| PSCSC | | ☑ | |
| FirstEnergy | | ☑ | |
| WECC MIC MIS ATC TF. | ☑ | | The TTC determinative process for the Rated System Path methodology accurately resides in the MOD-29. The WECC Team suggests that these determinants be fully vetted through the augmented expertise of those being added to the team via the most recent ATC SAR.<br>The WECC Team does not believe it is FERC's intent to require a posting of TTC for each and every path and each and every possible permutation of paths or POR/PODs within a utility's system. It is estimated that this could result in a million plus postings for some utilities; most of these posting would be on paths for which no service has been requested.<br>Rather, FERC has already made it clear that as to posting of ATC and TTC, FERC's intent was stated |

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | in its approved definition of "Posted Path." It is the "Posted Path" that requires a posting of ATC and TTC. The WECC Team has the below positive suggestions that will remedy many concerns for MOD-29.<br>Suggested Remedy:<br>18 CFR 37.6, Order 889/RM95-9-000, P. 58-60 and NAESB R-4005 all utilize "Posted Path" as the delineated paths for which ATC and TTC must be posted.<br>At 18 CFR 37.6, the definition for Posted Path states: (control area has been replaced with Balancing Authority to bring the definition in line with the Functional Model)<br>Posted Path means: 1) any Balancing Authority to Balancing Authority interconnection; 2) any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months; 3) and any path for which a customer requests to have ATC or TTC posted. For purposes of this definition, an hour includes any part of an hour during which service was denied, curtailed or interrupted.<br>(Plagiarized from NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60. See also: 18 CFR 37.6;<br>http://a257.g.akamaitech.net/7/257/2422/12feb20041500/edocket.access.gpo.gov/cfr_2004/aprqtr/pdf/18cfr37.5.pdf<br>First, in refining this draft the term "Posted Path" must be adopted in accordance with FERC's intent.<br>The WECC MIC MIS ATC TF Team suggests the following rewrite of R6:<br>R6. For each Posted Path, each Planning Coordinator shall determine TTC using the applicable method below:<br>R6.1. For Posted Paths whose capacity is limited by thermal, voltage or stability limits, TTC shall be the lesser of the thermal, voltage or stability limits as determined by adjusting generation dispatch, area interchange schedules, and Load levels to maximum values (without introducing fictitious facilities or unrealistic values into the system model) to determine the maximum flow that can be simulated on the path while at the same time satisfying the planning criteria in TPL-001 and TPL-002 for the Contingencies in Table 1, Category B or the successor criteria.<br>• If it is not possible to simulate a flow sufficiently large to reach a reliability-limited TTC, the TTC of the path is equal to the maximum flow simulated and the path is said to be flow limited.<br>• If the TTC determined for a path in one direction is reliability limited and the TTC determined for the same path in the other direction is flow limited, the reliability limited TTC may be used for both directions.<br>R6.2. for Posted Paths whose capacity is limited by contract, TTC shall be set on the Posted Path at the maximum allowable contract capacity, not to exceed the thermal, voltage or stability limits of that Posted Path.<br>R6.3 For Posted Paths whose capacity is jointly owned, TTC shall be set for each separate owner of the Posted Path at the maximum capacity owned by each separate owner.<br>R6.3.1. The Transmission Service Provider shall ensure that for jointly owned paths, the sum of all owners' allocations is equal to the TTC of the path |

<table>
<tr><th colspan="4">Question #1</th></tr>
<tr><th>Commenter</th><th>Yes</th><th>No</th><th>Comment</th></tr>
<tr><td></td><td></td><td></td><td>R6.4. For Posted Paths whose capacity has been established for ten years or more (subject to contingency and seasonal adjustment), and that are known to have operated reliably at that established capacity rating, TTC shall be set on the Posted Path at the established, reliable level at which that Posted Path has been operating for at least the previous ten years.<br>R6.5. For new or revised Posted Paths, the Planning Coordinator shall determine if the TTC adversely impacts the path rating or TTC values of existing paths by modeling the flow on the new or revised Posted Path at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level, and if there is an adverse impact:<br>• Limit the TTC for the new or revised path to eliminate the adverse impacts, or<br>• Follow a local or regional procedure for resolving the impact with the affected parties.<br>R6.6. Draft a report to document the steps performed in determining the TTC for the Posted Path.</td></tr>
<tr><td colspan="4">Response: The SDT has accepted those comments with the exception that “R6” as included in the last drafted release should be changed from “maximum values” to “maximum or minimum values.”<br><br>The SDT modified the standard adopting the intent of most of the suggestions identified above.<br>The drafting team adopted the term, ‘Posted Path’ with the proposed definition. The term, ‘Posted Path’ is now used consistently in the set of ATC-related standards.<br>R6 was modified to include the term, ‘Posted Path’ and the requirement was further modified, based on other stakeholder comments, to assign responsibility for determining TTC to the Transmission Operator rather than the Transmission Service Provider.</td></tr>
<tr><td>SRP</td><td>☑</td><td></td><td>SRP supports the comments on this subject submitted by the WECC contingent. Additionally we suggest that the drafting team provide for a "phasing-in" period to allow time for the TSP's who use the Rated System Path Methodology to re-study the TTC for their Posted Paths. This is needed because of the large number of Posted Paths in the west whose TTC was not established by the rigorous methodology stipulated in the R6 of the new standard. If a "phasing-in" period is not appropriately addressed in the standard itself it needs to be provided for somewhere. We suggest an Implementation Plan similar to the CIP Standards. One that requires the Responsible Entities to become Substantially Compliant, Compliant, and then Audibly Compliant within a defined schedule.</td></tr>
<tr><td colspan="4">Response: The SDT concurs that MOD-29 as drafted may expose some entities to compliance risk. The SDT also concurs that a phased in approach is appropriate and necessary and will take that into consideration when the implementation schedule is formulated for this standard.</td></tr>
<tr><td>Entergy</td><td>☑</td><td></td><td>Each Transmission Service Provider should calculated TTC for all posted using the same method for consistency</td></tr>
<tr><td colspan="4">Response: The SDT agrees and believes adoption of the WECC comments will greatly enhance consistency in calculating TTC under this selected methodology.</td></tr>
</table>

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

**Summary Consideration:** Most stakeholders who responded to this comment indicated that the requirements relative to ETC needed improvement. The drafting team modified the requirements by converting the descriptive language into algorithms with a definition for each element in each algorithm:

In the revised standard, the algorithm for firm ETC is: $ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$

**Where:**

**$NL_F$** is the firm capacity reserved to serve peak Native Load forecast commitments for the time period being calculated, to include Native Load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**$NITS_F$** is the firm capacity reserved for Network Integration Transmission Service serving Load, to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**$GF_F$** is the capacity reserved for grandfathered Firm Transmission Service and bundled contracts for energy and Transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC.

**$PTP_F$** is the firm capacity reserved for confirmed Point-to-Point Transmission Service,

**$ROR_F$** is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**$OS_F$** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service.

In the revised standard, the algorithm for non-firm ETC is: $ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$

**Where:**

**$NITS_{NF}$** is the non-firm capacity reserved for Network Integration Transmission Service serving Load, to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**$GF_{NF}$** is the non-firm capacity reserved for grandfathered Transmission Service and bundled contracts for energy and Transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm.

**Question #2**

| Commenter | Yes | No | Comment |
|---|---|---|---|
| WECC MIC MIS ATC TF | | ☑ | The impact of load growth for Network Integration Transmission Service should be included in R12.2. |
| **Response:** The SDT has included the impact of load growth in Network Integration Transmission Service.<br><br>The revised standard includes an algorithm for firm ETC, and in that algorithm, $\mathbf{NITS_F}$ is defined as the firm capacity reserved for Network Integration Transmission Service serving Load, to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.<br><br>The revised standard also includes an algorithm for non-firm ETC, and in that algorithm, $\mathbf{NITS_{NF}}$ is defined as the non-firm capacity reserved for Network Integration Transmission Service serving Load, to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin. | | | |
| APPA | | ☑ | See my comments on MOD-028 |
| **Response:** The SDT has reviewed the appropriateness of the functions and endeavored to accurately align them with the NERC Functional Model. In all of the revised standards, the responsibility for determining TTC or TFC is assigned to the Transmission Operator, and the responsibility for determining ATC is assigned to the Transmission Service Operator. | | | |
| BPA | | ☑ | The impact of load growth for Network Integration Transmission Service should be included in R12.2. The "five years or longer in duration" language should be removed from R12.5. due to the fact that this element of Order 890 is only to be implemented by a Transmission Service Provider (TSP) once the FERC has approved the TSP's Attachment K -- this may not occur for some TSPs until after the standards are to be implemented. Additionally, regardless of whether a TSP's Attachment K is approved, there will be a transition period (to be developed by each TSP) from the old 1-year/60-day roll-over paradigm to the 5-year/1-year -- the standard should not preclude a TSP from encumbering capacity for those existing Customers who have not yet been required to commit to five years of service to retain their roll-over rights. |
| **Response:** The SDT modified the standard in support of these suggestions.<br><br>The revised standard includes an algorithm for firm ETC, and in that algorithm, $\mathbf{NITS_F}$ is defined as the firm capacity reserved for Network Integration Transmission Service serving Load, to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.<br><br>The revised standard also includes an algorithm for non-firm ETC, and in that algorithm, $\mathbf{NITS_{NF}}$ is defined as the non-firm capacity reserved for Network Integration Transmission Service serving Load, to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.<br>The reference to 'five years or longer' was removed as suggested. | | | |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Entergy | | ☑ | We suggest that R12.10 should be a stand alone requirement rather than a sub requirement. R 13 should be a lead requirement with R14 and R 14.1 - R14.5 as sub requirements under R13 requirements. R15 is similar to post back, therefore, it should also be made as a subrequirement under R13. |
| **Response:** R12.10 was revised and instead of a description of how to calculate non-firm ATC, in the revised standard, there is an algorithm that identifies how to calculate non-firm ATC.<br><br>R14 should have been a sub-requirement under R13 – this was a typographical error in the version that was posted for comment. In the revised standard there is an algorithm for the calculation of non-firm ETC that includes what had been R13 through R14.5.<br><br>R15 has been absorbed into the algorithm for determining non-firm ATC in Postbacks. (See R8 in the revised standard.) | | | |
| IESO | | ☑ | We feel that R12.1, R12.2, R12.6 and R14 leave room for double counting for components that shold have been taken care of by TRM and CBM. Further, details to be included for non-firm ATC calculation are missing in R13. |
| **Response:** In the revised standard, the numbering and structure of the standard has been reorganized for clarity.<br><br>The SDT cannot comment on IESO's concern at R13 addressing missing non-firm components as IESO has given the SDT no guidance as to what they believe is missing.<br><br>R12.1, 12.2, 12.6 and R14. all include the as the qualifier "not otherwise included in TRM and CBM" to prevent double counting between either of those standards (MOD-04 and MOD-08) and MOD-29. | | | |
| IRC | | ☑ | We feel that R12.1, R12.2, R12.6 and R14 leave room for double counting for components that shold have been taken care of by TRM and CBM. Further, details to be included non-firm ATC calculation are missing in R13. |
| **Response:** R12.1, 12.2, 12.6 and R14. all include the qualifier "not otherwise included in TRM and CBM" to prevent double counting between either of those standards (MOD-04 and MOD-08) and MOD-29. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| Response: See response to IRC / Charles Yeung. | | | |
| HQTE<br>NPCC | ☑ | | R12.10 should be renumbered R13, R13 should be renumbered R14, R14 should be renumbered R14.1, R14.1 should be renumbered R14.2 (etc.) |
| **Response:** The SDT agrees that the standard as drafted would be clearer if restructured and has reorganized the standard for clarity in the revised standard. | | | |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| R12.10 was revised and instead of a description of how to calculate non-firm ATC, in the revised standard, there is an algorithm that identifies how to calculate non-firm ATC.<br><br>R14 should have been a sub-requirement under R13 – this was a typographical error in the version that was posted for comment. In the revised standard there is an algorithm for the calculation of non-firm ETC that includes what had been R13 through R14.5. | | | |
| PSCSC | ☑ | | |

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

**Summary Consideration:** Most stakeholders who responded to this question indicated that reliability would not be diminished if the standard allowed the modeling of fictitious devices. The drafting team removed the parenthetical phrase that had been included in R6.1 which precluded the use of fictitious facilities, but did not make any other revisions to MOD-029 to specifically address the use of fictitious devices**.** The revised standard is silent on this matter – and does not require nor prohibit the use of fictitious modeling elements.

R~~6~~2.1 Except where otherwise specified within MOD-029-1, adjust ~~Determine the reliability limited TTC for a path by adjusting~~ base case generation schedules and Load levels ~~to extreme values (without introducing fictitious facilities into the model)~~ within the updated power flow model to determine the maximum flow (reliability limit) that can be simulated on the Posted P~~p~~ath while at the same time satisfying ~~the~~ all planning for N-0, N-1, and N-2 contingencies as follows: ~~criteria in TPL-001 and TPL-002 for the Contingencies in Table 1, Category B or the successor criteria~~.

| **Question #3** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSCSC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| **Response:** The SDT concurs and appreciates your participation. | | | |
| APPA | | | R6 and its Sub-requirements are study methodologies that should not be included in any standard. Requirements of this nature could be interpreted to mean that an entities' future plan that included a resource 6 years from now would be fictitious if in the next planning cycle they determined to remove it. These Standards are written in a Policy format. |
| **Response:** R6 and its sub-requirements outlined the required actions to determine TTC using the rated system path methodology and are necessary to ensure consistency in the determination of TTC.<br><br>The revised standard does not require nor prohibit the usage of fictitious modeling elements. However, FERC has stated that: "We conclude that the NERC process is appropriate as it is open to all industry participants and, therefore, is a suitable arena for establishment of common standards for modeling assumptions." Order 890. P. 298.<br><br>The standards have been rewritten such that they no longer reflect a Policy format as suggested by this commenter. | | | |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| BCTC | | ☑ | The use of artificial input data to increase a TTC limit for scenarios analysis and evaluating the impacts of a proposed generator (which is a fictitious until it has been constructed) would not diminish the liabilty of the system. |
| **Response:** The SDT concurs that in most cases usage of fictitious elements in modeling will not diminish the reliability of the grid for those using the RSP.<br><br>Further, the revised standard does not require nor prohibit the usage of fictitious modeling elements. | | | |
| Entergy | | ☑ | Realistically TTC should be calculated using any controls that can impact flow on the path. By not using all controls such as phase shifting transformers, TTC values are lower than what they can practically be, therefore, potential of underutilizing the transmission system. |
| **Response:** The revised standard does not require nor prohibit the usage of fictitious modeling elements. Note that the revised standard includes more specific requirements concerning modeling, including requiring the modeling of phase shifting transformers. | | | |
| IRC | | ☑ | Reliability would not be diminished by fictitions simulations. This practice is not uncommon in the determination of operating limits and TTCs when available resources are insufficient to stress an interface or transfer level to the "edge". |
| **Response:** The SDT is in agreement with the commenter. The revised standard does not require nor prohibit the usage of fictitious modeling elements. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** Please see the response to IRC's comments. | | | |
| FirstEnergy | | ☑ | Permitting the arbitrary introduction of fictitious devices potentially encourages producing the limitation wanted rather than determining the actual limitation. First bullet in R6.1 says the path will be said to be "flow limited", which is a misleading characterization. It really would be "extreme value limited" and should be identified as such. The second bullet in R6.1 seems to be very arbitrary and should be deleted to result in a limit that more accurately reflects the actual ability of the system to transfer power. |
| **Response:** Utilization of fictitious elements in modeling has routinely and reasonably been used by those utilizing the Rated System Path for some time. However, in moving into a mandatory regime the inclusion of this discretionary approach as a mandate may not produce an optimum outcome. Thus, the SDT has opted not to make inclusion or exclusion of fictitious modeling elements a Requirement.<br><br>As to inclusion of the term "flow limited" the term is used widely in the industry, with particular emphasis on those currently using the RSP, that inclusion was warranted Nevertheless, the term flow limited has been deleted from the next version of | | | |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| the standard. | | | |
| IESO | | ☑ | Reliability would not be diminished by incorporating fictitious devices into power flow simulations. This practice is not uncommon in the determination of operating limits and TTCs when available resources are insufficient to stress an interface or transfer level to the "edge" or for other practical modeling reasons. However, entities which use such fictitious devices must ensure that its modeling assumptions are shared with other possible affected entities. |
| **Response:** The SDT is in agreement with the commenter. The revised standard does not require nor prohibit the usage of fictitious modeling elements. The standard does require sharing of assumptions. | | | |
| SRP | | ☑ | The system should be reliable if the TTC in both directions of all paths is reliability limited even if one or more of the reliability limits was found using fictitious devices for stressing the system in order to determine the reliability limit. The flow limit does not represent the capability of the transmission system to reliably transfer power. It does represent the limit of the capability of the system to stress the system which doesn't imply the limit beyond which reliability is in jeopardy. |
| **Response:** The revised standard does not require nor prohibit the usage of fictitious modeling elements. | | | |
| HQTE<br>NPCC | ☑ | ☑ | Real-time system reliability would not be diminished since the actual power transfer is less than the reliability limit. However, long-term reliability could be diminished because posted TTC would be higher than the actual maximum flow. Transmission users could overestimate the path capacity and consequently overestimate the amount of power that can be delivered on this specific path. A path might be voltage limited, not flow limited, and the introduction of a fictitious generator might hide the reliability rating if it supports the voltage on the path in the simulation, but not in "real life". |
| **Response:** The commenters' point is well taken and properly noted. Nevertheless, in moving into a mandatory regime the inclusion of this discretionary approach as a mandate may not produce an optimum outcome. Thus, the SDT has opted not to make inclusion or exclusion of fictitious modeling elements a Requirement. | | | |
| BPA | ☑ | | Allowing the use of artificial input data to increase a TTC limit does not represent the most relevent system conditions to establish a reliabilty limit. |
| **Response:** The revised standard does not require the usage of fictitious modeling elements. | | | |

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

**Summary Consideration:** The stakeholders who responded to this question all indicated that the standard does not need to address the practice of selling the same Non-firm Transmission multiple times. Based on this consensus, the SDT has concluded that the selling of non-firm multiple times should be a NAESB Business Practice and has referred the issue to NAESB. By contrast, "how" non-firm is calculated and accounted for after that calculation is made remains a NERC issue and is included herein.

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF | | ☑ | The incremental sells of the same non-firm transmission to multiple customers represents a prioritization issue that would best be addressed in a NAESB Business Practice. |
| **Response:** The selling of non-firm multiple times should be a NAESB Business Practice and we will refer that issue to NAESB. | | | |
| APPA | | ☑ | This is a business practice, not reliability |
| **Response:** The selling of non-firm multiple times should be a NAESB Business Practice and we will refer that issue to NAESB. | | | |
| Entergy | | ☑ | Sale of service should not be in scope of this standard, only how TTCs and ATCs are calculated should be included. Accounting for Non-Firm Transmission already sold multiple times should be included in this standard so that accurate ATCs can be calculated and offered for sale to the market place. Sale of Non-Firm Transmission multiple times is a commercial issue and should be addressed by NAESB Business Practice Standard. |
| **Response:** The SDT concurs. | | | |
| FirstEnergy | | ☑ | This is better covered by NAESB as a business practice issue. However, the requirements for loading and unloading the interchange schedules associated with this practice should be included in the NERC Standards to ensure that reliability is not jeopardized. |
| **Response:** The SDT has recommended that "practices" be referred to NAESB. However, the SDT is unclear as to the nuances within the "requirements for loading and unloading the interchange schedules" that FirstEnergy would have the SDT address. FirstEnergy is encouraged to clarify their concerns and make recommendations. | | | |
| HQTE<br>NPCC | | ☑ | As requested in R12.10, non-firm ATC is calculated by reducing TTC by non-firm-ETCs. Depending on time horizon, unscheduled transmission service could be sold multiple-times This is a business issue that should be addressed by NAESB. |
| **Response:** The selling of non-firm multiple times should be a NAESB Business Practice and we will refer that issue to | | | |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| NAESB. | | | |
| IESO<br>IRC | | ☑ | This seems to be a business practice issue. Similar issues are selling non-firm services out of TRMs and/or CBMs which may be recalled when these latter components need to be used for capacity needs or transmission reliability needs. |
| **Response:** The selling of non-firm multiple times should be a NAESB Business Practice and we will refer that issue to NAESB. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See the response to IRC's comments. | | | |
| PSCSC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| **Response:** The SDT concurs and appreciates your participation. | | | |

5. Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

**Summary Consideration:** The SDT has included new language to address how non-firm is treated within the ATC calculation. Here is the algorithm for calculating non-firm ATC as included in the revised standard:

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + Counter\text{-}schedules_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the Posted Path for that period.

**TTC** is the Total Transfer Capability of the Posted Path for that period.

**$ETC_F$** is the sum of existing non-firm commitments for the Posted Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm commitments for the Posted Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the Posted Path that has been scheduled during that period.

**$TRM_U$** is the Transmission Reliability Margin for the Posted Path that has not been released for sale as non-firm capacity by the Transmission Service Provider during that period,

**$Postbacks_{NF}$** are adjustments to non-firm Available Transfer Capability due to postbacks for that period, as defined in business practices, and

**$Counter\text{-}schedules_{NF}$** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and described in its Available Transfer Capability Implementation Document.

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSCSC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| **Response:** The SDT concurs and appreciates your participation. | | | |
| NPCC | | ☑ | This is a business issue to be addressed by NAESB. |
| **Response:** The SDT concurs that it has overtones of a business practice; however, in light of FERC's comments in Order 890, P. 262, at this stage of drafting it should be included in the NERC process and not the NAESB process. Here is the directive from Order 890: Concerning TAPS' proposal to remove the reservation decision from the sole discretion of transmission providers, we determine that LSEs should be permitted to call for use of CBM, if they do so pursuant to conditions established in the reliability standards | | | |

| **Question #5** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| development process. We direct public utilities working through NERC to modify the CBM-related standards to specify the generation deficiency conditions during which an LSE will be allowed to use the transfer capability reserved as CBM. In addition, we direct that transmission set aside as CBM shall be zero in non-firm ATC calculations. Finally, we order public utilities to work with NAESB to develop an OASIS mechanism that will allow for auditing of CBM usage. | | | |
| WECC MIC MIS ATC TF | ☑ | | As drafted the standard is unclear. This team suggests language that better reflects the following: Order 890, P. 351. "The Commission also required transmission providers to make any transfer capability set aside for CBM available on a non-firm basis and to post this availability on OASIS."<br>For clarity, this statement needs to be reconciled with MOD-04-1, R.3.4 stating, "The Transmission Service Provider shall use "zero" as the value for all unscheduled CBM for all non-firm ATC calculations for all methodologies. Order 890. P. 262. |
| **Response:** The SDT clarifies that the "calculation" for CBM should be in MOD-04. However, this MOD-29 Requirement stipulates the "application" of the resulting CBM calculation as one variable within the overall ATC calculation as stipulated in MOD-29. Restated: The CBM variable is calculated in MOD-04; the value is then applied to the overall ATC equation described in MOD-29.<br><br>To address the stated concern, the SDT has Modified the non-firm ATC calculation to include only scheduled CBM. See the algorithm in the Summary Consideration above. | | | |
| APPA | | ☑ | This should be removed, the rules for using CBM should stay in the CBM standards. |
| **Response:** The SDT concurs that it has overtones of a business practice; however, in light of FERC's comments in Order 890, P. 262, at this stage of drafting it should be included in the NERC process and not the NAESB process. Here is the directive from Order 890:<br>Concerning TAPS' proposal to remove the reservation decision from the sole discretion of transmission providers, we determine that LSEs should be permitted to call for use of CBM, if they do so pursuant to conditions established in the reliability standards development process. We direct public utilities working through NERC to modify the CBM-related standards to specify the generation deficiency conditions during which an LSE will be allowed to use the transfer capability reserved as CBM. In addition, we direct that transmission set aside as CBM shall be zero in non-firm ATC calculations. Finally, we order public utilities to work with NAESB to develop an OASIS mechanism that will allow for auditing of CBM usage. | | | |
| FirstEnergy | | ☑ | MOD-004 should contain all the rules related to CBM. However, R13 and R14 should be renumbered to reflect the appropriate formatting. |
| **Response:** The SDT concurs that it has overtones of a business practice; however, in light of FERC's comments in Order 890, P. 262, at this stage of drafting it should be included in the NERC process and not the NAESB process. Here is the directive from Order 890:<br>Concerning TAPS' proposal to remove the reservation decision from the sole discretion of transmission providers, we determine that | | | |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| LSEs should be permitted to call for use of CBM, if they do so pursuant to conditions established in the reliability standards development process. We direct public utilities working through NERC to modify the CBM-related standards to specify the generation deficiency conditions during which an LSE will be allowed to use the transfer capability reserved as CBM. In addition, we direct that transmission set aside as CBM shall be zero in non-firm ATC calculations. Finally, we order public utilities to work with NAESB to develop an OASIS mechanism that will allow for auditing of CBM usage.<br><br>R14 should have been a sub-requirement under R13 – this was a typographical error in the version that was posted for comment. In the revised standard there is an algorithm for the calculation of non-firm ETC that includes what had been R13 through R14.5. | | | |
| HQTE | | ☑ | This is a business issue to be addressed by NAESB. |
| **Response:** The SDT concurs that it has overtones of a business practice; however, in light of FERC's comments Order 890, P. 262, at this stage of drafting it should be included in the NERC process and not the NAESB process. Here is the directive from Order 890:<br>Concerning TAPS' proposal to remove the reservation decision from the sole discretion of transmission providers, we determine that LSEs should be permitted to call for use of CBM, if they do so pursuant to conditions established in the reliability standards development process. We direct public utilities working through NERC to modify the CBM-related standards to specify the generation deficiency conditions during which an LSE will be allowed to use the transfer capability reserved as CBM. In addition, we direct that transmission set aside as CBM shall be zero in non-firm ATC calculations. Finally, we order public utilities to work with NAESB to develop an OASIS mechanism that will allow for auditing of CBM usage. | | | |
| Entergy | ☑ | | For consistency with other methods, excluding CBM from Non-Firm ETC should be included in this standard.. |
| **Response:** .Agree. | | | |
| IESO<br>IRC | ☑ | | It needs to be, but then again it may be a business practice issue. Along this vein, MOD-028 is silent on this and also has no mention of the CBM quantity in the calculation of non-firm ATC. |
| **Response:** The SDT concurs that it has overtones of a business practice; however, in light of FERC's comments Order 890, P. 262, at this stage of drafting it should be included in the NERC process and not the NAESB process. Here is the directive from Order 890:<br>Concerning TAPS' proposal to remove the reservation decision from the sole discretion of transmission providers, we determine that LSEs should be permitted to call for use of CBM, if they do so pursuant to conditions established in the reliability standards development process. | Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Note that the revised MOD-028 does include an algorithm for the calculation of non-firm ATC and it does require consideration of CBM. Here is the algorithm for determining ATC using the Area Interchange Methodology:<br><br>$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + Counterflows_{NF}$<br><br>CBMs is the Capacity benefit margin for the postd path that has been scheduled during that period | | | |
| ERCOT | ☑ | | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC's comments. | | | |

6. Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

**Summary Consideration:** After the posting of the Comment request, the NERC ATC Team met with FERC for a progress report on these standards. It was concluded that greater detail needed to be added to many of the affected standards. The NERC Team further decided that a more uniform structuring across the MOD-28-29-30 standards would better serve the industry. Although it is not anticipated that each of these three standards will be completely uniform in structure, any movement toward that goal will renumber / restructure and reorganize the flow of each affected standard accordingly.

The revised standard does include the following algorithm for the determination of non-firm ATC:

$$ATC_{NF} = TTC - ETC_{F} - ETC_{NF} - CBM_{S} - TRM_{U} + Postbacks_{NF} + Counter\text{-}schedules_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the Posted Path for that period.

**TTC** is the Total Transfer Capability of the Posted Path for that period.

**$ETC_{F}$** is the sum of existing non-firm commitments for the Posted Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm commitments for the Posted Path during that period.

**$CBM_{S}$** is the Capacity Benefit Margin for the Posted Path that has been scheduled during that period.

**$TRM_{U}$** is the Transmission Reliability Margin for the Posted Path that has not been released for sale as non-firm capacity by the Transmission Service Provider during that period,

**$Postbacks_{NF}$** are adjustments to non-firm Available Transfer Capability due to postbacks for that period, as defined in business practices, and

**$Counter\text{-}schedules_{NF}$** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and described in its Available Transfer Capability Implementation Document.

This shall serve as a single response to all comments offered in response to this question.

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSCSC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| NPCC | | ☑ | R14 is for planning and operating horizons and R15 is only for operating horizon |
| APPA | | ☑ | These are confusing and should be removed. R14 is written in a manner it is impossible to determine which Reliability function is responsible to meet the standard. In addition, any reference to non-firm |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | ATC should be in MOD-001, not spread out through several standards. |
| HQTE | | ☑ | R14 is for planning and operating horizons and R15 is only for operating horizon |
| WECC MIC MIS ATC TF | ☑ | | Merely combining these may not be sufficient to make clear what the TSP is supposed to do. R14 should, at minimum, be a subset of R13, lest there be no responsible party. Adding R15 as a subset of R13 would be appropriate.<br>Some in WECC assert that all "non-firm" is a business practice to be determined by NAESB. Others believe "non-firm" should be addressed in MOD-01 - not here. |
| Entergy | ☑ | | Please see comments to Question 2 above |
| ERCOT | ☑ | | See IRC comments submitted by Charles Yeung. |
| FirstEnergy | ☑ | | They should be combined to strengthen the reader's understanding of the material. |
| IESO | ☑ | | R14 and R15 could be combined. However, in R15, we do not understand what would be the items that are "the amount of capacity associated with unscheduled Transmission Service accounted for within firm and non-firm ETC,.." |
| IRC | ☑ | | R14 and R15 may be combined. However, in R15, we do not understand what would be the items that are "the amount of capacity associated with unscheduled Transmission Service accounted for within firm and non-firm ETC,.." |

7. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

**Summary Consideration:** The SDT has engaged NERC and the Functional Model team in an effort to add additional Applicable entities for insertion into the standard(s). That dialogue is ongoing. The SDT has requested a new role of "Operations Planner" utilizing the Functional Model. In the interim, the term Transmission Operator has supplanted Operations Planner. The Reliability Coordinator and Planning Coordinator were removed as 'applicable entities' in the revised standard. In the set of revised standards, the Transmission Operator has been assigned responsibility for determining TTC and TFC and the Transmission Service Provider has been assigned responsibility for determining ATC.

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF | | ☑ | Although the "Applicability" section states it is applicatable to Relaibility Coordinators, there is nothing in the draft that applies to an RC. |
| **Response:** References to the Reliability Coordinator have been removed. | | | |
| APPA | | ☑ | See Comments on MOD-029 |
| **Response:** We do not find your additional comments on MOD-29. | | | |
| BCTC | | ☑ | ATC related standards should be applicable only to entities who have the obligation to provide non-discrimintory transmission service, that is the Transmission Service Providers. |
| **Response:** The SDT believes this standard applies to entities other than the TSP. For example, the TSP is required to post assorted data. If there is no requirement for the providing entity to supply the data, the TSP cannot be obligated to post that which other entities will not provide. Thus, additional entities are implicated.<br>In the revised set of standards (MOD-028, MOD-029, MO-030), the drafting team assigned the Transmission Operator the responsibility for determining TTC or TFC and assigned the Transmission Service Provider with the responsibility for determining ATC. The requirements for the Planning Coordinator and Reliability Coordinator were removed from the revised standard. | | | |
| BPA | | ☑ | "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority. |
| **Response:** According to members of the Functional Model Work Group, the Planning Coordinator and the Planning Authority are essentially the same. The drafting team will post a definition of 'Planning Coordinator' so that it can be formally entered into the NERC Glossary of Terms Used in Reliability Standards. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** See response to IRC. | | | |
| IESO | | ☑ | Unlike the other MOD standards, this standard more appropriately reflect the role of the PC and RC in the determination of transfer capabilities, not ATC. However, the applicability section gives rise to unclear responsibilities between TSP and the PC/RC in that both calculate transfer capabilities of the "paths". We feel that the PC and RC are responsible for calculating the total path capability, whereas the TSP is responsible for calculating the available path capability. This distinction needs to applied to all the MOD standards. |
| **Response:** The SDT concurs that the RC is not responsible for calculating TTC. Please see the Summary Consideration for this question. In the revised set of standards (MOD-028, MOD-029, MO-030), the drafting team assigned the Transmission Operator the responsibility for determining TTC or TFC and assigned the Transmission Service Provider with the responsibility for determining ATC. The requirements for the Planning Coordinator and Reliability Coordinator were removed from the revised standard. | | | |
| IRC | | ☑ | Unlike the other MOD standards, this standard more appropriately reflect the role of the PC and RC the determination of transfer capabilities, not ATC. However, the applicability section gives rise to unclear responsibilities between TSP and the PC/RC in that both calculate transfer capabilities of the "paths". We feel that the PC and RC are responsible for calculating the total path capability, whereas the TSP is responsible for calculating the available path capability. |
| **Response:** See comments at the summary header of this section. In the revised set of standards (MOD-028, MOD-029, MO-030), the drafting team assigned the Transmission Operator the responsibility for determining TTC or TFC and assigned the Transmission Service Provider with the responsibility for determining ATC. The requirements for the Planning Coordinator and Reliability Coordinator were removed from the revised standard. | | | |
| NPCC<br>HQTE | ☑ | ☑ | MOD-029 includes applicability to Reliability Coordinator, but there is no reference in the details of the standard to the RC. A role should be defined, or RC should be removed from the Applicability section. All MOD standards should be consistent in their description of the roles for providing input and calculating ATC. |
| **Response:** References to the RC have been removed. In the revised set of standards (MOD-028, MOD-029, MO-030), the drafting team assigned the Transmission Operator the responsibility for determining TTC or TFC and assigned the Transmission Service Provider with the responsibility for determining ATC. | | | |
| FirstEnergy | ☑ | | MOD-001, 028, 029, and 030 should be combined into one standard to eliminate the need to reference several standards at once, eliminate duplication, and simplify the applicability sections of MOD-028, 029, and 030. |
| **Response:** The SDT discussed this issue in depth and asked stakeholders for feedback on this issue – most stakeholders | | | |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| supported separating the standards – as this adds clarity by providing more details on each of the the diverse metholdogies addressed therein. | | | |
| Entergy | ☑ | | |
| PSCSC | ☑ | | |

8. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

**Summary Consideration:** The SDT has adequately addressed the directives identified in the FERC Orders 890 and 693 related to Rated System Path**.** To assist stakeholders, when the revised standards are posted, the drafting team will post a table that shows each of the directives and identifies the standard in which the directive is addressed.

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The Federal Energy Regulatory Commission (FERC) has requested Standards that determine the requirements to calculate TTC will be handled in the FAC Standards. Order 693 States the following: 1050. We adopt the NOPR proposal and require that TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. The FAC series of standards contain the Reliability Standards that form the technical and procedural basis for calculating transfer capabilities. FAC-008-1 provides the basis for determining the thermal ratings of facilities while FAC-009-1 provides the basis for communicating those ratings. FAC-010-1 and FAC-011-1 provide the system operating limits methodologies for the planning and operational horizon respectively and FAC-014 provides for the communication of those ratings.<br>FERC has correctly recognized that FAC-012 and FAC-013, while associated with modeling is highly dependent on the previous FAC Standards as noted by FERC. |
| **Response:** After clarification from FERC and in depth discussions on this issue, the SDT is proposing to retire FAC-12 and 13 and has imported all substantive requirements into the appropriate MOD-28-29-30. | | | |
| IESO<br>IRC | ☑ | ☑ | It appears that the SDT has addressed all of the FERC directives. However, in view of the many comments provided to this and the other related MOD standards, and hence substantive changes are expected, we see the need to revisit this subject again when revised standards are posted. |
| **Response:** To assist stakeholders, when the revised standards are posted, the drafting team will post a table that shows each of the directives and identifies the standard in which the directive is addressed. | | | |
| ERCOT | ☑ | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC. | | | |
| FirstEnergy | | ☑ | |
| Entergy | ☑ | | |

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| FirstEnergy | ☑ | | |
| PSCSC | ☑ | | |

9. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

**Summary Consideration:** In general the industry has identified no regulatory conflicts. However, the industry does remain concerned that some if not all of these standards may not apply to them based on their specific circumstance. Assigning liability is outside the scope of this SDT. Where an entity believes they are exempt for regional differences the regional variance process is available.

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | | See question 8 above |
| **Response:** See response above to APPA on Question 8. | | | |
| HQTE | | | We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the requirements defined in these standards do not apply to entities that do not sell transmission service in advance of the physical flow of energy. For example, many or all items associated with firm and non-firm ETC would be zero for these markets. |
| **Response:** The SDT concurs and suggests that the narratives required in the ATCID and the OATT Attachment C should address HQTE's concerns; however, HQTE has raised enforcement concerns that are outside the scope of the SDT. | | | |
| IESO<br>IRC | | ☑ | No, but please note that some markets do not offer physical transmission services and hence some of the requirements in this standard do not apply to these entities. |
| **Response:** The SDT concurs. | | | |
| NPCC | | | We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the requirements defined in these standards do not apply to entities that do not sell transmission service in advance of the physical flow of energy. For example, many or all items associated with firm and non-firm ETC would be zero for these markets. |

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT Interconnection. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority Interconnection and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area and there has been no reservation of transmission capacity in ERCOT.<br><br>Available Transfer Capability is defined as the measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin. The ERCOT Interconnection has already moved “beyond” ATC and into a Market design which resulted in the disappearance of an explicit transmission service product. In addition the DC Tie transfer capability is planned and coordinated by a TSP that is a member of both Regions and therfore both ERCOT and SPP are notified when the DC Tie capability is reduced.<br><br>Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. Currently ERCOT employs a zonal congestion management scheme that is flow-based, whereby the ERCOT transmission grid, including attached generation resources and load, are divided into a predetermined number of congestion zones. This congestion management scheme applies zonal shift factors, determined by ERCOT, to predict potential congestion under the known topology of the ERCOT System. This scheme is used in the Day Ahead and Adjustment Periods to evaluate potential congestion. During the operating period ERCOT uses zonal shift factors to determine zonal Redispatch deployments needed to maintain flows within zonal limits. The local congestion management scheme relies on a more detailed Operational Model to determine how each particular Resource or Load impacts the transmission system. This model uses the current known topology of the transmission system. Unit specific Redispatch instructions are then issued to manage local congestion.<br><br>In the future ERCOT will be transitioning from a Zonal Market to a full LMP market. This system is designed to manage congestion in the Day Ahead and Real-Time on a Resource specific basis. Under both of these market designs transmission facility limits are established in advance and updated based on coordinated exchange of information between transmission providers and ERCOT in planning and operating periods.<br><br>In the current and future ERCOT market design the method of calculating ATC, TTC and the use of |

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | CBM and TRM are not applicable to the ERCOT Interconnection. ERCOT does not have a synchronous connection with any other Balancing Authority Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Balancing Authority Areas and/or offer transmission reservations and schedules within the interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance. |
| **Response:** The drafting team believes the Applicable Entities delineated in the Applicability section of MOD-29 would already exclude ERCOT from compliance "so long as" ERCOT does not use the Rated System Path Methodology.<br><br>While the SDT can establish Applicable Entities, it cannot determine liability on ERCOT's part for failure to adhere to a Standard. Assigning liability is outside the scope of this SDT. FERC has made it clear that where an entity believes they are exempt for regional differences the regional variance process is available. | | | |

10. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

**Summary Consideration: Varied.**

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| WECC MIC MIS ATC TF | A. The current "R14." should be numbered as "R13.1." and this will have an impact on all subsequent requirements.<br>B. In the "Applicability" section, the term "Available Transfer Capability Implementation Document" is used as a defined term. The term is used in MOD-01 R3. At minimum the ATCID either needs to be defined or a reference to the MOD-01 must be inserted for cross reference into each Standard in which it appears.<br>C. R1. Change the determinant from "the" to "a" in the parenthetical.<br>D. I n the "Applicability" section, either "Planning Coordinator" needs to be defined and imported into the NERC Glossary or a more appropriate entity such as "Planning Authority" may be in order.agreed<br>E. R6. The term "extreme" is overly vague. This Team suggests replacement with the words "maximum or minimum".<br>F. R7-R8. Change "posted path" to "Posted Path".<br>As with MOD-08, Posted Path should be defined as:<br>Posted Path<br>Posted Path means: 1) any Balancing Authority to Balancing Authority interconnection; 2) any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months; 3) and any path for which a customer requests to have ATC or TTC posted. For purposes of this definition, an hour includes any part of an hour during which service was denied, curtailed or interrupted. (Plagiarized from NAESBE R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.<br><br>G. The term "postbacks" appeared in Order 890, P. 212. "Therefore, we direct public utilities, working through NERC, to modify related ATC standards by implementing the following principles for firm and non-firm ATC calculations: (1) for firm ATC calculations, the transmission provider shall account only for firm commitments; and (2) for non-firm ATC calculations, the transmission provider shall account for both firm and non-firm commitments, postbacks of redirected services, unscheduled service, and counterflows." Since the term is not defined and whereas FERC did not specify exactly what it is, the NERC Team should clarify what FERC meant by the term before inserting it into the calculation process.<br>H. R6. Everytime the word "path" is used it should be replaced with "POSTED PATH." agreed<br>I. To assist the industry in determining which of the three methodologies is best suited for the TSP's needs, it is suggested that a statement be inserted into the "Purpose" section of MOD-28 / 29 / 30 stating its intended use.<br>E.g. MOD-28 was modeled on the ATC process of much of the Eastern Interconnect. |

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| | MOD-29 was modeled on the ATC process of much of the WECC Interconnet.<br>J. R12.5 Delete "five years or longer in duration." |
| **Response:**<br><br>A. Agreed. R14 should have been numbered as R13.1 – the content of R13 has been converted into an algorithm in the revised standard.<br>B. Agreed. The drafting team added a definition for Available Transfer Capability Implementation Document. The term is introduced in MOD-001 and is defined in the revised version of MOD-001.<br>C. Agreed. This change is reflected in the revised standard – see R2,6.<br>D. Agreed. The Planning Coordinator is the same entity as the Planning Authority – just a new name introduced in Version 3 of the Functional Model. The drafting team will post a definition for the Planning Coordinator. Note that the RC has been supplanted by Transmission Operator in this standard.<br>E. R6 was revised and now requires the determination of the 'maximum' flow in support of your suggestion.<br>F. Agreed. The drafting team adopted the defined term, 'Posted Path' and has used this in the revised set of ATC-related standards.<br>G. Agreed. We have asked NAESB to define this term, as we believe that Post Backs are commercial in nature.<br>H. Agreed. The drafting team adopted the defined term, 'Posted Path' and has used this in the revised set of ATC-related standards.<br>I. Agreed. All of the Purpose statements were modified to include a reference to the associated methodology as proposed.<br>J. Agreed. The reference to 'five years or longer in duration' was removed from what had been R23.5. | |
| APPA | The Standard is written much like a Policy and it cannot be determined who is responsible for the different calculations of the components of the ATC. The Standard does not provide the Compliance Monitor or the TSP who calculates the Hourly. Daily, and Monthly ATCs with the necessary requirements to know what is necessary to be compliant. |
| **Response:** We have modified the standard to address this concern. | |
| BCTC | Requirements R3, R4, R5, and R6 are similar to what we are required to do under FAC-010-1. Similarity is good, but in this case there are areas of duplication and inconsistency. For example:<br>1. FAC-010-1 requires Planning Authorities to have an SOL Methodology that reflects the requirements similar to R3 and R4. Is NERC proposing that they will audit on having an SOL Methodology consistent with FAC-010 and then audit on determining TTCs consistent with MOD-029.<br>What happens if our SOL Methodology differs from MOD-029?<br>It seems that the TTC standard should only require to determine TTCs based on SOLs, which is what FAC-012 requires. |

| **Question #10** | |
|---|---|
| **Commenter** | **Comment** |
| | 2. Requirement R5 requires the use of assumptions consistent with expansion planning analysis. It is unclear what this means or how this would be audited, except by looking at SOL Methodology, unless we are also required to document our assumptions for MOD-029. This would be duplicative of our SOL Methodology.<br><br>3. Requirement R6 is not acceptable because it limits what we can consider in determining TTCs. R6.1, which references TPL-001 and TPL-002, is somewhat consistent with FAC-010. However, the reference should be to FAC-010, System Operating Limits, not the transmission planning standards. TPL-001 and TPL-002 do not have Western Interconnection differences, and TTCs need to allow for consideration of regional differences. Furthermore, we have to ask what is the purpose of BCTC having an SOL Methodology (FAC-010) and determining SOLs according to this Methodology (FAC-014), if MOD-029 provides criteria for determining TTCs. This is setting us up for a reliablity vs. commercial capacity conflict.<br><br>4. The second bullet under R6.1 is not acceptable. If a path is flow limited to less than "the reliability limit", how can we provide TTC up to the reliability limit. Firstly, we cannot calculate a reliability limit for anything higher than what will flow on the path (without using fictitious devices). Secondly, how can a customer use it?<br><br>5. Our suggestion to NERC would be to follow the structure layed out in the FAC series. Transmission Owners determine Facility Ratings according to FAC-008 and 009. Based on these Facility Ratings and other factors, Planning Coordinators, Reliability Coordinators, Transmission Planners determine SOLs according to FAC-010, 011,and -014. Based on these SOLs, PCs, RCs, and TSPs determine TTC, etc. according to the applicable NERC standard.<br><br>The above comments are also applicable to MOD-28-1 and MOD 30-1. |

**Response:**

(1) BCTCs suggestion is well received, and the drafting team added the following requirement to the revised standard to address this concern.

- R4. Each Transmission Operator shall establish the TTC as the lesser of the TTC calculated in MOD-029-1 or any System Operating Limit for that Posted Path.)

The SDT concurs that, much like FAC-10, FAC-11 (and FAC-12) as proposed for FERC approval FERC (), language needs to be added to MOD-29 stating that TTC shall not exceed the SOL. Restated, the TTC predicated on the TPL approach shall not exceed the SOL as determined in the FACs. "The TTCs shall respect all applicable System Operating Limits."

As FERC has pointed out, ATC is both a commercial as well as a reliability issue. A series of checks and balances is created by predicating the MOD-29 TTC on the proposed TPL method tempered by the SOLs as suggested by BCTC. By predicating the TTC on the proposed TPL methodology, a more robust TTC figure is calculated thereby prompting full utilization of the grid. By contrast, when that same TTC value is filtered through the SOL value, as BCTC suggests, system reliability keeps TTC in check and prompts over utilization. In no way does establishment of TTC via the proposed TPL-001 and TPL-002 methodology infringe on BCTC's need nor obligation to continue to calcuate an SOL. Both are needed.

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| As for the substantive requirements of FAC-12 and FAC-13, the SDT is importing these into the ATC-related MOD standards and proposing 12 and 13 be retired.<br><br>B. (2) R5 was inserted in the standard to satisfy a directive in Order 890 (P.292). The SDT has moved R5 into MOD-001. R8 was added to the revised MOD-001 to ensure that, whatever method is used to calculate TTC, TFC or ATC, the assumptions used must be consistent with those used in any associated operations or planning studies for the time period being studied.<br><br>C. (3) MOD-28, 29 and 30 were not specificially designed to include all features of the ATC calcuation for any specific RRO. Although the TPL approach proposed in the first draft of proposed revisions to MOD-029, did not directly incorporate all of WECC's regional differences, by using TPL-001 and TPL-002, the standard mimiced WECC's Path Rating approach at a high level thus allowing non-WECC entities a proper umbrella for inclusion should they decide to select the RSP.<br>The drafting team modified R6 so that the specific reference to the TPL standards (". . .while at the same time satisfying the planning criteria in TPL-001 and TPL-002 for the Contingencies in Table 1, Category B or the successor criteria.") was replaced with more generic language to achieve the same purpose (". . .while at the same time satisfying all planning criteria for N-0, N-1, and N-2 contingencies as follows:")<br><br>D. (4) The SDT modified the second bullet under R6 in support of your suggestion – in the revised standard, this is R2.2:<br>R2.2. Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction.<br><br>E. (5) The SDT reviewed the Applicability section in light of the NERC Functional Model and has assigned Applicable entities based on the Model and the Team's best understanding of the activities assigned. In the revised set of standards, the Transmission Operator is assigned responsibility for determining TTC and the Transmission Service Provider is assigned responsibility for determining ATC. | |
| BPA | The ATC MODs (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) do not clearly distinguish the methodologies and their applications. Please provide narrative descriptions of these methodologies.<br>The Applicability section 4.1. through 4.3. and R1., R4. through R11., R15., and R16. should be clarified that ATC need only be calculated and posted for Posted Paths, where "Posted Path" is defined consistent with NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60. agreed<br>R2. and R9. -- Making TTC study reports publicly available would present system security concerns due to the fact that such studies will identify the most limiting contingencies. Identifying the most critical contingencies publicly could make them a target and thus reduce system reliability. This information should only be shared with those |

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| | entities demonstrably impacted by such limiting contingencies.<br>R12.7. and R14.5. -- Please define the term "Post-back".<br>The current "R14." should be numbered as "R13.1." and this will have an impact on all subsequent requirements. |
| **Response:**<br><br>The purpose statement of MOD-028, MOD-029 and MOD-030 was revised to include a description of the associated methodology – and each of the methodologies has been defined. The Reliability Standards Development Procedure does not have a place, other than in definitions and reference documents, for inclusion of narrative descriptions.<br><br>"Posted Path" concept has been adopted and is used extensively in the set of revised standards.<br><br>As to the confidentiality concerns, the drafting team removed all requirements in the standards that used the term, 'make publicly available' - NAESB will be addressing any public release of information.<br><br>As to "post back", the SDT agrees. NAESB is developing a definition for this term.<br><br>As to R14, the SDT concurs that The version of the standard posted for comment was not numbered correctly. In the revised standard, the content of R13 has been placed into an algorithm and there are no sub-requirements. | |
| Entergy | R1- it is not clear which "report drafted for a TTC study" is referred to and what study is conducted.<br><br>R3 - "critical modeling details" is vague and should be explained.<br><br>R3 and R4 - it appears that only one model is used for calculation of TTC for all paths and time horizons, if yes, it appears unrealistic, if no, model should be made plural.<br>R4 - are Long Term Firm Transmission Service Reservations included in base cases? If so, these should be included as subrequirement under R4.<br><br>R4 - R4 should include planned and unplanned outages, if included in the base case.<br><br>R6.2 refers to path rating - is it same as TTC of that path, if so, only TTC based on path rating should be used.<br><br>R6.2, it is not clear what is "revised path".<br><br>R6.2 second bullet - are local or regional procedures approved by any entity? These should be included in the data to be made publicly available and included in R9. |

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| | R8 - it appears like each Planning Coordinator determine TTC for all posted path of Transmission Service Provider. "value" should be made plural. It is not clear how frequently TTC values are calculated or updated. |
| **Response:**<br><br>R1 – SDT agrees. This has been corrected in the revised standard by rearranging the sequence of requirements so that all steps associated with determining TTC are in a single requirement. Putting together a report that includes the TTC and its associated assumptions, etc is now part of R2. The new sub-requirement refers to the report as a "study report," providing detail as to what goes in the study report<br>R3 – SDT agrees. This requirement has been clarified by the following rewording and is R1 in the revised standard:<br><br>When calculating TTC for Posted Paths, the Transmission Operator shall use a Transmission model the meets the following criteria:<br><br>R3-R4 – There is a separate study for each path for each time period using a separate model if deemed appropriate. The WECC coordinated base cases are usually the seed cases for building these models. Although normally the same model is not used to conduct all TTC studies since R3 & R4 reference model in a generic sense the SDT feels that using the word "model" in the singular form is appropriate.<br>R4 - Initially, they are included but since generation and load can be adjusted to maximize stress on the path of interest they are not very relevant. TTC studies are case specific or outage specific. A special study will be run if the TTC for a particular outage condition is of interest.<br>R6.2 – Path Rating and TTC are the same thing in WECC vernacular. You are correct that we should be using the word "TTC" instead of "path rating" for this section of the standard to avoid confusion, and we've modified the standard in support of this suggestion. See the use of the acronym, TTC instead of 'path rating' in the revised standard's Requirement 2.<br>R6.2 "Revised path" is a Posted Path that has been revised. Note that the requirement to make the study results publicly available has been deleted as all posting requirements are being addressed by NAESB as business practices.<br>R8 - The SDT believes the correct role for this task is actually the "Operations Planner," a role that does not exist in the functional model at this time. The SDT has requested a new role of "Operations Planner" utilizing the Functional Model. In the interim, the term Transmission Operator has supplanted Operations Planner.<br><br>TTC will be calculated as necessary to support the requirements for ATC specified in MOD-001. | |
| FirstEnergy | R6.2 demonstrates the essential difference with Network Response ATC calculations.<br><br>R11 should be revised to eliminate the subtraction of a portion of TRM from TTC to calculate ATC since this has |

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| | already occurred in R6.2 where parallel path impacts are covered. |
| **Response:**<br>The drafting team modified the standard so that it includes algorithms for the determination of ETC and ATC. The revised standard includes the following algorithm for the determination of firm ATC, and it does subtract TRM from TTC as proposed:<br>$ATC_F = TTC – ETC_F – CBM – TRM + Postbacks_F + Counter\text{-}schedules_F$ | |
| NPCC<br>HQTE | For Clarification:<br>R6.1 Regional criteria (NPCC) are not all included in TPL-001 and TPL002 for contingencies in Table 1, category B…There should be acknowledgement that there can be regional differences in the application of planning criteria that may extend beyond Category B contingencies in determination of TTC.<br>R.12.10 (re-numbered to R13) : Note that the TRM allocated to the path for non-firm ATC may be less than the TRM for firm ATC.<br>R12.10 (renumbered to R13): As it is not specified , we understand that the TSP is free to calculate the ATC by reducing the TTC by reserved or by scheduled transmission services depending on the time horizon.<br>R11: Use of the word "impact" in the formula for ATC introduces confusion. Can R11 be written in formula format like the Version Zero standards?<br>R11.4 Use of the word "impact" is redundant. |
| **Response:**<br>R6.1 – The drafting team modified R6.1 so that the specific reference to the TPL standards (“. . .while at the same time satisfying the planning criteria in TPL-001 and TPL-002 for the Contingencies in Table 1, Category B or the successor criteria.”) was replaced with more generic language to achieve the same purpose (“. . .while at the same time satisfying all planning criteria for N-0, N-1, and N-2 contingencies as follows:”)<br><br>R.12.10 was converted into a requirement to use an algorithm to determine non-firm ETC – here is the algorithm:<br><br>R6. When calculating ETC for non-firm Existing Transmission Commitments ($ETC_{NF}$) for all time horizons for a Posted Path the Transmission Service Provider shall use the following algorithm:<br>$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$<br>**Where:** | |

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| | **$NITS_{NF}$** is the non-firm capacity reserved for Network Integration Transmission Service serving Load, to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.<br><br>**$GF_{NF}$** is the non-firm capacity reserved for grandfathered Transmission Service and bundled contracts for energy and Transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC.<br><br>**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.<br><br>**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm.<br><br>R.11 – Agreed. The term "impact" has been removed and the descriptive language was converted into an algorithm similar to the one above for R12.10. |

| **Response:** See response to IRC comments. | |
| MEC | Our footprint does not include facilities in the WECC, therefore, I do not answer all the questions on the MOD-029-1 but provides the following comments:<br><br>1. The purpose of each of the standards should be revised to be more in-line with each other, that is some refer to "transparent" and others do not. The purpose in MOD-028-1 be revised to replace "uniform" with "transparent".<br><br>2. The Functional Entity as provided in A.4. should not be qualified, for example, A.4. should just list Planning Coordinator, Reliability Coordinator, and Transmission Service Provider.<br><br>3. For R1, R3, R4, R5, R6, R7, and R8, the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as |

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| | appropriate", do these requirements in the standard.<br><br>4. R6.1 refers to only certain NERC planning criteria, when the TTC must be based upon the appropriate planning criteria whatever that is. The references to planning criteria should be expanded to include all applicable planning criteria, including NERC, regional, subregional, Transmission Owner, etc.<br><br>5. R2, R9, R16 and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available publicly "on the OASIS" so that this information is not made publicly without registration.<br><br>6. R12 should be revised to indicate that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an appropriate level of " the following inputs.<br><br>7. R14 should be renumbered R13.1 and R14.1 through R14.5 should be renumbered R13.2 through R13.6. R15 and R16 should be renumber R14 and R15.<br><br>8. Existing transmission commitments should be listed without capital letters or else it needs to be defined for the NERC Glossary. |

**Response:**
(1) Agreed; the drafting team modified the purpose statements in MOD-28, 29, 30 to include a reference to the associated methodology and to clarify that the purpose was to increase consistency and transparency.
(2) The qualifiers used in the Applicability section clarify which entities are being held responsible for the various requirements. The qualifying language is included in support of the Reliability Standards Development Procedure.
(3) The SDT modified the Applicable entities to more closely align with the Functional Model – the Transmission Operator has been assigned responsibility for determining TTC or TFC and the Transmission Service Provider has been assigned responsibility for determining ATC. This change was made in MOD-028, MOD-029 and MOD-030. The SDT disagrees that MOD-29 presumes the existence of an RTO.
(4) The drafting team modified R6.1 so that the specific reference to the TPL standards (". . .while at the same time satisfying the planning criteria in TPL-001 and TPL-002 for the Contingencies in Table 1, Category B or the successor criteria.") was replaced with more generic language to achieve the same purpose (". . .while at the same time satisfying all planning criteria for N-0, N-1, and N-2 contingencies as follows:")
(5) The SDT agrees; however, R2, R9 and R16 have been removed from the revised standard as all posting issues are being addressed by NAESB in business practices.. The SDT will advise NAESB of your comments.
(6) R12 was revised now states:

When calculating ETC for firm Existing Transmission Commitments ($ETC_F$) for a specified period for a Posted Path, the

| Question #10 | |
|---|---|

| | NERC Glossary. |

**Response:** (1) Agreed; the drafting team modified the purpose statements in MOD-28, 29, 30 to include a reference to the associated methodology and to clarify that the purpose was to increase consistency and transparency.
(2) The qualifiers used in the Applicability section clarify which entities are being held responsible for the various requirements. The qualifying language is included in support of the Reliability Standards Development Procedure.
(3) The SDT modified the Applicable entities to more closely align with the Functional Model – the Transmission Operator has been assigned responsibility for determining TTC or TFC and the Transmission Service Provider has been assigned responsibility for determining ATC. This change was made in MOD-028, MOD-029 and MOD-030. The SDT disagrees that MOD-29 presumes the existence of an RTO.
(4) The drafting team modified R6.1 so that the specific reference to the TPL standards (". . .while at the same time satisfying the planning criteria in TPL-001 and TPL-002 for the Contingencies in Table 1, Category B or the successor criteria.") was replaced with more generic language to achieve the same purpose (". . .while at the same time satisfying all planning criteria for N-0, N-1, and N-2 contingencies as follows:")
(5) The SDT agrees; however, R2, R9 and R16 have been removed from the revised standard as all posting issues are being addressed by NAESB in business practices.. The SDT will advise NAESB of your comments.
(6) R12 was revised now states:

> When calculating ETC for firm Existing Transmission Commitments ($ETC_F$) for a specified period for a Posted Path, the Transmission Service Provider shall use the following algorithm:

(7) The SDT concurs that renumbering / restructuring would have added clarity to the standard. The format of the revised standard is quite different, and the requirements for calculation of ETC and ATC include specific algorithms and don't have any sub-requriements.
(8) The SDT agrees. A defintion for ETC has been included with the revised version of MOD-001.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a standard drafting team on March 17, 2006.

**Description of Current Draft:**

This is the first draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to comments. | TBD |
| 2. Post revised standard for stakeholder comment. | TBD |
| 3. Respond to comments. | TBD |
| 4. Post for 30-day pre-ballot review. | TBD |
| 5. First ballot of standard. | TBD |
| 6. Respond to comments. | TBD |
| 7. Recirculation ballot. | TBD |
| 8. 30-day posting before board adoption. | TBD |
| 9. Board adoption. | TBD |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**None.**

## A. Introduction

1. **Title:** **Network Response Available Transfer Capability**

2. **Number:** MOD-028-1

3. **Purpose:** To promote the consistent and uniform application and documentation of Available Transfer Capability (ATC) calculations performed using the Network Response method for reliable system operations.

4. **Applicability:**

   **4.1.** Each Planning Coordinator that uses the Network Response method to calculate ATCs for paths identified in an Available Transfer Capability Implementation Document.

   **4.2.** Each Reliability Coordinator that uses the Network Response method to calculate ATCs for paths identified in an Available Transfer Capability Implementation Document.

   **4.3.** Each Transmission Service Provider that uses the Network Response method to calculate ATCs for paths identified in an Available Transfer Capability Implementation Document.

5. **Proposed Effective Date:** To be determined.

## B. Requirements

**R1.** Each Planning Coordinator and Reliability Coordinator shall provide its Transmission Service Provider with a list of the Contingencies and assumptions it uses in determining Transfer Capabilities for the paths under the Transmission Service Provider's tariff.

**R2.** The Transmission Service Provider shall make the Contingencies and assumptions provided by the Planning Coordinator or Reliability Coordinator publicly available.

**R3.** The Transmission Service Provider shall make publicly available a list of its Point-of-Receipt (POR) to Point-of-Delivery (POD) Paths that includes, at a minimum, all interfaces between Balancing Authorities within or adjacent to the Transmission Service Provider's area.

**R4.** Each Planning Coordinator and Reliability Coordinator shall ensure that the Total Transfer Capability (TTC) for each of its Transmission Service Provider's POR to POD Paths is calculated and up-to-date for use within the Transfer Capability time horizons specified in MOD-001 R2.

**R5.** Prior to calculating TTC, each Planning Coordinator and Reliability Coordinator shall update the following components of the base case power flow model it uses to calculate TTC for the time horizon being studied:

**R5.1.** Anticipated transmission system configuration.

**R5.2.** Facility Ratings.

**R5.3.** Load forecast.

**R5.4.** Transmission system Elements scheduled to be taken out of or returned to service.

**R5.5.** Generation resources scheduled to be taken out of or returned to service.

**R5.6.** Unplanned transmission system Element outages.

**R5.7.** Unplanned generation resource outages.

**R5.8.** Typical generation dispatch order or the generation participation factors of all units on an affected Balancing Authority basis.

**R5.9.** Special Protection System models.

**R5.10.** Appropriate Firm Transmission Service Reservations.

**R5.11.** The data from R5.1 through R5.10 provided by adjacent Transmission Service Providers, and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.** Each Planning Coordinator and Reliability Coordinator shall follow these steps in determining the TTC for each path specified:

**R6.1.** Study the impact of increasing the transfer(s) between the POR and POD by adjusting Loads or generation to reach a reliability limit (first contingency incremental transfer capability) such that the system can withstand any single Contingency and achieve the following results:

**R6.1.1.** Transient, dynamic or voltage instability shall not occur.

**R6.1.2.** All facilities shall be within their associated Facility ratings.

**R6.1.3.** Cascading Outages or uncontrolled separation shall not occur.

**R6.2.** Add into the first contingency incremental transfer capability, all impacts of Firm Transmission Service Reservations that were included in the study model to obtain the 'first contingency TTC'.

**R6.3.** Use (as the TTC) the lesser of the value of the 'first contingency TTC' or the sum of Facility Ratings of all interfaces between the POR and POD.

**R7.** The Planning Coordinator and Reliability Coordinator shall each provide its Transmission Service Provider with the TTC for each of the specified paths.

**R8.** The Transmission Service Provider shall make publicly available the TTCs provided by its Planning Coordinator and Reliability Coordinator(s) upon their being made available to the Transmission Service Provider.

**R9.** The Transmission Service Provider shall calculate Available Transfer Capability (ATC) for the time horizons specified in MOD-001 R2 according to the ATC calculation schedule specified in MOD-001 R5.

**R10.** The Transmission Service Provider shall calculate firm ATC by reducing the TTC by the sum of the firm Existing Transmission Commitments (ETCs), the Capacity Benefit Margin (CBM), and the Transmission Reliability Margin (TRM) allocated to the path.

**R11.** The Transmission Service Provider shall determine the impact of firm ETCs based on the following inputs:

**R11.1.** The transmission capability utilized in serving Native Load commitments, to include Native Load growth, load forecast error and losses not otherwise included in TRM or CBM.

**R11.2.** The impact of Firm Network Integration Transmission Service serving Load, to include load forecast error and losses not otherwise included in TRM or CBM.

**R11.3.** The impact of grandfathered Firm Transmission Service Agreements and bundled contracts for energy and transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or Safe Harbor Tariff accepted by FERC.

**R11.4.** The impact of Firm Point to Point Transmission Service.

**R11.5.** The impact of maintaining roll-over rights for Firm Transmission Service contracts, five years or longer in duration, granting Transmission Customers the right of first refusal to take or continue to take Transmission Service from a Transmission Owner when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**R11.6.** The impact of any Ancillary Services not otherwise included in CBM or TRM.

**R11.7.** Post-backs of redirected or released Firm services.

Re: R11.7 - Being discussed at NAESB - may need to be included. Maybe for temporary "undesignation" of a DNR

**R11.8.** The impact of counter-flows not otherwise accounted for in the ATC calculation.

**R11.9.** The impact of any other services, contracts, or agreements not specified above using transmission that serves Native Load or Firm Network Integration Transmission Service.

**R12.** The Transmission Service Provider shall limit the total impact of all Transmission Service from a specific POR to not exceed sum of the nameplate ratings of all generators at that POR.

**R13.** The Transmission Service Provider shall calculate non-Firm ATC by reducing the TTC by the sum of the firm ETCs, the non-firm ETCs, and the TRM that the Transmission Service Provider has not elected to release allocated to the path.

**R14.** The Transmission Service Provider shall determine the impact of non-firm ETCs based on the following inputs:

**R14.1.** The impact of Non-Firm Network Integration Transmission Service serving Load, to include load forecast error and losses not otherwise included in TRM or CBM.

**R14.2.** The impact of grandfathered non-firm Transmission Service Agreements and bundled contracts for energy and transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or Safe Harbor Tariff accepted by FERC.

**R14.3.** The impact of Non-Firm Point to Point Transmission Service.

**R14.4.** The impact of counterflows not otherwise accounted for in the ATC calculation.

**R14.5.** Capacity utilized for TRM that the Transmission Service Provider has elected to be released as non-firm ATC.

**R14.6.** Post-backs due to the reinstating of Firm from a “Firm-to-Non-Firm” redirect.

**R15.** The Transmission Service Provider shall increase non-firm ATC by the amount of capacity associated with unscheduled Transmission Service accounted for within firm and non-firm ETC, to the extent allowable by the agreement associated with the service, in accordance with established business practices.

**R16.** The Transmission Service Provider shall make publicly available the ATC for each path.

## C. Compliance

To be added with next posting.

## D. Measures

To be added with next posting.

## E. Regional Differences

None.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The impact of load growth for Network Integration Transmission Service should be included in R11.2.
   The "five years or longer in duration" language should be removed from R11.5. due to the fact that this element of Order 890 is only to be implemented by a Transmission Service Provider (TSP) once the FERC has approved the TSP's Attachment K -- this may not occur for some TSPs until after the standards are to be implemented. Additionally, regardless of whether a TSP's Attachment K is approved, there will be a transition period (to be developed by each TSP) from the old 1-year/60-day roll-over paradigm to the 5-year/1-year -- the standard should not preclude a TSP from encumbering capacity for those existing Customers who have not yet been required to commit to five years of service to retain their roll-over rights.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☐ Yes

   ☒ No

   Comments: "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

   ☐ Yes

   ☐ No

   Comments:

**5.** In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: R2. -- For system security reasons, the contingency list details should not be publicly available. Identifying the most critical contingencies publicly could make them a target and thus reduce system reliability. This information should only be shared with those entities demonstrably impacted by such limiting contingencies.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: The ATC MODs (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) do not clearly distinguish the methodologies and their applications. Please provide narrative descriptions of these methodologies.

The Applicability section 4.1. through 4.3. and R1., R3., R6. through R10., R13., and R16. should be clarified that ATC need only be calculated and posted for Posted Paths, where "Posted Path" is defined consistent with NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.

R11.7. and R14.6. -- Please define the term "Post-back".

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☐ Yes

   ☒ No

– Comments: The Federal Energy Regulatory Commission (FERC) has requested Standards that determine the requirements to calculate TTC will be handled in the FAC Standards. Order 693 States the following: 1050. We adopt the NOPR proposal and require that TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. The FAC series of standards contain the Reliability Standards that form the technical and procedural basis for calculating transfer capabilities. FAC-008-1 provides the basis for determining the thermal ratings of facilities while FAC-009-1 provides the basis for communicating those ratings. FAC-010-1 and FAC-011-1 provide the system operating limits methodologies for the planning and operational horizon respectively and FAC-014 provides for the communication of those ratings.

FERC has correctly recognized that FAC-012 and FAC-013, while associated with modeling is highly dependent on the previous FAC Standards as noted by FERC.

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: This Standard is trying to detail the requirements of ETC and TTC in the same document. A large amount of the sub requirements in R11 and R14 are incorrect and/or being preformed by the wrong Applicable Function. The formula for Non-Firm ATC is incorrect and cannot be complied with by the Applicable Function listed,

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area.

   ☐ Yes

   ☒ No

   Comments: As stated in comment no. 1, TTC is directed to be handled in the FAC series Standards. Therefore the Applicable Functions are incorrect.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

☐ Yes

☒ No

Comments: The requirements in R5 have already been mandated, correctly, in the FAC and other MOD models. To repeat those requirements in this standard will confuse the industry and make it impossible the maintain a workable compliance program for several standards.

**5.** In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☒ No

Comments: The statement as written will impair the operational flexibility of the BES. Any path or network or flowgate that has a rating higher at its POR than the rating of a generator connected at the same POR would limit the transfers at that POR to the generator size. The SDT does not want that. The only time this will be appropriate is when the generator is connected by a radial generator-tie and no other transaction from the system will use this node as the POR.

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: Requirements R1 through R9 should be in the FAC series Standards. The TTC Standards do not address any of the reliability issues that would have been address in FAC-012 and FAC-013, if they had not been written as a fill-in-the-blank standard. The Regional Procedures for determining TTC that are requested in the existing FAC-012 would not have been written as proposed in MOD-028, 029, or 030.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: See comment No. 1

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: MOD-028 is very confusing and it will be difficult, if not impossible, to integrate into a Compliance program. The Compliance Monitor and the industry will have a very difficult time determining what needs to be accomplished to be compliant.

All of the Documents in this review have been written like a policy and this will not permit a Compliance Monitor to be able to determine if the Registered Applicable Function is conducting themselves in a manner that will meet the objectives of the Standards.

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☐ Yes

   ☒ No

   Comments: Conditional Firm Service (CFS) and Planning Redispatch Service (PRS) under Order No. 890 create new issues relating to modeling and calculating ATC. Specifically, when PRS is offered to maintain service, modeling for ATC calculations will be impacted during these periods. TTC must be modeled/calculated accounting for the new CFS/PRS requirements.

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: R11.4 should read as follows: The impact of Firm Point to Point Transmission Service adjusted for Post-backs.
   R11.5 should read as follows: The impact of maintaining roll-over rights for Long-Term Firm Transmission Service contracts.
   R11.6 should be deleted or replaced with more specific details of what Ancillary Services impacts are to be considered.
   R11.7 should be deleted, since this is now included in R11.4 above.
   R11.8 should be deleted or replaced with more specific details of how counterflows should be included.
   R11.9 should read as follows: The impact of any other services, contracts, or agreements not specified above using transmission that serves Native Load or Firm Network Integration Transmission Service, adjusted for Post-backs.
   R14.3 should read as follows: The impact of Non-Firm Point to Point Transmission Service, with adjustments for Post-backs.
   R14.4 should be deleted or replaced with more specific details of how counterflows should be included.
   R14.6 should be deleted, since this is now included in R14.3 above.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☒ Yes

   ☐ No

   Comments:

**4.** Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

☐ Yes

☒ No

Comments:

**5.** In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☒ No

Comments: The Transmission Service Provider shall limit the modeling of all Transmission Reservations from a specific generating plant to not exceed the modeled rating of all generators at that plant. Transmission Reservations should be allocated first to DNR's and the remainder allocated proportionately up to the modeled plant rating.

