply.</p>		

3. Do you agree with the revision to IRO-001, R1 for certifying Reliability Coordinators? If not, please explain in the comment area below.

Summary Consideration: Stakeholders were asked if they agree with the revision to IRO-001, R1 for certifying Reliability Coordinators. Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.

Organization	Yes or No	Question 3 Comment
ERCOT ISO	No	<p>The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be.</p> <p>The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator.</p> <p>In R2, should “of” be “to”? Reliability Directives are issued to TOPs, BA, etc.</p> <p>The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.</p>
ISO New England	No	<p>The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be.</p> <p>The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator.</p> <p>In R2, should “of” be “to”? Reliability Directives are issued to TOPs, BA, etc.</p> <p>The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.</p>
IRC Standards Review Committee	No	<p>The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be.</p> <p>The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator.</p> <p>In R2, should “of” be “to”? Organization	Yes or No	Question 3 Comment
Northeast Power Coordinating Council	No	<p>The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect what the enforceability of the standards are meant to be.</p> <p>Response: Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES are covered under a Reliability Coordinator.</p> <p>Response: R1 has been removed from the standard based on stakeholder comments.</p> <p>In R2, should “of” be “to”? Reliability Directives are issued to TOPs, BA, etc.</p> <p>Response: The requirement was rewritten for clarity as follows:</p> <p style="padding-left: 40px;">R2. Each Reliability Coordinator shall take actions or direct actions (which could include issuing Reliability Directives) by Transmission Operators, Balancing Authorities, Generator Operators, and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts.</p> <p>The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.</p> <p>Response: R1 has been removed from the standard based on stakeholder comments.</p>
Response: The RCSDT thanks you for your comment.		
Bonneville Power Administration	Yes	
PPL	Yes	
SERC OC Standards Review Group	No	<p>We think you are attempting to create a requirement similar to BAL-005, R1. That language copied here is clear and concise - All generation, transmission, and load operating within an Interconnection must be included within the metered boundaries of a Balancing Authority Area.</p>
Response: The RCSDT thanks you for your comment. Many commenters suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.		
MRO's NERC Standards Review	No	<p>A. R1, As written it is unclear what level of certification this will entail? Presently written within the NERC Reliability Standards, responsibility is given to RC's to manage the reliability of their areas. Recommend</p>

Organization	Yes or No	Question 3 Comment
Subcommittee		<p>deleting this requirement. The ERO has pushed back in other Standards to having a responsibility for any NERC Requirements, since they are not a user, owner, or operator of the BES (see EOP-004-2).</p> <p>Response: Many commenters also suggested removing the requirement because it is addressed in the NERC Rules of Procedure. The RCSDT concurs and has removed R1 from IRO-001-2.</p> <p>If this does move forward and an RC is certified by the ERO and then the RC is found non-compliant by a Regional Entity, for an associated certified item, will the ERO be held responsible, too?</p> <p>Response: The RCSDT has removed R1 from IRO-001-2.</p> <p>If the SDT selects to keep R1, there are some issues with how the requirement is written. The requirement places emphasis on regions and regional boundaries when no emphasis should be placed there. There are multiple Reliability Coordinators the span multiple regions.</p> <p>Response: The RCSDT has removed R1 from IRO-001-2.</p> <p>The language “to continuously assess transmission reliability” should be changed to “to continuously assess Bulk Electric System reliability” to reflect on what the standards are enforceable.</p> <p>The requirement on the ERO should also be expanded similar to BAL-005-0.1b R1 to ensure that all operating entities and the entire BES is covered under a Reliability Coordinator.</p> <p>B. In R2, should “of” be “to”. Reliability Directives are issued to TOPs, BA, etc.</p> <p>C. The VSL for R1 is not consistent with the requirement. The requirement applies to the ERO but the VSL applies to the Regional Entity.</p> <p>Response: Please see the response to the comments from NPCC above on these same topics..</p>
<p>Response: The RCSDT thanks you for your comment.</p>		
FirstEnergy	Yes	
Midwest ISO Standards Collaborators	No	<p>In general, we are not opposed to the concept of the ERO certifying the Reliability Coordinators; however, there are some issues with how the requirement is written.</p> <p>Response: Thank you.</p> <p>The requirement places emphasis on regions and regional boundaries when no emphasis should be placed</p>

Organization	Yes or No	Question 3 Comment
		<p>there. 6. Do you have any other comment, not expressed in questions above, for the RC SDT?

Summary Consideration:

The RCSDT received comments suggesting clarification of COM-002-3. The RCSDT intends the communication of Reliability Directives to be person-to-person and in such a manner that the Reliability Directive is understood and not necessarily repeated verbatim. COM-002-3 is not intended to be prescriptive on how the Reliability Directive is issued. Spoken or written communications are valid methods (i.e. using the telephone, radio, electronic texting, email, etc.). The purpose of COM-002-3 is to ensure emergency communications between operating personnel are effective. There is no proxy requirement for 24/7 operating personnel regarding small entities. Only “capability” as provided for in COM-001-2 is applicable. The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation. As envisioned, communications protocols would be addressed in the COM-003 standard being developed in Project 2007-02.

Some commenters suggested revisions to IRO-014, requirement R8 to conform to similar requirements R6 and R7. The RCSDT made the suggested revision by re-ordering R8:

R8. During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements. [Violation Risk Factor: High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]

IRO-014-2, requirement R4 is applicable to those Reliability Coordinators engaged in activities related to requirement R1 and part 1.7, it is unlikely that Reliability Coordinators geographically and electrically distant from one another will have mutually agreed upon operating procedures (per requirement R1), and therefore requirement R4 would not be applicable. The RCSDT believes IRO-014-2, requirement R4 which requires weekly communication provides reasonable contact and flexibility – and this requirement is in effect today. The RCSDT coordinated the use of the NERC Glossary term “Adverse Reliability Impact” with the Real-Time Operations team and continues the practice of informing all RCs of Adverse Reliability Impacts in requirement R5. The RCSDT has revised IRO-014-2, requirements R6-R8 to clarify that when one RC identified a problem and presents an action plan for another RC, the second RC is obligated to implement the action plan. The RCSDT will forward the concern about RC's identifying themselves and the receiver to establish authority to the Project 2007-02, Operating Personnel Communications Protocols SDT. The Project 2007-02 team is developing a standard that includes requirements for use of specific communications protocols.

Organization	Yes or No	Question 6 Comment
Northeast Power Coordinating		The SDT did not address all concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be

Organization	Yes or No	Question 6 Comment
Council		<p>confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving as the Transmission Operator or Balancing Authority. It should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, standards should be made clear that the Reliability Directive is directed to another company. In place of requiring an operator, in real-time, to state “this is a Reliability Directive,” there should be an allowance for an entity to develop procedures indicating, in advance, their expectations for three-part communications to their sub-operating entities.</p> <p>Therefore, we suggest modifying R1 to be</p> <p>“When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action, either verbally, when the communication is issued, or in advance through documented procedures, as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time.]”</p> <p>Response: COM-002 does not preclude text or other forms of communication for issuing Reliability Directives. However, entities still must comply with the requirements of COM-002. Further, the RCSDT believes it to be equally imperative that each NERC registered function hold the authority to issue Reliability Directives, and the ability to receive Reliability Directives, whether those Reliability Directives are issued to subordinate registered functions within a vertically integrated utility, or to registered entities that are corporately separate. The RCSDT believes the following response to draft 3 comments still holds true:</p> <p style="padding-left: 40px;">“The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Face-to-face communication of Reliability Directives are subject to the requirements of COM-002 and can be measured for COM-002 by allowing Operator Logs as possible evidence to support compliance”.</p> <p>The use of operator logs to memorialize and provide evidence of compliance is directly specific to those Reliability Directives issued and received within the same control room or operations center. The RCSDT believes that any Registered Entity or person operating as such must understand the intent of the issued Reliability Directive, and that the issuer of the Reliability Directive believe that the Reliability Directive was correctly received. COM-002 should not be construed to mean that an individual serving in two functions be</p>

Organization	Yes or No	Question 6 Comment
		<p>required to issue a Reliability Directive to himself, but rather it is expected that such an individual would appropriately address the reliability issues as required by the function they are serving and its subsequent responsibilities.</p> <p>Also, the definition of Emergency as currently cited in these draft Standards and included in the existing NERC Glossary should be modified to include the NERC Glossary term Adverse Reliability Impact to make the Standards more crisp, clear and enforceable. Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team.</p> <p>Response: With respect to the suggestion of modifying the definition of Emergency. The RCSDT believes that the term Emergency relates to the actual state of the system, including local and wide area, while an Adverse Reliability Impact is the impact resulting from an event resulting in instability or cascading that affects a widespread area of an Interconnection. There could be an Emergency that is local, or that threatens equipment but which does not necessarily result in cascading or instability; it is in this regard that the RCSDT believes that the definition of Emergency should not be dependent upon or pertain only to Adverse Reliability Impact events. The RCSDT coordinated the use of Adverse Reliability Impacts with the Real-Time Operations team.</p> <p>There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation that indicates requirements are being move to this standard. Delete the text box.</p> <p>Response: We have deleted the text box.</p> <p>Strike IRO-014-2 Part 1.7. There is no need to have a weekly conference to discuss every Operating Procedure, Operating Process and Operating Plan. As this requirement is written, a conference call would be necessary for each. Furthermore, IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update.</p> <p>Response: The intent of R1 is for Reliability Coordinators to coordinate specific activities with other impacted Reliability Coordinators. These activities are listed as sub requirements. R1.7 requires you to have a procedure relating to weekly conference calls while R4 requires participation in weekly calls. Further, the RCSDT believes that it is prudent that Reliability Coordinators talk at least once a week to verify viability of mutual plans, procedures or processes.</p> <p>With respect to the relation of IRO-14-2 R1.7 and R4. R1.7 is requires you to have a procedure relating to</p>

Organization	Yes or No	Question 6 Comment
		<p>weekly conference calls while R4 requires participation in weekly calls.</p> <p>Requirement R2 in IRO-001 contains the words “which could include issuing Reliability Directives”, but Reliability Directives are not referenced anywhere else in the standard. This inclusion seems unnecessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. These words should be removed. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary.</p> <p>Response: R2 requires the Reliability Coordinator to act. These actions could include Reliability Directives in the case of an Emergency; however, issuing Reliability Directives might not always be necessary, as the Reliability Coordinator may be acting proactively well in advance of an emergency. R2 promotes this proactive approach, but reserves the use of Reliability Directives for circumstances that require its use.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
PPL		<p>We are providing the following comments for the Standards Drafting Team to consider.</p> <p>1) Consider changing R1 to ‘Each RC shall have the capability for Interpersonal Communications with the following entities to exchange Interconnection and operating information...’ for clarity as Interpersonal Communications and capability are both nouns.</p> <p>Response: Thank you for your suggestion to modify the sentence structure into a noun phrase, however the RCSDT believes the current form is unambiguous.</p> <p>2) We feel changing the applicability of the standard is important to the accuracy of the standard. The purpose of COM-002 is ‘To ensure emergency communications between operating personnel are effective’. Since operating personnel are covered by the applicability of RC, BA, TOP and GOP, we suggest the applicability to TSP, LSE, and PSE be removed from COM-002-3.</p> <p>Response: We agree and have removed those entities</p> <p>3) Additionally, we would like to bring to the attention of the Standards Drafting Team, that the implementation plan for COM-001-2 and IRO-001-2 still includes TSP, LSE, and PSE although the revised standard does not include these entities in the Applicability Section. For COM-001-2 refer to the implementation plan, page 1. For IRO-001-2 refer to the implementation plan for new R2, new R3, new R4</p>

Organization	Yes or No	Question 6 Comment
		<p>and the chart on the last page. Thank you for your consideration in addressing these comments.</p> <p>Response: The RCSDT has revised the applicability of COM-001, COM-002 and IRO-001 to align with each other. TSP, LSE and PSE are no longer in either standard.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
PSEG		<p>IRO COM-002-3 standard continues to include PSE. PSE's do not play an active role and have no authority or ability to perform reliability coordination. PSE's should be removed from the standard.-001-2 references PSE's in the implementation for R2, R3, R4 and "Functions that must comply with the requirements in this standard" table. PSE's were removed from the standard and should be removed from the implementation plan.</p>
<p>Response: The RCSDT thanks you for your comments. The RCSDT has revised the applicability of COM-001 and COM-002 to align with each other. TSP, LSE and PSE are no longer in either standard.</p>		
Dominion		<p>We do not agree with the addition of weekly conference calls as required in R4. We believe that RCs should schedule calls as needed but do not agree that a weekly scheduled call improves reliability.</p>
<p>Response: The RCSDT thanks you for your comments. The requirement for weekly conference calls exists in IRO-015-1. The RCSDT has revised the requirement and incorporated it into proposed IRO-014-2.</p> <p>R2. The Reliability Coordinator shall participate in agreed upon conference calls and other communication forums with adjacent Reliability Coordinators.</p> <p>R2.1. The frequency of these conference calls shall be agreed upon by all involved Reliability Coordinators and shall be at least weekly.</p>		
SERC OC Standards Review Group		<p>Reliability Directives may be issued by blast calls from Reliability Coordinators. It is inefficient and may be a hindrance to reliability to require 3-part communications in these instances.</p> <p>Response: The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. However the essence of accurately implementing Reliability Directives is accomplished by use of 3-part communications. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation.</p> <p>There are several organizations registered as BAs, RCs and TOPs. It is not uncommon for those entities to be distributed across multiple desks in the same control room without regard to how an entity is registered.</p>

Organization	Yes or No	Question 6 Comment
		<p>Thus, a single System Operator may perform functions that are categorized under two or more of those functional entities. The drafting team should clarify that under no circumstances should that System Operator be required to issue a Reliability Directive to himself. This is a corporate governance issue.</p> <p>Response: COM-002 does not preclude text or other forms of communication for issuing Reliability Directives. However, entities still must comply with the requirements of COM-002. Further, the RCSDT believes it to be equally imperative that each NERC registered function hold the authority to issue Reliability Directives, and the ability to receive Reliability Directives, whether those Reliability Directives are issued to subordinate registered functions within a vertically integrated utility, or to registered entities that are corporately separate. The RCSDT believes the following response to draft 3 comments still holds true:</p> <p style="padding-left: 40px;">“The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Face-to-face communication of Reliability Directives are subject to the requirements of COM-002 and can be measured for COM-002 by allowing Operator Logs as possible evidence to support compliance”.</p> <p>The use of operator logs to memorialize and provide evidence of compliance is directly specific to those Reliability Directives issued and received within the same control room or operations center. The RCSDT believes that any Registered Entity or person operating as such must understand the intent of the issued Reliability Directive, and that the issuer of the Reliability Directive believe that the Reliability Directive was correctly received. COM-002 should not be construed to mean that an individual serving in two functions be required to issue a Reliability Directive to himself, but rather it is expected that such an individual would appropriately address the reliability issues as required by the function they are serving and its subsequent responsibilities.</p> <p>In IRO-014, R1, delete sub-requirement 1.7. The requirement for weekly conference calls related to operating procedures is duplicative to R4 and could be burdensome while adding very little value under certain circumstances. In IRO-014, R4, delete the phrase “(per Requirement 1, Part 1.7)” as a conforming change.</p> <p>Response: The intent of R1 is for Reliability Coordinators to coordinate specific activities with other impacted Reliability Coordinators. These activities are listed as sub requirements. R1.7 requires you to have a procedure relating to weekly conference calls while R4 requires participation in weekly calls. Further, the RCSDT believes that it is prudent that Reliability Coordinators talk at least once a week to verify viability of mutual plans, procedures or processes.</p> <p>In IRO-014, Requirements R6-R8 allow at least the theoretical possibility that an RC may determine an Adverse Reliability Impact in another RC’s area that the other RC neither can see nor believes that any</p>

Organization	Yes or No	Question 6 Comment
		<p>action should be taken. R7 puts the burden on the first RC to develop a plan that it cannot implement because it has no agreement with the BAs and TOPs in the other RC area. As such, this requirement is unenforceable.</p> <p>Response: Requirements R6-R8 are translated from IRO-016-1, Requirement R1. If an RC sees a problem and another does not see the same problem, then there may be an issue with someone's model or processes or procedures. The RC's are supposed to have coordinated Operating Plans, Processes or Procedures to operate reliably. R6-R8 are only applicable if one of the two (or more) RCs do not see that a problem exists. It would be a detriment to reliability for both RCs to take no action. RCs are required to coordinate actions under existing IRO-016-1, R1. If one RC identifies a problem and provides an action plan to another RC to mitigate the problem, the second RC is obligated under R8 to implement it. We have revised the R8 to clarify this intent. R8. During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements.</p> <p>IRO-014-2, Revised R8. During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements.</p> <p>Please review all the implementation plans to be sure the applicable entities match those in the standards.</p> <p>Response: These have been updated.</p> <p>"The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
<p>IRC Standards Review Committee</p>		<p>The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to</p>

Organization	Yes or No	Question 6 Comment
		<p>their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company.</p> <p>Response: COM-002 does not preclude text or other forms of communication for issuing Reliability Directives. However, entities still must comply with the requirements of COM-002. Further, the RCSDT believes it to be equally imperative that each NERC registered function hold the authority to issue Reliability Directives, and the ability to receive Reliability Directives, whether those Reliability Directives are issued to subordinate registered functions within a vertically integrated utility, or to registered entities that are corporately separate. The RCSDT believes the following response to draft 3 comments still holds true:</p> <p style="padding-left: 40px;">“The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Face-to-face communication of Reliability Directives are subject to the requirements of COM-002 and can be measured for COM-002 by allowing Operator Logs as possible evidence to support compliance”.</p> <p>The use of operator logs to memorialize and provide evidence of compliance is directly specific to those Reliability Directives issued and received within the same control room or operations center. The RCSDT believes that any Registered Entity or person operating as such must understand the intent of the issued Reliability Directive, and that the issuer of the Reliability Directive believe that the Reliability Directive was correctly received. COM-002 should not be construed to mean that an individual serving in two functions be required to issue a Reliability Directive to himself, but rather it is expected that such an individual would appropriately address the reliability issues as required by the function they are serving and its subsequent responsibilities.</p> <p>We believe that, in place of requiring an operator, in real-time, to state “this is a Reliability Directive,” there should be an allowance for an entity to develop procedures indicating, in advance, their expectations of three-part to their sub-operating entities. Therefore, we suggest modifying R1 to be</p> <p>“When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action, either verbally, when the communication is issued, or in advance through documented procedures, as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time.]”</p> <p>Response: In regards to your suggested modification of R1 to include “or in advance through documented</p>

Organization	Yes or No	Question 6 Comment
		<p>procedures”, the intent of R1 in its current form is to provide that ability, as such any documented procedure would require stating such implemented action is considered a response to a Reliability Directive. And would follow acknowledge and confirmation requirements.</p> <p>Also, we believe that the definition of Emergency, as currently cited in these draft Standards and included in the existing NERC Glossary should be modified to include the NERC Glossary term Adverse Reliability Impact to make the Standards more crisp, clear and enforceable. Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team.</p> <p>Response: The RCSDT believes that the term Emergency relates to the actual state of the system, including local and wide area, while an Adverse Reliability Impact is the impact resulting from an event resulting in instability or cascading that affects a widespread area of an Interconnection. There could be an Emergency that is local, or that threatens equipment but which does not necessarily result in cascading or instability; it is in this regard that the RCSDT believes that the definition of Emergency should not be dependent upon or pertain only to Adverse Reliability Impact events. The RCSDT coordinated the use of Adverse Reliability Impacts with the Real-Time Operations team.</p> <p>There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard.</p> <p>Response: The text box was removed.</p> <p>Please delete the text box. IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update.</p> <p>Response: The intent of R1 is for Reliability Coordinators to coordinate specific activities with other impacted Reliability Coordinators, these activities are listed as sub requirements. Further the RCSDT believes that it is prudent that Reliability Coordinators talk at least once a week to verify viability of mutual plans, procedures or processes. The relation of IRO-14-2 R1.7 to R4 is that R1.7 requires having a conference call, R4 requires participation by all impacted Reliability Coordinators, as such, neither replaces the other.</p> <p>In the definition of Reliability Directive, we suggest changing “to address an Emergency” to “to address a reliability constraint or a declared Emergency”. The RCSDT believes that reliability constraint is ambiguous and undefined, thus introducing confusion. Further modifying Reliability Directive by including “declared Emergency” would add unnecessary step in mitigation of the Emergency</p>

Organization	Yes or No	Question 6 Comment
		<p>Further, Requirement R2 in IRO-001 contains the words “which could include issuing Reliability Directives” but Reliability Directives are not referenced anywhere else in the standard. This inclusion seems unnecessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. We suggest that these words be removed. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary.</p> <p>Response: R2 requires the Reliability Coordinator to act, these actions could in include Reliability Directives in the case of an Emergency, however issuing Reliability Directives it might not always be necessary, as the Reliability Coordinator may be acting pro-active well in advance of an emergency. R2 promotes this pro-active approach, but reserves the use of Reliability Directives for circumstances that require its use.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
<p>Midwest ISO Standards Collaborators</p>		<p>The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company.</p> <p>Response: COM-002 does not preclude text or other forms of communication for issuing Reliability Directives. However, entities still must comply with the requirements of COM-002. Further, the RCSDT believes it to be equally imperative that each NERC registered function hold the authority to issue Reliability Directives, and the ability to receive Reliability Directives, whether those Reliability Directives are issued to subordinate registered functions within a vertically integrated utility, or to registered entities that are corporately separate. The RCSDT believes the following response to draft 3 comments still holds true:</p> <p>“The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Face-to-face communication of Reliability Directives are subject to the requirements of COM-</p>

Organization	Yes or No	Question 6 Comment
		<p>002 and can be measured for COM-002 by allowing Operator Logs as possible evidence to support compliance”.</p> <p>The use of operator logs to memorialize and provide evidence of compliance is directly specific to those Reliability Directives issued and received within the same control room or operations center. The RCS DT believes that any Registered Entity or person operating as such must understand the intent of the issued Reliability Directive, and that the issuer of the Reliability Directive believe that the Reliability Directive was correctly received. COM-002 should not be construed to mean that an individual serving in two functions be required to issue a Reliability Directive to himself, but rather it is expected that such an individual would appropriately address the reliability issues as required by the function they are serving and its subsequent responsibilities.</p> <p>We also are concerned about the need to conduct three-part communications for a Reliability Directive issued through a blast call. Under these circumstances, the need for immediate action of multiple parties may require a blast call and there may not be time for all parties to complete three-part communications before initiating actions. Thus, we believe blast calls should be treated separately and that should be made clear.</p> <p>Response: The RCS DT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. However the essence of accurately implementing Reliability Directives is accomplished by use of 3-part communications. The RCS DT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation.</p> <p>COM-002-3 R2 needs to be rewritten as it is too verbose. The point is for the recipient of the original message to get the issuer to confirm that the message was understood. We suggest rewording R2 to “Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive.” Once the receiver has completed this requirement, the ball is in the issuer’s court per Requirement R3. No additional words are necessary in the requirement.</p> <p>Response: The RCS DT believes that the additional verbiage is necessary to ensure that an entity understands the Reliability Directive and is able to communicate that understanding back to the Reliability</p>