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: R2, R3, R8 and R16 are "communications" in nature and should be removed from NERC requirements and should be put into NAESB business practice standards where the communications requirements can be justified.

Need to re-word the following requirements:
R4. The Planning Coordinator, Reliability Coordinator or Transmission Service Provider shall ensure that the Total Transfer Capability (TTC) for each of its Transmission Service Provider's POR to POD Paths is calculated and up-to-date for use within the Transfer Capability time horizons spedified in MOD-001 R2.
R5. Prior to calculating TTC, the Planning Coordinator, Reliability Coordinator or Transmission Service Provider shall ensure the following components of the base case power flow model used to calculate TTC for the time horizon being studied are updated:
R5.6. Unplanned transmission system Element outages, or unplanned returned to service.
R5.7. Unplanned generation resource outages, or unplanned returned to service.
R5.10. Appropriate Firm Transmission Service Reservations, to eliminate netting of flows to avoid reliability concerns with associated reservations not being scheduled.
R6. The Planning Coordinator, Reliability Coordinator or Transmission Service Provider shall follow these steps in determining the TTC for each path specified:
R7. Each Planning Coordinator and Reliability Coordinator that calculates TTC shall provide its Transmission Service Provider with the TTC for each of the specified paths.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments:

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: R 12 is part of ETC for Firm ETC and R15 is adjustment to the Non-Firm ETC which is similar to post back of capacity, therefore, these should be included as sub bullets under R11 and R14 respectively.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☒ Yes

   ☐ No

   Comments: Applicability section correctly includes entities to whom this standard is applicable. However, in requirements the entities are not qualified as "…..that uses the Network Response method….". Appropriate adjustments to the requirements should be made throughout this standard.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

   ☐ Yes

   ☒ No

   Comments: If intent of R5.4 and R5.5 is to update power flow models to include all known outages , R5.6 and R5.7 should be merged with R 5.4 and R5.5 to include planned and unplanned outages.

5. In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☒ No

Comments: The language of R12 does not directly address the intent of Order 890 paragraph 245. It does not provide clear instructions for treatment of multiple reservation from a POR (generator) other than limiting the impact to name plate rating. We suggest that a uniform method, or alternate methods be included for treating these reservations to address Order 890 paragraph 245.

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: From R5.11, language "with which coordination agreements have been executed" should be struck. In R6.3, "interfaces" should be changed to ties/interconnections. In R7, "each of the specified' should be struck and "idenfied in R3" should be added after paths. From R11.5, the language "five years or longer in duration…..renewal" should be struck and "as applicable" be added after contracts.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments:

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT Interconnection. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority Interconnection and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area and there has been no reservation of transmission capacity in ERCOT.

Available Transfer Capability is defined as the measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin. The ERCOT Interconnection has already moved "beyond" ATC and into a Market design which resulted in the disappearance of an explicit transmission service product. In addition the DC Tie transfer capability is planned and coordinated by a TSP that is a member of both Regions and therfore both ERCOT and SPP are notified when the DC Tie capability is reduced.

Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. Currently ERCOT employs a zonal congestion management scheme that is flow-based, whereby the ERCOT transmission grid, including attached generation resources and load, are divided into a predetermined number of congestion zones. This congestion management scheme applies zonal shift factors, determined by ERCOT, to predict potential congestion under the known topology of the ERCOT System. This scheme is used in the Day Ahead and Adjustment Periods to evaluate potential congestion. During the operating period ERCOT uses zonal shift factors to determine zonal Redispatch deployments needed to maintain flows within zonal limits. The local congestion management scheme relies on a more detailed Operational Model to determine how each particular Resource or Load impacts the transmission system. This model uses the current known topology of the transmission system. Unit specific Redispatch instructions are then issued to manage local congestion.

In the future ERCOT will be transitioning from a Zonal Market to a full LMP market. This system is designed to manage congestion in the Day Ahead and Real-Time on a Resource specific basis. Under both of these market designs transmission facility limits are established in advance and updated based on coordinated exchange of information between transmission providers and ERCOT in planning and operating periods.

In the current and future ERCOT market design the method of calculating ATC, TTC and the use of CBM and TRM are not applicable to the ERCOT Region. ERCOT does not have a synchronous connection with any other Balancing Authority Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Balancing Authority Areas and/or offer transmission reservations and schedules within the interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance.

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: However, the term "Post-backs" is industry jargon and should be replaced with the term "reinstatement" to add clarity.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☒ Yes

   ☐ No

   Comments: MOD-001, 028, 029, and 030 should be combined into one standard to eliminate the need to reference several standards at once, eliminate duplication, and simplify the applicability sections of MOD-028, 029, and 030.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

   ☐ Yes

   ☒ No

   Comments: R 5.11 requires inclusion of the data provided by adjacent Transmission Service Providers and any other TSP with which coordination agreements have been executed; however, this standard does not include a requirement for adjacent TSPs to provide this data nor for executing coordination agreements with other TSPs.

5. In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☒ Yes

☐ No

Comments: However, the phrase "not exceed" can be replaced with the word "the" since the term "limiting the total impact" is synononomous.

6. Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☒ Yes

☐ No

Comments:

7. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

8. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: The standard should include specifics of methods for complying with the term "publicly available" such as posting on OASIS, a corporate web page, etc. (This concept is mentioned in all MOD-028, MOD-029, and MOD-030.)

R5.10 needs more clarity. While it provides leeway with respect to recognizing Firm Reservations, the term appropriate is subjective in nature and requires quidance on determing what is appropriate and what is not.

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission’s (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC’s directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If “No,” please identify which directives were ‘missed’ in the comments area.

   ☒ Yes

   ☒ No

   Comments: We believe the fundemental concerns of the FERC Orders 890 and 693 are identified in the standard. However, there are many detailed requirements in Orders 890 and 693 such that there has not been adequate time to do a thorough comparison. It is expected that the supplemental SAR would be addressing the issues that remain outstanding from those Orders.

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If “No,” please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☒ Yes

   ☒ No

   Comments: We agree with the entities listed. However, the description of the applicability for the PC and RC are not valid. The PC and RC provide input to ATC calculations, but they do not calculate ATCs. Suggest replacing 'ATCs' with 'TTCs' in the description of Requirement 4.1 and 4.2. Also, the language in these Applicability descriptions should be the consistent between MOD-028 and MOD-029.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If “Yes,” please list the elements and explain why they need to be updated in the comments area.

   ☐ Yes

   ☒ No

   Comments:

5. In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If “No,” please

suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: R1: MOD-028 requires 'a list', MOD-029 requires 'a description'. The language for this requirement between these two MODs should be consistent.
R2: This list of contingencies could contain critical infrastructure information. The phrase "consistent with CEII policies" should be added to the end of this requirement.
R6.1: The intent of the text of Requirement 6.1 in MOD-028 and MOD-029 seems to be the same. If the intent is the same, the language should be the same.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the requirements defined in these standards do not apply to entities that do not sell transmission service in advance of the physical flow of energy. For example, many or all items associated with firm and non-firm ETC would be zero for these markets.

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments:

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☒ Yes

   ☒ No

   Comments: We agree that the drafting team appears to have addressed all the FERC directives. However, we feel that this and the other MOD standards need revisions to properly align responsibilities and eliminate duplications (also see our comments on the other MOD standards).

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: We feel that R11.1, R11.2, R11.6 and R14.1 leave room for double counting of components that shold have been taken care of by TRM and CBM. Further, we do not understand why the CBM component is excluded from R13. If the omission is based on the rationale that CBM could be offered as non-firm ATC, then wouldn't TRM be treated in the same manner?

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☐ Yes

   ☒ No

   Comments: The Planning Coordinator and Reliability Coordinator do not calculate ATCs. We suspect the reason that they are included in the applicability section is for their role in determining TTC. However, their roles are incorrectly stated in the applicability description.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

   ☒ Yes

   ☒ No

   Comments: While the component list appears to be complete, we find it difficult to keep track of or understand the rationale behind putting this requirement in this standard, while being uncertain of what changes are to be made to FAC-012 and -013. If those parts of FAC-012 and -013 that relate to TTC calculation are to be absorbed in this standard, then we'd think that having R5 (and R6) alone may not be sufficient. On the other hand, if FAC-012 and -013 are to remain as is or be moved to other standards, then we do not see the need to replicate partical requirements in MOD-028.

Note that the supplementarty SAR indicates that: "Specifically, the following Standards may be modified, transferred to NAESB or retired:

FAC-012 Transfer Capability Methodology
FAC-013 Establish and Communicate Transfer Capabilities

The SDT needs to be more specific and certain of its direction on these two standards to help the industry better understand and track changes.

**5.** In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: We have a question on R13 with respect to the omision of CBM (see our comments under Q2). Further, in R15, we do not understand what would be the items that are "by the amount of capacity associated with unscheduled Transmission Service accounted for within firm and non-firm ETC" when increasing non-firm ATC.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: However, please note that some markets do not offer physical transmission services and hence some of the requirements in this standard do not apply to these entities.

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: Please see our comments on the Supplementary SAR. Also, as indicated under Q4, we are concerned with the lack of details and specific direction on treatment of FAC-012 and -013, and how changes to these two standards will be coordinated with the requirements in this standard (and MOD-029 and MOD-030).

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☒ Yes

   ☒ No

   Comments: We agree that the drafting team appears to have addressed all the FERC directives. However, we feel that this and the other MOD standards need revisions to properly align responsibilities and eliminate duplcations (also see our comments on the other MOD standards). We should resist this question again when updated standard versions are posted.

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: We feel that R11.1, R11.2, R11.6 and R14.1 leave room for double counting for components that shold have been taken care of by TRM and CBM.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☐ Yes

   ☒ No

   Comments: The Planning Coordinator and Reliability Coordinator do not calculate ATCs. We suspect the reason that they are included in the applicability section is for their role in determining TTC. However, their roles are incorrectly stated in the applicability description.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

   ☒ Yes

   ☒ No

   Comments: While the component list appears to be complete, we find it difficult to keep track of or understand the rationale behind putting this requirement in this standard, while being uncertain of what changes are to be made to FAC-012 and -013. If those parts of FAC-012 and -013 that relate to TTC calculation are to be absorbed in this standard, then we'd think that having R5 (and R6) alone may not be sufficient. On the other hand, if FAC-012 and -013 are to remain as is or be moved to other standards, then we do not see the need to replicate partical requirements in MOD-028.

Note that the supplementarty SAR indicates that: "Specifically, the following Standards may be modified, transferred to NAESB or retired:

FAC-012 Transfer Capability Methodology
FAC-013 Establish and Communicate Transfer Capabilities

The SDT needs to be more specific and certain of its direction on these two standards to help the industry better understand and track changes.

**5.** In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☐ No

Comments: We have a question on R13 wrt the omision of CBM (see our comments under Q2). Further, in R15, we do not understand what would be the itemss that are "by the amount of capacity associated with unscheduled Transmission Service accounted for within firm and non-firm ETC" when increasing non-firm ATC.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments: No, but please note that some markets do not offer physical transmission services and hence some of the requirements in this standard do not apply to these entities.

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: Please see our comments on the Supplementary SAR. Also, as indicated under Q4, we are concerned with the lack of details and specific direction on treatment of FAC-012 and -013, and how changes to these two standards will be coordinated with the requirements in this standard (and MOD-029 and MOD-030).

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission’s (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC’s directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If “No,” please identify which directives were ‘missed’ in the comments area.

   ☒ Yes

   ☒ No

   Comments: We believe the fundemental concerns of the FERC Orders 890 and 693 are identified in the standard. However, there are many detailed requirements in Orders 890 and 693 such that there has not been adequate time to do a thorough comparison.

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If “No,” please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: We suggest rephrasing R11 and R14 so that it also states that: "The TSP shall determine the impact of firm ETCs based on the inputs listed below. If any of the inputs listed below refer to a product or service that is not contained in the TSP's FERC-approved Tariff, the TSP shall document this fact in their ATCID and the value of such input(s) in the ETC calculation shall be considered to be zero MW."

   The wording of 11.8 and 14.4 imply that the TSP MUST include the impact of counterflow. We do not agree that the impact of counterflow MUST be considered. It should up to the TSP as to if, when and how counter flow is considered. The requirement should be worded to allow for that flexibility and require that the TSP document how it is considered.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☒ Yes

   ☒ No

   Comments: We agree with the entities listed. However, the description of the applicability for the PC and RC are not valid. The PC and RC provide input to ATC calculations, but they do not calculate ATCs. Suggest replacing 'ATCs' with 'TTCs' in the description.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If “Yes,” please list the elements and explain why they need to be updated in the comments area.

   ☐ Yes

   ☒ No

Comments:

**5.** In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: R1. MOD-028 requires 'a list', MOD-029 requires 'a description'. The language for this requirement between these two MODs should be consistent.
R2. This list of contingencies could contain critical infrastructure information. The phrase "consistent with CEII policies" should be added to the end of this requirement.
R6.1 The intent of the text of Requirement 6.1 in MOD-028 and MOD-029 seems to be the same. If the intent is the same, the language should be the same.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the services (e.g., the offering of firm point to point service, see R.11.4) to which these requirements apply are not offered by Transmission Service Providers that do not sell transmission service in advance of the physical flow of energy. For example, many or all items associated with firm and non-firm ETC would be zero in the markets administered by these TSPs. For example, over the Pool Transmission Facilities in New England, all capability is considered available to the market (i.e., the Total Transfer Capability) until real-time scheduling occurs. With the current arrangement of these proposed standards, the ATC Implementation Document would clearly document how the TSP complies with these standards, based on what services are offered through the Commission-approved tariff and/or market rules .

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments:

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: 1. R11 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm existing transmission committements based on an appropriate level of the following inputs." 2. Existing transmission commitments should not be listed in capatalized letters unless a definition is going to be developed for the NERC Glossary.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☐ Yes

   ☒ No

   Comments: The Functional Entity as provided in A.4. should not be qualified, for example, A.4. should just list Planning Coordinator, Reliability Coordinator, and Transmission Service Provider.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

   ☐ Yes

   ☒ No

   Comments:

5. In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

   ☒ Yes

   ☒ No

Comments: The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. Also, this requirement is a transmission service request evaluation process requirement and does not belong in its present form in a standard concerning ATCs calculation. Also, there are issues with implementing this requirement. When there are numerous point to point requests for transmission service where some of them are partial path requests, it is not clear how to enforce the impacts of all transmission service shall not exceed the source at a particular point. If the Standards Drafting Team intends to continue with this requirement, the Standards Drafting Team should outline some subrequirements which explain how the Transmission Service Provider is to do this. It would be helpful if the SDT would develop an example of multiple requests some of which are partial path requests and show how the Transmission Service Provider than reviews the impacts to meet the requirement.

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: 1. For R1, R2, R4, R5, R6, and R7, the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as appropriate", do these requirements in the standard. 2. R6.2 and R6.3 use "first contingency" which implies that the only planning criteria to be used is first contingency outages. The TTC must be based upon the appropriate planning criteria whatever that is. The references to first contingency should be made more generic. 3. R3, R8 and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available publicly "on the OASIS" so that this information is not made publicly without registration. 4. R11 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an appropraite level of " the following inputs. 5. R14 should be expanded to include the use of metered data to forecast non-firm ETC in the operating horizon and therefore, allowing the release of non-firm ETC for non-firm ATCs in the operating horizon. This method is being used in the area to maximize the non-firm offerings in the operating horizon. I suggest wording such as the following for R18 or as a subrequirement: "Forecasts of non-firm ETC may be made using metered data so as to allow the release of non-firm ETC in the operating horizon. When such forecasting methods are used, it may be assumed that reductions in metered flows in the operating horizon are due to reductions in non-firm ETC."

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: The purpose of each of the standards should be revised to be more in-line with each other, that is some refer to "transparent" and others do not. The purpose in MOD-028-1 be revised to replace "uniform" with "transparent".

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☐ Yes

   ☒ No

   Comments: The entire point of 890 and 693 appeared to be not only for transparency, but consistency.

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☐ Yes

   ☐ No

   Comments: This is very difficult because the functional model seems to be very specific, but roles within a utility are not so clearly defined.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

   ☒ Yes

   ☐ No

   Comments: A consistent way of modeling all of the things listed in R5 should be clearly identified within the standard (partial path reservations, conditional firm service, outages that last 1 day for a monthly model, etc.)

5. In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

   ☒ Yes

   ☐ No

Comments: The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. This appears to make unit specific service of less value then service that lists a control area for redirecting that service.

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: This is a fill-in-the-blank standard.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: No requirement for consistency

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: This standard should be combined with MOD-30 and the requirements should be written to require consistency.

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: 1. R11 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm existing transmission committements based on an appropriate level of the following inputs." 2. Existing transmission commitments should not be listed in capatalized letters unless a definition is going to be developed for the NERC Glossary.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☐ Yes

   ☒ No

   Comments: The MRO believes that the Functional Entity as provided in A.4. should not be qualified, for example, the MRO recommends that A.4. just list Planning Coordinator, Reliability Coordinator, and Transmission Service Provider.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

   ☐ Yes

   ☒ No

   Comments:

5. In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

   ☒ Yes

☒ No

Comments: The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. Also, this requirement is a transmission service request evaluation process requirement and does not belong in its present form in a standard concerning ATCs calculation. Also, there are issues with implementing this requirement. When there are numerous point to point requests for transmission service where some of them are partial path requests, it is not clear how to enforce the impacts of all transmission service shall not exceed the source at a particular point. If the Standards Drafting Team intends to continue with this requirement, the Standards Drafting Team should outline some subrequirements which explain how the Transmission Service Provider is to do this. It would be helpful if the SDT would develop an example of multiple requests some of which are partial path requests and show how the Transmission Service Provider than reviews the impacts to meet the requirement.

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: 1. The MRO believes that for R1, R2, R4, R5, R6, and R7, the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as appropriate", do these requirements in the standard. 2. R6.2 and R6.3 use "first contingency" which implies that the only planning criteria to be used is first contingency outages. The TTC must be based upon the appropriate planning criteria whatever that is. The references to first contingency should be made more generic. 3. R3, R8 and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available publicly "on the OASIS" so that this information is not made publicly without registration. 4. R11 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an appropraite level of " the following inputs. 5. R14 should be expanded to include the use of metered data to forecast non-firm ETC in the operating horizon and therefore, allowing the release of non-firm ETC for non-firm ATCs in the operating horizon. This method is being used in the MRO to maximize the non-firm offerings in the operating horizon. The MRO suggests wording such as the following for R18 or as a subrequirement: "Forecasts of non-firm ETC may be made using metered data so as to allow the release of non-firm ETC in the operating horizon. When such forecasting methods are used, it may be assumed that reductions in metered flows in the operating horizon are due to reductions in non-firm ETC."

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: The purpose of each of the standards should be revised to be more in-line with each other, that is some refer to "transparent" and others do not. The MRO recommends that the purpose in MOD-028-1 be revised to replace "uniform" with "transparent".

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission’s (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC’s directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If “No,” please identify which directives were ‘missed’ in the comments area.

   ☒ Yes

   ☒ No

   Comments: We believe the fundemental concerns of the FERC Orders 890 and 693 are identified in the standard. However, there are many detailed requirements in Orders 890 and 693 such that there has not been adequate time to do a thorough comparison. It is expected that the supplemental SAR would be addressing the issues that remain outstanding from those Orders.

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If “No,” please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☒ Yes

   ☒ No

   Comments: We agree with the entities listed. However, the description of the applicability for the PC and RC are not valid. The PC and RC provide input to ATC calculations, but they do not calculate ATCs. Suggest replacing 'ATCs' with 'TTCs' in the description of Requirement 4.1 and 4.2. Also, the language in these Applicability descriptions should be the consistent between MOD-028 and MOD-029.

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If “Yes,” please list the elements and explain why they need to be updated in the comments area.

   ☐ Yes

   ☒ No

   Comments:

5. In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If “No,” please

suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: R1: MOD-028 requires 'a list', MOD-029 requires 'a description'. The language for this requirement between these two MODs should be consistent.
R2: This list of contingencies could contain critical infrastructure information. The phrase "consistent with CEII policies" should be added to the end of this requirement.
R6.1: The intent of the text of Requirement 6.1 in MOD-028 and MOD-029 seems to be the same. If the intent is the same, the language should be the same.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the requirements defined in these standards do not apply to entities that do not sell transmission service in advance of the physical flow of energy. For example, many or all items associated with firm and non-firm ETC would be zero for these markets.

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☐ Yes

   ☒ No

   Comments: The applicability section needs clarification. Referencing R4 and R5, they should apply only to those entities performing the function. The standard should not require the calculations be made by the PC and RC, but should be applicable to the designated entitiy performing these calculations . The designated entity must be specified as a requirement in this standard. For example: The TSP, PC and RC must specify and agree to the entity that performs this function in the TSP's ATCID as required in MOD 1. The current revision of MOD-001 states the following requirement as R1: "Each Transmission Service Provider, and its associated Planning Coordinators and Reliability Coordinators, shall agree upon and implement one or more of the ATC methodologies specified in Reliability Standard MOD-028, MOD-029, and MOD-030 for use in determining Transfer Capabilities of those Facilities under the tariff administration of that Transmission Service Provider." The requirements of MOD-0028 should refer to the Designated Entity specified through this requirement. The following are examples of how this would be implemented in the standard:

   B. Requirements
   R4. Each Designated Entity shall ensure that the Total Transfer Capability (TTC) for each of its Transmission Service Provider's POR to POD Paths is calculated and up-to-date for use within the Transfer Capability time horizons specified in MOD-001 R2.
   R5. Prior to calculating TTC, each Designated Entity shall update the following components of the base case power flow model it uses to calculate TTC for the time horizon being studied:

**4.** Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

☐ Yes

☒ No

Comments:

**5.** In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: See comments in Question 3.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments: Standard is not clear as to what applies to long-term timeframe and short-term timeframe.

Reference in R12 to generator nameplate should be changed to maximum capability since in some conditions the generator can exceed nameplate rating.

Please use this form to submit comments on the 1st draft of standard MOD-028-1 Network Response ATC. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.
The standard drafting team was charged with revising the set of modeling standards.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-028-1 Network Response ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NR ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area**.**

   ☒ Yes

   ☐ No

   Comments:

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

   ☐ Yes

   ☒ No

   Comments:

5. In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

   ☐ Yes

   ☒ No

   Comments: We interpret the intent of paragraph 245 to imply that a generator should not be modeled at a level exceeding its maximum capability. With this interpretation, service could be granted up to the capability of the generator for each different POD. This is not allowed as R12 is currently drafted.

**6.** Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

☐ Yes

☒ No

Comments: R5.11 Comments. It may not be feasible to include all data from neighboring systems (e.g. PC or RC may not be able to incorporate all Special Protection schemes in a base case for TTC calculation). Also, the timeframes for which the values are being calculated may not allow for the incorporation of this data.

**7.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: R12 requires the TSP to limit the total impact of all Transmission Service from a "POR" (multiple generators) not a specific "generator" as written in Order 890.

**8.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

Comments:

1. As drafted, it is not completely clear as to which of the requirements would apply to long-term planning and which requirements would not apply.

2. The group should consider how conditional firm will be treated with respect to ETC and the TTC calculation.

3. The reference in R12 to "nameplate" should be change to "maximum capability." Under certain conditions, the output of a generator can exceed the value of its nameplate.

**Consideration of Comments — 2nd Draft of Standard MOD-028-1 — Network Response ATC (Project 2006-07)**

The ATC Standard Drafting Team requesters thank all commenters who submitted comments on the first draft of standard MOD-028-1, Network Response (Project 2006-07). This standard was posted for a 30-day public comment period from May 25 through June 24, 2007. The requesters asked stakeholders to provide feedback on the standard through a special standard Comment Form. There were 17 sets of comments, including comments from 76 different people from more than 40 companies representing all of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received, the drafting team has significantly redrafted the standard. The drafting team has addressed a significant number of the concerns expressed, but the changes have been so extensive that the revised standard bears very little resemblance to the last posted draft. Major changes include:

- A new term was defined to support a change in the name of the methodology described in the standard – Area Interchange Methodology
- The title was changed from, 'Network Response ATC' to 'Area Interchange Methodology' to have a title that is more self-descriptive.
- The Purpose statement was enhanced to clarify that the standard's purpose is to 'increase consistency and transparency in the development of transfer capability calculations' rather than to 'increase consistency and transparency in the development and documentation of ATC.'
- The Applicability was modified to eliminate the Planning Coordinator and Reliability Coordinator and to add the Transmission Operator. R1, which required the Planning Coordinator and Reliability Coordinator to provide specific information about contingencies and assumptions used to determine Transfer Capabilities to the Transmission Service Provider was eliminated. The intent of the requirement was to ensure that these contingencies and assumptions were respected by the Transmission Service Provider in the determination of TTC – and in the revised standard's R1, the Transmission Service Provider must document these contingencies, and other information used in the calculation of TTC in the Transmission Service Provider's Available Transfer Capability Implementation Document.
- R2, R3, R8 and R16 all required the Transmission Service Provider to make information publicly available, and all four of these requirements have been deleted from the revised standard. NAESB's business practices will address all ATC-related posting requirements.
- R4 which required the Planning Coordinator and Reliability Coordinator to ensure that TTC for each of the Transmission Service Provider's paths was calculated according to a schedule has been deleted. All requirements for the Planning Coordinator and Reliability Coordinator to calculate TTC have been removed from the standard and have been replaced with more detailed requirements for the Transmission Service Provider and/or the Transmission Operator to calculate TTC.
- R5 which required the Planning Coordinator and Transmission Operator to update the models used to calculate TTC has been revised so that the requirement is applied to the

Transmission Operator. The various components of the model that must be updated have been modified to provide more specificity to the elements of the model that must be used in calculating TTC.

- R6 outlined a process for the Planning Coordinator and Reliability Coordinator to follow in determining TTC for a path – and this requirement has been modified so that it applies to the Transmission Operator. The steps in the process have been modified to improve the clarity of the steps in the process.
- R7 required the Planning Coordinator and Reliability Coordinator to provide the Transmission Service Provider with the TTCs they had calculated – and this requirement has been revised so that it applies to the Transmission Operator. In the revised requirement, the Transmission Operator must make the TTCs it has calculated available to the Transmission Service Provider within five days of the determination of those TTCs.
- R9, R10 and R13 required the Transmission Service Provider to calculate ATC in accordance with very high-level formulas and requirements in MOD-001. In the revised standard there is a very detailed formula for calculating Firm ATC (R10) and a very detailed formula for calculating Non-Firm ATC (R11).
- R11 required the determination of Firm ETC in accordance with a set of 'inputs'. This requirement has been modified so that it includes a very detailed formula for calculating Firm ETC (R8).
- R12 required the Transmission Service Provider to limit the total impact of all transmission service from a specific POR to not exceed the sum of the nameplate ratings of all generators at that POR. The drafting team could not find a reliable approach to specifying how this could be implemented and the requirement was deleted.
- R13 and R15 were 'rules' relative to the calculation of ATC and have been deleted as separate requirements – they are now addressed in the algorithm for calculating non-firm ATC in the revised standard (R12).
- R14 required the determination of Non-Firm ETC in accordance with a high level formula. This requirement has been modified so that it includes a very detailed algorithm for calculating Non-Firm ETC (R9).
- Added measures and compliance information.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

## Index to Questions, Comments, and Responses

1. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to ATC and TTC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to ATC/TTC in this draft of MOD-028-1? If "No," please identify which directives were 'missed' in the comments area.

**Summary Consideration:** None of the stakeholders who responded to this question provided a specific directive from either of the FERC Orders relative to MOD-028 that was missing in the proposed MOD-028. Several stakeholders expressed concerns that insufficient time had been allocated to fully review the Orders against the proposed standard. The Drafting Team met with members of FERC staff to gain more insight into the directives in the two Orders and determined that some directives needed additional attention – and the drafting team remedied this in draft 2 of the proposed standard. The drafting team will post a matrix that shows each of the directives and identifies the standard and requirement where the directive has been addressed.

| **Question #1** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The Federal Energy Regulatory Commission (FERC) has requested Standards that determine the requirements to calculate TTC will be handled in the FAC Standards. Order 693 States the following: 1050. We adopt the NOPR proposal and require that TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. The FAC series of standards contain the Reliability Standards that form the technical and procedural basis for calculating transfer capabilities. FAC-008-1 provides the basis for determining the thermal ratings of facilities while FAC-009-1 provides the basis for communicating those ratings. FAC-010-1 and FAC-011-1 provide the system operating limits methodologies for the planning and operational horizon respectively and FAC-014 provides for the communication of those ratings.<br><br>FERC has correctly recognized that FAC-012 and FAC-013, while associated with modeling is highly dependent on the previous FAC Standards as noted by FERC. |
| **Response:** FERC has provided the Drafting Team additional guidance regarding this area. The TTC Standard will be moved from the FAC standards to the MOD standards. | | | |
| Duke Energy | | ☑ | Conditional Firm Service (CFS) and Planning Redispatch Service (PRS) under Order No. 890 create new issues relating to modeling and calculating ATC. Specifically, when PRS is offered to maintain service, modeling for ATC calculations will be impacted during these periods. TTC must be modeled/calculated accounting for the new CFS/PRS requirements. |
| **Response:** It is important to note that Planning Redispatch and CFS are only offered to long-term (one year or longer) service requests and that these two service types are considered firm when ATC is available in the short-term horizons. We believe this will be handled as a part of the NAESB work. | | | |
| MEC Trading | | ☑ | The entire point of 890 and 693 appeared to be not only for transparency, but consistency. |
| **Response:** Agree. The SDT thanks you for your comments. | | | |
| NPCC WG | ☑ | ☑ | We believe the fundamental concerns of the FERC Orders 890 and 693 are identified in the standard. |

| Question #1 | | | |

| **Commenter** | **Yes** | **No** | **Comment** |
| HQT | | | However, there are many detailed requirements in Orders 890 and 693 such that there has not been adequate time to do a thorough comparison. It is expected that the supplemental SAR would be addressing the issues that remain outstanding from those Orders. |
| **Response:** The SDT thanks you for your comments. The drafting team will post a matrix that shows each of the directives and identifies the standard and requirement where the directive has been addressed. | | | |
| ISO NE | ☑ | ☑ | We believe the fundamental concerns of the FERC Orders 890 and 693 are identified in the standard. However, there are many detailed requirements in Orders 890 and 693 such that there has not been adequate time to do a thorough comparison. |
| **Response:** The SDT thanks you for your comments. The drafting team will post a matrix that shows each of the directives and identifies the standard and requirement where the directive has been addressed. | | | |
| IESO | ☑ | ☑ | We agree that the drafting team appears to have addressed all the FERC directives. However, we feel that this and the other MOD standards need revisions to properly align responsibilities and eliminate duplications (also see our comments on the other MOD standards). |
| **Response:** The drafting team looked for these examples and considered this when modifying the standards. The drafting team did modify the applicability of this and other standards in support of the stakeholder comments indicating that some of the requirements had been in appropriately applied to the Planning Coordinator and Reliability Coordinator. | | | |
| IRC | ☑ | ☑ | We agree that the drafting team appears to have addressed all the FERC directives. However, we feel that this and the other MOD standards need revisions to properly align responsibilities and eliminate duplcations (also see our comments on the other MOD standards). We should resist this question again when updated standard versions are posted. |
| **Response:** The drafting team looked for these examples and considered this when modifying the standards. The drafting team did modify the applicability of this and other standards in support of the stakeholder comments indicating that some of the requirements had been in appropriately applied to the Planning Coordinator and Reliability Coordinator. | | | |
| ERCOT | ☑ | ☑ | See IRC comments submitted by Charles Yeung. |

2. Do you believe that all elements of ETC have been adequately captured in Requirements eleven and fourteen (R11 and R14)? If "No," please explain why in the comments area.

**Summary Consideration:** The SDT made several changes to the standard to address the comments received, including the following:
Modified R8 (now

Modified R11 (now R8) so that instead of requiring the Transmission Service Provider to 'determine the impact' of firm ETCs based on a set of inputs, the Transmission Service Provider must use the following algorithm to 'calculate' Firm ETC:

$$ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

Modified R14 (now R11) so that instead of requiring the Transmission Service Provider to 'determine the impact' of Non-firm ETCs based on a set of inputs, the Transmission Service Provider must use the following algorithm to 'calculate' Non-Firm ETC:

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + Counterflows_{NF}$$

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | This Standard is trying to detail the requirements of ETC and TTC in the same document. A large amount of the sub requirements in R11 and R14 are incorrect and/or being preformed by the wrong Applicable Function. The formula for Non-Firm ATC is incorrect and cannot be complied with by the Applicable Function listed. |
| **Response:** The drafting team considered this when modifying the standards, and redrafted the standard in hopes of addressing your concerns.<br>R11 and R14 required the TSP to determine the impact of firm and non-firm ETC – and the TSP is the functional entity that should perform these calculations, so the applicability was not changed.<br>The drafting team did revisit the sub-requirements for determining ETCs and converted the 'inputs' into elements in algorithms. Please see the Summary Consideration. | | | |
| BPA | | ☑ | The impact of load growth for Network Integration Transmission Service should be included in R11.2.<br><br>The "five years or longer in duration" language should be removed from R11.5. due to the fact that this element of Order 890 is only to be implemented by a Transmission Service Provider (TSP) once the FERC has approved the TSP's Attachment K -- this may not occur for some TSPs until after the standards are to be implemented. Additionally, regardless of whether a TSP's Attachment K is approved, there will be a transition period (to be developed by each TSP) from the old 1-year/60-day |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | roll-over paradigm to the 5-year/1-year -- the standard should not preclude a TSP from encumbering capacity for those existing Customers who have not yet been required to commit to five years of service to retain their roll-over rights. |
| **Response:** The SDT modified the format of the requirement so that it requires the use of an algorithm rather than requiring the use of 'inputs'. In the revised requirement, 'Firm Network Integration Transmission Service' is one element in the Firm ETC algorithm, defined as the firm capacity reserved for network integration transmission service reserved on Posted Paths that serve as interfaces with other Transmission Service Providers.<br>The SDT has removed the timeframe noted in R11.5. (See the algorithm in R8 in the revised standard- the revision is in the definition of Firm Roll Over Rights.) | | | |
| Duke Energy | | ☑ | R11.4 should read as follows: The impact of Firm Point to Point Transmission Service adjusted for Post-backs.<br>R11.5 should read as follows: The impact of maintaining roll-over rights for Long-Term Firm Transmission Service contracts.<br>R11.6 should be deleted or replaced with more specific details of what Ancillary Services impacts are to be considered.<br>R11.7 should be deleted, since this is now included in R11.4 above.<br>R11.8 should be deleted or replaced with more specific details of how counterflows should be included.<br>R11.9 should read as follows: The impact of any other services, contracts, or agreements not specified above using transmission that serves Native Load or Firm Network Integration Transmission Service, adjusted for Post-backs.<br>R14.3 should read as follows: The impact of Non-Firm Point to Point Transmission Service, with adjustments for Post-backs.<br>R14.4 should be deleted or replaced with more specific details of how counterflows should be included.<br>R14.6 should be deleted, since this is now included in R14.3 above. |
| **Response:**<br>The SDT incorporated the intent of the R11.4 suggestion by changing, 'Firm Point to Point Transmission Service' to 'Firm capacity reserved for confirmed Point-to-Point Transmission Service'.<br><br>The SDT incorporated the intent of the R11.5 suggestion by changing the requirement so that instead of 'determining the impact of maintaining roll-over rights' the revised standard requires use of an algorithm to calculate ETC for Firm Commitments - and one element in the algorithm is 'Firm Roll-over Rights' – defined as the 'capacity reserved for roll-over rights for Firm Transmission Service contracts . . . '<br><br>The SDT incorporated the intent of the R11.7 through R11.9 in the revisions made to modify what had been R11.9 – in the revised standard, the algorithm for calculating Firm ETC has an element called, '$OS_F$' – defined as the capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other | | | |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| firm adjustments to reflect impacts on other Posted Paths as described in the ATCID. With this revision, the intent of what had been R11.6, R11.7, R11.8 and R11.9 have been addressed in the determination of $OS_F$.<br>The SDT modified MOD-001 – Available Transfer Capability to include specific requirements that (R 4 and R5) that specify how to determine the impact of counterflows when determining firm and non-firm ATC. In addition, the revisions to MOD-001 require the Transmission Service Provider to prepare a document (called ATCID) that includes information about the methodology used to determine ATC, and one of the new requirements states that the Transmission Service Provider must document, in its ATCID, how it accounts for counterflows.<br><br>R14.3 – The SDT incorporated the intent of the suggestion by changing, 'Non-Firm Point to Point Transmission Service' to 'Non-Firm capacity reserved for confirmed Point-to-Point Transmission Service'.<br><br>R14.4, R14.6 - in the revised standard (see R9), there is an algorithm for calculating Non-Firm ETC with an element called, '$OS_{NF}$' – defined as the capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts on other Posted Paths as described in the ATCID. With this revision, the requirements that had been included in R14.4, R14.5, and R14.6 are addressed in the determination of $OS_{NF}$. | | | |
| Entergy | | ☑ | R.12 is part of ETC for Firm ETC and R15 is adjustment to the Non-Firm ETC which is similar to post back of capacity, therefore, these should be included as sub bullets under R11 and R14 respectively. |
| **Response:**<br>The SDT could not find a reliable approach to specifying how this should be implemented and the requirement (R12) was removed. | | | |
| IESO | | ☑ | We feel that R11.1, R11.2, R11.6 and R14.1 leave room for double counting of components that shold have been taken care of by TRM and CBM. Further, we do not understand why the CBM component is excluded from R13. If the omission is based on the rationale that CBM could be offered as non-firm ATC, then wouldn't TRM be treated in the same manner? |
| **Response:** The drafting team made significant modifications to this standard to eliminate opportunities for double counting – and one of the significant modifications was to formalize the algorithms for calculating ETC. The revised standard is more specific, and instead of requiring the Transmission Service Provider to determine the 'impact of firm ETC's' the revised standard includes the following algorithm for calculating Firm ETC and includes a definition of each of the elements used in the algorithm:<br><br>$ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F$<br><br>R11.1, which addressed native load commitments, was removed from the standard.<br>R11.2 was which focused on the 'impact' of Firm Network | | | |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| IRC | | ☑ | We feel that R11.1, R11.2, R11.6 and R14.1 leave room for double counting for components that shold have been taken care of by TRM and CBM. |
| **Response:** The requirement language was modified such that these comments are not applicable to the current version of the standard. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** Please see the response to IRC's comments. | | | |
| ISO NE | | ☑ | We suggest rephrasing R11 and R14 so that it also states that: "The TSP shall determine the impact of firm ETCs based on the inputs listed below. If any of the inputs listed below refer to a product or service that is not contained in the TSP's FERC-approved Tariff, the TSP shall document this fact in their ATCID and the value of such input(s) in the ETC calculation shall be considered to be zero MW."<br><br>The wording of 11.8 and 14.4 imply that the TSP MUST include the impact of counterflow. We do not agree that the impact of counterflow MUST be considered. It should up to the TSP as to if, when and how counter flow is considered. The requirement should be worded to allow for that flexibility and require that the TSP document how it is considered. |
| **Response:** The suggested language for ETC was not adopted since the standard allows for each ATCID to document how the components are determined. If the component is not applicable due to the TSP tariff, the ATCID can describe that and the suggested language is not required to be in the standards for that to occur.<br><br>The DT is following FERC guidance on establishing consistency and defines default treatment of counterflow in the standard. If a TSP has reliability reasons for doing something different, they can include that description in their ATCID. | | | |
| MEC<br>MRO | | ☑ | 1. R11 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm existing transmission committements based on an appropriate level of the following inputs."<br>2. Existing transmission commitments should not be listed in capatalized letters unless a definition is going to be developed for the NERC Glossary. |
| **Response:** The DT believes "appropriate level" is too vague to be measured objectively. When determining ETC, impacts of all Firm commitments should be noted.<br>ETC is capitalized because it is an acronym, and we have added a definition. | | | |
| FirstEnergy | ☑ | | However the term "Post-backs" is industry jargon and should be replaced with the term "reinstatement" to add clarity., |
| **Response:** We have included the term postback and it is intended that NAESB work to clarify what is included in postbacks. | | | |
| MEC Trading | ☑ | | |
| PSC SC | ☑ | | |
| SCS | ☑ | | |

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-028-1 standard. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to in the comments area.

**Summary Consideration:** Many stakeholders who responded to this question disagreed with the proposed applicability. The SDT has redrafted the standard after significant study of the functional model to address these concerns and the revised standard does not have any requirements applied to either the Planning Coordinator or the Reliability Coordinator.

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| MEC Trading | | | This is very difficult because the functional model seems to be very specific, but roles within a utility are not so clearly defined. |
| **Response:** The SDT agrees that it can be difficult to apply the functional model to a specific entity. | | | |
| MRO | | ☑ | The MRO believes that the Functional Entity as provided in A.4. should not be qualified, for example, the MRO recommends that A.4. just list Planning Coordinator, Reliability Coordinator, and Transmission Service Provider. |
| **Response:** Per the guidance provided by the NERC standards staff, the 'Applicability' section of the standard should always identify any limitations associated with the applicability. MOD-028 only applies to entities that use the network response methodology of calculating ATC. | | | |
| MEC | | ☑ | The Functional Entity as provided in A.4. should not be qualified, for example, A.4. should just list Planning Coordinator, Reliability Coordinator, and Transmission Service Provider. |
| **Response:** Per the guidance provided by the NERC standards staff, the 'Applicability' section of the standard should always identify any limitations associated with the applicability. MOD-028 only applies to entities that use the network response methodology of calculating ATC. | | | |
| SERC ATCWG | | ☑ | The applicability section needs clarification. Referencing R4 and R5, they should apply only to those entities performing the function. The standard should not require the calculations be made by the PC and RC, but should be applicable to the designated entitiy performing these calculations . The designated entity must be specified as a requirement in this standard. For example: The TSP, PC and RC must specify and agree to the entity that performs this function in the TSP's ATCID as required in MOD 1. The current revision of MOD-001 states the following requirement as R1: "Each Transmission Service Provider, and its associated Planning Coordinators and Reliability Coordinators, shall agree upon and implement one or more of the ATC methodologies specified in Reliability Standard MOD-028, MOD-029, and MOD-030 for use in determining Transfer Capabilities of those Facilities under the tariff administration of that Transmission Service Provider." The requirements of MOD-0028 should refer to the Designated Entity specified through this requirement. The following are examples of how this would be implemented in the standard:<br>B. Requirements<br>R4. Each Designated Entity shall ensure that the Total Transfer Capability (TTC) for each of its |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | Transmission Service Provider's POR to POD Paths is calculated and up-to-date for use within the Transfer Capability time horizons specified in MOD-001 R2.<br>R5. Prior to calculating TTC, each Designated Entity shall update the following components of the base case power flow model it uses to calculate TTC for the time horizon being studied: |
| **Response:** The SDT has redrafted the standard after significant study of the functional model to address these concerns.<br>The drafting team revised MOD-001 — Available Transfer Capability so that R1 has been deleted from the revised set of standards, and MOD-001 no longer has any requirement assigned to either the Planning Coordinator or the Reliability Coordinator.<br>The revised MOD-028 does not have any requirements applied to either the Planning Coordinator or the Reliability Coordinator.<br>The Functional Entity may delegate tasks but the responsibility remains with the Registered Entity, so adding a new term and assigning requirements to that new 'function' is not an acceptable modification. The standard must identify the same functional entities that register in NERC's compliance registry. | | | |
| APPA | | ☑ | As stated in comment no. 1, TTC is directed to be handled in the FAC series Standards. Therefore the Applicable Functions are incorrect. |
| **Response:** MOD-028, MOD-029 and MOD-030 include the appropriate requirements for total transfer capability as they apply to each ATC methodology. All requirements that were included in FAC-012 and FAC-013 are now incorporated into the MOD standards. | | | |
| BPA | | ☑ | "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority. |
| **Response:** MOD-028 and the ATC calculations are limited to the 13 month timeframe and Planning Coordinator is no longer included in the standard. | | | |
| IESO<br>IRC | | ☑ | The Planning Coordinator and Reliability Coordinator do not calculate ATCs. We suspect the reason that they are included in the applicability section is for their role in determining TTC. However, their roles are incorrectly stated in the applicability description. |
| **Response:** The SDT has redrafted the standard after significant study of the functional model to address these concerns.<br>The revised MOD-028 does not have any requirements applied to either the Planning Coordinator or the Reliability Coordinator. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** Please see the response to IRC's comments. | | | |
| HQT<br>NPCC WG | ☑ | ☑ | We agree with the entities listed. However, the description of the applicability for the PC and RC are not valid. The PC and RC provide input to ATC calculations, but they do not calculate ATCs. Suggest replacing 'ATCs' with 'TTCs' in the description of Requirement 4.1 and 4.2. |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | Also, the language in these Applicability descriptions should be the consistent between MOD-028 and MOD-029. |
| **Response:** The SDT has redrafted the standard after significant study of the functional model to address these concerns. The revised MOD-028 does not have any requirements applied to either the Planning Coordinator or the Reliability Coordinator.<br>The descriptive language in the applicability section of MOD-028 was already used in MOD-029 and MOD-030. | | | |
| ISO NE | ☑ | ☑ | We agree with the entities listed. However, the description of the applicability for the PC and RC are not valid. The PC and RC provide input to ATC calculations, but they do not calculate ATCs. Suggest replacing 'ATCs' with 'TTCs' in the description. |
| **Response:** The SDT has redrafted the standard after significant study of the functional model to address these concerns. The revised MOD-028 does not have any requirements applied to either the Planning Coordinator or the Reliability Coordinator. | | | |
| Entergy | ☑ | | Applicability section correctly includes entities to whom this standard is applicable. However, in requirements the entities are not qualified as ".....that uses the Network Response method....". Appropriate adjustments to the requirements should be made throughout this standard. |
| **Response:** This comment has been addressed in the applicability section of the standard; therefore, the requirements only pertain to users of this method. | | | |
| FirstEnergy | ☑ | | MOD-001, 028, 029, and 030 should be combined into one standard to eliminate the need to reference several standards at once, eliminate duplication, and simplify the applicability sections of MOD-028, 029, and 030. |
| **Response:** The DT began with this approach but the resulting standard was very large and confusing as to what requirements a TSP had to comply with. We believe that by separating the standards to each cover a different methodology the standards will be easier to follow and enforce. | | | |
| Duke Energy | ☑ | | |
| PSC SC | ☑ | | |
| SCS | ☑ | | |

4. Are there any elements other than those currently listed in R5 that need to be updated in the power flow model for calculating TTC? If "Yes," please list the elements and explain why they need to be updated in the comments area.

**Summary Consideration:** The majority of commenters agreed that there was no need for additional elements. There were some suggestions to refine or reorganize the sub-requirements, and the drafting modified R5 so that rather than specifying that the model has to be updated for the time horizon being studied – in the revised standard there are several requirements that address the modeling requirements - one general requirement (R2), and two additional requirements. One of the new requirements specifies, in greater detail, certain data that must be brought up to date in the model used for determining TTC for the intra-day and next-day time periods (R3); and another requirement for data that must be updated for determining TTC for time periods beyond the next day (R4).

| **Question #4** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The requirements in R5 have already been mandated, correctly, in the FAC and other MOD models. To repeat those requirements in this standard will confuse the industry and make it impossible the maintain a workable compliance program for several standards. |
| **Response:** The requirements related to determining TTC for use in ATC will now be solely located within the MOD standards and the FAC-012 and FAC-013 standards will be retired. | | | |
| Entergy | | ☑ | If intent of R5.4 and R5.5 is to update power flow models to include all known outages, R5.6 and R5.7 should be merged with R 5.4 and R5.5 to include planned and unplanned outages. |
| **Response:** The DT modified the standard so that the intent of requirements R5.4 and R5.5 have been merged as suggested. In the revised standard, the merged requirement is organized by 'time period' and appears in R3.1.1, R3.2.1, R4.1.1 and R4.2.1.<br>Because 'unplanned outages' (identified in the posted version of the standard as R5.4 and R5.5) can't be predicted, these were removed from the revised standard. | | | |
| FirstEnergy | | ☑ | R 5.11 requires inclusion of the data provided by adjacent Transmission Service Providers and any other TSP with which coordination agreements have been executed; however, this standard does not include a requirement for adjacent TSPs to provide this data nor for executing coordination agreements with other TSPs. |
| **Response:** The requirement already exists in MOD-001, which is the 'parent' to this standard. This was intentionally left somewhat open because NERC cannot force coordination agreements to occur. We want to enforce that to the extent they are in place, that data MUST be utilized. | | | |
| IRC<br>IESO | ☑ | ☑ | While the component list appears to be complete, we find it difficult to keep track of or understand the rationale behind putting this requirement in this standard, while being uncertain of what changes are to be made to FAC-012 and -013. If those parts of FAC-012 and -013 that relate to TTC calculation are to be absorbed in this standard, then we'd think that having R5 (and R6) alone may not be |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | sufficient. On the other hand, if FAC-012 and -013 are to remain as is or be moved to other standards, then we do not see the need to replicate partical requirements in MOD-028.<br>Note that the supplementarty SAR indicates that: "Specifically, the following Standards may be modified, transferred to NAESB or retired:<br>FAC-012 Transfer Capability Methodology<br>FAC-013 Establish and Communicate Transfer Capabilities<br>The SDT needs to be more specific and certain of its direction on these two standards to help the industry better understand and track changes. |
| **Response:** The requirements related to determining TTC for use in ATC will now be solely located within the MOD standards and the FAC-012 and FAC-013 standards will be retired. | | | |
| ERCOT | ☑ | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** Please see the response to IRC's comments. | | | |
| MEC Trading | ☑ | | A consistent way of modeling all of the things listed in R5 should be clearly identified within the standard (partial path reservations, conditional firm service, outages that last 1 day for a monthly model, etc.) |
| **Response:** The drafting team has added detail to clarify where possible. Please see the Summary Consideration. | | | |
| HQT | | ☑ | |
| Duke Energy | | ☑ | |
| ISO NE | | ☑ | |
| MEC | | ☑ | |
| MRO | | ☑ | |
| NPCC WG | | ☑ | |
| PSC SC | | ☑ | |
| SCS | | ☑ | |
| SERC ATCWG | | ☑ | |

5. In R12, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R12 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

**Summary Consideration:** The drafting team received very few comments in response to this question, and there was no consensus amongst those who did comment. The Drafting Team discussed this issue in an attempt to define specific requirements to ensure consistent implementation. Several different approaches were discussed. However, talking through examples, it was determined that each implementation would have a detrimental impact on either reliability or Open Access. Therefore, this requirement has been removed. This shall serve as a singe response to all opinions offered.

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The statement as written will impair the operational flexibility of the BES. Any path or network or flowgate that has a rating higher at its POR than the rating of a generator connected at the same POR would limit the transfers at that POR to the generator size. The SDT does not want that. The only time this will be appropriate is when the generator is connected by a radial generator-tie and no other transaction from the system will use this node as the POR. |
| Duke Energy | | ☑ | The Transmission Service Provider shall limit the modeling of all Transmission Reservations from a specific generating plant to not exceed the modeled rating of all generators at that plant. Transmission Reservations should be allocated first to DNR's and the remainder allocated proportionately up to the modeled plant rating. |
| Entergy | | ☑ | The language of R12 does not directly address the intent of Order 890 paragraph 245. It does not provide clear instructions for treatment of multiple reservation from a POR (generator) other than limiting the impact to name plate rating. We suggest that a uniform method, or alternate methods be included for treating these reservations to address Order 890 paragraph 245. |
| SCS | | ☑ | We interpret the intent of paragraph 245 to imply that a generator should not be modeled at a level exceeding its maximum capability. With this interpretation, service could be granted up to the capability of the generator for each different POD. This is not allowed as R12 is currently drafted. |
| ERCOT | ☑ | ☑ | See IRC comments submitted by Charles Yeung. |
| MEC | ☑ | ☑ | The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. Also, this requirement is a transmission service request evaluation process requirement and does not belong in its present form in a standard concerning ATCs calculation. Also, there are issues with implementing this requirement. When there are numerous point to point requests for transmission service where some of them are partial path requests, it is not clear how to enforce the impacts of all transmission service shall not exceed the source at a particular point. If the Standards Drafting Team intends to continue with this requirement, the Standards Drafting Team should outline some subrequirements which explain how the Transmission Service Provider is to do this. It would be helpful if the SDT would develop an example of multiple requests some of which are partial path requests and show how the Transmission Service Provider than reviews the impacts to |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | meet the requirement. |
| MRO | ☑ | ☑ | The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. Also, this requirement is a transmission service request evaluation process requirement and does not belong in its present form in a standard concerning ATCs calculation. Also, there are issues with implementing this requirement. When there are numerous point to point requests for transmission service where some of them are partial path requests, it is not clear how to enforce the impacts of all transmission service shall not exceed the source at a particular point. If the Standards Drafting Team intends to continue with this requirement, the Standards Drafting Team should outline some subrequirements which explain how the Transmission Service Provider is to do this. It would be helpful if the SDT would develop an example of multiple requests some of which are partial path requests and show how the Transmission Service Provider than reviews the impacts to meet the requirement. |
| FirstEnergy | ☑ | | However, the phrase "not exceed" can be replaced with the word "the" since the term "limiting the total impact" is synonomous. |
| MEC Trading | ☑ | | The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. This appears to make unit specific service of less value then service that lists a control area for redirecting that service. |
| PSC SC | ☑ | | |

6. Do you agree with the requirements included in the proposed standard? If "No," please list the requirements you do not agree with and explain why in the comments area.

**Summary Consideration:** Requirements related to TTC as they relate to ATC calculations have been incorporated in MOD-028, MOD-029 and MOD-030 and FAC-012 and FAC-013 will be retired. The drafting team is transferring all requirements dealing with public posting to NAESB. Changes were made to the standard to address the remaining comments.

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | Requirements R1 through R9 should be in the FAC series Standards. The TTC Standards do not address any of the reliability issues that would have been address in FAC-012 and FAC-013, if they had not been written as a fill-in-the-blank standard. The Regional Procedures for determining TTC that are requested in the existing FAC-012 would not have been written as proposed in MOD-028, 029, or 030. |
| **Response:** Requirements related to TTC as they relate to ATC calculations have been incorporated in MOD-028, MOD-029 and MOD-030 and FAC-012 and FAC-013 will be retired. | | | |
| BPA | | ☑ | R2. -- For system security reasons, the contingency list details should not be publicly available. Identifying the most critical contingencies publicly could make them a target and thus reduce system reliability. This information should only be shared with those entities demonstrably impacted by such limiting contingencies. |
| **Response:** The drafting team has been working cooperatively with NAESB and all requirements dealing with public communication will be addressed by NAESB business practices. | | | |
| Duke Energy | | ☑ | R2, R3, R8 and R16 are "communications" in nature and should be removed from NERC requirements and should be put into NAESB business practice standards where the communications requirements can be justified.<br><br>Need to re-word the following requirements:<br>R4. The Planning Coordinator, Reliability Coordinator or Transmission Service Provider shall ensure that the Total Transfer Capability (TTC) for each of its Transmission Service Provider's POR to POD Paths is calculated and up-to-date for use within the Transfer Capability time horizons spedified in MOD-001 R2.<br><br>R5. Prior to calculating TTC, the Planning Coordinator, Reliability Coordinator or Transmission Service Provider shall ensure the following components of the base case power flow model used to calculate TTC for the time horizon being studied are updated:<br>R5.6. Unplanned transmission system Element outages, or unplanned returned to service.<br>R5.7. Unplanned generation resource outages, or unplanned returned to service.<br>R5.10. Appropriate Firm Transmission Service Reservations, to eliminate netting of flows to avoid reliability concerns with associated reservations not being scheduled. |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | R6. The Planning Coordinator, Reliability Coordinator or Transmission Service Provider shall follow these steps in determining the TTC for each path specified:<br>R7. Each Planning Coordinator and Reliability Coordinator that calculates TTC shall provide its Transmission Service Provider with the TTC for each of the specified paths. |

**Response:**

R2, R3, R8, R16 - The drafting team has been working cooperatively with NAESB and all requirements dealing with public communication will be addressed by NAESB business practices.

R4 - which required the Planning Coordinator and Reliability Coordinator to ensure that TTC for each of the Transmission Service Provider's paths was calculated according to a schedule has been deleted. In the revised standard, the drafting team uses the term, 'Posted Path' rather than referring to the paths as 'POR to POD Paths'. The revised standard assigns the Transmission Operator the responsibility for calculating TTC (R6) at specified intervals unless otherwise requested by the Transmission Service Provider – this supports the intent of your suggestion.

R5 – the requirement was reassigned so that it applies only to the Transmission Operator and the requirement was subdivided into several requirements with a greater focus on the data updates that are needed for calculating TTC for different time periods – the modeling updates required for calculating TTC for for intra-day and next-day periods differ from the modeling updates required for calculating TTC for use during time periods beyond the next day. This supports the intent of your suggestion.

R5 and R7 – the suggestions to add the Transmission Service Provider to the list of functional entities responsible for calculating TTC was not adopted. The drafting team modified this standard, based on stakeholder comments and a more thorough review of the Functional Model, and determined that the Transmission Operator should be responsible for calculating TTC.

R5.6 – the suggestion to enhance the requirements for modeling 'unplanned outages' was not adopted as proposed – modeling 'unplanned outages' is problematic in certain time periods – instead the drafting team merged the language from R5.4 through R5.7 which addressed various types of generation and transmission outages into a single sub-requirement that says, " Expected generation and transmission outages, additions, and retirements' This set of changes supports the intent of your suggestion.

R7 – the suggestion to qualify the subset of Transmission Planners and Reliability Coordinators that must provide the Transmission Service Provider with TTCs was not adopted because the responsibility for determining TTCs has been assigned to the Transmission Operator and the applicability section of the standard already states that the requirements in the standar are only applicable to those Transmission Operators who use the Area Interchange Methodology to calculate TTCs for Posted Paths.

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | |
| Entergy | | ☑ | From R5.11, language "with which coordination agreements have been executed" should be struck.<br>In R6.3, "interfaces" should be changed to ties/interconnections.<br>In R7, "each of the specified' should be struck and "idenfied in R3" should be added after paths.<br>From R11.5, the language "five years or longer in duration…..renewal" should be struck and "as applicable" be added after contracts. |
| **Response:** The drafting team did not understand why the language in 5.11 should be modified – the drafting team did add a qualifying phrase (provided that data can be associated with Facilities that are explicitly represented in the Transmission model) to clarify the reason why this data is needed<br><br>The drafting team modified the 'process' (R6) that is used to calculate TTC and the sub-requirement R6.3 was modified as follows (R7 in the revised standard) using the suggested word, 'ties' rather than 'ties/interconnections':<br>- The sum of the incremental Transfer Capability and the impacts of Firm Transmission Service that were included in the study model, or<br>- The sum of Facility Ratings of all ties comprising the Posted Path.<br><br>R7 – the drafting team modified this requirement so that it is assigned to the Transmission Operator and links with the other 'ATC-related' standards by referencing 'Posted Paths.'<br>R11.5 – the suggestion to remove the phrase, 'five years or longer in duration' was removed from the standard but the phrase, 'as applicable' was not added as this is ambiguous. | | | |
| ERCOT | | | See IRC comments submitted by Charles Yeung. |
| **Response:** See the response to IRC's comments. | | | |
| HQT<br>ISO NE<br>NPCC WG | | ☑ | R1: MOD-028 requires 'a list', MOD-029 requires 'a description'. The language for this requirement between these two MODs should be consistent.<br>R2: This list of contingencies could contain critical infrastructure information. The phrase "consistent with CEII policies" should be added to the end of this requirement.<br>R6.1: The intent of the text of Requirement 6.1 in MOD-028 and MOD-029 seems to be the same. If the intent is the same, the language should be the same. |
| **Response:**<br>R1 and R2 – R1 was revised and in the revised standard the contingencies and assumptions need to be identified in the Transmission Service Provider's ATCID. There are no posting requirements in the standard – the entities that receive the information are those that need the information for reliability.<br>R6.1 – while both MOD-028 and MOD-029 include a 'process' for determining TTC, the processes are different. | | | |
| IESO<br>IRC | | ☑ | We have a question on R13 with respect to the omission of CBM (see our comments under Q2). Further, in R15, we do not understand what would be the items that are "by the amount of capacity associated with unscheduled Transmission Service accounted for within firm and non-firm ETC" when |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | increasing non-firm ATC. |
| **Response:** With regard to R13, FERC indicated that non-firm should not include CBM. R15 was describing the typical release of unused Firm service that will increase non-firm ATC. The algorithms added to the standard should clarify these requirements. | | | |
| SCS | | ☑ | R5.11 Comments. It may not be feasible to include all data from neighboring systems (e.g. PC or RC may not be able to incorporate all Special Protection schemes in a base case for TTC calculation). Also, the timeframes for which the values are being calculated may not allow for the incorporation of this data. |
| **Response:** The standard was revised and this requirement is now assigned to the Transmission Operator. In the revised standard, not all data needs to be updated for all time periods for which TTC must be determined. | | | |
| SERC ATCWG | | ☑ | See comments in Question 3. |
| **Response:** See response to SERC ATCWG Question 3. | | | |
| MEC | | ☑ | 1. For R1, R2, R4, R5, R6, and R7, the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as appropriate", do these requirements in the standard.<br><br>2. R6.2 and R6.3 use "first contingency" which implies that the only planning criteria to be used is first contingency outages. The TTC must be based upon the appropriate planning criteria whatever that is. The references to first contingency should be made more generic.<br><br>3. R3, R8 and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available publicly "on the OASIS" so that this information is not made publicly without registration.<br><br>4. R11 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an appropraite level of " the following inputs.<br><br>5. R14 should be expanded to include the use of metered data to forecast non-firm ETC in the operating horizon and therefore, allowing the release of non-firm ETC for non-firm ATCs in the operating horizon. This method is being used in the area to maximize the non-firm offerings in the operating horizon. I suggest wording such as the following for R18 or as a subrequirement: "Forecasts of non-firm ETC may be made using metered data so as to allow the release of non-firm ETC in the operating horizon. When such forecasting methods are used, it may be assumed that reductions in metered flows in the operating horizon are due to reductions in non-firm ETC." |
| **Response:**<br>1. The reliability entities have been modified in the standard based on stakeholder comments and a more thorough review of | | | |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| the Functional Model. The revised standard does not assign any requirements to the Planning Coordinator or the Reliability Coordinator – but does assign responsibility for determining TTC to the Transmission Operator.<br>2. The language in R6 has been modified so that the term, 'first contingency', is not used.<br>3. The DT agrees, all publishing of information will be handled by NAESB - R<br>4. The term, 'appropriate' is ambiguous - the SDT did modify the language to be more clear. The revised standard includes an algorithm for the determination of ETC.<br>5. The revised language in the standard does not preclude the use of meter-data to increase accuracy of the calculations or the modeling. | | | |
| MRO | | ☑ | 1. The MRO believes that for R1, R2, R4, R5, R6, and R7, the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as appropriate", do these requirements in the standard. 2. R6.2 and R6.3 use "first contingency" which implies that the only planning criteria to be used is first contingency outages. The TTC must be based upon the appropriate planning criteria whatever that is. The references to first contingency should be made more generic. 3. R3, R8 and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available publicly "on the OASIS" so that this information is not made publicly without registration. 4. R11 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an approprite level of " the following inputs. 5. R14 should be expanded to include the use of metered data to forecast non-firm ETC in the operating horizon and therefore, allowing the release of non-firm ETC for non-firm ATCs in the operating horizon. This method is being used in the MRO to maximize the non-firm offerings in the operating horizon. The MRO suggests wording such as the following for R18 or as a subrequirement: "Forecasts of non-firm ETC may be made using metered data so as to allow the release of non-firm ETC in the operating horizon. When such forecasting methods are used, it may be assumed that reductions in metered flows in the operating horizon are due to reductions in non-firm ETC." |
| **Response:** 1. The reliability entities have been modified in the standard based on stakeholder comments and a more thorough review of the Functional Model. The revised standard does not assign any requirements to the Planning Coordinator or the Reliability Coordinator – but does assign responsibility for determining TTC to the Transmission Operator.<br>2. The language in R6 has been modified so that the term, 'first contingency', is not used.<br>3. The DT agrees, all publishing of information will be handled by NAESB - R<br>4. The term, 'appropriate' is ambiguous - the SDT did modify the language to be more clear. The revised standard includes an algorithm for the determination of ETC.<br>5. The revised language in the standard does not preclude the use of meter-data to increase accuracy of the calculations or the modeling. | | | |
| MEC Trading | | ☑ | This is a fill-in-the-blank standard. |
| **Response:** The revised language in the standard has attempted to eliminate the 'fill-in-the-blank' aspects that existed. | | | |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSC SC | ☑ | | |
| FirstEnergy | ☑ | | |

7. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

**Summary Consideration:** The majority of commenters did not see any conflicts.

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| HQT | | ☑ | We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the requirements defined in these standards do not apply to entities that do not sell transmission service in advance of the physical flow of energy. For example, many or all items associated with firm and non-firm ETC would be zero for these markets. |
| **Response:** The DT recognizes that some of the ETC components may be zero. The applicable entities should identify and explain the zero ETC components as part of complying with the standard. Note that the standard's applicability has been modified, and the revised standard is only applicable to those Transmission Operators that use the Area Interchange Methodology to calculate TTCs for Posted Paths – and to those Transmission Service Providers that use the Area Interchange Methodology to calculate ATCs for Posted Paths. | | | |
| IESO | | ☑ | However, please note that some markets do not offer physical transmission services and hence some of the requirements in this standard do not apply to these entities. |
| **Response:** Note that the standard's applicability has been modified, and the revised standard is only applicable to those Transmission Operators that use the Area Interchange Methodology to calculate TTCs for Posted Paths – and to those Transmission Service Providers that use the Area Interchange Methodology to calculate ATCs for Posted Paths. | | | |
| IRC | | ☑ | No, but please note that some markets do not offer physical transmission services and hence some of the requirements in this standard do not apply to these entities. |
| **Response:** Note that the standard's applicability has been modified, and the revised standard is only applicable to those Transmission Operators that use the Area Interchange Methodology to calculate TTCs for Posted Paths – and to those Transmission Service Providers that use the Area Interchange Methodology to calculate ATCs for Posted Paths. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** Please see the response to IRC's comments. | | | |
| ISO NE | | ☑ | We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the services (e.g., the offering of firm point to point service, see R.11.4) to which these requirements apply are not offered by Transmission Service Providers that do not sell transmission service in advance of the physical flow of energy.For example, many or all items associated with firm and non-firm ETC would be zero in the markets administered by these TSPs. For example, over the Pool Transmission Facilities in New England, all capability is considered available to the market (i.e., the Total Transfer Capability) until real-time scheduling occurs. With the current arrangement of these proposed standards, the ATC Implementation Document would clearly document how the TSP complies with these standards, based on what services are offered through the Commission-approved tariff and/or market rules. |
| **Response:** The DT recognizes that some of the ETC components may be zero. The applicable entities should identify and | | | |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| explain the zero ETC components as part of complying with the standard. Note that the standard's applicability has been modified, and the revised standard is only applicable to those Transmission Operators that use the Area Interchange Methodology to calculate TTCs for Posted Paths – and to those Transmission Service Providers that use the Area Interchange Methodology to calculate ATCs for Posted Paths. | | | |
| NPCC WG | | ☑ | We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the requirements defined in these standards do not apply to entities that do not sell transmission service in advance of the physical flow of energy. For example, many or all items associated with firm and non-firm ETC would be zero for these markets. |
| **Response:** Note that the standard's applicability has been modified, and the revised standard is only applicable to those Transmission Operators that use the Area Interchange Methodology to calculate TTCs for Posted Paths – and to those Transmission Service Providers that use the Area Interchange Methodology to calculate ATCs for Posted Paths. | | | |
| MEC | | ☑ | |
| Duke Energy | | ☑ | |
| Entergy | | ☑ | |
| FirstEnergy | | ☑ | |
| MRO | | ☑ | |
| PSC SC | | ☑ | |
| APPA | ☑ | | See comment No. 1 |
| **Response:** See APPA response to comment No. 1. | | | |
| MEC Trading | ☑ | | No requirement for consistency |
| **Response:** The drafting team feels there are requirements for consistency in calculating ATC and TTC in the revised set of standards. | | | |
| SCS | ☑ | | R12 requires the TSP to limit the total impact of all Transmission Service from a "POR" (multiple generators) not a specific "generator" as written in Order 890. |
| **Response:** This requirement has been removed, see Summary Consideration of Question 5. | | | |

8. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-028-1.

**Summary Consideration:** The SDT agrees with the comment regarding "Posted Path," and has changed the standards accordingly. The DT uses the term "post-backs" and it is expected that NAESB will defined the details of what is included in postbacks. Additionally, all aspects of publishing information have been removed from these standards and will be handled by NAESB.

| Question #8 | |
|---|---|
| **Commenter** | **Comment** |
| APPA | MOD-028 is very confusing and it will be difficult, if not impossible, to integrate into a Compliance program. The Compliance Monitor and the industry will have a very difficult time determining what needs to be accomplished to be compliant.<br>All of the Documents in this review have been written like a policy and this will not permit a Compliance Monitor to be able to determine if the Registered Applicable Function is conducting themselves in a manner that will meet the objectives of the Standards. |
| **Response:** The language of the standards has been revised such that the requirements are measurable. | |
| BPA | The ATC MODs (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) do not clearly distinguish the methodologies and their applications. Please provide narrative descriptions of these methodologies.<br>The Applicability section 4.1. through 4.3. and R1., R3., R6. through R10., R13., and R16. should be clarified that ATC need only be calculated and posted for Posted Paths, where "Posted Path" is defined consistent with NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.<br>R11.7. and R14.6. -- Please define the term "Post-back". |
| **Response:** The drafting team revised each of the standards to improve their clarity.<br><br>The drafting team has adopted the term, 'Posted Path' as proposed and will post it with the revised standard.<br><br>The SDT modified the set of ATC standards to use the term, "Posted Path," throughout to improve consistency and clarity.<br><br>The DT uses the term "post-backs" and it is expected that NAESB will defined the details of what is included in postbacks. | |
| ERCOT | ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT Interconnection. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single |

| Question #8 | |
|---|---|
| **Commenter** | **Comment** |
| | Balancing Authority Interconnection and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area and there has been no reservation of transmission capacity in ERCOT.<br><br>Available Transfer Capability is defined as the measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin. The ERCOT Interconnection has already moved "beyond" ATC and into a Market design which resulted in the disappearance of an explicit transmission service product. In addition the DC Tie transfer capability is planned and coordinated by a TSP that is a member of both Regions and therefore both ERCOT and SPP are notified when the DC Tie capability is reduced.<br><br>Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. Currently ERCOT employs a zonal congestion management scheme that is flow-based, whereby the ERCOT transmission grid, including attached generation resources and load, are divided into a predetermined number of congestion zones. This congestion management scheme applies zonal shift factors, determined by ERCOT, to predict potential congestion under the known topology of the ERCOT System. This scheme is used in the Day Ahead and Adjustment Periods to evaluate potential congestion. During the operating period ERCOT uses zonal shift factors to determine zonal Redispatch deployments needed to maintain flows within zonal limits. The local congestion management scheme relies on a more detailed Operational Model to determine how each particular Resource or Load impacts the transmission system. This model uses the current known topology of the transmission system. Unit specific Redispatch instructions are then issued to manage local congestion.<br><br>In the future ERCOT will be transitioning from a Zonal Market to a full LMP market. This system is designed to manage congestion in the Day Ahead and Real-Time on a Resource specific basis. Under both of these market designs transmission facility limits are established in advance and updated based on coordinated exchange of information between transmission providers and ERCOT in planning and operating periods.<br><br>In the current and future ERCOT market design the method of calculating ATC, TTC and the use of CBM and TRM are not applicable to the ERCOT Region. ERCOT does not have a synchronous connection with any other Balancing Authority Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Balancing Authority Areas and/or offer transmission reservations and schedules within the interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance. |
| **Response:** The SDT agrees that this is a concern – ERCOT may wish to submit a request for a Regional Difference. | |
| FirstEnergy | The standard should include specifics of methods for complying with the term "publicly available" such as posting on OASIS, a corporate web page, etc. (This concept is mentioned in all MOD-028, MOD-029, and MOD-030.) |

| Question #8 | |
|---|---|
| **Commenter** | **Comment** |
| addressed very prescriptively in each TSPs OATT; therefore to avoid any potential conflict MOD-028 only pertains to short-term transmission service requests. Additionally, as mandated by FERC Order 890, it is expected that long-term service requests be evaluated by the same criteria that a transmission owners use to plan their respective system.<br><br>Conditional Firm Service (hours based) should be treated as Firm ETC except in the time frames (horizons) that curtailment is probable. Conditional Firm Service (contingency based) should be treated as Firm ETC for all horizons; however, operationally it is expected that RCs will develop processes to curtail this service when the limiting contingency occurs. NAESB should develop business practices for the conversion of both types of long-term Conditional Firm Service(CFS) when sufficient short-term ATC is available to make all or a portion of the CFS service firm as described in FERC Order 890.<br><br>R12 has been removed from the Standard | |
| SERC ATCWG | Standard is not clear as to what applies to long-term timeframe and short-term timeframe.<br>Reference in R12 to generator nameplate should be changed to maximum capability since in some conditions the generator can exceed nameplate rating. |
| **Response:** The standard applies only to the short-term service horizon. Language was added to the standard (R4.1) to clarify that the calculations of TTC are for time periods through 13 months.<br>R12 has been removed from the Standard. | |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a standard drafting team on March 17, 2006.

**Description of Current Draft:**

This is the first draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to comments. | TBD |
| 2. Post revised standard for stakeholder comment. | TBD |
| 3. Respond to comments. | TBD |
| 4. Post for 30-day pre-ballot review. | TBD |
| 5. First ballot of standard. | TBD |
| 6. Respond to comments. | TBD |
| 7. Recirculation ballot. | TBD |
| 8. 30-day posting before board adoption. | TBD |
| 9. Board adoption. | TBD |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**None.**

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**

2. **Number:** MOD-008-1

3. **Purpose:** To promote consistent and transparent calculation of the maximum Transmission Reliability Margin (TRM) and supporting methodologies among Transmission Service Providers, Transmission Planners, and Transmission Operators to help ensure more accurate calculation of transfer capabilities.

4. **Applicability:**

   **4.1.** Transmission Planner.

   **4.2.** Transmission Operator.

   **4.3.** Transmission Service Provider.

   **4.4.** Reliability Coordinator.

   **4.5.** Planning Coordinator.

   **4.6.** Load-Serving Entity.

5. **Proposed Effective Date:** To be determined.

## B. Requirements

**R1.** The Transmission Planner, and Transmission Operator shall each document its TRM calculation methodology, and shall include all of the following in that methodology:

**R1.1.** Identification any of the following uncertainties used to calculate its TRM:

- Aggregate Load forecast error (not included in determining generation reliability requirements).
- Load distribution error.
- Forecast uncertainty in transmission system topology.
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch.
- Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window).
- Reserve sharing requirements.
- Inertial response.

**R1.2.** A statement to confirm that it shall use the same assumptions in calculating TRM as those that are used in the transmission planning process for the appropriate time periods.

**R1.3.** The description of the method of allocation across paths.

**R1.4.** The identification of that TRM calculation used for the following time periods:

**R1.4.1.** Same day and real-time.

**R1.4.2.** Day-ahead and pre-schedule.

**R1.4.3.** Beyond the day-ahead and pre-schedule.

**R1.5.** If a Transmission Planner or Transmission Operator reserves zero (0) TRM in any time horizon, that Transmission Planner or Transmission Operator shall document in its TRM methodology the reason(s) why it did not reserve any TRM.

**R2.** Each Transmission Planner and Transmission Operator that reserves TRM shall document in its TRM Calculation Methodology (on each of its respective posted Contract Paths or Flowgates) each of the following components of uncertainty if used in calculating TRM and shall describe how that component is used to calculate a TRM value:

- Aggregate Load forecast error (not included in determining generation reliability requirements).
- Load distribution error.
- Forecast uncertainty in transmission system topology.
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch.
- Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window).
- Reserve sharing requirements.
- Inertial response.

**R3.** The Transmission Planner and Transmission Operator shall only use the components of uncertainty from R1.1 to calculate TRM.

**R4.** The Load-Serving Entity shall not use the components of uncertainty from R1.1 to determine its CBM megawatt import requirement.

**R5.** At least once each year, the Transmission Operator shall calculate (in accordance with its TRM methodology) a TRM value for the following time periods (on each path or Flowgate) and provide these TRM values to its Transmission Service Provider(s):

**R5.1.** Same day and real-time.

**R5.2.** Day-ahead and pre-schedule.

**R6.** At least once each year, the Transmission Planner shall calculate (in accordance with its TRM methodology) a TRM value for the time period beyond the day-ahead and pre-schedule (on each path or Flowgate) and provide these TRM values to its Transmission Service Provider(s).

**R7.** Each Transmission Service Provider shall make its TRM calculation methodology publicly available.

**R8.** Each Transmission Service Provider shall make available (within seven calendar days) any underlying documentation, work papers and load flow base cases used to determine TRM for the Facilities within its service territory to adjacent requesting Transmission Service Providers and to any requesting transmission customer or Load-Serving Entity within its service area unless providing the information violates an applicable rule, regulation or confidentiality agreement prohibiting such disclosure or where release of the requested data would pose a security risk to the grid.

**R9.** Each Transmission Planner, Transmission Operator, and Transmission Service Provider shall provide its TRM calculation methodology and supporting documentation to the Reliability Coordinator and Planning Coordinator responsible for oversight of the Facilities for which the Transmission Service Provider offers service.

**R10.** Each Transmission Service Provider shall make publicly available (for each posted path or Flowgate) the TRM value for each of the following time periods:

**R10.1.** Same day and real-time.

**R10.2.** Day-ahead and pre-schedule.

**R10.3.** Beyond the day-ahead.

**R11.** If a Transmission Planner or Transmission Operator reserves capacity on its transmission system for use as TRM, then the associated Transmission Service Provider shall use TRM in its calculation of Available Transfer Capabilities (ATCs) or Available Flowgate Capabilities (AFCs).

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☐ No

   Comments:

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☐ Yes

   ☐ No

   Comments:

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a “maximum uncertainty” to support the validity of a TRM value? If “Yes,” please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☐ No

Comments:

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If “Yes,” please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☐ No

Comments:

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If “Yes,” please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments:

# References to Transmission Reliability Margin in FERC Orders

## *From FERC Order 890*

***From Page 1045:***

**§ 37.6 Information to be posted on the OASIS**.
(viii) Transmission Reliability Margin or TRM means the amount of TTC necessary to provide reasonable assurance that the interconnected transmission network will be secure, or such definition as contained in Commission-approved Reliability Standards.

***Starting on Page 164:***

### (4) Transmission Reserve Margin (TRM)

**NOPR Proposal**

266. Finally, the Commission proposed the development of reliability standards MOD-008 and MOD-009[173] that specify the uncertainties that TRM could be used to accommodate, which could include (1) load forecast and load distribution error, (2) variations in facility loadings, (3) uncertainty in transmission system topology, (4) loop flow impact, (5) variations in generation dispatch, including intermittent resources, (6) automatic sharing of reserves, and (7) other uncertainties identified through the NERC reliability standards development process.

**Comments**

267. Most commenters agree that the existing definitions for TRM require clarification.[174] Commenters also agree that NERC should be required to develop clear standards for the determination of TRM, including specifying the criteria used in the determination of TRM.[175] PNM-TNMP supports the Commission's proposal, pointing out that the

---

[173] The MOD-008 and MOD-009 reliability standards document regional TRM methodologies and procedures for verifying TRM values.

[174] E.g., Allegheny, APPA, EEI, EPSA, Exelon, LPPC, MidAmerican, NRECA, Northwest IOUs, NorthWestern, Occidental, Pinnacle, Powerex, PNM-TNMP, PPL, PJM, PPM, and WestConnect.

[175] Exelon recommends that the following factors should be the same for the planning process and ATC/AFC process to achieve consistency: base case flows, reservation impacts, TRM and CBM forecasted to occur simultaneously; counterflows; positive impacts resulting from reservations and generation dispatch; TRM for the same scenarios; and CBM.

implementation of the current NERC standards definition for TRM and CBM could result in its double-counting, which must be eliminated. APPA members in the Western Interconnection suggest that regional variations be permitted. They also note that the modeling methods used by WECC and its sub-regions may differ from those used in the Eastern Interconnection. For example, they contend that uncertainties associated with transmission maintenance schedules that are driven by hydro-production curves will seasonally affect TRM set-asides on certain transfer paths. PJM believes that the TRM methodology should be consistent at the regional reliability organization level. PJM also contends that TRM should be coordinated, exchanged and respected on external flowgates and that the concept of a maximum TRM, by percentage, should be adopted in the NERC standards.

268. Consistent with its position on CBM, TAPS proposes that TRM set-asides should be conditioned on inclusive reserve-sharing arrangements, with the reservations determined by the reserve-sharing group, subject to dispute resolution before the Commission (and, eventually, approval by joint planning groups).

269. PNM-TNMP suggests that the Commission consider definitions to include the following clarification taken from WECC procedures on ATC: "If the limitation on the use of TRM to 59 minutes would force a Transmission Provider to set aside unnecessary CBM on the same path as the TRM, that Transmission Provider may utilize the TRM beyond the 59 minutes."[176] PNM-TNMP states that this would allow the transmission provider to maximize the ATC by not needlessly setting aside twice the amount of transmission (TRM and CBM) than is necessary for reliability.

270. Nevada Companies argue that no new standards are required for TRM and that any further action would be burdensome. They explain that NERC has a well-established definition that does not require further clarification. In their view, all that is required is a complete statement, to be posted on OASIS, regarding the transmission provider's application of TRM. NERC comments that the existing reliability standards for TRM will be revised to require clear documentation of the calculation of TRM. It also adds that the revised standard will make various TRM components mandatory to achieve more consistency across methodologies.

271. Santee Cooper urges the Commission to ensure that service to native load and transmission system reliability will not be compromised as the Commission seeks greater levels of consistency in the calculation of ATC. It states that the Commission also must be cognizant of the importance of TRM in the provision of service to native load.

---

[176] Citing WECC Rocky Mountain Operating and Planning Group, Determination of Available Transfer Capability within the Western Interconnection, June 2001, page 9, http://www.wecc.biz/modules.php?op=modload&name=Downloads&file=index&req=getit&lid=1035.

**Commission Determination**

272. The Commission adopts the NOPR proposal and requires public utilities, working through NERC, to complete the ongoing process of modifying TRM standards MOD-008 and MOD-009. We understand that the standard drafting process is underway as a joint project with NAESB.

273. The Commission also adopts the NOPR proposal to establish standards specifying the appropriate uses of TRM to guide NERC and NAESB in the drafting process. Transmission providers may set aside TRM for (1) load forecast and load distribution error, (2) variations in facility loadings, (3) uncertainty in transmission system topology, (4) loop flow impact, (5) variations in generation dispatch, (6) automatic sharing of reserves, and (7) other uncertainties as identified through the NERC reliability standards development process. Because load, facility loading and other uncertainties constantly deviate, we will not require that TRM set aside capacity be set at zero in the non-firm ATC calculation. In other words, we will not require transfer capability that is set aside as TRM to be sold on a non-firm basis. We find that clear specification in this Final Rule of the permitted purposes for which entities may reserve CBM and TRM will virtually eliminate double-counting of TRM and CBM.

274. We will not adopt PNM-TNMP's proposal regarding use of set aside transfer capability as TRM beyond 59 minutes, rather than converting it to CBM. Our proposal is to separate transfer capability set asides as either CBM or TRM without regard to duration of use of the set aside. Therefore, such a clarification is not necessary.

275. In addition, we direct public utilities, working through NERC, to establish an appropriate maximum TRM. One acceptable method may be to use a percentage of ratings reduction, i.e., model the system assuming all facility ratings are reduced by a specific percentage. This is a relatively simple method and, if adopted as the reliability standard's method, should not restrict a transmission provider from using a more sophisticated method that may allow for greater ATC without reducing overall reliability.

276. Because of the operational characteristics of the uncertainties that are to be accommodated using TRM, and their aggregate impact on reliable operation, we require each transmission provider to calculate, and allocate on the paths and flowgates, the aggregate TRM value for all LSEs within its area. We support NERC's plan to revise existing reliability standards for TRM to require clear documentation of the TRM calculation, as we expect the TRM value to be supported and fully transparent. In addition, we require each transmission provider to make available all underlying documentation, including work papers and load flow base cases, used to determine TRM, to any transmission customer and LSE within its control area, subject to a confidentiality agreement,[177] if necessary. We agree with Santee Cooper's comments that the

[177] The agreement may appropriately restrict the sharing of sensitive information with customer personnel that are involved only in transmission functions, as opposed to merchant functions.

Commission must ensure that service to native load and system reliability are not compromised. We believe that our requirement for public utilities to work through NERC satisfies such concerns.

277. With respect to the proposal to permit regional variations in the TRM calculation methodology, we reiterate our position stated above that any request for regional difference from the applicable reliability standards must take place through the NERC reliability standards development process. With respect to TAPS' proposal regarding reserve sharing groups, we clarify that, to the extent transfer capability is needed for transmission of shared reserves, this is included under TRM. However, as noted previously in the CBM discussion, we are not mandating the use of reserve sharing groups.

## ***From FERC Order 693***

***Starting on Page 305:***

### j. Documentation and Content of Each Regional Transmission Reliability Margin Methodology (MOD- 008-0)

1112. MOD-008-0 requires the development and posting of a regional methodology for TRM, which is transmission capacity that is reserved to provide reasonable assurance that the interconnected transmission network will remain secure under various system conditions. The Reliability Standard requires each regional reliability organization to: (1) develop and document a regional TRM methodology in conjunction with its members and (2) post on a website the most recent version of its TRM methodology.

1113. In the NOPR, the Commission identified MOD-008-0 as a fill-in-the-blank standard, proposing that because the regional methodologies had not been submitted, the Commission would not propose to approve or remand MOD-008-0 until the ERO submitted the additional information. The Commission expressed concern about the lack of: (1) clear requirements on how TRM should be calculated and allocated across paths and (2) consistent criteria and clarity with regard to the entity on whose behalf TRM had been set aside.

1114. The Commission requested comment in the NOPR on how TRM is currently calculated and allocated across paths, and what would be a recommended approach for the future.

### i. Comments

1115. APPA agrees that MOD-008-0 is a fill-in-the-blank standard, is not sufficient as currently drafted, and should not be approved as a mandatory Reliability Standard until

NERC and the regional reliability organizations and regional entities develop the necessary regional methodologies and the Commission approves them.

1116. MISO adds that there should be a consistent framework to be followed by entities in determining TRM. It states that relevant MOD standards should be revised if such a framework is not clearly delineated. However, MISO cautions that a Reliability standard should not be used to address a perceived equity concern. MidAmerican also supports greater uniformity of TRM definitions and calculations, and proposes that a revised standard and/or new standards should encourage transparency with increased availability of information, consistent data input and certain modeling assumptions. International Transmission agrees and proposes that TRM consistency should be addressed either on a regional basis or on an Interconnection-wide basis.

1117. In response to the Commission's request for comments on the current calculation of TRM, and recommended approaches for the future, International Transmission provides a description of the MISO approach to TRM. International Transmission states that during the operating horizon (next 48 hours), TRM is limited to a reserve sharing component which only applies to flowgates that are not based on transmission outages (unit tripping and transmission outages are considered a double contingency). International Transmission states that the logic behind this approach is that there are fewer uncertainties in the operating horizon because schedules and market flows are known. International Transmission explains that during the planning horizon (next 48 hours), a two percent TRM component for uncertainty is used on all flowgates, including those requiring reserve sharing TRM. In addition, other assumptions regarding the sale of transmission service enter into the need for TRM to cover "uncertainties." In addition, International Transmission cautions that MISO's minimal two percent margin may not be sufficient for long-term planning horizon requests (i.e., over 13 months) if planning "assumptions" are not reasonable. International Transmission argues that MISO must also employ proper sensitivity studies to other system variables for a two percent margin to be sufficient. TRMs in the five to ten percent range are not necessarily unreasonable if a wide range of potential system operating conditions is not studied. Regardless of the ultimate approach adopted in future standards, International Transmission proposes that all entities follow a consistent framework when calculating TRM.

1118. MidAmerican responds with a discussion of its current approach to TRM calculation, which has been performed in accordance with MAPP-approved methodologies. MidAmerican states that these methodologies include an amount to allow for both the delivery of operating reserves and for uncertainties. Since delivery of operating reserves keeps the interconnected network in service, benefiting all market participants, MidAmerican contends that it is appropriate for TRM to include an amount to allow for the delivery of operating reserves. The allowance for uncertainty is calculated as a percentage of TTC required to protect reliability. All market participants benefit from the provision of an appropriate margin for uncertainty because the reliability of the interconnected network is maintained and service interruptions are reasonably minimized.

1119. With respect to applicable entities, APPA proposes the addition of two new functional entities. Specifically, APPA believes that NERC should expand the applicability section of MOD-008-0 to include planning authorities and reliability coordinators. APPA points out that these are the only entities that can evaluate the amount of error in their transfer capability predictions.

1120. ERCOT states that the Commission's concerns about TRM do not apply to ERCOT, because ERCOT has a balanced grid in which all transmission is firm, no transmission is reserved and there are no transmission paths.

**ii. Commission Determination**

1121. The Commission does not approve or remand MOD-008-0 until the ERO submits additional information. Consistent with Order No. 890 and comments received in response to the NOPR, the Commission directs the ERO to modify MOD-008-0 through the Reliability Standards development process, as discussed below.

1122. Consistent with the NOPR proposal and Order No. 890, the Commission directs the ERO to modify standard MOD-008-0 to clarify how TRM should be calculated and allocated across paths or flowgates. We understand that the standards drafting process is underway as a joint project with NAESB. We agree with International Transmission, MidAmerican and MISO about the need for more uniformity and transparency in TRM calculation methodology and use, in order to eliminate potential reliability and discrimination concerns. Consistent with Order No. 890, the Commission directs the ERO to specify the parameters for entities to use in determining uncertainties for which TRM can be set aside and used, such as: (1) load forecast and load distribution error; (2) variations in facility loadings; (3) uncertainty in transmission system topology; (4) loop flow impact; (5) variations in generation dispatch; (6) automatic reserve sharing and (7) other uncertainties as identified through the NERC Reliability Standards development process. We find that clear specification in this Final Rule of the permitted purposes for which entities may reserve CBM and TRM will also virtually eliminate double-counting of TRM and CBM. Therefore, we direct the ERO to determine clear requirements regarding permitted uses for TRM through its Reliability Standards development process.

1123. We agree with the commenters that the percentage reduction of line rating can be one way to establish an appropriate maximum TRM if thermal considerations are the only limiting factors. While this is a relatively simple method, it ignores limitations relative to voltage or stability limitations which are the more typical reasons for transmission limitations. If adopted as the Reliability Standard method, it should not restrict a transmission provider from using a more sophisticated method that may allow for greater ATC without reducing overall reliability. However, we disagree with the use of an arbitrary percentage over a long time frame that is not based on either proven historical need or sensitivity studies that support that determination. Therefore, consistent with our OATT Reform Final Rule, we direct the ERO to develop requirements regarding transparency of the documentation that supports TRM determination**.**

1124. We agree with APPA that NERC should revise the applicability section of this standard to add planning authorities and reliability coordinators, and in addition, any other entities that may be identified in the Reliability Standards development process.

1125. Regarding ERCOT's statement that TRM does not apply to ERCOT, we reiterate our position that any request for a regional exemption from the applicable Reliability Standards must take place in the Reliability Standards development process.

1126. The Commission neither accepts nor remands MOD-008-0 until the ERO submits additional information. In the interim, compliance with MOD-008-0 should continue on a voluntary basis, and the Commission considers compliance with the Reliability Standard to be a matter of good utility practice. Although the Commission did not propose any action with regard to MOD-008-0, it addressed above a number of concerns regarding the Reliability Standard, consistent with those proposed in Order No. 890. Accordingly, we direct the ERO to develop modifications to the Reliability Standard through the Reliability Standards development process including: (1) clear requirements on how TRM should be calculated, including a methodology for determining the maximum TRM value, and allocated across paths; (2) clear requirements for permitted purposes for which TRM can be set aside and used; (3) clear requirements for availability of documentation that supports TRM determination and (4) expanding the applicability to add planning authorities and reliability coordinators and any other appropriate entity identified in the Reliability Standards development process.

### k. Procedure for Verifying Transmission Reliability Margin Values (MOD-009-0)

1127. MOD-009-0 requires each regional reliability organization to develop and implement a procedure to review TRM calculations and the resulting values determined by member transmission providers to ensure compliance with the regional TRM methodology.

1128. In the NOPR, the Commission identified MOD-009-0 as a fill-in-the-blank standard that requires each regional reliability organization to develop a procedure for review of TRM calculations and the resulting values. In the NOPR, the Commission stated that because the regional procedures had not been submitted, the Commission would not propose to approve or remand MOD-009-0 until the ERO submits the additional information.

#### i. Comments

1129. APPA agrees that MOD-009-0 is a fill-in-the-blank standard, is not sufficient as currently drafted, and should not be approved as a mandatory Reliability Standard until NERC and the regional reliability organizations and regional entities develop the necessary regional methodologies and the Commission approves them.

**ii. Commission Determination**

1130. The Commission will not approve or remand MOD-009-0 until the ERO submits additional information. Because the regional procedures have not been submitted to the Commission, it is not possible to determine at this time whether MOD-009-0 satisfies the statutory requirement that a proposed Reliability Standard be “just, reasonable, not unduly discriminatory or preferential, and in the public interest.” Accordingly, the Commission neither approves nor remands this Reliability Standard until the regional procedures are submitted. In the interim, compliance with MOD-009-0 should continue on a voluntary basis, and the Commission considers compliance with the Reliability Standard to be a matter of good utility practice.

Please use this form to submit comments on the 1st draft of standard MOD-008-1 Transmission Reliability Margin. Comments must be submitted by **June 24, 2007**. **Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**2.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**3.** The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

☐ Yes

☒ No

Comments: "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority.

**4.** The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

☐ Yes

☒ No

Comments: R1.3. should read "The description of the method of allocation across Posted Paths or Flowgates" where Posted Path is defined consistent with NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.
R2. -- The parenthetical statement should read "…on each of its respective Posted Paths or Flowgates..."
R5. and R6. -- The term "path" should be replaced with "Posted Path".
R10. -- The term "posted path" should be capitalized.

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments: Please clarify that the uncertainties listed in R1.1 may be used in TRM calculations (as opposed to being required to be used).

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

☒ Yes

☐ No

Comments: While this methodology may be sufficient for several Transmission Service Providers (TSPs), it may not be for others. Therefore, use of this type of percentage should not be the only mechanism available for TSPs to determine TRM on their systems.

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments: BPA may not calculate TRM on some of its constraints due to uncertainty components being included in those constraints' TFC determinations. Therefore, a TRM of "0 MW" would be posted and documented, per R1.5. of MOD-008-1. Would this practice meet the intent of this standard?

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: It is unclear that the drafting team has addressed FERC's direction in paragraph 275 of Order No. 890 to establish appropriate maximum TRM. Perhaps the Standards Drafting Team should consider using the TPL standards requirements as a basis for bounding the maximum TRM value.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: This standard shouldn't be applicable to the Reliability Coordinator because this is a calculation methodology, and Reliability Coordination is a real-time role. Also, it is unclear which requirements of this standard apply to the Planning Coordinator. Unless specific roles in TRM determination are identified for the Reliability Coordinator and Planning Coordinator, they should be deleted from the Applicability section.

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☐ Yes

   ☒ No

   Comments: There is no requirement for coordination between the Transmission Operator and the Transmission Planner. Also, there should be a requirement that the TRM values should be equal to or lower than long-term TRM as you move closer to real-time and uncertainty diminishes.

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments:

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☒ No

Comments:

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: The explanation should describe how reliability is maintained in light of the uncertainties identified in R1.1

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☐ Yes

☒ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments: The "make publically available" Requirements R7 and R10 are inappropriate for NERC standards. These are communications which should be in the NAESB standards.

Please use this form to submit comments on the 1st draft of standard MOD-008-1 Transmission Reliability Margin. Comments must be submitted by **June 24, 2007**. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: There is no requirement applicable to Reliability Coordinator or Planning Coordinator. Therefore, MOD-008-1 should not be applicable to Reliability Coordinator and Planning Coordinator.

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☐ Yes

   ☒ No

   Comments: It is not clear if the intent of R2 is to document component of uncertainty on TRM on each posted path, or a general process to include impact of uncertainties in TRM methodologies is sufficient. The requirement should clarify such that the impact of uncertainties are included in TRM methodologies and not to document each component. R4 is written as a requirement for CBM methodology rather than for TRM methodology, it should be deleted or reworded.

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a “maximum uncertainty” to support the validity of a TRM value? If “Yes,” please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☒ Yes

☐ No

Comments: Study should include using historic data to determine impact of actual versus forecasted information on loading of transmission system components that are limiting the TTCs or TFCs.

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If “Yes,” please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☒ No

Comments: There is no technical justification of using 2 - 5% of Facility Rating as TRM. Since Facility Ratings are determined using conditions that are already worst case conditions, using additional safety factor results in underutilizing the transmission system. If uncertainties such as using first contingency conditions and using worst case scenarios for components that are used for ATC/AFC calculations already include uncertainties there should not be double counting of these uncertainties. If data can be supported by historic information, then only data should be used for setting aside TRM.

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: R1.5 tends to imply that all Transmission Planner and Transmission Operators must use TRM, unless they can justify not using it. On the contrary, those TPs and TOs who use TRM should justify its use as use of TRM results in lower ATCs due to uncertainties that may already be included in determining the components that are used for ATC calculations.

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If “Yes,” please explain your answer in the comments area.

☐ Yes

☒ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: See IRC comments submitted by Charles Yeung.

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: See IRC comments submitted by Charles Yeung.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: See IRC comments submitted by Charles Yeung.

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☐ Yes

   ☒ No

   Comments: See IRC comments submitted by Charles Yeung.

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☒ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☐ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT Interconnection. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority Interconnection and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area and there has been no reservation of transmission capacity in ERCOT.

Transmission Reliability Margin is defined as the amount of transmission transfer capability necessary to provide reasonable assurance that the interconnected transmission network will be secure.TRM accounts for the inherent uncertainty in system conditions and the need for operating flexibility to ensure reliable system operation as system conditions change.

Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT.

Currently ERCOT employs a zonal congestion management scheme that is flow-based, whereby the ERCOT transmission grid, including attached generation resources and load, is divided into a predetermined number of congestion zones. This congestion management scheme applies zonal shift factors, determined by ERCOT, to predict potential congestion under the known topology of the ERCOT System. This scheme is used in the Day Ahead and Adjustment Periods to evaluate potential congestion. During the operating period ERCOT uses zonal shift factors to determine zonal Redispatch deployments needed to maintain flows within zonal limits. The local congestion management scheme relies on a more detailed Operational Model to determine how each particular Resource or Load impacts the transmission system. This model uses the current known topology of the transmission system. Unit specific Redispatch instructions are then issued to manage local congestion.

In the future ERCOT will be transitioning from a Zonal Market to a full LMP market. This system is designed to manage congestion in the Day Ahead and Real-Time on a Resource specific basis. Under both of these market designs transmission facility limits are established in advance and updated based on coordinated exchange of information between transmission providers and ERCOT in planning and operating periods.

In the current and future ERCOT market design the use of TRM is not applicable to the ERCOT Region. ERCOT does not have a synchronous connection with any other Control Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Balancing Authority Areas and/or offer transmission reservations and schedules within the interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting TRM without the need for a Regional variance.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments: See IRC comments submitted by Charles Yeung.

Please use this form to submit comments on the 1st draft of standard MOD-008-1 Transmission Reliability Margin. Comments must be submitted by **June 24, 2007**. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: We agree with combining the two standards, but the newly created standards contain quite a few more requirements than MOD-008-0 and MOD-009-0 taken together, and some of the requirements are duplicated (for example, R1 and R2). Also, some requirements are not clear as to who should be responsible, for example: there are conflicting yet sometimes duplicated requirements for documenting and calculating TRM. R1 and R2 hold the TP and TOP responsible for these tasks, yet R8 and R9 hold TSP responsible as well.

   There needs more clarity particularly in the accountability for documenting the methodology and in providing the supporting basis for determining TRM.

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: Most of the directives appear to be addressed. However, in view of the above comments, we expect the standards need more work so a revisit of this question is required.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: We do not think the standard clearly conveys the accountability of each of the responsibility entities well enough. Please see our comments to Q1 above.

   In addition, we feel that the entire set of MOD-001, -004, -008, -028, -029 and -30 lacks clarity in responsibility. For example, the RC and PC should not be responsible for calculating ATC. Why would they be included in the applicability section of some standards/requirements?

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

☐ Yes

☒ No

Comments: There are a number of duplicated requirements (e.g. R1 and R2 as noted above_) and there is no clarity on the accountability (e.g. R9). The standard needs to be reviewed and revised to more clearly convey the roles and responsibilities in accordance with the functional model and today's practice (on a functional entity basis).

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments: We do not believe any maximum values should be set as a standard. Individual TSP (or TP and TOP according to the proposed standard) should each determine the amount needed to cover transmission uncertainties, which may vary among systems. The validity of the calculated values can be assessed against the documented methodology and audit process.

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☒ No

Comments: We do not believe this approach duly addresses the various components of TRM which may change depending on the system conditions. However, we hold no position on individual entities who choose to apply this approach to determine the TRM.

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☒ Yes

☒ No

Comments: If a 0 MW TRM is reserved, it suggests that the TP and TOP are comfortable with the available control actions other than utilizing the transmission service reserved for TRM to address transmission uncertainties. On the other hand, the value of TRM reserved, including 0 MW, are subject to verification if need be. The question then becomes why 0 MW needs to be explained but not any other values? For example, other transmission users may question a high value of TRM reserved which reduces the ATC for use by others.

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☐ Yes

☒ No

Comments: None, but there appears to be two requirements that pertain to access to external generation that may be duplicated or in excess of the CBM value: they are aggregate load forecast error and reserve sharing requirements. We suggest the SDT to review the two lists to eliminate any duplication or excessive allocation.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: None, but it should be noted that some entities do not provide physical transmission services and therefore some of the requirements in this standard may not be applicable to them.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments:

Requirement 1.1 should not only include generation dispatch variations but also peak and off peak dispatch variations. Additionally, Requirement 1.1 – the first line "Identification any of the following…" should be written to read as "Identification of any of the following…"

We have provided similar comments on the supplementary SAR, MOD-001 and MOD-004. The SAR for revising and creating this set of standards has not gone through prior public review and comment on the need and direction for these standards. It is posted simultaneously with the revised standard, making posting of the SAR irrelevant. Yet the revised standards appear to be uncoordinated, duplicated and convoluted in some.

We understand these standards need to be revised to meet the FERC's timeline but they should be done in a proper and orderly manner to ensure manageability not just by the staff and the SDT but also by the stakeholders in the industry. We do not agree with the process, and we do have trouble reviewing the set of standards that in our view are not well structured (for example: combining all 4 standards MOD-004 to MOD-007 into one). There has been no industry input process that either supports or disagrees with this proposed combining before the standards are drafted and posted.

And some of the standards assign responsibilities to entities that should not be responsible for some of the tasks. For example, the RC and PC are not responsible for calculating ATC. The proposed intent to combine some of the MODs as one includes the RC and PC in these standards because of the TTC calculation requirements. But in doing so, the assignment of tasks and responsibilities becomes confusing resulting in these entities being assigned some tasks inappropriately.

We suggest the SDT to revise the supplementary SAR and post it for comments, with sufficient detail and specificity on the proposed scope and structure of the standard set, before drafting/revising the standards.

Please use this form to submit comments on the 1st draft of standard MOD-008-1 Transmission Reliability Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages.  Comments must be submitted by **June 24, 2007**.  You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: We agree with combining the two standards, but the newly created standards contain quite a few more requirements than MOD-008-0 and MOD-009-0 taken together, and some of the requirements are duplicated (for example, R1 and R2). Also, some requirements are not clear as to who should be responsible, for example: there are conflicting yet sometimes duplicated requirements for documenting and calculating TRM. R1 and R2 hold the TP and TOP responsible for these task, yet R8 and R9 hold TSP responsible as well.

   There needs more clarity particularly in the accountability for documenting the methodology and in providing the supporting basis for determining TRM.

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: Most of the directives appear to be addressed. However, in view of the above comments, we expect the standards need more work so a revisit of this question is required.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: We do not think the standard clearly conveys the accountability of each of the responsibility entities well enough. Please see our comments to Q1 above.

   In addition, we feel that the entire set of MOD-001, -004, -008, -028, -029 and -30 lacks clarity in responsibility. For example, the RC and PC should not be responsible for calculating ATC. Why would they be included in the applicability section of some standards/requirements?

**4.** The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

☐ Yes

☒ No

Comments: There are a number of duplicated requirements (e.g. R1 and R2 as noted above_) and there is no clarity on the accountability (e.g. R9). The standard needs to be reviewed and revised to more clearly convey the roles and responsibilities in accordance with the functional model and today's practice (on a functional entity basis).

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments: We do not believe any maximum values should be set as a standard. Individual TSP (or TP and TOP according to the proposed standard) should each determine the amount needed to cover transmission uncertainties, which may vary among systems. The validity of the calculated values can be assessed against the documented methodology and audit process.

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☒ No

Comments: We do not believe this approach duly addresses the various components of TRM which may change depending on the system conditions. However, we hold no position on individual entities who choose to apply this approach to determine the TRM.

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☒ Yes

☒ No

Comments: If a 0 MW TRM is reserved, it suggests that the TP and TOP are comfortable with the available control actions other than utilizing the transmission service reserved for TRM to address transmission uncertainties. On the other hand, the value of TRM reserved, including 0 MW, are subject to verification if need be. The question then becomes why 0 MW needs to be explained but not any other values? For example, other transmission users may question a high value of TRM reserved which reduces the ATC for use by others.

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☐ Yes

☒ No

Comments: None, but there appears to be two requirements that pertain to access to external generation that may be duplicated or in excess of the CBM value: they are aggregate load forecast error and reserve sharing requirements. We suggest the SDT to review the two lists to eliminate any duplication or excessive allocation.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: None, but it should be noted that some entities do not provide physical transmission services and therefore some of the requirements in this standard may not be applicable to them.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments: We have provided similar comments on the supplementary SAR, MOD-001 and MOD-004. The SAR for revising and creating this set of standards has not gone through prior public review and comment on the need and direction for these standards. It is posted simultaneously with the revised standard, making posting of the SAR irrelevant. Yet the revised standards appear to be uncoordinaed, duplicated and convoluted in some.

We understand these standards need to be revised to meet the FERC's timeline but they should be done in a proper and orderly manner to ensure manageability not just by the staff and the SDT but also by the stakeholders in the industry. We do not agree with the process, and we do have trouble reviewing the set of standards that in our view are not well structured (for example: combining all 4 standards MOD-004 to MOD-007 into one). There has been no industry input process that either supports or disagrees with this proposed combining before the standards are drafted and posted.

And some of the standards assign responsibilities to entities that should not be responsbile for some of the tasks. For example, the RC and PC are not responsible for calculating ATC. The proposed intent to combine some of the MODs as one includes the RC and PC in these standards because of the TTC calculation requirements. But in doing so, the assignment of tasks and responsibilities becomes confusing resulting in these entities being assigned some tasks inappropriately.

We suggest the SDT to revise the supplementary SAR and post it for comments, with sufficient detail and specificity on the proposed scope and structure of the standard set, before drafting/revising the standards.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team’s decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If “No,” please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission’s (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC’s directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If “No,” please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: Some of the requirements, such as R1.2 and R4 need additional work.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities you believe the standard should apply to and why.

   ☒ Yes

   ☒ No

   Comments: For once, the Reliability Coordinator may be an appropriate entity in these standards. TRM is addressing uncertainty. A real-time operator will be more aware of actual system uncertainties than most people, including planners. "Loopflow" has proven to an elusive animal to keep track of. TRM for loopflow is an important parameter. The RC should have input here.

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If “No,” please explain why in the comment area.

   ☒ Yes

   ☒ No

   Comments: This is a difficult question to answer but easily "measured". TRM is dealing with uncertainty so you're guessing at whatever you do. However, the ultimate real-time system response is your "test result" to see if you picked an appropriate TRM. If no one is denied service and there are no TLRs or congestion, you're right. If there are no or few TSR denials, and congestion or TLRs are persistent, the TRM is probably too low. If TSR is being denied and there is no evidence of congestion or TLR (level 3 for non-firm), TRM might be too high.

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a “maximum uncertainty” to support the validity of a TRM value? If “Yes,” please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☒ Yes

☒ No

Comments: You only need to investigate TRM if there is evidence of overselling or underselling. The compliance monitor should be so instructed. TRM is dealing with uncertainty. How do you study uncertainty? You don't, you just observe it in real-time.

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If “Yes,” please provide what you believe is an appropriate percentage in your response in the comments area.

☒ Yes

☐ No

Comments: 5% is appropriate. However, as we have stated before, it could change with observed system response. If you are using 5% and denying service with no TLRs or congestion, you may want to lower it. Compliance monitoring of this standard should (must) include this type of evaluation. Just picking a number only works if the real-time system response justifies it.

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: The justification is simple, no TLRs are observed and no market congestion is observed. If either symtom is present, TRM of zero is not justifiable. I.e, R1.5 is very easy to comply with.

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If “Yes,” please explain your answer in the comments area.

☒ Yes

☒ No

Comments: We're dealing with uncertainty here. What is legitimate uncertainty? There are enough requirements to find something to use.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments: As we have stated before, all compliance and measures should be based on evidence of overselling or underselling. Otherwise its just bureaucratic red-tape.

Please use this form to submit comments on the 1st draft of standard MOD-008-1 Transmission Reliability Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

### Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☒ Yes

   ☐ No

   Comments:

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☒ Yes

   ☐ No

   Comments:

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a “maximum uncertainty” to support the validity of a TRM value? If “Yes,” please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments: Once the determination of TRM methodology has been identified, the TSP or TP or TC should use it to determine the required TRM values. It should not be required to perform many other studies to determine a TRM with the "maximum uncerttainty".

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If “Yes,” please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☒ No

Comments:

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If “Yes,” please explain your answer in the comments area.

☐ Yes

### Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: The Planning Coordinator and the Reliability Coordinator should have some role in this standard. They are listed as applicable Functional Entities that the standard is applicable yet they are not listed as the subject of any requirement.

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☒ Yes

   ☒ No

   Comments: 1. R1.2 should be revised to indicated that "A statement to confirm that it shall be used CONSISTENT assumptions in calculating TRM.." Same assumptions implies an exactness which is not appropriate and is not required by FERC Order 890. 2. Makes revisions to R1.1 and R2 per comments provided in response to Question 8 below.

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a “maximum uncertainty” to support the validity of a TRM value? If “Yes,” please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments: These studies should be coordinated as a NERC-wide activity outside of these standards.

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If “Yes,” please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☒ No

Comments: No - some of the area Transmission Service Providers use a percentage and also provide for incremental power flows for reserve sharing.

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: Generally zero TRM is potentially providing inadequate protection for reliability.

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If “Yes,” please explain your answer in the comments area.

☒ Yes

☐ No

Comments: Maintinance Outages, Uncertainty in Location of future generation, and uncertainty in power transactions. Also, the Standards Drafting Team should clarify that the Reserve sharing requirements are "Incremental power flows for reserve sharing requirements or automatic sharing of reserves."

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments: 1. The purpose of each of the standards should be revised to be more in-line. The purpose in this standard be revised by replacing "to help ensure more accurage calculation of transfer capabilities" with "for reliability system operations." 2. The Standards Drafting Team has defined a scheduling horizon in addition to an operating horizon and a planning horizon. Why did the Standards Drafting Team establish it and why have they defined it as provided in the standard.

Please use this form to submit comments on the 1st draft of standard MOD-008-1 Transmission Reliability Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

### Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: This appears to require no consistency and appears to be a fill-in-the-blank standard.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: The Planning Coordinator and the Reliability Coordinator should have some role in this standard. They are listed as applicable Functional Entities that the standard is applicable yet they are not listed as the subject of any requirement.

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☐ Yes

   ☒ No

   Comments: Again, this still seems like a fill-in-the-blank standard.

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments:

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☐ No

Comments:

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: The reason for TRM is uncertainty. It is hard to believe that all of the ATC calculations are without uncertainty, so if uncertainty is buried in another part of the ATC calculation, it would be helpful to know where.

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☐ Yes

☒ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: This appears to be a fill-in-the-blank standard.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☒ Yes

   ☐ No

   Comments:

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☒ Yes

   ☐ No

   Comments:

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments: I don't know what the value of a maximum uncertainty would be. Each uncertainty has a probabalitic component to it. It would be simple enough to add up all the uncertainites but if the probalistic analysis determined that the maximum uncertainty event was once every 10 years or once every 15 years, I do not know what value that would have. If the standard listed some assumptions, e.g. events that you expect to see within a 1 year or 3 year time frame, then this analysis could become more meaningful.

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☐ No

Comments: I think that a percentage could be appropriate, but the best TRM value will always be one that is based on analysis of the potential uncertainties on a flowgate. I would hope that the committee will consider using a percentage as a default methodology, but allow for an analysis of uncertainties to modify the final value. A percentage would have to be based on flowgate capability. 5% may be a good default on a 100MW flowgate but overkil on a 1600MW flowgate.

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: The analysis need not be extensive and based on past performance, however a 0 TRM allows the tranmission custmers access to a flowgate with no margin of error, and some thought should be put into that situation.

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☒ Yes

☐ No

Comments: I believe that the need to hold back TRM for Inertial response is broad enough. Just as system load can degrade inertial response, system loading can degrade voltage response. I would recommend that initertial response be changed to include transient, dynamic, and voltage response.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☐ No

   Comments:

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☐ Yes

   ☐ No

   Comments:

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments:

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☒ No

Comments:

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: explaination may divulge commercially sensitive or critical infrastructure information

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☐ Yes

☐ No

Comments: in the case of a system that is radially connected to other systems via a single interconnection will become islanded for a single contingency (loss of the interconnection). If the system was importing more than 10% (nominal) of its load at the time of the interconnection, the system will likely trigger Stage 1 under frequency load shedding. Therefore there must be a TRM facto that varies with system load to limit the amount of UFLS. In Nova Scotia, we set the import limit at 22% of total net load on our system to avoid Stage 2 UFLS for a single contingency. We use TRM as that variable (with additional margin for load forecast uncertainty. It is not clear if this need is addressed in this standard. Another need would be to share load following with our neighbour (AGC margin). For example, if NS and NB are jointly controlling the NB-New England tie, the NS-NB tie capacity must be held back from its TTC to allow room to respond to load and generation fluctuations (especially wind generation). The latter may be the intent of the R2 "Variations in generation dispatch".

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☒ No

Comments: Tariffs and Market Rules may have to be updated to reflect the new requirements of MOD-008.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments:

Please use this form to submit comments on the 1st draft of standard MOD-008-1 Transmission Reliability Margin. Comments must be submitted by **June 24, 2007**. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**2.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**3.** The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments: No comment.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments:

   First, the "Applicability" section uses the term "Planning Coordinator" which is not a defined term in the NERC Glossary. If the NERC Team intends it use, it should become a defined term.

   Second, where the term Planning Coordinator is used, WECC queries whether or not the more accurate entity would be the Transmission Planner.

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

   ☐ Yes

   ☐ No

   Comments:

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☒ No

Comments:

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

☒ Yes

☐ No

Comments:

Two to five percent is acceptable. However, it should not be mandated as the single methodology allowed. Further, the TRM has multiple components, one of which is the Reserve Sharing Group component. The 2-5% is not appropriately applied to the Reserve Sharing Group subset of TRM; rather, the 2-5% accurately applies only to the "uncertainty" portion of the TRM.

While this methodology may be sufficient for several TSPs, it may not be sufficient for others. Therefore, use of this type of percentage should not be the only mechanism available for TSPs to determine TRM on their systems.

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☐ Yes

☒ No

Comments: Howver, the NERC Team should clarify that the uncertainties listed in R1.1 "may" be used in TRM calculations (as opposed to being required to be used).

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments:

A.

Reiterating comments from MOD-04 CBM, the Team suggests the following CBM definition replace the existing CBM and TRM NERC defintions:

“Capacity Benefit Margin”

CBM is the amount of firm import transmission capability, requested by the LSE, to exclusively serve identified load only during periods of emergency generation deficiencies extending beyond the beginning of the scheduling hour in which the emergency generation deficiency occurs.”

B.

Typo on the first line of R1.1. Should state: "Identification of any of the following…"

C.

R8. Add: "Each Transmisison Service Provider shall make available (within seven CALENDAR days OF A REQUEST)… (Emphasis added.)

D.

As previously stated, there is an existing FERC approved definition for Posted Path that should be included in the NERC Glossary and utilized in the ATC standards.

R10. The term Posted Path should be used as a defined term.

The definition for Posted Path should be as follows:

Posted Path

Posted Path means: 1) any Balancing Authority to Balancing Authority interconnection; 2) any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months; 3) and any path for which a customer requests to have ATC or TTC posted. For purposes of this definition, an hour includes any part of an hour during which service was denied, curtailed or interrupted. (Plagiarized from NAESBE R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.

E.

R5. Should read "…(on each POSTED PATH or Flowgate)…"

F.

R2. At minimum, the word "Contract Path" should be deleted as the intent is to cover all Posted Paths. This Team continues to suggest the adoption of the CFR defined term "Posted Path" that is the more accurate useage for this R.

G.

R11. Should be reworded as neither the Transmission Planner nor the Transmission Operator "reserve capacity" on their system(s). That's not within their Functional Model purview. The Transmission Planner and the Transmission Operator can identify capacity that "should be reserved" on their system(s); however, the Transmission Service Provider is the accurate entity to actually "reserve" the capacity.

Please use this form to submit comments on the 1st draft of standard MOD-008-1 Transmission Reliability Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

☐ Yes

☐ No

Comments:

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: This is unnecessary "busy work." FERC is concerned about TSP's hoarding transmission capacity by unjustifiably setting aside large quantities of TRM. If I set aside zero TRM this should make FERC very happy because it frees up more ATC for purchase. By making me justify why I am setting aside zero TRM I am being encouraging to set aside non-zero TRM to avoid having to justify it. At the very least R1.5 should be rewritten to clarify precisely what circumstance require justification for zero TRM. For example, if I set aside zero TRM for only one hour on only one path do I have to explain why? Conversely, if I have zero TRM for all time periods and for all paths but one have I avoided the need to justfy why I have zero TRM for the other paths?

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

## Consideration of Comments on 2nd Draft of Standard MOD-008-1 — Available Transfer Capability (Project 2006-07)

The ATC Standard Drafting Team requesters thank all commenters who submitted comments on First Draft of Standard MOD-008-1 TRM. This SAR was posted for a 30-day public comment period from May 25 through June 24, 2007. The requesters asked stakeholders to provide feedback on the standard through a special standard Comment Form. There were 19 sets of comments, including comments from 95 different people from more than 45 companies representing all of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received from stakeholders, comments from the cooperative effort with NAESB in developing associated business practices, and comments received from FERC staff, the drafting team has significantly redrafted the standard. The changes have been so extensive that the revised standard bears very little resemblance to the last posted draft. Major changes include:

- Added a new term, 'Transmission Reliability Margin Implementation Document' that replaces the references to a Transmission Reliability Margin Calculation Methodology
- Expanded the purpose statement
- Eliminated the Transmission Planner, Reliability Coordinator, Planning Coordinator and Load-serving Entity from the applicability section of the standard
- Revised R1 to limit applicability to the Transmission Operator
- Absorbed R2 into R1 and expanded R1 to add more specificity to the documentation the Transmission Operator must have to support its TRM calculation methodology, including new language that:
    - Clarifies that documentation must be provided for each Posted Path or Flowgate
    - Requires that the documentation of the uncertainties used in calculating TRM include maintenance outages and future generation
    - Requires that the documentation of the uncertainties used in calculating TRM include uncertainties regarding frequency bias
    - Requires documentation of the practice if TRM is zero for all time periods rather than requiring why it did not reserve any TRM
    - Added an upper boundary of up to 13 months for the calculation of TRM in the 'beyond day-ahead and pre-schedule' time period
    - Eliminated references (from original R2) to posted Contract Paths
- Modified what had been R3 and R4 (now R2 in the revised standard) to clarify that the uncertainties used in calculating TRM may not include any of the components of CBM
- Modified R5 and merged it with R6, moving the requirement for the Transmission Planner to calculate TRM for the time period beyond the day-ahead and pre-schedule period to the Transmission Operator - and added an outer boundary of 13 months to the 'beyond the day-ahead and pre-schedule' time period.
- Eliminated R7 which required the Transmission Service Provider to make its TRM calculation methodology publicly available – the posting requirements will be addressed in NAESB business practices.
- Modified R8 so that the Transmission Service Provider is only required to provide its TRM Implementation Document and associated documentation to those Transmission

Service Providers who have made a request for the information – the requirement to provide the information to transmission customers and load-serving entities has been removed

- Modified R9 (now R3) to limit applicability to the Transmission Operator and added some words to improve the clarity
- Eliminated R10 as the posting requirements are being addressed by NAESB
- Eliminated R11 which required the Transmission Planner and Transmission Operator that reserved capacity on its transmission system for use as TRM to also use TRM in its ATC or AFC calculations.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

## Index to Questions, Comments, and Responses

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If "No," please explain why in the comments area.

**Summary Consideration:** The majority of commenters agreed with the combination. The Standard Drafting Team has redrafted the standard to eliminate the duplication between R1 and R2, as well as clear up some of the confusion and conflicts in regard to responsibilities. Please see the list of major changes made to the standard on the cover page of this report.

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| IESO<br>IRC SRC | ☑ | ☑ | We agree with combining the two standards, but the newly created standards contain quite a few more requirements than MOD-008-0 and MOD-009-0 taken together, and some of the requirements are duplicated (for example, R1 and R2). Also, some requirements are not clear as to who should be responsible, for example: there are conflicting yet sometimes duplicated requirements for documenting and calculating TRM. R1 and R2 hold the TP and TOP responsible for these tasks, yet R8 and R9 hold TSP responsible as well.<br><br>There needs more clarity particularly in the accountability for documenting the methodology and in providing the supporting basis for determining TRM. |
| **Response:** The Standard Drafting Team has redrafted the standard to eliminate the duplication between R1 and R2, as well as clear up some of the confusion and conflicts in regard to responsibilities. Please see the list of major changes made to the standard on the cover page of this report. | | | |
| APPA | ☑ | | |

| Question #1 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| PSC SC | ☑ | | |
| SERC ATCWG | ☑ | | |
| WECC MIC MIS ATC TF | ☑ | | |
| SOCO | ☑ | | |

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If "No," please explain why in the comments area.

**Summary Consideration:** While most stakeholders who responded to this question indicated that the SDT has adequately responded to the directives in Order 890 and 693, there were some suggestions for improvement. The SDT has redrafted some parts of the standard to address these stakeholder suggestions.
R1.2 was modified as follows:

**R1.2** A statement to confirm that it shall use ~~the same~~ consistent assumptions in calculating TRM as those that are used in the transmission planning process for the appropriate time periods.

R3 and R4 were modified as follows:

**R~~3~~2.** The ~~Transmission Planner and~~ Transmission Operator shall only use the components of uncertainty from R1.1 to calculate TRM , and not include any of the components of CBM.

~~R4. The Load-Serving Entity shall not use the components of uncertainty from R1.1 to determine its CBM megawatt import requirement.~~

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The SDT has addressed most of the issues in the FERC Orders. However, it is not clear from the Standard that once transmission capacity has been reserved as TRM, under what circumstances can energy be scheduled on TRM transmission Capacity? |
| **Response:** The standard drafting team does not believe it is appropriate to specify scheduling requirements in this standard. | | | |
| Duke Energy | | ☑ | It is unclear that the drafting team has addressed FERC's direction in paragraph 275 of Order No. 890 to establish appropriate maximum TRM. Perhaps the Standards Drafting Team should consider using the TPL standards requirements as a basis for bounding the maximum TRM value. |
| **Response:** The drafting team feels that a maximum TRM would be the calculated amount of TRM in order to account for the types of uncertainty listed in the standard. | | | |
| ITC | | ☑ | Some of the requirements, such as R1.2 and R4 need additional work. |
| **Response:** The drafting team has redrafted the standard to address these comments.<br>Please see the list of modifications made to the standard listed on the cover page of this report. Both R1.2 and R4 were modified. | | | |
| MEC Trading | | ☑ | This appears to require no consistency and appears to be a fill-in-the-blank standard. |
| **Response:** The standard drafting team feels that because different entities experience different amounts of uncertainty, | | | |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| flexibility is required in this standard.. For example, some entities experience much larger loop flows through their system than other entities. | | | |
| IESO<br>IRC SRC | ☑ | ☑ | Most of the directives appear to be addressed. However, in view of the above comments, we expect the standards need more work so a revisit of this question is required. |
| **Response:** The Standard Drafting Team has continued to diligently work on the standard and has made numerous change based on comments from stakeholders, NAESB and FERC. Please see the list of modifications made to the standard listed on the cover page of this report. | | | |
| ERCOT | ☑ | | |
| FirstEnergy | ☑ | | |
| HQT | ☑ | | |
| MEC | ☑ | | |
| Manitoba Hydro | ☑ | | |
| MRO | ☑ | | |
| PSC SC | ☑ | | |
| WECC MIC MIS ATC TF | ☑ | | |
| SOCO | ☑ | | |

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why

**Summary Consideration:** There was no consensus amongst the stakeholders who responded to this question – however several commenters indicated here and elsewhere that the standard should not apply to the Reliability Coordinator or the Planning Coordinator, and the Standard Drafting Team has removed the Reliability Coordinator and Planning Coordinator from the applicability section of the standard.

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The Applicable Reliability Functions are identified; however the standard is requiring those Functions to duplicate their duties in this Standard that is required in other Standards. If this Standard wants to post the results of those duties, then the correct standard must be referenced in lieu of repeating the requirement. |
| **Response:** It is not the standard drafting team's intention to repeat requirements in other standards. The drafting team has examined the other reliability standards to check for repeat requirements and found no repeated requirements. | | | |
| BPA | | ☑ | "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority. |
| **Response:** Planning Coordinator is the current terminology used in the NERC Functional Model. We will add this definition to the Glossary. Note that the Standards Committee directed all drafting teams to begin using the term, 'Planning Coordinator' in the drafting of reliability standards. | | | |
| Duke Energy | | ☑ | This standard shouldn't be applicable to the Reliability Coordinator because this is a calculation methodology, and Reliability Coordination is a real-time role. Also, it is unclear which requirements of this standard apply to the Planning Coordinator. Unless specific roles in TRM determination are identified for the Reliability Coordinator and Planning Coordinator, they should be deleted from the Applicability section. |
| **Response:** The Standard Drafting Team has removed the Reliability Coordinator and Planning Coordinator from the applicability section of the standard | | | |
| ERCOT | | ☑ | There is no requirement applicable to Reliability Coordinator or Planning Coordinator. Therefore, MOD-008-1 should not be applicable to Reliability Coordinator and Planning Coordinator. |
| **Response:** The Standard Drafting Team has removed the Reliability Coordinator and Planning Coordinator from the applicability section of the standard. | | | |
| IESO<br>IRC SRC | | ☑ | We do not think the standard clearly conveys the accountability of each of the responsibility entities well enough. Please see our comments to Q1 above.<br><br>In addition, we feel that the entire set of MOD-001, -004, -008, -028, -029 and -30 lacks clarity in |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | responsibility. For example, the RC and PC should not be responsible for calculating ATC. Why would they be included in the applicability section of some standards/requirements? |
| **Response:** The standard drafting team has identified, for each requirement, the entity accountable for carrying out that requirement. Note that the applicability section of the standard was revised, and the standard no longer has any requirements applicable to the Planning Coordinator or the Reliability Coordinator. | | | |
| MEC<br>MEC Trading | | ☑ | The Planning Coordinator and the Reliability Coordinator should have some role in this standard. They are listed as applicable Functional Entities that the standard is applicable yet they are not listed as the subject of any requirement. |
| **Response:** The Standard Drafting Team has removed the Reliability Coordinator and Planning Coordinator from the applicability section of the standard. They are recipients of some of the products, but they are not assigned accountability for any requirements. | | | |
| MRO | | ☑ | The MRO believes that the Planning Coordinator and the Reliability Coordinator should have some role in this standard. They are listed as applicable Functional Entities that the standard is applicable yet they are not listed as the subject of any requirement. |
| **Response:** The Standard Drafting Team has removed the Reliability Coordinator and Planning Coordinator from the applicability section of the standard. They are recipients of some of the products, but they are not assigned accountability for any requirements. | | | |
| ITC | ☑ | ☑ | For once, the Reliability Coordinator may be an appropriate entity in these standards. TRM is addressing uncertainty. A real-time operator will be more aware of actual system uncertainties than most people, including planners. "Loopflow" has proven to an elusive animal to keep track of. TRM for loopflow is an important parameter. The RC should have input here. |
| **Response:** The SDT agrees that a real-time operator will have first hand knowledge of actual system uncertainties, which is why the Transmission Operator was included in the applicability of the standard. The SDT reviewed the standard and the functional model and did not assign any requirements to the Reliability Coordinator. | | | |
| FirstEnergy | ☑ | | |
| MEAG | ☑ | | |
| Manitoba Hydro | ☑ | | |
| PSC SC | ☑ | | |
| WECC MIC MIS ATC TF | ☑ | | No comment. |
| SOCO | ☑ | | |

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If "No," please explain why in the comment area.

**Summary Consideration:** Several stakeholders suggested modifying or deleting some of the requirements in the first draft of the standard. Based on stakeholder comments, the SDT has deleted R2, and the language in R1 was modified to address R2's deletion as shown below (text highlighted in yellow was in both R1 and R2 in the last draft of the standard – text highlighted in red was added based on stakeholder comments or to better meet the FERC directives):

**R1.1.** Identification ~~any~~ of (on each of its respective Posted Paths or Flowgates) each of the following components of uncertaint~~ies~~y if used to calculate ~~its~~ a TRM value:

- Aggregate Load forecast ~~error~~ uncertainty (not included in determining generation reliability requirements).
- Load distribution ~~error~~ uncertainty.
- Forecast uncertainty in transmission system topology (including maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions
- Variations in generation dispatch (including maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window).
- Reserve sharing requirements.
- Inertial response and frequency bias.

Based on stakeholder comments, the SDT has rewritten R3 and eliminated R4 from the standard as shown below (now combined into R2 in the revised standard):

R~~3~~2. The ~~Transmission Planner and~~ Transmission Operator shall only use the components of uncertainty from R1.1 to calculate TRM , and not include any of the components of CBM.

~~R4. The Load-Serving Entity shall not use the components of uncertainty from R1.1 to determine its CBM megawatt import requirement.~~

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The standard is requiring Applicable Functions to duplicate their duties in this Standard that are required in other Standards. This Standard as written created duplication of same actions in two different and will cause confusion within the Compliance Program. R 1.1 and R 2 seem to say the |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | same thing. This Standard should not set or limit the ways a Planner will determine uncertainty in their in their calculations. It should require that all factors used to determine its uncertainty is provided, but do not set or limit the possibilities. This Standard's scope for TRM does not include the authority to determine study methods. |
| **Response:** It is not the standard drafting team's intention to repeat requirements in other standards. We have examined the other reliability standards to check for duplicate requirements, and found none. The Standard Drafting Team agrees there is some redundancy in Requirement R1 and Requirement R2, and revised the standard by merging R1 and R2 into a single requirement, eliminating the redundancy.<br><br>In order to obtain consistency between the different TRM calculation methodologies we have limited the types of uncertainty that can be used in a TRM calculation. The revised standard does not limit the study methods used in calculating the different types of uncertainty. | | | |
| BPA | | ☑ | R1.3. should read "The description of the method of allocation across Posted Paths or Flowgates" where Posted Path is defined consistent with NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.<br>R2. -- The parenthetical statement should read "…on each of its respective Posted Paths or Flowgates..."<br>R5. and R6. -- The term "path" should be replaced with "Posted Path".<br>R10. -- The term "posted path" should be capitalized. |
| **Response:** The standard drafting team has implemented the suggested changes and they are reflected in the revised standard. | | | |
| Duke Energy | | ☑ | There is no requirement for coordination between the Transmission Operator and the Transmission Planner. Also, there should be a requirement that the TRM values should be equal to or lower than long-term TRM as you move closer to real-time and uncertainty diminishes. |
| **Response:** The standard drafting team revised the standard to require Transmission Operator calculate TRM and for the Transmission Operator to provide the TRM values to the Transmission Planner. The standard drafting team feels that these modifications address Duke Energy's concerns. | | | |
| ERCOT | | ☑ | It is not clear if the intent of R2 is to document component of uncertainty on TRM on each posted path, or a general process to include impact of uncertainties in TRM methodologies is sufficient. The requirement should clarify such that the impact of uncertainties are included in TRM methodologies and not to document each component.<br>R4 is written as a requirement for CBM methodology rather than for TRM methodology, it should be deleted or reworded. |
| **Response:** The SDT has deleted R2, and the language in R1 was modified to address R2's deletion. We have included this requirement such that the different assumptions used in determining TRM across your system can be understood. The intent is for the information to be posted for each posted path or flowgate, as stated in the requirement. | | | |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Upon examining R4, we have rewritten R3 and eliminated R4 from the standard. (See R2 in the revised standard.) | | | |
| HQT | | ☑ | Variations in facility loading should be back in the R1.1 list |
| **Response:** We have updated the language to replace "error" with "uncertainty," which we believe should address your concern. We also believe "Variation in Generation Dispatch" will address this. The drafting team believes that R1.1 contains the components that will cause variations in facility loadings, so adding this would be redundant. | | | |
| IESO<br>IRC SRC | | ☑ | There are a number of duplicated requirements (e.g. R1 and R2 as noted above_) and there is no clarity on the accountability (e.g. R9). The standard needs to be reviewed and revised to more clearly convey the roles and responsibilities in accordance with the functional model and today's practice (on a functional entity basis). |
| **Response:** There were some redundancies in Requirement R1 and Requirement R2, which have been addressed with new language. R2 was eliminated as a separate requirement, and was merged into R1.<br>R9 was modified (now R3) to limit applicability to the Transmission Operator and added some words to improve the clarity | | | |
| ITC | ☑ | ☑ | This is a difficult question to answer but easily "measured". TRM is dealing with uncertainty so you're guessing at whatever you do. However, the ultimate real-time system response is your "test result" to see if you picked an appropriate TRM. If no one is denied service and there are no TLRs or congestion, you're right. If there are no or few TSR denials, and congestion or TLRs are persistent, the TRM is probably too low. If TSR is being denied and there is no evidence of congestion or TLR (level 3 for non-firm), TRM might be too high. |
| **Response:** This could be an approach to validate the calculated TRM but it is something that may not belong in the TRM requirements (but perhaps in measures and compliance). | | | |
| MEC Trading | | ☑ | Again, this still seems like a fill-in-the-blank standard. |
| **Response:** Because different entities experience different amount of uncertainty, flexibility is required in this standard in order to account it in each area. For example, some entities experience much larger loop flows through their system than other entities. | | | |
| WECC MIC MIS ATC TF | | ☑ | First, the "Applicability" section uses the term "Planning Coordinator" which is not a defined term in the NERC Glossary. If the NERC Team intends it use, it should become a defined term.<br><br>Second, where the term Planning Coordinator is used, WECC queries whether or not the more accurate entity would be the Transmission Planner. |
| **Response:** Planning Coordinator is current terminology used in the NERC Functional Model and the drafting team is taking steps to add this to the NERC Glossary. However, the standard drafting team did revise the applicability section of the standard to address other industry comments suggesting that the standard should not be applicable to the Planning Coordinator, and the standard was revised so that there are no requirements applicable to the Planning Coordinator. | | | |
| MRO<br>MEC | ☑ | ☑ | 1. R1.2 should be revised to indicated that "A statement to confirm that it shall be used CONSISTENT assumptions in calculating TRM.." Same assumptions implies an exactness which is not appropriate and is not required by FERC Order 890. |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | 2. Makes revisions to R1.1 and R2 per MRO comments provided in response to Question 8 below. |
| **Response:** The standard drafting team modified the standard in support of your suggestion, and the revised standard R1.2 uses the phrase, 'consistent assumptions'.<br><br>Please see the response to your comments on Question 8. | | | |
| Manitoba Hydro | ☑ | | |
| FirstEnergy | ☑ | | |
| MEAG | ☑ | | |
| PSC SC | ☑ | | |
| SERC ATCWG | ☑ | | |
| SOCO | ☑ | | |

5. Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a "maximum uncertainty" to support the validity of a TRM value? If "Yes," please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

**Summary Consideration:** The majority of commenters did not believe that a study should be required. The drafting team feels that a maximum TRM would be the calculated amount of TRM in order to account for the types of uncertainty listed in the standard.

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSC SC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| APPA | | ☑ | This Standard should only require the TRM value be provided and the associated assumptions for determine the amount of error in the planning or operating studies. |
| **Response:** The standard drafting team feels that in order to obtain some consistency in TRM calculations we should define the types of uncertainty that can be used to determine TRM. | | | |
| BPA | | ☑ | Please clarify that the uncertainties listed in R1.1 may be used in TRM calculations (as opposed to being required to be used). |
| **Response:** The standard currently states that the information must be provided only "if used." | | | |
| IESO<br>IRC SRC | | ☑ | We do not believe any maximum values should be set as a standard. Individual TSP (or TP and TOP according to the proposed standard) should each determine the amount needed to cover transmission uncertainties, which may vary among systems. The validity of the calculated values can be assessed against the documented methodology and audit process. |
| **Response:** The drafting team feels that a maximum TRM would be the calculated amount of TRM in order to account for the types of uncertainty listed in the standard. | | | |
| MEAG | | ☑ | Once the determination of TRM methodology has been identified, the TSP or TP or TC should use it to determine the required TRM values. It should not be required to perform many other studies to determine a TRM with the "maximum uncerttainty". |
| **Response:** We agree. The standard drafting team feels that a maximum TRM would be the calculated amount of TRM in order to account for the chosen types of uncertainty from the list in the standard per the entity's TRM methodology. | | | |
| MEC<br>MRO | | ☑ | These studies should be coordinated as a NERC-wide activity outside of these standards. |
| **Response:** The standard drafting team appreciates the concern, and will request the Planning Committee develop a white-paper to provide the industry guidance on how to calculate TRM and uncertainty. | | | |
| Manitoba Hydro | | ☑ | I don't know what the value of a maximum uncertainty would be. Each uncertainty has a probabalitic component to it. It would be simple enough to add up all the uncertainites but if the probalistic analysis determined that the maximum uncertainty event was once every 10 years or once every 15 years, I do not know what value that would have. If the standard listed some assumptions, e.g. events that you expect to see within a 1 year or 3 year time frame, then this analysis could become more meaningful. |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** The standard drafting team feels that a maximum TRM would be the calculated amount of TRM in order to account for the chosen types of uncertainty from the list in the standard per the entity's TRM methodology. | | | |
| SOCO | | ☑ | |
| Duke Energy | | ☑ | |
| FirstEnergy | | ☑ | |
| MEC Trading | | ☑ | |
| NPSI | | ☑ | |
| SERC ATCWG | | ☑ | Once the determination of TRM methodology has been identified, the TSP or TP or TC should use it to determine the required TRM values. It should not be required to perform many other studies to determine a TRM with the "maximum uncertainty". |
| **Response:** We agree. The standard drafting team feels that a maximum TRM would be the calculated amount of TRM in order to account for the chosen types of uncertainty from the list in the standard per the entity's TRM methodology. | | | |
| ITC | ☑ | ☑ | You only need to investigate TRM if there is evidence of overselling or underselling. The compliance monitor should be so instructed. TRM is dealing with uncertainty. How do you study uncertainty? You don't, you just observe it in real-time. |
| **Response:** Underselling and overselling is not covered by this standard; NERC is focused on ensuring that the TRM is calculated as the Transmission Operator has described in the methodology. Concerns regarding the actual values will need to be pursued through other venues. The standard drafting team believes some of this may be addressed in measures and compliance. We feel that it is possible for entities to calculate the amount of exposure to uncertainty they will experience and use those calculations to determine the amount of TRM they require to maintain reliability. | | | |
| ERCOT | ☑ | | Study should include using historic data to determine impact of actual versus forecasted information on loading of transmission system components that are limiting the TTCs or TFCs. |
| **Response:** The majority of commenters did not believe that a study should be required. Using historic data to determine the impact of actual versus forecasted information on loading of transmission system could be a valid method for determining the amount of uncertainty due to aggregate load forecast error. | | | |

6. Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If "Yes," please provide what you believe is an appropriate percentage in your response in the comments area.

**Summary Consideration:** Stakeholders who responded to this question indicated that the standard should not preclude nor require that a percentage of Facility Ratings be reserved as TRM. The standard drafting team believes that as long as the TRM is calculated based on the different types of uncertainty listed in R1.1 then it does not matter how that TRM is applied i.e. across interfaces or as a percentage of Facility Ratings. The proposed standard allows each entity to determine the appropriate TRM values for its own system.