Organization	Yes or No	Question 6 Comment
		<p>Coordinator. It is not necessary to repeat the exact same verbiage of the Reliability Directive, but rather the intent of the actions required. Having to repeat verbiage of the Reliability Directive word-for-word could be an impediment to achieving the reliability intent of the Reliability Directive when the focus is on repeating verbatim.</p> <p>Per COM-002-3 R1, who decides that actions need to be issued as a Reliability Directive? Shouldn't it be the responsible entity? Thus, can we assume that if the responsible entity does not identify a communication as a Reliability Directive that it is not a Reliability Directive per the requirement? After all, why would an entity require actions but not issue a Reliability Directive. Following this logic, the VSL for R1 would never apply. Would a compliance auditor second guess if an action required a Reliability Directive?</p> <p>Response: Those orders issued as a Reliability Directive, and identified as such, will heighten awareness, tighten communications and require the receiver of the Reliability Directive to prioritize its response. Moreover, linking Reliability Directives to Emergencies establishes that normal non-Emergency operating communications or actions are not applicable to COM-002.</p> <p>Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team.</p> <p>Response: The RCSDT coordinated the use of Adverse Reliability Impacts with the Real-Time Operations team</p> <p>There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box.</p> <p>Response: The text box has been removed.</p> <p>Please strike part IRO-014-2 Part 1.7. There is no need to have a weekly conference to discuss every Operating Procedure, Operating Process and Operating Plan. As this requirement is written, a conference call would be necessary for each. Furthermore, IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update.</p> <p>Response: The intent of R1 is for Reliability Coordinators to coordinate specific activities with other impacted</p>

Organization	Yes or No	Question 6 Comment
		<p>Reliability Coordinators, these activities are listed as sub requirements. R1.7 is requires you to have a procedure relating to weekly conference calls while R4 requires participation in weekly calls. Further the RCSDT believes that it is prudent that Reliability Coordinators talk at least once a week to verify viability of mutual plans, procedures or processes.</p> <p>IRO-014-2 R4 is overly broad and would require Reliability Coordinators that will not impact one another to participate on conference calls with one another without any reliability benefit. The issue is created by the addition of the clause “within the same Interconnection” to the requirement. ISO-NE, FRCC, Midwest ISO, and SPP are all in the same Interconnection. It is hard to fathom there being reliability benefit to SPP and ISO-NE conversing weekly or Midwest ISO and FRCC conversing weekly. We suggest limiting the requirement to adjacent Reliability Coordinators.</p> <p>Response: IRO-14-2 R4 is applicable to those Reliability Coordinators engaged in activities related to R1 and subsequently R1.7, it is unlikely that Reliability Coordinators whom are geographically and electrically distant will have <i>mutually agreed upon</i> operating procedures (per R1), and as such they are not applicable to R4.</p> <p>For IRO-014-2 R5, we suggest replacing “other” with “impacted” to limit the notification of Adverse Reliability Impacts to only those Reliability Coordinators that need to know. Because the definition of Adverse Reliability Impact includes “Bulk Electric System instability or Cascading”, it is possible that the cascading of 138 kV lines serving a load pocket or generator outlet stability issues could require a Reliability Coordinator to notify all other Reliability Coordinators regardless of impact. This would include Reliability Coordinators outside of the Interconnection with the problem. It would also include Reliability Coordinators that are not impacted. For instance, an issue in New England that would not pose a threat outside the northeast would require ISO-NE to notify SPP and FRCC and Reliability Coordinators in the Western Interconnection. There is no reliability benefit to this notification.</p> <p>Response: This requirement continues the current practice of informing all RCs of ARIs. Due to the nature of an ARI, this requirement is typically implemented as an RCIS message or a hotline call to all RC’s. This is intended to make all RCs aware of ARIs and support situational awareness.</p> <p>IRO-014-2 R6-R8 are problematic and need to be refined to make clear that the Reliability Coordinators shall operate to the most conservative limit. It should not require a Reliability Coordinator that disagrees with an action plan to implement the action plan. The Reliability Coordinator will be disagreeing with the action plan for reliability reasons. Assuming they are correct, the requirement to implement said action plan will actually put the Interconnection at greater risk. These requirements inappropriately attempt to codify the debate and analysis that occurs between and within Reliability Coordinators when there are differing results in reliability</p>

Organization	Yes or No	Question 6 Comment
		<p>analysis. This is part of the problem with having a Wide Area view that results in Reliability Coordinators having a view into other Reliability Coordinator Areas. Their results and conclusions may be different. There should be a hierarchical structure for whose results should be used. It should be the Reliability Coordinator with primary responsibility unless the other Reliability Coordinator has evidence to demonstrate that the Reliability Coordinator with primary responsibility is incorrect. What this should do is to trigger both to review their models and data to assess the problem. None of this needs to be codified in the standards though.</p> <p>Response: Requirements R6-R8 are translated from IRO-016-1, Requirement R1. If an RC sees a problem and another does not see the same problem, then there may be an issue with someone's model or processes or procedures. The RC's are supposed to have coordinated Operating Plans, Processes or Procedures to operate reliably. R6-R8 are only applicable if one of the two (or more) RCs do not see that a problem exists. It would be a detriment to reliability for both RCs to take no action. RCs are required to coordinate actions under existing IRO-016-1, R1. If one RC identifies a problem and provides an action plan to another RC to mitigate the problem, the second RC is obligated under R8 to implement it. We have revised the R8 to clarify this intent.</p> <p>In the definition of Reliability Directive, we suggest changing "to address an Emergency" to "to address a declared Emergency". This would help limit second guessing for a situation where a System Operator took action because he truly believed he was an Emergency but after the fact analysis demonstrates there really was not an Emergency.</p> <p>Response: Modifying Reliability Directive by including "declared Emergency" would add an unnecessary step in mitigation of the Emergency. The act of issuing a Reliability Directive to address an Emergency (per the proposed definition) is sufficient.</p> <p>The drafting team should expand its rationale for deleting IRO-002-1 R3. Currently, TOP-005 R1 is referenced. The Real-Time Operations drafting team proposed to retire TOP-005-2 R1 in its most recent posting.</p> <p>Response: The data provisions are covered in recently approved IRO-010-1, R1-R3 which replaced TOP-005-1, R1. The secure network provisions are covered in the CIP body of standards.</p> <p>We disagree with deleting IRO-002-1 R5 and R7 which establish tools and monitoring capabilities. There should be basic tools requirements established for Reliability Coordinators. Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities will be addressing these issues in more detail. Thus, it does not make sense to delete these requirements until that drafting team completes its task.</p> <p>Response: Each RC has been certified to continue operations as an RC or been certified prior to beginning operations as an RC. The minimum set of tools and capabilities for an RC are "checked off" during the certification process. The reliability objective of R5 and R7 is to perform analyses to ensure reliability of the</p>

Organization	Yes or No	Question 6 Comment
		<p>BES by specifying capability rather than mandating specific tools. The analysis provisions of R5 and R7 are covered under IRO-008-1, Requirements R1 (perform Operational Planning Analysis) and R2 (perform Real-time Analysis). It is anticipated that Project 2009-02 team will address this issue more fully.</p>
<p>MRO's NERC Standards Review Subcommittee</p>		<p>A. COM-002-3, R2 As stated in FERC Order 693, section 512, it is essential that RCs, BA's and TOP's have communications with DPs. R2 also applies to TSPs, LSEs and PSEs. There is no directive for this and it is going to be almost impossible to communicate with a DP since DPs are usually not operated 24 hours per day as like a RC, TOP, or BA. Many DPs have answering services that will relay a message once they receive it and then pass it along to someone. An answering company could repeat the directive word for word but this will not add to any reliability level. The SDT should reconsider the applicability section of this Standard to only apply to a RC, TOP and BA for the issuance of a Reliability Directive. BA's should have the responsibility to have an Interpersonal Communication medium with DPs in their BA area per COM-001-2.</p> <p>Response: The purpose of COM-002 is "To ensure emergency communications between operating personnel are effective." It is not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a <u>method</u> of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical that they have a means of communication, in many cases this may be via a receptionist, or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.</p> <p>B. IRO-002-2, R1, Recommend that "System Operators" be replaced with "system operators" since NERC has defined System Operator to be an individual at a control center (BA, TOP, GOP, or RC). The lower cased system operator will only point to the RC system operator that will have this R1 authority.</p> <p>Response: IRO-002-2 is applicable only to Reliability Coordinators, as such the using System Operator as it defined by the NERC Glossary of terms is appropriate.</p> <p>C. The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity</p>

Organization	Yes or No	Question 6 Comment
		<p>coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company.</p> <p>Response: COM-002 does not preclude text or other forms of communication for issuing Reliability Directives. However, entities still must comply with the requirements of COM-002. Further, the RCSDT believes it to be equally imperative that each NERC registered function hold the authority to issue Reliability Directives, and the ability to receive Reliability Directives, whether those Reliability Directives are issued to subordinate registered functions within a vertically integrated utility, or to registered entities that are corporately separate. The RCSDT believes the following response to draft 3 comments still holds true:</p> <p style="padding-left: 40px;">“The way that COM-002 is crafted, it focuses on functional entity communication between and among functions. Face-to-face communication of Reliability Directives are subject to the requirements of COM-002 and can be measured for COM-002 by allowing Operator Logs as possible evidence to support compliance”.</p> <p>The use of operator logs to memorialize and provide evidence of compliance is directly specific to those Reliability Directives issued and received within the same control room or operations center. The RCSDT believes that any Registered Entity or person operating as such must understand the intent of the issued Reliability Directive, and that the issuer of the Reliability Directive believe that the Reliability Directive was correctly received. COM-002 should not be construed to mean that an individual serving in two functions be required to issue a Reliability Directive to himself, but rather it is expected that such an individual would appropriately address the reliability issues as required by the function they are serving and its subsequent responsibilities.</p> <p>D. We also are concerned about the need to conduct three-part communications for a Reliability Directive issued through a blast call. Under these circumstances, the need for immediate action of multiple parties may require a blast call and there may not be time for all parties to complete three-part communications before initiating actions. Thus, we believe blast calls should be treated separately and that should be made clear.</p> <p>Response: The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation.</p> <p>E. COM-002-3 R2 needs to be rewritten as it is too verbose. The point is for the recipient of the original message to get the issuer to confirm that the message was understood. We suggest rewording R2 to</p> <p>“Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient</p>

Organization	Yes or No	Question 6 Comment
		<p>of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive.”</p> <p>Once the receiver has completed this requirement, the ball is in the issuer’s court per Requirement R3. No additional words are necessary in the requirement.</p> <p>Response: The RCSDT believes that the additional verbiage is necessary to ensure that an entity understands the Reliability Directive and is able to communicate that understanding back to the Reliability Coordinator. It is not necessary to repeat the exact same verbiage of the Reliability Directive, but rather the intent of the actions required. Having to repeat verbiage of the Reliability Directive word-for-word could be an impediment to achieving the reliability intent of the Reliability Directive when the focus is on repeating verbatim.</p> <p>F. Per COM-002-3 R1, who decides that actions need to be issued as a Reliability Directive? Shouldn’t it be the responsible entity? Thus, can we assume that if the responsible entity does not identify a communication as a Reliability Directive that it is not a Reliability Directive per the requirement? After all, why would an entity require actions but not issue a Reliability Directive. Following this logic, the VSL for R1 would never apply. Would a compliance auditor second guess if an action required a Reliability Directive?</p> <p>Response: Those orders issued as a Reliability Directive, and identified as such, will heighten awareness, tighten communications and require the receiver of the Reliability Directive to prioritize its response. Moreover, linking Reliability Directives to Emergencies establishes that normal non-Emergency operating communications or actions are not applicable to COM-002.</p> <p>G. Because the Project 2007-03 (“Real-Time Operations SDT”) proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team.</p> <p>Response: The RCSDT coordinated the use of Adverse Reliability Impacts with the Real-Time Operations team</p> <p>H. There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box.</p> <p>Response: The text box has been removed.</p> <p>I. Please strike part IRO-014-2 Part 1.7. There is no need to have a weekly conference to discuss every Operating Procedure, Operating Process and Operating Plan. As this requirement is written, a conference call would be necessary for each. Furthermore, IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures,</p>

Organization	Yes or No	Question 6 Comment
		<p>Processes and Plans likely will not need to be discussed weekly as it only requires an annual update.</p> <p>Response: The intent of R1 is for Reliability Coordinators to coordinate specific activities with other impacted Reliability Coordinators, these activities are listed as sub requirements. R1.7 is requires you to have a procedure relating to weekly conference calls while R4 requires participation in weekly calls. Further the RCSDT believes that it is prudent that Reliability Coordinators talk at least once a week to verify viability of mutual plans, procedures or processes.</p> <p>J. IRO-014-2 R4 is overly broad and would require Reliability Coordinators that will not impact one another to participate on conference calls with one another without any reliability benefit. Organization	Yes or No	Question 6 Comment
		<p>having a view into other Reliability Coordinator Area. Their results and conclusions may be different. There should be a hierarchical structure for whose results should be used. It should be the Reliability Coordinator with primary responsibility unless the other Reliability Coordinator has evidence to demonstrate that the Reliability Coordinator with primary responsibility is incorrect. What this should do is, to trigger both to review their models and data to assess the problem. None of this needs to be codified in the standards though.</p> <p>Response: Requirements R6-R8 are translated from IRO-016-1, Requirement R1. If an RC sees a problem and another does not see the same problem, then there may be an issue with someone’s model or processes or procedures. The RC’s are supposed to have coordinated Operating Plans, Processes or Procedures to operate reliably. R6-R8 are only applicable if one of the two (or more) RCs do not see that a problem exists. It would be a detriment to reliability for both RCs to take no action. RCs are required to coordinate actions under existing IRO-016-1, R1. If one RC identifies a problem and provides an action plan to another RC to mitigate the problem, the second RC is obligated under R8 to implement it. We have revised the R8 to clarify this intent.</p> <p>M. In the definition of Reliability Directive, we suggest changing “to address an Emergency” to “to address a declared Emergency”. This would help limit second guessing for a situation where a System Operator took action because he truly believed he was in an Emergency but after the fact analysis demonstrates there really was not an Emergency.</p> <p>Response: Modifying Reliability Directive by including “declared Emergency” would add an unnecessary step in mitigation of the Emergency. The act of issuing a Reliability Directive to address an Emergency (per the proposed definition) is sufficient.</p> <p>N. The drafting team should expand its rationale for deleting IRO-002-1 R3. Currently, TOP-005 R1 is referenced. The project 2007-03 (“Real-Time Operations SDT”) proposed to retire TOP-005-2 R1 in its most recent posting.</p> <p>Response: The data provisions are covered in recently approved IRO-010-1, R1-R3 which replaced TOP-005-1, R1. The secure network provisions are covered in the CIP body of standards.</p> <p>O. We disagree with deleting IRO-002-1 R5 and R7 which establishes tools and monitoring capabilities. There should be basic tool requirements established for Reliability Coordinators. The project 2009-02 (“Real-time Reliability Monitoring and Analysis Capabilities”) will be addressing these issues in more detail. Thus, it does not make sense to delete these requirements until that drafting team completes its task.</p> <p>Response: Each RC has been certified to continue operations as an RC or been certified prior to beginning</p>

Organization	Yes or No	Question 6 Comment
		<p>operations as an RC. The minimum set of tools and capabilities for an RC are “checked off” during the certification process. The reliability objective of R5 and R7 is to perform analyses to ensure reliability of the BES by specifying capability rather than mandating specific tools. The analysis provisions of R5 and R7 are covered under IRO-008-1, Requirements R1 (perform Operational Planning Analysis) and R2 (perform Real-time Analysis). It is anticipated that Project 2009-02 team will address this issue more fully.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
FirstEnergy		<p>FirstEnergy offers the following additional comments:</p> <ol style="list-style-type: none"> <li data-bbox="709 521 1965 703">1. The effective dates of the standards indicate an effective date of the first day of the first calendar quarter following regulatory approval. The changes to these standards will require changes to existing compliance evidence, as well as the creation of compliance evidence for some entities such as the Generator Operator which is a new applicable entity in COM-001. Therefore, to give entities ample time to get their compliance evidence in place, we suggest the effective state “the first day of the second quarter after regulatory approval”. <p>Response: The RCSDT agrees and will change the implementation plan to reflect the “first day of the second quarter after regulatory approval.”</p> <ol style="list-style-type: none"> <li data-bbox="709 846 1965 995">3. With regard to the requirements for Alternative Interpersonal Communications, we question why the Generator Operator or Distribution Provider is not required to have backup communication. It would be difficult for a Reliability Coordinator, for instance, to contact a Generator Operator whose primary communications have been disabled if that entity does not have a backup. We suggest that the drafting team consider adding the GOP and DP as applicable entities requiring alternative communications. <p>Response: The RCSDT asserts the standard meets FERC Order 693 regarding DP and GOP entities by requiring these entities to have Interpersonal Communication capability. Not requiring DP and GOP entities to have Alternative Interpersonal Communication capability meets FERC’s intention as stated here: “We (FERC) clarify that the NOPR did not propose to require redundancy on generator operators’ or distribution providers’ telecommunication facilities...” (Order 693, RM06-16-000, Paragraph 487).</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
SPP Standards Development		<p>IRO-001-2, R2 implies that the RC could interrupt the normal chain of command from the TOP and/or BA to their respective GOPs, ICs and DPs thereby circumventing the coordinating process that currently exists. In fact, these entities may not even know their RCs nor be able to identify them and as such any directive from</p>

Organization	Yes or No	Question 6 Comment
		<p>the RC may not be implemented in a timely manner. We would like to see a qualifier on this requirement that does not remove the normal coordination role from the TOP with his DP, etc.</p> <p>Response: There may be unusual circumstances whereby the requirement may indeed circumvent the normal coordinating process in the interest of time / reliability. The RC has the ultimate authority with respect to BES reliability.</p> <p>We would suggest that "with enough details that the accuracy of the message has been confirmed" be deleted from COM-002-3, R2.</p> <p>Response: The RCSDT believes that the additional verbiage is necessary to ensure that an entity understands the Reliability Directive and is able to communicate that understanding back to the Reliability Coordinator. It is not necessary to repeat the exact same verbiage of the Reliability Directive, but rather the intent of the actions required. Having to repeat verbiage of the Reliability Directive word-for-word could be an impediment to achieving the reliability intent of the Reliability Directive when the focus is on repeating verbatim.</p> <p>We would suggest the use of the term 'instruction" and its derivatives rather than 'direct' in IRO-001-2, R2, R3 and R4.</p> <p>Response: This proposed change is stylistic in nature. Stakeholder consensus indicates that this is not an issue for the overwhelming majority of commenters.</p> <p>Delete 'issue an alert to' in IRO-005-4, R1. There are yellow boxes in IRO-005-4, redline versions, which indicate that this standard is being retired, but it isn't because two requirements from IRO-001 are being returned to this standard.</p> <p>Response: These are typos and have been corrected as noted.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
Kansas City Power & Light		<p>There are more requirements that are being removed in the IRO standards than are currently proposed. It would be helpful if the SDT would consider a mapping of each requirement that is being eliminated and whether the requirement is duplicated elsewhere, moved elsewhere and where, or is deemed not needed would be helpful in judging if the changes are appropriate. Without this mapping it is difficult to fully support all the proposed changes to all these Standards.</p>

Organization	Yes or No	Question 6 Comment
<p>Response: The RCSDT thanks you for your comments. The implementation plan contains the requested mapping.</p>		
<p>Competitive Suppliers</p>		<p>EPSA is the trade association for competitive suppliers including both generators and marketers that represent over 700 entities in the NERC compliance registry. As such, the EPSA membership includes members registered as Purchasing Selling Entities (PSE) in each NERC region. Moreover, many of EPSA's members are also registered as LSEs in several regions. In general, EPSA supports the progress made in revising COM-001, COM-002 and IRO-001 in Project 2006-06, particularly the improvements made to the definition of Reliability Directive.</p> <p>However, EPSA also has concerns with some proposed changes to the applicability sections of the revised standards. In addition, EPSA requests that the implementation plans be be changed so that they are consistent with the standard.</p> <p>Regarding applicability, EPSA agrees that COM-001 should continue to not apply to Purchasing Selling Entity (PSE) and Load Serving Entity (LSE) functions.</p> <p>However, the implementation plan for COM-001-2 still includes a reference that PSEs and LSEs must comply (page 11 of the implementation plan). Additionally, EPSA supports the removal of LSEs and PSEs from IRO-001-2. Much like the situation with COM-001-2, the implementation plan for IRO-001-2 still includes a reference that LSEs and PSEs must comply (page 11 of the implementation plan). In both the implementation plans for COM-001-2 and IRO-001-2 these references should be removed. For reasons similar to those underlying why COM-001-2 and IRO-001-2 do not apply to PSEs and LSEs, EPSA opposes the addition of PSEs to the COM-002-3 applicability. The purpose of the emergency communications in these standards is "To ensure emergency communications between operating personnel are effective." The removal would recognize that PSEs and LSEs do not play an active role in reliability coordination under this standard since they have no authority, nor ability to assume or perform responsibilities associated with reliability coordination. When a RC, TOP, or BA needs to address an Emergency they do not contact, consult, or direct a PSE to take action to address the Emergency. Reliability is neither improved nor degraded by having these Standards applicable to PSEs or LSEs; therefore, COM-001, COM-002 and IRO-001 need not be applicable to PSEs or LSEs. Thanks to the drafting team members for their effort on revising the Project 2006-06 standards.</p>
<p>Response: The RCSDT thanks you for your comments.</p> <p>The RCSDT has removed the PSE and LSE from the COM-001-2 and IRO-001-2 implementation plans.</p> <p>For COM-002, the RCSDT believes that all registered NERC entities engaged in daily operational activities must adhere to requirements related to Reliability</p>		

Organization	Yes or No	Question 6 Comment
<p>Directives. While LSE and PSE's are not engaged in coordination activities, they are engaged in load serving, as well as purchasing and selling activities on a daily basis. These activities could be subject to Reliability Directives, either in the form of load reduction, or schedule curtailments.</p>		
<p>Exelon</p>		<ol style="list-style-type: none"> 1. COM-002-2, R2 - Remove the word "recapitulate", feel that "restate or rephrase" is adequate. The word "recapitulate" is not commonly used and is somewhat obscure. Response: The proposed changes are stylistic in nature. The RCSDT included the phrase including "recapitulate" at the suggestion of another stakeholder, and has decided to leave the phrase "restate, rephrase, or recapitulate" intact as suggested by the other stakeholder. 2. COM-002-2, R3 - Suggest using the words "repeat back" rather than "state or respond that" to more clearly identify the expectation with more commonly used language. Response: The proposed changes are stylistic in nature. The RCSDT included the phrase including "recapitulate" at the suggestion of another stakeholder, and has decided to leave the phrase "restate, rephrase, or recapitulate" intact as suggested by the other stakeholder. 3. IRO-001-2, R3 - While we appreciate that the SDT has defined the term "directive" as a much needed definition, IRC-001-2 R.3 now introduces a new term "direction", what is a "direction" and how does it differ from "directive"? If a new term is going to be introduced it needs to be defined, if the intent was to use the word "directive" then "direction" should be replaced with "directive." Response: The requirement language specifically ties back to Requirement R2 which states that the RC "shall take actions or direct actions, which could include issuing Reliability Directives, ". This is the "direction in accordance with Requirement R2" stated in R3 and the "direction in accordance with Requirement R3" stated in R4. 3. IRO-001-2, R4 - Again the term "as directed" is confusing, recommend that the text be changed to align with the term directive, "unable to perform the directive per Requirement R3." Response: The requirement language specifically ties back to Requirement R2 which states that the RC "shall take actions or direct actions, which could include issuing Reliability Directives, ". This is the "direction in accordance with Requirement R2" stated in R3 and the "direction in accordance with Requirement R3" stated in R4.
<p>Response: The RCSDT thanks you for your comments.</p>		
<p>PacifiCorp</p>		