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSC SC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| Manitoba Hydro | | | I think that a percentage could be appropriate, but the best TRM value will always be one that is based on analysis of the potential uncertainties on a flowgate. I would hope that the committee will consider using a percentage as a default methodology, but allow for an analysis of uncertainties to modify the final value. A percentage would have to be based on flowgate capability. 5% may be a good default on a 100MW flowgate but overkil on a 1600MW flowgate. |
| **Response:** As long as the TRM is calculated based on the different types of uncertainty listed in R1.1 then it does not matter how that TRM is applied i.e. across interfaces or as a percentage of facility ratings. The proposed standard allows each entity to determine the appropriate TRM values for its own system. | | | |
| ERCOT | | ☑ | There is no technical justification of using 2 - 5% of Facility Rating as TRM. Since Facility Ratings are determined using conditions that are already worst case conditions, using additional safety factor results in underutilizing the transmission system. If uncertainties such as using first contingency conditions and using worst case scenarios for components that are used for ATC/AFC calculations already include uncertainties there should not be double counting of these uncertainties. If data can be supported by historic information, then only data should be used for setting aside TRM. |
| **Response:** The standard drafting team disagrees. We feel that TRM as a percentage of facility ratings is just as quantifiable as TRM across interfaces. Therefore even if an entity uses percentages of Facility Ratings as TRM they must still explain and provide the assumptions they used to arrive at the percentage value. | | | |
| HQT | | ☑ | TRM depends on system and path topology. |
| **Response:** The standard drafting team disagrees. We feel TRM depends on the different types of uncertainty that the system is exposed to. Therefore any of the different types of uncertainty listed in R1.1 can be used to determine TRM not just system and path topology. | | | |
| IESO<br>IRC SRC | | ☑ | We do not believe this approach duly addresses the various components of TRM which may change depending on the system conditions. However, we hold no position on individual entities who choose to apply this approach to determine the TRM. |
| **Response:** The standard drafting team feels that the different types of uncertainty outlined in the standard adequately | | | |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| addresses the various components of uncertainty that a system would be exposed to. Therefore in order to maintain consistency between transmission systems, the types of uncertainty defined in R1.1 are the only components that can be used to determine a system's TRM. | | | |
| MEC<br>MRO | | ☑ | No - some of the area Transmission Service Providers use a percentage and also provide for incremental power flows for reserve sharing. |
| **Response:** The TRM standard will continue to allow entities to use a percentage of facility ratings as TRM as long as they arrived at that percentage by using the different types of uncertainty listed in R1.1 which includes reserve sharing agreement. | | | |
| FirstEnergy | | ☑ | |
| MEAG | | ☑ | |
| NPSI | | ☑ | |
| SERC ATCWG | | ☑ | |
| SOCO | | ☑ | |
| APPA | ☑ | | If a percentage is used then it should be asked of the industry how large of a percentage is permitted before having to explain or provide the assumptions to arrive at the percent value. |
| **Response:** In general, we agree. However, we feel that TRM as a percentage of facility ratings is just as quantifiable as TRM across interfaces. Therefore even if an entity uses percentages of Facility Ratings as TRM they must still explain and provide the assumptions they used to arrive at the percentage value. | | | |
| BPA | ☑ | | While this methodology may be sufficient for several Transmission Service Providers (TSPs), it may not be for others. Therefore, use of this type of percentage should not be the only mechanism available for TSPs to determine TRM on their systems. |
| **Response:** The standard drafting team agrees. We feel that using a percentage of facility ratings is a valid way to account for uncertainty but by no means is the only way to account for uncertainty. | | | |
| ITC | ☑ | | 5% is appropriate. However, as we have stated before, it could change with observed system response. If you are using 5% and denying service with no TLRs or congestion, you may want to lower it. Compliance monitoring of this standard should (must) include this type of evaluation. Just picking a number only works if the real-time system response justifies it. |
| **Response:** The standard drafting team feels that TRM as a percentage of facility ratings is quantifiable by using the different types of uncertainty listed in R1.1. Therefore by calculating the uncertainty exposure each entity will arrive on the appropriate TRM value for its own system. The standard drafting team feels that monitoring TLRs or congestion on the system may be valid a way to validate TRM values but it is not necessarily the only way. | | | |
| WECC MIC MIS ATC TF | ☑ | | Two to five percent is acceptable. However, it should not be mandated as the single methodology allowed. Further, the TRM has multiple components, one of which is the Reserve Sharing Group component. The 2-5% is not appropriately applied to the Reserve Sharing Group subset of TRM; |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | rather, the 2-5% accurately applies only to the "uncertainty" portion of the TRM.<br><br>While this methodology may be sufficient for several TSPs, it may not be sufficient for others. Therefore, use of this type of percentage should not be the only mechanism available for TSPs to determine TRM on their systems. |
| **Response:** The standard drafting team had decided that as long as the TRM is calculated based on the different types of uncertainty listed in R1.1 then it does not matter how that TRM is applied i.e. across interfaces or as a percentage of facility ratings. We have also decided to let each entity to determine the appropriate TRM values for their own system. | | | |
| Duke Energy | ☑ | | |

7. Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

**Summary Consideration:** The drafting team has modified this requirement to more closely align with what is explicitly described in the pro-forma tariff section (attachment C paragraph D) of 890. R1.5 was modified as shown below:

**R1.5** If a ~~Transmission Planner or~~ Transmission Operator elects to utilize a TRM of ~~reserves~~ zero ~~(0) TRM in any~~ for all the time periods listed in R1.4 above, ~~time horizon,~~ that ~~Transmission Planner or~~ Transmission Operator shall ~~document~~ include a statement of that practice in its TRM ID ~~methodology the reason(s) why it did not reserve any TRM~~.

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSC SC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| BPA | | | BPA may not calculate TRM on some of its constraints due to uncertainty components being included in those constraints' TFC determinations. Therefore, a TRM of "0 MW" would be posted and documented, per R1.5. of MOD-008-1. Would this practice meet the intent of this standard? |
| **Response:** We believe the answer to be yes, but compliance would have the final say. However if you have any suggestions how to make the requirement more clear, please provide them to the group. | | | |
| APPA | | ☑ | A zero TRM will provide more ATC for the use by the Transmission Customers. To make the TP or TOP post the reason they have determined that zero is the number is busy work and against good reliable practices. |
| **Response:** See summary consideration. | | | |
| ERCOT | | ☑ | R1.5 tends to imply that all Transmission Planner and Transmission Operators must use TRM, unless they can justify not using it. On the contrary, those TPs and TOs who use TRM should justify its use as use of TRM results in lower ATCs due to uncertainties that may already be included in determining the components that are used for ATC calculations. |
| **Response:** See summary consideration. | | | |
| HQT | | ☑ | TP or TO should only explain why it reserves non-zero TRM since it reduces the available capacity for the market. |
| **Response:** See summary consideration. | | | |
| NPSI | | ☑ | Explaination may divulge commercially sensitive or critical infrastructure information. |
| **Response:** See summary consideration. | | | |
| SOCO | | ☑ | It is unclear what benefit would be gained by requiring the Transmission Planner or Transmission Operator to supply this explanation. |
| **Response:** See summary consideration. | | | |
| SRP | | ☑ | This is unnecessary "busy work." FERC is concerned about TSP's hoarding transmission capacity by unjustifiably setting aside large quantities of TRM. If I set aside zero TRM this should make FERC |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | very happy because it frees up more ATC for purchase. By making me justify why I am setting aside zero TRM I am being encouraging to set aside non-zero TRM to avoid having to justify it. At the very least R1.5 should be rewritten to clarify precisely what circumstance require justification for zero TRM. For example, if I set aside zero TRM for only one hour on only one path do I have to explain why? Conversely, if I have zero TRM for all time periods and for all paths but one have I avoided the need to justy why I have zero TRM for the other paths? |
| **Response:** See summary consideration. | | | |
| IESO<br>IRC SRC | ☑ | ☑ | If a 0 MW TRM is reserved, it suggests that the TP and TOP are comfortable with the available control actions other than utilizing the transmission service reserved for TRM to address transmission uncertainties. On the other hand, the value of TRM reserved, including 0 MW, are subject to verification if need be. The question then becomes why 0 MW needs to be explained but not any other values? For example, other transmission users may question a high value of TRM reserved which reduces the ATC for use by others. |
| **Response:** See summary consideration. | | | |
| FirstEnergy | ☑ | | This explanation increases tranparency in the calculation process which is desired by FERC. |
| **Response:** See summary consideration. | | | |
| Duke Energy | ☑ | | The explanation should describe how reliability is maintained in light of the uncertainties identified in R1.1 |
| **Response:** See summary consideration. | | | |
| ITC | ☑ | | The justification is simple, no TLRs are observed and no market congestion is observed. If either symtom is present, TRM of zero is not justifiable. I.e, R1.5 is very easy to comply with. |
| **Response:** See summary consideration. | | | |
| MEC | ☑ | | Generally zero TRM is potentially providing inadequate protection for reliability. |
| **Response:** The standard drafting team feels that not all systems require the use of TRM, due to the fact that elements of uncertainty can be accounted for elsewhere in the calculation of ATC/TTC or AFC/TFC. | | | |
| MEC Trading | ☑ | | The reason for TRM is uncertainty. It is hard to believe that all of the ATC calculations are without uncertainty, so if uncertainty is buried in another part of the ATC calculation, it would be helpful to know where. |
| **Response:** See summary consideration. | | | |
| Manitoba Hydro | ☑ | | The analysis need not be extensive and based on past performance, however a 0 TRM allows the tranmission custmers access to a flowgate with no margin of error, and some thought should be put into that situation. |
| **Response:** The standard drafting team feels that not all systems require the use of TRM, due to the fact that elements of uncertainty can be accounted for elsewhere in the calculation of ATC/TTC or AFC/TFC. | | | |
| MRO | ☑ | | The MRO generally considers zero TRM as potentially providing inadequate protection for reliability. |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** The standard drafting team feels that not all systems require the use of TRM, due to the fact that elements of uncertainty can be accounted for elsewhere in the calculation of ATC/TTC or AFC/TFC. | | | |
| SERC ATCWG | ☑ | | |

8. Are there other legitimate needs for TRM that should be in the list described in R1? If "Yes," please explain your answer in the comments area.

**Summary Consideration:** None of the stakeholders who responded to this question identified other legitimate neds for TRM that should be described in R1. However, some stakeholders did recommend modifications to the list of uncertainties that must be documented. The standard drafting team has modified R1 to address stakeholder comments suggesting that the list of uncertainties should be expanded to include maintenance outages and the location of future generation. The other items proposed are either already addressed as written, or are addressed in other standards.

| **Question #8** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| NPSI | | | In the case of a system that is radially connected to other systems via a single interconnection will become islanded for a single contingency (loss of the interconnection). If the system was importing more than 10% (nominal) of its load at the time of the interconnection, the system will likely trigger Stage 1 under frequency load shedding. Therefore there must be a TRM facto that varies with system load to limit the amount of UFLS. In Nova Scotia, we set the import limit at 22% of total net load on our system to avoid Stage 2 UFLS for a single contingency. We use TRM as that variable (with additional margin for load forecast uncertainty. It is not clear if this need is addressed in this standard. Another need would be to share load following with our neighbour (AGC margin). For example, if NS and NB are jointly controlling the NB-New England tie, the NS-NB tie capacity must be held back from its TTC to allow room to respond to load and generation fluctuations (especially wind generation). The latter may be the intent of the R2 "Variations in generation dispatch". |
| **Response:** We believe that this should be handled more appropriately as an SOL that impacts the calculation of TTC, rather than including it in TRM. If there are concerns with equity and commercial needs, they would need to be addressed via NAESB business practices or coordination/allocation agreements. | | | |
| IESO<br>IRC SRC | | ☑ | None, but there appears to be two requirements that pertain to access to external generation that may be duplicated or in excess of the CBM value: they are aggregate load forecast error and reserve sharing requirements. We suggest the SDT to review the two lists to eliminate any duplication or excessive allocation. |
| **Response:** These are not duplicate values. Requirements 3.1.2, 3.2.1, and 3.3.1 of MOD 4 are intended to address the CBM/reserve sharing issue. Regarding Load Forecast error, there are different kinds of load forecast error – one is the operating (day to day) error, which should be used in TRM; the other is long-term error, which is used in generation planning and CBM. | | | |
| WECC MIC MIS ATC TF | | ☑ | However, the NERC Team should clarify that the uncertainties listed in R1.1 "may" be used in TRM calculations (as opposed to being required to be used). |
| **Response:** These are the only types of uncertainties that can be used in a TRM calculation. The language as written requires "Identification of (on each of its respective Posted Paths or Flowgates) each of the following components of uncertainty *if used* in calculating TRM," which we believe allows for the option to not use. | | | |
| Duke Energy | | ☑ | |

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ERCOT | | ☑ | |
| FirstEnergy | | ☑ | |
| MEC Trading | | ☑ | |
| MEAG | | ☑ | |
| PSC SC | | ☑ | |
| SOCO | | ☑ | |
| ITC | ☑ | ☑ | We're dealing with uncertainty here. What is legitimate uncertainty? There are enough requirements to find something to use. |
| **Response:** Legitimate uncertainty is the uncertainty we list in R1.1. We agree that there are enough types of uncertainty to choose from in order to satisfy everyone's needs to account for their exposure to uncertainty. | | | |
| APPA | ☑ | | The SDT has not made it clear when energy can be scheduled on TRM capacity. |
| **Response:**<br>In general, TRM is not scheduled upon except in the case of reserves sharing (in which case it is tagged after the fact) or unless the TRM has been posted back as non-firm. | | | |
| HQT | ☑ | | 1. Variation of load (for daily, weekly, monthly and yearly ATCs)<br>2. Uncertainty about weather conditions (for daily, weekly, monthly and yearly ATCs)<br>3. Variation in facility loading (sufficient TRM should be maintained for deviations from load forecast due to balancing of generation within a control area )<br>4. Calculation Inaccuracies (Sufficient TRM should be assumed to account for the limitation of the TTC calculation method.) |
| **Response:** These uncertainties are accounted for in the present list of uncertainties. | | | |
| MEC | ☑ | | Maintenance Outages, Uncertainty in Location of future generation, and uncertainty in power transactions. Also, the Standards Drafting Team should clarify that the Reserve sharing requirements are "Incremental power flows for reserve sharing requirements or automatic sharing of reserves." |
| **Response:** The standard drafting team has made modifications to R1.1 to modify 'Variations in generation dispatch' to now state, 'Variations in generation dispatch (including maintenance outages and location of future generation' in support of your suggestion.<br>The other items we believe are already addressed as written. | | | |
| Manitoba Hydro | ☑ | | I believe that the need to hold back TRM for Inertial response is broad enough. Just as system load can degrade inertial response, system loading can degrade voltage response. I would recommend that initertial response be changed to include transient, dynamic, and voltage response. |
| **Response:** The uncertainty element of transient, dynamic, and voltage response variables should be covered under FAC- | | | |

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| 010. | | | |
| MRO | ☑ | | Maintenance Outages, Uncertainty in Location of future generation, and uncertainty in power transactions.  Also, the MRO requests that the Standards Drafting Team clarify that the Reserve sharing requirements are "Incremental power flows for reserve sharing requirements or automatic sharing of reserves." |
| **Response:** The standard drafting team has made modifications to address the concerns related to outages and future generation.  The other items we believe are already addressed as written. | | | |
| SERC ATCWG | ☑ | | |

9. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

**Summary Consideration:** The majority of commenters did not have concerns. The SDT notes that some entities may elect to pursue regional differences.

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| IESO | | ☑ | None, but it should be noted that some entities do not provide physical transmission services and therefore some of the requirements in this standard may not be applicable to them. |
| **Response:** The SDT understands your concerns, and notes that entities may elect to pursue regional differences. | | | |
| IRC SRC | | ☑ | None, but it should be noted that some entities do not provide physical transmission services and therefore some of the requirements in this standard may not be applicable to them. |
| **Response:** The SDT understands your concerns, and notes that entities may elect to pursue regional differences. | | | |
| NPSI | ☑ | ☑ | Tariffs and Market Rules may have to be updated to reflect the new requirements of MOD-008. |
| **Response:** We understand that some entities may need to make such changes. | | | |
| MEC Trading | ☑ | | This appears to be a fill-in-the-blank standard. |
| **Response:** Because different entities experience different amount of uncertainty, flexibility is required in this standard in order to account it in each area. For example, some entities experience much larger loop flows through their system than other entities. | | | |
| Duke Energy | | ☑ | |
| ERCOT | | ☑ | |
| FirstEnergy | | ☑ | |
| ITC | | ☑ | |
| MEC | | ☑ | |
| Manitoba Hydro | | ☑ | |
| MRO | | ☑ | |
| PSC SC | | ☑ | |
| WECC MIC MIS ATC TF | | ☑ | |
| SOCO | | ☑ | |

10. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

**Summary Consideration:** Based on stakeholder comments, the drafting team made the following modifications to the standard:

- Removed the requirements to make documents publicly available (R7 and R10). The drafting team has been working closely with NAESB and NAESB confirmed it will address all posting requirements in its business practices
- Removed R4 which required the Load-serving Entity to refrain from using the components of uncertainty identified in the determination of TRM to determine the Load-serving Entity's CBM MW import requirement. If a requirement is needed for this, that requirement should be in the standard covering CBM (MOD-004)
- Modified R8 (R4 in the revised standard) to be more explicit in who it applies to and the method of requesting the information
- Revised the Purpose statement by replacing the phrase "to help ensure more accurate calculation of transfer capabilities" with "for reliable system operations"
- Corrected the typographical error in R1.1 to add the missing word, 'of' after the word, 'Identification'
- Added the words, 'of a documented request' to R8 (R4 in the revised standard)
- Adopted the proposed definition of 'Posted Path' which is already used by FERC
- Added the word, 'Posted' in R5 to change 'Path' to 'Posted Path'
- Absorbed R2 into R1 and eliminated the reference to 'Contract Path'
- Deleted R11

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| IESO | Requirement 1.1 should not only include generation dispatch variations but also peak and off peak dispatch variations. Additionally, Requirement 1.1 – the first line "Identification any of the following…" should be written to read as "Identification of any of the following…"<br>We have provided similar comments on the supplementary SAR, MOD-001 and MOD-004. The SAR for revising and creating this set of standards has not gone through prior public review and comment on the need and direction for these standards. It is posted simultaneously with the revised standard, making posting of the SAR irrelevant. Yet the revised standards appear to be uncoordinated, duplicated and convoluted in some.<br>We understand these standards need to be revised to meet the FERC's timeline but they should be done in a proper and orderly manner to ensure manageability not just by the staff and the SDT but also by the stakeholders in the industry. We do not agree with the process, and we do have trouble reviewing the set of standards that in our view are not well structured (for example: combining all 4 standards MOD-004 to MOD-007 into one). There has been no industry input process that either supports or disagrees with this proposed combining before the standards are drafted and posted.<br>And some of the standards assign responsibilities to entities that should not be responsible for some of the tasks. For example, the RC and PC are not responsible for calculating ATC. The proposed intent to combine some of the MODs as one includes the RC and PC in these standards because of the TTC calculation requirements. But in doing so, the assignment of tasks and responsibilities becomes confusing resulting in these entities being assigned some tasks inappropriately.<br>We suggest the SDT to revise the supplementary SAR and post it for comments, with sufficient detail and specificity on the proposed scope and structure of the standard set, before drafting/revising the standards. |

**Response:**

We believe that "peak and off peak dispatch variations" are covered already in generation and load variations.

We changed R1.1 to "identification of … each of the following".

We recognize the concern expressed by the IESO related to the SAR. However, we are attempting to both address the needs of the industry and the need to comply with the FERC Order, and felt this was the best way to meet both the requirements of the NERC process and be responsive to the Commission. Note that a SAR sets the scope of the technical content of the work, but leaves the structure of the actual standards to the Drafting Team's discretion. The Reliability Standards Development Procedure does allow the simultaneous posting of a SAR and its associated standard or standards.

The drafting team refined the applicability of each standard, based on stakeholder comments and a thorough review of the latest approved version of the Functional Model, and there were several places where the applicability was revised to eliminate the Planning Coordinator and Reliability Coordinator. The drafting team has revised the standards to state more explicitly which functional entity is responsible for each requirement.
Most stakeholders who commented on the SAR indicated support for the SAR as written so the drafting team did not make

| Question #10 | |

| ITC | As we have stated before, all compliance and measures should be based on evidence of overselling or underselling. Otherwise its just bureaucratic red-tape. |
| **Response:** The purpose the NERC standards is to maintain reliability. | |
| MEC | 1. The purpose of each of the standards should be revised to be more in-line. The purpose in this standard be revised by replacing "to help ensure more accurage calculation of transfer capabilities" with "for reliability system |

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| | operations."<br>2. The Standards Drafting Team has defined a scheduling horizon in addition to an operating horizon and a planning horizon. Why did the Standards Drafting Team establish it and why have they defined it as provided in the standard. |
| **Response:** The standard drafting team agrees and has revised the purpose of the standard to include the phrase, 'for reliable system operations' in support of your suggestion.<br><br>The standard drafting team has eliminated the term "horizons," but elected to include time periods specified by the FERC that apply to the standards. | |
| MRO | 1. The purpose of each of the standards should be revised to be more in-line. The MRO recommends that the purpose in this standard be revised by replacing "to help ensure more accurage calculation of transfer capabilities" with "for reliability system operations." 2. The MRO notes that the Standards Drafting Team has defined a scheduling horizon in addition to an operating horizon and a planning horizon. The MRO is not familiar with the use of a scheduling horizon and questions why the Standards Drafting Team established it and why they have defined it as provided in the standard. |
| **Response:** The standard drafting team agrees and has revised the purpose of the standard to include the phrase, 'for reliable system operations' in support of your suggestion.<br>The standard drafting team has eliminated the term "horizons," but elected to include time periods specified by the FERC that apply to the standards. | |
| WECC MIC MIS ATC TF | A. Reiterating comments from MOD-04 CBM, the Team suggests the following CBM definition replace the existing CBM and TRM NERC definitions:<br>"Capacity Benefit Margin"<br>CBM is the amount of firm import transmission capability, requested by the LSE, to exclusively serve identified load only during periods of emergency generation deficiencies extending beyond the beginning of the scheduling hour in which the emergency generation deficiency occurs."<br>B. Typo on the first line of R1.1. Should state: "Identification of any of the following…"<br>C. R8. Add: "Each Transmission Service Provider shall make available (within seven CALENDAR days OF A REQUEST)… (Emphasis added.)<br>D. As previously stated, there is an existing FERC approved definition for Posted Path that should be included in the NERC Glossary and utilized in the ATC standards.<br>R10. The term Posted Path should be used as a defined term.<br>The definition for Posted Path should be as follows:<br>Posted Path<br>Posted Path means: 1) any Balancing Authority to Balancing Authority interconnection; 2) any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months; 3) and any path for which a customer requests to have ATC or TTC posted. For purposes of this definition, an hour includes any part of an hour |

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| | during which service was denied, curtailed or interrupted. (Plagiarized from NAESBE R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.<br>E. R5. Should read "…(on each POSTED PATH or Flowgate)…<br>F. R2. At minimum, the word "Contract Path" should be deleted as the intent is to cover all Posted Paths. This Team continues to suggest the adoption of the CFR defined term "Posted Path" that is the more accurate usage for this R.<br>G. R11. Should be reworded as neither the Transmission Planner nor the Transmission Operator "reserve capacity" on their system(s). That's not within their Functional Model purview. The Transmission Planner and the Transmission Operator can identify capacity that "should be reserved" on their system(s); however, the Transmission Service Provider is the accurate entity to actually "reserve" the capacity. |

**Response:**

A. The drafting team did not adopt the proposed definition of CBM as there is already an approved definition of CBM.
B. The typographical error in R1.1 was corrected.

C. The drafting team added the words, 'of a documented request' to R8 (R4 in the revised standard)

D. The drafting team adopted the proposed definition of Posted Path.

E. R5 – the word, 'Posted' was inserted in front of 'Path' as suggested

F. R2 was absorbed into R1 and the reference to 'Contract Path was eliminated as suggested.

G. R11 was deleted as suggested.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a standard drafting team on March 17, 2006.

**Description of Current Draft:**

This is the first draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to comments. | TBD |
| 2. Post revised standard for stakeholder comment. | TBD |
| 3. Respond to comments. | TBD |
| 4. Post for 30-day pre-ballot review. | TBD |
| 5. First ballot of standard. | TBD |
| 6. Respond to comments. | TBD |
| 7. Recirculation ballot. | TBD |
| 8. 30-day posting before board adoption. | TBD |
| 9. Board adoption. | TBD |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Available Flowgate Capability (AFC):** A measure of the capability remaining in the Flowgate for further commercial activity over and above already committed uses. It is equal to the Total Flowgate Capability less the impacts of existing Transmission commitments (including retail customer service), less the impacts of Capacity Benefit Margin and less the impacts of Transmission Reliability Margin.

**Flowgate:** A single transmission element, or a group of transmission elements, or a single transmission element with one or more contingencies, or a group of transmission elements with one or more contingencies, intended to model MW flow impact relating to transmission limitations and transmission service usage.

**Total Flowgate Capability (TFC):** The amount of electric power that can flow across the Flowgate under specified system conditions without exceeding the capability of the Facilities. Typically expressed in the form of thermal capability. Flowgates can be proxies for Stability and other limiting criteria.

**Transmission Reservation:** A reservation is a confirmed Transmission Service Request.

**Transmission Service Request:** A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

## A. Introduction

1. **Title:** **Capacity Benefit Margin**

2. **Number:** MOD-004-1

3. **Purpose:** To promote the consistent and transparent calculation, verification, preservation, and use of Capacity Benefit Margin (CBM) to ensure accurate calculation of reliable transfer capabilities.

4. **Applicability:**

   **4.1. Functional Entity:**

   **4.1.1** Load-Serving Entity that is entitled and would like to have transmission capability set aside in the form of CBM to maintain resource adequacy requirements.

   **4.1.2** Transmission Service Provider.

   **4.1.3** Balancing Authority.

   **4.1.4** Transmission Planner.

5. **Facility Limitations/Specifications:**

   **5.1.** None.

6. **Proposed Effective Date:** To be determined.

## B. Requirements

**R1.** The Transmission Service Provider shall make publicly available:

**R1.1.** Its procedure for a Load-Serving Entity to request its CBM import MW requirement on each Point of Receipt — Point of Delivery (POR-POD) combination (path) for meeting its resource adequacy requirement (i.e., its procedure for setting aside of Transfer Capability in the form of CBM to maintain a Load-Serving Entity's resource adequacy requirement).

**R1.2.** Its procedure and assumptions for allocating CBM over each path or Flowgate.

**R1.3.** Its procedure for CBM use (i.e., its procedure for scheduling of energy over transmission capacity set aside as CBM).

**R1.4.** The most recent values of CBM used for calculating Available Transmission Capacity (ATC) or Available Flowgate Capability (AFC) for each timeframe by Flowgate or path, as applicable.

**R2.** The Transmission Service Provider shall make publicly available copies of the models used for allocating CBM over each path or Flowgate within seven calendar days following a request by an entity with a valid need for such information.

**R3.** The Transmission Service Provider shall determine CBM for the purpose of calculating ATC or AFC for each POR-POD combination (path) as follows:

**R3.1.** The Transmission Service Providers that uses the Network Response Methodology for determining Total Flowgate Capability shall allocate CBM to each Flowgate based on the distribution factor for the POR to the POD multiplied by the quantity of CBM import MW requirement on each POR-POD combination (path) requested.

**R3.1.1.** The Transmission Service Provider shall use the same methodology as used for its Existing Transmission Commitments (ETC) calculation for accounting for counter-flow when CBM is requested from multiple PORs.

**R3.1.2.** The Transmission Service Provider shall not include transmission capacity set aside for reserve sharing in CBM.

**R3.2.** The Transmission Service Provider that uses the Rated System Path Methodology for determining Total Transfer Capability shall use the algebraic sum of all valid CBM requests for that specific path as the CBM for that path.

**R3.2.1.** The Transmission Service Provider shall not include transmission capacity set aside for reserve sharing in CBM.

**R3.3.** The Transmission Service Provider that uses the Network Response Methodology for determining Total Transfer Capability shall use the algebraic sum of all valid CBM requests for that specific path as the CBM for that path.

**R3.3.1.** The Transmission Service Provider shall not include transmission capacity set aside for reserve sharing in CBM.

**R3.4.** The Transmission Service Provider shall use "zero" as the value for all unscheduled CBM for all non-firm ATC calculations for all methodologies.

**R4.** The Load-Serving Entity that wants CBM allocated for its potential use shall submit, (at least annually) a request for its CBM import MW requirement (i.e., a request for setting aside of Transfer Capability in the form of CBM to maintain the Load-Serving Entity's resource adequacy requirement) to its Transmission Service Provider and Balancing Authority documenting the quantity of CBM import MW requirement to which the Load-Serving Entity is entitled based upon verifiable historical, state, Regional Transmission Organization, regional, or other resource adequacy criteria. The request shall be accompanied by a report (CBM Import Entitlement Report), which shall include:

> See paragraph 1077 of FERC Order 890: "…. We also clarify that CBM should only be set aside upon request of any LSE within a balancing area to meet its verifiable historical, state, RTO or regional generation reliability criteria requirement such as reserve margin, loss of load probability, loss of largest units, etc. We expect verification of the CBM values to be part of the Requirements with appropriate Measures and Levels of Non-Compliance."

**R4.1.** Identification of the Load-Serving Entity

**R4.2.** Projected CBM import MW requirement for each POR-POD combination (path) for each year for the next ten-year period.

**R4.3.** Identification of the entity responsible for establishing the Load-Serving Entity's resource adequacy requirements.

**R4.4.** Identification of all applicable reserve margin and resource adequacy requirements for the Load-Serving Entity.

**R4.5.** Summary of results of resource studies performed to determine the quantity of CBM, not to include confidential information.

**R5.** The Load-Serving Entity shall document and retain the following information for a period of five years:

**R5.1.** Projected CBM import MW requirement for each POR-POD combination (path) for each year for the next ten-year period.

**R5.2.** Documentation identifying the municipality, state commission, Regional Transmission Organization/Independent System Operator, Regional Reliability Organization, or Regional Entity responsible for establishing the Load-Serving Entity's resource adequacy requirements.

**R5.3.** Copies of all applicable reserve margin and resource adequacy requirements to include one or more of the following:

- Municipality generation reserve margin and resource adequacy requirements
- State generation reserve margin and resource adequacy requirements
- Regional Transmission Organization/Independent System Operator generation reserve margin and resource adequacy requirements
- Regional Reliability Organization reserve margin and resource adequacy requirements

**R5.4.** Copies of all resource planning studies performed to determine the Load-Serving Entity's quantity of CBM to include one or more of the following:

- Loss of load expectation (LOLE) studies/loss of load probability (LOLP) studies
- Loss of largest unit studies
- Other reliability resource adequacy studies utilized by a Load-Serving Entity in establishing its CBM import MW requirements.

**R6.** The Load-Serving Entity that uses probabilistic studies for determining the CBM import MW requirement on each POR-POD combination (path) shall:

**R6.1.** Identify and use the criteria required by the Load-Serving Entity's documented resource adequacy requirements (e.g., the LOLE value is 1 day in 10 years, or 1 event in 10 years).

**R6.2.** Identify and use load assumptions (e.g., a load forecast that has a 50% probability of occurrence) in the study that are the same as the load assumptions used to determine the Load-Serving Entity's resource adequacy requirements.

**R6.3.** Identify all resources committed to serve the Load-Serving Entity's load, including:

**R6.3.1.** Generators within the Load-Serving Entity's area with Designated Network Resource (DNR) status.

**R6.3.2.** Generators with Capacity contracts to serve load within the Load-Serving Entity's area.

**R6.3.3.** Generators external to the Load-Serving Entity's area with firm Transmission Reservations to the Load-Serving Entity's area.

**R6.3.4.** Firm capacity backed transaction contracts with external entities with firm Transmission Reservations to the Load-Serving Entity's area.

**R6.4.** Identify all resources in the Load-Serving Entity's area excluded from serving the Load-Serving Entity's load, including:

**R6.4.1.** Generation within the Load-Serving Entity's area with firm contracts to serve load outside the Load-Serving Entity's area.

**R6.4.2.** Uncommitted generation within the Load-Serving Entity's area including uncommitted Independent Power Producers' resources.

**R6.5.** Use forced outage rates to represent generation unit availability that are the same as the forced outage rates used to determine the Load-Serving Entity's resource adequacy requirements.

**R6.6.** Use firm system purchases that are the same as the firm system purchases used to determine the Load-Serving Entity's resource adequacy requirements.

**R6.7.** Identify the treatment of the following:

**R6.7.1.** Forced outage rates for new units.

**R6.7.2.** Generator seasonal ratings.

**R6.7.3.** Projected generator maintenance schedules.

**R6.7.4.** Fuel, wind, hydro or other reasons which may limit dispatch of a resource.

**R6.7.5.** Common mode outages that effect resource adequacy.

**R6.7.6.** Availability of resources with environmental or regulatory restrictions.

**R6.8.** Identify exceptions to R6.1 thru R6.7 permitted by the entity responsible for the Load-Serving Entity's resource adequacy requirements.

**R7.** The Transmission Service Provider shall determine if transmission capability is available to meet a request for CBM import MW requirement on each POR-POD combination (path) within 30 calendar days of receiving the request and CBM Import Entitlement report identified in R4.

**R7.1.** The Transmission Service Provider shall set aside Transfer Capability in the form of CBM to maintain a Load-Serving Entity's resource adequacy requirement on its transmission system for each Load-Serving Entity that submits a request for CBM transmission capacity in an amount equal to or less then the amount its transmission system can accommodate.

**R7.2.** The Transmission Service Provider shall pro-rate all requests for CBM transmission capacity if the requests for CBM for a POR-POD combination (path) exceed the amount its transmission system can accommodate for that specific POR-POD combination (path) and shall set aside Transfer Capability in the form of CBM to maintain the Load-Serving Entity's pro-rated requests.

**R7.3.** The Transmission Service Provider shall provide to a Load-Serving Entity's Transmission Planner and make publicly available, the CBM Import Entitlement report provided by a Load-Serving Entity as required in R4.

**R8.** The Load-Serving Entity may request the scheduling of energy over transmission capacity set aside as CBM up to an amount equal to that determined under R7 as required by the Transmission Service Provider's procedure pursuant to R1.3.

**R8.1.** In the event CBM was reduced pursuant to R7.2, the Load-Serving Entity is still entitled to the full CBM import MW requirement on a POR-POD combination (path) requested when scheduling of energy over transmission capacity set aside as CBM

**R9.** The Balancing Authority shall waive the timing and ramping requirements for scheduling of energy over transmission capacity set aside as CBM.

**R10.** The Load-Serving Entity shall declare a NERC Energy Emergency Alert (EEA) 2 and initiate all steps in EEA 2 prior to scheduling of energy over transmission capacity set aside as CBM.

**R11.** The Load-Serving Entity shall provide a report to its Transmission Service Provider within 7 calendar days after the scheduling of energy over transmission capacity set aside as CBM and retain for a period of five years:

**R11.1.** Circumstances under which a NERC EEA 2 was declared and all steps initiated in EEA 2 before energy was scheduled over transmission capacity set aside as CBM.

**R11.2.** Amount of CBM capacity used and energy scheduled over transmission capacity set aside as CBM.

**R11.3.** Start and stop times of when energy was scheduled over transmission capacity set aside as CBM.

**R12.** The Transmission Service Provider shall make publicly available (for a period of one year) the report prepared by a Load-Serving Entity pursuant to R11 beginning within 7 calendar days after receiving the report.

**R13.** The Transmission Planner shall include all valid requests and projected CBM import MW requirements for each POR-POD combination (path) for each year for the next ten-year period, based on the information supplied in the Load-Serving Entities requests and as required in R4.1, in its planning process.

**R14.** The Load-Serving Entity shall not incorporate any of the components of uncertainty identified in Reliability Standard MOD-008-1 R1.1 into its determination of its CBM import MW requirement.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Transmission Reliability Margin (TRM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-008-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations. Please review the 'White Paper' and the proposed MOD-008 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "TRM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-008-0 and MOD-009-0 into the draft MOD-008-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team’s decision to combine all the requirements for Transmission Reliability Margin determination, verification, and use into a single standard? If “No,” please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission’s (FERC) Orders 890 and 693 related to TRM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC’s directives in FERC Orders 890 and 693 related to TRM in this draft of MOD-008-1? If “No,” please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-008-1 standard and expanded the applicability section of the TRM standard to include all applicable entities. Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☐ No

   Comments:

4. The drafting team created new TRM requirements and expanded or deleted some prior TRM requirements. Do you agree with the requirements identified in the draft standard MOD-008-1? If “No,” please explain why in the comment area.

   ☐ Yes

   ☐ No

   Comments:

**5.** Requirement R1.1 lists the uncertainties for which TRM may be set aside. Should studies be required to determine a “maximum uncertainty” to support the validity of a TRM value? If “Yes,” please explain what kinds of studies should be performed for any or all of the uncertainties in your response in the comments area.

☐ Yes

☐ No

Comments:

**6.** Several Transmission Service Providers use a percentage of Facility Rating for the TRM preserved for reliability (typically 2–5%). Do you believe that a percentage of Facility Ratings reserved as TRM is sufficient to maintain adequate reliability for all ATC calculations? If “Yes,” please provide what you believe is an appropriate percentage in your response in the comments area.

☐ Yes

☐ No

Comments:

**7.** Do you agree with the necessity of R1.5, which requires any Transmission Planner or Transmission Operator who reserves zero (0) TRM in any time horizon to explain why? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**8.** Are there other legitimate needs for TRM that should be in the list described in R1? If “Yes,” please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-008-1.

Comments:

# References to Capacity Benefit Margin in FERC Orders

## *From FERC Order 890*

***From Page 1045:***

**§ 37.6 Information to be posted on the OASIS**.

(vii) Capacity Benefit Margin or CBM means the amount of TTC preserved by the Transmission Provider for load-serving entities, whose loads are located on that Transmission Provider's system, to enable access by the load-serving entities to generation from interconnected systems to meet generation reliability requirements, or such definition as contained in Commission-approved Reliability Standards.

***Starting on Page 157:***

### (3) Capacity Benefit Margin (CBM)

**NOPR Proposal**

248. In the NOPR, the Commission proposed three options to address the CBM component of ATC: (1) have NERC develop clear standards for how the CBM value should be determined, allocated across transmission paths, and used; (2) charge an entity for which transfer capability has been set aside to meet generation reliability criteria a separate rate for this service; or (3) eliminate CBM and require an entity reserving ATC to meet generation reserve (currently through CBM) to designate network resources on the other side of the interface and make an associated transmission service reservation.

**Comments**

249. Numerous commenters support the Commission's proposed option one, requiring NERC to develop clear standards for how the CBM value should be determined, allocated across transmission paths, and used.[173] They believe that CBM ensures the ability to import needed power to support system conditions. TVA argues that option two would be costly and may cause some systems to forego CBM, thereby jeopardizing service to native load customers. PJM states that option two is irrelevant in PJM since PJM "totals" reservations and decides when CBM can be used. Supporters of option one criticize option three, elimination of CBM, as costly and a threat to transmission system reliability. Southern, Progress Energy, and PJM emphasize that, without CBM, the LSEs would need to increase their reserve margin by contracting for additional generation

[173] E.g., Allegheny, Ameren, EEI, Duke, NRECA, TVA, APPA, Bonneville, EPSA, FirstEnergy, Indianapolis Power, MidAmerican, Pinnacle, PJM, PGP, PNMTNMP, Public Power Council, Sacramento, Seattle, South Carolina E&G, TANC, TDU Systems, and Wisconsin Electric.

capacity, costing millions of dollars. In addition, Ameren and TVA believe that CBM elimination will increase the likelihood of widespread blackouts in emergency conditions.

250. At the October 12 Technical Conference, Exelon supported option two proposing a charge for CBM. Exelon contended that, in a rate-making context, there would be an increase in the divisor of the rate by the amount of CBM set-aside which would lower the point-to-point charge. Consequently, those not benefiting from the CBM set-aside effectively would be paying a lower charge.

251. Constellation and Morgan Stanley support the elimination of CBM and argue thatCBM and TRM are often used interchangeably and result in duplicative transmission set-asides. They also argue that there is no compelling need for CBM in the current liquid market environment. In addition, Morgan Stanley states that LSEs affiliated with the transmission provider should not be allowed to use CBM for long-term planning purposes as an excuse to avoid undertaking needed resource additions or to conceal the true cost of their load serving functions. Furthermore, the Commission should not be distracted by assertions that such long-term arrangements are necessary for "reliability," when in fact they are simply a way to protect the economic interests of a particular entity.

252. Duke replies that Constellation mistakenly believes that CBM is currently only available to a transmission provider's native load when, in fact, for those transmission providers that establish CBM, it should be established for the load of all LSEs in the control area. Duke contends that not all transmission providers set aside capacity through CBM for their native load; to the extent that a transmission provider does not set aside CBM, there should be no obligation to allow other LSEs to do so. Duke proposes that the Commission should continue to permit such flexibility.

253. NERC takes no position on CBM, expecting that the issue can be settled through the NERC and NAESB Procedure for Joint Standards Development and Coordination and through other open forums.

254. TAPS suggests that the Commission ensure that all LSEs have both access to CBM to meet their reserve-sharing needs and meaningful input into how much CBM is reserved. To do so, TAPS recommends the creation of a reserve-sharing group made up of the transmission provider and LSEs it serves. It argues that this would remove reservation decisions from the sole discretion of the vertically-integrated transmission provider and instead have them made by the transmission provider/LSE reserve-sharing group, subject to dispute resolution at the Commission. All LSEs would be invited to participate in the studies as well as review the results and assumptions. Moreover, once a regional planning process is established, as proposed in the NOPR, TAPS recommends that the regional planning group be required to approve the CBM reservation as well.

255. Williams suggests that a transmission provider must designate network resources and reserve firm transfer capability on both sides of the control area transmission

interface in order to reserve CBM. Duke replies that, although some commenters prefer eliminating CBM and replacing it with additional designated network resources, CBM is the preferable option because it is less costly. Duke further argues that the choice is between setting aside both additional transmission and generation capacity to deal with emergencies (the additional designated network resource approach) versus setting aside only transmission (the CBM approach). Having to procure additional designated network resources to keep in reserve reduces one of the main benefits of interconnected operations. Duke argues that eliminating CBM would drive up costs for network customers, as they would have to procure additional generation and transmission resources. EEI adds that such a proposal may result in increased LSE reserve requirements, over-building of generation supply, and a reduction, rather than an increase, in ATC.

**Commission Determination**

256. The Commission concludes that it is appropriate to allow LSEs to retain the option of setting aside transfer capability in the form of CBM to maintain their generation reliability requirement. We agree with commenters that, without CBM, LSEs would have to increase their generation reserve margins by contracting for generation capacity, which may result in higher costs without additional reliability benefits. We require, however, the development of standards for how CBM is determined, allocated across transmission paths, and used in order to limit misuse of transfer capability set aside as CBM. Transmission providers also must reflect the set-aside of transfer capability as CBM in the development of the rate for point-to-point transmission service to ensure comparable treatment for point-to-point to customers.

257. The Commission therefore adopts a combination of the NOPR options one and two, and declines to adopt option three. First, we require public utilities, working through NERC and NAESB, to develop clear standards for how the CBM value shall be determined, allocated across transmission paths, and used. We understand that NERC has already begun the process of modifying several of the CBM-related reliability standards and that the drafting process is a joint project with NAESB. Second, we require transmission providers to reflect the set-aside of transfer capability as CBM in the development of the rate for point-to-point transmission service.

258. We note that there is broad concern that eliminating CBM (option three) would impose extraordinary costs for meeting generation reliability criteria, which then may lead utilities to reduce their generation reliability requirement to avoid the cost increase. We believe that the reforms reflected in combining options one and two are sufficient to remedy undue discrimination and that the adverse effects associated with option three are neither warranted nor required. We reject Morgan Stanley’s call for CBM elimination on the grounds that CBM is acting as a disincentive to undertake needed generation resource additions. It would be inappropriate for the Commission to restrict the ability of an LSE to determine how best to meet its generation reliability criteria.

259. To ensure CBM is used for its intended purpose, CBM shall only be used to allow an LSE to meet its generation reliability criteria. Consistent with Duke's statement, we clarify that each LSE within a transmission provider's control area has the right to request the transmission provider to set aside transfer capability as CBM for the LSE to meet its historical, state, RTO, or regional generation reliability criteria requirement such as reserve margin, loss of load probability (LOLP), the loss of largest units, etc.

260. We direct public utilities, working through NERC, to develop clear requirements for allocating CBM over transmission paths and flowgates. While we do not mandate a particular methodology for allocating CBM to paths and flowgates, one approach could be based on the location of the outside resources or spot market hubs that an LSE has historically relied on during emergencies resulting from an energy deficiency.

261. We concur with TAPS' proposal that all LSEs should have access to CBM and meaningful input into how much transfer capability is set aside as CBM. In the transparency section below, we provide detailed requirements regarding availability of documentation used to determine the amount of transfer capability to be set aside as CBM and the posting of CBM values and narratives. Access to this documentation will enable LSEs to validate how much transfer capability is set aside as CBM on each system and provide them with information to question whether the set-aside is consistent with the reliability standards and this Final Rule.

262. Concerning TAPS' proposal to remove the reservation decision from the sole discretion of transmission providers, we determine that LSEs should be permitted to call for use of CBM, if they do so pursuant to conditions established in the reliability standards development process. We direct public utilities working through NERC to modify the CBM-related standards to specify the generation deficiency conditions during which an LSE will be allowed to use the transfer capability reserved as CBM. In addition, we direct that transmission set aside as CBM shall be zero in non-firm ATC calculations. Finally, we order public utilities to work with NAESB to develop an OASIS mechanism that will allow for auditing of CBM usage.

263. We also require transmission providers to design their transmission charges to ensure that the class of customers not benefiting from the CBM set-aside, i.e., point-to-point customers, do not pay a transmission charge that includes the cost of the CBM setaside. To do this, transmission providers are required to submit redesigned transmission charges that reflect the CBM set-aside through a limited issue FPA section 205 rate filing as part of its initial ATC-related compliance filing. These filings, which may be submitted within 120 days after the publication of the Final Rule in the Federal Register, may be limited to the rate design change only, i.e., they will not require the submission of cost of service data or a revision to the transmission provider's revenue requirement.

264. With respect to TAPS' proposal that all LSEs should be allowed to use CBM to meet their reserve-sharing needs, we believe that TRM is the appropriate category for that purpose, not CBM. We reject TAPS' proposal to use CBM for the LSE's reserve-sharing needs, but instead make TRM available for the incremental power flows resulting from reserve sharing, as explained next.

265. As we are rejecting option three, which would have required the reservation of transfer capability rather than using CBM, we also reject Williams' proposal to require the reservation of transfer capability on both sides of an interface for CBM.

## ***From FERC Order 693***

***Starting on Page 293:***

### f. Documentation of Regional Reliability Organization Capacity Benefit Margin Methodologies (MOD-004-0)

1067. MOD-004-0 requires each regional reliability organization to: (1) develop and document a regional CBM[174] methodology in conjunction with its members and (2) post the most recent version of its CBM methodology on a website accessible by NERC, regional reliability organizations and transmission users.

1068. In the NOPR, the Commission identified MOD-004-0 as a fill-in-the-blank standard that requires each regional reliability organization to develop and document a regional CBM methodology. The NOPR stated that because the regional CBM methodologies had not been submitted, the Commission would not propose to approve or remand MOD-004-0 until the ERO submits the additional information.

1069. Although not proposing any action, the Commission nonetheless indicated that MOD-004-0 could be improved by: (1) providing more specific requirements on how CBM should be determined and allocated to interfaces and (2) including a provision ensuring that CBM, TRM and ETC cannot be used for the same purpose, such as the loss of an identical generation unit. Further, the Commission expressed concern that the Reliability Standard may unduly impact competition because of the lack of consistent criteria and clarity with regard to the entity on whose behalf CBM has been set aside.

---

[174] The NERC glossary defines "capacity benefit margin" or "CBM" as the amount of firm transmission transfer capability preserved by a transmission provider for load serving entities whose loads are located on the transmission service provider's system, to enable access by the load serving entity to generation from interconnected systems to meet generation reliability requirements. NERC Glossary at 2.

This lack of consistent criteria has the potential to result in the transmission provider's setting aside capacity that it might not otherwise need to set aside, thus increasing costs for native load customers and blocking third party uses of the transmission system.

**i. Comments**

1070. APPA agrees with the Commission that MOD-004-0 should not be approved as a mandatory Reliability Standard until the relevant regional procedures are submitted and approved.[175]

1071. FirstEnergy states that transmission capacity margins such as CBM and TRM are vitally important to the reliability of the system, and any methodology that would unduly limit these margins could create a danger of limiting transmission capacity over interconnected facilities that would limit the ability of balancing authorities and others to obtain generation reserves needed from the grid during contingency events. In contrast, TAPS questions how TRM or, especially, CBM, can be viewed as Reliability Standards if they are optional for the transmission provider.

1072. MidAmerican supports greater uniformity of CBM definitions and calculations and states that the revised standard and/or new standards should support transparency and uniformity by encouraging increased availability of information and consistent data input and modeling assumptions. EEI emphasizes that additional data and information-sharing requirements would improve the transparency of various calculations and assumptions related to CBM, including this standard and the other CBM-related standards. EEI believes that, similar to the peer review processes of the planning studies carried out under the TPL standards, industry participants are best suited to developing the totality of assumptions, system conditions and other input variables that support the calculations.

1073. EEI notes that, with respect to the Commission's particular concern about criteria in determining resources and loads used in the CBM methodology, NERC's "ATC Definitions and Determination"[176] document clearly delineates the purpose and intent of the calculation of CBM and TRM. EEI states that CBM is intended to provide generation reliability, and TRM is intended to provide transmission reliability. EEI believes that, to

[175] APPA notes that it has expressed its own concerns with CBM calculations and set-asides in its August 7, 2006 Initial Comments filed in Docket No. RM05-25-000, at 31–55. APPA is hopeful these concerns can be addressed through NERC's Reliability Standards development process.

[176] NERC, Available Transfer Capability Definitions and Determination - A Framework for Determining Available Transfer Capabilities of the Interconnected Transmission Networks for a Commercially Viable Electricity Market (June 1996).

the extent capacity capable of supplying CBM is located in the vicinity of the designated facility experiencing an outage, transmission may or may not be available under the native load reservation normally used for the facility. Therefore, EEI argues, CBM may be needed on an interface where capacity is available for use as CBM, and not allowing all generation to be considered in this manner may unduly increase the generation reserve requirement within the transmission provider's system.

1074. EEI agrees with the Commission's concern about double-counting TRM for those transmission providers who do not opt to use CBM. However, EEI argues that for transmission providers who do opt to use CBM, it may be appropriate in some circumstances to use the same generation unit outage to determine the impact on both generation and transmission reliability because the impacts are different. EEI cautions that artificially restricting such use is not appropriate, especially before NERC's development of TRM and CBM standards and their presentation to FERC through the Reliability Standards development process. EEI recommends that the Commission encourage transmission providers to make CBM and TRM capacity available to wholesale markets for purchase on a non-firm basis, because doing so would ensure that both CBM and TRM capacity are available to the transmission provider during system emergencies, as intended. EEI notes that at other times the transfer capability associated with TRM and CBM would be available to the market, alleviating the concern of possible double-counting. MidAmerican also supports the Commission's conclusion that double-counting would be inappropriate, although MidAmerican states that it is not aware of any cases of double-counting of margins.

1075. TAPS notes the significant potential for abuse[177] that could result from the current flexibility afforded transmission providers in the calculation of CBM and TRM, and proposes innovative approaches[178] to take CBM and (to the extent it is intended to cover transmission required for reserve sharing) TRM out of the hands of individual transmission providers, and to therefore reduce the opportunity for abuse.

**ii. Commission Determination**

1076. The Commission adopts the NOPR proposal not to approve or remand MOD-004-0 until the ERO submits additional information. Because the regional procedures have not been submitted to the Commission, it is not possible to determine at this time whether MOD-004-0 satisfies the statutory requirement that a proposed Reliability Standard be "just, reasonable, not unduly discriminatory or preferential, and in the public interest."

---

[177] Documented by NERC's April 14, 2005 Long-Term AFC/ATC Task Force

Final Report.

[178] TAPS refers the Commission to its August 7, 2006 comments in Docket No.

RM05-25-000 at 21-24.

Accordingly, the Commission neither accepts nor remands this Reliability Standard until the regional procedures are submitted. In the interim, compliance with MOD-004-0 should continue on a voluntary basis, and the Commission considers compliance with the Reliability Standard to be a matter of good utility practice. Consistent with Order No. 890 and comments received in response to the NOPR, the Commission directs the ERO, through the Reliability Standards development process, to modify MOD-004-0 as discussed below.

1077. We agree with FirstEnergy that CBM is important for system reliability by allowing the LSEs to meet their historical, state, RTO or regional generation reliability criteria requirement such as reserve margin, loss of load probability, loss of largest units, etc. We agree with EEI and MidAmerican that transparency of the studies supporting CBM determination will reduce the opportunity for transmission service providers to overestimate the amount of CBM and misuse transfer capability. We therefore direct the ERO to develop Requirements regarding transparency of the generation planning studies used to determine CBM values. We also clarify that CBM should only be set aside upon request of any LSE within a balancing area to meet its verifiable historical, state, RTO or regional generation reliability criteria requirement such as reserve margin, loss of load probability, loss of largest units, etc. We expect verification of the CBM values to be part of the Requirements with appropriate Measures and Levels of Non-Compliance.

1078. We continue to believe this Reliability Standard should be modified to include a provision ensuring that CBM, TRM and ETC cannot be used for the same purpose, such as loss of the identical generating unit. In order to limit misuse of transfer capability set aside as CBM, we direct the ERO to provide more specific requirements for how CBM should be determined and allocated across transmission paths or flowgates. As we stated in Order No. 890, we do not mandate a particular methodology for allocating CBM to paths or flowgates. For example, one approach could be based on the location of the outside resources or spot market hubs that a LSE has historically relied on during emergencies resulting from an energy deficiency, but we agree with EEI that flexible rules should be allowed to prevent unnecessary increase of the generation reserve requirement within the transmission provider's system. Therefore, we support flexibility, but expect that the ERO, using its Reliability Standards development process, will adequately approach these complex technical issues and propose a new version of MOD-004-0 that addresses the methods for CBM determination and allocation on paths that will reduce reliability and discrimination concerns.

1079. In response to TAPS's question asking how CBM can be viewed as a Reliability Standard if it is optional to the transmission provider, our understanding is that transmission providers that have opted not to use CBM have instead set aside transmission margin (needed to bring in outside power to meet generation reliability criteria) either through ETC or TRM. CBM is not the only way to reserve transmission capacity for a margin. However, if the Reliability Standard is not clear regarding the method of calculating transmission margins, it may cause double-counting of transmission margins and reduction of ATC. As we stated in Order No. 890, we find that clear specification of the permitted purposes for which entities may reserve CBM and TRM will virtually eliminate double-counting of TRM and CBM. Therefore, we direct the ERO to modify its standard in order to prevent setting aside transfer capability for the same purposes.

1080. We share TAPS's concern that there is a significant potential for abuse as a result of the current flexibility afforded to transmission providers in the calculation of both CBM and TRM. In response to TAPS's concern, we clarify that in accordance with the OATT Reform Final Rule and the ERO CBM definition, each LSE has the right to request CBM be set aside and use it to meet its verifiable historical, state, RTO or regional generation reliability criteria requirement such as reserve margin, loss of load probability, loss of largest units, etc. As such, the LSEs that request CBM be set aside must be identified as applicable entities with identified Requirements, including Requirements on generation studies to verify the set aside, Measures and Levels of Non-Compliance. We direct the ERO to modify the Reliability Standard accordingly.

1081. We agree with TAPS that there is a need for clearer requirements in the standard regarding to whom and how to submit a request for CBM set-aside, and what the transmission service provider should do if the sum of all CBM requirements exceeds the amount of available transfer capability. We direct the ERO to address the reliability aspects in the Reliability Standards development process and explore with NAESB whether business practices would be required.

1082. Accordingly, the Commission neither accepts nor remands MOD-004-0 until the ERO submits additional information. In the interim, compliance with MOD-004-0 should continue on a voluntary basis, and the Commission considers compliance with the Reliability Standard to be a matter of good utility practice. Although the Commission did not propose any action with regard to MOD-004-0, it addressed above a number of concerns regarding the Reliability Standard, consistent with those set forth in Order No. 890. Therefore, we direct the ERO to develop modifications to the Reliability Standard through the Reliability Standards development process to: (1) clarify that CBM shall be set aside upon request of any LSE within a balancing area to meet its verifiable historical, state, RTO or regional generation reliability criteria; (2) develop requirements regarding transparency of the generation planning studies used to determine CBM value; (3) modify the current Requirements to make clear the process for how CBM is allocated across transmission paths or flowgates; (3) modify its standard in order to prevent setting aside CBM and TRM for the same purposes; (4) modify the standard by adding LSE as an applicable entity and (5) coordinate with NAESB business practice standards.

1083. We direct the ERO to consider APPA's suggestion that MOD-004-0 may be redundant and should be eliminated if the ERO develops a modification to the MOD-002-0 Reliability Standard that includes reporting requirements

### g. Procedure for Verifying Capacity Benefit Margin Values (MOD-005-1)

1084. MOD-005-1 specifies the requirements regarding the periodic review of a transmission service provider's adherence to the regional reliability organization's CBM methodology. It requires each regional reliability organization to: (1) develop and implement a procedure to review at least annually the CBM calculations and the resulting values determined by member transmission service providers; (2) document its CBM review procedure and (3) make the results of the most current CBM review available to NERC upon request.

1085. In the NOPR, the Commission identified MOD-005-0 as a fill-in-the-blank standard that requires each regional reliability organization to develop and implement a procedure to review CBM calculations and the resulting values and to make the documentation of the results of the CBM review available to NERC and others. The NOPR stated that because the regional procedures had not been submitted, the Commission would not propose to approve or remand MOD-005-0 until the ERO submits the additional information.

#### i. Comments

1086. APPA agrees that MOD-005-0 is a fill-in-the blank standard, and that in its current form, it is not sufficient and should not be accepted for approval as a mandatory Reliability Standard until the necessary regional procedures have been submitted and approved. APPA suggests that NERC modify MOD-006-0, so that MOD-004-0 and MOD-005-0 could be eliminated.

#### ii. Commission Determination

1087. The Commission adopts the NOPR proposal not to approve or remand MOD-005-0 until the ERO submits additional information. Because the regional procedures have not been submitted to the Commission, it is not possible to determine at this time whether MOD-005-0 satisfies the statutory requirement that a proposed Reliability Standard be "just, reasonable, not unduly discriminatory or preferential, and in the public interest." Accordingly, the Commission neither accepts nor remands this Reliability Standard until the regional procedures are submitted. In the interim, compliance with MOD-005-0 should continue on a voluntary basis, and the Commission considers compliance with the Reliability Standard to be a matter of good utility practice.

1088. As to APPA's comment on incorporating MOD-004 and MOD-005 into MOD-006, we direct the ERO to consider those comments through the Reliability Standards development process.

### h. Procedure for Use of Capacity Benefit Margin Values (MOD-006-0)

1089. The purpose of MOD-006-0 is to promote the consistent and uniform use of transmission CBM calculations among transmission system users. MOD-006-0 requires that each transmission service provider document its procedure for the scheduling of energy against a CBM reservation and make the procedure available on a website accessible by the regional reliability organization, NERC and transmission users.

1090. In the NOPR, the Commission proposed to approve Reliability Standard MOD-006-0 as mandatory and enforceable. In addition, the Commission proposed to direct NERC to submit a modification to MOD-006-0 that: (1) includes a provision that will ensure that CBM and TRM are not used for the same purpose; (2) modifies Requirement R1.2 so that concurrent occurrence of generation deficiency and transmission constraints is not a required condition for CBM usage; (3) modifies Requirement R1.2 to define "generation deficiency" based on a specific energy emergency alert level and (4) expands the applicability section to include the entities that actually use CBM, such as LSEs.

1091. In addition, the Commission proposed that NERC should clarify the requirements to address when and how CBM can be used to reduce transmission provider discretion with regard to CBM usage. The Commission provided guidance expressing its belief that CBM should be used only when the LSE's local generation capacity is insufficient to meet balancing Reliability Standards, and that CBM should have a zero value in the calculation of non-firm ATC.

**i. Comments**

1092. APPA supports the Commission's proposal to approve MOD-006-0. Moreover, APPA agrees with the Commission's proposed directives[179] that the standard should address the use of CBM and TRM for the same purpose. However, APPA believes that the specificity of the Commission's proposed directives to NERC, if implemented, would undermine NERC's role as the approved ERO with the technical expertise to develop and revise standards for the Commission's subsequent review. APPA therefore suggests that the Commission in its Final Rule make clear to NERC its concerns about MOD-006-0, but then let NERC address those concerns through its Reliability Standard development process.

1093. Regarding the Commission's proposal that MOD-006-0 R1.2 be modified "so that concurrent occurrence of transmission constraints and a generation deficiency is not a requirement for CBM usage," WEPCO asserts that the Commission is misinterpreting CBM. WEPCO states that if there is no transmission constraint then there is no need to use CBM. In that case, transmission capacity exists for a LSE to import energy. If there is a transmission constraint, CBM reserves transmission capacity that the LSE can use to import energy for reliability needs.

[179] NOPR at P 642.

1094. EEI points out that the explicit intention for CBM is that it be used only during conditions where there are emergency generation deficiencies. However, EEI emphasizes that the Commission's recommendation does not consider that the LSE's supply and demand balance varies season to season, over time, and with supply and demand uncertainties. EEI says that the development of CBM quantities must be carried out in a manner that sets aside transmission capability for forecasted conditions and uncertainties much like the native load reservations necessary for serving reasonably forecasted native load. An argument may be made that during a period of time when a LSE's expected reserves are substantially greater than its targeted reserves, the need for CBM set-aside decreases. However, should the LSE foresee that this "excess" would occur substantially in the future, a reduction in CBM would not be warranted since substantial uncertainties still exist.

1095. Additionally, regarding the Commission's proposal that a LSE that "has sufficient generation resources within its balancing authority to meet the balancing Reliability Standards, should not need to preserve capacity for CBM at all," WEPCO argues that just because the balancing authority has sufficient generation does not mean that there is sufficient transmission capacity to deliver the energy to the LSE. WEPCO states that the LSE may be remote from the bulk of the balancing authority, so there may be occasions when a LSE that has sufficient generation resources within its balancing authority to meet the balancing Reliability Standards may still need to reserve capacity for CBM. In addition, EEI argues that the Commission's viewpoint does not take into account the availability of these resources unless they are under contract with the LSE to provide this service. EEI contends that the implication of this suggestion is to unduly restrict the sources of generation capacity available for CBM during times of generation shortage, which results in the LSE's being captive to local generation that is available and does not allow access to the market outside of the LSE's balancing authority. Additionally, EEI cautions that this action may require the LSE to develop contractual agreements with local generation and thus increase costs to the LSE's rate payers.

1096. Given the strong direction on CBM issues in the OATT Reform NOPR, TAPS assumes that the Commission would not be approving the Version 0 standards on these competitively crucial issues, but would continue to address them forcefully in the OATT Reform proceeding. TAPS notes that, although that is the course largely adopted by the NOPR in this proceeding, the NOPR[180] proposes to approve MOD-006-0 and MOD-007-0, with directions to improve these standards. TAPS notes that such action is inconsistent with the Commission's general approach to ATC/TTC/TRM/CBM standards in this docket and the OATT Reform NOPR. TAPS further states that, given the absence of clear access of non-transmission owner LSEs to CBM, the proposed expansion of MOD-007-0 to include such LSEs in the NOPR[181] seems bizarre.

[180] Id. at P 642, 648.

[181] Id. at P 647-48.

**ii. Commission Determination**

1097. The Commission adopts the NOPR proposal to approve MOD-006-0 as mandatory and enforceable. Consistent with Order No. 890 and comments received in response to the NOPR, the Commission directs the ERO to modify MOD-006-0 as discussed below.

1098. Consistent with the views of many commenters, we adopt the NOPR proposal that requires a provision that will ensure that CBM and TRM are not used for the same purpose. As discussed under MOD-004-0 concerning the reservation of transfer capacity, we believe that if the Reliability Standard is not clear regarding the conditions specifying both the reservation and the use of CBM, it may cause double-counting. Such double-counting will lead to an unnecessary reduction of ATC, and create opportunities for discrimination. Therefore, we direct the ERO to modify its standard to prevent use of CBM and TRM for the same purposes. We agree with APPA that the ERO should use its Reliability Standards development process to address the double-counting problem.

1099. We adopt the NOPR's proposal and direct the ERO to modify Requirement R1.2 so that a transmission constraint is not a required condition for CBM usage. The glossary definition and the use as defined in Order No. 890 is that CBM "is intended to be used by the LSE only in time of emergency generation deficiencies."[182] Therefore we direct the ERO to modify the standard in the manner proposed in the NOPR.

1100. We adopt the NOPR proposal that requires modification of Requirement R1.2 to define "generation deficiency" based on a specific energy emergency alert level. This approach will provide clarity as to when the use of CBM may be permitted. We therefore direct the ERO to modify the Reliability Standard to include a specific energy emergency alert level that will trigger CBM usage.

1101. We also reiterate the direction in Order No. 890 that CBM should have a zero value in the calculation of non-firm ATC because non-firm service may be curtailed so that CBM can be used. CBM is reserved as part of the firm transfer capability so that it is available when needed for energy emergencies. We determine that each LSE should be permitted to call for use of CBM, provided all of the other Requirements of R1.1 are met. We direct that CBM may be implemented up to the reserved value when a LSE is facing firm load curtailments.

1102. We adopt the NOPR proposal that CBM should be used only when the LSE's local generation capacity is insufficient to meet balancing Reliability Standards, with the clarification that the local generation is that generation capacity that is either owned or contracted for by the LSE. We disagree with WEPCO that just because the balancing authority has sufficient generation does not mean that there is transmission capacity to

[182] See NERC Glossary at 2.

deliver the energy to the LSE. The Commission finds that such a scenario would violate existing transmission operating and transmission planning Reliability Standards. There is an explicit requirement in the transmission operating standards that generation reserves must be deliverable to load.[183] Also, there is an explicit requirement in the transmission planning standards that all firm load must be supplied under various system conditions with and without contingencies.[184] The Commission is not prescribing how these requirements should be met. There are a variety of approaches to do so, including adequate transmission capability, local or dynamic generation transfers into the area or DSM. To clarify for EEI, our proposal does not take into account the availability of these resources unless they are under contract with the LSE to provide this service. We developed our NOPR proposal on the rationale derived from the CBM concept, and believe that if there are enough resources to meet generation reliability criteria within the balancing authority, there is no need to request CBM.

1103. We also adopt the NOPR proposal to require the applicability section to include the entities that actually use CBM, such as LSEs. The current CBM definition in the NERC glossary determines that LSEs are users of CBM. Load-serving entities determine when to use CBM, initiate CBM use and call for its end. Load-serving entities therefore have to comply with the standard requirements that specify the conditions under which CBM will be used. We direct the ERO to modify the standard accordingly.

1104. With regard to TAPS's comments concerning its assumption that the Commission would not be approving the Version 0 standards on these issues, but would continue to address them in the OATT Reform proceeding, the Commission finds that MOD-006-0 and MOD-007-0 do not establish CBM values, but rather address CBM implementation and documentation. The implementation of CBM has critical implications for the reliable operation of the Bulk-Power System and we find that these Reliability Standards should be mandatory and enforceable. The competitively significant issue is to assure that there is no double-counting of CBM and to determine the magnitude of CBM which is addressed in other Reliability Standards that the Commission has not approved or remanded.

1105. The Commission approves MOD-006-0 as mandatory and enforceable. In addition, the Commission directs the ERO to develop a modification to Reliability Standard MOD-006-0 through the Reliability Standards development process that: (1) includes a provision that will ensure that CBM and TRM are not used for the same purpose; (2) provides that CBM should be used for emergency generation deficiencies; (3) modifies Requirement R1.2 to define "generation deficiency" based on a specific energy emergency alert level; (4) includes a provision that CBM should have a zero value

[183] TOP-002-2.

[184] TPL-002-0.

in the calculation of non-firm ATC and (5) expands the applicability section to include the entities that actually use CBM, such as LSEs.

### i. Documentation of the Use of Capacity Benefit Margin (MOD-007-0)

1106. MOD-007-0 requires transmission service providers that use CBM to report and post its use.

1107. In the NOPR, the Commission proposed to approve Reliability Standard MOD-007-0 as mandatory and enforceable. In addition, the Commission proposed to direct NERC to submit a modification to MOD-007-0 that expands the applicability section to include the entities that actually use CBM, such as LSEs.

#### i. Comments

1108. APPA supports the Commission’s proposed approval of MOD-007-0. However, it believes that the issue of whether LSEs should be made subject to MOD-007-0 should be left to NERC in the first instance to decide. In so doing, NERC should consider expanding MOD-007-0 to cover not only LSEs, but also balancing authorities. Under NERC’s Functional Model, the balancing authority is the entity that would schedule energy over transmission capacity reserved as CBM. Moreover, it is the balancing authority that would know the information necessary to report an incident during which the balancing authority had to import energy from outside the balancing authority’s own area from a resource designated as operating reserves and change the net scheduled interchange with the neighboring balancing authorities to allow the energy to flow into the balancing authority’s area.

#### ii. Commission Determination

1109. The Commission approves MOD-007-0 as mandatory and enforceable. Consistent with the comments received in response to the NOPR, the Commission directs the ERO to modify the standard as discussed below.

1110. We also adopt the NOPR’s proposal to require the applicability section to include the entities that actually use CBM and report on their CBM use, such as LSEs. The current CBM definition in the NERC glossary determines when a LSE is a CBM user. The LSE determines how much CBM will be set aside, when CBM use will start and when it will end. The LSE must therefore comply with the standard requirements that require reporting and posting of CBM use. We direct the ERO to modify the standard to include the entities that actually use CBM, such as LSEs. In addition, we agree with APPA that the Reliability Standard should apply to balancing authorities and direct the ERO to include balancing authorities within the entities to which this standard is applicable.

1111. Accordingly, the Commission approves MOD-007-0 as mandatory and enforceable. In addition, the Commission directs the ERO to develop a modification through its Reliability Standards development process that expands the applicability of MOD-007-0 to include the entities that actually use CBM, such as LSEs and balancing authorities.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The Standard, as written, will continue to allow the applicable functions to define CBM without any amount of consistency, which is what Order 890 wanted the Standards to accomplish. In addition, the Standard does not recognize that ATC is calculated on 3 different time horizons and CBM transmission reservation will vary from the Monthly to the Daily to the Hourly calculations.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: All throughout this Standard the author has Reliability Functions performing duties that are counter to those duties prescribe in the Functional Model. In addition, the SDT has incorrectly included requirements for scheduling of energy, maintenance schedules, and so-on, which are preformed by other Reliability Functions in other Standards.

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The Standard has Functional Entities performing duties that is contrary to the Functional Model's directions. Examples are in Requirement R 1.3 and R 10; the scheduling of energy over the transmission capacity that is designated CBM only occur during the active hour to meet “generation reliability requirements.” The Balancing Authority is the only Function that has that authority to schedule energy during the real-time. This Standard, as written, will create an environment where confusion will exist during critical situation in the real-time and cause the possibility of a command and control break down during a critical situation in the real-time. To require the Transmission Service Provider or the Load Serving Entity to be responsible for declaring emergencies or scheduling energy during those emergencies will create very non-reliable situation. A large part of this Standard needs to be rewritten to ensure reliable operations.

5. In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The definition of CBM is causing the industry to calculate CBM is many different ways. The definition of CBM states that CBM is used to meet an entity's "generation reliability requirements." Some entities are saying that the use of CBM to handle "Planning Reserves" is the correct and reserve transmission capacity as CBM to bring in energy from energy resources outside the BA's area that were determined when the entity calculated "Planning Reserves." Other entities calculate the amount of CBM capacity based on "Operating Reserves." As the definition of CBM is written either one could be correct or incorrect. This definition worked well when the industry maintained reliability of the BES from Reliability Policies.

   The CBM definition's undefined term "generation reliability requirement" allows an excessive amount of transmission capacity to be removed from the BES as CBM and prevents the correct amount of ATC to be placed on the market for use by other entities. In addition, the definition of CBM is so general it is impossible for a Compliance Program to determine if an entity is non-compliant.

6. In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

   ☐ Yes

   ☒ No

   Comments: The needs to secure a transmission path to reach generation resources outside a LSE Balancing Authority Area that will "meet generation reliability requirements" are extremely important to reliable operations of the BES. Since the Reliability Standards are written to insure reliable operations a TSP would be hard pressed to deny an LSE the ability to secure resources to meet "generation reliability requirements." If a TSP denied this service it could be exposed to acts of non-compliance should the BES's integrity diminish because the TSP denied the LSE the CBM capacity.

7. Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: The use of CBM capacity is just a reservation of transmission capacity that will only be used should an adverse situation develop in the BES and generation resources are needed to meet "generation reliability requirements." However, those generation resources are out side the LSE's Balancing Authority's Area. The simulation of energy over the CBM would be a study to determine how the system reacted under adverse operating conditions of the BES. How the use of CBM transmission capacity is treated will be determined how the final definition of CBM is written. Presently, both method would be needed because CBM is used for different purposes throughout the industry.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: Reducing the CBM because new generation is built in the LSE's Balancing Authority's Area would be a financial decision by the LSE. I do not believe this Standard has authority to mandate financial decisions. However if new reliability rules are passed that limit the amount of resources located outside the LSE's Balancing Authority's Area, which can be used to meet "generation reliability requirements" then this Standard has the obligation to lower the CBM to the predetermined about of transmission capacity used for CBM.

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: The LSE is performing many functions of the other Functional Entities, which are described in the Functional Model. As stated in Question 3 the author has incorrectly assigned duties of many different Functional Entities to the LSE in R.6 and will create confusion between this Standard and other Standards that are written for the many different subjects covered in R.6. It is recommended this requirement be completely removed.

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: As noted above.

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: NA

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: It is not within the scope of this SDT to deal with resource studies, in fact the glossary states the Resource Planner determines the resource adequacy. Generation Reserves has not been defined in the standards nor has Resource Adequacy.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: It is not within the scope of this SDT to deal with resource studies, in fact the glossary states the Resource Planner determines the resource adequacy. LOLE and LOLP are methods used by the Resource Planners.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: R1 of MOD-004-1 needs to clarify that CBM procedures need only be made publicly available if the Transmission Service Provider uses CBM.

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☐ No

   Comments:

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments: The discussion of CBM in Order 890 and NERC's definition of CBM refer only to generation reliability requirements, not resource adequacy requirements. Please clarify what is meant by "resource adequacy requirements".

**5.** In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☐ No

Comments:

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: R1. through R9. and R13. should be clarified that CBM need only be posted and requested on Posted Paths, where "Posted Path" is defined consistent with NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: For Generation Reserve and Resource Adequacy requirements, BPA follows the procedures developed by the Northwest Power Pool which meet the WECC's Minimum Operating Reliability Criteria. BPA also meets the requirements in the NERC standards for Control Performance BAL-001-0 and Disturbance Control BAL-002-0.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team’s decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If “No,” please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission’s (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC’s directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If “No,” please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities you believe the standard should apply to and why.

   ☒ Yes

   ☐ No

   Comments:

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If “No,” please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

**5.** In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☒ Yes

☐ No

Comments: CBM requests should be addressed on a "first-come first-served" basis. LSE's are required to submit annual 10-year projections to the Transmission Service Provider. CBM requests will have lower priority than existing queued firm transmission service requests. NAESB should formalize the queuing process.

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: The standard should be flexible enough to allow the Transmission Service Provider to use either method which best supports reliability in their control area.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: As resource mix changes, CBM would be re-evaluated on an annual basis with updated LSE requests for CBM.

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: R3.1.1 - Existing Transmission Commitments (ETC) is not included in definitions, but it should be defined.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: The NC and SC state commissions exercise their authority in this area by requiring an annual filing by the regulated utilities, which includes the identification and justification of reserve margins.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: None

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments: Entergy supports combination of CBM Calculation, verification, preservation, and use into one standard.

**2.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**3.** The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

☒ Yes

☐ No

Comments:

**4.** The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**5.** In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☒ No

Comments: There is no need to have a queue process for CBM. Transmission Service Requests are approved if ATC is available and ATC is calculated using CBM. Therefore, CBM needs to be set aside first to accurately calculate ATC before Transmission Service Requests can be approved.

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: CBM should be set aside on a path based on the response of CBM import MW level on that path. This should be treated similar to impact of loads or generation on paths by including their response on paths rather than algebraically subtracting from the path..

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: CBM should be recalculated to determine accurate CBM requirements that should include meeting the generation requirement from any other transmission service or new generation. Any double counting of elements that impact CBM calculations should be avoided.

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: Requirement R6 addresses resource adequacy requirement and it does not belong in the CBM standard. Requirement R5.2 covers identification of appropriate criteria used for resource adequacy studies that will identify need for CBM, if any. Probabilistic studies, if included in resource adequacy studies criteria shall be used and there is no need to include requirement R6 in this standard.

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: Entergy does not understand asking for comments on standard MOD-001-1 in this questionaire. Requirement R8.1 should include a condition by appending the language " if other entities who reserved CBM on that path are not using their share of CBM. Under no circumstances, the total use of CBM by all entities on a path at any time will exceed the total amount of CBM reserved on that path and for that period." Definitions of terms on page 2 do not belong in this standard and should be removed. Entergy does not use CBM in their ATC/AFC calculations. It appears from the standard that it is mandatory for Transmission Service Providers to use CBM. It should be left to the descretion of Tansmission Service Provider to use CBM and its use should not be made mandatory.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply:

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

☒ Yes

☐ No

Comments: ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT Interconnection. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority Interconnection and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area Interconnection and there has been no reservation of transmission capacity in ERCOT.

Capacity Benefit Margin is defined as the amount of firm transmission transfer capability preserved by the transmission provider for Load- Serving Entities (LSEs), whose loads are located on that Transmission Service Provider's system, to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.

Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. In the current and future ERCOT market design the use of CBM is not applicable to the ERCOT Interconnection. ERCOT does not have a synchronous connection with any other Control Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Balancing Authority Areas and/or offer transmission reservations and schedules within the interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance.

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: See IRC comments submitted by Charles Yeung.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?

Reply: Within ERCOT, a technical recommendation is developed by ERCOT System Planning, acting as the Planning Coordinator. ERCOT Market Participants can give input to the process through open meetings. The technical recommendation is subject to approval by the ERCOT Board of Directors and the Public Utilities Commission of Texas (PUCT). The technical recommendation stipuates generation reserve and resource adequacy requirements both for long term planning and for operating reserve.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: CBM is not used within ERCOT.

Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☒ No

Comments: CBM is a reliability product that must be available when called upon. Transmission service requests are a business product that may have reliability impacts if properly scheduled. Any queing process would have to give priority to CBM.

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: The posted ATC for the CBM reserved path should have been based on the network response or contractual limit for that POR to POD, and thus subtracting CBM on that path is consistent with the ATC determination.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: In the case of new generation, the recalcuation periodicity would conceivably be in frequent. In the case of capacity-backed transmission service, the recalculation periodicity may be frequent, but is necessary to allow the markets to function properly.

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: R2 requires copies of models used for CBM allocation, but the allocations are not required to be and may not be based on power flow modeling. In addition, it requires a request from an entity with a valid need. Methods are needed to determine what constitutes a valid need, who decides the validity of the need, and for resolving disputes. R4.2 requires the LSE to allocate the CBM by path; however, the LSE may not have/use power flow tools consequently they may have difficulty complying with this requirement. The standard should include a method for managing offsetting resource requirements where the TSP has multiple LSEs such as the situation where LSE A provides needed energy to LSE B without requiring an import. Under this scenario too much CBM may be set aside as the standard is currently written. R7.1 appears to attempt to cover this situation but it is not clearly stated and the basis for managing this is not addressed. R13 states the TP "shall include all valid requests and projected CBM import MW requirements ... in its planning process." However, a method for needs to be established for managing situations where the import limitation is outside his area of responsibility. Overall, there are many good things in here. R12 requires the TSP to make publicly available the report prepared by the LSE pursuant to R11. This requirement should be placed on the LSE that created and owns the report and has the retention responsibility. To reduce confusion R14 should list the components of uncertainty rather than refering to MOD-008-1 R1.1. This MOD-008-1 requirment requires TPs and TOPs to include these elements in the TRM analysis where MOD-004-1 requires the LSE to exclude these values from the CBM calculation. The difference in application may be lost in switching back and forth between the two standard's requirements.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: The Regional Reliability Organization - ReliabilityFirst

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.

- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: Currently the ISO determines CBM via an LOLE study based on 1/10 of a day/year. Currently Ohio does not have a requirement for an LOLP. ReliabilityFirst has established a 1 day in 10 year LOLP criteria that is voluntary. In the future, the ISO PRSG may self-contract an LOLP enforcement requirement. It is expected that the ISO market rules will eventually enforce LOLP.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: We do not agree with combining all of the above mentioned standards in one standard (MOD-004). This coupled with the need to make a distinction between the ATC calculation methods used and the descriptive procedure for resource adequacy assessment has made the new MOD-004 very convoluted, and the requirements difficult to follow and measured. If combining some standards of related objective is desired, a more manageable and appropriate alternative is to divide these 4 standards into two groups - one on the determining and verifying the calculation of CBM and the other on the use and reporting of use of CBM.

**2.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments: In a general sense, yes, but the amount of detail seems to exceed the requirements implied by the FERC directives, which has resulted in repetitions and circular requirements. For example, R5 repeats most of R4's requirements, except in R5 the retention periods are specified, which arguably should be covered in the compliance section. Another example is R6.1 suggests that the CBM is calculated as a parameter or a by-product of a resource adequacy assessment, but R6.2 requires that the load assumption of the CBM study be the same as that assumed in the the resource adequacy assessment.

**3.** The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

☐ Yes

☒ No

Comments: There is only one requirement for the Transmission Planner, and that is in R13. However, we do not feel that R13 belongs to this standard. The inclusion of requested and projected CBM values in its planning process belongs to a standard that stipulate requirements for transmission planning. If this requirement is removed or relocated, then TP does not need to be included as an applicable entity. Similar thoughts for the applicability of the BA.

**4.** The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: Please see the above comments on some of the repetitive and extraneous requirements.

**5.** In the NERC glossary, CBM is defined as being necessary to meet “Generation Reliability Requirements.” Do you believe the current NERC definition is adequate? If “No,” please explain why in the comments area.

☐ Yes

☒ No

Comments: We should redefine it along the line that is provided in FERC's directive that CBM is required for generation deficiency only.

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If “Yes” please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☒ No

Comments: By virtue of the definition and formula of ATC determination, CBM is the component that must be allotted before any transmission service requests are assessed and granted.

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments: The way it is specified in R3.3 (and R3.2) is the correct approach.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: CBM is intended for having transmission capability to meet generation deficiency. If this deficiency can be met via other means, then the CBM allotted will no longer be required and could even be reduced to 0 if required.

**9.** Do you think that Requirement R6 is appropriate for this standard? If “No,” please explain why in the comments area.

☒ Yes

☒ No

Comments: By and large, R6 describe the process and assumption requirements for resource adequacy assessment via which the CBM is determined. It is our interpretation that FERC requires the basis of this assessment be made known to support and demonstrate a fair and consistent approach is taken in determining the CBM value. That said, R6 could arguably be placed in a standard on resource adequacy assessment. If R6 is to stay, at the very least some of the subrequirements can be removed or combined (see Comments under Q2 for an example).

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: However, there are entities that do not provide physical transmission services. Hence, these standards or some of the requirements in these standards may not apply.

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: ETC is introduced in this standard for the first time and hence this term needs to be defined here.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: In Ontario, it would be the IESO and the Ontario Power Authority (OPA) which would be responsible for establishing generation reserve and resource adequacy requirements.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: The IESO uses stochastic tools like GE MARS to establish reserve requirements for meeting loss of load expectations (LOLE). However, for Ontario, the concept of CBM is not used and is set to 0.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. **Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin.  Once there is consensus on the requirements, the drafting team will add measures and compliance elements.  Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages.  Comments must be submitted by **June 24, 2007**.  You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: We do not agree with combining all of the above mentioned standards in one standard (MOD-004). This, coupled with the need to make a distinction between the ATC calcualtion methods used and the descriptive procedure for resource adequacy assessment has made the new MOD-004 very convoluted, and the requirements difficult to follow and measured. If combining some standards of related objective is desired, a more manageable and appropriate alternative is to divide these 4 standards into two groups - one on the determining and verifying the calculation of CBM and the other on the use and reporting of use of CBM.

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: In a general sense, yes, but the amount of detail seems to exceed the requirements implied by the FERC directives which has resulted in repetitions and circular requirements. For example, R5 repeats most of R4's requirements, except in R5 the retention periods are specified, which arguably should be covered in the compliance section. Another example is R6.1 suggests that the CBM is calculated as a parameter or a by-prodcut of a resource adequacy assessment, but R6.2 requires that the load assumption of the CBM study be the same as that assumed in the the resource adequacy assessent.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: There is only one requirement for the Transmission Planner, and that is in R13. However, we do not feel that R13 belongs to this standard. The inclusion of requested and projected CBM values in its planning process belongs to a standard that stipulate requirements for transmission planning. If this requirement is removed or relocated, then TP does not need to be included as an applicable entity. Similar thoughts for the BA.

**4.** The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: Please see the above comments on some of the repetitive and extraneous requirements.

5. In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: We should redefine it along the line that is provided in FERC's directive that CBM is required for generation deficiency only.

6. In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☒ No

Comments: By virtue of the definition and formula of ATC determination, CBM is the component that must be allotted before any transmission service requests are assessed and granted.

7. Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: CBM on path/flowgate should be the 'max' rather than 'sum' of all that's required to meet each individual LSE's resource adequacy requirement. Reasoning: Generation emergencies don't happen all at once. Reserve a 'sum' is beyond the 1-day-in-10-year criterion (or whatever criterion that's used by the region), and is not an efficient way of utilizing transmission capacity..

8. If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: CBM is intended for having transmission capability to meet generation deficiency. If this deficiency can be met via other means, then the CBM allotted will no longer be required.

9. Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☒ Yes

☒ No

Comments: By and large, R6 describe the process and assumption requirements for resource adequacy assessment via which the CBM is determined. It is our interpretation that FERC requires the basis of this assessment be made known to support and demonstrate a fair and consistent approach is taken in determining the CBM value. That said, R6 could arguably be placed in a standard on resource adequacy assessment. If R6 is to stay, at the very least some of the subrequirements can be removed or combined (see Comments under Q2 for an example).

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: However, there are entities that do not provide physical transmission services. Hence, these standards or some of the requirements in these stnadards may not apply.

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: ETC is introduced in this standard for the first time. This needs to be defined here.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: Unable to provide a specific answer as a group. Gernally speaking, however, it is the region that stipuates generation reserve and resource adequacy requirements both for long term planning as well as for operating reserve. (SRC please note: I'm only speculating. Don't let me put words in your mouth)

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: Unable to provide a specific answer as a group. Again, the LOLE approach is rather commonly used by the ISOs and RTOs in assessing resource adequacy. (SRC please note: ditto the above)

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: We highly recommend sticking to one single standard to address all of the CBM requirements.

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☒ Yes

   ☐ No

   Comments:

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

**5.** In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: The NERC glossary and CBM definition should be expanded to include other terms, such as "Resource Adequacy" to fully address this issue. This expansion may come as a result of future LSE requests for CBM based on a justification not currently envisioned.

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☒ No

Comments: Absolutely not. The original justification for CBM is that the transmission system was built for the contingencies envisioned by CBM. It was paid for by the original local network customers. No one should be allowed, by queuing process, to supercede this. However, if there is not sufficient transmission capacity to provide a CBM margin as well as requests for transmission service, the system should be expanded to provide the needed capacity. While there is a system impact process to cover this situation, it has not worked well in the last 10 years. Improved import capacity into a deficient system to meet all needs should be addressed in the planning process not some queuing process.

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: It should be based on the response of the network to the most likely sources. It is important that the availability of generation in the source area be considered when doing this. For example, assuming a source network with minimal reserves would be a poor assumption. This is an area that will ultimately require a very astute compliance monitor to determine compliance.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: This is a simple answer. You invite double counting if you don't reduce CBM when this happens. It amounts to hoarding. This is already a problem in our opinion.

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☒ Yes

☒ No

Comments: How else would a compliance monitor be able to evaluate a justification for CBM if he doesn't have the input used to make such a determination. If anything, this could be expanded to assist the compliance monitor in such a determination.

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: R4 gives the LSE great latitude in defining their resource adequacy requirements. R4 allows the LSE to fully document whatever requirement they have. It will ultimately be up to the compliance monitor to evaluated their justification and documentation.

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: (note question 11 should have referred to MOD-004 not MOD-001) While compliance has not been addressed, it is worth noting that the compliance monitor for CBM requirements will have to be a very astute individual or group to deal with the multiple possible resource adequacy requirements under the ERO. They will no doubt have to deal with non-jurisdictional entities to make their evaluations. We suspect it will be a lengthy process in some cases. We would also like to point out that the TSP has little latitude in using the MW import requirement supplied by the LSE. If they suspect that this value is too high, they don't have recourse here to do anything about it. Even if a large fine could result from a compliance issue, the TSP must sell service with a margin they may have good reason to feel is unjustified. Is a large find justification enough to not give the TSP some latitute?

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: ITC does not have a resource adequacy requirement. We must work with the LSEs in our service territory to determine appropriate CBM to plan for. These requirements allow for this to happen.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: ITC does not have a requirement, although we are familiar with the LOLE/LOLP evaluations. We strongly believe that R6 is a must for this standard. We have heard estimates that as much as 90% of the load in this country is subject to LOLE requirements based on LOLP studies. To not have requirements in this area would be negligent.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☒ Yes

   ☐ No

   Comments:

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: R8.1 needs clarification.

**5.** In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☐ No

Comments:

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: The use of CBM capacity is for LSE under any potential emergency of generation deficiency. By modeling the CBM as the transaction from the POR to POD at the required CBM import MW level would treat the adverse operation asa normal condition and reduce the import TTC for the TSP.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: 1. R3.1.2, R3.2.1, and R3.3.1 should be clarified by matching the language in FERC 890 as follows: "The Transmission Service Provider shall not include transmission capacity set aside for THE INCREMENTAL POWER FLOWS RESULTING FROM reserve sharing in CBM." (The words in all caps be added.) It could be that CBM is reserved to the LSE's generation reliability criteria which is based upon a reserve sharing requirement. It is just that those flows that result from increment power flows resulting from reserve sharing are to be included in TRM. 2. In R1.1, it would be better to include the exact language from Order 890 in the parantheses to explain the resource adequacy requirements that are to be included in the CBM, as follows: "…..for meeting its resource adequacy requirement (i.e., its procedure for setting aside of Transfer Capability in the form of CBM to MEET a Load-Serving Entity's GENERATION RELIABILITY CRITERIA.)

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: I believe that the Functional Entity as provided in A.4.1.1 should not be qualified, for example, A.4.1.1 should just list Load-Serving Entity. However, if the Standards Drafting Team continues to list only those "Load-Serving Entity that is entitled and would like to have transmission capability set aside in the form of CBM" then I recommend that "would like" changed to "needed" in other words, reservation of CBM should not be based on likes but based on needs as demonstrated with the studies to be provided in support of the CBM.

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: 1. I recommend that R2 be changed from "following a request by an entity with a valid need for such information" to "following a request by a Functional Entity with a valid need for such information, subject to security and confidentiality requirements." 2. R5.3 does not represent all the conditions that organizationally exist, therefore, I recommend that a bullet be added under R5.3 as follows" "Planning Reserve Sharing Group reserve margin to meet the Regional Reliability Organization resource adequacy requirements". 3. R6.2 should refer to "a load forecast that has a 50/50% probability of occurrence". This means that there is a 50% probability that the load will actually be below the forecast and there is a 50% probability that the load is above the forecast. A statement that it is a 50% probability forecast has no mening without adding some information to it. For example, is it a 50% Confidence Interval forecast in which case it would be two numbers with 50 percent probability that the actual number will be within the two numbers.

5. In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☒ Yes

☒ No

Comments: It would be better if CBM is defined in the NERC glossary as provided in the FERC Order 890 as meeting "Generation Reliability Criteria" however, the existing definition is adequate.

6. In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☒ No

Comments: CBM is basic reliability requirement. If not met, transmission expansion planning should plan for it and should not sell addition transmission service on the same path/flowgate.

7. Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: CBM on path/flowgate should be the 'max' rather than 'sum' of all that's required to meet each individual LSE's resource adequacy requirement. Reasoning: Generation emergencies don't happen all at once. Reserve a 'sum' is beyond the 1-day-in-10-year criterion (or whatever criterion that's used by the region), and is not an efficient way of utilizing transmission capacity.

8. If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: It is to the benefits of all stakeholders if the use of transmission is optimized so CBM should be re-evaluated and possible reduced if CBM is met by other means.

9. Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☒ Yes

☒ No

Comments: I prefer if all CBM requests were supported by appropriate probabilistic based studies. It does seem odd that when the better approach (the probabilistic approach) is used, then the standard has all kinds of requirements defining how the better approach is to be done.

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: The purpose of each of the standards should be revised to be more in-line with the other ATC/TTC/TRM stanadards. The purpose in this standard be revised to state: "To promote the consistent and transparent…use of Capacity Benefit Margin (CBM) for reliable system operation."

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: It is my understanding of the 2005 Energy Policy Act that the Regional Reliability Organization or NERC can either set the generation reliability critiera or enforce the generation reliability criteria, but it cannot do both. The MRO is in the process of proposing to set the generation reliability criteria as 1 day in 10 years. It will be the responsibility of the Load Serving Enetity or its delegate (such as a Planning Reserve Sharing Group) within the MRO to set the reserve margin to meet the 1 day in 10 year criteria. The State will enforce the generation reliability criteria and the Planning Reserve Sharing Group will enforce the reserve margin requirement.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: I would prefer an LOLE study requirement to support the CBM requests of the Load Serving Entities.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

### Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: 1. R3.1.2, R3.2.1, and R3.3.1 should be clarified by matching the language in FERC 890 as follows: "The Transmission Service Provider shall not include transmission capacity set aside for THE INCREMENTAL POWER FLOWS RESULTING FROM reserve sharing in CBM." It could be that CBM is reserved to the LSE's generation reliability criteria which is based upon a reserve sharing requirement. It is just that those flows that result from increment power flows resulting from reserve sharing are to be included in TRM. 2. In R1.1, it would be better to include the exact language from Order 890 in the parantheses to explain the resource adequacy requirements that are to be included in the CBM, as follows: ".....for meeting its resource adequacy requirement (i.e., its procedure for setting aside of Transfer Capability in the form of CBM to MEET a Load-Serving Entity's GENERATION RELIABILITY CRITERIA.) 890 and 693 also require some level of consistency and the methodology requirements for CBM appear to be fill-in-the-blank.

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☒ Yes

   ☐ No

   Comments:

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: Many of the requirements are fill-in-the-blank (Isn't R1.2 a requirement to "tell me how you do it? and shouldn't it be "this is how you do it")

**5.** In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☒ Yes

☐ No

Comments: This should be address in the TSPs OATT and filed at FERC. (Maybe it could be a requirement to just that in this standard)

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments: (Not sure if the Yes/No is for the first part of thequestion or the second) Network Response on path should be based upon network response by modeling it from the POR to the POD.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: It is to the benefits of all stakeholders if the use of transmission is optimized so CBM should be re-evaluated and possible reduced if CBM is met by other means. Maybe the TSPs OATT should be the right place for this information.

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: FERC Order 890 required consistency and this standard does not require any consistency.

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: The purpose of each of the standards should be revised to be more in-line with the other ATC/TTC/TRM stanadards. We recommend that the purpose in this standard be revised to state: "To promote the consistent and transparent…use of Capacity Benefit Margin (CBM) for reliable system operation." The standard should make it clear that an LSE should be required to do comply with certain requirements within this standard only if it requests CBM. Also this industry is sophisticated enough to perform or have performed a probabilistic study so that it what the CBM should be based on.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply:

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: LOLE study

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: 1. R3.1.2, R3.2.1, and R3.3.1 should be clarified by matching the language in FERC 890 as follows: "The Transmission Service Provider shall not include transmission capacity set aside for THE INCREMENTAL POWER FLOWS RESULTING FROM reserve sharing in CBM." (The MRO is recommending that the words in all caps be added.) It could be that CBM is reserved to the LSE's generation reliability criteria which is based upon a reserve sharing requirement. It is just that those flows that result from increment power flows resulting from reserve sharing are to be included in TRM. 2. In R1.1, it would be better to include the exact language from Order 890 in the parantheses to explain the resource adequacy requirements that are to be included in the CBM, as follows: ".....for meeting its resource adequacy requirement (i.e., its procedure for setting aside of Transfer Capability in the form of CBM to MEET a Load-Serving Entity's GENERATION RELIABILITY CRITERIA.)

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☒ No

   Comments: The MRO believes that the Functional Entity as provided in A.4.1.1 should not be qualified, for example, the MRO recommends that A.4.1.1 just list Load-Serving Entity. However, if the Standards Drafting Team continues to list only those "Load-Serving Entity that is entitled and would like to have transmission capability set aside in the form of CBM" then the MRO recommends that "would like" changed to "needed" in other words, reservation of CBM should not be based on likes but based on needs as demonstrated with the studies to be provided in support of the CBM.

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: 1. MRO recommends that R2 be changed from "following a request by an entity with a valid need for such information" to "following a request by a Functional Entity with a valid need for such information, subject to security and confidentiality requirements." 2. R5.3 does not represent all the conditions that organizationally exist in the MRO, therefore, we recommend that a bullet be added under R5.3 as follows" "Planning Reserve Sharing Group reserve margin to meet the Regional Reliability Organization resource adequacy requirements". 3. R6.2 should refer to "a load forecast that has a 50/50% probability of occurrence". This means that there is a 50% probability that the load will actually be below the forecast and there is a 50% probability that the load is above the forecast. A statement that it is a 50% probability forecast has no mening without adding some information to it. For example, is it a 50% Confidence Interval forecast in which case it would be two numbers with 50 percent probability that the actual number will be within the two numbers.

**5.** In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☒ Yes

☒ No

Comments: It would be better if CBM is defined in the NERC glossary as provided in the FERC Order 890 as meeting "Generation Reliability Criteria" however, the existing definition is adequate.

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☒ No

Comments: CBM is basic reliability requirement. If not met, transmission expansion planning should plan for it and should not sell addition transmission service on the same path/flowgate.

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: CBM on path/flowgate should be the 'max' rather than 'sum' of all that's required to meet each individual LSE's resource adequacy requirement. Reasoning: Generation emergencies don't happen all at once. Reserve a 'sum' is beyond the 1-day-in-10-year criterion (or whatever criterion that's used by the region), and is not an efficient way of utilizing transmission capacity.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: It is to the benefits of all stakeholders if the use of transmission is optimized so CBM should be re-evaluated and possible reduced if CBM is met by other means.

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☒ Yes

☒ No

Comments: The MRO would prefer if all CBM requests were supported by appropriate probabilistic based studies. It does seem odd that when the better approach (the probabilistic approach) is used, then the standard has all kinds of requirements defining how the better approach is to be done.

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: The purpose of each of the standards should be revised to be more in-line with the other ATC/TTC/TRM stanadards. The MRO recommends that the purpose in this standard be revised to state: "To promote the consistent and transparent…use of Capacity Benefit Margin (CBM) for reliable system operation."

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: It is the MRO's understanding of the 2005 Energy Policy Act that the Regional Reliability Organization or NERC can either set the generation reliability critiera or enforce the generation reliability criteria, but it cannot do both. The MRO is in the process of proposing to set the generation reliability criteria as 1 day in 10 years. It will be the responsibility of the Load Serving Enetity or its delegate (such as a Planning Reserve Sharing Group) within the MRO to set the reserve margin to meet the 1 day in 10 year criteria. The State will enforce the generation reliability criteria and the Planning Reserve Sharing Group will enforce the reserve margin requirement.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: MRO would prefer an LOLE study requirement to support the CBM requests of the Load Serving Entities.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: What happened to the requirement that CBM is a planning quantity only and tends to zero in the operating horizon. Does this mean that CBM cannot be used for non-firm import transactions?

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☐ Yes

   ☐ No

   Comments:

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

5. In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: CBM is required to meet Resource Adequacy Requirements. Generation Reliability implies that access to transmission makes generation (and generators) more reliable. Resource Adequacy ensures that firm load can be supplied to a level of reliability adopted by the RRO. The resources to meet those requirements include reserve margin provided by excess generation or interruptable load. If the "resource" is located across a posted path, then CBM provides access to the resource. Since "resource" can include generation and load, then the NERC definition is insufficient.

6. In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☒ Yes

☐ No

Comments: There can easily be conflicts for multple LSE's requesting CBM, and there is a problem if the aggregate of all CBM requests exceeds the transmission capacity (R7). Therefore, if this is a new requirement, then there must be some "open season" to collect requests within a fixed time window similar to the Section 2.1 of FERC Order 888 pro-forma tariff. The CBM would be awarded to all comers if there is sufficient capacity but is allocated in lottery fashion if there are more requests than capacity. However, there is the question of the role of ETC in allocating CBM by this method. How much transmission capacity would be offered for CBM? I assume that existing Transmission Reservations cannot be impacted by the CBM bidding process, so only ATC for the planning horizon (if there is any) can be offered. What would an LSE pay for CBM. If it was required to pay the same as it would for a long-term (firm) reservation, then are they really getting CBM or are they getting a long-term firm Transmission Reservation). Some entities interpret Section 2.1 of Order 888 pro-forma tariff to permit bidding on amount and duration to award capacity to the "highest net present value" of the capacity. If there is no charge for CBM, how does the TSE recover lost transmission revenue? It seems that many of these questions must be directed to NAESB

7. Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☒ Yes

☒ No

Comments: It will depend on where the LSE is located in relation to the interface. For example, can an LSE request CBM to access reserve capacity two systems away? Let's say that there are there radially connected systems A is connected to B and C is is only connected to B. LSE#1 in A requests CBM through B to access capacity in C. LSE#2 requests access to capacity in A. In assigning import CBM on the A-B interface, LSE B must consider that the requirement for capacity reserve is due to a shortage in B or in C or to a lesser probability in B+C.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: CBM requirements can change from year to year. For example, if the market responds to price signals and additional generation is built, there is no longer a need for the originally plannned CBM, which should be released to the market. The same is true for entities which are required to install renewable generation or demand-side management programs, which can free existing generation to provide Resource Adequacy without the need for CBM

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments: There should be a high level of proof that CBM is required. An important component is the ability to deliver this energy with single contingencies.

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: R2 requires documention to be "publically released" (published on OASIS) information that is either commercially sensitive or can include Critical Infrastructure Information, the wording of R8 in MOD-008 should be used in MOD-004 to protect information. The process of taking bids on CBM will require modifcations to transmission tariffs Tariffs and Market Rules may have to be updated to reflect the new requirements.

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: The standard does not address the issue of export transmission capacity, since CBE is an import capacity only. An interface involves at least two TSP's: the TSP owning the export side and the TDP owning the import side. Has the drafting team examined the issues around a LSE that requests CBM held back from import but the export TDP can accept reservations without consideration to CBM. Say that the ATC on A-B interface is 200 MW. An LSE in B requires 50 MW of CBM which reduces import ATC on the B side to 150 MW and ATC on the A side remains at 200 MW. A transmission customer in B requests firm reservations on the A-B interface of 200 MW. The A TSP assigns 200 MW to the customer and the B TSP says he can only have 150 MW. The customer takes all 200 MW on the A side but nothing on the B side. Does he then effectively block A-B transactions?.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: NPCC sets LOLE standards.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: LOLE simulations with assumed transmission capacity, however the answer is around 20% reserve

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: PSCSC reviews reserve margin / resource adequacy of regulated electric utilities in Integrated Resource Plans.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: Our comments are from a regulatory perspective. This is strictly a technical issue.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☒ Yes

   ☐ No

   Comments:

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments:
   5.2 comments: The wording in R5.2 of the proposed standard implies that only one of the identified entities has a role in determining the Load-Serving Entity's resource adequacy requirements. These adequacy requirement could be determined by one or more or none of the listed entities. This requirement should be reworded to require the LSE to list the responsible entity(ies).

   Suggested wording:

R5.2. Identify the entity(ies) (e.g., the municipality, state commission, Regional Transmission Organization/Independent System Operator, Regional Reliability Organization, or Regional Entity) responsible for establishing the Load-Serving Entity's resource adequacy requirements.

5.3 comments: The Load-Serving entity should be added to the list in R5.3.

6.4 comments: The resources referenced in R6.4 should be limited to only those owned or controlled by the Load-Serving entity. Therefore, R6.4 should be reworded and R6.4.2. should be removed.

Suggested wording:
"R6.4. Identify all resources that are owned or controlled by the Load-Serving Entity in its area excluded from serving the Load-Serving Entity's load, including:"

6.5 & 6.7.1 comments: Replace rates with assumptions.

6.7.5 comments (grammatical): Change effect to affect.

**5.** In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☒ Yes

☐ No

Comments: The request to reserve (set aside) a CBM amount by the LSE should be treated like any other firm transmission service request.

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: For this method, a maximum TTC is calculated for each path, and the CBM set aside is decremented from that path to yield the remaining capacity available for Firm use. The network response for the CBM set aside (POR to POD) is considered and reflected in the TTC when it is calculated. To consider the network response of the CBM set aside for a second time would result in a lower value than the requested amount being decremented from the requested path. This could result in an over-commitment for that path.

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: This could facilitate the opportunity for hording transmission capacity. The standard as drafted requires the LSE to request CBM as needed and maintain the proper documentation as required.

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: This requirement would be best addressed in the resource adequacy standard. If the drafting team decides not to remove R6, more specific comments were made in question 4.

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: R7 requires the Transmission Service Provider to answer a request for CBM within 30 days of receipt. This is inconsistent with the time allowed to answer other firm transmission service requests per Tariff and should be revised to track the tariff requirements for processing long term firm transmission requests.

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments:

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply:

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: Addressing these concerns should be the role of the resource adequacy drafting team and should be handled in the resource adequacy standard.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

Comments:

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments:

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: SRP sets its Generation Reserve and Resource Adequacy requirements in accordance with WECC Standards.

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

Reply: SRP's current planning reserve target is based on historical study work that considered unit availability, load uncertainty, and projected costs associated with carrying different levels of reserves.

Please use this form to submit comments on the 1st draft of standard MOD-004-1 Capacity Benefit Margin. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

Capacity Benefit Margin (CBM) is one component of the TTC/ATC/AFC calculations, the calculation, verification, preservation, and use of which is detailed in draft standard MOD-004-1.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-004-1 Capacity Benefit Margin. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-004-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "CBM Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.

   ☒ Yes

   ☐ No

   Comments:

4. The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

**5.** In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**6.** In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.

☐ Yes

☐ No

Comments:

**7.** Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**8.** If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**10.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**11.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments: I suggest the following changes to the definitions: Transmission Service Request: A request by the Transmission Customer to the Transmission Service Provider for transmission service to move energy from a Point of Receipt to a Point of Delivery.

**In R1 requirements, the multiple meanings of "its" is confusing. Also, Network Customers can have many PORs and PODs on a system, there could be several hundred combination paths, an unmanagable number. I suggest the following language for R1 requirements.**

**R1. The Transmission Service Provider shall make publicly available:**

**R1.1. Its procedure for a Load-Serving Entity to request a CBM import MW requirement on each Point of Receipt for meeting its resource adequacy requirement (i.e., its procedure for setting aside of Transfer Capability in the form of CBM to maintain a Load-Serving Entity's resource adequacy requirement).**

**R1.2. Its procedure and assumptions for allocating CBM over each path or Flowgate.**

**R1.3. Its procedure for CBM use (i.e., its procedure for scheduling of energy over transmission capacity set aside as CBM).**

**R1.4. The most recent values of CBM used for calculating Available Transmission Capacity (ATC) or Available Flowgate Capability (AFC) for each timeframe by Flowgate or path, as applicable.**

**(If this comment is adopted, this same type of change is needed in other places in this standard)**

.

In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

**12.** What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)?
Reply: .

**13.** With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource.

**Consideration of Comments on 1st Draft of Standard MOD-004-1 — Capacity Benefit Margin (Project 2006-07)**

The ATC Standard Drafting Team thanks all commenters who submitted comments on Draft 1 of the MOD-004-1 Capacity Benefit Margin. This standard was posted for a 30-day public comment period from May 25 through June 24, 2007. The drafting team asked stakeholders to provide feedback on the standard through a special standard Comment Form.

There were 20 sets of comments, including comments from 97 different people from more than 45 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received from stakeholders, comments from the cooperative effort with NAESB in developing associated business practices, and comments received from FERC staff, the drafting team has significantly redrafted the standard. The changes have been so extensive that the revised standard bears very little resemblance to the last posted draft. Major changes include:

- Added two defined terms: Generation Capability Import Requirement (GCIR) and Capacity Benefit Margin Implementation Document (CBMID)
- Revised the proposed definitions of Flowgate, Total Flowgate Capability, and Available Flowgate Capability – but moved these definition to the draft MOD-030 standard
- Eliminated Transmission Reservation and Transmission Service Request as proposed defined terms
- Modified the Purpose statement to clarify that the purpose is to ensure reliable system operations rather than accurate calculation of transfer capabilities
- Adopted the use of the defined term, 'Posted Path' to match the definition used by FERC and NAESB (without the explanatory information at the end of the definition)
- Modified the description of the Load-Serving Entities that must comply with the standard so that the standard now applies to all Load-Serving Entities. While the standard does not require that all LSEs must request CBM, it does allow any Load-Serving Entity to use CBM in a capacity deficiency emergency even if they did not originally request to have it set aside. (They would, however, only be allowed to use CBM if those, who originally asked for it, were not using it).
- Modified R1 so that it requires a Capacity Benefit Margin Implementation Document rather that includes a set of procedures rather than just identifying the list of procedures
- Eliminated the posting elements of R1 and R2 as NAESB will address all public postings in its associated business practices but retained the other aspects of the requirements.
- R2 which required the Transmission Service Provider to make copies of its models used to determine CBM available to others has been modified and merged into R7 in the revised standard.
- Added more details to R3 to clarify that the Transmission Service Provider must first determine the amount of CBM to allocate for each CBM request, then set CBM for each

116-390 Village Boulevard, Princeton, New Jersey 08540-5721
Phone: 609.452.8060 ▪ Fax: 609.452.9550 ▪ www.nerc.com

Posted Path or Flowgate according to a set of criteria. The revised requirement (R4 in the revised standard merges portions of R3 and R7.

- R4 required the Load-Serving Entity that wants CBM to submit a request for CBM at least annually. This requirement has been modified to expand on the scope of documentation that must be provided to support the request for CBM. For example, in the revised requirement the Balancing Authority that has the generation to be imported must be identified, resource studies that show the need for CBM must be provided, etc. A sub-requirement was added to require the Load-Serving Entity to update its CBM request at least once every 31 days.
- R5 was structured as a data retention requirement for the Load-Serving Entity. Many of the items listed have been moved into the revised R3 and must be supplied to the Transmission Service Provider with the request for CBM. The drafting team deleted the data retention aspect from the requirement. Data retention is addressed in the compliance section of the revised standard and is identified on a requirement-by-requirement basis.
- R6 required the Load-Serving Entity to follow certain steps if it performed probabilistic studies for determining CBM import MW requirements and the drafting team removed the requirement from the revised standard. The revised standard assumes that studies have been conducted and requires the results of the studies be provided with a request for CBM, but the revised standard does not identify 'how' to perform these studies.
- R7 was merged into the revised R3. The portion of R7 that required the Transmission Service Provider to make a CBM Import Entitlement Report 'publicly available' has been removed from the revised standard. NAESB is developing business practices to address all of the 'posting' requirements associated with the set of ATC-related standards.
- R8 stated an 'allowance' for the Load-Serving Entity to request CBM under certain conditions. The requirement did not include a statement of required performance and several commenters indicated it was difficult to understand. The drafting team removed this from the revised standard.
- R9 required the Balancing Authority to waive timing and ramping requirements for scheduling of energy over transmission capacity set aside as CBM. This requirement was revised to require both the Balancing Authority and Transmission Service Provider to adhere to this requirement.
- R10 required the Load-Serving Entity to declare a NERC Energy Emergency Alert (EEA) level 2 before scheduling energy over transmission capacity set aside as CBM. This requirement was modified to clarify that it is not the Load-Serving Entity that 'declares' the EEA, but the Load-Serving Entity is 'experiencing' an EEA level 2. (See R8 in the revised standard)
- R11 required the Load-Serving Entity to provide a report to its Transmission Service Provider after scheduling energy over transmission capacity set aside as CBM and to retain that report for five years. The drafting team removed this requirement as any reporting requirements can be addressed under the compliance section of the standard as 'Exception Reporting'.
- R12 required the Transmission Service Provider to make the report from R11 'publicly available' and since the report is no longer required and NAESB is addressing all posting requirements, this requirement was removed from the revised standard.
- R13 required the Transmission Planner to consider CBM import MW requirements in its planning processes. This requirement has been merged into ~~R4~~ R5 and more details have been added to the requirement for the Transmission Planner.

- R14 required the Load-Serving Entity to avoid use of the same uncertainties for both CBM and TRM. A similar requirement is within MOD-008 — Transmission Reliability Margin and the drafting team removed R14 from MOD-004 to avoid having the same requirement in more than one standard.
- Added measures and compliance elements.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/Backup_Facilities.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

## Index to Questions, Comments, and Responses

1. **The drafting team combined the topics of MOD-004-0, MOD-005-0, MOD-006-0, and MOD-007-0 into the draft MOD-004-1 in an attempt to make the standard easier to follow. Do you agree with the drafting team's decision to combine all the requirements for Capacity Benefit Margin calculation, verification, preservation, and use into a single standard? If "No," please explain why in the comments area.**

**Summary Consideration:** Most stakeholders who responded to this question indicated a preference for keeping the requirements in a single standard. Based on responses received, the drafting team has retained the requirements in a single standard.

| **Question #1** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| BPA | | ☑ | R1 of MOD-004-1 needs to clarify that CBM procedures need only be made publicly available if the Transmission Service Provider uses CBM. |
| **Response:** All public posting requirements will be addressed by NAESB, however, FERC has indicated that the TSP must offer CBM to its LSEs, and as such, the standard requires all TSPs to prepare and maintain CBM procedures. | | | |
| IESO<br>IRC SRC | | ☑ | We do not agree with combining all of the above mentioned standards in one standard (MOD-004). This coupled with the need to make a distinction between the ATC calculation methods used and the descriptive procedure for resource adequacy assessment has made the new MOD-004 very convoluted, and the requirements difficult to follow and measured. If combining some standards of related objective is desired, a more manageable and appropriate alternative is to divide these 4 standards into two groups - one on the determining and verifying the calculation of CBM and the other on the use and reporting of use of CBM. |
| **Response:** Based on stakeholder responses received, the consensus is to keep the single standard. Note that several requirements have been removed from the revised standard, including the requirements referencing resource adequacy. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC comments. | | | |
| ITC | ☑ | ☑ | We highly recommend sticking to one single standard to address all of the CBM requirements. |
| **Response:** Most responders agree and based on stakeholder responses received, the consensus is to keep the single standard. | | | |
| Entergy Services | ☑ | | Entergy supports combination of CBM Calculation, verification, preservation, and use into one standard. |
| **Response:** Most responders agree and based on stakeholder responses received, the consensus is to keep the single standard. | | | |
| Duke Energy | ☑ | | |

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |

| SERC ATCWG | ☑ | | |

2. **The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to CBM (summarized in Attachment 1). Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to CBM in this draft of MOD-004-1? If "No," please explain why in the comments area.**

**Summary Consideration:** Most stakeholders who responded to this question indicated that the drafting team has adequately responded to all of the Commission's directives in Order 890 and 693, however there were some suggestions for modifications that would improve compliance with the directives.

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The Standard, as written, will continue to allow the applicable functions to define CBM without any amount of consistency, which is what Order 890 wanted the Standards to accomplish. In addition, the Standard does not recognize that ATC is calculated on 3 different time horizons and CBM transmission reservation will vary from the Monthly to the Daily to the Hourly calculations. |
| **Response:** The standard requires the LSE "prove" and document its need for CBM. It is quite possible that these requirements will not be consistent across the country. By law, the ERO cannot determine these requirements but is fully responsible for ensuring that the LSE is stating these requirements accurately as determined by "the entity responsible for establishing the Load-Serving Entity's resource adequacy requirements." However, it is expected that most requirements will be based on some LOLE requirement. The compliance monitor (now called the Compliance Enforcement Authority) will be required to ensure that the LSE is not deviating from the resource adequacy requirements of the "entity responsible" for these requirements. | | | |
| MEC Trading<br>MEC<br>MRO | | ☑ | 1. R3.1.2, R3.2.1, and R3.3.1 should be clarified by matching the language in FERC 890 as follows: "The Transmission Service Provider shall not include transmission capacity set aside for THE INCREMENTAL POWER FLOWS RESULTING FROM reserve sharing in CBM." It could be that CBM is reserved to the LSE's generation reliability criteria which is based upon a reserve sharing requirement. It is just that those flows that result from increment power flows resulting from reserve sharing are to be included in TRM.<br><br>2. In R1.1, it would be better to include the exact language from Order 890 in the parantheses to explain the resource adequacy requirements that are to be included in the CBM, as follows: "…..for meeting its resource adequacy requirement (i.e., its procedure for setting aside of Transfer Capability in the form of CBM to MEET a Load-Serving Entity's GENERATION RELIABILITY CRITERIA.)<br><br>890 and 693 also require some level of consistency and the methodology requirements for CBM appear to be fill-in-the-blank. |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** 1.) The drafting team agrees that this is what FERC intended. Please see the revised requirement in the summary consideration above. As defined, CBM is a transaction and you can't subtract flows from transactions. In the revised standard's R4.2.1, we subtract "the transfer capability set aside for reserve sharing" because this is a transaction quantity. Posted Paths are transaction paths (ATC)<br><br>In 4.2.2 we subtract "the 'impact' of transfer capability set aside for reserve sharing. The "impact" is a flow quantity. Flowgates use "flows" and not transactions (AFC). This "impact" equals what FERC calls the "incremental power flows resulting from reserve sharing".<br><br>2.) The existing language is appropriate based on FERC's use of the term in attachment C, paragraph e of the pro-forma OATT included with Order 890.<br>The standard drafting team has attempted to increase the consistency of CBM determination in the latest revision. Please see the summary of changes to requirement on the cover page of this report. | | | |
| Nova Scotia Power | ☑ | ☑ | What happened to the requirement that CBM is a planning quantity only and tends to zero in the operating horizon. Does this mean that CBM cannot be used for non-firm import transactions? |
| **Response:** This requirement has been addressed in the specific ATC standards, such that non-firm ATC is increased by unscheduled CBM. (See the algorithms for the determination of ATC and AFC in MOD-028, MOD-029 and MOD-030.) | | | |
| IESO<br>IRC SRC | ☑ | | In a general sense, yes, but the amount of detail seems to exceed the requirements implied by the FERC directives, which has resulted in repetitions and circular requirements. For example, R5 repeats most of R4's requirements, except in R5 the retention periods are specified, which arguably should be covered in the compliance section. Another example is R6.1 suggests that the CBM is calculated as a parameter or a by-product of a resource adequacy assessment, but R6.2 requires that the load assumption of the CBM study be the same as that assumed in the the resource adequacy assessment. |
| **Response:** You are correct in that CBM is a by-product of resource adequacy assessments required by whatever entity directs the LSE to meet their requirements. The standard drafting team has attempted to clarify and improve the standard to consolidate where possible. R5 was deleted and is addressed in the compliance section of the standard under data retention. R6 was also deleted from the revised standard. | | | |
| ERCOT | ☑ | | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC comments. | | | |
| Duke Energy | ☑ | | |
| Entergy Services | ☑ | | |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| FirstEnergy | ☑ | | |
| ITC | ☑ | | |
| PSC of SC | ☑ | | |
| Southern Co Svcs | ☑ | | |

3. **The drafting team attempted to clearly identify the functional classes of entities responsible for complying with the proposed draft MOD-004-1 standard and expanded the applicability section of the CBM standard to include all applicable entities. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities you believe the standard should apply to and why.**

**Summary Consideration:** Most commenters who responded to this question supported the applicability section of the standard – there were suggestions to remove the 'qualifying language' associated with the Load-Serving Entity, and the drafting team has removed this qualifying language – the revised standard is applicable to all Load-Serving Entities. There were also some suggestions to clarify the responsibilities of the Transmission Planner. As revised, the Transmission Planner is responsible for two requirements – for allocating CBM for use in the long-term horizon (beyond one year) and for providing copies of the supporting data used to allocate CBM. The Drafting team has rewritten the standard to be more clear, and to explicitly explain the responsibilities of the Transmission Planner.

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | All throughout this Standard the author has Reliability Functions performing duties that are counter to those duties prescribe in the Functional Model. In addition, the SDT has incorrectly included requirements for scheduling of energy, maintenance schedules, and so-on, which are preformed by other Reliability Functions in other Standards. |
| **Response:** We have attempted to address this in the new draft of the standard. Please see the summary of revisions made to the standard on the cover page of this document. | | | |
| MEC | | ☑ | I believe that the Functional Entity as provided in A.4.1.1 should not be qualified, for example, A.4.1.1 should just list Load-Serving Entity. However, if the Standards Drafting Team continues to list only those "Load-Serving Entity that is entitled and would like to have transmission capability set aside in the form of CBM" then I recommend that "would like" changed to "needed" in other words, reservation of CBM should not be based on likes but based on needs as demonstrated with the studies to be provided in support of the CBM. |
| **Response:** We have modified the applicability for the Load-Serving Entity to eliminate the qualifiers in support of your suggestion. | | | |
| MRO | | ☑ | The MRO believes that the Functional Entity as provided in A.4.1.1 should not be qualified, for example, the MRO recommends that A.4.1.1 just list Load-Serving Entity. However, if the Standards Drafting Team continues to list only those "Load-Serving Entity that is entitled and would like to have transmission capability set aside in the form of CBM" then the MRO recommends that "would like" changed to "needed" in other words, reservation of CBM should not be based on likes but based on needs as demonstrated with the studies to be provided in support of the CBM. |
| **Response:** We have modified the applicability for the Load-Serving Entity to eliminate the qualifiers in support of your | | | |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| suggestion. | | | |
| IESO<br>IRC SRC | | ☑ | There is only one requirement for the Transmission Planner, and that is in R13. However, we do not feel that R13 belongs to this standard. The inclusion of requested and projected CBM values in its planning process belongs to a standard that stipulate requirements for transmission planning. If this requirement is removed or relocated, then TP does not need to be included as an applicable entity. Similar thoughts for the applicability of the BA. |
| **Response:** We have rewritten the standard to more fully explain the role of the Transmission Planner. Note that the drafting team did ask stakeholders to weigh in on whether all requirements related to CBM should be contained within a single standard and most commenters indicated support for having all CBM-related requirements in the single standard. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC comments. | | | |
| WECC MIC MIS ATC Task Force | ☑ | | |
| Duke Energy | ☑ | | |
| Entergy Services | ☑ | | |
| FirstEnergy | ☑ | | |
| ITC | ☑ | | |
| MEAG | ☑ | | |
| MEC Trading | ☑ | | |
| PSC of SC | ☑ | | |
| Southern Co Svcs | ☑ | | |
| SERC ATCWG | ☑ | | |

4. **The drafting team created new CBM requirements and expanded or deleted some prior CBM requirements. Do you agree with the requirements identified in the draft standard MOD-004-1? If "No," please explain why in the comments area.**

**Summary Consideration:** Please see the cover page of this report for a complete list of the modifications made to the standard based on stakeholder comments and discussions with NAESB and FERC.

| **Question #4** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| BPA | | | The discussion of CBM in Order 890 and NERC's definition of CBM refer only to generation reliability requirements, not resource adequacy requirements. Please clarify what is meant by "resource adequacy requirements". |
| **Response:** The "resource adequacy requirement" is the same as the "planning" reserve margin as defined by "the entity responsible for establishing the Load-Serving Entity's resource adequacy requirements." For those entities with LOLE requirements, it is usually the LSE's dependence on external resources to meet those LOLE requirements. The drafting team did remove the resource adequacy requirements from the revised standard – the revised standard assumes that the studies have been conducted and requires that the study documentation be provided as part of the request for CBM. | | | |
| WECC MIC MIS ATC Task Force | | ☑ | See general comments. |
| **Response:** See response to general comments. | | | |
| APPA | | ☑ | The Standard has Functional Entities performing duties that is contrary to the Functional Model's directions. Examples are in Requirement R 1.3 and R 10; the scheduling of energy over the transmission capacity that is designated CBM only occur during the active hour to meet "generation reliability requirements." The Balancing Authority is the only Function that has that authority to schedule energy during the real-time. This Standard, as written, will create an environment where confusion will exist during critical situation in the real-time and cause the possibility of a command and control break down during a critical situation in the real-time. To require the Transmission Service Provider or the Load Serving Entity to be responsible for declaring emergencies or scheduling energy during those emergencies will create very non-reliable situation. A large part of this Standard needs to be rewritten to ensure reliable operations. |
| **Response:** Requirement 1.3 in the first draft of this standard required the Transmission Service Provider to document its procedure for an LSE to request CBM. The drafting team did not change the applicability for this requirement as it is the Transmission Service Provider that must have this procedure.<br>R10 in the first draft of this standard required the Transmission Service Provider to declare a NERC EEA 2 – and this has been revised. In the revised standard, this requirement (now R8) clarifies that the LSE cannot request to schedule energy over Firm Transfer Capability set aside as CBM unless the LSE is experiencing a NERC EEA 2 . You are correct that it is not the | | | |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| LSE that 'declares' the EEA 2.<br>As revised, there are no requirements for the Transmission Service Provider or Load-Serving Entity to declare emergencies. | | | |
| IESO<br>IRC SRC | | ☑ | Please see the above comments on some of the repetitive and extraneous requirements. |
| **Response:** See responses to previous questions. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See the response to IRC comments. | | | |
| MEAG | | ☑ | R8.1 needs clarification. |
| **Response:** Several commenters indicated that R8.1 needs clarification and the intent of this requirement has been absorbed into R10 of the revised standard. | | | |
| MEC Trading | | ☑ | Many of the requirements are fill-in-the-blank (Isn't R1.2 a requirement to "tell me how you do it? and shouldn't it be "this is how you do it") |
| **Response:** We have attempted to eliminate the fill-in-the-blank elements of the standard. The drafting team is trying to find the right balance between mandating that all entities perform the calculations the same way, and allowing some latitude for justifiable differences. As the standards are implemented and more documents become 'transparent' the standard may need to be revised to eliminate any 'fill-in-the-blank' elements if there is evidence that this flexibility is adversely impacting either reliabilty or energy markets. | | | |
| MEC | | ☑ | 1. I recommend that R2 be changed from "following a request by an entity with a valid need for such information" to "following a request by a Functional Entity with a valid need for such information, subject to security and confidentiality requirements."<br><br>2. R5.3 does not represent all the conditions that organizationally exist, therefore, I recommend that a bullet be added under R5.3 as follows" "Planning Reserve Sharing Group reserve margin to meet the Regional Reliability Organization resource adequacy requirements".<br><br>3. R6.2 should refer to "a load forecast that has a 50/50% probability of occurrence". This means that there is a 50% probability that the load will actually be below the forecast and there is a 50% probability that the load is above the forecast. A statement that it is a 50% probability forecast has no mening without adding some information to it. For example, is it a 50% Confidence Interval forecast in which case it would be two numbers with 50 percent probability that the actual number will be within the two numbers. |
| **Response :** 1. R2 has been revised such that the portion of the requirement that aimed at making information 'publicly available' was deleted – and the portion that focused on sharing information with reliability-related entities was moved into R7 of the revised standard. R7 of the revised standard has two parts – the first part requires that the Transmission Service Provider give data and information to its Transmission Operators (without needing a request) within 7 days of a modification | | | |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| to CBM – the second part requires the Transmission Service Provider to share the same information with other reliability-related entities that request the information within 7 days of the request. With these changes, the confidentiality issue should not be a concern. All the requirements that indicated that an entity had to make data or information 'publicly available' have been removed from the standard. Public availability of information will be addressed by NAESB in business practices. This modification supports the intent of your suggestion.<br>2. R5 was merged into R3 in the revised standard except that the retention of this data is now addressed in the compliance section of the revised standard. The revised standard requires that all reserve margin requirements be documented – see R3.1.2 in the revised standard. This change supports the intent of your suggestion.<br>3. R6.2 - All of the resource adequacy requirements were removed from the standard as they will be addressed in greater detail in a new resource adequacy standard under development with a different SAR and drafting team. As revised, this standard assumes that the resource adequacy studies have taken place and the studies and study results must be made available as support for a request for CBM. | | | |
| | | ☑ | 1. MRO recommends that R2 be changed from "following a request by an entity with a valid need for such information" to "following a request by a Functional Entity with a valid need for such information, subject to security and confidentiality requirements."<br>2. R5.3 does not represent all the conditions that organizationally exist in the MRO, therefore, we recommend that a bullet be added under R5.3 as follows" "Planning Reserve Sharing Group reserve margin to meet the Regional Reliability Organization resource adequacy requirements".<br>3. R6.2 should refer to "a load forecast that has a 50/50% probability of occurrence". This means that there is a 50% probability that the load will actually be below the forecast and there is a 50% probability that the load is above the forecast. A statement that it is a 50% probability forecast has no mening without adding some information to it. For example, is it a 50% Confidence Interval forecast in which case it would be two numbers with 50 percent probability that the actual number will be within the two numbers. |
| **Response:** 1. R2 has been revised such that the portion of the requirement that aimed at making information 'publicly available' was deleted – and the portion that focused on sharing information with reliability-related entities was moved into R7 of the revised standard. R7 of the revised standard has two parts – the first part requires that the Transmission Service Provider give data and information to its Transmission Operators (without needing a request) within 7 days of a modification to CBM – the second part requires the Transmission Service Provider to share the same information with other reliability-related entities that request the information within 7 days of the request. With these changes, the confidentiality issue should not be a concern. All the requirements that indicated that an entity had to make data or information 'publicly available' have been removed from the standard. Public availability of information will be addressed by NAESB in business practices. This modification supports the intent of your suggestion.<br>2. R5 was merged into R3 in the revised standard except that the retention of this data is now addressed in the compliance section of the revised standard. The revised standard requires that all reserve margin requirements be documented – see R3.1.2 in the revised standard. This change supports the intent of your suggestion. | | | |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| 3. R6.2 - All of the resource adequacy requirements were removed from the standard as they will be addressed in greater detail in a new resource adequacy standard under development with a different SAR and drafting team. As revised, this standard assumes that the resource adequacy studies have taken place and the studies and study results must be made available as support for a request for CBM. | | | |
| Southern Co Svcs | | ☑ | 5.2 comments: The wording in R5.2 of the proposed standard implies that only one of the identified entities has a role in determining the Load-Serving Entity's resource adequacy requirements. These adequacy requirement could be determined by one or more or none of the listed entities. This requirement should be reworded to require the LSE to list the responsible entity(ies).<br><br>Suggested wording:<br>R5.2. Identify the entity(ies) (e.g., the municipality, state commission, Regional Transmission Organization/Independent System Operator, Regional Reliability Organization, or Regional Entity) responsible for establishing the Load-Serving Entity's resource adequacy requirements.<br><br>5.3 comments: The Load-Serving entity should be added to the list in R5.3.<br><br>6.4 comments: The resources referenced in R6.4 should be limited to only those owned or controlled by the Load-Serving entity. Therefore, R6.4 should be reworded and R6.4.2. should be removed.<br><br>Suggested wording:<br>"R6.4. Identify all resources that are owned or controlled by the Load-Serving Entity in its area excluded from serving the Load-Serving Entity's load, including:"<br><br>6.5 & 6.7.1 comments: Replace rates with assumptions.<br><br>6.7.5 comments (grammatical): Change effect to affect. |
| **Response:** The data retention aspects of R5 were modified and moved to the compliance elements of the standard – the requirement to have the data and information has been absorbed into Requirement 3 in the revised standard.<br>The revised standard includes the following language: "Identification of all applicable reserve margin and resource adequacy requirements, and the entity(ies) responsible for establishing them. . ." in support of your suggestion relative to R5.2.<br><br>R5.3 was assigned to the Load-Serving Entity, and required the Load-Serving Entity to retain documentation relative to the determination of CBM. The drafting team isn't sure how to incorporate the suggested modification.<br>The drafting team removed the requirement (R6) that addressed probabilistic studies. This standard has been revised to assume that the studies have taken place. | | | |
| SERC ATCWG | | ☑ | 1. R8.1 needs clarification. |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | 2. As drafted, R5.2 implies that only one of the identified entities has a role in determining the Load-Serving Entity's resource adequacy requirements. This adequacy requirement could be determined by more than one or none of the listed entities. This requirement should be reworded to require the LSE to disclose the responsible entity(ies).<br><br>3. The resources referenced in R6.4 should be limited to only those owned or controlled by the Load-Serving entity. Therefore, R6.4 should be reworded to state, and R6.4.2. should be removed. |
| **Response:** 1. Based on stakeholder comments, R8.1 was removed from the standard.<br>2. The data retention aspects of R5 were modified and moved to the compliance elements of the standard – the requirement to have the data and information has been absorbed into Requirement 3 in the revised standard.<br>The revised standard includes the following language: "Identification of all applicable reserve margin and resource adequacy requirements, and the entity(ies) responsible for establishing them. . ." in support of your suggestion relative to R5.2.<br><br>3. The drafting team removed the requirement (R6) that addressed probabilistic studies. This standard has been revised to assume that the studies have taken place. | | | |
| Entergy Services | ☑ | | |
| FirstEnergy | ☑ | | |
| ITC | ☑ | | |
| PSC of SC | ☑ | | |

**5. In the NERC glossary, CBM is defined as being necessary to meet "Generation Reliability Requirements." Do you believe the current NERC definition is adequate? If "No," please explain why in the comments area.**

**Summary Consideration:** There was no consensus amongst those who responded to this question. Based on a review of all the detailed comments submitted, the Drafting Team believes that the current NERC definition of CBM is adequate.

| **Question #5** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC Task Force | | ☑ | GRR is used as a defined term without a definition. If retained as a defined term it needs a definition.<br>As to the definition of CBM, the Team suggests a more specific NERC CBM definition as follows:<br>"Capacity Benefit Margin"<br>CBM is the amount of firm import transmission capability, requested by the LSE, to exclusively serve identified load only during periods of emergency generation deficiencies extending beyond the beginning of the scheduling hour in which the emergency generation deficiency occurs."<br>Commentary:<br>The "located on" was excluded from the suggested language because the definition would have to generically identify the system of "that TSP" – which TSP is "that"? This is impractical when the definition is written from the standpoint of the LSE as opposed to the existing TSP paradigm.<br><br>"…[T]o enable access by the LSE to generation from interconnected systems" was deleted as that is conveyed in the determinant "import" as suggested in the new definition.<br><br>"Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements" was excluded from the suggested definition as it is merely commentary and adds nothing to the definition. |
| **Response:** GRR was not intended to be treated as a defined term, and it is not indicated as such in the actual definition. GRR does not completely define CBM. The revised MOD-004 does not use the acronym, 'GRR.' | | | |
| APPA | | ☑ | The definition of CBM is causing the industry to calculate CBM is many different ways. The definition of CBM states that CBM is used to meet an entity's "generation reliability requirements." Some entities are saying that the use of CBM to handle "Planning Reserves" is the correct and reserve transmission capacity as CBM to bring in energy from energy resources outside the BA's area that were determined when the entity calculated "Planning Reserves." Other entities calculate the amount of CBM capacity based on "Operating Reserves." As the definition of CBM is written either one could be correct or incorrect. This definition worked well when the industry maintained reliability of the BES from Reliability Policies. |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | The CBM definition's undefined term "generation reliability requirement" allows an excessive amount of transmission capacity to be removed from the BES as CBM and prevents the correct amount of ATC to be placed on the market for use by other entities. In addition, the definition of CBM is so general it is impossible for a Compliance Program to determine if an entity is non-compliant. |
| **Response:** The intent of all of the new requirements is that the LSE must prove, to the compliance monitors (now called Compliance Enforcement Authority) satisfaction, that it is properly stating its need for transmission margin to meet its "resource adequacy" requirements. It is the full intent of the language used in the requirements to prevent the overstatement of CBM that you imply will happen. The compliance monitor will have significant responsibility to make this determination. | | | |
| IESO<br>IRC SRC | | ☑ | We should redefine it along the line that is provided in FERC's directive that CBM is required for generation deficiency only. |
| **Response:** See summary response, | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC comments. | | | |
| ITC | | ☑ | The NERC glossary and CBM definition should be expanded to include other terms, such as "Resource Adequacy" to fully address this issue. This expansion may come as a result of future LSE requests for CBM based on a justification not currently envisioned. |
| **Response:** While we understand this desire, the definition is a high-level description of CBM; the requirements contain all the details, and therefore, we don't believe that the definition should be expanded to include all this detail. | | | |
| Nova Scotia Power | | ☑ | CBM is required to meet Resource Adequacy Requirements. Generation Reliability implies that access to transmission makes generation (and generators) more reliable. Resource Adequacy ensures that firm load can be supplied to a level of reliability adopted by the RRO. The resources to meet those requirements include reserve margin provided by excess generation or interruptable load. If the "resource" is located across a posted path, then CBM provides access to the resource. Since "resource" can include generation and load, then the NERC definition is insufficient. |
| **Response:** See summary response. | | | |
| MEC<br>MRO | ☑ | ☑ | It would be better if CBM is defined in the NERC glossary as provided in the FERC Order 890 as meeting "Generation Reliability Criteria" however, the existing definition is adequate. |
| **Response:** See summary response. | | | |
| FirstEnergy | ☑ | | |
| SERC ATCWG | ☑ | | |
| Duke Energy | ☑ | | |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Entergy Services | ☑ | | |
| MEAG | ☑ | | |
| MEC Trading | ☑ | | |
| PSC of SC | ☑ | | |
| Southern Co Svcs | ☑ | | |

6. **In the future, LSEs will be required to request CBM. Do you believe there should be a queuing process to deal with potential conflicts between requests for CBM and transmission service requests? If "Yes" please describe how you believe the queuing process should work and whether the process should be addressed in this standard or elsewhere.**

**Summary Consideration:** There was no consensus amongst the stakeholders who responded to this question. In the absence of a clear consensus, a queuing process has not been incorporated in the revised draft of the standard. This shall serve as a single response to all opinions offered in response to this question.

| **Question #6** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSC of SC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| **Response:** Note that stakeholders do not need to respond to every question on the comment form. | | | |
| APPA | | ☑ | The needs to secure a transmission path to reach generation resources outside a LSE Balancing Authority Area that will "meet generation reliability requirements" are extremely important to reliable operations of the BES. Since the Reliability Standards are written to insure reliable operations a TSP would be hard pressed to deny an LSE the ability to secure resources to meet "generation reliability requirements." If a TSP denied this service it could be exposed to acts of non-compliance should the BES's integrity diminish because the TSP denied the LSE the CBM capacity. |
| Entergy Services | | ☑ | There is no need to have a queue process for CBM. Transmission Service Requests are approved if ATC is available and ATC is calculated using CBM. Therefore, CBM needs to be set aside first to accurately calculate ATC before Transmission Service Requests can be approved. |
| FirstEnergy | | ☑ | CBM is a reliability product that must be available when called upon. Transmission service requests are a business product that may have reliability impacts if properly scheduled. Any queing process would have to give priority to CBM. |
| IESO<br>IRC SRC | | ☑ | By virtue of the definition and formula of ATC determination, CBM is the component that must be allotted before any transmission service requests are assessed and granted. |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| ITC | | ☑ | Absolutely not. The original justification for CBM is that the transmission system was built for the contingencies envisioned by CBM. It was paid for by the original local network customers. No one should be allowed, by queuing process, to supercede this. However, if there is not sufficient transmission capacity to provide a CBM margin as well as requests for transmission service, the system should be expanded to provide the needed capacity. While there is a system impact process to cover this situation, it has |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | not worked well in the last 10 years. Improved import capacity into a deficient system to meet all needs should be addressed in the planning process not some queuing process. |
| MEC<br>MRO | | ☑ | CBM is basic reliability requirement. If not met, transmission expansion planning should plan for it and should not sell addition transmission service on the same path/flowgate. |
| SERC ATCWG | | ☑ | We need more clarification on the queing process. What is the definition. |
| WECC MIC MIS ATC Task Force | ☑ | | The question is unclear at to whether it applied to an R4/R6 "request to set aside" or an R8 "request to schedule energy." A queuing should apply at the initial "request" stage (R4 and R6). Since by definition, CBM is a "firm" commitment, its request under R4/R6 would place it in the highest priority queue. If addressed there, no queuing problem exists in R8. Since the R8 "schedule" cannot take place until the RC declares an EE2 under R10; and whereas the R4/R6 set the priority, it would seem there would be no queuing issue even in emergency conditions. If this is not the case, the NERC Team should clarify how each of these "Rs" interplays sequentially.<br><br>R4. In R4 CBM is "requested" to comply with a regulatory mandate. This would include a body such as a state or local governance board in which case the LSE is at the mercy of the regulatory body.<br>R6. We read R6 as an alternative method for determining CBM "IF" the regulatory approach in R4 does not apply. (If that's not the case that should be clarified.)<br>R5. Either way, in R5 the approach and the details get documented and retained.<br>R7-R8. In R7 the TSP makes sure there is enough to go around in ***anticipation*** that the LSE can "schedule" it when needed under R8.<br><br>If the request for queuing is under R4, the LSE's request should have the absolute highest priority; otherwise, it could be forced into immediate noncompliance with it regulatory mandate. Since the requested amount under R4 or R6 is set aside as firm before R8 is triggered (with the condition precedent under R10), then under R8 queuing should not be a problem as the capability requested in R4 was already set aside in R7. Thus, if the question addresses R4 – "request" to "set aside" – than "yes" there should be a queue and the LSE should be first.<br>If the question addresses, R8 – "request" to "schedule" the question is actually moot as the capacity has already been set aside as firm by the TSP in R7 and queuing should simply be in accordance with the now applicable rules. Firm first… others next. |
| **Response:** Re your first comment: Assuming that all LSEs have submitted their request per section R4.2, there should be | | | |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| no need for queuing as long as the appropriate CBM was set aside in the first place.<br><br>Re: your 2nd comment: We believe all LSEs are "at the mercy" of those entities responsible for setting their resource adequacy requirements. I.e., you can't ask for more CBM then they would allow you to have via a CBM MW import requirement. If "there is not enough to go around," you need to go back to the responsible entities (the ones setting your rates) and request additional transmission to meet resource adequacy. If they don't agree, you don't have any justification.<br><br>Re: your 3rd comment: The last comment implies there shouldn't be a queuing process. If the LSE's request for CBM is of the highest priority, there is no queuing, they come first. We agree the LSE should come first and get all they ask for. | | | |
| Duke Energy | ☑ | | CBM requests should be addressed on a "first-come first-served" basis. LSE's are required to submit annual 10-year projections to the Transmission Service Provider. CBM requests will have lower priority than existing queued firm transmission service requests. NAESB should formalize the queuing process. |
| MEC Trading | ☑ | | This should be address in the TSPs OATT and filed at FERC. (Maybe it could be a requirement to just that in this standard) |
| **Response:** FERC has already stated that transmission rates must be adjusted to account for those that use or don't use CBM. | | | |
| Nova Scotia Power | ☑ | | There can easily be conflicts for multple LSE's requesting CBM, and there is a problem if the aggregate of all CBM requests exceeds the transmission capacity (R7). Therefore, if this is a new requirement, then there must be some "open season" to collect requests within a fixed time window similar to the Section 2.1 of FERC Order 888 pro-forma tariff. The CBM would be awarded to all comers if there is sufficient capacity but is allocated in lottery fashion if there are more requests than capacity. However, there is the question of the role of ETC in allocating CBM by this method. How much transmission capacity would be offered for CBM? I assume that existing Transmission Reservations cannot be impacted by the CBM bidding process, so only ATC for the planning horizon (if there is any) can be offered. What would an LSE pay for CBM. If it was required to pay the same as it would for a long-term (firm) reservation, then are they really getting CBM or are they getting a long-term firm Transmission Reservation). Some entities interpret Section 2.1 of Order 888 pro-forma tariff to permit bidding on amount and duration to award capacity to the "highest net present value" of the capacity. If there is no charge for CBM, how does the TSE recover lost transmission revenue? It seems that many of these questions must be directed to NAESB |
| **Response:** If the filed requests for CBM in section R4.2 exceed the transmission capacity available, it should be discovered at that point (re: your statement "aggregate of all CBM requests exceeds the transmission capacity"). It is important to note that R4 requests are based on recognized historic entities responsible for resource adequacy. If the system is not capable of handling these requirements (as would happen if there wasn't sufficient capacity to cover all "valid" CBM requests), then this entity should be consulted as to what to do. A queuing process will not result in someone meeting their resource adequacy | | | |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| responsibility. | | | |
| Southern Co Svcs | ☑ | | The request to reserve (set aside) a CBM amount by the LSE should be treated like any other firm transmission service request. |
| The STD disagrees. The LSE's request for CBM is of the highest priority, there is no queuing, and they come first. | | | |

**7. Do you agree with R3.3 of MOD-004-1 that requires that CBM be algebraically subtracted from the path on which it was reserved, or should the CBM set aside be based on the response of the network by modeling the transaction from the POR to POD at the CBM import MW level? Please explain your answer in the comments area.**

**Summary Consideration:** There was no consensus amongst those who responded to this question to indicate support or rejection for the version of R3.3 in the first draft of the standard. Several commenters suggested that the impact of the generation import capability needs to be a consideration in CBM allocation and this was added to the revised requirements. Based on feedback in response to other questions in this comment form and feedback on other standards, the drafting team has also revised this section of the standard to make the determination of CBM a two-step process that aligns more closely with MOD-028, MOD-029, and MOD-030, while merging portions of R3 and R 7 into R4 of the revised standard. In the first step of the process the Transmission Service Provider analyzes how much of each request's CBM can be allocated, and in the second step the Transmission Service Provider sets CBM for a specific Posted Path or Flowgate. Here is the relevant revised portion of the standard – (note that in the revised standard the Load-Serving Entity that wants CBM must provide significant documentation to support the CBM request):

R4.1. Determine the amount of CBM (for use in R3.2) for each request by using one of the following:

R4.1.1. For the Area Interchange Methodology and the Rated System Path Methodology, using the requested Generation Capability Import Requirement for the Posted Path

R4.1.2. For the Flowgate Methodology, determining the significant impacts of each request on each Flowgate

4.1.2.1. Determine impacts of a request by multiplying the requested GCIR by the Distribution Factor for the transfer of that import from the specified Balancing Authority relative to the Flowgate.