Organization	Yes or No	Question 6 Comment
Arizona Public Service Company		
LG&E and KU Energy		<p>1) LG&E/KU suggests that the definitions and related Reliability Standards be edited to provide a clearer understanding of what is required. When used in the requirements of COM-001, the proposed definitions for Interpersonal Communication and Alternative Interpersonal Communication read improperly (i.e., a “medium capability”). This may cause confusion as to what is required by the Applicable entities. Any further use of these terms may cause greater confusion. Suggested Alternative: Interpersonal Communication: Any instance where two or more individuals interact, consult, or exchange information. The definition of “Alternative Interpersonal Communication” would not have to be changed since it is dependent upon the definition of “Interpersonal Communication.”The change of the definitions of Interpersonal Communication and Alternative Interpersonal Communication shifts their focus to the communication itself-the event. This makes the Requirements themselves much clearer since the Requirements focus on the need that entities have the capabilities-the medium. It appears the SDT’s intent is to ensure that the event takes place by requiring that the medium for those events are in place. This is much clearer if there is a distinction between the two (the event and the medium) than if they have similar definitions (a medium and a “medium capability”).</p> <p>Response: The RCSDT chose to use “medium” so as to not preclude the use of text, voice, electronic or other technology. The intent of the definition as well as the requirements is to require that functional entities have a means to communicate.</p> <p>2) LG&E/KU question the consistency of the Applicability sections as they pertain to the TSP, LSE and PSE functions between COM-001 and COM-002. The deletion of the TSP, LSE and PSE from COM-001 is supported, but if these entities are not required to establish Interpersonal Communication (or Alternative Interpersonal Communication) capability with reliability entities (RC, BA, TOP), should they still be required to follow the reliability directive process of COM-002? If the probability of issuing a Reliability Directive to a TSP, LSE or PSE is so low that Interpersonal Communications capabilities with reliability entities is not justified under COM-001, why are the TSP, LSE and PSE still held to the</p> <p>3 way communication requirements of COM-002? Suggest the Applicability of COM-002 to TSP, LSE and PSE and associated requirements be deleted.</p> <p>Response: The RCSDT has revised the applicability of COM-001 and COM-002 such that they contain the same functional entities. These are: RC, TOP, BA, GOP, and DP.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		

Consideration of Comments on Reliability Coordination — Project 2006-06

Organization	Yes or No	Question 6 Comment
Southern Company		<p>Comments: It appears that the requirements for entities designated in the IRO standards to have tools to access and/or monitor the system have been moved to pending standards that are not enforceable. It seems that if the newest revisions of the IRO standards are not implemented as a group there will be either missing requirements or duplicate requirements in the IRO standards.</p>
<p>Response: The RCSDT thanks you for your comments. The implementation plans note prerequisite approvals that must occur prior to retiring requirements. FERC recently approved IRO-008, 009 and 010. The standards under this project will be filed together with FERC.</p>		
Green Country Energy, Green Country Operating Services		<p>IRO-001-2 as proposed does not include the PSE in the applicability, nor does it require the PSE to respond to a directive. However, COM-002 requires them to repeat the directive back... If the directive is that important to repeat back should they not have to act upon the directive? I think the PSE should be included in IRO-001-2 this standard as they represent and direct generation facility deployment in many cases. Including the PSE in COM-001 may be a good idea too, just for the situations listed above.</p>
<p>Response: The RCSDT thanks you for your comments. The RCSDT has revised the applicability of COM-001 and COM-002 such that they contain the same functional entities. These are: RC, TOP, BA, GOP, and DP.</p>		
Central Lincoln		<p>The stated purpose of COM-002 is:</p> <p>“To ensure emergency communications between operating personnel are effective.” As written, the standard fails to meet this purpose because the three requirements only deal with communications at the entity level. There is no requirement for the directing entity to even try to reach operating personnel at the receiving entity. The directing entity may follow all the requirements of this standard by following R1 and R3 with the receiving entity’s receptionist, answering service, janitor, night watchman, etc. The receiving entity only needs to meet R2, parroting the directive. Again this could be accomplished by anyone with no assurance the directive reaches the operating personnel who can implement it. When we stated a similar objection during the last comment period, The SDT’s answer suggested this was a PER staffing issue, but none of the PER requirements even apply to DP/LSE directive recipients. We suggest the entity issuing the directive should be required to make an attempt to get it to those who are competent to understand and implement the directive. This is not a staffing, training, or credentials issue; it is a performance issue that falls squarely within the stated purpose of this standard.</p> <p>COM-001 R10 presents a paradoxical situation to an entity attempting to comply. Consider an interpersonal communication capability failure that lasts longer than 60 minutes past initial detection. At or before 60 minutes, the affected entity is expected to notify impacted entities. If it has no interpersonal communication capability, how shall it make this notification? And if the entity does manage to make such a notification, it has thereby proven that it does have interpersonal communication capability making such notification</p>

Organization	Yes or No	Question 6 Comment
		<p>unnecessary.</p> <p>Response: The DP or GOP has access to additional Interpersonal Communications, in all likelihood, to make notifications for failure. There is not a requirement for an alternative, but it is highly unlikely that someone couldn't use their cell phone to make the notification.</p> <p>We again ask the SDT to consider that not all the entities in the applicability sections of COM-001 and 002 have 24/7 dispatch centers. These are typically smaller entities that were required to register because they exceed 25 MW or were asked in the past to voluntarily provide UFLS. They do not and do not need to continuously communicate with TOPs, BAs, RCs, etc; and a "reliability directive" is a theoretical thing that has never happened during the memories of thirty year employees. The directive issuing entities simply realize the limitations around the receiving entities and work around them. The financial burden on these small entities and their customers to go to 24/7 dispatch will not have a corresponding reliability benefit. And while the two COM standards do not explicitly state that entities must maintain 24/7 dispatch, when all the requirements and definitions and time horizons are taken together 24/7 continuous competent communication is implied. During the last comment period, the SDT suggested this was a registration issue beyond their control. We submit instead that this is a standard applicability question that the SDT does have control over, since it is right there in Section A.4 of the two COM standards. While we appreciate that the SDT is responding to FERC order 693 to include DPs, we note that FERC also stated: Paragraph 487: "We expect the telecommunication requirements for all applicable entities will vary according to their roles and that these requirements will be developed under the Reliability Standards development process." Paragraph 6: "A Reliability Standard may take into account the size of the entity that must comply and the costs of implementation" Paragraph 141: "...the Commission clarifies that it did not intend to ... impose new organizational structures..." Paragraph 31: "We emphasize that we are not, at this time, mandating a particular outcome by way of these directives, but we do expect the ERO to respond with an equivalent alternative and adequate support that fully explains how the alternative produces a result that is as effective as or more effective than the Commission's example or directive. We ask the SDT to exclude DPs, LSEs, and PSEs that do not have 24/7 dispatch centers from the applicability of these two standards in order to meet FERC order 693.</p>
<p>Response: The RCSDT thanks you for your comments. There is no requirement for 24/7 support - the requirement is to have communications capability. The type of system (e.g., On-Call) is not prescribed in the standard and the standard is designed not to impose needless communications requirements. The purpose of COM-002 is "To ensure emergency communications between operating personnel are <u>effective</u>." It is not a proxy requirement to establish 24/7 operating personnel at small distribution providers. The intent is to establish a <u>method</u> of communicating Reliability Directives during Emergencies. While it is true that many small Distribution Providers are not staffed 24x7, it is typical that they have a means of communication, in many cases this may be via a receptionist, or answering service. It is the expectation that an issuer of a Reliability Directive would request a return call by the Distribution Provider operating personnel, then issue the Reliability Directive. If this return call would not be timely enough, then the issuer would determine a different mitigation plan.</p>		

Organization	Yes or No	Question 6 Comment
Lakeland Electric		COM-002-3 R2. Each Balancing Authority, Transmission Operator, Generator Operator, Transmission Service Provider, Load-Serving Entity, Distribution Provider, and Purchasing-Selling Entity that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message can be confirmed by the originator. (Replace 'has been' with 'can be' and add 'by the originator' to better fit into the sequence with R3.)
<p>Response: The RCSDT thanks you for your comments. The RCSDT agrees with the intent of your comment and has modified R2 as:</p> <p>R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive issued in accordance with Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message is confirmed.</p>		
Manitoba Hydro		-The current data retention requirement of 90 days is more than adequate. Increasing this period to 12 months would result in a significant amount of work with no benefit to reliability. -Clarification required on the VSL for R9 - there appears to be no
<p>Response: The RCSDT thanks you for your comment. The data retention periods for the set of standards proposed is consistent with the guidelines provided in the NERC Drafting team Guidelines. Your second comment is incomplete and does not reference specific standard(s) or requirement(s).</p>		
NextEra Energy, Inc.		At this stage in evolution of compliance with the mandatory Reliability Standards, it is important that any new or revised Reliability Standard clearly articulate all compliance obligations and tasks consistent with Sections 302 (6) and (8) of the NERC Rules of Procedure. COM-002, IRO-001, IRO-002 and IRO-014 do not meet this threshold. Thus, NextEra has numerous recommended corrections to provide clarity and completeness to these Reliability Standards.COM-002 R1The addition of defined terms for Reliability Directive and Emergency is a very good approach that helps provides clarity. Hence, it is also be appropriate to make the language in the requirement as clear as possible, and not add other implied or unexplained notions. Also, at times, in those regions with markets, it is not always clear whether a requirement to curtail for reliability reasons is being issued pursuant to market rules or from the Reliability Coordinator or Transmission Operator under the Reliability Standards. Therefore, it is also appropriate that the Reliability Coordinator, Transmission Operator, Balancing Authority be required to identify themselves;, and if they fail to identify themselves or fail to use the term Reliability Directive, the registered entity receiving the flawed issuance should not be consider in violation of a Reliability Standard for failing to act. Accordingly, R1 would be clearer and have the same intent, if it stated as follows:"A Reliability Coordinator, Transmission Operator or Balancing Authority have the authority to issue an oral or written Reliability Directive as authorized in [list the specific Reliability Standard requirements such as IRO-001 R8 and TOP-001 R3]. The issuance of an oral of written Reliability Directive,

Organization	Yes or No	Question 6 Comment
		<p>by a Reliability Coordinator, Transmission Operator or Balancing Authority shall: (1) use the term ‘Reliability Directive;’ and (2) identify the issuer of the Reliability Directive as a Reliability Coordinator, Transmission Operator or Balancing Authority. If a Reliability Coordinator, Transmission Operator or Balancing Authority issues an oral or written directive without using the term “Reliability Directive” or failing to identify itself as a Reliability Coordinator, Transmission Operator or Balancing Authority, the registered entity receiving the directive cannot be considered in violation for its failure to act.”</p> <p>Response: Only reliability entities can issue Reliability Directives and only reliability entities are held compliant to NERC reliability standards. COM-002, R1 requires the issuer of a Reliability Directive to identify the action as a “Reliability Directive”, it is incumbent on the issuer or receiver to identify themselves in order establish authority, the RCSDT disagrees that identification should be part of the COM-002 standard, however, the RCSDT will pass this concern to Project 2007-02, Operating Personnel Communications Protocols SDT. Furthermore, your suggested revision is a compound requirement, making the requirement indistinct and difficult to measure and in contradiction with SAR. The RCSDT agrees that if an action is not identified as a “Reliability Directive” then the receiving entity cannot be held in violation of failing to follow a Reliability Directive.</p> <p>IRO-001The definition of Adverse Reliability Impacts uses the term “instability.” It is important that this term be technically defined in the same way “Cascading” is defined, otherwise the new requirement is not adding clarity; rather, it is maintaining the ambiguous term “instability” that will likely lead to confusion and debate.</p> <p>Response: The RCSDT disagrees that the term “instability” is ambiguous, and further believes the term is understood in the industry. The majority of stakeholder comments do not indicate that the definition is confusing.</p> <p>R1 Similar to the comments set forth with respect to COM-001 (question #1), the term “at least” should be deleted from R1 - it serves no useful purpose from a technical or compliance perspective; instead, it will add unnecessary ambiguity to the requirement.</p> <p>Response: The RCSDT agrees and has removed “at least” for IRO-001, R1.</p> <p>R2, as drafted, states:”Each Reliability Coordinator shall take actions or direct actions, which could include issuing oral or written Reliability Directives, of Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse</p>

Organization	Yes or No	Question 6 Comment
		<p>Reliability Impacts. “This long sentence has several significant grammatical errors that result in the reader not being able to discern the meaning of the requirement. It also unnecessarily adds verbiage that detracts from its primary focus. It is, therefore, recommended that R2 be revised as follows:</p> <p>“Each Reliability Coordinator shall take all necessary actions to prevent identified Emergencies or Adverse Reliability Impacts. These Reliability Coordinator actions shall include, to the extent necessary, the issuing of oral or written Reliability Directives to Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers located within its Reliability Coordinator Area.</p> <p>Response: The RCSDT disagrees that the suggested revisions adds clarity, and in fact removes directing actions “to mitigate the magnitude or duration of actual events” which weakens the requirement. Phrases such as “to the extent necessary” and “necessary actions” are not measurable and lead to a more confusing requirement. Stakeholders generally agree with the proposed verbiage of the proposed requirement.</p> <p>“R3, as drafted, is confusing and inconsistent with R2, and, thus, R3 should be revised to read as follows:</p> <p>”Upon receipt of a Reliability Directive issued pursuant to R2, a Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator and Distribution Provider shall comply with the Reliability Directive, unless compliance would violate safety, equipment, regulatory or statutory requirements. In the event that a Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider determines that compliance with a Reliability Directive would violate safety, equipment, regulatory or statutory requirements, the Transmission Operator, Balancing Authority, Generator Operator, Interchange Coordinator or Distribution Provider shall, within 10 minutes after the determination, inform the Reliability Coordinator of its inability to comply.”</p> <p>Response: The RCSDT disagrees with the suggested revision to R3. The revision creates a compound requirement with a specific time requirement. Upon recognition of the inability to perform a directed action, the receiver should immediately inform the Reliability Coordinator. Typically this would be during the original communication of the directive. The suggested 10 minute time is not technically justified and provides no reliability benefit beyond the currently worded requirement and only serves to extend the time before an RC is notified.</p> <p>IRO-002R1 and R2, as written, are confusing. It is recommended that R1 and R2 be combined to read as follows: “Pursuant to a written procedure to mitigate the impact of a Reliability Coordinator’s analysis tool outage, a Reliability Coordinator’s System Operator shall also have the authority to approve, deny or cancel a</p>

Organization	Yes or No	Question 6 Comment
		<p>planned outage for its analysis tool.”</p> <p>Response: The suggested revision to IRO-002-2 creates a compound requirement, which is indistinct and difficult to measure and in contradiction with SAR. The SAR for this project directs the team to “Improve clarity of, improve measurability of, and remove ambiguity from the requirement”.</p> <p>IRO-014It is unclear why the terms Operating Procedure, Operating Process or Operating Plan needs to be plural, as currently written in the Standard. Hence, it is recommended that these terms be made singular, otherwise a violation may be inferred for not having more than one Procedure, Process or Plan.</p> <p>Response: IRO-014, R1, The RCSDT disagrees with making Procedures, Processes, or Plans non-plural; this could lead to entities being audited on a procedure by procedure basis. In other words, it is meant that the weekly conference calls create an opportunity to discuss all of the Procedures, Processes, or Plans, and to not require a call for each.</p> <p>1.1 Insert the word “applicable” before “Reliability Coordinator.”</p> <p>Response: The RCSDT disagrees with the use of applicable, as the 1.1 is subordinate to R1, which notes impacted Reliability Coordinators.</p> <p>2.1, as written, is confusing. Recommend that 2.1 read as follows:</p> <p style="padding-left: 40px;">”Review and update, if an update is necessary, on an annual basis. Annual basis means the review shall be within one month plus or minus that date of the last review.”</p> <p>Response: The RCSDT disagrees, and believes the suggested revision is unclear. In its current draft form, the plan or procedure is required to be reviewed every 15 months, if the review indicates that there are no changes required, and then the update would simply be to change the revision date on the published procedure.</p> <p>R3 This requirement uses a very vague term “reliability-related information,” which, also, does not track the language used in R1 -- “information.” It is recommended that R1 and R3 use the same terms and read “. . . information, as defined by the Reliability Coordinator, . . . “</p> <p>Response: The RCSDT believes the reference to R1 within R3 clearly is representative of exchange of information related to R1.</p> <p>R4 As stated above, “at least” does not add value, and, therefore, should be deleted.</p>

Organization	Yes or No	Question 6 Comment
		<p>Response: The RCSDT disagrees. The inclusion of “at least” allows the calls take place every day or multiple times within a week if desired, and adds flexibility. e.g. if there was scheduled weekly call, however due to system conditions an interim call was held, during this interim call all of the necessary information for the week was exchanged, thus removing the need to the scheduled call, the use of “at least” allows for this kind of flexibility. R4 is applicable to those Reliability Coordinators engaged in activities related to R1 and subsequently R1.7, it is unlikely that Reliability Coordinators whom are geographically and electrically distant will have <i>mutually agreed upon</i> operating procedures (per R1), and as such they are not applicable to R4.</p> <p>R5, as written, is confusing. The recommended fix is to delete “all other” and replace with “impacted”.</p> <p>Response: This requirement continues the current practice of informing all RCs of ARIs. Due to the nature of an ARI, this requirement is typically implemented as an RCIS message or a hotline call to all RC’s. This is intended to make all RCs aware of ARIs and support situational awareness.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
United Illuminating Company		<p>Comments: 1. COM-002 R2 seems awkwardly worded.</p> <p>R2. Each [Entity] that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message has been confirmed. " R2 as it is written says the repeat is confirming the accuracy of the message itself. I think it is agreed that the repeat back in R2 is to allow the issuer of the Directive to confirm that the message was received accurately understood by the recipient. I suggest:R2. Each [Entity] that is the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details to allow the Issuer to confirm that the directive recipient accurately understands the Directive"</p> <p>Response: The RCSDT agrees with the intent of your comment and has modified COM-002-3, R2 as:</p> <p style="padding-left: 40px;">R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive issued in accordance with Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive.</p> <p>2. The VSL for R2 is severe and states "The responsible entity that was the recipient of a Reliability Directive failed to repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message was confirmed." The purpose of the R2 repeat-back is to allow the Issuer verify the message</p>

Organization	Yes or No	Question 6 Comment
		<p>was accurately received. This VSL penalizes the responsible entity for not accurately receiving the message. The VSL should penalize the refusal of the registered entity to repeat back the message not for receiving the message incorrectly. Suggested rewording: "The responsible entity that was the recipient of a Reliability Directive failed to repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message can be evaluated by the entity issuing the Reliability Directive"3. United Illuminating does agree with the definition of Reliability Directive and Emergency.</p> <p>Response: The RCSDT agrees and has revised the VSL to:</p> <p>The responsible entity that was the recipient of a Reliability Directive failed to repeat, restate, rephrase or recapitulate the Reliability Directive. with enough details that the accuracy of the message was confirmed.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
<p>Shell Energy North America (US), L.P.</p>		<p>The introduction of the definition of "Reliability Directive" and its connection to the definition of "Emergency" within this Project brings much needed clarity for the sector and will promote consistency between Regional Entities and within the audits of Registered Entities. Shell Energy supports the removal of Purchasing Selling Entities as a function to which IRO-001 applies. This removal recognizes that PSEs do not play a role in reliability coordination under this standard since they have no authorities and no abilities to assume or perform responsibilities associated with reliability coordination. This conclusion is reinforced by the adoption of the defined term "Reliability Directive". Where a RC, TOP, or BA needs to address an Emergency they do not contact, consult, or direct a PSE to take action that would address the Emergency. Rather, where the PSE is a user of the grid to perform or execute transactions, it is subject to the actions of these other entities that have the authority to stop, curtail, or alter the submitted transactions of the PSE in a way that aids in resolving the problem. With the fitting adoption of "Reliability Directive" into COM-002 as well, Shell Energy does not believe it is necessary or appropriate for the applicability of this standard to include Purchasing Selling Entities, as is contained in the current draft proposal. This standard does not apply to PSEs today, however, during the progression of Project 2006-06 this applicability was added to an early draft version that preceded the discussions and clarification that comes from the definition of a Reliability Directive in the standard. Shell Energy does not support the inclusion of PSEs in the current draft version of COM-002, and feels that it should be removed. The purpose of this standard is, "To ensure Emergency communications between operating personnel are effective" and relates directly to the capabilities and authorities established for the RC, TOP, or BA that requires actions to be taken by a recipient of a Reliability Directive. As noted previously, PSEs are acted upon by the entities with the necessary authority, and are not in a role that would initiate or fulfill the required actions. As additional matters related to the clarification and cleanup of the standards in this project, the implementation plans for both IRO-001 and COM-001 erroneously contain references to PSEs in the sections "Functions that Must Comply with the Requirements". These references</p>

Organization	Yes or No	Question 6 Comment
		need to be removed.
<p>Response: The RCSDT thanks you for your comments. The applicability of COM-001 and COM-002 were revised to be consistent and only include the RC, TOP, BA, DP and GOP.</p>		
American Electric Power		<p>The language used in COM-002-3 R2 including “with enough details that the accuracy of the message has been confirmed” is subjective and ambiguous.</p> <p>Response: The RCSDT agrees with the intent of your comment and has modified COM-002-3, R2 as:</p> <p style="padding-left: 40px;">R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive issued in accordance with Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive.</p> <p>IRO-001 R2, R3, and R4 have replaced “Directives” with the word direction in lower case (while it appears that “Directives” is a subset of “directions”). We believe that this muddies the waters and could bring numerous conversations and dialog into scope unnecessarily. The end result is that the RC has the right to issue and use “Directives” and anything short of this could just be communications. For example, a number of entities that are Reliability Coordinators also facilitate energy markets. There are many communications related to markets that probably should be out of scope with respect to the standards. Furthermore, it might not be clear what role (eg Reliability Coordinator, market operator, etc) the staff at these entities are fulfilling.</p> <p>Response: IRO-001 is written so that typical daily operating orders or directives could be used, and also to cover emergency scenarios, but stating the use of Reliability Directives is included. The requirement language specifically ties back to Requirement R2 which states that the RC “shall take actions or direct actions, which could include issuing Reliability Directives, “. This is the “direction in accordance with Requirement R2” stated in R3 and the “direction in accordance with Requirement R3” stated in R4.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
American Transmission Company		None

Organization	Yes or No	Question 6 Comment
ISO New England		<p>The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. In these companies, it is not uncommon for those responsibilities to be distributed across multiple desks. Thus, for certain situations, a single System Operator may actually be the Reliability Coordinator and the Transmission Operator. In other situations, the System Operator serving the Reliability Coordinator function may be adjacent to the System Operator serving the as the Transmission Operator or Balancing Authority. We believe that it should never be necessary for these System Operators to issue Reliability Directives to themselves in the first example or to their co-worker in the second example to demonstrate compliance to NERC standards. How the entity coordinates its actions among its Reliability Coordinator, Balancing Authority and Transmission Operator roles is a corporate governance issue that should not be confused or complicated by the NERC standards. Thus, we believe that standards should be made clear that the Reliability Directive is directed to another company. We believe that, in place of requiring an operator, in real-time, to state “this is a Reliability Directive,” there should be an allowance for an entity to develop procedures indicating, in advance, their expectations of three-part to their sub-operating entities. Therefore, we suggest modifying R1 to be “When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action, either verbally, when the communication is issued, or in advance through documented procedures, as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time.]” Also, we believe that the definition of Emergency, as currently cited in these draft Standards and included in the existing NERC Glossary should be modified to include the NERC Glossary term Adverse Reliability Impact to make the Standards more crisp, clear and enforceable. Because the Project 2007-03 Real-Time Operations SDT proposed to utilize the definition of Adverse Reliability Impact in TOP-001-2 R5 during the last posting, the change to the definition should be coordinated with that team. There is a text box in IRO-005-4 that indicates this standard will be retired. Yet, there still remain requirements in the standard and various other associated documentation indicates requirements are being move to this standard. Please delete the text box. IRO-014-2 R4 already includes a requirement to have weekly conference calls that should suffice. IRO-014-2 R2 seems to recognize that these Operating Procedures, Processes and Plans likely will not need to be discussed weekly as it only requires an annual update. In the definition of Reliability Directive, we suggest changing “to address an Emergency” to “to address a reliability constraint or a declared Emergency”. Further, Requirement R2 in IRO-001 contains the words “which could include issuing Reliability Directives” but Reliability Directives are not referenced anywhere else in the standard. This inclusion seems unnecessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. We suggest that these words be removed. Note that COM-002 already stipulates the requirement for 3-part communication when a</p>

Organization	Yes or No	Question 6 Comment
		Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary.
<p>Response: The RCS DT thanks you for your comments. See response to MRO above.</p>		
ERCOT ISO		<p>The SDT did not address all of our concerns with COM-002-3 from the last posting. For entities registered as multiple functions, the combination of the definition of Reliability Directive and Requirement R1 could be confused to require a company to issue directives to itself. There are several organizations registered as a Reliability Coordinator, Transmission Operator and Balancing Authority. Whether or not a Reliability Directive is issued is irrelevant in this requirement. We suggest that these words be removed. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary.</p>
<p>Response: The RCSDT thanks you for your comments. See response to MRO above.</p>		
WECC		<p>Suggested minor revision to the definition of Reliability Directive as follows (change in caps)A communication, IDENTIFIED AS A RELIABILITY DIRECTIVE, initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency. Clearly identifying a communication as a Reliability Directive provides immediate information to the recipient as to the nature of the communications.</p>
<p>Response: The RCSDT thanks you for your comments. The RCSDT believes embedding the term in “Reliability Directive” in the definition is a not proper method for defining a term.</p>		
BGE		<p>BGE has no additional comments.</p>
Duke Energy		<p>o COM-002-3 contains the proposed definition “Reliability Directive”. We continue to believe Requirement R1 should be deleted and that this definition should contain the phrase “identified as a Reliability Directive to the recipient”. Otherwise, compliance controversies will arise when auditors second-guess the RC, TOP or BA’s judgment regarding whether or not an abnormal system condition met the definition of “Emergency”, and warranted a “Reliability Directive” with 3-part communication. A conforming change will need to be made to R2, since it refers to R1. This change in the definition of “Reliability Directive” is also needed because this term is used in other standards such as IRO-001-2, and without repeating a similar requirement to COM-002-3 requirement R1 in IRO-001-2, there is potential for confusion.</p> <p>Response: The RCSDT disagrees as the suggestion embeds a requirement in a definition. The SDT believes the requirements of COM-002 are clear as written.</p> <p>o We disagree with the VSL for COM-002-3. This is clearly a requirement with two possible compliance failures: Failure to acknowledge a correct repeat-back, and failure to resolve an incorrect repeat-back. These failures have dramatically different consequences, which the drafting team should recognize via a graduated VSL. We think that the failure to acknowledge should either be “Lower” or “Medium”.</p> <p>Response: The RCSDT contends that missing the requirement is a binary violation that results in a severe</p>

Organization	Yes or No	Question 6 Comment
		<p>VSL. You are including risk to the BES in your proposal for the VSL. Risk to the BES is captured in VRFs, while VSLs consider the degree to which the entity failed to meet the Requirement.</p> <p>O Requirement R2 of IRO-001-2 is unclear and should be reworded as follows:</p> <p>“Each Reliability Coordinator shall take actions or direct actions (which could include issuing Reliability Directives to Transmission Operators, Balancing Authorities, Generator Operators, Interchange Coordinators and Distribution Providers within its Reliability Coordinator Area) to either prevent identified events that could result in an Adverse Reliability Impact, or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts.”</p> <p>Response: The RCSDT believes that the suggested revision does not add further clarity to the requirement.</p> <p>o Various changes have been made to the defined term “Adverse Reliability Impact” as this project has progressed. We believe the latest change should not be made, and the Phrase “uncontrolled separation” should be reinserted in the definition, because that phrase is part of the EAct 2005 legislation definition of “reliable operation”. Here is the text from the legislation: “The term ‘reliable operation’ means operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements.”</p> <p>Response: During the last posting of the proposed definition, the RCSDT received the following comment and revised the definition appropriately: “This change is problematic in that any automatic protective element operation that trips a BES element could be construed to be an Adverse Reliability Impact.”. The modification eliminated the phrase “that affects a widespread area of the Interconnection” which clarified the scope of the definition. “Uncontrolled separation” has been deleted from the definition, as it is included in the definition of Cascading.</p>
<p>Response: The RCSDT thanks you for your comments. Please see responses above.</p>		
CECD		<p>1. COM-002 R2 states that "the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the accuracy of the message has been confirmed." Recommend a change to "the recipient of a Reliability Directive issued per Requirement R1, shall repeat, restate, rephrase or recapitulate the Reliability Directive with enough details that the desired outcome of the message is clear".</p> <p>Response: The RCSDT agrees with the intent of your comment and has modified COM-002-3, R2 as:</p> <p>R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of a Reliability Directive issued in accordance with Requirement R1, shall repeat, restate,</p>

Organization	Yes or No	Question 6 Comment
		<p>rephrase or recapitulate the Reliability Directive.</p> <p>2. IRO-001 R2 states "Each Reliability Coordinator shall take actions or direct actions which could include issuing Reliability Directives of Transmission Operators," Recommend a change to "Each Reliability Coordinator shall take actions or direct actions which could include issuing Reliability Directives [See COM-002] to Transmission Operators, ..."</p> <p>Response: Based on feedback from other stakeholders, the RCSDT believes that the existing verbiage is clear and does not require further revision.</p> <p>3. IRO-001 R4 states entities "shall inform its Reliability Coordinator upon recognition of its inability to perform as directed per Requirement R3." Recommend a change to, entities "shall inform its Reliability Coordinator upon recognition of its inability to perform as directed."</p> <p>Response: Based on feedback from other stakeholders, the RCSDT believes that the existing verbiage is clear and does not require further revision.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
Indeck Energy Services		
City of Springfield, IL - City Water Light and Power (CWLP)		<p>CWLP generally concurs with and supports comments previously submitted by the SERC Operating Committee where those comments are not in conflict with the specific comments above.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
South Carolina Electric and Gas		<p>1. Reliability Directives may be issued by blast calls from Reliability Coordinators. It is inefficient and may be a hindrance to reliability to require 3-part communications in these instances.</p> <p>Response: The RCSDT agrees that the use of Blast Calls to issue Reliability Directives, in mass, is efficient and effective. The RCSDT believes Reliability Directives issued in mass should be defined by procedure, and that the procedure would establish a method of affirmation and notice of implementation.</p> <p>2. There are several organizations registered as BAs, RCs and TOPs. It is not uncommon for those entities to be distributed across multiple desks in the same control room without regard to how an entity is registered. Thus, a single System Operator may perform functions that are categorized under two or more of those functional entities. The drafting team should clarify that under no circumstances should that System Operator be required to issue a Reliability Directive to himself. This is a corporate governance</p>

Organization	Yes or No	Question 6 Comment
		<p>issue.</p> <p>Response: The RCSDT believes that any Registered Entity or person operating as such must understand the intent of the issued Reliability Directive, and that the issuer of the Reliability Directive believe that the Reliability Directive was correctly received. COM-002 should not be construed to mean that an individual serving in two functions be required to issue a Reliability Directive to himself, but rather it is expected that such an individual would appropriately address the reliability issues as required by the function they are serving and its subsequent responsibilities</p> <p>3. In IRO-014, R1, delete sub-requirement 1.7. The requirement for weekly conference calls related to operating procedures is duplicative to R4 and could be burdensome while adding very little value under certain circumstances.</p> <p>Response: R1, Part 1.7 requires an entity to address how and when they will hold conference calls in their Operating Plans, Processes or Procedures. R4 requires the participation in those calls.</p> <p>4. In IRO-014, R4, delete the phrase “(per Requirement 1, Part 1.7)” as a conforming change.</p> <p>Response: R1, Part 1.7 requires an entity to address how and when they will hold conference calls in their Operating Plans, Processes or Procedures. R4 requires the participation in those calls.</p> <p>5. In IRO-014, Requirements R6-R8 allow at least the theoretical possibility that an RC may determine an Adverse Reliability Impact in another RC’s area that the other RC neither can see nor believes that any action should be taken. R7 puts the burden on the first RC to develop a plan that it cannot implement because it has no agreement with the BAs and TOPs in the other RC area. As such, this requirement is unenforceable.</p> <p>Response: You are correct. Requirements R6-R8 are translated from IRO-016-1, Requirement R1. If an RC sees a problem and another does not see the same problem, then there may be an issue with someone’s model or processes or procedures. The RC’s are supposed to have coordinated Operating Plans, Processes or Procedures to operate reliably. R6-R8 are only applicable if one of the two (or more) RCs do not see that a problem exists. It would be a detriment to reliability for both RCs to take no action. RCs are required to coordinate actions under existing IRO-016-1, R1. If one RC identifies a problem and provides an action plan to another RC to mitigate the problem, the second RC is obligated under R8 to implement it. We have revised the R8 to clarify this intent.</p> <p>Revised R8. During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements.</p>

Organization	Yes or No	Question 6 Comment
		<p>6. Please review all the implementation plans to be sure the applicable entities match those in the standards.</p> <p>Response: We have revised the implementation plans to reflect the appropriate applicability.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		
<p>Independent Electricity System Operator</p>		<p>1. IRO-001: Reliability Directive: We do not agree with the proposed definition since it addresses Emergencies only. There are situations where a Reliability Directive is issued such that the directed action must be taken by the receiving entity to address a reliability constraint or any condition on the BES which if left unattended could, in the judgment of the issuing entity, lead to an Emergency. These conditions themselves do not constitute an Emergency which is defined as “Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.” There could be no abnormal condition but the actions must nevertheless be taken promptly to prevent the bulk electric system from entering into an abnormal condition. We therefore suggest the term Reliability Directive be revised to: Reliability Directive: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address a reliability constraint or an Emergency.</p> <p>Response: The RCSDT believes that your comment concerns “directives” or “instructions” for normal operational activities rather than a Reliability Directive. There is no requirement preventing an entity from issuing either directives or instructions for the situations you mention. The intent of creating a Reliability Directive definition is to ensure that communications is tightened during Emergencies (per blackout report). When an RC issues a Reliability Directive, the RC has made a deliberate decision to formally end collaboration and require specific action(s).</p> <p>2. IRO-001, Requirement R2: This requirement contains the words “which could include issuing Reliability Directives” which is not referenced anywhere else in the standard. We do not think this inclusion is necessary since without it, R2 already requires that the RC take actions or direct actions by others to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. Whether or not a Reliability Directive is issued is irrelevant in this requirement. We suggest to remove these words. Note that COM-002 already stipulates the requirement for 3-part communication when a Reliability Directive is issued. The inclusion of “which could include issuing Reliability Directives” in IRO-001 is unnecessary. We suggest replacing “identified events” with “anticipated events”. This requirement also lists Interchange Coordinators as one of the recipients of Reliability Directives which is not consistent with the</p>

Organization	Yes or No	Question 6 Comment
		<p>implementation plan.</p> <p>Response: R2 requires the Reliability Coordinator to act. These actions could include Reliability Directives in the case of an Emergency. However, issuing Reliability Directives might not always be necessary, as the Reliability Coordinator may be acting proactively well in advance of an emergency. R2 promotes this proactive approach, but reserves the use of Reliability Directives for circumstances that require its use. Your suggested edits are not supported by the majority of stakeholder comments. The Interchange Coordinator has been removed from the standard.</p> <p>3. IRO-014: R4 as written creates unnecessary requirements for an RC to participate in conference calls for issues that may not affect the RC itself. We suggest to reinstate the original word “impacted” as opposed to “other”, and remove the words “within the same Interconnection” since such calls and coordination may be required for RCs on both side of the Interconnection boundary. Same change suggested for R5, i.e. replace “other” with “impacted”.</p> <p>Response: The requirement for weekly conference calls exists in IRO-015-1. The RCSDT has revised the requirement and incorporated it into proposed IRO-014-2. IRO-14-2, R4 is applicable to those Reliability Coordinators engaged in activities related to R1 and subsequently R1.7, it is unlikely that Reliability Coordinators that are geographically and electrically distant will have mutually agreed upon operating procedures (per R1), and as such they are not applicable to R4. If RCs in different interconnections have operating procedures (per R1) with each other, then these operating procedures may include specifications for conference calls at least weekly.</p> <p>4. If an entity provides Interpersonal Communication for day-to-day communication using two different media, e.g. radio and telephone, the proposed definition of Alternative Interpersonal Communication suggests that it would not be possible for one medium to be used as the Alternative Interpersonal Communication for the other since the two media are both used every day.</p> <p>Response: The intent of AIC is to make sure there is an alternative in case the IC fails. If you have two, you may designate one as the AIC regardless of how often you use it.</p> <p>5. COM-001-2 R10 suggests that the responsible entity must wait for at least 30 minutes before notifying other entities of the failure of its Interpersonal Communication capability. We recommend changing “that lasts 30 minutes” to “that lasts or is expected to last 30 minutes”. This allows responsible entities to start notifying other entities earlier.</p>

Organization	Yes or No	Question 6 Comment
		<p>Response: The requirement is written such that an outer bound is set for notifications. An entity does not have to wait and can begin notifications immediately if it knows that an outage will last more than 30 minutes.</p> <p>6. In IRO-005-4 R1: Delete “notify”.</p> <p>Response: The phrase “issue an alert” was removed in the redline version but was not removed from the clean version. This was corrected.</p>
<p>Response: The RCSDT thanks you for your comments.</p>		

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009. (Note that as part of the second posting, the sole requirements retained from IRO-002 were posted for the second time within IRO-001 with a suggestion to retire IRO-002.)
9. RC SDT coordinated with OCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 18, 2010. (Note that in this posting, the requirements for IRO-002 were posted in IRO-001.)
11. Fourth posting of revised standards for a comment period with an initial ballot from January 18, 2011 through March 7, 2011. (Note that in this posting, the requirements for IRO-002 were moved from IRO-001 back into IRO-002.)

Proposed Action Plan and Description of Current Draft:

This is the fifth draft of the requirements in this standard posted for a recirculation ballot. The standards that did not receive comments in the initial ballot will move forward for a recirculation ballot; standards needing significant revision will move forward to another comment period and a successive ballot. IRO-005-4 did not have any significant changes following the initial ballot and is being posted for a recirculation ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Standard posted for recirculation ballots.	July 2011
1. Standard sent to BOT for approval.	August 2011
2. Standard filed with regulatory authorities.	September 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** **Reliability Coordination – Analysis Tools**
2. **Number:** IRO-002-3
3. **Purpose:** To ensure that Reliability Coordinators provide their System Operators with authority with respect to analysis tool outages and to have procedures to mitigate effects of analysis tool outages.
4. **Applicability**
 - 4.1. Reliability Coordinator
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

B. Requirements

- R1. Each Reliability Coordinator shall provide its System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools. [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time Operations, Same Day Operations and Operations Planning*]
- R2. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time Operations, Same Day Operations and Operations Planning*]

C. Measures

- M1. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools. (R1)
- M2. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that that the Reliability Coordinator has procedures in place to mitigate the effects of analysis tool outages. (R2)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity is the Compliance Enforcement Authority except where the Reliability Coordinator works for the Regional Entity. Where the Reliability Coordinator works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting
Complaint

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1 and R2 and Measures M1 and M2.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

Violation Severity Levels				
R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Reliability Coordinator failed to provide its System Operator with the authority to approve, deny or cancel planned outages of its own analysis tools.
R2	N/A	N/A	N/A	The Reliability Coordinator failed to have a procedure to mitigate the effects of analysis tool outages.

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	
1	April 4, 2007	Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs) Corrected typographical errors in BOT approved version of VSLs	Revised to add missing measures and compliance elements
2	October 17, 2008	Deleted R2, M3 and associated compliance elements as conforming changes associated with approval of IRO-010-1	Revised as part of IROL Project
2	October 17, 2008	Adopted by NERC Board of Trustees	IROL Project
2	March 23, 2011	Order issued by FERC approving IRO-002-2 (approval effective 5/23/11)	
3	To be determined	Retired R1-R8 under Project 2006-06.	Project 2006-06

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009. (Note that as part of the second posting, the sole requirements retained from IRO-002 were posted for the second time within IRO-001 with a suggestion to retire IRO-002.)
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 18, 2010. (Note that in this posting, the requirements for IRO-002 were posted in IRO-001.)
11. Fourth posting of revised standards for a comment period with an initial ballot from January 18, 2011 through March 7, 2011. (Note that in this posting, the requirements for IRO-002 were moved from IRO-001 back into IRO-002.)

Proposed Action Plan and Description of Current Draft:

This is the fifth draft of the requirements in this standard posted for a recirculation ballot. The standards that did not receive comments in the initial ballot will move forward for a recirculation ballot; standards needing significant revision will move forward to another comment period and a successive ballot. IRO-005-4 did not have any significant changes following the initial ballot and is being posted for a recirculation ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Standard posted for recirculation ballots.	July 2011
1. Standard sent to BOT for approval.	August 2011
2. Standard filed with regulatory authorities.	September 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** **Reliability Coordination – Analysis Tools**
2. **Number:** IRO-002-~~23~~
3. **Purpose:** To ensure that Reliability Coordinators provide their System Operators with authority with respect to analysis tool outages and to have procedures to mitigate effects of analysis tool outages.
4. **Applicability**
 - 4.1. Reliability Coordinators~~s~~.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

B. Requirements

- R1. Each Reliability Coordinator shall provide its System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*
- R2. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

C. Measures

- M1. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators~~s~~ with the authority to approve, deny or cancel planned outages of its own analysis tools. (R1)
- M2. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that that the Reliability Coordinator has procedures in place to mitigate the effects of analysis tool outages. (R2)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~Regional Entity~~

The Regional Entity is the Compliance Enforcement Authority except where the Reliability Coordinator works for the Regional Entity. Where the Reliability Coordinator works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits~~s~~

Self-Certifications~~s~~

- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1 and R2 and Measures M1 and M2.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

<u>Violation Severity Levels</u>				
Violation Severity Levels R#R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Reliability Coordinator failed to provide its System Operator with the authority to approve, deny or cancel planned outages of its own analysis tools.
R2	N/A	N/A	N/A	The Reliability Coordinator failed to have a procedure to mitigate the effects of analysis tool outages.

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised <u>Revised to add missing measures and compliance elements</u>
1	April 4, 2007	Regulatory Approval — Effective Date	New
<u>2</u>	<u>October 17, 2008</u>	<u>Retired R2 as a conforming change associated with approval of IRO-010-1 – Approved by Board of Trustees</u>	<u>IROL Project</u>
<u>23</u>	<u>To be determined</u>	Retired R1, R3-8 <u>under Project 2006-06.</u>	Revised <u>under Project 2006-06</u>

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009. (Note that as part of the second posting, the sole requirements retained from IRO-002 were posted for the second time within IRO-001 with a suggestion to retire IRO-002.)
9. RC SDT coordinated with OCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 18, 2010. (Note that in this posting, the requirements for IRO-002 were posted in IRO-001.)
11. Fourth posting of revised standards for a comment period with an initial ballot from January 18, 2011 through March 7, 2011. (Note that in this posting, the requirements for IRO-002 were moved from IRO-001 back into IRO-002.)

Proposed Action Plan and Description of Current Draft:

This is the fifth draft of the requirements in this standard posted for a recirculation ballot. The standards that did not receive comments in the initial ballot will move forward for a recirculation ballot; standards needing significant revision will move forward to another comment period and a successive ballot. IRO-005-4 did not have any significant changes following the initial ballot and is being posted for a recirculation ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Standard posted for recirculation ballots.	July 2011
1. Standard sent to BOT for approval.	August 2011
2. Standard filed with regulatory authorities.	September 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Reliability Coordination — ~~Facilities Analysis Tools~~
2. **Number:** IRO-002-~~23~~
3. **Purpose:** ~~To ensure that~~ Reliability Coordinators ~~need information, tools and other capabilities to perform~~ provide their ~~responsibilities~~ System Operators with authority with respect to analysis tool outages and to have procedures to mitigate effects of analysis tool outages.
4. **Applicability**
 - 4.1. Reliability ~~Coordinators~~ Coordinator

Proposed Effective Date: ~~In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval.~~ In those jurisdictions where no regulatory approval is required, ~~the~~ this standard shall become effective on the ~~latter of either April 1, 2009 or the~~ first day of the first calendar quarter, ~~three months~~ after Board of ~~Trustee~~ adoption.
 5. ~~In those jurisdictions where regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval.~~ Trustees approval.

B. Requirements

- ~~R1.~~ Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real time emergency condition.
- ~~R2.~~ Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network.
- ~~R3.~~ Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection.
- ~~R4.~~ Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator's operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.
- ~~R5.~~ Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.

- ~~R6.~~ Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays.
- ~~R7.~~ Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable.
- R1. Each Reliability Coordinator shall ~~control~~provide its ~~Reliability Coordinator~~System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools, including approvals for planned maintenance. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*
- ~~R8.~~R2. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

C. Measures

- ~~M1.~~ Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a document that lists its voice communications facilities with Transmission Operators, Balancing Authorities and Generator Operators within its Reliability Coordinator Area and with neighboring Reliability Coordinators, that will be used to confirm that it has communication facilities in accordance with Requirements 1 and 3.
- ~~M2.~~ Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a data link facility description document, computer print out, training document, or other equivalent evidence that will be used to confirm that it has data links with entities within its Reliability Coordinator Area and with neighboring Reliability Coordinators, as specified in Requirements 1 and 3.
- ~~M3.~~ Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection system communications performance or equivalent evidence to demonstrate that it has real-time monitoring capability of its Reliability Coordinator Area and monitoring capability of its surrounding Reliability Coordinator Areas to identify potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations.
- ~~M4.~~ Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, documentation from suppliers, operating and planning staff training documents, examples of studies, or other equivalent evidence to show that it has analysis tools in accordance with Requirement 6.
- ~~M5.~~ Each Reliability Coordinator shall provide evidence such as equipment specifications, operating procedures, staff records of their involvement in training, or other equivalent evidence to show that it has a backup monitoring facility that can be used to identify and monitor SOLs and IROLs. (Requirement 7)
- ~~M6.~~M1. Each Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to ~~vet~~approve, deny or cancel planned outages ~~to~~of its own analysis tools, ~~including final approvals for planned maintenance as specified in Requirement 8 Part 1.~~ (R1)
- ~~M7.~~M2. Each Reliability Coordinator shall have and provide upon request its ~~current~~evidence that could include, but is not limited to, a documented procedure or equivalent

evidence that will be used to confirm that that the Reliability Coordinator has procedures used in place to mitigate the effects of analysis tool outages as specified in Requirement 8 Part 2. (R2)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance ~~Monitoring Responsibility~~ Enforcement Authority

The Regional Entity is the Compliance Enforcement Authority except where the Reliability Coordinator works for the Regional Entity. Where the Reliability Coordinator works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.