4.1.2.2. Classify each impacts based on a Distribution Factor of 3% or greater as a significant impact.

R4.2. Set CBM for each Posted Path or Flowgate based on the sum of all requests such that all requests can be met simultaneously or all firm Available Transfer Capability (ATC) or Available Flowgate Capability (AFC) has been allocated to CBM as follows:

R4.2.1. For Posted Paths, set the CBM for each Posted Path equal to the lesser of:

- The sum of all requests for Generation Capability Import Requirement for that Posted Path, minus the transfer capability set aside for reserve sharing for that Posted Path or
- The firm ATC for that Posted Path

R4.2.2. For Flowgates, set the CBM for each Flowgate equal to the lesser of:

- The sum of the significant impacts of all requests for GCIR for that Flowgate minus the impact of transfer capability set aside for reserve sharing for that Flowgate, or
- The firm AFC for that Flowgate

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSC of SC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| **Response:** Note that stakeholders do not need to respond to every question on the comment form. | | | |
| MEC Trading | | | (Not sure if the Yes/No is for the first part of thequestion or the second) Network Response on path should be based upon network response by modeling it from the POR to the POD. |
| **Response:** Please see the revised standard. | | | |
| IESO | | | The way it is specified in R3.3 (and R3.2) is the correct approach. |
| **Response:** Please see the summary consideration. The drafting team made significant modifications to this requirement in support of stakeholder comments. | | | |
| APPA | | ☑ | The use of CBM capacity is just a reservation of transmission capacity that will only be used should an adverse situation develop in the BES and generation resources are needed to meet "generation reliability requirements." However, those generation resources are out side the LSE's Balancing Authority's Area. The simulation of energy over the CBM would be a study to determine how the system reacted under adverse operating conditions of the BES. How the use of CBM transmission capacity is treated will be determined how the final definition of CBM is written. Presently, both method would be needed because CBM is used for different purposes throughout the industry. |
| **Response:** In general, we agree with your observations. However, CBM should not be used for "different purposes." The intent of this standard is to specify what purposes CBM may be used for. | | | |
| Duke Energy | | ☑ | The standard should be flexible enough to allow the Transmission Service Provider to use either method which best supports reliability in their control area. |
| **Response:** Agree. The standard was revised to align more closely with the modifications made to MOD-028, MOD-029 and MOD-030. | | | |
| Entergy Services | | ☑ | CBM should be set aside on a path based on the response of CBM import MW level on that path. This should be treated similar to impact of loads or generation on paths by including their response on paths rather than algebraically subtracting from the path.. |
| **Response:** As revised, the standard requires consideration of the generation import capability in support of your suggestion. | | | |
| IRCSRC | | ☑ | CBM on path/flowgate should be the 'max' rather than 'sum' of all that's required to meet each individual LSE's resource adequacy requirement. Reasoning: Generation emergencies don't happen all at once. Reserve a 'sum' is beyond the 1-day-in-10-year criterion (or whatever criterion that's used by the region), and is not an efficient way of utilizing transmission capacity.. |
| **Response:** As revised, the standard requires consideration of the generation import capability before 'capping' the amount of CBM that can be allocated. | | | |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ERCOT | ☑ | | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC comments. | | | |
| ITC | | ☑ | It should be based on the response of the network to the most likely sources. It is important that the availability of generation in the source area be considered when doing this. For example, assuming a source network with minimal reserves would be a poor assumption. This is an area that will ultimately require a very astute compliance monitor to determine compliance. |
| **Response:** This is not a NERC issue, but really a FERC or Market Monitor issue. From the NERC perspective, the TSP should base their analysis on the request made by the LSE. | | | |
| MEC<br>MRO | | ☑ | CBM on path/flowgate should be the 'max' rather than 'sum' of all that's required to meet each individual LSE's resource adequacy requirement. Reasoning: Generation emergencies don't happen all at once. Reserve a 'sum' is beyond the 1-day-in-10-year criterion (or whatever criterion that's used by the region), and is not an efficient way of utilizing transmission capacity. |
| **Response:** See response to IRC SRC above. | | | |
| Nova Scotia Power | ☑ | ☑ | It will depend on where the LSE is located in relation to the interface. For example, can an LSE request CBM to access reserve capacity two systems away? Let's say that there are there radially connected systems A is connected to B and C is is only connected to B. LSE#1 in A requests CBM through B to access capacity in C. LSE#2 requests access to capacity in A. In assigning import CBM on the A-B interface, LSE B must consider that the requirement for capacity reserve is due to a shortage in B or in C or to a lesser probability in B+C. |
| **Response:** It is the responsibility of the TSP to define in its procedure for requesting CBM any limitations on the Balancing Authorities from which generation supporting the GCIR may be supplied. | | | |
| FirstEnergy | ☑ | | The posted ATC for the CBM reserved path should have been based on the network response or contractual limit for that POR to POD, and thus subtracting CBM on that path is consistent with the ATC determination. |
| **Response:** See summary response. | | | |
| MEAG | ☑ | | The use of CBM capacity is for LSE under any potential emergency of generation deficiency. By modeling the CBM as the transaction from the POR to POD at the required CBM import MW level would treat the adverse operation as a normal condition and reduce the import TTC for the TSP. |
| **Response:** See summary response. | | | |
| Southern Co Svcs | ☑ | | For this method, a maximum TTC is calculated for each path, and the CBM set aside is decremented from that path to yield the remaining capacity available for Firm use. The network response for the CBM set aside (POR to POD) is considered and reflected in the TTC when it is calculated. To consider the network response of the CBM set aside for a second time would result in a lower value than the requested amount being decremented from the requested path. This could result in an over- |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | commitment for that path. |
| **Response:** See summary response. | | | |

8. **If the needs for capacity that resulted in a request for CBM have been met by other means (e.g., via capacity-backed transmission service or new generation), should this standard require that CBM be re-evaluated and possibly reduced (resulting in a change in ATC)? Please explain your answer in the comments area.**

**Summary Consideration:** Most stakeholders who responded to this question indicated that the standard should require that CBM be re-evaluated and possibly reduced, resulting in a change in ATC. The standard has been changed to incorporate the following sub-requirement for a monthly re-evaluation by the LSE of its request to reflect any changes in future CBM needs.

R3.2 At least every thirty-one days, update the request provided per R3.1 to reflect any changes that alter future needs for CBM or indicate that no change is needed.

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PSC of SC | | | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| **Response:** Note that stakeholders do not need to respond to every question on the comment form. | | | |
| Southern Co Svcs | | ☑ | This could facilitate the opportunity for hording transmission capacity. The standard as drafted requires the LSE to request CBM as needed and maintain the proper documentation as required. |
| **Response:** It can't be hoarding if the CBM is reduced. Currently, many TSPs set aside CBM but fail to reduce it when LSE's make additional firm purchases, thus reducing their LOLE when CBM is not reduced. It is also conceivable that an LSE may not renew a purchase thus increasing their LOLE. In that instance, the CBM should be increased. A new requirement to that the LSE adjust CBM when their Generation Capability Import Requirement needs change would prevent hoarding. | | | |
| WECC MIC MIS ATC Task Force | ☑ | | CBM should be called on only after TRM has been utilized during 0-59 minutes. Rolling into 60+ minutes, CBM should be called on. That said, as the foundational emergency subsides there should be a statement in the standard to "unwind" the utilization of CBM. If, for example, an LSE had reserved 100 MW of CBM in accordance with R4 but when required to use that capacity under R8 could actually serve 60 MW by other means, then CBM should be reduced to 40 MW and ATC increased accordingly. |
| **Response:** This question was intended not to cover decrementing of CBM when scheduled, but decrementing of CBM when assumptions change regarding how much is needed. We don't believe the Firm ATC will change, as the "reserved" capacity for CBM will simply turn into "scheduled" energy flow. The Non-Firm ATC would decrease, as the CBM that could be sold as non-firm would decrease. | | | |
| APPA | ☑ | | Reducing the CBM because new generation is built in the LSE's Balancing Authority's Area would be a financial decision by the LSE. I do not believe this Standard has authority to mandate financial decisions. However if new reliability rules are passed that limit the amount of resources located outside the LSE's Balancing Authority's Area, which |

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | can be used to meet "generation reliability requirements" then this Standard has the obligation to lower the CBM to the predetermined about of transmission capacity used for CBM. |
| **Response:** You're correct in that this standard cannot mandate financial decisions. However, when new generation is built or external resources are purchased, it is the decision by the LSE to meet its resource adequacy requirements in a more stable way than dependence on CBM. At the same time, when an LSE does this, it no longer is entitled to the full CBM prior to this change in resource adequacy. | | | |
| Duke Energy | ☑ | | As resource mix changes, CBM would be re-evaluated on an annual basis with updated LSE requests for CBM. |
| **Response:** We agree that the resource adequacy requirements supporting CBM should be reevaluated every year. However this question is referring to resource decisions made between resource adequacy calculations. | | | |
| Entergy Services | ☑ | | CBM should be recalculated to determine accurate CBM requirements that should include meeting the generation requirement from any other transmission service or new generation. Any double counting of elements that impact CBM calculations should be avoided. |
| **Response:** Most stakeholders who responded to this question indicated agreement. | | | |
| FirstEnergy | ☑ | | In the case of new generation, the recalcuation periodicity would conceivably be infrequent. In the case of capacity-backed transmission service, the recalculation periodicity may be frequent, but is necessary to allow the markets to function properly. |
| **Response:** Most stakeholders who responded to this question indicated agreement. | | | |
| IESO | ☑ | | CBM is intended for having transmission capability to meet generation deficiency. If this deficiency can be met via other means, then the CBM allotted will no longer be required and could even be reduced to 0 if required. |
| **Response:** Most stakeholders who responded to this question indicated agreement. | | | |
| IRC SRC | ☑ | | CBM is intended for having transmission capability to meet generation deficiency. If this deficiency can be met via other means, then the CBM allotted will no longer be required. |
| **Response:** Most stakeholders who responded to this question indicated agreement. | | | |
| ERCOT | ☑ | | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC comments. | | | |
| ITC | ☑ | | This is a simple answer. You invite double counting if you don't reduce CBM when this happens. It amounts to hoarding. This is already a problem in our opinion. |
| **Response:** Most stakeholders who responded to this question indicated agreement. | | | |
| MEC Trading | ☑ | | It is to the benefits of all stakeholders if the use of transmission is optimized so CBM should be re-evaluated and possible reduced if CBM is met by other means. Maybe the TSPs OATT should be the right place for this information. |

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** The SDT agrees with your point one. However, the OATT doesn't need to be changed if the standard we're writing requires CBM to be adjusted when additional resources are acquired which reduce dependence on CBM. | | | |
| MEC<br>MRO | ☑ | | It is to the benefits of all stakeholders if the use of transmission is optimized so CBM should be re-evaluated and possible reduced if CBM is met by other means. |
| **Response:** We agree, and will have modified the standard to incorporate reviews and updates to CBM at appropriate time intervals. | | | |
| Nova Scotia Power | ☑ | | CBM requirements can change from year to year. For example, if the market responds to price signals and additional generation is built, there is no longer a need for the originally plannned CBM, which should be released to the market. The same is true for entities which are required to install renewable generation or demand-side management programs, which can free existing generation to provide Resource Adequacy without the need for CBM |
| **Response:** We agree that the resource adequacy requirements supporting CBM should be reevaluated at least every year. However this question is referring to resource decisions made between resource adequacy calculations. | | | |
| MEAG | ☑ | | |

**9. Do you think that Requirement R6 is appropriate for this standard? If "No," please explain why in the comments area.**

**Summary Consideration:** R6 has been removed from the revised standard. There was no consensus amongst those who commented to support the retention of the ~~standard~~ requirement – the standard was revised assuming that the resource adequacy studies have taken place – the results of these studies must be documented to support the Generation Import Capability Requirement, but 'how' to conduct these studies is not addressed in the revised standard. This shall serve as a single response to all opinions offered. Note that there is another SAR under development to address resource adequacy assessments.

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The LSE is performing many functions of the other Functional Entities, which are described in the Functional Model. As stated in Question 3 the author has incorrectly assigned duties of many different Functional Entities to the LSE in R.6 and will create confusion between this Standard and other Standards that are written for the many different subjects covered in R.6. It is recommended this requirement be completely removed. |
| Entergy Services | | ☑ | Requirement R6 addresses resource adequacy requirement and it does not belong in the CBM standard. Requirement R5.2 covers identification of appropriate criteria used for resource adequacy studies that will identify need for CBM, if any. Probabilistic studies, if included in resource adequacy studies criteria shall be used and there is no need to include requirement R6 in this standard. |
| WECC MIC MIS ATC Task Force | ☑ | | As drafted, the standard appears to say there are two ways to establish the level of CBM required: 1) via regulatory mandate at R4 or 2) via probabilistic analysis at R6, assuming there is no regulatory mandate.<br><br>If that is not the intent of the two methods, than perhaps the more clarity on when the two methods would be used is in order. |
| IESO<br>IRC SRC | ☑ | ☑ | By and large, R6 describe the process and assumption requirements for resource adequacy assessment via which the CBM is determined. It is our interpretation that FERC requires the basis of this assessment be made known to support and demonstrate a fair and consistent approach is taken in determining the CBM value. That said, R6 could arguably be placed in a standard on resource adequacy assessment. If R6 is to stay, at the very least some of the subrequirements can be removed or combined (see Comments under Q2 for an example). |
| ERCOT | ☑ | ☑ | See IRC comments submitted by Charles Yeung. |
| ITC | ☑ | ☑ | How else would a compliance monitor be able to evaluate a justification for CBM if he |

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | doesn't have the input used to make such a determination. If anything, this could be expanded to assist the compliance monitor in such a determination. |
| MEC | ☑ | ☑ | I prefer if all CBM requests were supported by appropriate probabilistic based studies. It does seem odd that when the better approach (the probabilistic approach) is used, then the standard has all kinds of requirements defining how the better approach is to be done. |
| MRO | ☑ | ☑ | The MRO would prefer if all CBM requests were supported by appropriate probabilistic based studies. It does seem odd that when the better approach (the probabilistic approach) is used, then the standard has all kinds of requirements defining how the better approach is to be done. |
| Nova Scotia Power | ☑ | | There should be a high level of proof that CBM is required. An important component is the ability to deliver this energy with single contingencies. |
| Duke Energy | ☑ | | |
| FirstEnergy | ☑ | | |
| MEC Trading | ☑ | | |
| PSC of SC | ☑ | | |

**10. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.**

**Summary Consideration:** Some entities may desire to pursue regional differences based on their current practice or tariff. We agree there may be commercially sensitive information in the CBM process, and have removed all public posting requirements from this standard and have requested that NAESB address the requirements related to "public posting." We have modified the timings in the standard to allow for processing of requests in a reasonable amount of time.

| Question #10 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | ☑ | | As noted above. |
| **Response:** Please see response above. | | | |
| ERCOT | ☑ | | ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT Interconnection. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority Interconnection and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area Interconnection and there has been no reservation of transmission capacity in ERCOT.<br><br>Capacity Benefit Margin is defined as the amount of firm transmission transfer capability preserved by the transmission provider for Load- Serving Entities (LSEs), whose loads are located on that Transmission Service Provider's system, to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.<br><br>Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. In the |

| Question #10 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | current and future ERCOT market design the use of CBM is not applicable to the ERCOT Interconnection. ERCOT does not have a synchronous connection with any other Control Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Balancing Authority Areas and/or offer transmission reservations and schedules within the interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance. |
| **Response:** The SDT agrees this is a concern - ERCOT may wish to pursue a request for a Regional Difference.. | | | |
| MEC Trading | ☑ | | FERC Order 890 required consistency and this standard does not require any consistency. |
| **Response:** The consistency is achieved by requiring an LSE to prove that they have supportable resource adequacy requirements that allow for the use of CBM. By law, the ERO cannot set resource adequacy standards but can require an LSE to demonstrate that they have supportable requirements that do provide for CBM to meet these requirements. We expect consistency within the domain of the local entity responsible for resource adequacy (by state, by region, etc). | | | |
| Nova Scotia Power | ☑ | | R2 requires documentation to be "publicly released" (published on OASIS) information that is either commercially sensitive or can include Critical Infrastructure Information, the wording of R8 in MOD-008 should be used in MOD-004 to protect information. The process of taking bids on CBM will require modifications to transmission Tariffs and Market Rules may have to be updated to reflect the new requirements. |
| **Response:** We have changed R2 so that it no longer includes the phrase, 'make publicly available,' and expect that NAESB will address release of information to customers. Note that in the revised standard, the Transmission Service Provider must share the models it uses to allocate CBM with various reliability entities in R7 of the revised standard.<br><br>We don't expect tariff changes for CBM. See responses to question 6 regarding queuing. | | | |
| Southern Co Svcs | ☑ | | R7 requires the Transmission Service Provider to answer a request for CBM within 30 days of receipt. This is inconsistent with the time allowed to answer other firm transmission service requests per Tariff and should be revised to track the tariff requirements for processing long term firm transmission requests. |
| **Response:** The revised draft of the standard requires the TSP to respond in 14 days to requests for monthly values in the current and subsequent year, because the LSE is required to update the request every 31 days. (See R3 in the revised standard.) The time for response to requests for yearly values beyond that time period has been extended to 60 days. (See R4 in the revised standard.) | | | |
| ITC | | ☑ | R4 gives the LSE great latitude in defining their resource adequacy requirements. R4 allows the LSE to fully document whatever requirement they have. It will ultimately be |

| Question #10 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | up to the compliance monitor to evaluated their justification and documentation. |
| **Response:** The SDT agrees with this comment. | | | |
| IESO<br>IRC SRC | | ☑ | However, there are entities that do not provide physical transmission services. Hence, these standards or some of the requirements in these standards may not apply. |
| **Response:** FERC has indicated that the TSP must offer CBM to its LSEs, and as such, the standard requires all TSPs to prepare and maintain CBM procedures. Requirement 1 applies regardless of whether or not you provide physical transmission service, but allows for the TSP to specify the details of how they have elected to implement CBM. All other requirements are dependent upon a requested need for or use of CBM, and may not apply if CBM is not used in the region. | | | |

11. **Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1. Comments:**

**Summary Consideration:** Several commenters provided suggestions for improvement, which have been incorporated into the new standard. The drafting team notes that this question incorrectly referred to MOD-001, and apologizes for any confusion this may have caused. Please see the cover page of this report for a complete list of requirements modified in response to stakeholder comments.

| **Question #11** | |
|---|---|
| **Commenter** | **Comment** |
| WECC MIC MIS ATC Task Force | **A.** R3. Each of the sub-bullets contains the term "reserve sharing" (R.3.1.2; R.3.2.1; R.3.3.1). This is not used as a defined term in the standards; however, Reserve Sharing Groups is a NERC defined term and may more accurately address what the standard is seeking to address.<br>Suggested rewrite:<br>(E.g.) R3.2. The Transmission Service Provider that uses the Rated System Path…<br>R3.2.1. The Transmission Service provider shall not include in the CBM calculation any transmission capacity set aside as part of a Reserve Sharing Group agreement already accounted for in the TRM calculation.<br>**B.** R4. We suggest the second parenthetical phrase be deleted as it does not add any significant clarification.<br>**C.** R6.3.1. Designated Network Resource (DNR) is used as a defined term without a NERC Glossary definition. The Team suggests using language from Section 1.26 "Network Resource" within the Pro Forma OATT as a springboard for a new definition.<br>**D.** R6.4. - Intent is unclear.<br>R6.4 Suggested rewrite: "Identify all resources in the Load-Serving Entity's ***Balancing Authority Area*** excluded from serving the Load-Serving Entity's load, including: " (Emphasis and language added)<br>**E.** R8 is unclear.<br>If CBM is "reduced" in R7.2 what does it mean that the LSE is "still entitled to the CBM MW import?" Please clarify or rewrite. |
| **Response:**<br>A. R3 **-** Re: Reserve sharing – the term 'reserve sharing' is not defined and has a meaning that is well understood so the team did not define the term. Drafting teams have been asked to avoid defining terms that have a commonly understood meaning.<br>B. R4 – Re elimination of second parenthetical – the drafting team adopted this suggestion and revised the entire requirement so it is simpler to read.<br>**C.** The term "Designated Network Resource" has been removed.<br>D. Requirement 6 was deleted from the revised standard. The revised standard assumes that the studies have been completed and requires that there be documentation to support the studies, but the revised standard does not detail 'how' to perform the studies.<br>E. R8 was confusing and has been deleted. The revised standard includes much clearer requirements for the allocation of CBM and requires | |

| Question #11 | |
|---|---|
| **Commenter** | **Comment** |
| that the Load-Serving Entity update its request for CBM at least once/31 days. | |
| WECC MIC MIS ATC Task Force | **F.** Order 890, P. 262 states:<br>"…we determine that LSEs should be permitted to call for use of CBM, if they do so pursuant to conditions established in the reliability standards…process." (Emphasis added.)<br>"We direct public utilities…to specify the generation deficiency conditions during which an LSE will be allowed to use…CBM." (Emphasis added.)<br>R10. states,<br>"The Load-Serving Entity shall declare a NERC Energy Emergency Alert (EEA) 2 and initiate all steps in EEA 2 prior to scheduling of energy over transmission capacity set aside as CBM." (Emphasis added.)<br>EOP-002, states:<br>"A. General Requirements<br>**1.** Initiation by Reliability Coordinator. An Energy Emergency Alert may be initiated *only by a Reliability Coordinator* at 1) the Reliability Coordinator's own request, or 2) upon the request of a Balancing Authority, or 3) upon the request of a Load Serving Entity." (Emphasis added.)<br>In contravention to Order 890, P. 262, R10 as drafted *does not state the specific "generation deficiency conditions" required as a condition precedent for an LSE to call upon CBM*.<br>In contravention to EOP-002, R10 grants an LSE the right to declare a NERC Energy Emergency 2. The NERC Drafting Team needs to remedy the conflict.<br>Suggested language:<br>*(Plagiarized from Attachment 1-EOP-002-0; Energy Emergency Alerts)*<br>RX.1. Each Load-Serving Entity that is, or expects to be, unable to provide its customers' energy requirements, and has been unsuccessful in locating other systems with available resources from which to purchase, or that cannot schedule known resources due to insufficient transmission capacity, shall instruct its Reliability Coordinator to declare an Energy Emergency 2.<br>RX.2. Each Load-Serving Entity shall instruct its Reliability Coordinator to declare a NERC Energy Emergency 2 prior to scheduling any energy on transmission capacity reserved for CBM.<br>R.X3. Each Reliability Coordinator instructed by a Load-Serving Entity to declare a NERC Energy Emergency 2 pursuant to this Standard, shall:<br>• Initiate a NERC Energy Emergency Alert as detailed in Attachment 1-EOP-002-0 "Energy Emergency Alert Levels."<br>• Act to mitigate the emergency condition, including a request for emergency assistance if<br>• Required |
| **Response:** The drafting team revised the language in R10 rather than propose modifications to EOP-002. As revised, R10 requires the Transmission Service Provider to only approve Interchange Transaction Tags using CBM if the deficient entity is under an EEA | |

| Question #11 | |
|---|---|
| **Commenter** | **Comment** |
| 2 and CBM is available. This supports your suggestion to clarify that it is not the Load-serving entity that declares the EEA. | |
| WECC MIC MIS ATC Task Force | **G.** R11. The report required in R11 should also be mandated for delivery to the Balancing Authority and the Reliability Coordinator for purposes of post mortem examination.<br><br>R11. Change "declared" to "instructed."<br>**H**. R1.1. Should be changed to read: "Its procedure for a Load-Serving Entity to request its CBM import MW requirement on each REQUESTED Point of Receipt – Point of Delivery (POR-POD) combination or POSTED PATH…." (Emphasis Added.)<br>Orders 889/890 do not require posting of information on every possible combination of POR/POD nor on every possible path. Thus information must only be posted on "Posted Paths."<br>The defined term "Posted Path" must be added to the NERC Glossary to meet the intent of Orders 889 and 890 without creating an onerous burden to post information need by no one. It was not FERC's intent to require the posting of ATC / TTC et al for paths upon which there is no request for service.<br>The following Posted Path definition must be added to the NERC Glossary and utilized in each of the ATC related standards:<br>Posted Path<br>Posted Path means: 1) any Balancing Authority to Balancing Authority interconnection; 2) any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months; 3) and any path for which a customer requests to have ATC or TTC posted. For purposes of this definition, an hour includes any part of an hour during which service was denied, curtailed or interrupted. (Plagiarized from NAESBE R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.<br>Although the WECC Team has only addressed the definition of a Posted Path, we would encourage the NERC ATC to develop a parallel definition to properly delimit the Flowgates upon which information must be posted, as clearly, FERC did not intend that information be posted on each and every Flowgate or path simply because a Flowgate or path exists. FERC's intent as to what paths and Flowgates were affected by posting was clearly laid out in Order 889 as well as 890 per the aforementioned references. |
| **Response:** The requirement has been removed. The post mortem examination is the responsibility of the compliance monitor and if needed can be added to the standard as a type of 'exception reporting'. | |
| WECC MIC MIS ATC Task Force | **I.** R1.2 Should read, "…over each POSTED PATH or Flowgate."<br>**J.** R1.4 Should read, "…for each timeframe by Flowgate or POSTED PATH, as applicable." (Emphasis Added.)<br>**K.** R2. Should read, "…over each POSTED PATH or Flowgate…"<br>**L.** R3.2 Should read, "…for determining Total Transfer Capability shall use the algebraic sum of all valid CBM requests for each POSTED PATH as the CBM for that path." (Emphasis Added.)<br>**M.** R4.2. Should read, "…for each POSTED PATH or specified POR-POD combination for each year…" Again, a parallel definition to POSTED PATH for affected Flowgates would be of value here. This Team did not pursue |

| Question #11 | |
|---|---|
| **Commenter** | **Comment** |
| | LSEs such as the situation where LSE A provides needed energy to LSE B without requiring an import. Under this scenario too much CBM may be set aside as the standard is currently written. R7.1 appears to attempt to cover this situation but it is not clearly stated and the basis for managing this is not addressed.<br><br>3. R13 states the TP "shall include all valid requests and projected CBM import MW requirements ... in its planning process." However, a method for needs to be established for managing situations where the import limitation is outside his area of responsibility. Overall, there are many good things in here.<br><br>4. R12 requires the TSP to make publicly available the report prepared by the LSE pursuant to R11. This requirement should be placed on the LSE that created and owns the report and has the retention responsibility.<br><br>5. To reduce confusion R14 should list the components of uncertainty rather than refering to MOD-008-1 R1.1. This MOD-008-1 requirment requires TPs and TOPs to include these elements in the TRM analysis where MOD-004-1 requires the LSE to exclude these values from the CBM calculation. The difference in application may be lost in switching back and forth between the two standard's requirements. |

**Response:**

1. The standard drafting team modified the requirement as follows to eliminate the need to make the model publicly available and to allow for information other than models to be provided.

> The Transmission Service Provider and Transmission Planner shall each provide copies of the supporting data, including any models, used for allocating CBM over each Posted Path or Flowgate to the following:
>
> > Each of its associated Transmission Operators within seven calendar days of a modification to the CBM.

2. The standard is placing a responsibility on the LSE to document and provide data to support the justification of CBM. Beyond the LSE, it is expected that TSPs will have to upgrade their methods and systems in order to comply with this standard. This standard does place new obligations on several entities that may require time, money and manpower to comply.

3. CBM is only set aside on the facilities of the TSP in which the load is located. Accordingly, the TSP may not address import limitations outside their area of responsibility, consistent with their other planning processes.

4. We have eliminated this requirement and have requested that it NAESB address this and all other public posting requirements as business practices.

5. We intended to reduce confusion by referring the list in only one place, rather than create a potential for the lists to get

**Question #11**

| Commenter | Comment |
|---|---|
| out of synchronization as standards change. R14 was removed and the standard for TRM (MOD-008) includes a requirement to ensure that the same components of uncertainty are not used for both CBM and TRM. (See R2 in the revised MOD-008.) removed | |
| IESO<br>IRC SRC | ETC is introduced in this standard for the first time and hence this term needs to be defined here. |
| **Response:** We have written a definition for ETC, and have included it with the revised draft of MOD-001. | |
| ERCOT | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC comments. | |
| ITC | (note question 11 should have referred to MOD-004 not MOD-001) While compliance has not been addressed, it is worth noting that the compliance monitor for CBM requirements will have to be a very astute individual or group to deal with the multiple possible resource adequacy requirements under the ERO. They will no doubt have to deal with non-jurisdictional entities to make their evaluations. We suspect it will be a lengthy process in some cases. We would also like to point out that the TSP has little latitude in using the MW import requirement supplied by the LSE. If they suspect that this value is too high, they don't have recourse here to do anything about it. Even if a large fine could result from a compliance issue, the TSP must sell service with a margin they may have good reason to feel is unjustified. Is a large fine justification enough to not give the TSP some latitute? |
| **Response:** There was a typographical error in the question and it should have referenced MOD-004 rather than MOD-001. We recognize that compliance may be challenging. The drafting team modified the standard so that the requirements that focused on conducting resource adequacy studies have been removed – the revised standard is written assuming that the studies have been conducted – and the revised standard requires that the results of the studies be documented. | |
| MEC Trading | The purpose of each of the standards should be revised to be more in-line with the other ATC/TTC/TRM stanadards. We recommend that the purpose in this standard be revised to state: "To promote the consistent and transparent…use of Capacity Benefit Margin (CBM) for reliable system operation." The standard should make it clear that an LSE should be required to do comply with certain requirements within this standard only if it requests CBM. Also this industry is sophisticated enough to perform or have performed a probabilistic study so that it what the CBM should be based on. |
| **Response:** We revised the purpose in support of your suggestion.<br>The standard drafting team has attempted to address the second comment in the requirements by limiting the scope of the requirement. The revised standard's R3 states, 'A LSE with that wants transfer capability set aside in the form of CBM shall:"<br>The standard was revised so that the requirement for probabilistic studies (R6) has been removed – the revised standard's requirements are written assuming that these studies have been conducted, and the revised standard requires that the results of the studies be documented | |
| MEC | The purpose of each of the standards should be revised to be more in-line with the other ATC/TTC/TRM stanadards. |

| Question #11 | |
|---|---|
| **Commenter** | **Comment** |
| MRO | The purpose in this standard be revised to state: "To promote the consistent and transparent…use of Capacity Benefit Margin (CBM) for reliable system operation." |
| **Response:** We revised the purpose in support of your suggestion. | |
| Manitoba Hydro | MH is not a supporter of the use of CBM as we believe that CBM makes the unsupportable assumption that there will be energy and transmission avaialable in the adjoining entitity during the time of the emergency. However as there a desire to maintain this feature, MH believes that there should be a requirement to build if CBM causes the AFC on a flowgate to become negative and that a portion of cost should be assigned to the LSE who is responsible for the CBM. |
| **Response:** The CBM needs to be considered in the annual evaluation of network service that TOs are supposed to make. If the transmission system in question cannot support the requested CBM, then a system impact study should commence. i.e., if you use CBM, then you should plan for it. NERC does not have the authority to require entities to 'build' transmission or generation facilities. | |
| Nova Scotia Power | The standard does not address the issue of export transmission capacity, since CBM is an import capacity only. An interface involves at least two TSP's: the TSP owning the export side and the TDP owning the import side. Has the drafting team examined the issues around a LSE that requests CBM held back from import but the export TDP can accept reservations without consideration to CBM. Say that the ATC on A-B interface is 200 MW. An LSE in B requires 50 MW of CBM which reduces import ATC on the B side to 150 MW and ATC on the A side remains at 200 MW. A transmission customer in B requests firm reservations on the A-B interface of 200 MW. The A TSP assigns 200 MW to the customer and the B TSP says he can only have 150 MW. The customer takes all 200 MW on the A side but nothing on the B side. Does he then effectively block A-B transactions?. |
| **Response:** This is an important point that is not being addressed. The assumption is that interconnections with neighbors are shared and were constructed, in most cases, to insure access to external resources to meet resource adequacy requirements. This was a mutual benefit. Both sides have access to external resources. An import problem to one is an export problem to the other. If one side has had "historical" access to external resources to meet their resource adequacy requirements, can the other side now complain that it impedes their "export" capability? This may be debatable but CBM has been a recognized margin for at least the 11 years since US deregulation. That's why it's important that any CBM claim be both documentable and supportable by whoever is responsible for the resource adequacy requirements of the LSE. | |

**12. In addition to the questions above, the standard drafting team is seeking industry input on a few issues discussed during the revisions of MOD-004 thru MOD-007 related to Capacity Benefit Margin. The intent of this portion of the comment form is to solicit general feedback from the industry related to CBM. Please take a few minutes to offer your opinion relative to the questions below. It is not the intent of the drafting team to prepare formal responses to the questions below; we are solely interested in industry opinions on these issues.**

We would like to better understand the various generation supply adequacy requirements that have transmission-related implications, implied or specified. This will assist in further development of MOD-004-01 CBM.

What entity is responsible for establishing your Generation Reserve and Resource Adequacy requirements (commission, region, etc)? Reply:

**Summary Consideration:** The drafting team thanks all who provided responses. This shall serve as the summary response to all information provided.

| Question #12 | |
|---|---|
| **Commenter** | **Yes**<br>**No**<br>**Comment** |
| APPA | It is not within the scope of this SDT to deal with resource studies, in fact the glossary states the Resource Planner determines the resource adequacy. Generation Reserves has not been defined in the standards nor has Resource Adequacy. |
| BPA | For Generation Reserve and Resource Adequacy requirements, BPA follows the procedures developed by the Northwest Power Pool which meet the WECC's Minimum Operating Reliability Criteria. BPA also meets the requirements in the NERC standards for Control Performance BAL-001-0 and Disturbance Control BAL-002-0. |
| Duke Energy | The NC and SC state commissions exercise their authority in this area by requiring an annual filing by the regulated utilities, which includes the identification and justification of reserve margins. |
| ERCOT | Within ERCOT, a technical recommendation is developed by ERCOT System Planning, acting as the Planning Coordinator. ERCOT Market Participants can give input to the process through open meetings. The technical recommendation is subject to approval by the ERCOT Board of Directors and the Public Utilities Commission of Texas (PUCT). The technical recommendation stipuates generation reserve and resource adequacy requirements both for long term planning and for operating reserve. |
| FirstEnergy | The Regional Reliability Organization - ReliabilityFirst |
| IESO | In Ontario, it would be the IESO and the Ontario Power Authority (OPA) which would be responsible for establishing generation reserve and resource adequacy requirements. |
| IRC SRC | Unable to provide a specific answer as a group. Gernally speaking, however, it is the region that |

| **Question #12** | |
|---|---|
| **Commenter** | **Yes**<br>**No**<br>**Comment** |
| | stipuates generation reserve and resource adequacy requirements both for long term planning as well as for operating reserve. (SRC please note: I'm only speculating. Don't let me put words in your mouth) |
| ITC | TC does not have a resource adequacy requirement. We must work with the LSEs in our service territory to determine appropriate CBM to plan for. These requirements allow for this to happen. |
| MEC | It is my understanding of the 2005 Energy Policy Act that the Regional Reliability Organization or NERC can either set the generation reliability criteria or enforce the generation reliability criteria, but it cannot do both. The MRO is in the process of proposing to set the generation reliability criteria as 1 day in 10 years. It will be the responsibility of the Load Serving Entity or its delegate (such as a Planning Reserve Sharing Group) within the MRO to set the reserve margin to meet the 1 day in 10 year criteria. The State will enforce the generation reliability criteria and the Planning Reserve Sharing Group will enforce the reserve margin requirement. |
| MRO | It is the MRO's understanding of the 2005 Energy Policy Act that the Regional Reliability Organization or NERC can either set the generation reliability critiera or enforce the generation reliability criteria, but it cannot do both. The MRO is in the process of proposing to set the generation reliability criteria as 1 day in 10 years. It will be the responsibility of the Load Serving Enetity or its delegate (such as a Planning Reserve Sharing Group) within the MRO to set the reserve margin to meet the 1 day in 10 year criteria. The State will enforce the generation reliability criteria and the Planning Reserve Sharing Group will enforce the reserve margin requirement. |
| Nova Scotia Power | NPCC sets LOLE standards. |
| PSC of SC | PSCSC reviews reserve margin / resource adequacy of regulated electric utilities in Integrated Resource Plans. |
| Salt River Project | SRP sets its Generation Reserve and Resource Adequacy requirements in accordance with WECC Standards. |

**13. With respect to draft standard MOD-004-1 R5.4, what type of deterministic and probabilistic studies do you perform or what rules do you follow to determine a Load Serving Entity's quantity of CBM? Some examples:**

- A Loss of Load Expectation (LOLE) study based on a Loss of Load Probability (LOLP) that allows or establishes a transmission requirement for access to external resources.
- A statutory obligation to meet a regional standard (which might also be an LOLE requirement). What is the transmission requirement if definable?
- A statute with a defined transmission obligation implied or specified.
- A generation requirement, such as loss of the largest unit, which can be interpreted to require access to external resources to cover the loss of the resource. Reply:

**Summary Consideration:** The drafting team thanks all who provided responses. This shall serve as the summary response to all information provided.

| **Question #13** | |
|---|---|
| **Commenter** | |
| APPA | It is not within the scope of this SDT to deal with resource studies, in fact the glossary states the Resource Planner determines the resource adequacy. LOLE and LOLP are methods used by the Resource Planners. |
| Duke Energy | None |
| ERCOT | CBM is not used within ERCOT, |
| FirstEnergy | Currently the ISO determines CBM via an LOLE study based on 1/10 of a day/year. Currently Ohio does not have a requirement for an LOLP. ReliabilityFirst has established a 1 day in 10 year LOLP criteria that is voluntary. In the future, the ISO PRSG may self-contract an LOLP enforcement requirement. It is expected that the ISO market rules will eventually enforce LOLP. |
| IESO | The IESO uses stochastic tools like GE MARS to establish reserve requirements for meeting loss of load expectations (LOLE). However, for Ontario, the concept of CBM is not used and is set to 0. |
| ISO SRC | Unable to provide a specific answer as a group. Again, the LOLE approach is rather commonly used by the ISOs and RTOs in assessing resource adequacy. (SRC please note: ditto the above) |
| ITC | ITC does not have a requirement, although we are familiar with the LOLE/LOLP evaluations. We strongly believe that R6 is a must for this standard. We have heard estimates that as much as 90% of the load in this country is subject to LOLE requirements based on LOLP studies. To not have requirements in this area would be negligent. |
| MEC Trading | LOLE study |
| MEC | I would prefer an LOLE study requirement to support the CBM requests of the Load Serving Entities. |
| MRO | MRO would prefer an LOLE study requirement to support the CBM requests of the Load Serving Entities. |

| Question #13 | |
|---|---|
| Commenter | |
| Nova Scotia Power | LOLE simulations with assumed transmission capacity, however the answer is around 20% reserve |
| PSC of SC | Our comments are from a regulatory perspective. This is strictly a technical issue. |
| Southern Co Svcs | Addressing these concerns should be the role of the resource adequacy drafting team and should be handled in the resource adequacy standard. |
| Salt River Project | SRP's current planning reserve target is based on historical study work that considered unit availability, load uncertainty, and projected costs associated with carrying different levels of reserves. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a standard drafting team on March 17, 2006.
4. SDT posted first draft for comment from February 15–March 16, 2007.

**Description of Current Draft:**

This is the second draft of the proposed standard posted for stakeholder comments. This draft represents consideration of stakeholder comments submitted with the first draft of the proposed revisions to MOD-001 as well as consideration of applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to comments. | TBD |
| 2. Post revised standard for stakeholder comment. | TBD |
| 3. Respond to comments. | TBD |
| 4. Post for 30-day pre-ballot review. | TBD |
| 5. First ballot of standard. | TBD |
| 6. Respond to comments. | TBD |
| 7. Recirculation ballot. | TBD |
| 8. 30-day posting before board adoption. | TBD |
| 9. Board adoption. | TBD |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**None.**

## A. Introduction

1. **Title:** **Available Transfer Capability**
2. **Number:** MOD-001-1
3. **Purpose:** To promote the consistent and uniform application and documentation of Available Transfer Capability (ATC) calculations for reliable system operations.
4. **Applicability:**
   **4.1.** Planning Coordinator.
   **4.2.** Reliability Coordinator.
   **4.3.** Transmission Service Provider.
5. **Proposed Effective Date:** To be determined.

## B. Requirements

**R1.** Each Transmission Service Provider, and its associated Planning Coordinators and Reliability Coordinators, shall agree upon and implement one or more of the ATC methodologies specified in Reliability Standard MOD-028, MOD-029, and MOD-030 for use in determining Transfer Capabilities of those Facilities under the tariff administration of that Transmission Service Provider.

**R2.** Each Transmission Service Provider, and its associated Planning Coordinators and Reliability Coordinators, shall apply the agreed upon ATC methodology or methodologies to calculate values for all ATC time horizons listed below:

**R2.1.** Scheduling horizon (same day and real-time).

**R2.2.** Operating horizon (day ahead and pre-schedule).

**R2.3.** Planning horizon (beyond the operating horizon).

**R3.** Each Transmission Service Provider shall make publicly available an "Available Transfer Capability Implementation Document" (ATCID) that includes, as a minimum, the following information:

**R3.1.** Information describing which methodology (or methodologies) has been selected and how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC calculations may be validated.

**R3.2.** A description of the manner in which the Transmission Service Provider will account for counter-flows.

**R3.3.** The identity of the Planning Coordinator and Reliability Coordinator associated with each Facility under the Transmission Service Provider's tariff.

**R3.4.** The identity of the Transmission Service Providers to which it provides data for use in calculating transfer capability.

**R3.5.** The identity of the Transmission Service Providers from which it receives data for use in calculating transfer capability.

**R4.** The Transmission Service Provider shall notify the following entities (via electronic mail) a minimum of 14 calendar days before implementing a new or revised ATCID:

**R4.1.** Each Transmission Planner in the Transmission Service Provider's area.

**R4.2.** Each Planning Coordinator in the Transmission Service Provider's area.

**R4.3.** Each Reliability Coordinator in the Transmission Service Provider's area.

**R4.4.** Each Transmission Operator in the Transmission Service Provider's area.

**R4.5.** Each Planning Coordinator adjacent to the Transmission Service Provider's area.

**R4.6.** Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

**R4.7.** Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

**R4.8.** Each party that has previously requested to be notified of such actions.

**R5.** Each Transmission Service Provider that calculates ATC shall, at a minimum, recalculate ATC at the following frequency:

**R5.1.** For hourly ATC, once per hour, (on the hour), for the next 168 hours.

**R5.2.** For daily ATC, once per day, (at midnight prevailing time the day previous), for thirty days.

**R5.3.** For weekly ATC, once per day, (at midnight prevailing time on the Monday previous), for four weeks.

**R5.4.** For monthly ATC, once per month, (at midnight prevailing time on the first day of the month previous) for 13 months.

**R6.** Each Transmission Service Provider shall make the following information available to any requesting Transmission Service Provider, Planning Coordinator, Transmission Planner, Reliability Coordinator, Transmission Operator, or other party with a demonstrated reliability need (subject to security and confidentiality requirements):

**R6.1.** Load forecasts.

**R6.2.** Generation dispatch, in the form of dispatch order, participation factors, or block dispatch.

**R6.3.** Planned and unplanned transmission outages.

**R6.4.** Planned and unplanned generation outages.

**R6.5.** Transmission Reservations.

**R6.6.** Power flow models.

**R6.7.** Facility Ratings.

**R6.8.** ATC recalculation frequency and times.

**R6.9.** Transmission Reservation impact modeling identification, such that a source-to-sink analysis of power flow impacts could be undertaken.

## C. Compliance

To be added with next posting.

## D. Measures

To be added with next posting.

## E. Regional Differences

None identified.

## F. Associated Documents

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☐ No

   Comments:

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☐ Yes

☐ No

Comments:

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an "umbrella" standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The MOD-001 Standard incorrectly assigns duties to the Transmission Service Provider (TSP). The duties of the TSP, according to the Functional Model, do not include the determination of a method of calculating the ATC. The three methods suggested in MOD-028 through 030 will be determined as detailed in the Functional Model by the reliability Functions; Planning Authority, Transmission Operator, or Reliability Coordinator; depending on the time horizon of the Studies.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☒ No

   Comments: The Federal Energy Regulatory Commission (FERC) has requested Standards that determine the requirements to calculate TTC will be handled in the FAC Standards. Order 693 States the following: 1050. We adopt the NOPR proposal and require that TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. The FAC series of standards contain the Reliability Standards that form the technical and procedural basis for calculating transfer capabilities. FAC-008-1 provides the basis for determining the thermal ratings of facilities while FAC-009-1 provides the basis for communicating those ratings. FAC-010-1 and FAC-011-1 provide the system operating limits methodologies for the planning and operational horizon respectively and FAC-014 provides for the communication of those ratings.
   FERC has correctly recognized that FAC-012 and FAC-013, while associated with modeling is highly dependent on the previous FAC Standards as noted by FERC.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: MOD-001 if written correctly will detail has the Transmission Service Provider will: 1) acquire the necessary data to calculculate the ATC; 2) the frequency of calculation; 3) the posting of values of the ATC, ATC formula components, and the assumptions use to obtain the values of the the ATC formula components. ---- The other Applicable Functions will be in supporting Standards for TTC/TFC, CBM, TRM, and ETC.

**4.** Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

☐ Yes

☒ No

Comments: The Requirement 5 should set the Maximum amount of time between calculations. The way it is written is that the Requirement sets a Minimum amount of time between calculations. What if an entity updated the Daily before the 24 hours was up; they would be non-compliant. In addition, since hourly covers the next 168 hours, Daily or Weekly calculations will be overlaping each other, one should be omitted. Note TVA's posted method, while they mention Daily and Weekly, they only post Daily for 30 days.

**5.** Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: Available Transfer Capability Implementation Document (ATCID) is redundant should not be made a requirement of the TSP. The ATC is just the algebraic sum of the four components; TTC, ETC, CBM, and TRM. What ever method is used to calculate the TTC, i.e. Flow Gate, Rated System Path, or Network is determined by the planners; RC or TOP and the assumptions will accompany the TTC/TFC values and be posted. The complete description of the ATC calculation is contained in the assumptions of the other components, CBM, TRM, and ETC, which will be posted on the OASIS or other electronic means.

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☐ No

Comments: The posting that are listed are for TTC, the SDT needs to address the assumptions for the other components.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: What is meant by "evaluation of the transmission service request?" If "evaluation of the transmission service request" is prioritizing the transmission service requests base on a predetermined set of rules, the answer is no. Rules to prioritize transmission service requests are based upon negotiated or regulated terms that are a business decision, not reliability.mean by the evaluation of transmission requests? Evaluation of the transmission service request for reliability issues will be made by TOPs or BAs.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: Requirements within this proposed standard deal with the assumptions that will be required by those functions that determine TTC.

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: The Standard is written much like a Policy and it cannot be determined who is responsible for the different calculations of the components of the ATC. The Standard does not provide the Compliance Monitor or the TSP who calculates the Hourly. Daily, and Monthly ATCs with the necessary requirements to know what is necessary to be compliant. A copy of a Draft MOD-001 that has been written in a Standard Format that will permit the Compliance Monitor and the Applicable Functions to respond to measureable requirements is attached for the SDT review and comments.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: ATC related standards should be applicable only to entities who have the obligation to provide non-discrimintory transmission service, that is the Transmission Service Providers.

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: The calculation frequency is a business practice and should not be part of NERC standards.

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☐ No

Comments:

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: Evaluation of Transmission Service Requests is a tariff and business issue not a reliability issue.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

A.

The horizons described in R2 are not consistent with FAC-010 and FAC-011, which describe the operating horizon and up to one year. These terms are not capitalized and defined anywhere, so I am not going to say that MOD is incorrect. there is a potential for confusion and iscommunications between the planners and the Transmission Service Providers.

B

The requirement "subject to security and confidentiality requirements" in R6 is in conflict with FERC's Standards of Conduct. The TSPs may not provide transmission information discriminatorily.

C

R6.9 is unclear.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: However, please clarify that "one standard" is MOD-001.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority.

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: The minimum calculation requirements should mandate recalculation during regular business hours, as opposed to every day at midnight. We suggest leaving the final determination of the proper time for ATC/AFC calculation updates to NAESB, as this is a business practice issue.
   Additionally, R5.5. should be added to address the calculation frequency for annual ATC/AFC values.

**5.** Do you agree the information to be included in the “Available Transfer Capability Implementation Document” that will be made publicly available (as required in R3) is appropriate and sufficient? If “No,” please explain why in the comments area.

☐ Yes

☒ No

Comments: R3.1. should read "… the results of the ATC/AFC calculations may be validated." R3.6. should be added to clarify that the ATCID must only include information pertaining to Posted Paths or Flowgates, where "Posted Path" is defined consistent with NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If “No,” please explain why in the comment area.

☒ Yes

☐ No

Comments: Except that R6.8. should read "ATC/AFC recalculation frequency and times."

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: The evaluation of Transmission Service Requests (TSRs) is outside the scope of FERC's Order 890 directives and there is insufficient time left, prior to the scheduled September 18th posting of these standards for balloting, to draft adequate TSR evaluation standards and provide sufficient industry comment periods.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: The ATC MODs (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) do not clearly distinguish the methodologies and their applications. Please provide narrative descriptions of these methodologies.

The horizons defined in R2.2. and R2.3. need to be reconciled with the Planning and Operating horizons previously defined by NERC.

R5. should be modified to the following:

"R5. Each Transmission Service Provider that calculates ATC for Posted Paths or AFC for Flowgates shall, at a minimum, recalculate those ATC/AFCs at the following frequency:

- R5.1. For hourly ATC/AFC…
- R5.2. For daily ATC/AFC…
- R5.3. For weekly ATC/AFC…
- R5.4. For monthly ATC/AFC…
- R5.5. For yearly ATC/AFC…"

Definitions of the terms "Counter flow" and "Loop flow" are needed, to understand the distinction between the two.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: Neither the standard nor the whitepaper provide enough background information to explain why the structure is necessary. Without the background information it is difficult to determine why this proposed structure is optimal.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: Specifically, R5.4: a minimum of "once a month" is not enough to facilitate commercial activities. Frequency should be "once a day" with a waiver if the inputs to the model have not changed "significantly" from the previous day. Also, what is the minimum frequency for yearly service?

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

   ☐ Yes

☒ No

Comments: Need to include more details as to how transmission service request are modeled.

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☐ Yes

☒ No

Comments: Need to include Transmission Customers as an entity.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments:

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: What determines which ATC calculation method a transmission service provider adapts or the frequency they can change?

In R4 please add Transmission Customers to the notification list.

In R6 please add Transmission Customers to the list that the transmission service provider will make the information available.

Also, please better define "subject to security and confidentiality requirements."

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☒ No

   Comments: FAC-012 should be modified to clearly state that the purpose is to provide instructions for calculating transfer capabilities used in regional reliability assessments. The methodologies used for calculating TTC and these transfer capabilities should be similar, but the assumptions will vary due to the different purposes of the calculations. The major difference is that transfer capabilities for use in reliability assessments are generally only calculated once or twice a year for peak season conditions and TTCs are generally calculated more frequently. Additionally, the transfer capabilities used in reliability assessments should use assumptions reflecting a "worst case" scenario, whereas the assumptions used for calculating TTC should reflect the best forecast of conditions for the particular time period the TTC is being calculated for.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: R5 should be modified to include yearly ATC.

**5.** Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: Need to add another requirement that describes the manner in which the Transmission Service Provider will account for allocation of firm transmission capacity (i.e. reciprocal flowgate allocation).

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☐ Yes

☒ No

Comments: Should specify that the information to be made available is information used in calculation of ATC. Also, need to include flowgate allocation data, identifying any portion of flowgate(s) that have been allocated for firm transmission.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: NAESB should be responsible for business practice standards for evaluation of Transmission Service Requests. The only impact the evaluation of TSRs have on ATC calculations is addressed in MOD-028-1, MOD-029-1 and MOD-030-1.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: Entergy supports this approach.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☒ Yes

   ☐ No

   Comments: Yes, FAC-012 and FAC-013 can be retired after requirements for TTC/TFC methodologies are included in these standards.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: Calculation frequency should be linked with the change in elements of ATC that impact ATC. For example Monthly ATC should not be only calculated once a month, rather it should be recalculated when any reservation impacting the Monthly ATC is confirmed, this could be a Daily or Weekly reservation. If a reservation that impacts the Monthly reservation is confirmed on second day of the month, and Monthly ATCs are not recalculated till first day of the next month, the Monthly ATC values for the impacted period will remain inaccurate for the remaining entire month. Recalculation frequency should be included in NAESB business Practice Standard rather than in reliability standard.

**5.** Do you agree the information to be included in the “Available Transfer Capability Implementation Document” that will be made publicly available (as required in R3) is appropriate and sufficient? If “No,” please explain why in the comments area.

☐ Yes

☒ No

Comments: R 3.5 requires to identify only TSPs from which data is received. In practice, TSP may receive data from entities other than TSP's such as PSEs, Generator Operators etc. for calculating transfer capability. Entergy suggests that TSP should identify all suppliers of data in ATCID for calculation of ATCs and not only other TSPs..

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If “No,” please explain why in the comment area.

☐ Yes

☒ No

Comments: It is not clear how other parties can demonstrate reliability need. In addition, in R6.9, it is not clear what is expected under Transmission Reservation impact modeling identification. If response factors are expected, it should be stated as such, or the term impact modeling identification be defined.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: Requirements of evaluation of Transmission Service Requests is not a reliability issue and it does not have to be included in NERC Realiability Standards. Once Transmission Service Request is confirmed, regardless of which evaluation process is used, it should be included in ETC as appropriate. If needed, Transmission Service Request evalulation process should be addressed by NAESB Business Practice Standards.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: Notification as required in R4 is not necessary if the ATCID is to be posted on a public site.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. 1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: See IRC comments.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☒ No

   Comments: See IRC comments submitted by Charles Yeung.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: See IRC comments submitted by Charles Yeung.

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☒ Yes

   ☒ No

   Comments: ERCOT does not perform these calculations since these concepts are not used within ERCOT. See IRC comments submitted by Charles Yeung.

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: See IRC comments submitted by Charles Yeung.

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT region. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area Interconnection and there has been no reservation of transmission capacity in ERCOT.

Available Transfer Capability is defined as the measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin. The ERCOT Interconnection has already moved "beyond" ATC and into a Market design which resulted in the disappearance of an explicit transmission service product. In addition the DC Tie transfer capability is planned and coordinated by a TSP that is a member of both Regions and therfore both ERCOT and SPP are notified when the DC Tie capability is reduced.

Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. Currently ERCOT employs a zonal congestion management scheme that is flow-based, whereby the ERCOT transmission grid, including attached generation resources and load, are divided into a predetermined number of congestion zones. This congestion management scheme applies zonal shift factors, determined by ERCOT, to predict potential congestion under the known topology of the ERCOT System. This scheme is used in the Day Ahead and Adjustment Periods to evaluate potential congestion. During the operating period ERCOT uses zonal shift factors to determine zonal Redispatch deployments needed to maintain flows within zonal limits. The local congestion management scheme relies on a more detailed Operational Model to determine how each particular Resource or Load impacts the transmission system. This model uses the current known topology of the transmission system. Unit specific Redispatch instructions are then issued to manage local congestion.

In the future ERCOT will be transitioning from a Zonal Market to a full LMP market. This system is designed to manage congestion in the Day Ahead and Real-Time on a Resource specific basis. Under both of these market designs transmission facility limits are established in advance and updated based on coordinated exchange of information between transmission providers and ERCOT in planning and operating periods.

In the current and future ERCOT market design the method of calculating ATC, TTC and the use of CBM and TRM are not applicable to the ERCOT Region. ERCOT does not have a synchronous connection with any other Balancing Authority Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Balancing Authority Areas and/or offer transmission reservations and schedules within the Interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance.

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: See IRC comments submitted by Charles Yeung.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: MOD-001, 028, 029, and 030 should be combined into one standard to eliminate the need to reference several standards at once and eliminate duplication.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☒ Yes

   ☐ No

   Comments: FAC-012 and 013 are similar in scope to MOD-001 and should be retired once MOD-001 is revised.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☒ Yes

   ☐ No

   Comments: R5 should require recalculation of ATC as interchange schedules or transmission reservations change.

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

Comments: R3 gives the TSP a lot of leeway in how it implements the calculations that it performs under this standard. R3.1 is not specific enough to meet the intent of 693-1057, additional detail on required elements is needed to insure that adequate data is exchanged to enable the duplication and verification of the calculations for validation..

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☐ No

Comments: Overall R6 addresses data sharing beter than it does the uniformity of the data. R6 should specify the time periods and method (electronic?) for sharing the specified data. In addition, it should specify the time period of the data to be shared - future data, past data, or both. As written, R6 leaves too much leeway to meets the stated purpose of promoting the consistent and uniform application and documentation of ATC calculations. Lastly, R6 requires the sharing of data with other parties with a demonstrated reliability need, methods are needed for determining that a reliability need has been demonstrated, who will make this determination, and for resolving conflicts.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: MOD-001 should include the Transmission Service Request evaluation rules necessary to maintain the relaibility of the Bulk Electric System.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: R1 requires agreement on methodology among TSP, PCs and RCs and should include a method for handling disagreements.

R2 implies need for incorporating schedules but does not imply or explicitly state the incorporation of transmission reservations.

R4.8 should require a written request as a means of formally documenting the request was made, received, and acknowledged.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☒ Yes

   ☒ No

   Comments: Are FAC-012 and FAC-013 intended to be for only interfaces where transmission service is sold? If not, and these standards are intended to cover the establishment of intra-area interfaces, then the retirement of these standards would be leaving a gap that is not covered by other standards.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: (1) Language needs to be clear that TSPs only have to calculate ATC for durations of service that they offer.
   (2) Regarding the frequency of the updates; it should be clear that if no inputs have changed that no recalculations are required. For example, for those entities that update ATC automatically based on receipt of service requests or a change in TTC, it would be burdensome to 'recalculate' on this stated frequency with no added value.
   (3) Regarding the timing of the updates; Suggest replace 'at' with 'no later than' so that the auditing aspect of this requirement is reasonable. Entities would be allowed to have calculated that data at any time prior to this required time point. Required timing of updates to be 'at' a

specific time creates an auditing trap. For example, how long does it take to perform a set of ATC calculations? Is this requiring that calculations be started at this time or completed by this time? Knowing when the calculations are completed will also provide a known time point for the posting requirements to be developed by NAESB.

**5.** Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☐ No

Comments:

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: The evaluation of Transmission Service Requests is a Business Practice and should continue to be addressed under NAESB

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: The current wording of Requirement 5 contains language that dictates precisely when ATC calculations must occur. There are areas with existing market rules and corresponding tariffs that dictate when publications of data occur (for example - after the clearing of a Day Ahead Market). NERC standards do not have the authority to require wholesale changes to existing market structures. Therefore, the wording of the timing of the required ATC calculations must be more general.

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: For those entities that do not provide physical transmission service, some of the requirements in these stanards do not apply. With the current arrangement of these proposed standards, the ATCID for these entities would clearly document what requirements of the standards are or are not applicable.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an "umbrella" standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: We do not have a strong view one way or the other on splitting the former MOD-001 into various standards with some of them each addressing an ATC calculation methodology. However, we have some fundamental disagreements with some of the standards as drafted. Unfortunately, the SAR that proposed the split has not provided the scope and description of what went into the draft standards such as MOD-001, MOD-028, MOD-029 and MOD-030, which in our view should have been posted for review and comments before this and the other MOD standards are drafted.

   Specific to this draft standard, we have a number of concerns and comments which we will list below.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☒ No

   Comments: Owing to the various concerns we have over MOD-001, MOD-028 to MOD-030, we are unable to determine at this time whether or not FAC-012 and FAC-013 can or cannot be retired until we see the more refined versions of the MOD standards.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The RC and PC do not have a role in MOD-001 as they are neither responsible for calculating ATC, nor are they responsible for implementing or agreeing to a method for use in calculating ATC.

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

☒ Yes

☐ No

Comments: We generally agree.

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: We do not know what this Available Transfer Capability Implementation Document (ATCID) is intended to provide and serve. Is this a document that resembles or replaces the existing Regional ATC Methodology document? If so, there is much more information to be provided. For example, coordination with neighboring TSPs on ATC calculation, interface definitions, path names, etc.

Notwithstanding the above concerns, we do not understand why the RC and the PC need to be identified in R3.3 but not the TOP.

6. Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☒ No

Comments: Though it is not stated in the requirement, we assume these data are related to ATC calculation. Some of the data do not support reliability need (e.g. time and frequency of ATC calculation), while there may be some that do but not listed. There are also some data that are proprietray information for which consent of the information owner must be sought before they can be disseminated. But until we see a more refined set of standards that better align roles and responsibilities, we are unable to provide any specific inputs to the completeness and appropriateness of the list.

In R6.5 – By Transmission Reservations, does the requirement mean both "firm" and "non-firm" reservations?

In R6.6 – The requirement should state both power flow models and the underlying modeling assumptions including the modeling of generators in the first-tier control areas.

The list of single and multiple element contingencies included in the ATC calculation should also be provided.

7. Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: It'd be best to keep this standard to calculating ATC only. Evaluation of transmission service request belongs to another standard, or even a NAESB businesss practice.

8. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: Not aware of any conflicts but it should be pointed out that some entities do not provide physical transmission services. Hence, these standards or some of the requirements in these standards may not apply.

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: Please see our high level comments to the SAR which we feel need to be addressed first before providing any comments specific to this standard.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

However, we have some fundamental disagreements with some of the standards as drafted. Unfortunately, the SAR that proposed the split has not provided the scope and description of what went into the draft standards such as MOD-001, MOD-028, MOD-029 and MOD-030, which in our view should have been posted for review and comments before this and the other MOD standards are drafted.

   Specific to this draft standard, we have a number of concerns and comments which we will list below.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☒ No

   Comments: Owing to the various concerns we have over MOD-001, MOD-028 to MOD-030, we are unable to determine at this time whether or not FAC-012 and FAC-013 can or cannot be retired until we see the more refined versions of the MOD standards.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The RC and PC are not responsible for calculating ATC, nor are they responsible for implementing or agreeing to a method for use to calculate ATC. They do not have a role in MOD-001.

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

☐ Yes

☒ No

Comments: The calculation frequency is not consistent across all methodologies. The frequency should allow for time to validate the values calculated. It may not be consistent with currently filed FERC Operating Agreements, which is not a minimum requirement for the whole industry.

**5.** Do you agree the information to be included in the “Available Transfer Capability Implementation Document” that will be made publicly available (as required in R3) is appropriate and sufficient? If “No,” please explain why in the comments area.

☐ Yes

☒ No

Comments: We do not know what this Available Transfer Capability Implementation Document is intended to provide and serve. Is this a document that resembles or replaces the existing Regional ATC Methodology document? If so, there is much more information to be provided. For example, coordination with neighbor TSPs on ATC calculation, interface definitions, path names, etc.

Notwithstanding the above concerns, we do not understand why the RC and the PC need to be identified in R3.3 but not the TOP.

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If “No,” please explain why in the comment area.

☒ Yes

☒ No

Comments: Though it is not stated in the requirement, we assume these data are related to ATC calculation. Some of the data do not support reliability need (e.g. time and frequency of ATC calculation), while there may be some that do but not listed. There are also some data that are proprietray information for which consent of the information owner must be sought before they can be disseminated. But until we see a more refined set of standards that better align roles and responsibilities, we are unable to provide any specific inputs to the completeness and appropriateness of the list.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: It'd be best to keep this standard to calculating ATC only. Evaluation of transmission service request belongs to another standard, or even a NAESB businesss practice.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: Not aware of any conflicts but it should be pointed out that some entities do not provide physical transmission services. Hence, these standards or some of the requirements in these stnadards may not apply.

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: Please see our high level comments to the SAR which we feel need to be addressed first before providing any comments specific to this standard.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an "umbrella" standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: While the RC and the PC do not calculate ATC, they are responsible for calculating TTC which is a direct input to the ATC calculation. Since the selection of the TTC methodology will determine which ATC standard is utilized by the TSP, it is appropriate for the RC and the PC to be applicable entities in this standard. While it is not specifically stated in R1 and R2 that the RC and PC are involved solely because of their involvement in TTC, the MOD-028, MOD-029 and MOD-030 clearly deliniate the responsibility for those entities.

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: (1) Language needs to be clear that TSPs only have to calculate ATC for durations of service that they offer.
   (2) Regarding the frequency of the updates; it should be clear that if no inputs have changed that no recalculations are required. For example, for those entities that update ATC automatically based on receipt of service requests or a change in TTC, it would be burdensome to 'recalculate' on this stated frequency with no added value.

(3) Regarding the timing of the updates; Suggest replace 'at' with 'no later than' so that the auditing aspect of this requirement is reasonable. Entities would be allowed to have calculated that data at any time prior to this required time point. Required timing of updates to be 'at' a specific time creates an auditing trap. For example, how long does it take to perform a set of ATC calculations? Is this requiring that calculations be started at this time or completed by this time? Knowing when the calculations are completed will also provide a known time point for the posting requirements to be developed by NAESB.

**5.** Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☐ No

Comments:

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: The evaluation of Transmission Service Requests is a Business Practice and should continue to be addressed under NAESB

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: The current wording of Requirement 5 contains language that dictates precisely when ATC calculations must occur. There are areas with existing market rules and corresponding tariffs that dictate when publications of data occur (for example - after the clearing of a Day Ahead Market). NERC standards do not have the authority to require wholesale changes to existing market structures. Therefore, the wording of the timing of the required ATC calculations must be more general.

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☒ No

   Comments: This is a qualified yes. The three methodsologies will make it easier for the various regions in the country to comply with the standards. A single standard would be best, but it would come at a cost for entities to adapt to the single methodology if they are in an area that would have to implement changes to comply with the chosen methodology. The costs would likely not be prohibitive, however, and FERC could mandate a single methodology if they so chose to. We would prefer MOD-030 as a single standard. As the three methodologies now exist, MOD-030 appears to provide the greatest flexibility and accuracy.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☒ Yes

   ☒ No

   Comments: We never thought FAC-012 or -013 should apply to ATC calculations. They are a system "test" and not a rigorous calculation of TTC for sale of transmission service.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: We understand that certain areas of the country may want Reliability Coordinators to be responsible entities, perhaps because they wear both the RC and TSP hat, but this is not a reason to include them. In the MISO footprint, it makes no sense to include the RC. However, we do think that a list of applicable entities should include the "Transmission Planner," as has been indicated in MOD-004 and MOD-008. This is more appropriate than the RC. As written, several entities are excluded from the applicability statement.

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☒ Yes

   ☐ No

Comments:

**5.** Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☒ Yes

☒ No

Comments: The more transparency there is in the process (except for commercially sensitive data), the better the process will be.

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☐ Yes

☒ No

Comments: We agree that what is asked for is appropriate, but it may not be sufficient. For example, the ratings provided should include "any value used to limit AFC/ATC." Ratings can have time, temperature, and seasonal adjustments. As written, compliance might mean just a single ratings set. This could be handled in the compliance and measures section but additional thought should be given to this section.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: This could be in measures and compliance and not necessarily in the requirements.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: Certain areas of the country have tariffs (such as New England) that were approved by FERC and do not require the sale of transmission service. These areas could be saved a lot of grief by excluding them from these standards. However, they should be required to provide any data to their neighbors (such as their impacts on neighbor system flows) that might impact ATC calculations.

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: Given that three methods are acceptable for calculating AFC/ATC, MOD-001 is a necessary prelude to any methodology chosen.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: I agree with team's decision to structure the standards in this manner but I have some comments about it. I believe the Standards Drafting Team should make it clearer in the MOD-001-1 that while one or more of the methods provided in MOD-028 through MOD-030 may be used by one party across a system, only one of these methods is to be used for a particular flowgate or for a particular path.

**2.** This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

☐ Yes

☒ No

Comments: FAC-012 and FAC-013 need to be revised as necessary to cover other reliability needs for Transfer Capability measurements such as for unusual operating conditions that do not need to be the basis for commercial offerings.

**3.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**4.** Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

☐ Yes

☒ No

Comments: In practice in the industry, the calculation frequency is not consistent across all methodologies. In some cases the times for posting and the frequency of recalculations are slower to allow for time to validate the values calculated. I believe that reliability will suffer if validation is eliminated so as to meet a target that is set by the Standard.

Further, the frequency requirements should be consistent with currently filed FERC Operating Agreements. Therefore, I suggest that whatever frequency requirements are provided that they be qualified with allowances that "other frequency recalculation and posting times are allowed provided the Transmission Provider coordinates such frequencies and posting times with its neighbors and documents the valid reasons for adopting such frequencies". Also, alternatively or in addtion, the Standards Drafting Team should indicate that "if the Transmission Provider has filed FERC Operating Agreement(s) that provides for alternative recalculation frequencies and/or posting times that those frequencies and/or posting times are acceptable."

Also, I do not believe that separate weekly posting are required. If a Transmission Provider provides enough daily postings into the future to meet weekly needs, that these daily postings should be adequate. The way the standard is written now it appears as if weekly postings are required. The Standards Drafting Team should clarify that the frequencies and posting for weekly are only if the Transmission Povider posts separate weekly quantitites. (The FERC requires hourly, daily, and monthly postings so no such clarification is required for the other frequencies and posting times listed in the draft standard.)

Also, the posting times in particular seem to be too inflexible particularly for longer period offerings. Why does everyone have to post the daily quantities at midnight and only midnight? MAPP posts daily quantities at 10 a.m. on the previous day which seems adequate to me. I suggest that, at a minimum, the posting team needs to either make these posting times times which the Tranmission Provider may post at or before, or else replace the posting times with an acceptable window for posting. For example, either the daily quantities can be posted "on or before midnight" or alternatively "on the previous day" if the SDT believes that posting too early is as big a problem as posting too late.

**5.** Do you agree the information to be included in the “Available Transfer Capability Implementation Document” that will be made publicly available (as required in R3) is appropriate and sufficient? If “No,” please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If “No,” please explain why in the comment area.

☒ Yes

☐ No

Comments:

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: Transmission request evaluation is not the subject of this standard. If there are reliability reasons that require a standard that should be the subject of a new SAR and a new Standards Drafting Team.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: 1. I question the approach in R1 that calls for the Transmission Service Provider, Planning Coordinator, and the Reliablity Coordinator to agree to the appropriate ATC methodologies. The Transmission Service Provider has the ultimate authority. Also there are no provisions in the standard for a way to resolve disputes. What happens if each of the three has a different idea as to which methodologies to use? I believe that the Planning Coordinator and the Reliability Coordinator should be responsible for resolving disputes between Transmission Service Providers if there are issues with regard to flowgates that involve more than one Transmission Service Provider. I suggest that either R1 be changed to have the Transmission Service Provider coordinate with the Planning Coordinator and the Reliability Coordinator the methodology or else, the words "as appropriate" be added to R1 so that, if necessary the functional entity that has the authority makes the decision when there is disagreement. 2. In R6, "other party" who may request the information should be changed to "other Functional Entity" so as to more properly describe the parties who might have a reliability need for the information. 3. The purpose of each of the standards should be revised to be more in-line with each other, that is some refer to "transparent" and "reliable system operations" and others do not. I recommend that the purpose in MOD-001-1 be revised to state: "To promote the consistent and transparent application and documentation of Available Transfer Capability (ATC) calculations for reliable system operations." 4. I note that the Standards Drafting Team has defined a scheduling horizon in addition to an operating horizon and a planning horizon. I am not familiar with the use of a scheduling horizon and questions why the Standards Drafting Team established it and why they have defined it as provided in the standard.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: MidAmerican Trading believes that only two methodologies really exist and those are a Rated System Path and the Network Response Methodology. Those that do network response are just monitoring a different set of facilities, studying a different set of contingencies and recalculating using the laws of physics with a different frequency. MidAmerican Trading is also concerned that the standard drafting team is still making most of the requirements fill-in-the-blank requirements and more the the requirements should be in MOD-001 and standarized for all methodologies.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☒ No

   Comments: FAC-012 and FAC-013 should be revised as necessary to clearly state that they are for covering the reliability needs for Transfer Capability measurements such as for unusual operating conditions to help establish operating guides or provide guidance to the operators and that are not the basis for commercial offerings or the for the decisions to accept or deny transmission service requests.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☒ Yes

   ☐ No

   Comments:

**5.** Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: The document should also include a technical explanation of how transmission service requests are being evaluated.

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☐ No

Comments:

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: ATC values are calculated for the evaluation of Transmission Service. If these processes aren't for the evaluation of TSRs, what are they for?

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: This standard in conjuction with the other MODS (28/29/30) are in direct conflict with FERC order 890 requiring consistency.

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. *Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The MRO agrees with team's decision to structure the standards in this manner but we have some comments about it. We believe the Standards Drafting Team should make it clearer in the MOD-001-1 that while one or more of the methods provided in MOD-028 through MOD-030 may be used by one party across a system, only one of these methods is to be used for a particular flowgate or for a particular path.

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☐ Yes

   ☒ No

   Comments: FAC-012 and FAC-013 need to be revised as necessary to cover other reliability needs for Transfer Capability measurements such as for unusual operating conditions that do not need to be the basis for commercial offerings.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: In practice in the industry, the calculation frequency is not consistent across all methodologies. In some cases the times for posting and the frequency of recalculations are slower to allow for time to validate the values calculated. The MRO believes that reliability will suffer if validation is eliminated so as to meet a target that is set by the Standard.

Further, the frequency requirements should be consistent with currently filed FERC Operating Agreements. Therefore, the MRO suggests that whatever frequency requirements are provided that they be qualified with allowances that "other frequency recalculation and posting times are allowed provided the Transmission Provider coordinates such frequencies and posting times with its neighbors and documents the valid reasons for adopting such frequencies". Also, alternatively or in addtion, the Standards Drafting Team should indicate that "if the Transmission Provider has filed FERC Operating Agreement(s) that provides for alternative recalculation frequencies and/or posting times that those frequencies and/or posting times are acceptable."

Also, the MRO does not believe that separate weekly posting are required. If a Transmission Provider provides enough daily postings into the future to meet weekly needs, that these daily postings should be adequate. The way the standard is written now it appears as if weekly postings are required. The Standards Drafting Team should clarify that the frequencies and posting for weekly are only if the Transmission Povider posts separate weekly quantitites. (The FERC requires hourly, daily, and monthly postings so no such clarification is required for the other frequencies and posting times listed in the draft standard.)

Also, the posting times in particular seem to be too inflexible particularly for longer period offerings. Why does everyone have to post the daily quantities at midnight and only midnight? MAPP posts daily quantities at 10 a.m. on the previous day which seems adequate to the MRO. The MRO suggests that, at a minimum, the posting team needs to either make these posting times times which the Tranmission Provider may post at or before, or else replace the posting times with an acceptable window for posting. For example, either the daily quantities can be posted "on or before midnight" or alternatively "on the previous day" if the SDT believes that posting too early is as big a problem as posting too late.

**5.** Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☐ No

Comments:

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: Transmission request evaluation is not the subject of this standard. If there are reliability reasons that require a standard that should be the subject of a new SAR and a new Standards Drafting Team.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: 1. The MRO questions the approach in R1 that calls for the Transmission Service Provider, Planning Coordinator, and the Reliablity Coordinator to agree to the appropriate ATC methodologies. The Transmission Service Provider has the ultimate authority. Also there are no provisions in the standard for a way to resolve disputes. What happens if each of the three has a different idea as to which methodologies to use? The MRO believes that the Planning Coordinator and the Reliability Coordinator should be responsible for resolving disputes between Transmission Service Providers if there are issues with regard to flowgates that involve more than one Transmission Service Provider. MRO suggests that either R1 be changed to have the Transmission Service Provider coordinate with the Planning Coordinator and the Reliability Coordinator the methodology or else, the words "as appropriate" be added to R1 so that, if necessary the functional entity that has the authority makes the decision when there is disagreement. 2. In R6, "other party" who may request the information should be changed to "other Functional Entity" so as to more properly describe the parties who might have a reliability need for the information. 3. The purpose of each of the standards should be revised to be more in-line with each other, that is some refer to "transparent" and "reliable system operations" and others do not. The MRO recommends that the purpose in MOD-001-1 be revised to state: "To promote the consistent and transparent application and documentation of Available Transfer Capability (ATC) calculations for reliable system operations." 4. The MRO notes that the Standards Drafting Team has defined a scheduling horizon in addition to an operating horizon and a planning horizon. The MRO is not familiar with the use of a scheduling horizon and questions why the Standards Drafting Team established it and why they have defined it as provided in the standard.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an "umbrella" standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☒ Yes

   ☒ No

   Comments: Are FAC-012 and FAC-013 intended to be for only interfaces where transmission service is sold? If not, and these standards are intended to cover the establishment of intra-area interfaces, then the retirement of these standards would be leaving a gap that is not covered by other standards.

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: (1) Language needs to be clear that TSPs only have to calculate ATC for durations of service that they offer.
   (2) Regarding the frequency of the updates; it should be clear that if no inputs have changed that no recalculations are required. For example, for those entities that update ATC automatically based on receipt of service requests or a change in TTC, it would be burdensome to 'recalculate' on this stated frequency with no added value.
   (3) Regarding the timing of the updates; Suggest replace 'at' with 'no later than' so that the auditing aspect of this requirement is reasonable. Entities would be allowed to have calculated that data at any time prior to this required time point. Required timing of updates to be 'at' a

specific time creates an auditing trap. For example, how long does it take to perform a set of ATC calculations? Is this requiring that calculations be started at this time or completed by this time? Knowing when the calculations are completed will also provide a known time point for the posting requirements to be developed by NAESB.

**5.** Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☐ No

Comments:

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: The evaluation of Transmission Service Requests is a Business Practice and should continue to be addressed under NAESB

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: The current wording of Requirement 5 contains language that dictates precisely when ATC calculations must occur. There are areas with existing market rules and corresponding tariffs that dictate when publications of data occur (for example - after the clearing of a Day Ahead Market). NERC standards do not have the authority to require wholesale changes to existing market structures. Therefore, the wording of the timing of the required ATC calculations must be more general.

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments: For those entities that do not provide physical transmission service, some of the requirements in these stanards do not apply. With the current arrangement of these proposed standards, the ATCID for these entities would clearly document what requirements of the standards are or are not applicable.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☒ Yes

   ☐ No

   Comments:

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☒ Yes

☐ No

Comments:

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments:

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an “umbrella” standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: The requirement is too prescriptive with respect to the times that the calculations need to be performed. Other processes (e.g., ramps, schedule updates, etc) are also being performed across the top of the hour. Each TSP should be allowed the flexibility to set a more appropriate time for recalculations.

   This requirement should also not require a recalculation of ATC unless the one of the components of the ATC equation changes.

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☐ Yes

☒ No

Comments: It is unclear why the TSP should exchange ATC recalculation frequency and times in R6.8 when they are prescribed in R5.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: The evaluation of Transmission Service Request are governed by the tariff and should remain so.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

1. As drafted, it is not completely clear as to which of the requirements would apply to long-term planning and which requirements would not apply. For example, R5 clearly limits the timeframe of the requirement to 13 months. However, R6 has no reference or indication of which timeframes this requirement would be applicable.

2. R6 requires that the data in R6.1 - R6.9 is shared with ". . . or other party with a demonstrated reliability need. . . ." To avoid potential conflicts with this data sharing, the term "reliability need" should be limited to those needs required to maintain reliability of the transmission system.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an "umbrella" standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

   Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

   ☐ Yes

   ☒ No

   Comments: Calculation frequency should be based on changes in system conditions or granting of additional transmission service. Calculations based on a set frequency would not improve reliability.

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☐ Yes

☒ No

Comments: R6.9 needs clarification.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: The MOD standards define the bounds for reliably selling transmission service. Tarriff admin and business practices are based on FERC approved tarriffs that operate within these bounds.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an "umbrella" standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow.

Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**2.** This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

☒ Yes

☐ No

Comments:

**3.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments:

First, the "Applicability" section uses the term "Planning Coordinator" which is not a defined term in the NERC Glossary. If the NERC Team intends it use, it should become a defined term.

Second, where the term Planning Coordinator is used, WECC queries whether or not the more accurate entity would be the Transmission Planner.

Third, this Standard should not apply to the Reliability Coordinator. The RC should be removed from R1 and R2. (See comments appended.)

**4.** Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

☐ Yes

☒ No

Comments:

1)

The minimum calculation requirements should require recalculation during regular business hours, as opposed to every day at midnight.

2)
Currently, most of WECC utilizes OATI. If the OATI system is required to recalcuate the entire West at a single moment, that system may not be capable of doing the calcuations. Since OATI currently recalulates continuously as variables change, can the NERC Team draft language to allow for a recalculation or reposting within an hour as opposed to all entities doing so at a specified moment?

3)
The WECC Team in general has the following question of interpretation for the NERC Team. To the extent the WECC Team does not understand "how" tocomply with the requirements, it would seem the requirements are either overly vague or unenforceable as written. Please answer the appended question and rewrite for clarity.

The question revolves around the calculation frequency and required recalculation (forecasts?) of ATC going forward:

A. Does this recalculation requirement in any way mandate that transmission providers should adjust (hourly, daily, etc) ATC in response to network load variations?
Taken as currently written, this standard could be interpreted to require TPs to (1) forecast load variations, by path, by day (or hour), (2) reduce network (and possibly PTP) load reservations, "freeing up" future daily (or hourly if offered) ATC and (3) sell firm capacity going forward in response to a load forecast on a path by path basis. This is not a reasonable expectation for TPs to be 100% accurate in load forecasts, and this standard, if making the requirement outlined in the above interpretation, should be clarified to require TPs to update ATC only in response to future capacity sold, and not be required to reduce network reservations as a response to load forecasts to allow future short term firm sales on a daily (or hourly if offered) basis.

In the interpretation outlined above, if the transmission provider (or LSE) is incorrect in load forecasts, and the TP has sold short term firm in these "freed up" ATC periods, it would restrict network (and PTP) customers from scheduling up to their "before the hour" rights without curtailment.

**5.** Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments: The WECC Team concurs that the stated content of the ATCID is appropriate. However, the term "ATCID" is used as a defined term without a definition. It is also used in multiple other standards. It should either be a defined term in the NERC Glossary or, at minuimum, must be cross referenced from all other standards back to this standard.

**6.** Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

☐ Yes

☒ No

Comments: See 9.D. below.

**7.** Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: Evaluation of Transmission Service Requests is outside the scope of the Order(s) and more appropriately falls into the purview of NAESB as a Business Practice.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

A.

As to the "Horizons" identified in the draft at R2, the WECC MIC MIS ATC TF opines that there is no singular practice across the industry as to "Horizons"; however those provided by FERC do not generally comport with how the industry uses those terms.

The WECC Team suggests that the terms utilized in the draft are at best unclear and at worst not consistent with industry usage. It is suggested these "Horizons" be defined by NAESB as part of the ATC process and that their definitions be established in a manner that best reflects accurate industry usage.

B. R1. requires TSPs, PCs and RC to "agree upon and implement" a methodology. The standard suggests no remedy if the three parties cannot "agree." The Team suggests the TSP should be the sole entity to select the methodology. The TSP should have a condition precedent to consult with the PC and RC before selection and a condition subsequent to inform the PC and RC of the selection, seek counsel from those entities on how the methodology should be implemented and ultimately inform the PC and RC as to how that selected methodology will be implemented.

C. R5. Should read:

"Each Transmission Service Provider that calculates ATC for a Posted Path shall, at minimum…"

This requires the addition of the below FERC approved term as excerpted from 18 CFR 37.6 and as utilitized in NAESB R0-4005 in compliance with Order 889. (References below):

Posted Path

Posted Path means: 1) Any Balancing Authority to Balancing Authority interconnection; 2) any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months; 3) and any path for which a customer requests to have ATC or TTC posted. For purposes of this definition, an hour includes any part of an hour during which service was denied, curtailed or interrupted. (Plagiarized from NAESBE R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60. See also: 18 CFR 37.6; http://a257.g.akamaitech.net/7/257/2422/12feb20041500/edocket.access.gpo.gov/cfr_2004/aprqtr/pdf/18cfr37.5.pdf

D. R6.

There is a concern that where two entities have not selected the same methodology, and where one requests data from the other, the requesting entity must still provide the requested data even if that data is not utilized in the methodology of the providing entity. In other words, an entity cannot be allowed to refuse data provision simply because that entity doesn't use such data in its selected methodology. The Requirement as drafted does not make this clear.

Please use this form to submit comments on the 2nd draft of standard MOD-001-1, Available Transfer Capability. Comments must be submitted by **June 24, 2007.** You may submit the completed form by e-mail to sarcomm@nerc.net with “ATC Standard” in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer/Flowgate Capability (TTC)/(TFC) and Available Transfer/Flowgate Capability (ATC)/(AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/TFC and ATC/AFC calculations and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/TFC and ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/TFC and ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/TFC and ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability. The proposed version of MOD-001 is an "umbrella" standard and it contains the general requirements applicable to ATC without regards to any particular methodology.

The standard drafting team would like to receive industry comment on the proposed requirements and structure of MOD-001-1 ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and the revised MOD-001 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

☐ Yes

☒ No

Comments: NAESB Business Practices and OATT requirements should address this.

**8.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**9.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

Comments:

NERC

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

**Consideration of Comments on 2nd Draft of Standard MOD-001-1 — Available Transfer Capability (Project 2006-07)**

The ATC Standard Drafting Team requesters thank all commenters who submitted comments on the second draft of standard MOD-001-1, Available Transfer Capability. This standard was posted for a 30-day public comment period from May 25 through June 24, 2007. The requesters asked stakeholders to provide feedback on the standard through a special standard Comment Form. There were 26 sets of comments, including comments from 107 different people from more than 60 companies representing all of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received from stakeholders, comments from the cooperative effort with NAESB in developing associated business practices, and comments received from FERC staff, the drafting team has significantly redrafted the standard. The changes have been so extensive that the revised standard bears very little resemblance to the last posted draft. Major changes include:

- Added definitions for Posted Path, Available Transfer Capability Implementation Document (ATCID), Transmission Operator Area, Existing Transmission Commitments (ETC), and Planning Coordinator.
- Modified R1 to change the applicability to the Transmission Operator and to clarify that the selected ATC methodologies are for use in determining transfer capabilities of those facilities for each Posted Path per time period within the Planning coordinator's planning area.
- Modified the purpose to clarify that the intent of the standard is to provide, 'transparent' rather than 'uniform' ATC calculations
- Eliminated the Planning Coordinator and Reliability Coordinator as applicable entities – and added the Transmission Operator.
- Modified the requirement to select the methodology for calculating ATC so this responsibility is assigned to the Transmission Operator rather than the Transmission Planner, Transmission Service Provider and Reliability Coordinator
- Modified the requirement to calculate ATC so this responsibility is assigned to the Transmission Operator and Transmission Service Provider rather than to the Planning Coordinator, Reliability Coordinator and Transmission Service Provider
- Updated the time frames for the Transmission Operator and Transmission Service Provider to calculate ATC and the time frames for the Transmission Service Provider to update ATC
- Modified requirements that mentioned 'make publicly available' to provide a cleaner handoff with NAESB's business practices – the revised standard requires that the information be 'prepared' – and the associated business practice will address the actual posting of the information
- Added a requirement that the Available Transfer Capability Implementation Document address third party allocation methodologies
- Added a requirement on how to account for counterflows in the calculation of ATC or AFC

- Added a requirement that, when calculating ATC, AFC, and TTC, the Transmission Operator and Transmission Service Provider use assumptions consistent with those used in any associated operations studies or planning studies for the time period studied
- Added much more specificity to the list of ATC calculation data and information that must be provided to others
- Added measures and compliance elements

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

## Index to Questions, Comments, and Responses

1. As stated above, the drafting team is posting three standards that specify requirements for three different acceptable methods for calculating TTC, TFC, AFC and ATC (i.e., MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability) and one standard that encompasses the requirements that must be followed for calculating ATC, regardless of which of the other three standards are used, including a requirement to use one or more of the other standards, in an attempt to make the standards easier to follow. Do you agree with the drafting team's decision to structure the standards in this manner? If "No," please explain why in the comments area.

**Summary Consideration:** Most commenters who responded to this question support the restructuring.

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The MOD-001 Standard incorrectly assigns duties to the Transmission Service Provider (TSP). The duties of the TSP, according to the Functional Model, do not include the determination of a method of calculating the ATC. The three methods suggested in MOD-028 through 030 will be determined as detailed in the Functional Model by the reliability Functions; Planning Authority, Transmission Operator, or Reliability Coordinator; depending on the time horizon of the Studies. |
| **Response:** The SDT has modified this Standard to assign determination of the method to the Transmission Operator. | | | |
| MEC | | ☑ | I agree with team's decision to structure the standards in this manner but I have some comments about it. I believe the Standards Drafting Team should make it clearer in the MOD-001-1 that while one or more of the methods provided in MOD-028 through MOD-030 may be used by one party across a system, only one of these methods is to be used for a particular flowgate or for a particular path. |
| **Response:** The SDT agrees and the standard requires that only one method may be used for each Posted Path per timeframe. | | | |
| Constellation Energy Commodities | | ☑ | Neither the standard nor the white paper provides enough background information to explain why the structure is necessary. Without the background information it is difficult to determine why this proposed structure is optimal. |
| **Response:** The SDT has modified this and other MOD Standards to make it clear that the structure used will be the correct and optimal structure. | | | |
| FirstEnergy | | ☑ | MOD-001, 028, 029, and 030 should be combined into one standard to eliminate the need to reference several standards at once and eliminate duplication. |
| **Response:** Based in the first set of comments on MOD-001, the SDT concluded that the best approach to the standards was to split them into multiple standards. | | | |
| MEC Trading | | ☑ | MidAmerican Trading believes that only two methodologies really exist and those are a Rated System Path and the Network Response Methodology. Those that do network response are just monitoring a different set of facilities, studying a different set of contingencies and recalculating using the laws of physics with a different frequency. MidAmerican Trading is also concerned that the standard drafting team is still making most of the requirements fill-in-the-blank requirements and more the the |

| **Question #1** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | requirements should be in MOD-001 and standardized for all methodologies. |
| **Response:** The SDT agrees with MEC Trading that the two primary methodologies for planning and operating the BES are Rated System Path and Network Response Methodology. However, the SDT has determined that in parts of the BES the Transmission Service Providers are using the Flowgate Methodology, which is a modification of the Network Response Methodology. Since these parts of the BES are being planned and operated using the Flowgate Methodology by the Transmission Planners, Transmission Operators and Reliability Coordinators the SDT believes that the Flowgate Methodology is necessary to accurately calculate ATC in that part of the BES.<br><br>The SDT has attempted to eliminate "fill-in-the-blank" requirments where possible. | | | |
| MRO | | ☑ | The MRO agrees with team's decision to structure the standards in this manner but we have some comments about it. We believe the Standards Drafting Team should make it clearer in the MOD-001-1 that while one or more of the methods provided in MOD-028 through MOD-030 may be used by one party across a system, only one of these methods is to be used for a particular flowgate or for a particular path. |
| **Response:** The standard drafting team could not identify a reliability-related reason to limit the number of methods used for a particular flowgate or path. | | | |
| IRC | ☑ | ☑ | We do not have a strong view one way or the other on splitting the former MOD-001 into various standards with some of them each addressing an ATC calculation methodology. However, we have some fundamental disagreements with some of the standards as drafted. Unfortunately, the SAR that proposed the split has not provided the scope and description of what went into the draft standards such as MOD-001, MOD-028, MOD-029 and MOD-030, which in our view should have been posted for review and comments before this and the other MOD standards are drafted.<br><br>Specific to this draft standard, we have a number of concerns and comments which we will list below. |
| **Response:** The SDT had made modifications to the MOD Standards to ensure the IRC and the industry has enough information to allow the reader to determine why the Standards contain certain requirements and structure. | | | |
| ERCOT | ☑ | ☑ | See IRC comments. |
| **Response:** See the response to IRC's comments. | | | |
| IESO | ☑ | ☑ | See IRC comments. |
| **Response:** See the response to IRC's comments. | | | |
| ITC | ☑ | ☑ | This is a qualified yes. The three methodologies will make it easier for the various regions in the country to comply with the standards. A single standard would be best, but it would come at a cost for entities to adapt to the single methodology if they are in an area that would have to implement changes to comply with the chosen methodology. The costs would likely not be prohibitive, however, and FERC could mandate a single methodology if they so chose to. We would prefer MOD-030 as a single standard. As the three methodologies now exist, MOD-030 appears to provide the greatest |

| **Question #1** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | flexibility and accuracy. |
| **Response:** The SDT has modified the standards to provide the industry with consistency and transparency, while keeping the structure of the MOD Standards as clear and simple as possible. While FERC could mandate the use of a single methodology, they have indicated that they will not do so at this time. | | | |
| BPA | ☑ | | However, please clarify that "one standard" is MOD-001. |
| **Response:** BPA is correct in assuming that the SDT meant that the "one Standard" is MOD-001-1 | | | |
| Entergy | ☑ | | Entergy supports this approach. |
| WECC MIC MIS ATC TF | ☑ | | |
| Prague Power | ☑ | | |
| BCTC | ☑ | | |
| Duke | ☑ | | |
| HQT | ☑ | | |
| ISO-NE | ☑ | | |
| Manitoba Hydro | ☑ | | |
| NPCC CP9 RSWG | ☑ | | |
| Piney Creek | ☑ | | |
| PSC SC | ☑ | | |
| SCANA | ☑ | | |
| SOCO Transmission | ☑ | | |
| SERC ATCWG | ☑ | | |

2. This standard and accompanying methodology standards (MOD-028, MOD-029, MOD-030) include requirements on establishing the Total Transfer Capability or Total Flowgate Capability that shall be used as input to the process. With the addition of these requirements for establishing TTC/TFC, do you believe that FAC-012 and FAC-013 should be retired? If "No," please describe what changes, if any, should be made to FAC-012 and/or FAC-013 in the comments area.

**Summary Consideration:** There was no consensus amongst the stakeholders who responded to this question. The drafting team has incorporated and expanded upon the requirements from FAC-012 and FAC-013 and included these requirements in the proposed set of ATC standards. Consequently, the SDT is recommending that Standards FAC-012 and -013 be retired. The SDT has developed its Standards to require that whatever TTC values and assumptions the TSP uses to calculate ATC must be the same TTC values and assumptions the Transmission Planners and Reliability Coordinators use for planning and operation of the BES.

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The Federal Energy Regulatory Commission (FERC) has requested Standards that determine the requirements to calculate TTC will be handled in the FAC Standards. Order 693 States the following: 1050. We adopt the NOPR proposal and require that TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. The FAC series of standards contain the Reliability Standards that form the technical and procedural basis for calculating transfer capabilities. FAC-008-1 provides the basis for determining the thermal ratings of facilities while FAC-009-1 provides the basis for communicating those ratings. FAC-010-1 and FAC-011-1 provide the system operating limits methodologies for the planning and operational horizon respectively and FAC-014 provides for the communication of those ratings.<br><br>FERC has correctly recognized that FAC-012 and FAC-013, while associated with modeling is highly dependent on the previous FAC Standards as noted by FERC. |
| **Response:** The SDT agrees that the FERC has recommended that TTC be addressed in the FAC Standards. The SDT has expanded the SDT membership to incorporate addition team members who are very knowledgeable in calculating TTC and TFC. The SDT has conferred with these new members to determine the best method of developing Standards that will provide the necessary requirements to accurately and clearly calculate TTC and TFC for each methodology, and these new members support retiring FAC-012 and FAC-013. | | | |
| Duke | | ☑ | FAC-012 should be modified to clearly state that the purpose is to provide instructions for calculating transfer capabilities used in regional reliability assessments. The methodologies used for calculating TTC and these transfer capabilities should be similar, but the assumptions will vary due to the different purposes of the calculations. The major difference is that transfer capabilities for use in reliability assessments are generally only calculated once or twice a year for peak season conditions and TTCs are generally calculated more frequently. Additionally, the transfer capabilities used in reliability assessments should use assumptions reflecting a "worst case" scenario, whereas the |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | assumptions used for calculating TTC should reflect the best forecast of conditions for the particular time period the TTC is being calculated |
| **Response:** The SDT has developed Standards that will ensure that what ever TTC values and assumption that are used by the TSP to calculate ATC will be the same TTC values and assumptions used by the Transmission Planners and Reliability Coordinators for planning and operations of the BES. | | | |
| IRC | | ☑ | Owing to the various concerns we have over MOD-001, MOD-028 to MOD-030, we are unable to determine at this time whether or not FAC-012 and FAC-013 can or cannot be retired until we see the more refined versions of the MOD standards. |
| **Response:** The drafting team has refined all of the standards based on stakeholder comments, NAESB comments, and feedback from FERC staff. The drafting team believes the revised standards incorporate and expand upon the requirements in FAC-012 and FAC-013. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See the response to IRC's comments. | | | |
| IESO | | ☑ | See IRC comments. |
| **Response:** See the response to IRC's comments. | | | |
| MEC | | ☑ | FAC-012 and FAC-013 need to be revised as necessary to cover other reliability needs for Transfer Capability measurements such as for unusual operating conditions that do not need to be the basis for commercial offerings. |
| **Response:** The SDT has developed Standards that will ensure that what ever TTC values and assumption that are used by the TSP to calculate ATC will be the same TTC values and assumptions used by the Transmission Planners and Reliability Coordinators for planning and operations of the BES. | | | |
| MRO | | ☑ | FAC-012 and FAC-013 need to be revised as necessary to cover other reliability needs for Transfer Capability measurements such as for unusual operating conditions that do not need to be the basis for commercial offerings. |
| **Response:** The SDT has developed Standards that will ensure that what ever TTC values and assumption that are used by the TSP to calculate ATC will be the same TTC values and assumptions used by the Transmission Planners and Reliability Coordinators for planning and operations of the BES. | | | |
| MEC Trading | | ☑ | FAC-012 and FAC-013 should be revised as necessary to clearly state that they are for covering the reliability needs for Transfer Capability measurements such as for unusual operating conditions to help establish operating guides or provide guidance to the operators and that are not the basis for commercial offerings or the for the decisions to accept or deny transmission service requests. |
| **Response:** The SDT has developed Standards that will ensure that what ever TTC values and assumption that are used by the TSP to calculate ATC will be the same TTC values and assumptions used by the Transmission Planners and Reliability | | | |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Coordinators for planning and operations of the BES. | | | |
| NPCC CP9 RSWG HQT | ☑ | ☑ | Are FAC-012 and FAC-013 intended to be for only interfaces where transmission service is sold? If not, and these standards are intended to cover the establishment of intra-area interfaces, then the retirement of these standards would be leaving a gap that is not covered by other standards. |
| **Response:** The SDT has developed Standards that will ensure that what ever TTC values and assumption that are used by the TSP to calculate ATC will be the same TTC values and assumptions used by the Transmission Planners and Reliability Coordinators for planning and operations of the BES. | | | |
| ITC | ☑ | ☑ | We never thought FAC-012 or -013 should apply to ATC calculations. They are a system "test" and not a rigorous calculation of TTC for sale of transmission service. |
| **Response:** The SDT has developed Standards that will ensure that what ever TTC values and assumption that are used by the TSP to calculate ATC will be the same TTC values and assumptions used by the Transmission Planners and Reliability Coordinators for planning and operations of the BES. | | | |
| Entergy | ☑ | | Yes, FAC-012 and FAC-013 can be retired after requirements for TTC/TFC methodologies are included in these standards. |
| FirstEnergy | ☑ | | FAC-012 and 013 are similar in scope to MOD-001 and should be retired once MOD-001 is revised. |
| Manitoba Hydro | ☑ | | |
| WECC MIC MIS ATC TF | ☑ | | |
| Prague Power | ☑ | | |
| Piney Creek | ☑ | | |
| PSC SC | ☑ | | |
| SCANA | ☑ | | |
| SOCO Transmission | ☑ | | |
| SERC ATCWG | ☑ | | |

3. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please explain why in the comments area.

**Summary Consideration:** There was no consensus amongst the stakeholders who responded to this question that the proposed standard identified the correct set of functional entities. Several stakeholders indicated that the Reliability Coordinator and Planning Coordinator should not be assigned requirements. Upon further review of the functional model, the SDT agrees the Reliability Coordinator and the Planning Coordinator do not have a role in the ATC process and the Transmission Operator does have a role in coordinating ATC with the Transmission Service Provider. Based on these comments and observations, the drafting team changed the applicability section of the standard to delete the Planning Coordinator and Reliability Coordinator and to add the Transmission Operator.

| **Question #3** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF | | ☑ | First, the "Applicability" section uses the term "Planning Coordinator" which is not a defined term in the NERC Glossary. If the NERC Team intends it use, it should become a defined term.<br>Second, where the term Planning Coordinator is used, WECC queries whether or not the more accurate entity would be the Transmission Planner.<br>Third, this Standard should not apply to the Reliability Coordinator. The RC should be removed from R1 and R2. (See comments appended.) |
| **Response:** The Reliability Coordinator and the Planning Coordinator have been removed from the Applicability section. | | | |
| APPA | | ☑ | MOD-001 if written correctly will detail has the Transmission Service Provider will:<br>1) acquire the necessary data to calculculate the ATC;<br>2) the frequency of calculation;<br>3) the posting of values of the ATC, ATC formula components, and the assumptions use to obtain the values of the the ATC formula components. ---- The other Applicable Functions will be in supporting Standards for TTC/TFC, CBM, TRM, and ETC. |
| **Response:** The SDT agrees with statements 1) and 2) and has changed the Standard to reflect this observation. The posting requirements are NAESB's responsibility and the drafting team has been working closely with NAESB to ensure the posting of the pertinent information. | | | |
| BCTC | | ☑ | ATC related standards should be applicable only to entities who have the obligation to provide non-discriminatory transmission service, that is the Transmission Service Providers. |
| **Response:** The SDT agrees MOD-001 should apply to the TSP, but also notes that the Functional Model assigns the Transmission Operator responsibility for coordinating ATC with the TSP and the team changed the Standard to reflect these observations. | | | |
| BPA | | ☑ | "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority. |
| **Response:** The SDT has removed the Planning Coordinator from the Applicability section of the standard. | | | |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| IRC | | ☑ | The RC and PC do not have a role in MOD-001 as they are neither responsible for calculating ATC, nor are they responsible for implementing or agreeing to a method for use in calculating ATC. |
| **Response:** Upon further review of the functional model, the SDT agrees the RC and the PC do not have a role in the ATC process and has changed the Standard to reflect this observation. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See the responses to the IRC's comments. | | | |
| IESO | | ☑ | See IRC comments. |
| **Response:** See the responses to the IRC's comments. | | | |
| ITC | | ☑ | We understand that certain areas of the country may want Reliability Coordinators to be responsible entities, perhaps because they wear both the RC and TSP hat, but this is not a reason to include them. In the MISO footprint, it makes no sense to include the RC. However, we do think that a list of applicable entities should include the "Transmission Planner," as has been indicated in MOD-004 and MOD-008. This is more appropriate than the RC. As written, several entities are excluded from the applicability statement. |
| **Response:** The SDT agrees that the RC should not be included and has changed the Standard to reflect this observation. The Standard Drafting Team has limited the applicability of these standards to ATC values calculated up to 13 months and therefore does not believe the Transmission Planner is applicable. The drafting team did add the Transmission Operator as a responsible entity, as the Transmission Operator is identified in the Functional Model as having a responsibility for coordinating ATC with the Transmission Service Provider. | | | |
| ISO-NE | ☑ | | While the RC and the PC do not calculate ATC, they are responsible for calculating TTC which is a direct input to the ATC calculation. Since the selection of the TTC methodology will determine which ATC standard is utilized by the TSP, it is appropriate for the RC and the PC to be applicable entities in this standard. While it is not specifically stated in R1 and R2 that the RC and PC are involved solely because of their involvement in TTC, the MOD-028, MOD-029 and MOD-030 clearly deliniate the responsibility for those entities. |
| **Response:** The Standard Drafting Team has limited the applicability of these standards to ATC values calculated up to 13 months, and therefore has removed the Planning Coordinator and Reliability Coordinator from the Applicability. | | | |
| Piney Creek | ☑ | | You may desire to 'reference' the generator rating standards (FAC-005-0/FAC-009-1) that requires submission of facility ratings where needed. |
| **Response:** The Standards now include references to facility ratings as required in the FAC standards. Note that FAC-005 is retired – it was replaced with FAC-008 and FAC-009. However, the Standard Drafting Team hesitates to reference specific standards because the specific requirements may move to a different standard or the standard may be renumbered. | | | |

4. Do you agree with the calculation frequency and schedule in R5.? If "No," please explain and suggest any alternatives you believe to be appropriate in the comments area.

**Summary Consideration:** There was no consensus amongst the stakeholders who responded to this comment. Several modifications were suggested, but no single proposed modification was supported by a majority of the stakeholders.
The SDT believes consistency in calculation timing is important to ensuring coordinated and reliable operation of the system, and has retained the calculation schedule, but eliminated the specific times since some stakeholders indicated that having all entities update ATC at the same time has some technical challenges See the changes below – note that in the revised standard, this requirement has been re-numbered and is Requirement R9.

Each Transmission Service Provider ~~that calculates ATC~~ shall update ATC, at a minimum, ~~recalculate ATC at~~ on the following frequency:

For hourly ATC, once per hour~~, (on the hour), for the next 168 hours.~~

For daily ATC, once per day~~, (at midnight prevailing time the day previous), for thirty days.~~

For weekly ATC, once per day~~, (at midnight prevailing time on the Monday previous), for four weeks.~~

For monthly ATC, once per month~~, (at midnight prevailing time on the first day of the month previous) for 13 months.~~

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF | | ☑ | 1) The minimum calculation requirements should require recalculation during regular business hours, as opposed to every day at midnight.<br><br>2) Currently, most of WECC utilizes OATI. If the OATI system is required to recalcuate the entire West at a single moment, that system may not be capable of doing the calcuations. Since OATI currently recalulates continuously as variables change, can the NERC Team draft language to allow for a recalculation or reposting within an hour as opposed to all entities doing so at a specified moment?<br><br>3) The WECC Team in general has the following question of interpretation for the NERC Team. To the extent the WECC Team does not understand "how" tocomply with the requirements, it would seem the requirements are either overly vague or unenforceable as written. Please answer the appended question and rewrite for clarity.<br><br>The question revolves around the calculation frequency and required recalculation (forecasts?) of ATC going forward:<br>A. Does this recalculation requirement in any way mandate that transmission providers should adjust (hourly, daily, etc) ATC in response to network load variations? |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | Taken as currently written, this standard could be interpreted to require TPs to (1) forecast load variations, by path, by day (or hour), (2) reduce network (and possibly PTP) load reservations, "freeing up" future daily (or hourly if offered) ATC and (3) sell firm capacity going forward in response to a load forecast on a path by path basis.<br><br>This is not a reasonable expectation for TPs to be 100% accurate in load forecasts, and this standard, if making the requirement outlined in the above interpretation, should be clarified to require TPs to update ATC only in response to future capacity sold, and not be required to reduce network reservations as a response to load forecasts to allow future short term firm sales on a daily (or hourly if offered) basis.<br><br>In the interpretation outlined above, if the transmission provider (or LSE) is incorrect in load forecasts, and the TP has sold short term firm in these "freed up" ATC periods, it would restrict network (and PTP) customers from scheduling up to their "before the hour" rights without curtailment. |
| **Response:** 1) The need to change the ATC during the off duty hours due to a change in one of the components needs to be covered. Procedures need to be in place where this action will be preformed during non-business hours.<br>2) The SDT has modified the requirement such that recalculations are done as needed, rather than at a specified time, but the revised requirements include a "minimum" time.<br>3A (1) (2) (3)) The SDT revised the Standard to remove this vagueness and confusion. | | | |
| APPA | | ☑ | The Requirement 5 should set the Maximum amount of time between calculations. The way it is written is that the Requirement sets a Minimum amount of time between calculations. What if an entity updated the Daily before the 24 hours was up; they would be non-compliant. In addition, since hourly covers the next 168 hours, Daily or Weekly calculations will be overlaping each other, one should be omitted. Note TVA's posted method, while they mention Daily and Weekly, they only post Daily for 30 days. |
| **Response:** The SDT has modified these statements to ensure that there will be no confusion. | | | |
| BCTC | | ☑ | The calculation frequency is a business practice and should not be part of NERC standards. |
| **Response:** The SDT believes consistency in calculation timing is important to ensuring coordinated and reliable operation of the system. | | | |
| BPA | | ☑ | The minimum calculation requirements should mandate recalculation during regular business hours, as opposed to every day at midnight. We suggest leaving the final determination of the proper time for ATC/AFC calculation updates to NAESB, as this is a business practice issue.<br>Additionally, R5.5. should be added to address the calculation frequency for annual ATC/AFC values. |
| **Response:** The SDT has removed the requirement to recalculate at a specified time. The Standard Drafting Team has limited the calculations to those that are generally required to be posted, as annual values often have more rigorous evaluation processes due to the increase in available time. | | | |

| **Question #4** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Constellation Energy Commodities | | ☑ | Specifically, R5.4: a minimum of "once a month" is not enough to facilitate commercial activities. Frequency should be "once a day" with a waiver if the inputs to the model have not changed "significantly" from the previous day. Also, what is the minimum frequency for yearly service? |
| **Response:** The SDT has increased the frequency to once per week. The Standard Drafting Team has limited the calculations to those that are generally required to be posted, as annual values often have more rigorous evaluation processes due to the increase in available time. | | | |
| Duke | | ☑ | R5 should be modified to include yearly ATC. |
| **Response:** The standard does not preclude the determination of a yearly ATC. If an entity wants to have a Yearly ATC then the entity can utilize monthly ATC, TTC, calculations to extend for as many months as an entity wants, i.e. 24 months, 36 months, 48 months, and so-on. AIf a request for transmission service beyond one year is denied, the entity requesting that transmission service can request that the TSP run studies and the transmission request will not be part of the ATC request, but a long-term request. | | | |
| Entergy | | ☑ | Calculation frequency should be linked with the change in elements of ATC that impact ATC. For example Monthly ATC should not be only calculated once a month, rather it should be recalculated when any reservation impacting the Monthly ATC is confirmed, this could be a Daily or Weekly reservation. If a reservation that impacts the Monthly reservation is confirmed on second day of the month, and Monthly ATCs are not recalculated till first day of the next month, the Monthly ATC values for the impacted period will remain inaccurate for the remaining entire month. Recalculation frequency should be included in NAESB business Practice Standard rather than in reliability standard. |
| **Response:**<br>The SDT believes consistency in calculation timing is important to ensuring coordinated and reliable operation of the system, and found it difficult to define for all paths on all systems what would produce a "significant" change in ATC values. | | | |
| HQT<br>ISO-NE | | ☑ | (1) Language needs to be clear that TSPs only have to calculate ATC for durations of service that they offer.<br>(2) Regarding the frequency of the updates; it should be clear that if no inputs have changed that no recalculations are required. For example, for those entities that update ATC automatically based on receipt of service requests or a change in TTC, it would be burdensome to 'recalculate' on this stated frequency with no added value.<br>(3) Regarding the timing of the updates; Suggest replace 'at' with 'no later than' so that the auditing aspect of this requirement is reasonable. Entities would be allowed to have calculated that data at any time prior to this required time point. Required timing of updates to be 'at' a specific time creates an auditing trap. For example, how long does it take to perform a set of ATC calculations? Is this requiring that calculations be started at this time or completed by this time? Knowing when the calculations are completed will also provide a known time point for the posting requirements to be developed by NAESB. |
| **Response:** Note that the already approved MOD-001 requires that ATC be determined and posted at specified intervals, so | | | |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| this is not a major revision to existing requirements.<br>The SDT believes consistency in calculation timing is important to ensuring coordinated and reliable operation of the system.<br>The SDT changed the wording for the timing of the updates so that an auditing program may be conducted without undue burden on the TSP by eliminating the specific posting times. | | | |
| MEC | | ☑ | In practice in the industry, the calculation frequency is not consistent across all methodologies. In some cases the times for posting and the frequency of recalculations are slower to allow for time to validate the values calculated. I believe that reliability will suffer if validation is eliminated so as to meet a target that is set by the Standard.<br><br>Further, the frequency requirements should be consistent with currently filed FERC Operating Agreements. Therefore, I suggest that whatever frequency requirements are provided that they be qualified with allowances that "other frequency recalculation and posting times are allowed provided the Transmission Provider coordinates such frequencies and posting times with its neighbors and documents the valid reasons for adopting such frequencies". Also, alternatively or in addition, the Standards Drafting Team should indicate that "if the Transmission Provider has filed FERC Operating Agreement(s) that provides for alternative recalculation frequencies and/or posting times that those frequencies and/or posting times are acceptable."<br><br>Also, I do not believe that separate weekly posting are required. If a Transmission Provider provides enough daily postings into the future to meet weekly needs, that these daily postings should be adequate. The way the standard is written now it appears as if weekly postings are required. The Standards Drafting Team should clarify that the frequencies and posting for weekly are only if the Transmission Provider posts separate weekly quantities. (The FERC requires hourly, daily, and monthly postings so no such clarification is required for the other frequencies and posting times listed in the draft standard.)<br><br>Also, the posting times in particular seem to be too inflexible particularly for longer period offerings. Why does everyone have to post the daily quantities at midnight and only midnight? MAPP posts daily quantities at 10 a.m. on the previous day which seems adequate to me. I suggest that, at a minimum, the posting team needs to either make these posting times which the Transmission Provider may post at or before, or else replace the posting times with an acceptable window for posting. For example, either the daily quantities can be posted "on or before midnight" or alternatively "on the previous day" if the SDT believes that posting too early is as big a problem as posting too late. |
| **Response:**<br>The SDT has modified the Standard to allow for additional flexibility.<br><br>If an entity wants to also calculate a Yearly and Weekly the Standard will not prevent the entity from posting this calculation. | | | |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| The SDT has modified the Standard to give the TSP flexibility by eliminating the specific posting times.<br><br>The SDT removed the requirement for weekly posting in support of your comments. | | | |
| MRO | | ☑ | In practice in the industry, the calculation frequency is not consistent across all methodologies. In some cases the times for posting and the frequency of recalculations are slower to allow for time to validate the values calculated. The MRO believes that reliability will suffer if validation is eliminated so as to meet a target that is set by the Standard.<br><br>Further, the frequency requirements should be consistent with currently filed FERC Operating Agreements. Therefore, the MRO suggests that whatever frequency requirements are provided that they be qualified with allowances that "other frequency recalculation and posting times are allowed provided the Transmission Provider coordinates such frequencies and posting times with its neighbors and documents the valid reasons for adopting such frequencies". Also, alternatively or in addition, the Standards Drafting Team should indicate that "if the Transmission Provider has filed FERC Operating Agreement(s) that provides for alternative recalculation frequencies and/or posting times that those frequencies and/or posting times are acceptable."<br><br>Also, the MRO does not believe that separate weekly posting are required. If a Transmission Provider provides enough daily postings into the future to meet weekly needs, that these daily postings should be adequate. The way the standard is written now it appears as if weekly postings are required. The Standards Drafting Team should clarify that the frequencies and posting for weekly are only if the Transmission Povider posts separate weekly quantities. (The FERC requires hourly, daily, and monthly postings so no such clarification is required for the other frequencies and posting times listed in the draft standard.)<br><br>Also, the posting times in particular seem to be too inflexible particularly for longer period offerings. Why does everyone have to post the daily quantities at midnight and only midnight? MAPP posts daily quantities at 10 a.m. on the previous day which seems adequate to the MRO. The MRO suggests that, at a minimum, the posting team needs to either make these posting times which the Transmission Provider may post at or before, or else replace the posting times with an acceptable window for posting. For example, either the daily quantities can be posted "on or before midnight" or alternatively "on the previous day" if the SDT believes that posting too early is as big a problem as posting too late. |
| **Response:**<br>The SDT has modified the Standard to allow for additional flexibility. | | | |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| If an entity wants to also calculate a Yearly and Weekly the Standard will not prevent the entity from posting this calculation. The SDT has modified the Standard to set the latest time to post, and give the TSP flexibility by eliminating the specific posting times.<br>The SDT removed the requirement for weekly posting in support of your comments. | | | |
| NPCC CP9 RSWG | | ☑ | (1) Language needs to be clear that TSPs only have to calculate ATC for durations of service that they offer.<br>(2) Regarding the frequency of the updates; it should be clear that if no inputs have changed that no recalculations are required. For example, for those entities that update ATC automatically based on receipt of service requests or a change in TTC, it would be burdensome to 'recalculate' on this stated frequency with no added value.<br>(3) Regarding the timing of the updates; Suggest replace 'at' with 'no later than' so that the auditing aspect of this requirement is reasonable. Entities would be allowed to have calculated that data at any time prior to this required time point. Required timing of updates to be 'at' a specific time creates an auditing trap. For example, how long does it take to perform a set of ATC calculations? Is this requiring that calculations be started at this time or completed by this time? Knowing when the calculations are completed will also provide a known time point for the posting requirements to be developed by NAESB. |
| **Response:** The SDT believes consistency in calculation timing is important to ensuring coordinated and reliable operation of the system. The SDT has changed the wording for the timing of the updates so that an auditing program may be conducted without undue burden on the TSP by eliminating the specific posting times. | | | |
| SCANA | | ☑ | Recalculation of TTC/TFC should be due to a change in system conditions that warrant a recalculation. Recalculation of ATC/AFC should be due to a change in one or more of the components included in the ATC/AFC calculation formula (including TTC/TFC). No set frequency should be set for these calculations. |
| **Response:** The SDT believes consistency in calculation timing is important to ensuring coordinated and reliable operation of the system, and found it difficult to define for all paths on all systems what would produce a "significant" change in ATC values. Note that the already approved MOD-001 requires that ATC be determined and posted at specified intervals, so this is not a major revision to existing requirements. | | | |
| SOCO Transmission | | ☑ | The requirement is too prescriptive with respect to the times that the calculations need to be performed. Other processes (e.g., ramps, schedule updates, etc) are also being performed across the top of the hour. Each TSP should be allowed the flexibility to set a more appropriate time for recalculations.<br>This requirement should also not require a recalculation of ATC unless the one of the components of the ATC equation changes. |
| **Response:** The SDT agrees that the timing requirements are too prescriptive and has removed the requirement to calculate at a specified time. However, the SDT believes consistency in calculation timing is important to ensuring coordinated and reliable operation of the system, and found it difficult to define for all paths on all systems what would produce a "significant" | | | |

| **Question #4** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| change in ATC values. Note that the already approved MOD-001 requires that ATC be determined and posted at specified intervals, so this is not a major revision to existing requirements. | | | |
| SERC ATCWG | | ☑ | Calculation frequency should be based on changes in system conditions or granting of additional transmission service. Calculations based on a set frequency would not improve reliability. |
| **Response:** Note that the already approved MOD-001 requires that ATC be determined and posted at specified intervals, so this is not a major revision to existing requirements. The SDT believes consistency in calculation timing is important to ensuring coordinated and reliable operation of the system, and found it difficult to define for all paths on all systems what would produce a "significant" change in ATC values. | | | |
| IRC | | ☑ | The calculation frequency is not consistent across all methodologies. The frequency should allow for time to validate the values calculated. It may not be consistent with currently filed FERC Operating Agreements, which is not a minimum requirement for the whole industry. |
| **Response:** The Standard Drafting Team has made the minimum frequency for calculating ATCs more consistent, but there are technical reasons why different methodologies should have different requirements for updating TTCs or AFCs. | | | |
| ERCOT | ☑ | ☑ | ERCOT does not perform these calculations since these concepts are not used within ERCOT. See IRC comments submitted by Charles Yeung. |
| **Response:** ERCOT may wish to submit a request for a Regional Difference. See the response to the IRC comments. | | | |
| FirstEnergy | ☑ | | R5 should require recalculation of ATC as interchange schedules or transmission reservations change. |
| **Response:** The SDT felt "as interchange schedules or transmission reservations change" would be too vague to measure. Note that the already approved MOD-001 requires that ATC be determined and posted at specified intervals, so this is not a major revision to existing requirements. | | | |
| IESO | ☑ | | We generally agree. |
| ITC | ☑ | | |
| Prague Power | ☑ | | |
| MEC Trading | ☑ | | |
| Piney Creek | ☑ | | |
| PSC SC | ☑ | | |

5. Do you agree the information to be included in the "Available Transfer Capability Implementation Document" that will be made publicly available (as required in R3) is appropriate and sufficient? If "No," please explain why in the comments area.

**Summary Consideration:** Most stakeholders did indicate that the information listed in Requirement 3 is appropriate and sufficient. There were some stakeholder suggestions to clarify the standard to ensure that only information pertaining to Posted Paths or networks is required and other comments suggesting specific additions to the sub-requirements in R3. Based on stakeholder comment, the SDT modified R1 so it is only applicable to the Transmission Operator and the scope of Transfer Capabilities has been clarified as being limited to those for each Posted Path within the Transmission Operator's Planning Coordinator's Area. The SDT modified R3 to add a sub-requirement to describe any third party allocation methodlogies in the ATCID. The changes are highlighted below:

**R1.** Each Transmission Operator ~~Service Provider, and its associated Planning Coordinators and Reliability Coordinators,~~ shall ~~agree upon and implement~~ select one or more of the ATC methodologies ~~specified in Reliability Standard MOD-028, MOD-029, and MOD-030~~ (Area Interchange methodology, Rated System Path methodology, or Flowgate methodology) for use in determining Transfer Capabilities of those Facilities for each Posted Path per time period within its Planning Coordinator's planning area. ~~under the tariff administration of that Transmission Service Provider~~.

**R3.** Each Transmission Service Provider shall ~~make publicly available~~ prepare and maintain an "Available Transfer Capability Implementation Document" (ATCID) that includes, at~~s~~ a minimum, the following information:

**R3.1** Information describing ~~which methodology (or methodologies) has been selected and~~ how the selected methodology (or methodologies) has (have) been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC calculations may be validated.

**R3.2** A description of the manner in which the Transmission Service Provider will account for counter-flows or counter schedules.

**R3.3** The identity of the Planning Coordinator and ~~Reliability Coordinator~~ Transmission Operator associated with each Facility under the Transmission Service Provider's tariff.

**R3.4** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer capability.

**R3.5** The identity of the Transmission Service Providers from which it receives data for use in calculating transfer capability.

**R3.6** Third party allocation methodologies.

| Question #5 |
|---|

| Commenter | Yes | No | Comment |
|---|---|---|---|
| APPA | | ☑ | Available Transfer Capability Implementation Document (ATCID) is redundant should not be made a requirement of the TSP. The ATC is just the algebraic sum of the four components; TTC, ETC, CBM, and TRM. What ever method is used to calculate the TTC, i.e. Flow Gate, Rated System Path, or Network is determined by the planners; RC or TOP and the assumptions will accompany the TTC/TFC values and be posted. The complete description of the ATC calculation is contained in the assumptions of the other components, CBM, TRM, and ETC, which will be posted on the OASIS or other electronic means. |
| **Response:** The SDT has reviewed and modified this Standard to ensure that any possibility of redundancy is removed. | | | |
| BPA | | ☑ | R3.1. should read "… the results of the ATC/AFC calculations may be validated."<br>R3.6. should be added to clarify that the ATCID must only include information pertaining to Posted Paths or Flowgates, where "Posted Path" is defined consistent with NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60. |
| **Response:**<br>R3.1 - FERC requires that ATC be calculated so there is no reason to add AFC to the requirement.<br><br>R3.6 - The proposed modification was made and is reflected in the revised R1 of the standard. The revised R1 clarifieds that the ATC methodologies are for use in determining Transfer Capabilities of the Faciities for each 'Posted Path . . . ' in support of your suggestion. | | | |
| Constellation Energy Commodities | | ☑ | Need to include more details as to how transmission service request are modeled. |
| **Response:** The SDT has included additional detail in MOD-028 and MOD-030, as these are the methodologies that require modeling of transmission service reservations. | | | |
| Duke | | ☑ | Need to add another requirement that describes the manner in which the Transmission Service Provider will account for allocation of firm transmission capacity (i.e. reciprocal flowgate allocation). |
| **Response:** The SDT has added a sub-requirement to include third party allocation methodologies in the ATCID. | | | |
| Entergy | | ☑ | R 3.5 requires identifying only TSPs from which data is received. In practice, TSP may receive data from entities other than TSP's such as PSEs, Generator Operators etc. for calculating transfer capability. Entergy suggests that TSP should identify all suppliers of data in ATCID for calculation of ATCs and not only other TSPs. |
| **Response:** While the drafting team agrees that other information is obtained and used in the determination of ATC, the intent of this requirement is to identify the other transmission service providers with which the TSP is coordinating. | | | |
| IRC | | ☑ | We do not know what this Available Transfer Capability Implementation Document (ATCID) is intended to provide and serve. Is this a document that resembles or replaces the existing Regional ATC Methodology document? If so, there is much more information to be provided. For example, coordination with neighboring TSPs on ATC calculation, interface definitions, path names, etc.<br><br>Notwithstanding the above concerns, we do not understand why the RC and the PC need to be |

| **Question #5** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | identified in R3.3 but not the TOP. |
| **Response:** The ATCID is intended to replace the Regional ATC Methodology documents. The ATCID can include more information than is required. Note that as long as the ATCID complies with the standard, it can effectively be identical to the Regional ATC Methodology document.<br><br>We have replaced the Reliability Coordinator with the Transmission Operator. | | | |
| IESO | | ☑ | See IRC comments. |
| **Response:** See reply to IRC comments | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See reply to IRC comments submitted by Charles Yeung | | | |
| FirstEnergy | | ☑ | R3 gives the TSP a lot of leeway in how it implements the calculations that it performs under this standard. R3.1 is not specific enough to meet the intent of 693-1057, additional detail on required elements is needed to ensure that adequate data is exchanged to enable the duplication and verification of the calculations for validation. |
| **Response:** There is a need for more detail, either in the standards themselves or in the ATCID. The SDT modified the Standard to address this issue – see the expanded list of data to be exchanged in Requirement 10 (was R6 in Draft 2) of the third draft of this Standard. | | | |
| Manitoba Hydro | | ☑ | No direct instruction for informing public of ongoing ATC values is provided, although this process is an implied result of adhering to R3.1 and R5. |
| **Response:** MOD-028, 029, and 030 specify that this information must be formatted for posting. The NAESB business practices will specify that ongoing ATC values must be provided to the public via OASIS. | | | |
| MEC Trading | | ☑ | The document should also include a technical explanation of how transmission service requests are being evaluated. |
| **Response:** The SDT has determined that the evaluation of transmission service request is determined by tariffs, contracts, or other type of agreements. The rules of the evaluation of transmission service request should be determined by the rules made by NAESB. Industry also indicated that evaluation and approval of transmission requests is not within the scope of the drafting team. | | | |
| ITC | ☑ | ☑ | The more transparency there is in the process (except for commercially sensitive data), the better the process will be. |
| **Response:** The SDT agrees, and notes that NAESB sets business practices for additional transparency. | | | |
| WECC MIC MIS ATC TF | ☑ | | The WECC Team concurs that the stated content of the ATCID is appropriate. However, the term "ATCID" is used as a defined term without a definition. It is also used in multiple other standards. It should either be a defined term in the NERC Glossary or, at minimum, must be cross referenced from all other standards back to this standard. |
| **Response:** The SDT has drafted a definition of ATCID for the glossary. | | | |

| Question #5 | | | |

2. Do you agree the information to be exchanged with requesting entities (as required in R6) is appropriate and sufficient? If "No," please explain why in the comment area.

**Summary Consideration:** The SDT has modified the Standard to specify the data is to be used in the ATC calculation. Distribution of this information to Transmission Customers should be addressed through the NAESB business practice standards process. The changes are in Requirement 10 of the revised standard and are highlighted below:

R10. Within fourteen calendar days of a request of any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator, ~~E~~each Transmission Service Provider shall begin to make the following information available on the schedule specified by the requester (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider), unless another request already specifies data on a more frequent basis, to all ~~to any~~ ~~requesting~~ Transmission Service Providers, Planning Coordinators, ~~Transmission Planner,~~ Reliability Coordinators, and Transmission Operators, ~~or other party with a demonstrated reliability need~~ current versions of the following data as requested in electronic format for use in ATC calculations, for up to 13 months into the future (subject to security and confidentiality requirements):

R10.1 Expected generation and Transmission outages, additions, and retirements

R10.2 Peak Load forecasts.

~~Generation dispatch, in the form of dispatch order, participation factors, or block dispatch~~.

R10.3 Unit commitments and dispatch orders, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:

- Dispatch order
- Participation factors
- Block dispatch

~~Planned and unplanned transmission outages.~~

~~Planned and unplanned generation outages.~~

R10.4 Firm and non-firm Network Integration Transmission Service details

R10.5 Confirmed firm and non-firm Transmission Reservations.

R10.6 Grandfathered firm and non-firm contracts

R10.7 Firm roll-over rights

R10.8 Any firm and non-firm adjustments to reflect parallel path impacts

R10.9 Power flow models and underlying assumptions.

R10.10 Contingencies, provided in one or more of the following formats:

- A list of Elements

- A list of Flowgates
- A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider

10.11 Facility Ratings.

10.12 Counterflows

~~ATC recalculation frequency and times.~~

10.13 Values of ATC, ETC, CBM, TRM, and TTC for all Posted Paths

10.14 Values of TFC and AFC for any Flowgates considered by the Transmission Service Provider when selling Transmission service

~~Transmission Reservation impact modeling identification, such that a source-to-sink analysis of power flow impacts could be undertaken.~~

10.15 Source and sink identification and mapping to the model.

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF | | ☑ | See 9.D. below.<br>9.D. -- There is a concern that where two entities have not selected the same methodology, and where one requests data from the other, the requesting entity must still provide the requested data even if that data is not utilized in the methodology of the providing entity. In other words, an entity cannot be allowed to refuse data provision simply because that entity doesn't use such data in its selected methodology. The Requirement as drafted does not make this clear. |
| **Response:** The SDT believes that it is important for the requesting entity to have the information necessary for its calculation. The requirement uses the word, 'shall,' meaning that the data must be provided or the responsible entity is non-compliant. | | | |
| Prague Power | | ☑ | The entities calculating ATC should also be required in Requirement R6 to include and honor third party flowgate/path limitations in their ATC calculations if that data is provided by affected third parties. |
| **Response:** The SDT has included this concept in MOD-028 – Area Interchange Methodology ( R2.7) and MOD-030 – Flowgate Methodology ( R2.1.3) | | | |
| Constellation Energy Commodities | | ☑ | Need to include Transmission Customers as an entity. |
| **Response:** Distribution of this information to Transmission Customers should be addressed through the NAESB business practice standards process. | | | |
| Duke | | ☑ | Should specify that the information to be made available is information used in calculation of ATC. Also, need to include flowgate allocation data, identifying any portion of flowgate(s) that have been allocated for firm transmission. |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** The SDT modified the Standard to specify the data is to be used in the ATC calculation. With regard to allocation data, this would only apply to entities within an operating agreement, in which case the data exchange would likely be already required. If not in an operating agreement, entities would not need the allocation data. | | | |
| ITC | | ☑ | We agree that what is asked for is appropriate, but it may not be sufficient. For example, the ratings provided should include "any value used to limit AFC/ATC." Ratings can have time, temperature, and seasonal adjustments. As written, compliance might mean just a single ratings set. This could be handled in the compliance and measures section but additional thought should be given to this section. |
| **Response:** The SDT expects the TSP to share the information used in its processes. Please see the revised standard which requires that much more data be provided to requesting entities. | | | |
| SOCO Transmission | | ☑ | It is unclear why the TSP should exchange ATC recalculation frequency and times in R6.8 when they are prescribed in R5. |
| **Response:** We have removed the requirement to share time and frequency of calculations. | | | |
| SERC ATCWG | | ☑ | R6.9 needs clarification. |
| **Response**: The SDT has modified the Standard to remove this lack of clarity. | | | |
| Entergy | | ☑ | It is not clear how other parties can demonstrate reliability need. In addition, in R6.9, it is not clear what is expected under Transmission Reservation impact modeling identification. If response factors are expected, it should be stated as such, or the term impact modeling identification be defined. |
| **Response:** The "reliability need" issue has been eliminated, as the entities have been explicitly identified.<br>The drafting team eliminated the phrase, 'impact modeling identification' and moved this into R10.15. R10.15 now states, 'Source and sink identification and mapping to the model.' | | | |
| IESO | ☑ | ☑ | Though it is not stated in the requirement, we assume these data are related to ATC calculation. Some of the data do not support reliability need (e.g. time and frequency of ATC calculation), while there may be some that do but not listed. There are also some data that are proprietray information for which consent of the information owner must be sought before they can be disseminated. But until we see a more refined set of standards that better align roles and responsibilities, we are unable to provide any specific inputs to the completeness and appropriateness of the list.<br>In R6.5 – By Transmission Reservations, does the requirement mean both "firm" and "non-firm" reservations?<br>In R6.6 – The requirement should state both power flow models and the underlying modeling assumptions including the modeling of generators in the first-tier control areas.<br>The list of single and multiple element contingencies included in the ATC calculation should also be provided. |
| **Response:** We have removed the requirement to share time and frequency of calculations and have clarified that the data are related to ATC calculations. We recognize the proprietary information concerns; TSPs will be expected to get releases to share this information for reliability reasons. | | | |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Re 6.5. Yes, this means both firm and non-firm.<br>Re R6.6. We have included a statement that underlying modeling assumptions should be provided. Publishing lists of contingencies is required in the individual MOD standards as appropriate. | | | |
| IRC | ☑ | ☑ | Though it is not stated in the requirement, we assume these data are related to ATC calculation. Some of the data do not support reliability need (e.g. time and frequency of ATC calculation), while there may be some that do but not listed. There are also some data that are proprietray information for which consent of the information owner must be sought before they can be disseminated. But until we see a more refined set of standards that better align roles and responsibilities, we are unable to provide any specific inputs to the completeness and appropriateness of the list. |
| **Response:** We have removed the requirement to share time and frequency of calculations and have clarified that the data are related to ATC calculations. We recognize the proprietary information concerns; TSPs will be expected to get releases to share this information for reliability reasons. | | | |
| ERCOT | ☑ | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC Comments submitted by Charles Yeung. | | | |
| APPA | ☑ | | The posting that are listed are for TTC, the SDT needs to address the assumptions for the other components. |
| **Response:** The SDT agrees and has updated the standard to address this issue. | | | |
| BPA | ☑ | | Except that R6.8. should read "ATC/AFC recalculation frequency and times." |
| **Response:** The SDT has modified the standard to require consistent calculation frequencies and has therefore removed this requirement. | | | |
| FirstEnergy | ☑ | | Overall R6 addresses data sharing better than it does the uniformity of the data. R6 should specify the time periods and method (electronic?) for sharing the specified data. In addition, it should specify the time period of the data to be shared - future data, past data, or both.<br>As written, R6 leaves too much leeway to meets the stated purpose of promoting the consistent and uniform application and documentation of ATC calculations. Lastly, R6 requires the sharing of data with other parties with a demonstrated reliability need, methods are needed for determining that a reliability need has been demonstrated, who will make this determination, and for resolving conflicts. |
| **Response:** The SDT has modified the standard to clarify the requirements related to the data exchange time and schedule. The "reliability need" issue has been eliminated, as the entities have been explicitly identified. | | | |
| BCTC | ☑ | | |

3. Should the scope of MOD-001 be expanded to include requirements for the evaluation of Transmission Service Requests? Please explain your answer in the comments area.

**Summary Consideration:** Most stakeholders who responded to this question indicated that the scope of MOD-001 should not be expanded to include requirements for the evaluation of Transmission Service Requests. Based on the comments received, we will consider this outside the scope of the SDT's charge. This shall serve as a single response to all opinions offered below.

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF | | ☑ | Evaluation of Transmission Service Requests is outside the scope of the Order(s) and more appropriately falls into the purview of NAESB as a Business Practice. |
| APPA | | ☑ | What is meant by "evaluation of the transmission service request?" If "evaluation of the transmission service request" is prioritizing the transmission service requests base on a predetermined set of rules, the answer is no. Rules to prioritize transmission service requests are based upon negotiated or regulated terms that are a business decision, not reliability, mean by the evaluation of transmission requests? Evaluation of the transmission service request for reliability issues will be made by TOPs or BAs. |
| BCTC | | ☑ | Evaluation of Transmission Service Requests is a tariff and business issue not a reliability issue. |
| BPA | | ☑ | The evaluation of Transmission Service Requests (TSRs) is outside the scope of FERC's Order 890 directives and there is insufficient time left, prior to the scheduled September 18th posting of these standards for balloting, to draft adequate TSR evaluation standards and provide sufficient industry comment periods. |
| Duke | | ☑ | NAESB should be responsible for business practice standards for evaluation of Transmission Service Requests. The only impact the evaluation of TSRs have on ATC calculations is addressed in MOD-028-1, MOD-029-1 and MOD-030-1. |
| Entergy | | ☑ | Requirements of evaluation of Transmission Service Requests are not a reliability issue and it does not have to be included in NERC Reliability Standards. Once Transmission Service Request is confirmed, regardless of which evaluation process is used, it should be included in ETC as appropriate. If needed, Transmission Service Request evaluation process should be addressed by NAESB Business Practice Standards. |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| HQT | | ☑ | The evaluation of Transmission Service Requests is a Business Practice and should continue to be addressed under NAESB. |
| IESO | | ☑ | See IRC comments. |
| IRC | | ☑ | It'd be best to keep this standard to calculating ATC only. Evaluation of transmission service request belongs to another standard, or even a NAESB businesss practice. |
| ISO-NE | | ☑ | The evaluation of Transmission Service Requests is a Business Practice and should continue to be |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | addressed under NAESB. |
| MEC | | ☑ | Transmission request evaluation is not the subject of this standard. If there are reliability reasons that require a standard that should be the subject of a new SAR and a new Standards Drafting Team. |
| MRO | | ☑ | Transmission request evaluation is not the subject of this standard. If there are reliability reasons that require a standard that should be the subject of a new SAR and a new Standards Drafting Team. |
| NPCC CP9 RSWG | | ☑ | The evaluation of Transmission Service Requests is a Business Practice and should continue to be addressed under NAESB. |
| Piney Creek | | ☑ | This may be desirable if/when TSR's are unable to be fulfilled. |
| SCANA | | ☑ | NAESB Business Practices and OATT requirements should address this. |
| SOCO Transmission | | ☑ | The evaluation of Transmission Service Request is governed by the tariff and should remain so. |
| SERC ATCWG | | ☑ | The MOD standards define the bounds for reliably selling transmission service. Tarriff admin and business practices are based on FERC approved tarriffs that operate within these bounds. |
| PSC SC | | ☑ | |
| Prague Power | ☑ | | A procedure should be established to reconcile differences across seams. |
| FirstEnergy | ☑ | | MOD-001 should include the Transmission Service Request evaluation rules necessary to maintain the relaibility of the Bulk Electric System. |
| ITC | ☑ | | This could be in measures and compliance and not necessarily in the requirements. |
| MEC Trading | ☑ | | ATC values are calculated for the evaluation of Transmission Service. If these processes aren't for the evaluation of TSRs, what are they for? |
| Constellation Energy Commodities | ☑ | | |

4. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

**Summary Consideration:** Most stakeholders indicated that they were not aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement.

- Some entities identified the need for a regional variance, and the drafting team advised these stakeholders it is up to the entity that wants a variance to request that variance.
- Some stakeholders indicated that the specific timing requirements for updating ATC may conflict with tariffs, and the drafting team revised the standard to eliminate the requirements to update ATC at specific times.

One stakeholder indicated a concern that the applicability in the standard needs revision. The SDT has reviewed the functional model and modified the Standard to eliminate the Reliability Coordinator and Planning Coordinator and to add the Transmission Operator as responsible entities. This standard will apply to all entities that are required to calculate ATCs.

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | ☑ | | Requirements within this proposed standard deal with the assumptions that will be required by those functions that determine TTC. |
| **Response:** The SDT has reviewed the functional model and modified the Standard as necessary to clarify the requirements and address any concerns. The applicability of the revised standard does include the Transmission Operator and does not include either the Transmission Planner or the Reliability Coordinator. | | | |
| ERCOT | ☑ | | ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT region. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area Interconnection and there has been no reservation of transmission capacity in ERCOT.<br><br>Available Transfer Capability is defined as the measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin. The ERCOT Interconnection has already moved "beyond" ATC and into a Market design which resulted in the disappearance of an explicit transmission service product. In addition the DC Tie transfer capability is planned and coordinated by a TSP that is a member of both Regions and therfore both ERCOT and SPP are notified when the DC Tie capability is reduced.<br>Under ERCOT market rules, Transmission Service allows all eligible transmission service customers |

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. Currently ERCOT employs a zonal congestion management scheme that is flow-based, whereby the ERCOT transmission grid, including attached generation resources and load, are divided into a predetermined number of congestion zones. This congestion management scheme applies zonal shift factors, determined by ERCOT, to predict potential congestion under the known topology of the ERCOT System. This scheme is used in the Day Ahead and Adjustment Periods to evaluate potential congestion. During the operating period ERCOT uses zonal shift factors to determine zonal Redispatch deployments needed to maintain flows within zonal limits. The local congestion management scheme relies on a more detailed Operational Model to determine how each particular Resource or Load impacts the transmission system. This model uses the current known topology of the transmission system. Unit specific Redispatch instructions are then issued to manage local congestion.<br><br>In the future ERCOT will be transitioning from a Zonal Market to a full LMP market. This system is designed to manage congestion in the Day Ahead and Real-Time on a Resource specific basis. Under both of these market designs transmission facility limits are established in advance and updated based on coordinated exchange of information between transmission providers and ERCOT in planning and operating periods.<br><br>In the current and future ERCOT market design the method of calculating ATC, TTC and the use of CBM and TRM are not applicable to the ERCOT Region. ERCOT does not have a synchronous connection with any other Balancing Authority Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Balancing Authority Areas and/or offer transmission reservations and schedules within the Interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance. |
| **Response:** The SDT agrees this is a concern - ERCOT may need to submit a request for a Regional Difference. Note that writing a Regional Difference is the responsibility of the entity that wishes that difference. | | | |
| HQT<br>ISO-NE | ☑ | | The current wording of Requirement 5 contains language that dictates precisely when ATC calculations must occur. There are areas with existing market rules and corresponding tariffs that dictate when publications of data occur (for example - after the clearing of a Day Ahead Market). NERC standards do not have the authority to require wholesale changes to existing market structures. Therefore, the wording of the timing of the required ATC calculations must be more general. |
| **Response:** The Standard has been modified to be more flexible and the specific times for updating ATC have been removed from the revised standard. | | | |

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ITC | ☑ | | Certain areas of the country have tariffs (such as New England) that were approved by FERC and do not require the sale of transmission service. These areas could be saved a lot of grief by excluding them from these standards. However, they should be required to provide any data to their neighbors (such as their impacts on neighbor system flows) that might impact ATC calculations. |
| **Response:** This standard will apply to all entities that are required to calculate ATCs. Entities may need to submit requests for regional differences if they feel the standard should not apply. | | | |
| MEC Trading | ☑ | | This standard in conjuction with the other MODS (28/29/30) are in direct conflict with FERC order 890 requiring consistency. |
| **Response:** The SDT is attempting to maximize consistency while preserving reliability. In the future, please be more specific in identifying any specific conflicts. | | | |
| NPCC CP9 RSWG | ☑ | | The current wording of Requirement 5 contains language that dictates precisely when ATC calculations must occur. There are areas with existing market rules and corresponding tariffs that dictate when publications of data occur (for example - after the clearing of a Day Ahead Market). NERC standards do not have the authority to require wholesale changes to existing market structures. Therefore, the wording of the timing of the required ATC calculations must be more general. |
| **Response:** The Standard has been modified to be more flexible and the specific times for updating ATC have been removed from the revised standard.. | | | |
| IRC | | ☑ | Not aware of any conflicts but it should be pointed out that some entities do not provide physical transmission services. Hence, these standards or some of the requirements in these standards may not apply. |
| **Response:** This standard will apply to all entities that are required to calculate ATCs. Entities may need to submit requests for regional differences if they feel the standard should not apply. | | | |
| IESO | | ☑ | See IRC comments. |

5. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-001-1.