~~Regional Reliability Organizations shall be responsible for compliance. Monitoring.~~

~~Compliance Monitoring and Reset Time Frame~~

~~One or more of the following methods will be used to assess compliance:~~

- ~~— Self-certification (Conducted annually with submission according to schedule.)~~
- ~~— Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~
- ~~— Periodic Audit (Conducted once every three years according to schedule.)~~
- ~~— Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)~~

~~The Performance Reset Period shall be 12 months from the last finding of non-compliance.~~

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaint

1.2.1.3. Data Retention

Each The Reliability Coordinator shall have keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement

Authority to retain specific evidence for a longer period of time as part of an investigation:

- ~~The Reliability Coordinator shall retain its current, in -force document and any documents used to show compliance within force for the current year and previous calendar year for Requirements R1 and R2 and Measures 1 through 7~~ M1 and M2.

If ~~an entity~~ a Reliability Coordinator is found non-compliant ~~the entity, it~~ shall keep information related to the ~~noncompliance non-compliance~~ until found compliant ~~or for two years plus the current year, whichever is longer.~~

- ~~Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor.~~
- The Compliance ~~Monitor~~ Enforcement Authority shall keep the last ~~periodic audit report records~~ and all requested and submitted subsequent ~~compliance audit~~ records.

1.3.1.4. Additional Compliance Information

None.

2. Violation Severity Levels:

<u>Violation Severity Levels</u>				
<u>Requirement #</u>	<u>Lower VSL</u>	<u>Moderate VSL</u>	<u>High VSL</u>	<u>Severe VSL</u>
R1	The Reliability Coordinator has demonstrated communication facilities for both voice and data exist to all appropriate entities and that they are staffed and available but they are less than adequate.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with one appropriate entity or 2) Data links with one appropriate entity.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with two appropriate entities or 2) Data links with two appropriate entities.	The Reliability Coordinator has failed to demonstrate that is has: 1) Voice communication links with more than two appropriate entities or 2) Data links with more than two appropriate entities or 3) Communication facilities are not staffed or 4) Communication facilities are not ready.
R2	N/A	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with one of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with two of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.	The Reliability Coordinator or designated Transmission Operator and Balancing Authority has failed to demonstrate it provided or arranged provision for the exchange of data with three of the other Reliability Coordinators or Transmission Operators and Balancing Authorities.

R3	N/A	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to one of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with neighboring Reliability Coordinators.	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to two or more of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with neighboring Reliability Coordinators.	The Reliability Coordinator has failed to demonstrate multi-directional communication capabilities to all of the Transmission Operators and Balancing Authorities in its Reliability Coordinator Area and with all neighboring Reliability Coordinators.
R4	The Reliability Coordinator's monitoring systems provide information in a way that is not easily understood and interpreted by the Reliability Coordinator's operating personnel or particular emphasis was not given to alarm management and awareness systems, automated data transfers and synchronized information systems.	The Reliability Coordinator has failed to demonstrate that is has detailed real time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that one potential or actual SOL or IROL violation is not identified.	The Reliability Coordinator has failed to demonstrate that is has detailed real time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that two or more potential and actual SOL and IROL violations are not identified.	The Reliability Coordinator has failed to demonstrate that is has detailed real time monitoring capabilities in its Reliability Coordinator Area and sufficient monitoring capabilities of its surrounding Reliability Coordinator Areas to ensure that all potential and actual SOL and IROL violations are identified.

<p>R5</p>	<p>The Reliability Coordinator failed to monitor: 1) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in one SOL violations or 2) or operating reserves for a small portion of the Reliability Authority Area.</p>	<p>The Reliability Coordinator failed to monitor: 1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing one IROL or to system restoration; 2) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in multiple SOL violations, or 3) operating reserves.</p>	<p>The Reliability Coordinator failed to monitor: 1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing two or more IROLs; or one IROL and to system restoration; 2) the status, real power flow or reactive power flow of Bulk Electric System elements that could result in multiple SOL violations and operating reserves, or 3) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing one IROL or system restoration and operating reserves.</p>	<p>The Reliability Coordinator failed to monitor: 1) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing all IROLs and to system restoration, or 2) the status, real power flow or reactive power flow of Bulk Electric System elements critical to assessing all SOL violations and operating reserves.</p>
<p>R6</p>	<p>The Reliability Coordinator failed to demonstrate that it has: 1) analysis tools capable of assessing all pre-contingency flows; 2) analysis tools capable of assessing all post-contingency flows, or 3) all necessary wide area overview displays exist.</p>	<p>The Reliability Coordinator failed to demonstrate that it has: 1) analysis tools capable of assessing the majority of pre-contingency flows; 2) analysis tools capable of assessing the majority of post-contingency flows, or 3) the majority of necessary wide area overview displays exist.</p>	<p>The Reliability Coordinator failed to demonstrate that it has: 1) analysis tools capable of assessing a minority of pre-contingency flows; 2) analysis tools capable of assessing a minority of post-contingency flows, or 3) a minority of necessary wide area overview displays exist.</p>	<p>The Reliability Coordinator failed to demonstrate that it has: 1) analysis tools capable of assessing any pre-contingency flows; 2) analysis tools capable of assessing any post-contingency flows, or 3) any necessary wide area overview displays exist.</p>

R7	<p>The Reliability Coordinator failed to demonstrate that:</p> <ol style="list-style-type: none"> 1) it or a delegated entity monitored SOLs when the main monitoring system was unavailable or 2) it has provisions to monitor SOLs when the main monitoring system is not available. 	<p>The Reliability Coordinator failed to demonstrate that:</p> <ol style="list-style-type: none"> 1) it or a delegated entity monitored one IROL when the main monitoring system was unavailable or 2) it has provisions to monitor one IROL when the main monitoring system is not available. 	<p>The Reliability Coordinator failed to demonstrate that:</p> <ol style="list-style-type: none"> 1) it or a delegated entity monitored two or more IROLs when the main monitoring system was unavailable, 2) it or a delegated entity monitored SOLs and one IROL when the main monitoring system was unavailable 3) it has provisions to monitor two or more IROLs when the main monitoring system is not available, or 4) it has provisions to monitor SOLs and one IROL when the main monitoring system was unavailable. 	<p>The Reliability Coordinator failed to demonstrate that it continuously monitored its Reliability Authority Area.</p>
R8R1	<p>Reliability Coordinator has approval rights for planned maintenance outages of analysis tools but does not have approval rights for work on analysis tools that creates a greater risk of an unplanned outage of the tools. <u>N/A</u></p>	<p>Reliability Coordinator has approval rights for planned maintenance but does not have plans to mitigate the effects of outages of the analysis tools. <u>N/A</u></p>	<p>Reliability Coordinator has approval rights for planned maintenance but does not have plans to mitigate the effects of outages of the analysis tools and does not have approval rights for work on analysis tools that creates a greater risk of an unplanned outage of the tools. <u>N/A</u></p>	<p><u>The Reliability Coordinator approval is not required for failed to provide its System Operator with the authority to approve, deny or cancel planned maintenance outages of its own analysis tools.</u></p>
R2	N/A	N/A	N/A	<p><u>The Reliability Coordinator failed to have a procedure to mitigate the effects of analysis tool outages.</u></p>

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1	<u>April 4, 2007</u>	Replaced Levels of Non-compliance with the Feb 28, BOT approved Violation Severity Levels (VSLs) Corrected typographical errors in BOT approved version of VSLs	<u>Revised to add missing measures and compliance elements</u>
2	<u>October 17, 2008</u>	Deleted R2, M3 and associated compliance elements <u>as conforming changes associated with approval of IRO-010-1</u>	Revised <u>as part of IROL Project</u>
2	October 17, 2008	Adopted by NERC Board of Trustees	<u>IROL Project</u>

Implementation Plan
IRO-002-3 – Reliability Coordination – Analysis Tools

Approvals Required

IRO-002-3 – Reliability Coordination – Analysis Tools

Prerequisite Approvals

None

Revisions to Glossary Terms

None

Applicable Entities

Reliability Coordinator

Conforming Changes to Other Standards

None

Effective Dates

IRO-002-3 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

Retirements

IRO-002-2 should be retired at midnight of the day immediately prior to the Effective Date of IRO-002-3 in the particular jurisdiction in which the new standard is becoming effective.

Summary of Changes

The RCSDT revised the standard and is proposing retiring several requirements (R1, R3, R4, R5, R6, R7 and R8). Changes were made to eliminate redundancies between standards (existing and proposed), align with NERCs Rules of Procedure, and to address the FERC Order 693 directive for IRO-002:

In addition we direct the ERO to develop a modification to IRO-002-1 through the Reliability Standards development process that requires a minimum set of tools that should be made available to reliability coordinators.

RCSDT response: The development of a minimum set of tools should be addressed through the work of the Real-Time Tools Best Practices Task Force. Their charge was to develop a list of tools required to perform real time operations functions and submit SARs based on their work. As requirements for these tools are developed, appropriate standards projects will be initiated to incorporate the tools within the NERC Organization Registration and Certification Process, and the applicable reliability standards. The RCSDT submits that this directive be addressed in that effort. This action is accommodated by the Standards Development Work Plan.

The following table identifies the sections of approved standards that shall be retired or revised when this standard is implemented.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-2</p> <p>R1. Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition. [<i>Violation Risk Factor: High</i>]</p>	<p>The first sentence of this requirement should be retired because it is a basic facility issue that should be addressed in certification. The second sentence is redundant with PER-004, R1 which requires the RC to be staffed 24x7.</p> <p>PER-004-1</p> <p>R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-2</p> <p>R2. Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]</p>	<p>None. Retire requirement as it is redundant with:</p> <p>TOP-005-1</p> <p>R1. Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area. (This requirement will be retired upon the implementation of IRO-010-1)</p> <p>IRO-014-1</p> <p>R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions that may impact other Reliability Coordinator Areas to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: <i>[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]</i></p> <p>R1.1. Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.</p> <p>R1.2. Energy and capacity shortages.</p> <p>R1.3. Planned or unplanned outage information.</p> <p>R1.4. Control of voltage, including the coordination of reactive resources.</p> <p>R1.5. Coordination of information exchange to support reliability assessments.</p> <p>R1.6. Authority to act to prevent and mitigate system conditions which could cause Adverse Reliability Impacts to other Reliability Coordinator Areas.</p> <p>R1.7. Weekly conference calls</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Notes: The “secure network” provisions of IRO-002-2 R2 are covered under the NERC Rules of Procedure, Section 1002 which states:</p> <p><i>NERC will provide tools and other support services for the benefit of reliability coordinators and other system operators, including the Area Control Error (ACE) and Frequency Monitoring System, NERC Hotline, Real-time Flows, System Data Exchange (SDX), Reliability Coordinator Information System (RCIS), Transmission Services Information Network (TSIN), Interchange Distribution Calculator (IDC), Interregional Security Network (ISN), and Central Repository for Security Events (CRC). To accomplish this goal, NERC will:</i></p> <ol style="list-style-type: none"> <i>1. Maintain the reliability and effectiveness of all mission-critical operating reliability support systems and services;</i> <i>2. Continue to support maintenance of a transmission provider curtailment report on the CRC site in response to Federal Energy Regulatory Commission Order 605;</i> <i>3. Investigate and analyze the use of high-speed real-time system measurements, including phasors, in predicting the behavior and performance of the Eastern Interconnection; and</i> <i>4. Facilitate real-time voice and data exchange services among reliability coordinators (e.g., Hotline, Interregional Security Network, NERCnet, System Data Exchange, etc.).</i> 	
<p>IRO-002-2</p> <p>R3. Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection. <i>[Violation Risk Factor: Medium]</i></p>	<p>None. Retire this requirement.</p> <p>R3 is addressed in COM-001-1, R1 as well as the proposed revisions to COM-001-2, R1-R8.</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-2</p> <p>R4. Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure.</p> <p>R5. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area.</p>	<p>None. Both should be retired based on the notes below.</p>
<p>Notes: R4 is a basic facility requirement that should be addressed in certification. For R5, real-time monitoring is a supporting activity and is only one of several processes used to support operation within SOLs or IROLs. It is not practical to measure real-time monitoring, nor is this necessary. The real reliability objective is to operate within identified parameters, not to monitor.</p>	
<p>IRO-002-2</p> <p>R6. Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays. <i>[Violation Risk Factor: High]</i></p>	<p>None. Retire this requirement. R7 is a basic facility requirement that should be addressed in certification.</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-2</p> <p>R7. Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable. <i>[Violation Risk Factor: High]</i></p>	<p>None. This requirement should be retired because it is redundant with:</p> <p>EOP-008-0</p> <p>R1. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have a plan to continue reliability operations in the event its control center becomes inoperable. The contingency plan must meet the following requirements:</p> <p>The contingency plan shall not rely on data or voice communication from the primary control facility to be viable.</p> <p>R1.2. The plan shall include procedures and responsibilities for providing basic tie line control and procedures and for maintaining the status of all inter-area schedules, such that there is an hourly accounting of all schedules.</p> <p>R1.3. The contingency plan must address monitoring and control of critical transmission facilities, generation control, voltage control, time and frequency control, control of critical substation devices, and logging of significant power system events. The plan shall list the critical facilities.</p> <p>R1.4. The plan shall include procedures and responsibilities for maintaining basic voice communication capabilities with other areas.</p> <p>R1.5. The plan shall include procedures and responsibilities for conducting periodic tests, at least annually, to ensure viability of the plan.</p> <p>R1.6. The plan shall include procedures and responsibilities for providing annual training to ensure that operating personnel are able to implement the contingency plans.</p> <p>R1.7. The plan shall be reviewed and updated annually.</p> <p>R1.8. Interim provisions must be included if it is expected to take more than one hour to implement the contingency plan for loss of primary control facility.</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Notes: Real-time monitoring is a supporting activity and is only one of several processes used to support operation within SOLs or IROLs. It is not practical to measure real-time monitoring, nor is this necessary. The real reliability objective is to operate within SOLs and IROLs, not to monitor.</p> <p>The proposed revisions to EOP-008 require the RC to have specific backup capabilities sufficient to, among other things, provide visualization capabilities that ensure that operating personnel have situational awareness of the BES.</p>	
<p>IRO-002-2</p> <p>R8. Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-002-2</p> <p>R2. Each Reliability Coordinator shall provide its System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools control its Reliability Coordinator analysis tools, including approvals for planned maintenance. <i>[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p> <p>R3. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. <i>[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p>

Implementation Plan-Contents:
IRO-002-3 – Reliability Coordination – Analysis Tools

Approvals Required

IRO-002-3 – Reliability Coordination – Analysis Tools

Prerequisite Approvals

- ~~▪ Adoption of IRO-001-2, IRO-007-0, IRO-010-0, COM-001-2~~

~~**Conforming Changes to Requirements in Already
Approved Standards**~~

None

~~**Coordination with revisions proposed in other standards projects**~~

- ~~▪ The IROL SDT proposes retiring the following requirements when IRO-010 is approved:
R2~~

~~**Revision-Revisions to Glossary Terms**~~

None

Applicable Entities

Reliability Coordinator

Conforming Changes to Other Standards

None

Effective Dates

IRO-002-3 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory

approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

Retirements

IRO-002-2 should be retired at midnight of the day immediately prior to the Effective Date of IRO-002-3 in the particular jurisdiction in which the new standard is becoming effective.

Summary of Changes

The RCSDT revised the standard and is proposing retiring several requirements (R1, R3, R4, R5, R6, R7 and R8). Changes were made to eliminate redundancies between standards (existing and proposed), align with NERCs Rules of Procedure, and to address ~~issues in FERC Order 693.~~

the FERC Order 693 directive for IRO-002:

In addition we direct the ERO to develop a modification to IRO-002-1 through the Reliability Standards development process that requires a minimum set of tools that should be made available to reliability coordinators.

RCSDT response: The development of a minimum set of tools should be addressed through the work of the Real-Time Tools Best Practices Task Force. Their charge was to develop a list of tools required to perform real time operations functions and submit SARs based on their work. As requirements for these tools are developed, appropriate standards projects will be initiated to incorporate the tools within the NERC Organization Registration and Certification Process, and the applicable reliability standards. The RCSDT submits that this directive be addressed in that effort. This action is accommodated by the Standards Development Work Plan.

Revisions or Retirements to Already Approved Standards

The following ~~tables identify~~ table identifies the sections of approved standards that shall be retired or revised when this standard is implemented. ~~If the drafting team is recommending the retirement or revision of a requirement, that text is blue.~~

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-12</p> <p>R1. Each Reliability Coordinator shall have adequate communications facilities (voice and data links) to appropriate entities within its Reliability Coordinator Area. These communications facilities shall be staffed and available to act in addressing a real-time emergency condition. [<i>Violation Risk Factor: High</i>]</p>	<p>The first sentence of this requirement should be retired because it is a basic facility issue that should be addressed in certification. The second sentence is redundant with PER-004, R1 which requires the RC to be staffed 24x7.</p> <p>PER-004-1</p> <p>R1. Each Reliability Coordinator shall be staffed with adequately trained and NERC-certified Reliability Coordinator operators, 24 hours per day, seven days per week.</p>

Notes:

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-1</p> <p>R2. Each Reliability Coordinator shall determine the data requirements to support its reliability coordination tasks and shall request such data from its Transmission Operators, Balancing Authorities, Transmission Owners, Generation Owners, Generation Operators, and Load-Serving Entities, or adjacent Reliability Coordinators. [<i>Violation Risk Factor: Medium</i>]</p>	<p>None — this requirement should be retired as it is redundant with:</p> <p>IRO-010-1</p> <p>R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. The specification shall include the following: (Violation Risk Factor: Low) (Time Horizon: Operations Planning)</p>

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Notes:</p> <ul style="list-style-type: none">This requirement is redundant and will be retired upon the adoption of IRO-010-1, R1 (draft standard).	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-12</p> <p>R3R2. Each Reliability Coordinator — or its Transmission Operators and Balancing Authorities — shall provide, or arrange provisions for, data exchange to other Reliability Coordinators or Transmission Operators and Balancing Authorities via a secure network. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]</p>	<p>None — Retire requirement as it is redundant with:</p> <p>TOP-005-1</p> <p>R1. Each Transmission Operator and Balancing Authority shall provide its Reliability Coordinator with the operating data that the Reliability Coordinator requires to perform operational reliability assessments and to coordinate reliable operations within the Reliability Coordinator Area. (This requirement will be retired upon the implementation of IRO-010-1)</p> <p>IRO-014-1</p> <p>R1. The<u>Each</u> Reliability Coordinator shall have Operating Procedures, <u>Operating</u> Processes, or <u>Operating</u> Plans in place for activities that require notification, exchange of information or coordination of actions with one or more that may impact other Reliability Coordinators<u>Coordinator Areas</u> to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall address Scenarios that affect other Reliability Coordinator Areas as well as those developed in coordination with other Reliability Coordinators.</p> <p>R1. R1.1. These Operating Procedures, Processes, or Plans shall collectively address, as a minimum, the following: <u>[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]</u></p> <p>R1.1. R1.1.1. Communications and notifications, including the conditions<u>mutually agreed to conditions</u> under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.</p> <p>R1.2. R1.1.2. Energy and capacity shortages.</p> <p>R1.3. R1.1.3. Planned or unplanned outage information.</p> <p>R1.4. R1.1.4. Voltage control<u>Control of voltage</u>, including the coordination of reactive resources for voltage control.</p> <p>R1.5. R1.1.5. Coordination of information exchange to support reliability assessments, January</p> <p>R1.6. R1.1.6. Authority to act to prevent and mitigate instances of causing system conditions which could cause Adverse Reliability Impacts to other Reliability Coordinator Areas.</p>
<p>24 July 14, 2011</p>	<p>Page 6</p>

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Notes: The “secure network” provisions of R3<u>IRO-002-2 R2</u> are covered under the NERC Rules of Procedure, Section 1002 which states:</p> <p><i>NERC will provide tools and other support services for the benefit of reliability coordinators and other system operators, including the Area Control Error (ACE) and Frequency Monitoring System, NERC Hotline, Real-time Flows, System Data Exchange (SDX), Reliability Coordinator Information System (RCIS), Transmission Services Information Network (TSIN), Interchange Distribution Calculator (IDC), Interregional Security Network (ISN), and Central Repository for Security Events (CRC). To accomplish this goal, NERC will:</i></p> <ol style="list-style-type: none"> <i>1. Maintain the reliability and effectiveness of all mission-critical operating reliability support systems and services;</i> <i>2. Continue to support maintenance of a transmission provider curtailment report on the CRC site in response to Federal Energy Regulatory Commission Order 605;</i> <i>3. Investigate and analyze the use of high-speed real-time system measurements, including phasors, in predicting the behavior and performance of the Eastern Interconnection; and</i> <i>4. Facilitate real-time voice and data exchange services among reliability coordinators (e.g., Hotline, Interregional Security Network, NERCnet, System Data Exchange, etc.).</i> 	
Already Approved Standard	Proposed Replacement Requirement(s)
<p><u>IRO-002-12</u> <u>R4R3</u>. Each Reliability Coordinator shall have multi-directional communications capabilities with its Transmission Operators and Balancing Authorities, and with neighboring Reliability Coordinators, for both voice and data exchange as required to meet reliability needs of the Interconnection. [<i>Violation Risk Factor: Medium</i>]</p>	<p>None— Retire this requirement. <u>R4R3</u> is addressed in COM-001-(Interpersonal Communications capability) and IRO-010 (data)-1, R1 as well as the proposed revisions to COM-001-2, <u>R1-R8</u>.</p>
<p>Notes:</p>	

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-12</p> <p>R5R4. Each Reliability Coordinator shall have detailed real-time monitoring capability of its Reliability Coordinator Area and sufficient monitoring capability of its surrounding Reliability Coordinator Areas to ensure that potential or actual System Operating Limit or Interconnection Reliability Operating Limit violations are identified. Each Reliability Coordinator shall have monitoring systems that provide information that can be easily understood and interpreted by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant and highly reliable infrastructure. <i>[Violation Risk Factor: High]</i></p> <p>R6R5. Each Reliability Coordinator shall monitor Bulk Electric System elements (generators, transmission lines, buses, transformers, breakers, etc.) that could result in SOL or IROL violations within its Reliability Coordinator Area. Each Reliability Coordinator shall monitor both real and reactive power system flows, and operating reserves, and the status of Bulk Electric System elements that are or could be critical to SOLs and IROLs and system restoration requirements within its Reliability Coordinator Area. <i>[Violation Risk Factor: High]</i></p>	<p>None— Both should be retired based on the notes below.</p>
<p>Notes:</p> <p>R5 R4 is a basic facility requirement that should be addressed in certification.</p> <p>R6: For R5, real-time monitoring is a supporting activity and is only one of several processes used to support operation within SOLs or IROLs. It is not practical to measure real-time monitoring, nor is this necessary. The real reliability objective is to operate within identified parameters, not to monitor.</p>	
<p>IRO-002-12</p> <p>R7R6. Each Reliability Coordinator shall have adequate analysis tools such as state estimation, pre- and post-contingency analysis capabilities (thermal, stability, and voltage), and wide-area overview displays. <i>[Violation Risk Factor: High]</i></p>	<p>None— Retire this requirement. R7 is a basic facility requirement that should be addressed in certification.</p>
<p>Notes:</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-12</p> <p>R8R7. Each Reliability Coordinator shall continuously monitor its Reliability Coordinator Area. Each Reliability Coordinator shall have provisions for backup facilities that shall be exercised if the main monitoring system is unavailable. Each Reliability Coordinator shall ensure SOL and IROL monitoring and derivations continue if the main monitoring system is unavailable. <i>[Violation Risk Factor: High]</i></p>	<p>None — This requirement should be retired because it is redundant with:</p> <p>EOP-008-0</p> <p>R1. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have a plan to continue reliability operations in the event its control center becomes inoperable. The contingency plan must meet the following requirements:</p> <p>The contingency plan shall not rely on data or voice communication from the primary control facility to be viable.</p> <p>R1.2. The plan shall include procedures and responsibilities for providing basic tie line control and procedures and for maintaining the status of all inter-area schedules, such that there is an hourly accounting of all schedules.</p> <p>R1.3. The contingency plan must address monitoring and control of critical transmission facilities, generation control, voltage control, time and frequency control, control of critical substation devices, and logging of significant power system events. The plan shall list the critical facilities.</p> <p>R1.4. The plan shall include procedures and responsibilities for maintaining basic voice communication capabilities with other areas.</p> <p>R1.5. The plan shall include procedures and responsibilities for conducting periodic tests, at least annually, to ensure viability of the plan.</p> <p>R1.6. The plan shall include procedures and responsibilities for providing annual training to ensure that operating personnel are able to implement the contingency plans.</p> <p>R1.7. The plan shall be reviewed and updated annually.</p> <p>R1.8. Interim provisions must be included if it is expected to take more than one hour to implement the contingency plan for loss of primary control facility.</p>

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Notes: Real-time monitoring is a supporting activity and is only one of several processes used to support operation within SOLs or IROLs. It is not practical to measure real-time monitoring, nor is this necessary. The real reliability objective is to operate within SOLs and IROLs, not to monitor.</p> <p>The proposed revisions to EOP-008 require the RC to have specific backup capabilities sufficient to, among other things, provide visualization capabilities that ensure that operating personnel have situational awareness of the BES.</p>	
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-002-12</p> <p>R9R8. Each Reliability Coordinator shall control its Reliability Coordinator analysis tools, including approvals for planned maintenance. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. <i>[Violation Risk Factor: Medium]</i></p>	<p>IRO-002-2</p> <p>R2. Each Reliability Coordinator shall provide its System Operators with the authority to approve, deny or cancel planned outages of its own analysis tools control its Reliability Coordinator analysis tools, including approvals for planned maintenance. <i>[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p> <p>R3. Each Reliability Coordinator shall have procedures in place to mitigate the effects of analysis tool outages. <i>[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p>

Standard	Functions that Must Comply With the Requirements							
	Reliability Coordinator	Balancing Authority	Interchange Authority	Transmission Operator	Transmission Owner	Generator Owner	Generator Operator	Load Serving Entity
IRO-002	X							

~~Effective Dates~~

TBD

VRFs and VSLs for IRO-002-3 - Reliability Coordination – Analysis Tools

R#	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Medium	N/A	N/A	N/A	The Reliability Coordinator failed to provide its System Operator with the authority to approve, deny or cancel planned outages of its own analysis tools.
R2	Medium	N/A	N/A	N/A	The Reliability Coordinator failed to have a procedure to mitigate the effects of analysis tool outages.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 3, 2010.
11. Fourth posting of revised standards for a comment period with an initial ballot from January 18, 2011 through March 7, 2011.

Proposed Action Plan and Description of Current Draft:

This is the third draft of this standard posted for a recirculation ballot. The standards that did not receive comments in the initial ballot will move forward for a recirculation ballot; standards needing significant revision will move forward to another comment period and a successive ballot. IRO-005-4 did not have any significant changes following the initial ballot and is being posted for a recirculation ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Standard posted for recirculation ballots.	July 2011
2. Standard sent to BOT for approval.	August 2011
3. Standards filed with regulatory authorities.	September 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

Introduction

1. **Title:** **Reliability Coordination — Current Day Operations**
2. **Number:** IRO-005-4
3. **Purpose:** To ensure that entities are notified when an expected or actual event with Adverse Reliability Impacts is identified.
4. **Applicability:**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

A. Requirements

- R1.** When the results of an Operational Planning Analysis or Real-time Assessment indicate an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*
- R2.** Each Reliability Coordinator that identifies an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the problem has been mitigated. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

B. Measures

- M1.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when it identified an anticipated or actual condition with Adverse Reliability Impacts, within its Reliability Coordinator Area. (R1)
- M2.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area had been mitigated. (R2)

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity is the Compliance Enforcement Authority except where the Reliability Coordinator works for the Regional Entity. Where the Reliability Coordinator works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaint

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its evidence for the most recent 90 days for voice recordings or 12 months for other documentation for Requirements R1 and R2 and Measures M1 and M2.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records or for the time period specified above, whichever is longer.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	<p>The Reliability Coordinator who identified an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to one, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p>	<p>The Reliability Coordinator who identified an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to two, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p>	<p>The Reliability Coordinator who identified an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to three, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p>	<p>The Reliability Coordinator who identified an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to more than three impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p> <p>OR</p> <p>The Reliability Coordinator who identified an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area (in cases where there are less than three impacted entities).</p>

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 3, 2010.
11. Fourth posting of revised standards for a comment period with an initial ballot from January 18, 2011 through March 7, 2011.

Proposed Action Plan and Description of Current Draft:

This is the third draft of this standard posted for a recirculation ballot. The standards that did not receive comments in the initial ballot will move forward for a recirculation ballot; standards needing significant revision will move forward to another comment period and a successive ballot. IRO-005-4 did not have any significant changes following the initial ballot and is being posted for a recirculation ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Standard posted for recirculation ballots.	July 2011
2. Standard sent to BOT for approval.	August 2011
3. Standards filed with regulatory authorities.	September 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

Introduction

1. **Title:** Reliability Coordination — Current Day Operations
2. **Number:** IRO-005-4
3. **Purpose:** To ensure that entities are notified when an expected or actual event with Adverse Reliability Impacts is identified.
4. **Applicability:**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

A. Requirements

- R1. When the results of an Operational Planning Analysis or Real-time Assessment indicate an ~~expected~~anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify ~~issue an alert to~~ all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. *[Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*
- R2. ~~The~~ Each Reliability Coordinator that identifies an ~~expected~~anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the problem has been mitigated. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

B. Measures

- M1. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when it identified ~~a real~~an anticipated or ~~potential~~actual condition with Adverse Reliability Impacts, within its Reliability Coordinator Area. (R1)
- M2. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when ~~a real~~an anticipated or ~~potential~~actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area had been mitigated. (R2)

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~Regional Entity~~

The Regional Entity is the Compliance Enforcement Authority except where the Reliability Coordinator works for the Regional Entity. Where the Reliability Coordinator works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.

1.2. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its evidence for the most recent 90 days for voice recordings or 12 months for other documentation for Requirements R1 and R2 and Measures M1 and M2.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records or for the time period specified above, whichever is longer.—

1.4. Additional Compliance Information

None.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	<p>The Reliability Coordinator who identified an expected <u>anticipated</u> or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to one, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p>	<p>The Reliability Coordinator who identified an expected <u>anticipated</u> or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to two, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p>	<p>The Reliability Coordinator who identified an expected <u>anticipated</u> or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to three, but not all, impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p>	<p>The Reliability Coordinator who identified an expected <u>anticipated</u> or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to more than three impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area.</p> <p>OR</p> <p>The Reliability Coordinator who identified an expected <u>anticipated</u> or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area failed to issue an alert to all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area (in cases where there are less than three impacted entities).</p>
R2	<p>The Reliability Coordinator failed to notify one, but not all, impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.</p>	<p>The Reliability Coordinator failed to notify two, but not all, impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.</p>	<p>The Reliability Coordinator failed to notify three, but not all, impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.</p>	<p>The Reliability Coordinator failed to notify more than three impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated.</p>

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
				<p>OR</p> <p>The Reliability Coordinator failed to notify more all impacted Transmission Operators, Balancing Authorities, when the transmission problem had been mitigated (in cases where there are less than three impacted entities).</p>

D. Regional Differences

None identified.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 3, 2010.
11. Fourth posting of revised standards for a comment period with an initial ballot from January 18, 2011 through March 7, 2011.

Proposed Action Plan and Description of Current Draft:

This is the third draft of this standard posted for a recirculation ballot. The standards that did not receive comments in the initial ballot will move forward for a recirculation ballot; standards needing significant revision will move forward to another comment period and a successive ballot. IRO-005-4 did not have any significant changes following the initial ballot and is being posted for a recirculation ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Standard posted for recirculation ballots.	July 2011
2. Standard sent to BOT for approval.	August 2011
3. Standards filed with regulatory authorities.	September 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

Introduction

1. **Title:** Reliability Coordination — Current Day Operations
 2. **Number:** IRO-005-~~3a4~~
 - ~~3. Purpose: The Reliability Coordinator must be continuously aware of conditions within its Reliability Coordinator Area and include this information in its reliability assessments. The Reliability Coordinator must monitor Bulk Electric System parameters that may have significant impacts upon the Reliability Coordinator Area and neighboring Reliability Coordinator Areas.~~
 - ~~4. Applicability~~
 3. Purpose: To ensure that entities are notified when an expected or actual event with Adverse Reliability Impacts is identified.
 4. Applicability:
 - 4.1. Reliability Coordinators.
 - ~~4.2. Balancing Authorities.~~
 - ~~4.3. Transmission Operators.~~
 - ~~4.4. Transmission Service Providers.~~
 - ~~4.5. Generator Operators.~~
 - ~~4.6. Load-Serving Entities.~~
 - ~~4.7. Purchasing-Selling Entities.~~
- Effective Date: In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, the standard shall become effective on the latter of either April 1, 2009 or the first day of the first calendar quarter, three months after BOT adoption.
- ~~5. In those jurisdictions where regulatory approval is required, the this standard shall become effective on the latter first day of the first calendar quarter after Board of either April 1, 2009 or the first day of the first calendar quarter, three months after applicable regulatory approval. Trustees approval.~~

A. Requirements

- ~~R1. Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following:~~
 - ~~R1.1. Current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.~~
 - ~~R1.2. Current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.~~

- ~~R1.3.~~ Current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.
- ~~R1.4.~~ System real and reactive reserves (actual versus required).
- ~~R1.5.~~ Capacity and energy adequacy conditions.
- ~~R1.6.~~ Current ACE for all its Balancing Authorities.
- ~~R1.7.~~ Current local or Transmission Loading Relief procedures in effect.
- ~~R1.8.~~ Planned generation dispatches.
- ~~R1.9.~~ Planned transmission or generation outages.
- ~~R1.10.~~ Contingency events.
- ~~R2.~~ Each Reliability Coordinator shall monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.
- ~~R3.~~ Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.
- ~~R4.~~ The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.
- R1. When the results of an Operational Planning Analysis or Real-time Assessment indicate an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area, each Reliability Coordinator shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]
- ~~R5.~~ Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities' performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.
- ~~R6.~~ The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.

- ~~R7.~~ As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities.
- ~~R8.~~ The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.
- ~~R9.~~ Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.
- ~~R10.~~ In instances where there is a difference in derived limits, the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.
- ~~R11.~~ The Transmission Service Provider shall respect SOLs and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes.
- ~~R12.~~ R2. Each Reliability Coordinator who foresees a transmission problem (such as an SOL that identifies an anticipated or IROL violation, loss of reactive reserves, etc.) actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area shall issue an alert to notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area without delay. The receiving Reliability Coordinator shall disseminate this information to its impacted Transmission Operators and Balancing Authorities. The Reliability Coordinator shall notify all impacted Transmission Operators, Balancing Authorities, when the transmission problem has been mitigated. *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]*

B. Measures

- ~~M1.~~ The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, a prepared report specifically detailing compliance to each of the bullets in Requirement 1, EMS availability, SCADA data collection system communications performance or equivalent evidence that will be used to confirm that it monitors the Reliability Coordinator Area parameters specified in Requirements 1.1 through 1.9.
- ~~M2.~~ If one of its Balancing Authorities has insufficient operating reserves, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to computer printouts, operating logs, voice recordings or transcripts of voice

~~recordings, or equivalent evidence that will be used to determine if the Reliability Coordinator directed and, if needed, assisted the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. (Requirement 2 and Requirement 7)~~

~~M3. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to determine if it informed Transmission Operators and Balancing Authorities of Geo-Magnetic Disturbance (GMD) forecast information and provided assistance as needed in the development of any required response plans. (Requirement 3)~~

~~M1. The Each Reliability Coordinator shall have and provide **upon request** evidence **that could** which may include, but is not limited to, dated operator logs, dated voice recordings or dated transcripts of voice recordings, **Hot Line recordings**, electronic communications, or equivalent **evidence documentation**, that will be used to determine **if that** it **disseminated information** notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when it identified an anticipated or actual condition with Adverse Reliability Impacts, within its Reliability Coordinator Area **in accordance with Requirement 4.** (R1)~~

~~M1. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, computer printouts, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it monitored system frequency and Balancing Authority performance and directed any necessary rebalancing, as specified in Requirement 5 Part 1.~~

~~M2. The Transmission Operators and Balancing Authorities shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it utilized all resources, including firm load shedding, as directed by its Reliability Coordinator, to relieve an emergent condition. (Requirement 5 Part 2)~~

~~M3. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, voice recordings or transcripts of voice recordings, electronic communications, operator logs or equivalent evidence that will be used to determine if it coordinated with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, CPS, or DCS violations including the coordination of pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities and Generator Operators. (Requirement 6 Part 1)~~

~~M4. If a large Area Control Error has occurred, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, Hot Line recordings, electronic communications or equivalent evidence that will be used to determine if it identified sources of the Area Control Errors, and initiated corrective actions with the appropriate~~

~~Balancing Authority if the problem was within the Reliability Coordinator's Area (Requirement 8 Part 1)~~

- ~~M5. If a Special Protection System is armed and that system could have had an inter-area impact, the Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, agreements with their Transmission Operators, procedural documents, operator logs, computer analysis, training modules, training records or equivalent evidence that will be used to confirm that it was aware of the impact of that Special Protection System on inter-area flows. (Requirement 9)~~
- ~~M6. If there is an instance where there is a disagreement on a derived limit, the Transmission Operator, Balancing Authority, Generator Operator, Load-serving Entity, Purchasing-selling Entity and Transmission Service Provider involved in the disagreement shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings, electronic communications or equivalent evidence that will be used to determine if it operated to the most limiting parameter. (Part 2 of Requirement 10)~~
- ~~M7. The Transmission Service Providers shall have and provide upon request evidence that could include, but is not limited to, procedural documents, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it respected the SOLs or IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes. (Requirement 11 Part 2)~~
- ~~M4. The Each Reliability Coordinator shall have and provide ~~upon request~~ evidence that ~~could~~which may include, but is not limited to, dated operator logs, dated voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent evidencedocumentation, that will be used to ~~confirm~~determine that it ~~issued alerts when it foresaw a transmission problem (such as an SOL or IROL violation, loss of reactive reserves, etc.) within its Reliability Coordinator Area, to~~notified all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area ~~as specified in Requirement 12 Part 1.~~~~
- ~~M5. The Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that upon receiving information such as an SOL or IROL violation, loss of reactive reserves, etc. it disseminated the information to its impacted Transmission Operators and Balancing Authorities as specified in Requirement 12 Part 2.~~
- ~~M1. Thewhen an anticipated or actual condition with Adverse Reliability Coordinator shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications or equivalent evidence that will be used to confirm that it notified all impacted Transmission Operators, Balancing Authorities and Reliability Coordinators when a transmission problem has Impacts within its Reliability Coordinator Area had been mitigated. (Requirement 12 Part 3R2)~~

C. Compliance

1. Compliance Monitoring Process

1.1. ~~Compliance~~ **Monitoring Responsibility** ~~Enforcement Authority~~

~~The Regional Entity is the Compliance Enforcement Authority except where the Reliability Coordinator works for the Regional Entity. Where the Reliability Coordinator works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.~~

~~Regional Reliability Organizations shall be responsible for compliance monitoring.~~

1.2. Compliance Monitoring and ~~Reset Time Frame~~ **Enforcement Processes:**

~~One~~ Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaint

1.3. Data Retention

~~The Reliability Coordinator shall keep data or more of the following methods will be used evidence to assess show compliance:~~

~~— Self-certification (Conducted annually with submission according as identified below unless directed by its Compliance Enforcement Authority to schedule.)~~

~~— Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)~~

~~— Periodic Audit (Conducted once every three years according to schedule.)~~

~~Triggered Investigations (Notification retain specific evidence for a longer period of time as part of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)~~

~~The Performance Reset Period shall be 12 months from the last finding of non-compliance.~~

~~5.1.~~ **Data Retention**

~~For Measures 1 and 9, each~~ Reliability Coordinator shall ~~have its current in-force documents as evidence.~~

- ~~• For Measures 2–8~~ retain its evidence for the most recent 90 days for voice recordings or 12 months for other documentation for Requirements R1 and R2 and Measures ~~12 through 13, the~~ M1 and M2.

~~If a~~ Reliability Coordinator shall keep ~~90 days of historical data (evidence).~~

~~For Measure 6, the~~ Transmission Operator and Balancing Authority shall keep 90 days of historical data (evidence).

~~For Measure 10, the~~ Transmission Operator, Balancing Authority, and Transmission Service Provider shall keep 90 days of historical data (evidence).

~~For Measure 11, the~~ Transmission Service Provider shall keep 90 days of historical data (evidence).

If an entity is found non-compliant ~~the entity, it~~ shall keep information related to the ~~non-compliance~~ non-compliance until found compliant ~~or for two years plus the current year, whichever is longer.~~

- ~~• Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,.~~
- The Compliance ~~Monitor~~ Enforcement Authority shall keep the last ~~periodic audit~~ report ~~records~~ and all requested and submitted subsequent ~~compliance records~~ audit records or for the time period specified above, whichever is longer.

1.4. Additional Compliance Information

None.

2. Violation Severity Levels:

Requirement R#	Lower <u>YSL</u>	Moderate <u>YSL</u>	High <u>YSL</u>	Severe <u>YSL</u>
R1	The Reliability Coordinator failed to monitor one (1) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor two (2) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.	The Reliability Coordinator failed to monitor more than three (3) of the elements listed in IRO-005-1 R1.1 through R1.10.
R1.1	The Reliability Coordinator failed to monitor the current status of Bulk Electric System elements (transmission or generation including critical auxiliaries such as Automatic Voltage Regulators and Special Protection Systems) and system loading.	N/A	N/A	N/A
R1.2	The Reliability Coordinator failed to monitor current pre-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.	N/A	N/A	N/A

Requirement#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.3	The Reliability Coordinator failed to monitor current post-contingency element conditions (voltage, thermal, or stability), including any applicable mitigation plans to alleviate SOL or IROL violations, including the plan's viability and scope.	N/A	N/A	N/A
R1.4	The Reliability Coordinator failed to monitor system real and reactive reserves (actual versus required).	N/A	N/A	N/A
R1.5	The Reliability Coordinator failed to monitor capacity and energy adequacy conditions.	N/A	N/A	N/A
R1.6	The Reliability Coordinator failed to monitor current ACE for all its Balancing Authorities.	N/A	N/A	N/A
R1.7	The Reliability Coordinator failed to monitor current local or Transmission Loading Relief procedures in effect.	N/A	N/A	N/A
R1.8	The Reliability Coordinator failed to monitor planned generation dispatches.	N/A	N/A	N/A

Requirement#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.9	The Reliability Coordinator failed to monitor planned transmission or generation outages.	N/A	N/A	N/A
R1.10	The Reliability Coordinator failed to monitor contingency events.	N/A	N/A	N/A
R2	N/A	The Reliability Coordinator failed to direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities.	The Reliability Coordinator failed to issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities.	The Reliability Coordinator failed to monitor its Balancing Authorities' parameters to ensure that the required amount of operating reserves was provided and available as required to meet the Control Performance Standard and Disturbance Control Standard requirements.
R3	N/A	N/A	The Reliability Coordinator ensured its Transmission Operators and Balancing Authorities were aware of Geo-Magnetic Disturbance (GMD) forecast information, but failed to assist, when needed, in the development of any required response plans.	The Reliability Coordinator failed to ensure its Transmission Operators and Balancing Authorities were aware of Geo-Magnetic Disturbance (GMD) forecast information.
R4R1	N/A The Reliability Coordinator who identified an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area	N/A The Reliability Coordinator who identified an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area	N/A The Reliability Coordinator who identified an anticipated or actual condition with Adverse Reliability Impacts within its Reliability Coordinator Area	The Reliability Coordinator failed to disseminate information who identified an anticipated or actual condition with Adverse Reliability Impacts

Appendix 1

Requirement Number and Text of Requirement

TOP-005-1 Requirement R3

~~Upon request, each Balancing Authority and Transmission Operator shall provide to other Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability, the operating data that are necessary to allow these Balancing Authorities and Transmission Operators to perform operational reliability assessments and to coordinate reliable operations. Balancing Authorities and Transmission Operators shall provide the types of data as listed in Attachment 1 TOP-005-0 “Electric System Reliability Data,” unless otherwise agreed to by the Balancing Authorities and Transmission Operators with immediate responsibility for operational reliability.~~

~~*The above referenced Attachment 1—TOP-005-0 specifies the following data as item 2.6: New or degraded special protection systems. [Underline added for emphasis.]*~~

IRO-005-1 Requirement R12[†]

~~**R12.** Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected. [Underline added for emphasis.]~~

PRC-012-0 Requirements R1 and R1.3

~~**R1.** Each Regional Reliability Organization with a Transmission Owner, Generator Owner, or Distribution Providers that uses or is planning to use an SPS shall have a documented Regional Reliability Organization SPS review procedure to ensure that SPSs comply with Regional criteria and NERC Reliability Standards. The Regional SPS review procedure shall include:~~

~~**R1.3.** Requirements to demonstrate that the SPS shall be designed so that a single SPS component failure, when the SPS was intended to operate, does not prevent the interconnected transmission system from meeting the performance requirements defined in Reliability Standards TPL-001-0, TPL-002-0, and TPL-003-0.~~

Background Information for Interpretation

The TOP-005-1 standard focuses on two key obligations. The first key obligation (Requirement R1) is a “responsibility mandate.” Requirement R1 establishes who is responsible for the obligation to provide operating data “required” by a Reliability Coordinator within the framework of the Reliability Coordinator requirements defined in the IRO standards. The second key obligation (Requirement R3) is a “performance mandate.” Requirement R3 defines the obligation to provide data “requested” by other reliability entities that is needed “to perform

[†] In the current version of the Standard (IRO-005-3a), this requirement is R9.

assessments and to coordinate operations.”

The Attachment to TOP-005-1 is provided as a guideline of what “can be shared.” The Attachment is not an obligation of “what must be shared.” Enforceable NERC Requirements must be explicitly contained within a given Standard’s approved requirements. In this case, the standard only requires data “upon request.” If a Reliability Coordinator or other reliability entity were to request data such as listed in the Attachment, then the entity being asked would be mandated by Requirements R1 and R3 to provide that data (including item 2.6, whether it is or is not in some undefined “degraded” state).

IRO-002-1 requires the Reliability Coordinator to have processes in place to support its reliability obligations (Requirement R2). Requirement R4 mandates that the Reliability Coordinator have communications processes in place to meet its reliability obligations, and Requirement R5 et al mandate the Reliability Coordinator to have the tools to carry out these reliability obligations.

IRO-003-2 (Requirements R1 and R2) requires the Reliability Coordinator to monitor the state of its system.

IRO-004-1 requires that the Reliability Coordinator carry out studies to identify Interconnection Reliability Operating Limits (Requirement R1) and to be aware of system conditions via monitoring tools and information exchange.

IRO-005-1 mandates that each Reliability Coordinator monitor predefined base conditions (Requirement R1), collect additional data when operating limits are or may be exceeded (Requirement R3), and identify actual or potential threats (Requirement R5). The basis for that request is left to each Reliability Coordinator. The Purpose statement of IRO-005-1 focuses on the Reliability Coordinator’s obligation to be aware of conditions that may have a “significant” impact upon its area and to communicate that information to others (Requirements R7 and R9). Please note: it is from this communication that Transmission Operators and Balancing Authorities would either obtain or would know to ask for SPS information from another Transmission Operator.

The IRO-005-1 (Requirement R12) standard implies that degraded is a condition that will result in a failure to operate as designed. If the loss of a communication channel will result in the failure of an SPS to operate as designed then the Transmission Operator would be mandated to report that information. On the other hand, if the loss of a communication channel will not result in the failure of the SPS to operate as designed, then such a condition can be, but is not mandated to be, reported.

Conclusion

The TOP-005-1 standard does not provide, nor does it require, a definition for the term “degraded.”

The IRO-005-1 (R12) standard implies that degraded is a condition that will result in a failure of an SPS to operate as designed. If the loss of a communication channel will result in the failure of an SPS to operate as designed, then the Transmission Operator would be mandated to report that information. On the other hand, if the loss of a communication channel will not result in the failure of the SPS to operate as designed, then such a condition can be, but is not mandated to be,

~~reported.~~

~~To request a formal definition of the term degraded, the Reliability Standards Development Procedure requires the submittal of a Standards Authorization Request.~~

Implementation Plan
IRO-005-4 – Reliability Coordination – Current Day Operations

Approvals Required

IRO-005-4 – Reliability Coordination – Current Day Operations

Prerequisite Approvals

None

Revisions to Glossary Terms

Adverse Reliability Impact - The impact of an event that results in ~~frequency-related Bulk Electric System instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection.~~

Applicable Entities

Reliability Coordinator

Conforming Changes to Other Standards

None

Effective Dates

IRO-005-4 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

Retirements

IRO-005-3a should be retired at midnight of the day immediately prior to the Effective Date of IRO-005-4 in the particular jurisdiction in which the new standard is becoming effective.

Summary of Changes

The RC SDT proposes retiring other requirements and revising R15 into two separate requirements.

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-3a R1. and sub-requirements Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: <i>[Violation Risk Factor: High]</i></p>	<p>Retire R1 and its sub-requirements – Monitoring capability can be objectively measured and is essential to real-time operations – however real-time monitoring is a supporting activity and is only one of several processes used to support operation within defined parameters. Monitoring capability should be assessed during certification and not as a requirement.</p>
<p>IRO-005-3a R2. Each Reliability Coordinator shall monitor its Balancing Authorities’ parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard (CPS) and Disturbance Control Standard (DCS) requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities. <i>[Violation Risk Factor: High]</i></p>	<p>None. The RCSDT proposes that this requirement be retired. The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. We view these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. This requirement should be retired. The requirement is also redundant with existing EOP-002-2.</p>
<p>Notes: EOP-002-2 R1. Each Balancing Authority and Reliability Coordinator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its respective area and shall exercise specific authority to alleviate capacity and energy</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
	<p>emergencies.</p> <p>R2. Each Balancing Authority shall implement its capacity and energy emergency plan, when required and as appropriate, to reduce risks to the interconnected system.</p> <p>R3. A Balancing Authority that is experiencing an operating capacity or energy emergency shall communicate its current and future system conditions to its Reliability Coordinator and neighboring Balancing Authorities.</p> <p>R4. A Balancing Authority anticipating an operating capacity or energy emergency shall perform all actions necessary including bringing on all available generation, postponing equipment maintenance, scheduling interchange purchases in advance, and being prepared to reduce firm load.</p> <p>R5. A deficient Balancing Authority shall only use the assistance provided by the Interconnection’s frequency bias for the time needed to implement corrective actions. The Balancing Authority shall not unilaterally adjust generation in an attempt to return Interconnection frequency to normal beyond that supplied through frequency bias action and Interchange Schedule changes. Such unilateral adjustment may overload transmission facilities.</p> <p>R6. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. These remedies include, but are not limited to:</p> <ul style="list-style-type: none"> R6.1. Loading all available generating capacity. R6.2. Deploying all available operating reserve. R6.3. Interrupting interruptible load and exports. R6.4. Requesting emergency assistance from other Balancing Authorities. R6.5. Declaring an Energy Emergency through its Reliability Coordinator; and R6.6. Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads. <p>R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall:</p> <ul style="list-style-type: none"> R7.1. Manually shed firm load without delay to return its ACE to zero; and R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.” <p>R8. A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.” The Reliability</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.</p> <p>R9. When a Transmission Service Provider expects to elevate the transmission service priority of an Interchange Transaction from Priority 6 (Network Integration Transmission Service from Non-designated Resources) to Priority 7 (Network Integration Transmission Service from designated Network Resources) as permitted in its transmission tariff (See Attachment 1-IRO-006-0 “Transmission Loading Relief Procedure” for explanation of Transmission Service Priorities):</p> <p>R9.1. The deficient Load-Serving Entity shall request its Reliability Coordinator to initiate an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0.</p> <p>R9.2. The Reliability Coordinator shall submit the report to NERC for posting on the NERC Website, noting the expected total MW that may have its transmission service priority changed.</p> <p>R9.3. The Reliability Coordinator shall use EEA 1 to forecast the change of the priority of transmission service of an Interchange Transaction on the system from Priority 6 to Priority 7.</p> <p>R9.4. The Reliability Coordinator shall use EEA 2 to announce the change of the priority of transmission service of an Interchange Transaction on the system from Priority 6 to Priority 7.</p>	
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R3. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.</p>	<p>The RCSDT proposes retiring this requirement as it is addressed in R15 below. A GMD is one of the “expected or actual threats with Adverse Reliability Impacts”.</p> <p>IRO-005-4 (proposed)</p> <p>R2. Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts, within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the problem has been mitigated. <i>[Violation Risk Factor: Medium]</i> <i>[Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p>
<p>IRO-005-3</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>R4. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.</p>	<p>None. The RCSDT recommends retiring this requirement.</p>
<p>Notes: The RCSDT proposes that this requirement is too vague and ambiguous to measure. We recommend retiring this requirement.</p>	
<p>IRO-005-3a</p> <p>R5. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities’ performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.</p>	<p>None. The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. RCSDT views these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. The second sentence is redundant with EOP-002, R4, R6, R7, and R9. This requirement should be retired.</p> <p>The RCSDT recommends retiring this requirement as it is redundant with:</p> <p>TOP-006-1</p> <p>R7. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall monitor system frequency.</p> <p>EOP-002-2</p> <p>R4. A Balancing Authority anticipating an operating capacity or energy emergency shall perform all actions necessary including bringing on all available generation, postponing equipment maintenance, scheduling interchange purchases in advance, and being prepared to reduce firm load.</p> <p>R6. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so.</p> <p>These remedies include, but are not limited to:</p> <p>R6.1. Loading all available generating capacity.</p> <p>R6.2. Deploying all available operating reserve.</p>

Already Approved Standard	Proposed Replacement Requirement(s)
	<p>R6.3. Interrupting interruptible load and exports.</p> <p>R6.4. Requesting emergency assistance from other Balancing Authorities.</p> <p>R6.5. Declaring an Energy Emergency through its Reliability Coordinator; and</p> <p>R6.6. Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads.</p> <p>R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall:</p> <p>R7.1. Manually shed firm load without delay to return its ACE to zero; and</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p>
<p>IRO-005-2</p> <p>R6. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p>None. The RCSDT proposes to retire this requirement from IRO-005.</p> <p>The RCSDT proposes retiring this requirement as it is redundant with TOP-003 and IRO-004 (all requirements) for next day requirements. The RC has the authority to coordinate pending outages in real-time through IRO-001-2, R1 (proposed). The issue of CPS and DCS is covered in EOP-002-2, R6, R7 and R8 (see above).</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Notes:</p> <p>TOP-003-0</p> <p>R1. Generator Operators and Transmission Operators shall provide planned outage information.</p> <p>R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p>R1.2. Each Transmission Operator shall provide outage information daily to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. The Reliability Coordinator shall establish the outage reporting requirements.</p> <p>R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p>R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.</p> <p>R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.</p> <p>R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.</p> <p>IRO-004-1</p> <p>R1. Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p> <p>R2. Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p> <p>R3. Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.</p> <p>R4. Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p>R5. Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.</p> <p>R6. If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.</p> <p>R7. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.</p> <p>IRO-001-2, R1 (proposed)</p> <p>R1. The Reliability Coordinator shall act or direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts. <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations and Same Day Operations]</i></p>	<p>None. The RCSDT proposes to retire this requirement as it is redundant with:</p> <p>EOP-002-2</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p> <p>R8. A Reliability Coordinator that has any Balancing Authority within its</p>
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-3a</p> <p>R7. As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities. <i>[Violation Risk Factor: High]</i></p>	<p>None. The RCSDT proposes to retire this requirement as it is redundant with:</p> <p>EOP-002-2</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p> <p>R8. A Reliability Coordinator that has any Balancing Authority within its</p>

Already Approved Standard	Proposed Replacement Requirement(s)
	<p>Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002-0 "Energy Emergency Alert Levels." The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.</p>
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-3a R8. The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.</p>	<p>None. The RCSDT recommends retiring this requirement as it is redundant with:</p> <p>IRO-001-2 (proposed)</p> <p>R2. Each Reliability Coordinator shall take actions or direct actions (which could include issuing Reliability Directives) by Transmission Operators, Balancing Authorities, Generator Operators, and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p> <p>TOP-006-1, R7 (existing)</p> <p>R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.</p>
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-3a R9. Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a SOL or IROL violation) is</p>	<p>None. The RCSDT recommends retiring this requirement as it is redundant with proposed IRO-010:</p> <p>IRO-010-1</p> <p>R1. The Reliability Coordinator shall have a documented data</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.</p>	<p>specification for data and information to build and maintain models to support Real-Time monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: <i>(Violation Risk Factor: Low) (Time Horizon: Operations Planning)</i></p> <p>R1.1. List of required data and information.</p> <p>R1.2. Mutually agreeable format.</p> <p>R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</p> <p>R1.4. Process for data provision when automated Real-Time system operating data is unavailable.</p> <p>R2. The Reliability Coordinator shall distribute its data specification to entities that have Facilities monitored by the Reliability Coordinator and to entities that provide Facility status to the Reliability Coordinator. <i>(Violation Risk Factor: Low) (Time Horizon: Operations Planning)</i></p> <p>R3. Each Balancing Authority, Generator Owner, Generator Operator, Interchange Authority, Load-serving Entity, Reliability Coordinator, Transmission Operator, and Transmission Owner shall provide data and information, as specified, to the Reliability Coordinator(s) with which it has a reliability relationship. The data and information is limited to data needed by the Reliability Coordinator to support Real-Time Monitoring, Operational Planning Analyses, and Real-Time Assessments. <i>(Violation Risk Factor: Medium) (Time Horizon: Operations Planning; Same-day Operations; Real-time Operations)</i></p>
<p>Notes: The RCSDT recommends retiring this requirement as it is redundant with proposed IRO-010, R1 and R3. Also, the scope of project</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
2007-3 includes enhancing the SPS provisions of TOP-005. IRO-003, R1 indicates the RC will monitor all items that will impact reliability, and SPSs are a part of that.

None

Revisions to Glossary Terms

Adverse Reliability Impact - The impact of an event that results in frequency-related Bulk Electric System instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection.

Applicable Entities

Reliability Coordinator

Conforming Changes to Requirements in Already Approved Other Standards

~~Revision Summary~~

- ~~Many of the requirements in this standard will be retired under the IROL SDT work plan. The RCSDT proposes retiring other requirements and revising R15 into two separate requirements.~~

~~Revisions or Retirements to Already Approved Standards~~

~~The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented. If the drafting team is recommending the retirement or revision of a requirement, that text is blue.~~

|

|

Functions that Must Comply with the Requirements in the Standards

None

Effective Dates

~~In those jurisdictions where regulatory approval is required, this standard~~ IRO-005-4 shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

Retirements

IRO-005-3a should be retired at midnight of the day immediately prior to the Effective Date of IRO-005-4 in the particular jurisdiction in which the new standard is becoming effective.

Summary of Changes

The RC SDT proposes retiring other requirements and revising R15 into two separate requirements.

The following tables identify the sections of approved standards that shall be retired or revised when this standard is implemented.

Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-3a R1. and sub-requirements Each Reliability Coordinator shall monitor its Reliability Coordinator Area parameters, including but not limited to the following: <i>[Violation Risk Factor: High]</i></p>	<p>Retire R1 and its sub-requirements – Monitoring capability can be objectively measured and is essential to real-time operations – however real-time monitoring is a supporting activity and is only one of several processes used to support operation within defined parameters. Monitoring capability should be assessed during certification and not as a requirement.</p>
<p>IRO-005-3a R2. Each Reliability Coordinator shall monitor its Balancing Authorities’ parameters to ensure that the required amount of operating reserves is provided and available as required to meet the Control Performance Standard (CPS) and Disturbance Control Standard (DCS) requirements. If necessary, the Reliability Coordinator shall direct the Balancing Authorities in the Reliability Coordinator Area to arrange for assistance from neighboring Balancing Authorities. The Reliability Coordinator shall issue Energy Emergency Alerts as needed and at the request of its Balancing Authorities and Load-Serving Entities. <i>[Violation Risk Factor: High]</i></p>	<p>None. The RCSDT proposes that this requirement be retired. The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. We view these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. This requirement should be retired. The requirement is also redundant with existing EOP-002-2.</p>
<p>Notes: EOP-002-2 R1. Each Balancing Authority and Reliability Coordinator shall have the responsibility and clear decision-making authority to take whatever actions are needed to ensure the reliability of its respective area and shall exercise specific authority to alleviate capacity and energy</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
	<p>emergencies.</p> <p>R2. Each Balancing Authority shall implement its capacity and energy emergency plan, when required and as appropriate, to reduce risks to the interconnected system.</p> <p>R3. A Balancing Authority that is experiencing an operating capacity or energy emergency shall communicate its current and future system conditions to its Reliability Coordinator and neighboring Balancing Authorities.</p> <p>R4. A Balancing Authority anticipating an operating capacity or energy emergency shall perform all actions necessary including bringing on all available generation, postponing equipment maintenance, scheduling interchange purchases in advance, and being prepared to reduce firm load.</p> <p>R5. A deficient Balancing Authority shall only use the assistance provided by the Interconnection’s frequency bias for the time needed to implement corrective actions. The Balancing Authority shall not unilaterally adjust generation in an attempt to return Interconnection frequency to normal beyond that supplied through frequency bias action and Interchange Schedule changes. Such unilateral adjustment may overload transmission facilities.</p> <p>R6. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so. These remedies include, but are not limited to:</p> <ul style="list-style-type: none"> R6.1. Loading all available generating capacity. R6.2. Deploying all available operating reserve. R6.3. Interrupting interruptible load and exports. R6.4. Requesting emergency assistance from other Balancing Authorities. R6.5. Declaring an Energy Emergency through its Reliability Coordinator; and R6.6. Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads. <p>R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall:</p> <ul style="list-style-type: none"> R7.1. Manually shed firm load without delay to return its ACE to zero; and R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.” <p>R8. A Reliability Coordinator that has any Balancing Authority within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.” The Reliability</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.</p> <p>R9. When a Transmission Service Provider expects to elevate the transmission service priority of an Interchange Transaction from Priority 6 (Network Integration Transmission Service from Non-designated Resources) to Priority 7 (Network Integration Transmission Service from designated Network Resources) as permitted in its transmission tariff (See Attachment 1-IRO-006-0 “Transmission Loading Relief Procedure” for explanation of Transmission Service Priorities):</p> <p>R9.1. The deficient Load-Serving Entity shall request its Reliability Coordinator to initiate an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0.</p> <p>R9.2. The Reliability Coordinator shall submit the report to NERC for posting on the NERC Website, noting the expected total MW that may have its transmission service priority changed.</p> <p>R9.3. The Reliability Coordinator shall use EEA 1 to forecast the change of the priority of transmission service of an Interchange Transaction on the system from Priority 6 to Priority 7.</p> <p>R9.4. The Reliability Coordinator shall use EEA 2 to announce the change of the priority of transmission service of an Interchange Transaction on the system from Priority 6 to Priority 7.</p>	
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-2</p> <p>R3. Each Reliability Coordinator shall ensure its Transmission Operators and Balancing Authorities are aware of Geo-Magnetic Disturbance (GMD) forecast information and assist as needed in the development of any required response plans.</p>	<p>The RCSDT proposes retiring this requirement as it is addressed in R15 below. A GMD is one of the “expected or actual threats with Adverse Reliability Impacts”.</p> <p>IRO-005-4 (proposed)</p> <p>R2. Each Reliability Coordinator that identifies an expected or actual condition with Adverse Reliability Impacts, within its Reliability Coordinator Area shall notify all impacted Transmission Operators and Balancing Authorities in its Reliability Coordinator Area when the problem has been mitigated. <i>[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i></p>
<p>IRO-005-3</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>R4. The Reliability Coordinator shall disseminate information within its Reliability Coordinator Area, as required.</p>	<p>None. The RCSDT recommends retiring this requirement.</p>
<p>Notes: The RCSDT proposes that this requirement is too vague and ambiguous to measure. We recommend retiring this requirement.</p>	
<p>IRO-005-3a</p> <p>R5. Each Reliability Coordinator shall monitor system frequency and its Balancing Authorities’ performance and direct any necessary rebalancing to return to CPS and DCS compliance. The Transmission Operators and Balancing Authorities shall utilize all resources, including firm load shedding, as directed by its Reliability Coordinator to relieve the emergent condition.</p>	<p>None. The BA has its own requirements regarding compliance with CPS and DCS standards as well as requesting emergency assistance. RCSDT views these as vestiges of an earlier program that no longer apply given the current mandatory requirements with which the BA must comply. The second sentence is redundant with EOP-002, R4, R6, R7, and R9. This requirement should be retired.</p> <p>The RCSDT recommends retiring this requirement as it is redundant with:</p> <p>TOP-006-1</p> <p>R7. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall monitor system frequency.</p> <p>EOP-002-2</p> <p>R4. A Balancing Authority anticipating an operating capacity or energy emergency shall perform all actions necessary including bringing on all available generation, postponing equipment maintenance, scheduling interchange purchases in advance, and being prepared to reduce firm load.</p> <p>R6. If the Balancing Authority cannot comply with the Control Performance and Disturbance Control Standards, then it shall immediately implement remedies to do so.</p> <p>These remedies include, but are not limited to:</p> <p>R6.1. Loading all available generating capacity.</p> <p>R6.2. Deploying all available operating reserve.</p>

Already Approved Standard	Proposed Replacement Requirement(s)
	<p>R6.3. Interrupting interruptible load and exports.</p> <p>R6.4. Requesting emergency assistance from other Balancing Authorities.</p> <p>R6.5. Declaring an Energy Emergency through its Reliability Coordinator; and</p> <p>R6.6. Reducing load, through procedures such as public appeals, voltage reductions, curtailing interruptible loads and firm loads.</p> <p>R7. Once the Balancing Authority has exhausted the steps listed in Requirement 6, or if these steps cannot be completed in sufficient time to resolve the emergency condition, the Balancing Authority shall:</p> <p>R7.1. Manually shed firm load without delay to return its ACE to zero; and</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p>
<p>IRO-005-2</p> <p>R6. The Reliability Coordinator shall coordinate with Transmission Operators, Balancing Authorities, and Generator Operators as needed to develop and implement action plans to mitigate potential or actual SOL, IROL, CPS or DCS violations. The Reliability Coordinator shall coordinate pending generation and transmission maintenance outages with Transmission Operators, Balancing Authorities, and Generator Operators as needed in both the real time and next-day reliability analysis timeframes.</p>	<p>None. The RCSDT proposes to retire this requirement from IRO-005.</p> <p>The RCSDT proposes retiring this requirement as it is redundant with TOP-003 and IRO-004 (all requirements) for next day requirements. The RC has the authority to coordinate pending outages in real-time through IRO-001-2, R1 (proposed). The issue of CPS and DCS is covered in EOP-002-2, R6, R7 and R8 (see above).</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Notes:</p> <p>TOP-003-0</p> <p>R1. Generator Operators and Transmission Operators shall provide planned outage information.</p> <p>R1.1. Each Generator Operator shall provide outage information daily to its Transmission Operator for scheduled generator outages planned for the next day (any foreseen outage of a generator greater than 50 MW). The Transmission Operator shall establish the outage reporting requirements.</p> <p>R1.2. Each Transmission Operator shall provide outage information daily to its Reliability Coordinator, and to affected Balancing Authorities and Transmission Operators for scheduled generator and bulk transmission outages planned for the next day (any foreseen outage of a transmission line or transformer greater than 100 kV or generator greater than 50 MW) that may collectively cause or contribute to an SOL or IROL violation or a regional operating area limitation. The Reliability Coordinator shall establish the outage reporting requirements.</p> <p>R1.3. Such information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p>R2. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of system voltage regulating equipment, such as automatic voltage regulators on generators, supplementary excitation control, synchronous condensers, shunt and series capacitors, reactors, etc., among affected Balancing Authorities and Transmission Operators as required.</p> <p>R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall plan and coordinate scheduled outages of telemetering and control equipment and associated communication channels between the affected areas.</p> <p>R4. Each Reliability Coordinator shall resolve any scheduling of potential reliability conflicts.</p> <p>IRO-004-1</p> <p>R1. Each Reliability Coordinator shall conduct next-day reliability analyses for its Reliability Coordinator Area to ensure that the Bulk Electric System can be operated reliably in anticipated normal and Contingency event conditions. The Reliability Coordinator shall conduct Contingency analysis studies to identify potential interface and other SOL and IROL violations, including overloaded transmission lines and transformers, voltage and stability limits, etc.</p> <p>R2. Each Reliability Coordinator shall pay particular attention to parallel flows to ensure one Reliability Coordinator Area does not place an unacceptable or undue Burden on an adjacent Reliability Coordinator Area.</p> <p>R3. Each Reliability Coordinator shall, in conjunction with its Transmission Operators and Balancing Authorities, develop action plans that may be required, including reconfiguration of the transmission system, re-dispatching of generation, reduction or curtailment of Interchange</p>	

Already Approved Standard	Proposed Replacement Requirement(s)
<p>Transactions, or reducing load to return transmission loading to within acceptable SOLs or IROLs.</p> <p>R4. Each Transmission Operator, Balancing Authority, Transmission Owner, Generator Owner, Generator Operator, and Load-Serving Entity in the Reliability Coordinator Area shall provide information required for system studies, such as critical facility status, Load, generation, operating reserve projections, and known Interchange Transactions. This information shall be available by 1200 Central Standard Time for the Eastern Interconnection and 1200 Pacific Standard Time for the Western Interconnection.</p> <p>R5. Each Reliability Coordinator shall share the results of its system studies, when conditions warrant or upon request, with other Reliability Coordinators and with Transmission Operators, Balancing Authorities, and Transmission Service Providers within its Reliability Coordinator Area. The Reliability Coordinator shall make study results available no later than 1500 Central Standard Time for the Eastern Interconnection and 1500 Pacific Standard Time for the Western Interconnection, unless circumstances warrant otherwise.</p> <p>R6. If the results of these studies indicate potential SOL or IROL violations, the Reliability Coordinator shall direct its Transmission Operators, Balancing Authorities and Transmission Service Providers to take any necessary action the Reliability Coordinator deems appropriate to address the potential SOL or IROL violation.</p> <p>R7. Each Transmission Operator, Balancing Authority, and Transmission Service Provider shall comply with the directives of its Reliability Coordinator based on the next day assessments in the same manner in which it would comply during real time operating events.</p> <p>IRO-001-2, R1 (proposed)</p> <p>R1. The Reliability Coordinator shall act or direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, Distribution Providers and Purchasing-Selling Entities within its Reliability Coordinator Area to prevent or mitigate the magnitude or duration of events that result in Adverse Reliability Impacts. <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations and Same Day Operations]</i></p>	<p>None. The RCSDT proposes to retire this requirement as it is redundant with:</p> <p>EOP-002-2</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p> <p>R8. A Reliability Coordinator that has any Balancing Authority</p>
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-3a</p> <p>R7. As necessary, the Reliability Coordinator shall assist the Balancing Authorities in its Reliability Coordinator Area in arranging for assistance from neighboring Reliability Coordinator Areas or Balancing Authorities. <i>[Violation Risk Factor: High]</i></p>	<p>None. The RCSDT proposes to retire this requirement as it is redundant with:</p> <p>EOP-002-2</p> <p>R7.2. Request the Reliability Coordinator to declare an Energy Emergency Alert in accordance with Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.”</p> <p>R8. A Reliability Coordinator that has any Balancing Authority</p>

Implementation Plan for Reliability Coordination Standards

Already Approved Standard	Proposed Replacement Requirement(s)
	<p>within its Reliability Coordinator area experiencing a potential or actual Energy Emergency shall initiate an Energy Emergency Alert as detailed in Attachment 1-EOP-002-0 “Energy Emergency Alert Levels.” The Reliability Coordinator shall act to mitigate the emergency condition, including a request for emergency assistance if required.</p>
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-3a R8. The Reliability Coordinator shall identify sources of large Area Control Errors that may be contributing to Frequency Error, Time Error, or Inadvertent Interchange and shall discuss corrective actions with the appropriate Balancing Authority. The Reliability Coordinator shall direct its Balancing Authority to comply with CPS and DCS.</p>	<p>None. The RCSDT recommends retiring this requirement as it is redundant with: IRO-001-2 (proposed) R2. Each Reliability Coordinator shall take actions or direct actions (which could include issuing Reliability Directives) by Transmission Operators, Balancing Authorities, Generator Operators, and Distribution Providers within its Reliability Coordinator Area to prevent identified events or mitigate the magnitude or duration of actual events that result in Adverse Reliability Impacts. <i>[Violation Risk Factor: High][Time Horizon: Real-time Operations, Same Day Operations and Operations Planning]</i> TOP-006-1, R7 (existing) R7. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall monitor system frequency.</p>
Already Approved Standard	Proposed Replacement Requirement(s)
<p>IRO-005-3a R9. Whenever a Special Protection System that may have an inter-Balancing Authority, or inter-Transmission Operator impact (e.g., could potentially affect transmission flows resulting in a</p>	<p>None. The RCSDT recommends retiring this requirement as it is redundant with proposed IRO-010: IRO-010-1</p>

Already Approved Standard	Proposed Replacement Requirement(s)
<p>SOL or IROL violation) is armed, the Reliability Coordinators shall be aware of the impact of the operation of that Special Protection System on inter-area flows. The Transmission Operator shall immediately inform the Reliability Coordinator of the status of the Special Protection System including any degradation or potential failure to operate as expected.</p>	<p>R1. The Reliability Coordinator shall have a documented data specification for data and information to build and maintain models to support Real-Time monitoring, Operational Planning Analyses, and Real-time Assessments. The specification shall include the following: <i>(Violation Risk Factor: Low) (Time Horizon: Operations Planning)</i></p> <p>R1.1. List of required data and information.</p> <p>R1.2. Mutually agreeable format.</p> <p>R1.3. Timeframe and periodicity for providing data and information (based on its hardware and software requirements, and the time needed to do its Operational Planning Analyses).</p> <p>R1.4. Process for data provision when automated Real-Time system operating data is unavailable.</p> <p>R2. Project 2006-06 Reliability Coordination

Associated with IRO-014-2 – Coordination Among Reliability Coordinators

Revised Definition for Approval:

Clean Proposed Definition:

Adverse Reliability Impact: The impact of an event that results in Bulk Electric System instability or Cascading.

Redline to Previously Approved Definition:

Adverse Reliability Impact: The impact of an event that results in Bulk Electric System ~~frequency related~~ instability; ~~unplanned tripping of load or generation; or uncontrolled separation~~ or ~~cascading~~ Cascading outages that affects a widespread area of the ~~Interconnection~~.

The defined term is used in two of the three standards posted for recirculation ballot:

- In IRO-005, the defined term is used in Requirement R1 and R2
- In IRO-014, the defined term is used in Requirement R1, R5, R6, R7 and R8

(The term is also used in IRO-001, Requirement R2 - and the revisions in IRO-001-3 standard will be posted for another comment period.)

The history of the refinement of the definition is confusing because so many of the requirements in the set of standards were shifted from one standard to another – and as you'll see, the team was not consistent in posting the definition with a single standard.

The first proposal for a revision to the definition was included in the first posting of the [implementation plan for IRO-001-2](#) - but was not prominently placed in the Definitions section of the standard. This is the original proposal:

Adverse Reliability Impact – The impact of an event that results in frequency-related instability; ~~unplanned tripping of load or generation;~~ or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection.

Commenters not only made suggestions for additional revisions to the definition, they also pointed out that the definition should be included not only in the implementation plan, but also at the front of the standard.

For the [second posting of IRO-014](#) the following definition was included:

Adverse Reliability Impact – The impact of an event that results in **Bulk Electric System** ~~frequency related~~ instability; ~~unplanned tripping of load or generation;~~ or uncontrolled separation or cascading outages ~~that affects a widespread area of the Interconnection.~~

For the third posting of the standard, the only change to the above definition was to capitalize the word, "Cascading" and remove the word, 'outages.' This is the version posted with [Draft 3 of IRO-001-2](#) – showing changes to the approved definition:

Adverse Reliability Impact – The impact of an event that results in **Bulk Electric System** ~~frequencyrelated~~ instability; ~~unplanned tripping of load or generation;~~ or uncontrolled separation or **C**ascading. ~~outages that affects a widespread area of the Interconnection.~~

The version posted for recirculation ballot is unchanged from the version that was last posted for comment/ballot.

The team subdivided its edits to IRO-001-2 – the first phase includes only the removal of a single requirement as a conforming change associated with the approval of IRO-014. The more extensive changes are moving forward as IRO-001-3 and will be posted for another comment period. Because the revised definition of Adverse Reliability Impact is used in both IRO-005 and IRO-014, it was necessary to move it forward for approval with the approval of these standards. So – once again the definition was moved from IRO-001 to IRO-014. Note that there were no comments that promoted the team to revise the definition following the initial ballot and comment period. Because the definition was last included in IRO-001-2, not in IRO-014-2, when we made a redline comparison of the proposed IRO-014 to the last posted version of IRO-014, the definition appears as though it is totally 'new' – but it is unchanged. When we have the webinar, I'll see if we can reinforce this.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 18, 2010.
11. The fourth draft of the standards was posted for a comment period with an Initial Ballot that ended on March 7, 2011.

Proposed Action Plan and Description of Current Draft:

The SDT began working on revisions to the standards in August 2007. The current posting is for the recirculation ballot. The initial ballot was conducted as a single vote for a set of standards and their associated implementation plans and definitions. Following the initial ballot the Standards Committee authorized the team to separate the standards and post the standards that have achieved consensus for individual recirculation ballots. This is the fifth posting of this standard.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Standards posted for recirculation ballots.	July 2011
2. Standards sent to BOT for approval.	August 2011
3. Standards filed with regulatory authorities.	September 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

The RC SDT proposes the following modified definition:

Adverse Reliability Impact: The impact of an event that results in Bulk Electric System instability or Cascading.

A. Introduction

1. **Title:** Coordination Among Reliability Coordinators
2. **Number:** IRO-014-2
3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.
4. **Applicability:**
 - 4.1. Reliability Coordinator
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after Board of Trustees approval.

B. Requirements

- R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions that may impact other Reliability Coordinator Areas to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]*
 - 1.1. Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.
 - 1.2. Energy and capacity shortages.
 - 1.3. Planned or unplanned outage information.
 - 1.4. Control of voltage, including the coordination of reactive resources.
 - 1.5. Coordination of information exchange to support reliability assessments.
 - 1.6. Authority to act to prevent and mitigate system conditions which could cause Adverse Reliability Impacts to other Reliability Coordinator Areas.
 - 1.7. Weekly conference calls
- R2. Each Reliability Coordinator shall maintain its Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 as follows: *[Violation Risk Factor: Lower] [Time Horizon: Same Day Operations and Operations Planning]*
 - 2.1. Review and update annually with no more that 15 months between reviews.
 - 2.2. Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.

- 2.3.** Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.
- R3.** Each Reliability Coordinator shall make notifications and exchange reliability-related information with other Reliability Coordinators in accordance with the Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations and Operations Planning]*
- R4.** Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly (per Requirement 1, Part 1.7) with other Reliability Coordinators within the same Interconnection. *[Violation Risk Factor: Lower][Time Horizon: Real-time Operations]*
- R5.** Each Reliability Coordinator, upon identification of an Adverse Reliability Impact, shall notify all other Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R6.** During each instance where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact each impacted Reliability Coordinator shall operate as though the problem exists. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R7.** During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, the Reliability Coordinator that identified the Adverse Reliability Impact shall develop an action plan to resolve the Adverse Reliability Impact. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R8.** During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*

C. Measures

- M1.** Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Processes, and Operating Plans that require notifications, information exchange or the coordination of actions among impacted Reliability Coordinators for conditions or activities that impact other Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements. (R1)
- M2.** Each Reliability Coordinator shall have dated evidence that the Operating Procedures, Processes, and Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were:
- 2.1** Reviewed and updated annually with no more than 15 months between reviews.

- 2.2** Agreed to, in writing, by all the Reliability Coordinators required to take the indicated action(s).
- 2.3** Distributed within 30 days of an update to all Reliability Coordinators that are required to take the indicated action(s).

This evidence may include, but is not limited to dated documentation with confirmation of receipt, dated notice of acceptance or agreement to take specified actions, or dated electronic communications with confirmation of receipt and acceptance or agreement to take specified actions. (R2)

- M3.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it made notifications and exchanged reliability-related information with impacted Reliability Coordinators in accordance with the Operating Procedures, Processes, or Plans identified in Requirement R1. (R3)
- M4.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it participated in agreed upon (at least weekly) conference calls with other Reliability Coordinators within the same Interconnection. (R4)
- M5.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it, upon identification of an Adverse Reliability Impact, notified other Reliability Coordinators. (R5)
- M6.** Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it operated under the assumption that the Adverse Reliability Impact existed during each instance where Reliability Coordinators disagreed on the existence of an Adverse Reliability Impact. (R6)
- M7.** Each Reliability Coordinator that identified an Adverse Reliability Impact shall have evidence and provide evidence that it developed an action plan during those instances where Reliability Coordinators disagreed on the existence of an Adverse Reliability Impact. This evidence may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation. (R7)
- M8.** Each impacted Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it implemented the action plan developed by the Reliability Coordinator who has the identified the Adverse Reliability Impact when a Reliability Coordinator has identified an Adverse Reliability Impact and the impacted Reliability

Coordinators disagree on an action unless such actions would have violated safety, equipment, or regulatory or statutory requirements. (R8)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity is the Compliance Enforcement Authority except where the Reliability Coordinator works for the Regional Entity. Where the Reliability Coordinator works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.

1.2. Compliance Monitoring Period and Reset Time Frame

Not Applicable

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Violation Investigation

Self-Reporting

Complaint

1.4. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Reliability Coordinator shall retain its current, in force document and any documents in force since the last compliance audit for Requirements R1, R2, and Measures M1, M2.
- Each Reliability Coordinator shall retain its most recent 12 months of evidence for Requirement R3, R4, R5 and Measure M3, M4, M5.
- Each Reliability Coordinator shall retain 3 calendar years plus current calendar year of evidence for Requirements R6 through R8 and Measures M6 through M8.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant, or for the time period specified above, whichever is longer.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address one of the topical areas identified in Parts 1.1 through 1.7.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address two of the topical areas identified in Parts 1.1 through 1.7.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address three of the topical areas identified in Parts 1.1 through 1.7.	The Reliability Coordinator failed to have Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability to address three or more of the topical areas identified in Parts 1.1 through 1.7.
R2	N/A	The Reliability Coordinator Operating Procedures, Operating Processes, or Operating Plans identified in R1 but failed to distribute these to all Reliability Coordinators that are required to take action.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in R1 but failed to obtain agreement from all Reliability Coordinators that are required to take action. OR Failed to review and update the Operating Procedures, Operating Processes, and Operating Plans identified in R1 annually.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans identified in R1 but failed to review and update annually and obtain written agreement from all Reliability Coordinators that are required to take action and failed to distribute these to all Reliability Coordinators that are required to take action.
R3	N/A	N/A	The Reliability Coordinator failed to make notifications OR exchange reliability-related information with impacted Reliability Coordinators.	The Reliability Coordinator failed to make notifications AND exchange reliability-related information with impacted Reliability Coordinators.

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R4	N/A	N/A	N/A	The Reliability Coordinator failed to participate in an agreed upon (at least weekly) conference call with impacted Reliability Coordinators within the same Interconnection.
R5	N/A	The Reliability Coordinator failed to notify one, but not all, of the impacted Reliability Coordinators upon identification of an Adverse Reliability Impact.	N/A	The Reliability Coordinator failed to notify more than one impacted Reliability Coordinators upon identification of an Adverse Reliability Impact. OR The Reliability Coordinator failed to notify the impacted Reliability Coordinator (when there is only one impacted Reliability Coordinator) upon identification of an Adverse Reliability Impact.
R6	N/A	N/A	N/A	The Reliability Coordinator failed to operate under the assumption that the Adverse Reliability Impact existed during an instance where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact.
R7	N/A	N/A	N/A	The Reliability Coordinator that identified the Adverse Reliability Impact failed to develop an action plan to resolve the Adverse Reliability Impact during an instance where Reliability Coordinators disagreed on the existence of an Adverse Reliability

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Impact.
R8	N/A	N/A	N/A	The Reliability Coordinator failed to implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact during an instance where Reliability Coordinators disagreed on the existence of an Adverse Reliability Impact.

E. Regional Differences

None identified.

F. Associated Documents**Version History**

Version	Date	Action	Change Tracking
1	August 10, 2005	<ol style="list-style-type: none"> 1. Changed incorrect use of certain hyphens (-) to “en dash (-).” 2. Hyphenated “30-day” when used as adjective. 3. Changed standard header to be consistent with standard “Title.” 4. Initial capped heading “Definitions of Terms Used in Standard.” 5. Added “periods” to items where appropriate. 6. Changed “Timeframe” to “Time Frame” in item D, 1.2. 7. Lower cased all words that are not “defined” terms — drafting team, self-certification. 8. Changed apostrophes to “smart” symbols. 9. Added comma in all word strings “Procedures, Processes, or Plans,” etc. 10. Added hyphens to “Reliability Coordinator-to-Reliability Coordinator” where used as adjective. 11. Removed comma in item 2.1.2. 12. Removed extra spaces between words where appropriate. 	January 20, 2006
1	February 7, 2006	Approved by BOT	Revised
1	April 4, 2007	Regulatory Approval — Effective Date	New
2	TBD	Revised per Project 2006-6; Revised existing requirements for clarity, retired R3 and R4 and incorporated requirements from IRO-015-1 and IRO-016-1 into this standard.	Revised

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. Draft SAR Version 1 posted January 15, 2007
2. Draft SAR Version 1 Comment Period ended February 14, 2007
3. Draft SAR Version 2 and comment responses on SAR version 1 posted March 19, 2007
4. Draft Version 2 SAR comment period ended April 17, 2007
5. SAR version 2 and comment responses for SAR version 2 accepted by SC and SDT appointed in June 2007.
6. First posting of revised standards on August 5, 2008 with comment period closed on September 16, 2008.
7. Draft Version 2 of standards and response to comments September 16, 2008–May 26, 2009.
8. Second posting of revised standards on July 10, 2009 with comment period closed on August 9, 2009.
9. RC SDT coordinated with OPCP SDT and RTO SDT on definitions relating to directives and three part communication and Draft Version 3 of standards and response to comments August 9–November 20, 2009.
10. Third posting of revised standards on January 4, 2010 with comment period closed on February 18, 2010.
11. The fourth draft of the standards was posted for a comment period with an Initial Ballot that ended on March 7, 2011.

Proposed Action Plan and Description of Current Draft:

The SDT began working on revisions to the standards in August 2007. The current posting is for the recirculation ballot. The initial ballot was conducted as a single vote for a set of standards and their associated implementation plans and definitions. Following the initial ballot the Standards Committee authorized the team to separate the standards and post the standards that have achieved consensus for individual recirculation ballots. This is the fifth posting of this standard.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Standards posted for recirculation ballots.	July 2011
2. Standards sent to BOT for approval.	August 2011
3. Standards filed with regulatory authorities.	September 2011

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

~~None~~ The RC SDT proposes the following modified definition:

Adverse Reliability Impact: The impact of an event that results in Bulk Electric System instability or Cascading.

A. Introduction

1. **Title:** Coordination Among Reliability Coordinators
2. **Number:** IRO-014-2
3. **Purpose:** To ensure that each Reliability Coordinator's operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.
4. **Applicability:**
 - 4.1. Reliability Coordinators.
5. **Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter that is 12 months after Board of Trustees approval.

B. Requirements

- R1. Each Reliability Coordinator shall have Operating Procedures, Operating Processes, or Operating Plans for activities that require notification, exchange of information or coordination of actions that may impact other Reliability Coordinator Areas to support Interconnection reliability. These Operating Procedures, Processes, or Plans shall collectively address the following: *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Planning]*
 - 1.1. Communications and notifications, including the mutually agreed to conditions under which one Reliability Coordinator notifies other Reliability Coordinators; the process to follow in making those notifications; and the data and information to be exchanged with other Reliability Coordinators.
 - 1.2. Energy and capacity shortages.
 - 1.3. Planned or unplanned outage information.
 - 1.4. Control of voltage, including the coordination of reactive resources.
 - 1.5. Coordination of information exchange to support reliability assessments.
 - 1.6. Authority to act to prevent and mitigate system conditions which could cause Adverse Reliability Impacts to other Reliability Coordinator Areas.
 - 1.7. Weekly conference calls
- R2. Each Reliability Coordinator shall maintain its Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 as follows: *[Violation Risk Factor: Lower] [Time Horizon: Same Day Operations and Operations Planning]*
 - 2.1. Review and update annually with no more that 15 months between reviews.
 - 2.2. Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.

- 2.3.** Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update.
- R3.** Each Reliability Coordinator shall make notifications and exchange reliability-related information with other Reliability Coordinators in accordance with the Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1. *[Violation Risk Factor: Medium][Time Horizon: Real-time Operations and Operations Planning]*
- R4.** Each Reliability Coordinator shall participate in agreed upon conference calls, at least weekly (per Requirement 1, Part 1.7) with other Reliability Coordinators within the same Interconnection. *[Violation Risk Factor: Lower][Time Horizon: Real-time Operations]*
- R5.** Each Reliability Coordinator, upon identification of an Adverse Reliability Impact, shall notify all other Reliability Coordinators. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R6.** During each instance where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact each impacted Reliability Coordinator shall operate as though the problem exists. *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R7.** During those instances where Reliability Coordinators disagree on the existence of an Adverse Reliability Impact, the Reliability Coordinator that identified the Adverse Reliability Impact shall develop an action plan to resolve the Adverse Reliability Impact. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*
- R8.** ~~When a Reliability Coordinator has identified an Adverse Reliability Impact and the other~~ During those instances where Reliability Coordinators disagree on ~~an action plan~~ the existence of an Adverse Reliability Impact, each Reliability Coordinator shall implement the action plan developed by the Reliability Coordinator that identified the Adverse Reliability Impact unless such actions would violate safety, equipment, regulatory or statutory requirements. *[Violation Risk Factor: High][Time Horizon: Operations Planning, Same Day Operations and Real-time Operations]*

C. Measures

- M1.** Each Reliability Coordinator shall have available the latest approved documented version of its Operating Procedures, Processes, and Operating Plans that require notifications, information exchange or the coordination of actions among impacted Reliability Coordinators for conditions or activities that impact other Reliability Coordinator Areas. This documentation shall include dated, current in force documentation with the specified elements. (R1)
- M2.** Each Reliability Coordinator shall have dated evidence that the Operating Procedures, Processes, and Plans that require one or more other Reliability Coordinators to take action (e.g., make notifications, exchange information, or coordinate actions) were:
- 2.1** Reviewed and updated annually with no more than 15 months between reviews.

2.2 Agreed to, in writing, by all the Reliability Coordinators required to take the indicated action(s).

2.3 Distributed within 30 days of an update to all Reliability Coordinators that are required to take the indicated action(s).

This evidence may include, but is not limited to dated documentation with confirmation of receipt, dated notice of acceptance or agreement to take specified actions, or dated electronic communications with confirmation of receipt and acceptance or agreement to take specified actions. (R2)

M3. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it made notifications and exchanged reliability-related information with impacted Reliability Coordinators in accordance with the Operating Procedures, Processes, or Plans identified in Requirement R1. (R3)

M4. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it participated in agreed upon (at least weekly) conference calls with other Reliability Coordinators within the same Interconnection. (R4)

M5. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it, upon identification of an Adverse Reliability Impact, notified ~~impacted~~other Reliability Coordinators. (R5)

M6. Each Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it operated under the assumption that the Adverse Reliability Impact existed during each instance where Reliability Coordinators disagreed on the existence of an Adverse Reliability Impact. (R6)

M7. Each Reliability Coordinator that identified an Adverse Reliability Impact shall have evidence and provide evidence that it developed an action plan during those instances where Reliability Coordinators disagreed on the existence of an Adverse Reliability Impact. This evidence may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation. (R7)

M8. Each impacted Reliability Coordinator shall have and provide evidence which may include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent dated documentation, that will be used to determine that it implemented the action plan developed by the Reliability Coordinator who has the identified the Adverse Reliability Impact when a Reliability Coordinator has identified an Adverse Reliability Impact and the impacted Reliability

Coordinators disagree on an action unless such actions would have violated safety, equipment, or regulatory or statutory requirements. (R8)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~Regional Entity~~The Regional Entity is the Compliance Enforcement Authority except where the Reliability Coordinator works for the Regional Entity. Where the Reliability Coordinator works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.

1.2. Compliance Monitoring Period and Reset Time Frame

Not Applicable

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits~~s~~

Self-Certifications~~s~~

Spot Checking

Compliance Violation Investigations~~s~~

Self-Reporting

Complaints~~s~~

1.4. Data Retention

The Reliability Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Reliability Coordinator shall retain its current, in force document and any documents in force since the last compliance audit for Requirements R1, R2, and Measures M1, M2.
- Each Reliability Coordinator shall retain its most recent 12 months of evidence for Requirement R3, R4, R5 and Measure M3, M4, M5.
- Each Reliability Coordinator shall retain 3 calendar years plus current calendar year of evidence for Requirements R6 through R8 and Measures M6 through M8.
- If a Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant, or for the time period specified above, whichever is longer.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. Violation Severity Levels

R#	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address one of the topical areas identified in Parts 1.1 through 1.7.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address two of the topical areas identified in Parts 1.1 through 1.7.	The Reliability Coordinator has Operating Procedures, Operating Processes, or Operating Plans in place for activities that require notification, exchange of information or coordination of actions with impacted Reliability Coordinators to support Interconnection reliability but failed to address three of the topical areas identified in Parts 1.1 through 1.7.