**Summary Consideration:** Based on stakeholder comments, the SDT made the following changes:

- Eliminated the reference to "horizons" in R2 to eliminate confusion.
- Modified R1 such that a single entity (Transmission Service Provider) is required to specify the methodology.
- Clarified the entities to which the standard is applicable.
- Added a definition for 'Posted Path'

| Question #9 | |
|---|---|
| **Commenter** | **Comment** |
| WECC MIC MIS ATC TF | A. As to the "Horizons" identified in the draft at R2, the WECC MIC MIS ATC TF opines that there is no singular practice across the industry as to "Horizons"; however those provided by FERC do not generally comport with how the industry uses those terms.<br>The WECC Team suggests that the terms utilized in the draft are at best unclear and at worst not consistent with industry usage. It is suggested these "Horizons" be defined by NAESB as part of the ATC process and that their definitions be established in a manner that best reflects accurate industry usage.<br><br>B. R1. requires TSPs, PCs and RC to "agree upon and implement" a methodology. The standard suggests no remedy if the three parties cannot "agree." The Team suggests the TSP should be the sole entity to select the methodology. The TSP should have a condition precedent to consult with the PC and RC before selection and a condition subsequent to inform the PC and RC of the selection, seek counsel from those entities on how the methodology should be implemented and ultimately inform the PC and RC as to how that selected methodology will be implemented.<br><br>C. R5. Should read:<br>"Each Transmission Service Provider that calculates ATC for a Posted Path shall, at minimum…"<br>This requires the addition of the below FERC approved term as excerpted from 18 CFR 37.6 and as utilitized in NAESB R0-4005 in compliance with Order 889. (References below):<br>Posted Path<br>Posted Path means: 1) Any Balancing Authority to Balancing Authority interconnection; 2) any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months; 3) and any path for which a customer requests to have ATC or TTC posted. For purposes of this definition, an hour includes any part of an hour during which service was denied, curtailed or interrupted. (Plagiarized from NAESBE R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60. See also: 18 CFR 37.6;<br>http://a257.g.akamaitech.net/7/257/2422/12feb20041500/edocket.access.gpo.gov/cfr_2004/aprqtr/pdf/18cfr37.5.pdf<br><br>D. R6. |

| **Question #9** | |
|---|---|
| **Commenter** | **Comment** |
| | There is a concern that where two entities have not selected the same methodology, and where one requests data from the other, the requesting entity must still provide the requested data even if that data is not utilized in the methodology of the providing entity. In other words, an entity cannot be allowed to refuse data provision simply because that entity doesn't use such data in its selected methodology. The Requirement as drafted does not make this clear. |
| **Response:** A) The SDT has eliminated the reference to "horizons" to eliminate confusion.<br>B) The Standard has been modified to require a single entity to perform the selection.<br>C) The definition as agreed to by NAESB should be adopted as a definition in the NERC Glossary. The drafting team will post this definition with the revised standard.<br>D) The standard clearly states that the Transmission Service Provider 'shall' provide the data. | |
| APPA | The Standard is written much like a Policy and it cannot be determined who is responsible for the different calculations of the components of the ATC. The Standard does not provide the Compliance Monitor or the TSP who calculates the Hourly. Daily, and Monthly ATCs with the necessary requirements to know what is necessary to be compliant. A copy of a Draft MOD-001 that has been written in a Standard Format that will permit the Compliance Monitor and the Applicable Functions to respond to measureable requirements is attached for the SDT review and comments. |
| **Response:** The Standard has been rewritten to remove this problem. Each requirement clearly identifies the responsible entity.<br>**Note –** the proposed standard was not delivered with the comments due to a technical error. The commenter participated in the drafting team meetings and is satisfied that his ideas were considered. | |
| BCTC | A. The horizons described in R2 are not consistent with FAC-010 and FAC-011, which describe the operating horizon and up to one year. These terms are not capitalized and defined anywhere, so I am not going to say that MOD is incorrect. there is a potential for confusion and is communications between the planners and the Transmission Service Providers.<br>B. The requirement "subject to security and confidentiality requirements" in R6 is in conflict with FERC's Standards of Conduct. The TSPs may not provide transmission information discriminatorily.<br>C. R6.9 is unclear. |
| **Response:**<br>**A.**) We have eliminated the reference to "horizons" to eliminate confusion.<br>**B.**) We have modified R6 such that the security and confidentiality applies to only reliability entities, eliminating the conflict.<br>**C.**) We have attempted to clarify 6.9. | |
| BPA | The ATC MODs (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) do not clearly distinguish the methodologies and their applications. Please provide narrative descriptions of these methodologies.<br>The horizons defined in R2.2. and R2.3. need to be reconciled with the Planning and Operating horizons previously |

| **Question #9** | |
|---|---|
| **Commenter** | **Comment** |
| | defined by NERC.<br>R5. should be modified to the following:<br>"R5. Each Transmission Service Provider that calculates ATC for Posted Paths or AFC for Flowgates shall, at a minimum, recalculate those ATC/AFCs at the following frequency:<br>R5.1. For hourly ATC/AFC…<br>R5.2. For daily ATC/AFC…<br>R5.3. For weekly ATC/AFC…<br>R5.4. For monthly ATC/AFC…<br>R5.5. For yearly ATC/AFC…"<br>Definitions of the terms "Counter flow" and "Loop flow" are needed, to understand the distinction between the two. |
| **Response:** 1) The SDT agrees with the commenter that additional work needs to be done in clearly distinguishing the methodologies used. We have drafted definitions for the methodologies, which highlight the differences.<br>2.) The SDT has eliminated the reference to "horizons" to eliminate confusion<br>**3.**) We have removed the references to the explicit time frames.<br>4.) The SDT attempted to provide clarity on the meaning of "counterflow" in R4 by requiring the use of specific formulas. | |
| Constellation Energy Commodities | What determines which ATC calculation method a transmission service provider adapts or the frequency they can change?<br>In R4 please add Transmission Customers to the notification list.<br>In R6 please add Transmission Customers to the list that the transmission service provider will make the information available.<br>Also, please better define "subject to security and confidentiality requirements." |
| **Response:** 1.) We believe the justification for and frequency of changes this is not a reliability issue, and should be handled elsewhere. R5 does require 14 days notice of any change.<br>2.) We believe that this should be handled through the NAESB process.<br>3.) We believe that this should be handled through the NAESB process.<br>4.) These are requirements that are specified in other standards and documents. | |
| Entergy | Notification as required in R4 is not necessary if the ATCID is to be posted on a public site. |
| **Response:** Public posting will be addressed by NAESB. The notification is strictly from a reliability perspective. | |
| ERCOT | See IRC comments submitted by Charles Yeung. |
| **Response:** See the responses to IRC's comments. | |
| FirstEnergy | R1 requires agreement on methodology among TSP, PCs and RCs and should include a method for handling disagreements.<br>R2 implies need for incorporating schedules but does not imply or explicitly state the incorporation of transmission |

<table>
<tr><th colspan="2">Question #9</th></tr>
<tr><th>Commenter</th><th>Comment</th></tr>
<tr><td></td><td>reservations.<br>R4.8 should require a written request as a means of formally documenting the request was made, received, and acknowledged.</td></tr>
<tr><td colspan="2">Response: The SDT agrees with these comments and has corrected these issues with the next draft.<br>1.) The standard has been modified such that a single entity is required to specify the methodology.<br>2.) The SDT has modified the requirement to remove any such implication from MOD-001; the appropriate individual methodologies address this requirement in more detail.<br>3.) We have eliminated the need to request the notifications.</td></tr>
<tr><td>HQT</td><td>For those entities that do not provide physical transmission service, some of the requirements in these standards do not apply. With the current arrangement of these proposed standards, the ATCID for these entities would clearly document what requirements of the standards are or are not applicable.</td></tr>
<tr><td colspan="2">Response: The SDT has attempted to clarify the entities to which the standard is applicable.  If there are specific requirements which you believe should not apply, please provide them in detail.</td></tr>
<tr><td>IESO</td><td>See IRC comments.</td></tr>
<tr><td colspan="2">Response: See the response to IRC's comments.</td></tr>
<tr><td>IRC</td><td>Please see our high level comments to the SAR which we feel need to be addressed first before providing any comments specific to this standard.</td></tr>
<tr><td colspan="2">Response: The drafting team responded to all comments submitted on the SAR.  These comments are publicly posted.</td></tr>
<tr><td>ITC</td><td>Given that three methods are acceptable for calculating AFC/ATC, MOD-001 is a necessary prelude to any methodology chosen.</td></tr>
<tr><td colspan="2">Response: Agree.</td></tr>
<tr><td>MEC</td><td>1.  I question the approach in R1 that calls for the Transmission Service Provider, Planning Coordinator, and the Reliablity Coordinator to agree to the appropriate ATC methodologies.  The Transmission Service Provider has the ultimate authority.  Also there are no provisions in the standard for a way to resolve disputes.  What happens if each of the three has a different idea as to which methodologies to use?  I believe that the Planning Coordinator and the Reliability Coordinator should be responsible for resolving disputes between Transmission Service Providers if there are issues with regard to flowgates that involve more than one Transmission Service Provider.  I suggest that either R1 be changed to have the Transmission Service Provider coordinate with the Planning Coordinator and the Reliability Coordinator the methodology or else, the words "as appropriate" be added to R1 so that, if necessary the functional entity that has the authority makes the decision when there is disagreement.<br>2.  In R6, "other party" who may request the information should be changed to "other Functional Entity" so as to more properly describe the parties who might have a reliability need for the information.<br>3.  The purpose of each of the standards should be revised to be more in-line with each other, that is some refer to "transparent" and "reliable system operations" and others do not.  I recommend that the purpose in MOD-001-1 be revised to state:  "To promote the consistent and transparent application and documentation of Available Transfer Capability (ATC) calculations for reliable system operations."<br>4.  I note that the Standards Drafting Team has defined a scheduling horizon in addition to an operating horizon and</td></tr>
</table>

| Question #9 | |
|---|---|
| **Commenter** | **Comment** |
| | a planning horizon. I am not familiar with the use of a scheduling horizon and questions why the Standards Drafting Team established it and why they have defined it as provided in the standard. |
| **Response:** The SDT agrees with these comments and has corrected these issues with the next draft.<br>1.) We have changed this to be the responsibility of a single entity.<br>2.) We have eliminated the reference to other parties.<br>3.) We have changed the purposes to reflect the need for transparency.<br>4.) We eliminated the uses of the words horizons form the standard. | |
| MRO | 1. The MRO questions the approach in R1 that calls for the Transmission Service Provider, Planning Coordinator, and the Reliablity Coordinator to agree to the appropriate ATC methodologies. The Transmission Service Provider has the ultimate authority. Also there are no provisions in the standard for a way to resolve disputes. What happens if each of the three has a different idea as to which methodologies to use? The MRO believes that the Planning Coordinator and the Reliability Coordinator should be responsible for resolving disputes between Transmission Service Providers if there are issues with regard to flowgates that involve more than one Transmission Service Provider. MRO suggests that either R1 be changed to have the Transmission Service Provider coordinate with the Planning Coordinator and the Reliability Coordinator the methodology or else, the words "as appropriate" be added to R1 so that, if necessary the functional entity that has the authority makes the decision when there is disagreement.<br>2. In R6, "other party" who may request the information should be changed to "other Functional Entity" so as to more properly describe the parties who might have a reliability need for the information.<br>3. The purpose of each of the standards should be revised to be more in-line with each other, that is some refer to "transparent" and "reliable system operations" and others do not. The MRO recommends that the purpose in MOD-001-1 be revised to state: "To promote the consistent and transparent application and documentation of Available Transfer Capability (ATC) calculations for reliable system operations."<br>4. The MRO notes that the Standards Drafting Team has defined a scheduling horizon in addition to an operating horizon and a planning horizon. The MRO is not familiar with the use of a scheduling horizon and questions why the Standards Drafting Team established it and why they have defined it as provided in the standard. |
| **Response:** The SDT agrees with these comments and has corrected these issues with the next draft.<br>1.) We have changed this to be the responsibility of a single entity.<br>2.) We have eliminated the reference to other parties.<br>3.) We have changed the purposes to reflect the need for transparency.<br>4.) We eliminated the uses of the words horizons form the standard. | |
| NPCC CP9 RSWG | For those entities that do not provide physical transmission service, some of the requirements in these standards do not apply. With the current arrangement of these proposed standards, the ATCID for these entities would clearly document what requirements of the standards are or are not applicable. |
| **Response:** The SDT has attempted to clarify the entities to which the standard is applicable. If there are specific requirements which you believe should not apply, please provide them in detail. | |
| SOCO Transmission | 1. As drafted, it is not completely clear as to which of the requirements would apply to long-term planning and which |

| Question #9 | |
|---|---|
| **Commenter** | **Comment** |
| | requirements would not apply. For example, R5 clearly limits the timeframe of the requirement to 13 months. However, R6 has no reference or indication of which timeframes this requirement would be applicable.<br>2. R6 requires that the data in R6.1 - R6.9 is shared with ". . . or other party with a demonstrated reliability need. . . ." To avoid potential conflicts with this data sharing, the term "reliability need" should be limited to those needs required to maintain reliability of the transmission system. |
| **Response:** 1) The SDT has modified the standard to limit the duration of data in R6 (R10 in the revised standard) to 13 months.<br>2) This issue has been addressed by removal of the "reliability-need" reference and listing the specific functional entities that are entitled to request the data. | |
| SRP | R2 - More clarification is required regarding exactly what period of time each of the time horizons represent. |
| **Response:** The SDT has removed the use of the word "Horizons" and explicitly indicated the timeframe. | |

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

## Announcement: Comment Period Opens

**The Standards Committee (SC) announces the following standards actions:**

### SAR and Draft Standards for Available Transfer Capability (Project 2006-07) Posted for 30-day Comment Period May 25–June 24, 2007

To fully address the directives in FERC Orders 890 and 693 relative to Available Transfer Capability (ATC), a "Supplemental ATC SAR" has been posted for a 30-day comment period. Please use the comment form to provide comments on this SAR.

The ATC Standard Drafting Team has posted a set of requirements distributed amongst six standards aimed at meeting the intent of the originally approved SARs for ATC/TTC/AFC and CBM/TRM as well as the directives in FERC Orders 890 and 693. The drafting team also posted a white paper that explains the following proposed organization of the revised set of standards:

- There is one "umbrella" standard with requirements related to ATC (MOD-001 and comment form)
- There are three separate standards to address the determination of ATC, with each also addressing associated requirements for TTC and ETC:
  - Network Response method of calculating ATC (MOD-028 and comment form)
  - Rated System Path method of calculating ATC (MOD-029 and comment form)
  - Flowgate Network Response method of calculating ATC (MOD-030 and comment form)
- There is a separate standard to address Capacity Benefit Margin (MOD-004 and comment form)
- There is a separate standard to address Transmission Reliability Margin (MOD-008 and comment form).

Because the modifications made to the standards are so extensive, no "redline" versions of the standards have been developed. The versions of the standards that have been posted contain only requirements — there are no measures or compliance elements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please use the comment forms posted with the proposed standards to provide comments on this set of standards.

## Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007

**Description of Current Draft:**

This is the second draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of stakeholder comments and applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to comments. | February 1, 2008 |
| 2. Post for 30-day pre-ballot review. | February 1, 2008 |
| 3. First ballot of standard. | March 3, 2008 |
| 4. Respond to comments. | April 10, 2008 |
| 5. Recirculation ballot. | April 10, 2008 |
| 6. 30-day posting before board adoption. | March 2, 2008 |
| 7. Board adoption. | April 24, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Flowgate:**

1.) A designated point on the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

2.) A mathematical construct, comprised of one or more monitored Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.

**Total Flowgate Capability (TFC):** The maximum flow on a Flowgate that will respect all System Operating Limits for that Flowgate.

**Available Flowgate Capability (AFC):** The flow capability remaining on a Flowgate for further commercial activity over and above already committed uses.

**Power Transfer Distribution Factor (PTDF):** In the pre-contingency configuration of a system under study, a measure of the responsiveness or change in electrical loadings on system facilities due to a change in electric power transfer from one area to another, expressed in percent (up to 100%) of the change in power transfer .

**Outage Transfer Distribution Factor (OTDF):** In the post-contingency configuration of a system under study, the electric Power Transfer Distribution Factor (PTDF) with a specific system facility removed from service (outaged).

**Flowgate Methodology:** The Flowgate methodology is characterized by identification of key Facilities as Flowgates. Total Flowgate Capabilities are determined based on facility ratings. The impacts of Existing Transmission Commitments (ETCs) are determined by simulation. The impacts of ETC, Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) are subtracted from the Transmission Flowgate Capability to determine the Available Flowgate Capability (AFC) value for that Flowgate. AFCs are used to determine Available Transmission Capability (ATC).

## A. Introduction

1. **Title:** **Flowgate Methodology**

2. **Number:** MOD-030-1

3. **Purpose:** To increase consistency and transparency in the development and documentation of transfer capability calculations for short-term Transmission services performed by entities using the Flowgate Methodology to support reliable system operations.

4. **Applicability:**

   **4.1.1** Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Transfer Capabilities (ATCs) for Posted Paths.

   **4.1.2** Each Transmission Service Provider that uses the Flowgate Methodology to calculate ATCs for Posted Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all six (MOD-001-1, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1, MOD-030-1)ATC-related standards are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** The Transmission Service provider shall include in its “Available Transfer Capability Implementation Document” (ATCID) the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.** The Transmission Operator shall perform the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Identify Flowgates for used in the AFC process based, at a minimum, on the following criteria:

**R2.1.1.** Any Facility within the Transmission Operator’s area based on thermal, stability or voltage limits is a Flowgate.

**R2.1.2.** All first Contingency transfer analyses from all adjacent Balancing Authority source sink combinations such that at a minimum the first three limiting Elements/Contingency combinations within the Transmission Operator’s system are included as Flowgates.

2.1.2.1. Use Contingencies consistent with the Contingencies used in operations studies and planning studies for the applicable time periods.

**R2.1.3.** Any limiting Element/Contingency combination within the Transmission model that has been subjected to an Interconnection-wide congestion management procedure OR any limiting element/contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where

2.1.3.1. If the coordination of the limiting element/contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or
- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF impact on the Flowgate.

**R2.2.** At a minimum, update the list of Flowgates to create, modify, or delete Flowgate definitions at least once per calendar quarter.

**R2.3.** Determine the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.4.** At a minimum, update the TFC once per calendar year.

**R2.5.** Provide the Transmission Service Provider with the updated TFCs within seven calendar days of their determination.

**R3.** The Transmission Operator shall use a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R3.1.** Contains Facility Ratings specified by the Transmission Owners and Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and topology for the Facilities within its Reliability Coordinator's Area.

**R3.5.** Contains modeling data and topology for at least three contiguous busses of the Bulk Electric System directly and synchronously connected to the tie-lines into the systems of each adjacent Reliability Coordinator Area.

**R3.6.** Contains modeling data and topology (or equivalent representation) for synchronous Facilities beyond three busses.

**R4.** When calculating AFCs, the Transmission Service Provider shall Use assumptions consistent with the assumptions used in operations studies and planning studies for the applicable time periods, including: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.1.** Contingencies.

**R4.2.** Modeling the impact of point-to-point reservations as follows:

- If the source has been specified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source has been specified in the reservation and the point can be mapped to an "equivalence" modeled in the Transmission Service Provider's Transmission model, use the modeled equivalence as the source.
- If the source has been specified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" modeled in the Transmission Service Provider's Transmission model, use the interface point with the adjacent upstream Transmission Service Provider as the source.
- If the source has not been specified, use the interface point with the adjacent upstream Transmission Service Provider as the source.
- If the sink has been specified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the sink.
- If the sink has been specified in the reservation and the point can be mapped to an "equivalence" modeled in the Transmission Service Provider's Transmission model, use the modeled equivalence as the sink.
- If the sink has been specified in the reservation and the point can not be mapped to a discretely modeled point or an "equivalence" modeled in the Transmission Service Provider's Transmission model, use the interface point with the adjacent downstream Transmission Service Provider as the sink.
- If the sink has not been specified, use the interface point with the adjacent downstream Transmission Service Provider as the sink.

**R5.** When calculating AFCs, the Transmission Service Provider shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R5.1.** Include all expected generation and Transmission outages, additions, and retirements in effect during the period calculated for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

**R5.2.** For external (third-party) Flowgates, use any AFC for each specific Flowgate provided by that third party as the AFC for that Flowgate.

**R6.** When calculating the impact of ETC for firm commitments ($ETC_{Fi}$) for all time periods for a Flowgate, the Transmission Service Provider shall sum: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R6.1.** The impact of Firm Network and Native Load Service, for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any other Transmission Service Providers with which coordination agreements have been executed, based on:

**R6.1.1.** For on-peak intra-day and next-day AFCs

6.1.1.1. Peak Load forecast for the on-peak period calculated, consistent with that used for planning and operations for applicable time periods, including native load and network service load

6.1.1.2. Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run.

**R6.1.2.** For off-peak intra-day and next-day AFCs

6.1.2.1. Peak Load forecast for the off-peak period calculated, consistent with that used for planning and operations for applicable time periods, including Native Load and network service Load

6.1.2.2. Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run.

**R6.1.3.** For days two through 31AFCs

6.1.3.1.1 Peak Load forecast for the day calculated, consistent with that used for planning and operations for applicable time periods, including native load and network service load

6.1.3.2. Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run.

**R6.1.4.** For months two through 13 AFCs

6.1.4.1. Peak Load forecast for the month calculated, consistent with that used for planning and operations for applicable time periods, including native load and network service load

6.1.4.2. Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run.

**R6.2.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider's area not included in the model.

**R6.3.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts, not included in the model in excess of 3%[1] for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed. The impact of any Grandfathered firm contracts expected to be scheduled for the Transmission Service Provider's area not included in the model.

**R6.4.** The impact of any Grandfathered firm contracts expected to be scheduled not included in the model in excess of 3%[2] for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

[1] Transmission Service Providers may use a threshold lower than 3% if desired.

[2] Transmission Service Providers may use a threshold lower than 3% if desired.

**R7.** When calculating the impact of ETC for non-firm commitments ($ETC_{NFi}$) for all time periods for a Flowgate the Transmission Service Provider shall sum: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service not included in the model for the Transmission Service Provider's area

**R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service not included in the model in excess of 3%[3] for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.3.** The impact of any Grandfathered non-firm contracts not included in the model for the Transmission Service Provider's area

**R7.4.** The impact of any Grandfathered non-firm contracts not included in the model in excess of 3%[4] for all adjacent Transmission Service Providers, and any other Transmission Service Providers with which coordination agreements have been executed.

**R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

$$AFC_F = TFC - ETC_{Fi} - CBM_i - TRM_i + Postbacks_{Fi} + Counterflows_{Fi}$$

**Where:**

**$AFC_F$** is the firm Available Flowgate Capability for the Flowgate for that period,

**TFC** is the Total Flowgate Capability of the Flowgate,

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period,

**$CBM_i$** is the impact of the Capacity Benefit Margin on the Flowgate during that period,

**$TRM_i$** is the impact of the Transmission Reliability Margin on the Flowgate during that period,

**$Postbacks_{Fi}$** are adjustments to firm AFC due to postbacks for that period, as defined in Business Practices, and

**$Counterflows_{Fi}$** are adjustments to firm ATC as determined by the Transmission Service Provider and described in their ATCID.

**R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC - ETC_{Fi} - ETC_{NFi} - CBM_{Si} - TRM_{Ui} + Postbacks_{NFi} + Counterflows$$

**Where:**

---

[3] Transmission Service Providers may include impacts less than 3% if desired.

[4] Transmission Service Providers may include impacts less than 3% if desired.

**$ATC_{NF}$** is the non-firm Available Flowgate Capability for the Posted Path for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$ETC_{NFi}$** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**$CBM_{Si}$** is the impact of any schedules during that period using Capacity Benefit Margin.

**$TRM_{Ui}$** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released for sale as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are adjustments to non-firm Available Flowgate Capability due to postbacks for that period, as defined in business practices.

**$Counterflows_{NF}$** are adjustments to non-firm AFC as determined by the Transmission Service Provider and described in their ATCID.

**R10.** The Transmission Service Provider shall convert Flowgate AFCs to ATCs (and TFCs to TTCs) for Posted Paths based on the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$TC = \min\{PTC_1, PTC_2, \ldots PTC_n\} \text{ and } PTC_n = \frac{FC_n}{DF_{np}}$$

**Where:**

**TC** is the Transfer Capability (either ‘Available’ or ‘Total’).

**P** is the set of partial Transfer Capabilities (either available or total) for all “impacted” Flowgates honored by the Transmission Service Provider; a Flowgate is considered “impacted” by a path if the Distribution Factor for that path is greater than 3% on an OTDF Flowgate or PTDF Flowgate.

**$PTC_n$** is the partial Transfer Capability (either ‘Available’ or ‘Total’) for a path relative to a Flowgate *n.*

**$FC_n$** is the Flowgate Capability (‘Available’ or ‘Total’) of a Flowgate *n*.

**$DF_{np}$** is the distribution factor for Flowgate *n* relative to path *p*.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in AFC calculations. (R1)

**M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

**M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per quarter. (R2.2)

**M4.** The Transmission Operator shall provide evidence (such as data and models) that it determined the TFC for each Flowgate as defined in R2.3.(R2.3)

**M5.** The Transmission Operator shall provide evidence (such as logs) that it updated the TFCs for each Flowgate at least once per calendar year. (R2.4)

**M6.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.5)

**M7.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

**M8.** The Transmission Service Provider shall provide evidence (such as written documentation and studies) that the assumptions used in AFC calculation were consistent with those used in operations and planning studies for the same period. (R4.1)

**M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

**M10.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation. (R5.1)

**M11.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties were used instead of those calculated by the Transmission Operator. (R5.2)

**M12.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of firm ETC included the elements described in R6 and did not include any additional elements. (R6)

**M13.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of non-firm ETC included the elements described in R7 and did not include any additional elements. (R7)

**M14.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of firm AFC used the algorithm and the elements described in R8 and did not include any additional elements. (R8)

**M15.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of non-firm AFC used the algorithm and the elements described in R9 and did not include any additional elements. (R9)

**M16.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of Transfer Capabilities follows the procedure described in R10. (R10)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

**1.3. Data Retention**

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate TTC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R6, R7, R8, R9, and R10 for the most recent calendar year plus current year.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted second first for comment from May 25–June 25, 2007

**Description of Current Draft:**

This is the second draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of stakeholder comments submitted in response to the first draft of the proposed standard and applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to comments. | February 1, 2008 |
| 2. Post for 30-day pre-ballot review. | February 1, 2008 |
| 3. First ballot of standard. | March 3, 2008 |
| 4. Respond to comments. | April 10, 2008 |
| 5. Recirculation ballot. | April 10, 2008 |
| 6. 30 Day posting before board adoption. | March 2, 2008 |
| 7. Board adopts MOD-001-1. | April 24, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Rated System Path Methodology:** The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC to derive Available Transmission Capability.

## A. Introduction

1. **Title:** **Rated System Path Methodology**
2. **Number:** MOD-029-1
3. **Purpose:** To increase consistency and transparency in the development and documentation of transfer capability calculations for Transmission services performed by entities using the Rated System Path Methodology to support reliable system operations.
4. **Applicability:**
   - **4.1.** Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for Posted Paths.
   - **4.2.** Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for Posted Paths.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all six (MOD-001-1, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1, MOD-030-1)ATC-related standards are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** When calculating TTCs for Posted Paths, the Transmission Operator shall use a Transmission model that meets the following criteria: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R1.1.** Includes at least:

**R1.1.1.** The Transmission Operator Area

**R1.1.2.** All Transmission Operator Areas contiguous with its own Transmission Operator Area

**R1.1.3.** Any other Transmission Operator Area linked to the Transmission Operator’s Area by joint operating agreement.

**R1.2.** Models all system elements as in-service for the assumed initial conditions.

**R1.3.** Models all generation Facilities larger than 20 MVA in the studied area.

**R1.4.** Models phase shifters in Non-regulating mode, unless otherwise specified in the ATCID.

**R1.5.** Uses current Facility Ratings as provided by the Transmission Owner and Generator Owner

**R1.6.** Uses peak load forecast by Balancing Authority.

**R1.7.** Uses Transmission Facility additions and retirements.

**R1.8.** Uses Generation Facility additions and retirements.

**R1.9.** Uses Special Protection System (SPS) models where currently existing or projected for implementation within the studied time horizon

**R1.10.** Models series compensation for each “Extra High Voltage (EHV)” line at the expected operating level unless specified otherwise in the ATCID.

**R1.11.** Includes any other modeling requirements or criteria specified in the ATCID.

**R1.12.** Where three phase fault damping is used to determine stability limits, identifies the percent used and includes justification for use unless specified otherwise in the ACTID.

**R2.** The Transmission Operator shall use the following process to determine TTC: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R2.1.** Except where otherwise specified within MOD-029-1, adjust base case generation and Load levels within the updated power flow model to determine the maximum flow (reliability limit) that can be simulated on the Posted Path while at the same time satisfying all planning criteria for N-0, N-1, and N-2 contingencies as follows:

**R2.1.1.** When modeling normal conditions (N-0), do not model any Transmission Element above 100% of its continuous rating.

**R2.1.2.** When modeling N-1 or N-2 contingencies, the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its emergency rating.

**R2.1.3.** Do not exceed any Facility Ratings (including thermal and voltage ratings)

**R2.1.4.** Uncontrolled separation shall not occur.

**R2.1.5.** Initiate system disturbances for stability studies by a three-phase-to-ground fault on all modeled “Extra High Voltage (EHV)” buses adjacent to the major interconnection point of the modeled Posted Path.

**R2.2.** Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction.

**R2.3.** For a Posted Path whose capacity is limited by contract, set TTC on the Posted Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R1.2.1.

**R2.4.** For Posted Paths whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.

**R2.5.** Verify that the TTC for the Posted Path being studied does not adversely impact the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1

**R2.6.** Where multiple ownership of Transmission rights exists on a Posted Path, allocate TTC of that Posted Path in accordance with the contractual agreement made by the multiple owners of that Posted Path.

**R2.7.** For Posted Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and the Regional Entity has not taken action to have the path rated using a different method, set the TTC at that previously established amount.

**R2.8.** Create a study report that describes the steps undertaken, including the contingencies and assumptions used, when determining the TTC and the results of the study.

**R3.** Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the Posted Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that Posted Path.

**R4.** Each Transmission Operator shall establish the TTC at the lesser of the TTC calculated in MOD-029-1 or any System Operating Limit for that Posted Path. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R5.** When calculating ETC for firm Existing Transmission Commitments ($ETC_F$) for a specified period for a Posted Path, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

$\mathbf{NL_F}$ is the firm capacity reserved to serve peak Native Load forecast commitments for the time period being calculated, to include Native Load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{NITS_F}$ is the firm capacity reserved for Network Integration Transmission Service serving Load, to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{GF_F}$ is the capacity reserved for grandfathered Firm Transmission Service and bundled contracts for energy and Transmission, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “Safe Harbor Tariff” accepted by FERC.

$\mathbf{PTP_F}$ is the firm capacity reserved for confirmed Point-to-Point Transmission Service,

$\mathbf{ROR_F}$ is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer’s Transmission Service contract expires or is eligible for renewal.

$\mathbf{OS_F}$ is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments ($ETC_{NF}$) for all time horizons for a Posted Path the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

$\mathbf{NITS_{NF}}$ is the non-firm capacity reserved for Network Integration Transmission Service serving Load, to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{GF_{NF}}$ is the non-firm capacity reserved for grandfathered Transmission Service and bundled contracts for energy and Transmission, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “Safe Harbor Tariff” accepted by FERC.

$\mathbf{PTP_{NF}}$ is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

$\mathbf{OS_{NF}}$ is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm.

**R7.** When calculating Firm ATC for a Posted Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

$$ATC_F = TTC – ETC_F – CBM – TRM + Postbacks_F + Counter\text{-}schedules_F$$

**Where**

**$ATC_F$** is the firm Available Transfer Capability for the Posted Path for that period.

**TTC** is the Total Transfer Capability of the Posted Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the Posted Path during that period.

**CBM** is the Capacity Benefit Margin for the Posted Path during that period.

**TRM** is the Transmission Reliability Margin for the Posted Path during that period.

**$Postbacks_F$** are adjustments to firm Available Transfer Capability due to postbacks for that period, as defined in business practices.

**$Counter\text{-}schedules_F$** are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and described in their Available Transfer Capability Implementation Document.

**R8.** When calculating non-firm ATC for a Posted Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_{NF} = TTC – ETC_F – ETC_{NF} – CBM_S – TRM_U + Postbacks_{NF} + Counter\text{-}schedules_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the Posted Path for that period.

**TTC** is the Total Transfer Capability of the Posted Path for that period.

**$ETC_F$** is the sum of existing non-firm commitments for the Posted Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm commitments for the Posted Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the Posted Path that has been scheduled during that period.

**$TRM_U$** is the Transmission Reliability Margin for the Posted Path that has not been released for sale as non-firm capacity by the Transmission Service Provider during that period,

**$Postbacks_{NF}$** are adjustments to non-firm Available Transfer Capability due to postbacks for that period, as defined in business practices, and

**$Counter\text{-}schedules_{NF}$** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and described in its Available Transfer Capability Implementation Document.

## C. Measures

**M1.** Each Transmission Operator that uses the Rated System Path Methodology shall produce each Transmission model it used to calculate TTC for purposes of posting ATC for each Posted Path, as required in R1, for the time horizon(s) to be examined.

**M1.1.** Production shall be in the same form and format used by the Transmission Operator to calculate the TTC used in its posted ATC calculations, as required in R1.

**M1.2.** The Transmission model produced must show the use of each attribute specified in R1.1; except that, no evidence shall be required to prove: 1) utilization of a Special Protection System where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred.

**M1.3.** The Transmission model produced must show the use of the modeling parameters stated in R1.1 through R.12.

**M2.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (See R1.4, R.1.10, R1.11 and R1.12).

**M3.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the source documents reflecting the values it used to meet the requirements in R.1.5 through R1.9 for the period examined. (R1)

**M4.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the models, reports, or study results that it used to establish TTC in accordance with R2.1 through R2.7. (R2)

**M5.** Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)

**M6.** Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R3)

**M7.** Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R.1.2 for each Posted Path, 2) Any corresponding SOLs for those Posted Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R6 and R7 for each Posted Path. (R4)

**M8.** Each Transmission Service Provider shall produce the algorithms it used to calculate ETCs for Firm and Non-Firm Transmission Service, as required in R5 and R6, showing that only the variables allowed in R5 and R6 were used to calculate ETCs.

**M8.1.** Production of the algorithms shall be in the same form and format used by the Transmission Service Provider to calculate ETCs in R5 and R6.

**M9.** Each Transmission Service Provider shall produce the algorithms it used to calculate Firm and Non-Firm ATCs, as required in R7 and R8, showing that only the variables allowed in R7 and R8 were used to calculate ATCs.

**M9.1.** Production of the algorithms shall be in the same form and format used by the Transmission Service Provider to calculate ATCs in R7 and R8.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

**1.3. Data Retention**

- The Transmission Operator shall have its latest models used to determine TTC and evidence of previous versions for R1. (M1 and M6)
- The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)
- The Transmission Operator shall retain the latest version and the prior version of the source documents used to update its models to show compliance with R1. (M3)
- The Transmission Operator shall retain evidence to show compliance with R2.1 through R2.7 for the most recent three calendar years plus the current year. (M4)
- The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M5)
- The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R1, R3 and R4. (M6 and M7)
- The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R5, R6, R7 and R8. (M8 and M9)
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator met all but one of the modeling requirements specified in R1<br>**OR**<br>The Transmission Operator utilized Facility Ratings that were different from those specified by a Transmission Owner in their Transmission model and one of those Facility Ratings were used (or should have been used) to establish a TTC for one or more Posted Paths. | The Transmission Operator met all but two of the modeling requirements specified in R1<br>**OR**<br>The Transmission Operator utilized Facility Ratings that were different from those specified by a Transmission Owner in their Transmission model and two to five of those Facility Ratings were used (or should have been used) to establish a TTC for one or more Posted Paths. | The Transmission Operator met all but three of the modeling requirements specified in R1<br>**OR**<br>The Transmission Operator utilized Facility Ratings that were different from those specified by a Transmission Owner in their Transmission model and six to ten of those Facility Ratings were used (or should have been used) to establish a TTC for one or more Posted Paths. | The Transmission Operator did not meet four or more of the modeling requirements specified in R1<br>**OR**<br>The Transmission Operator utilized Facility Ratings that were different from those specified by a Transmission Owner in their Transmission model and eleven or more of those Facility Ratings were used (or should have been used) to establish a TTC for one or more Posted Paths. |
| R2 | N/A | N/A | N/A | The Transmission Operator did not calculate TTC using the process described in R2. |
| R3. | The Transmission Operator provided the TTC and study report to the Transmission Service Provider after more than seven, but not more than 14 calendar days after the report was finalized. | The Transmission Operator provided the TTC and study report to the Transmission Service Provider after more than 14, but not more than 21 calendar days after the report was finalized. | The Transmission Operator provided the TTC and study report to the Transmission Service Provider after more than 21, but not more than 28 calendar days after the report was finalized. | The Transmission Operator provided the TTC and study report to the Transmission Service Provider 28 or more calendar days after the report was finalized. |
| R4. | N/A | N/A | The Transmission Operator did not specify the TTC as the lesser of the TTC calculated using the process described in R4 or the SOL for one to four Posted Paths. | The Transmission Operator did not specify the TTC as the lesser of the TTC calculated using the process described in or the SOL, for five or more Posted Paths |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R5. | N/A | N/A | N/A | The Transmission Service Provider did not use all the elements defined in R5 when determining Firm ETC, or used additional elements. |
| R6. | N/A | N/A | N/A | The Transmission Service Provider did not use all the elements defined in R6 when determining Non-Firm ETC, or used additional elements. |
| R7. | N/A | N/A | N/A | The Transmission Service Provider did not use all the elements defined in R7 when determining Firm ATC, or used additional elements. |
| R8. | N/A | N/A | N/A | The Transmission Service Provider did not use all the elements defined in R8 when determining Non-Firm ATC, or used additional elements. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007

**Description of Current Draft:**

This is the second draft of the proposed standard posted for stakeholder comments.  This draft includes the modifications identified in the SAR with consideration stakeholder comments and applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to comments. | February 1, 2008 |
| 2. Post for 30-day pre-ballot review. | February 1, 2008 |
| 3. First ballot of standard. | March 3, 2008 |
| 4. Respond to comments. | April 10, 2008 |
| 5. Recirculation ballot. | April 10, 2008 |
| 6. 30-day posting before board adoption. | March 2, 2008 |
| 7. Board adoption. | April 24, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Area Interchange Methodology:** The Area Interchange methodology is characterized by determination of incremental transfer capability via simulation, from which Total Transfer Capability (TTC) can be mathematically derived. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC to derive Available Transfer Capability.

## A. Introduction

1. **Title: Area Interchange Methodology**

2. **Number: MOD-028-1**

3. **Purpose:** To increase consistency and transparency in the development and documentation of transfer capability calculations for short-term Transmission services performed by entities using the Area Interchange Methodology to support reliable system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Area Interchange Methodology to calculate Total Transfer Capabilities (TTCs) for Posted Paths.

   **4.2.** Each Transmission Service Provider that uses the Area Interchange Methodology to calculate Available Transfer Capabilities (ATCs) for Posted Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all six (MOD-001-1, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1, MOD-030-1) ATC-related standards are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Service Provider shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining TTC: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R1.1.** Information describing how the selected methodology has been implemented, in such detail that, given the same information used by the Transmission Operator, the results of the TTC calculations may be validated.

**R1.2.** A description of the manner in which the Transmission Operator will account for Interchange Schedules in the calculation of TTC.

**R1.3.** Any contractual obligations for allocation of TTC.

**R1.4.** A description of the manner in which Contingencies are identified for use in the TTC process.

**R2.** When calculating TTC for Posted Paths, the Transmission Operator shall use a Transmission model that contains all of the following: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

**R2.1.** Modeling data and topology of its Reliability Coordinator's area of responsibility.

**R2.2.** Modeling data and topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination areas.

**R2.3.** Facility Ratings specified by the Generator Owners and Transmission Owners.

**R3.** When calculating TTCs (for intra-day and next-day ) for Posted Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's Area, all the following data as provided by adjacent Transmission Service Providers, and any of the following data provided by any other Transmission Service Providers with which coordination agreements have been executed, provided that data can be associated with Facilities that are explicitly represented in the Transmission model: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R3.1.** For on-peak intra-day TTCs, and next-day intra-peak TTCs, use (at a minimum):

**R3.1.1.** Expected generation and Transmission outages, additions, and retirements.

**R3.1.2.** Peak Load forecast for the on-peak period being calculated.

**R3.1.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R3.2.** For off-peak intra-day and next-day TTCs, use (at a minimum):

**R3.2.1.** Expected generation and Transmission outages, additions, and Retirements.

**R3.2.2.** Peak Load forecast for the off-peak period being calculated.

**R3.2.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R4.** When calculating TTCs (for time periods beyond next day) for Posted Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's Area, all the following data as provided by adjacent Transmission Service Providers, and any of the following data provided by any other Transmission Service Providers with which coordination agreements have been executed, provided that data can be associated with Facilities that are explicitly represented in the Transmission model: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** For days two through 31 TTCs, use (at a minimum):

**R4.1.1.** Expected generation and Transmission outages, additions, and retirements.

**R4.1.2.** Peak Load forecast for the day being calculated.

**R4.1.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R4.2.** For months two through 13 TTCs, use (at a minimum):

**R4.2.1.** Expected generation and Transmission outages, additions, and retirements.

**R4.2.2.** Peak Load forecast for the month calculated.

**R4.2.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R5.** When calculating TTCs for Posted Paths, the Transmission Operator shall meet all of the following conditions: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.1.** Use all Contingencies meeting the criteria described in its ATCID.

**R5.2.** Respect any contractual allocations of TTC.

**R5.3.** Include, for each time period, the expected schedules using monthly or longer firm Transmission service, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for the Transmission Service Provider's Area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed modeling the source and sink as follows:

- If the source has been specified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source has been specified in the reservation and the point can be mapped to an "equivalence" modeled in the Transmission Service Provider's Transmission model, use the modeled equivalence as the source.
- If the source has been specified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" modeled in the Transmission Service Provider's Transmission model, use the interface point with the adjacent upstream Transmission Service Provider as the source.
- If the source has not been specified, use the interface point with the adjacent upstream Transmission Service Provider as the source.
- If the sink has been specified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point shall as the sink.
- If the sink has been specified in the reservation and the point can be mapped to an "equivalence" modeled in the Transmission Service Provider's Transmission model, use the modeled equivalence as the sink.

- If the sink has been specified in the reservation and the point can not be mapped to a discretely modeled point or an "equivalence" modeled in the Transmission Service Provider's Transmission model, use the interface point with the adjacent downstream Transmission Service Provider as the sink.
- If the sink has not been specified, use the interface point with the adjacent downstream Transmission Service Provider as the sink.

**R6.** Each Transmission Operator shall calculate TTC for each Posted Path as defined below, unless otherwise requested by the Transmission Service Provider: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.1.** At least once per calendar week for TTCs used in hourly, and daily ATC calculations.

**R6.2.** At least once per calendar month for TTCs used in monthly ATC calculations.

**R7.** Each Transmission Operator shall calculate TTC for each Posted Path using the following process: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

a. Determine the incremental Transfer Capability for each Posted Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either:
   - A System Operating Limit is reached on the Transmission Service Provider's system, or
   - A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is greater than 5%.

b. If the limit in step 'a' can not be reached by adjusting any combination of load or generation, then set the incremental Transfer Capability by the results of the case where the maximum adjustments were applied.

c. Sum the incremental Transfer Capability and all impacts of Firm Transmission Service that were included in the study model.

d. Use (as the TTC) the lesser of:
   - The sum of the incremental Transfer Capability and the impacts of Firm Transmission Service that were included in the study model, or
   - The sum of Facility Ratings of all ties comprising the Posted Path.

e. For Posted Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Operator so the TTC does not exceed that Transmission Operator's contractual rights.

**R8.** The Transmission Operator shall provide the Transmission Service Provider of that Posted Path with the most current value for TTC for that Posted Path within seven calendar days of its determination.

**R9.** When calculating Existing Transmission Commitments (ETCs) for firm commitments ($ETC_F$) for all time periods for a Posted Path the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

$$ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

**$NITS_F$** is the firm capacity reserved for Network Integration Transmission Service reserved on Posted Paths that serve as interfaces with other Transmission Service Providers.

**$GF_F$** is the capacity reserved for Grandfathered Firm Transmission Service and bundled contracts for energy and Transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC

**$PTP_F$** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$ROR_F$** is the capacity reserved for roll-over rights for Firm Transmission Service contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal

**$OS_F$** is the capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts on other Posted Paths as described in the ATCID.

**R10.** When calculating ETC for non-firm commitments ($ETC_{NF}$) for all time periods for a Posted Path the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**$NITS_{NF}$** is the non-firm capacity reserved for Network Integration Transmission Service reserved on Posted Paths that serve as interfaces with other Transmission Service Providers.

**$GF_{NF}$** is the capacity reserved for Grandfathered Non-Firm Transmission Service and bundled contracts for energy and Transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts on other Posted Paths as described in the ATCID.

**R11.** When calculating Firm ATC for a Posted Path for a specified period, the Transmission Service Provider shall utilize the following algorithm: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + Counterflows_F$$

**Where:**

**$ATC_F$** is the firm Available Transfer Capability for the Posted Path for that period,

**TTC** is the Total Transfer Capability of the Posted Path for that period,

**$ETC_F$** is the sum of existing firm Transmission commitments for the Posted Path during that period,

**CBM** is the Capacity Benefit Margin for the Posted Path during that period,

**TRM** is the Transmission Reliability Margin for the Posted Path during that period,

**$Postbacks_F$** are adjustments to firm ATC due to postbacks for that period, as defined in Business Practices, and

**$Counterflows_F$** are adjustments to firm ATC as determined by the Transmission Service Provider and described in their ATCID.

**R12.** When calculating Non-Firm ATC for a Posted Path for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + Counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the Posted Path for that period,

**TTC** is the Total Transfer Capability of the Posted Path for that period,

**$ETC_F$** is the sum of existing firm Transmission commitments for the Posted Path during that period,

**$ETC_{NF}$** is the sum of existing non-firm Transmission commitments for the Posted Path during that period,

**$CBM_S$** is the Capacity Benefit Margin for the Posted Path that has been scheduled on during that period,

**$TRM_U$** is the Transmission Reliability Margin for the Posted Path that has not been released for sale as non-firm capacity by the Transmission Service Provider during that period,

**$Postbacks_{NF}$** are adjustments to non-firm ATC due to postbacks for that period, as defined in Business Practices, and

**$Counterflows_{NF}$** are adjustments to non-firm ATC as determined by the Transmission Service Provider and described in their ATCID.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its current ATCID that has the information described in R1 to show compliance with R1. (R1)

**M2.** The Transmission Operator shall provide evidence including the model used to calculate TTC as well as other evidence (such as Facility Ratings provided by facility owners, written documentation, logs, and data) to show that the modeling requirements in R2 were met. (R2)

**M3.** The Transmission Operator shall provide evidence, including scheduled outages, facility additions and retirements, (such as written documentation, logs, and data) that the data described in R3 and R4 were included in the determination of TTC.(R3) (R4)

**M4.** The Transmission Operator shall provide the contingencies used in determining TTC and its ATCID as evidence to show that the contingencies described in the ATCID were included in the determination of TTC. (R5)

**M5.** The Transmission Operator shall provide copies of contracts that contain requirements to allocate TTCs and TTCs to show that any contractual allocations of TTC were respected as required in R5.2. (R5)

**M6.** The Transmission Operator shall provide evidence (such as copies of coordination agreements, reservations, interchange transactions, or other documentation) to show that monthly or longer reservations were used to estimate scheduled interchange, the modeling of scheduled interchange was based on the rules described in R5.3, and that estimated scheduled interchange was included in the determination of TTC. (R5)

**M7.** The Transmission Operator shall provide evidence (such as logs and data and dated copies of requests from the Transmission Service Provider to calculate TTCs at specific intervals) that TTCs have been calculated at least once per calendar week for TTCs used in hourly, and daily ATC calculations and at least once per calendar month for TTCs used in monthly ATC calculations per the specifications in R6.(R6)

**M8.** The Transmission Operator shall provide evidence (such as written documentation) that TTCs have been calculated using the process described in R7. (R7)

**M9.** The Transmission Operator shall have evidence including a copy of the latest calculated TTC values along with a dated copy of email notices or other equivalent evidence to show that its provided its Transmission Service Provider with the most current values for TTC in accordance with R8.

**M10.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of Firm ETC used the algorithm and elements described in R9 and did not include any additional elements. (R9)

**M11.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of Non-Firm ETC used the algorithm and the elements described in R10 and did not include any additional elements. (R10)

**M12.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of Firm ATC used the algorithm and the elements described in R11 and does not include any additional elements. (R11)

**M13.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of Non-Firm ATC used the algorithm and the elements described in R12 and does not include any additional elements. (R12)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset

Not applicable.

#### 1.3. Data Retention

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2.
- The Transmission Operator shall retain evidence to show compliance with R3 and R4 for the most recent 12 months or until the model used to calculate TTC is updated, whichever is longer.
- The Transmission Operator shall retain evidence to show compliance with R5, R6, R7 and R8 for the most recent12 months.
- The Transmission Service Provider shall retain evidence to show compliance with R9, R10, R11 and R12 for the most recent12 months.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

#### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider has an ATCID that meets the intent of Requirement 1 but the ATCID is missing some minor information. | The Transmission Service Provider has an ATCID but it is missing one of the four required elements in R1. | The Transmission Service Provider has an ATCID but it is missing two of the four required elements in R1. | The Transmission Service Provider has an ATCID but it is missing three or more of the four required elements in R1. |
| R2. | The Transmission Operator utilized Facility Ratings that were different from those specified by a Transmission Owner in their Transmission model and one of those Facility Ratings was used (or should have been used) to establish TTC for one or more Posted Paths. | The Transmission Operator utilized Facility Ratings that were different from those specified by a Transmission Owner in their Transmission model and two to five of those Facility Ratings were used (or should have been used) to establish a TTC for one or more Posted Paths. | The Transmission Operator utilized Facility Ratings that were different from those specified by a Transmission Owner in their Transmission model and six to ten of those Facility Ratings were used (or should have been used) to establish a TTC for one or more Posted Paths.<br>**OR**<br>The Transmission Operator did not include in the Transmission model modeling data and topology (or equivalent representation) for one adjacent Reliability Coordinator area. | The Transmission Operator utilized Facility Ratings that were different from those specified by a Transmission Owner in their Transmission model and eleven or more of those Facility Ratings were used (or should have been used) to establish a TTC for one or more Posted Paths.<br>**OR**<br>The Transmission Operator did not include in the Transmission model detailed modeling data and topology for its own Reliability Coordinator area.<br>**OR**<br>The Transmission Operator did not include in the Transmission model detailed modeling data and topology (or equivalent representation) for two or more adjacent Reliability Coordinator areas. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R3. | The Transmission Operator did not include one to ten expected generation and Transmission outages, additions or retirements in the TTC process. | The Transmission Operator did not include eleven to twenty-five expected generation and Transmission outages, additions or retirements in the TTC process. | The Transmission Operator did not include twenty-six to fifty expected generation and Transmission outages, additions or retirements in the TTC process. | In calculating TTCs for intra-day and next-day, the Transmission Operator did not include more than fifty expected generation and Transmission outages, additions or retirements in the TTC process.<br>**OR**<br>In calculating TTCs for intra-day and next-day, the Transmission Operator did not include the peak Load forecast or unit commitment in its TTC calculation as described in R3.1. |
| R4. | N/A | N/A | N/A | In calculating TTCs for time periods beyond next day, the Transmission Operator did not include more than fifty expected generation and Transmission outages, additions or retirements in the TTC process.<br>**OR**<br>In calculating TTCs for time periods beyond next-day, the Transmission Operator did not include the peak Load forecast or unit commitment in its TTC calculation as described in R4.1. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R5. | N/A | N/A | N/A | The Transmission Operator did not include in the TTC calculation the contingencies that met the criteria described in the ATCID.<br>**OR**<br>The Transmission Operator did not respect contractual allocations of TTC.<br>**OR**<br>The Transmission Operator did not model reservations' sources or sinks as described in R5.3<br>**OR**<br>The Transmission Operator did not use monthly or longer reservations to estimate interchange or did not utilize that estimate in the TTC calculation as described in R5.3. |
| R6. | N/A | N/A | N/A | The Transmission Operator did not calculate TTCs per the minimum time frames specified in R6. |
| R7. | N/A | N/A | N/A | The Transmission Operator did not calculate TTCs per the minimum time frames specified in R7. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R8. | The Transmission Operator has not provided its Transmission Service Provider with its Posted Path TTCs within seven calendar days of their determination, but is has not been more than 14 calendar days since their determination. | The Transmission Operator has not provided its Transmission Service Provider with its Posted Path TTCs within calendar days of their determination, but is has not been more than 21 calendar days since their determination. | The Transmission Operator has not provided its Transmission Service Provider with its Posted Path TTCs within 21 calendar days of their determination, but is has not been more than 28 calendar days since their determination. | The Transmission Operator has not provided its Transmission Service Provider with its Posted Path TTCs within 28 or more calendar days of their determination |
| R9. | N/A | N/A | N/A | The Transmission Service Provider did not use all the elements defined in R9 when determining firm ETC, or used additional elements. |
| R10. | N/A | N/A | N/A | The Transmission Service Provider did not use all the elements defined in R10 when determining non-firm ETC, or used additional elements. |
| R11. | N/A | N/A | N/A | The Transmission Service Provider did not use all the elements defined in R11 when determining firm ATC, or used additional elements. |
| R12. | N/A | N/A | N/A | The Transmission Service Provider did not use all the elements defined in R12 when determining non-firm ATC, or used additional elements. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007

**Description of Current Draft:**

This is the second draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of stakeholder comments from the first posting and applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to comments. | February 1, 2008 |
| 2. Post for 30-day pre-ballot review. | February 1, 2008 |
| 3. First ballot of standard. | March 3, 2008 |
| 4. Respond to comments. | April 10, 2008 |
| 5. Recirculation ballot. | April 10, 2008 |
| 6. 30 Day posting before board adoption. | March 2, 2008 |
| 7. Board adopts MOD-001-1. | April 24, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Transmission Reliability Margin Implementation Document (TRMID**): A document that describes the implementation of a Transmission Reliability Margin methodology.

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**

2. **Number:** **MOD-008-1**

3. **Purpose:** To promote the consistent and transparent calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to ensure reliable system operations.

4. **Applicability:**

   **4.1.** Transmission Operator.

   **4.2.** Transmission Service Provider.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all six (MOD-001-1, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1, MOD-030-1)ATC-related standards are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** Identification of (on each of its respective Posted Paths or Flowgates) each of the following components of uncertainty if used in calculating TRM, and a description of how that component is used to calculate a TRM value:

- Aggregate Load forecast uncertainty (not included in determining generation reliability requirements).
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window).
- Reserve sharing requirements.
- Inertial response and frequency bias.

**R1.2.** A statement to confirm that it shall use assumptions in calculating TRM that are consistent with those assumptions that are used in the Transmission planning process for the corresponding time periods.

**R1.3.** The description of the method of TRM allocation across Posted Paths or Flowgates.

**R1.4.** The identification of the TRM calculation used for the following time periods:

**R1.4.1.** Same day and real-time.

**R1.4.2.** Day-ahead and pre-schedule.

**R1.4.3.** Beyond day-ahead and pre-schedule, up to thirteen months ahead.

**R1.5.** If TRM is zero for all the time periods listed in R1.4, a statement of that practice.

**R2.** The Transmission Operator shall only use the components of uncertainty from R1.1 to calculate TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.** Each Transmission Operator shall provide its TRMID, and any underlying documentation, work papers and load flow base cases used to determine TRM, to all of the following within seven calendar days of a request: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** The Transmission Service Provider responsible for tariff administration over the Facilities operated by the Transmission Operator

**R3.2.** The Reliability Coordinator responsible for oversight of the Facilities for which the Transmission Service Provider offers service.

**R3.3.** The Planning Coordinator responsible for oversight of the Facilities for which the Transmission Service Provider offers service.

**R4.** Each Transmission Service Provider shall make available (within seven calendar days of a documented request for such information) the TRMIDs used by its Transmission Operator(s), and any underlying documentation, work papers and load flow base cases used to determine TRM, to Transmission Service Providers who have made a request for such information. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** Each Transmission Operator shall calculate, at least once every 13 months (in accordance with the definitions in its TRMID), a TRM value for the following time periods (on each Posted Path or Flowgate) and shall provide these TRM values to its Transmission Service Provider(s) and Transmission Planner(s) within seven calendar days of the calculation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R5.1.** Same day and real-time.

**R5.2.** Day-ahead and pre-schedule.

**R5.3.** Beyond the day-ahead and pre-schedule, up to thirteen (13) months ahead.

## C. Measures

**M1.** The Transmission Operator shall provide its current TRMID that contains the information described in R1to show its compliance with R1. (R1)

**M2.** The Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, CBMID, and other evidence, (such as written documentation, study reports, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

**M3.** The Transmission Operator shall provide a dated copy of any request for its TRMID or associated documentation, and evidence such as copies of emails or postal receipts that show the recipient, date and contents as evidence that the requested documentation was provided within the specified timeframe to the entities described in R3. (R3)

**M4.** The Transmission Service Provider shall provide a dated copy of any request for its Transmission Operator's TRMID or associated documentation, and evidence such as copies of emails or postal receipts that show the recipient, date and contents as evidence that the requested documentation was provided within the specified timeframe to the requesting entity as described in R4. (R4)

**M5.** The Transmission Operator shall provide evidence (such as logs and data that it determined TRM at least once every thirteen months for each of the listed time periods and provided it to their Transmission Service Provider(s) and Transmission Planner(s) as described in R5. (R5)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

- The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.
- The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes

Any of the following may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator has a TRMID that does not incorporate changes made up to three months ago. | The Transmission Operator has a TRMID that does not incorporate changes been made three or more months ago but less than six months ago. | The Transmission Operator has a TRMID that does not incorporate changes made six or more months ago but less than one year ago. | The Transmission Operator has a TRMID that does not incorporate changes that have been made more than one year ago.<br>**OR**<br>The Transmission Operator does not have a TRMID, or its TRMID does not include any of the information described in R1. |
| R2. | N/A | N/A | N/A | The Transmission Operator included elements of uncertainty not defined in R1 in their calculation of TRM or it included components of CBM in TRM. |
| R3. | The Transmission Operator did provide the TRMID to all entities specified in R3 but provided TRMID to all parties in more than 7 days but less than 14 days. . | The Transmission Operator did not provide the TRMID to one entities specified in R3<br>**OR**<br>provided TRMID to all parties in more than 14 days or more but less than 30 days. . | The Transmission Operator did not provide the TRMID to two entities specified in R3<br>**OR**<br>provided TRMID to all parties in more than 30 days or more but less than 60 days. | The Transmission Operator did not provide the TRMID to any of the entities specified in R3<br>**OR**<br>provided TRMID to all parties in more than 60 days. |

| | | | | |
|---|---|---|---|---|
| R4. | The Transmission Service Provider made available the current TRMID and supporting documentation as specified in R4 in more than 7 calendar days but no more than 14 days of a request by a Transmission Service Provider. | The Transmission Service Provider made available the current TRMID and supporting documentation as specified in R4 in more than 14 calendar days but no more than 30 days of a request by a Transmission Service Provider. | The Transmission Service Provider made available the current TRMID and supporting documentation as specified in R4 in more than 30 calendar days but no more than 60 days of a request by a Transmission Service Provider. | The Transmission Service Provider made available the current TRMID and supporting documentation as specified in R4 in 60 days or more of a request by a Transmission Service Provider Or did not make the current TRMID available. |
| R5. | The Transmission Operator did not provide the Transmission Planner with its determined TRM values. | The Transmission Operator did not determine TRM for any of the listed time frames within thirteen months of the previous determination, and the last determination was not more than 15 months ago. | The Transmission Operator did not determine TRM for any of the listed time frames within thirteen months of the previous determination, and the last determination was more than 15 months ago, but not more than 18 months ago.<br>**OR**<br>The Transmission Operator did not provide the Transmission Service Provider with its determined TRM values, and one or more of those values changed by more than twenty percent from the previous value given to the Transmission Service Provider. | The Transmission Operator did not determine TRM for any of the listed time frames within thirteen months of the previous determination, and the last determination was more than 18 months ago.<br>**OR**<br>The Transmission Operator has not provided the Transmission Service Provider with any determined TRM values. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007

**Description of Current Draft:**

This is the second draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of stakeholder comments and applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to comments. | February 1, 2008 |
| 2. Post for 30-day pre-ballot review. | February 1, 2008 |

| 4. Respond to comments. | April 10, 2008 |
| 5. Recirculation ballot. | April 10, 2008 |
| 6. 30-day posting before board adoption. | March 2, 2008 |
| 7. Board adoption. | April 24, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Generation Capability Import Requirement (GCIR):** The amount of generation capability from external sources requested by a Load-Serving Entity (LSE) (or group of LSEs with an aggregated need for Capacity Benefit Margin) to meet its generation reliability or reserve adequacy requirements as an alternative to internal resources.

**Capacity Benefit Margin Implementation Document (CBMID):** A document that describes the implementation of a Capacity Benefit Margin methodology.

## A. Introduction

1. **Title:** **Capacity Benefit Margin**

2. **Number:** **MOD-004-1**

3. **Purpose:** To promote the consistent and transparent calculation, verification, preservation, and use of Capacity Benefit Margin (CBM) to support reliable system operations.

4. **Applicability:**

   **4.1. Functional Entity:**

   **4.1.1** Load-Serving Entity.

   **4.1.2** Transmission Service Provider.

   **4.1.3** Balancing Authority.

   **4.1.4** Transmission Planner.

5. **Facility Limitations/Specifications:**

   **5.1.** None.

6. **Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all six standards are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standards become effective on the first day of the first calendar quarter that is twelve months beyond the date the standards are approved by the NERC Board of Trustees.

## B. Requirements

**R1.** The Transmission Service Provider shall prepare and keep current a "Capacity Benefit Margin Implementation Document" (CBMID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** Its procedure for a Load-Serving Entity within a Balancing Authority associated with the Transmission Service Provider to request CBM to support its Generation Capability Import Requirement (GCIR).

**R1.2.** Its procedure and assumptions for setting CBM for each Posted Path or Flowgate based on Load-Serving Entity requests.

**R1.3.** Its procedure for a Load-Serving Entity to request the scheduling of energy over Transfer Capability set aside as CBM.

**R2.** The Transmission Service Provider shall make available the CBMID and any changes to the CBID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator within seven days of a change. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R3.** A Load-Serving Entity (or group of Load-Serving Entities with an aggregated need for CBM) that wants Transfer Capability to be set aside in the form of CBM shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Submit a request for CBM to the Transmission Service Provider and Transmission Planner identifying the amount of CBM requested for each month for each year for the next ten year period, that includes:

**R3.1.1.** The GCIR, specifying:

3.1.1.1. The Balancing Authority(ies) from which generation supporting the GCIR will be supplied or the specific Posted Paths to be utilized for import of the generation supporting the GCIR.

3.1.1.2. A monthly GCIR value for each month during the current year and following year for each Balancing Authority or Posted Path.

3.1.1.3. An annual GCIR value for each subsequent year for each Balancing Authority or Posted Path.

**R3.1.2.** Identification of all applicable reserve margin and resource adequacy requirements, and the entity(ies) responsible for establishing them, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities.

**R3.1.3.** A summary of the results of resource studies performed to determine the amount of the request, not to include confidential information.

**R3.1.4.** All resource studies (and supporting information) performed to determine the amount of the request.

**R3.2.** At least every thirty-one days, update the request provided per R3.1 to reflect any changes that alter future needs for CBM or indicate that no change is needed.

**R3.3.** Base the request provided per R3.1 on verifiable historical, state, regional transmission organization or regional entity criteria.

**R4.** Within fourteen calendar days of receiving a request or change to a request for CBM that meets the requirements defined in R3.1, the Transmission Service Provider shall set the CBM for the months requested as described in R3.1.1.2 as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.1.** Determine the amount of CBM (for use in R4.2) for each request by using one of the following::

**R4.1.1.** For the Area Interchange Methodology and the Rated System Path Methodology, using the requested Generation Capability Import Requirement for the Posted Path

**R4.1.2.** For the Flowgate Methodology, determining the significant impacts of each request on each Flowgate

4.1.2.1. Determine impacts of a request by multiplying the requested GCIR by the Distribution Factor for the transfer of that import from the specified Balancing Authority relative to the Flowgate.

4.1.2.2. Classify each impacts based on a Distribution Factor of 3% or greater as a significant impact.

**R4.2.** Set CBM for each Posted Path or Flowgate based on the sum of all requests such that all requests can be met simultaneously or all firm ATC or AFC has been allocated to CBM as follows:

**R4.2.1.** For Posted Paths, set the CBM for each Posted Path equal to the lesser of:

- The sum of all requests for GCIR for that Posted Path, minus the transfer capability set aside for reserve sharing for that Posted Path or
- The firm Available Transfer Capability (ATC) for that Posted Path

**R4.2.2.** For Flowgates, set the CBM for each Flowgate equal to the lesser of:

- The sum of the significant impacts of all requests for GCIR for that Flowgate minus the impact of transfer capability set aside for reserve sharing for that Flowgate, or
- The firm Available Flowgate Capability (AFC) for that Flowgate

**R4.3.** If the sum of all CBM requests can not be met simultaneously, and during the evaluation of monthly ATC or AFC, additional capacity becomes available, increase the CBM based on availability up to a maximum of the sum of all CBM requests.

**R5.** Within sixty calendar days of receiving a request or change to a request for CBM that meets the requirements defined in R3.1, the Transmission Planner shall set the CBM for the years requested as described in R3.1.1.3 as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** Use each GCIR to determine a margin to decrement Firm Transfer Capability for use in all future planning processes.

**R5.2.** Set the CBM for each Posted Path or Flowgate based on the sum of all CBM requests such that all requests can be met simultaneously or all available firm Transfer Capability has been allocated to CBM.

**R5.3.** If the sum of all requests can not be met simultaneously, and during the planning process, additional capacity becomes available, increase the CBM based on availability up to a maximum of the sum of all requests.

**R5.4.** Provide the Transmission Service Provider with the following:

**R5.4.1.** The total amount of CBM for each Posted Path or Flowgate on the Transmission Service Provider's system in each of the years specified in the original CBM request.

**R5.4.2.** If less than the sum of all requests was established as the CBM for any period, for each Posted Path or Flowgate, a list of the values of each GCIR used to set the CBM for each of the years specified in the original request.

**R6.** Within five days of the determination of CBM as described in R4 or R5, the Transmission Service Provider shall provide each Load-Serving Entity (or group of Load-Serving Entities with an aggregated need for CBM) that requested CBM and the Balancing Authority hosting its (their) load with a report that includes: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** The total amount of CBM for each Posted Path or Flowgate on the Transmission Service Provider's system in each of the months or years specified in the original request. If less than the sum of all requests was established as the CBM for any period:

- For each Posted Path or Flowgate, a list of the values of each GCIR used to set the CBM for each of the months and years specified in the original request
- The option to request a system impact study.

**R7.** The Transmission Service Provider and Transmission Planner shall each provide copies of the supporting data, including any models, used for allocating CBM over each Posted Path or Flowgate to the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R7.1.** Each of its associated Transmission Operators within seven calendar days of a modification to the CBM.

**R7.2.** To any Transmission Service Provider, Reliability Coordinator, Transmission Planner, or Planning Coordinator within seven calendar days of their making a request for the data.

**R8.** The Load-Serving Entity that wants to schedule energy over Firm Transfer Capability set aside as CBM shall submit an Interchange Transaction Tag, and shall not request to schedule energy over Firm Transfer Capability set aside as CBM unless experiencing a NERC Energy Emergency Alert (EEA) 2 or higher. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R9.** When reviewing an Interchange Transaction Tag using CBM, the Balancing Authority and Transmission Service Provider shall waive any timing and ramping requirements. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R10.** The Transmission Service Provider shall approve any Interchange Transaction Tag using CBM that is submitted by an Energy Deficient Entity under an EEA2 if the CBM is available. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

## C. Measures

**M1.** Each Transmission Service Provider shall have its CBMID that includes the information specified in R1 as to show that it is compliant with R1. (R1)

**M2.** The Transmission Service Provider shall have evidence (such as logs and data, copies of electronic messages, or other equivalent evidence) to show that within seven days of a change to its CBMID, it made the CBMID available to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator. (R2)

**M3.** The Load-Serving Entity that wants CBM shall provide a copy of its CBM request with the supporting information specified in R3.1 to show that it is compliant with R3.1. (R3)

**M4.** The Load-Serving Entity that wants CBM shall provide dated copies of its updated CBM requests as evidence that it has updated its CBM request or confirmed no update was needed at least every thirty-one days, per R3.2 (R3).

**M5.** The Load-Serving Entity that wants CBM shall provide evidence (such as studies, historical data, copies of state or regional transmission organization reliability criteria, regional generation reliability criteria or other equivalent evidence) they it has based its CBM request on verifiable historical, state, regional transmission organization, or regional generation reliability criteria in accordance with R3.3. (R3)

**M6.** The Transmission Service Provider shall provide evidence including copies of requests for CBM and requests for changes to CBM and other evidence such as copies of the actual computations to set CBM, or other equivalent evidence to show that CBM for the months requested as described in R3.1.1.2 has been established using the process described in R4. (R4)

**M7.** The Transmission Planner shall provide evidence including copies of requests for CBM and requests for changes to CBM and other evidence such as copies of actual computations to set CBM, or other equivalent evidence to show that CBM for the years requested as described in R3.1.1.3 has been established using the process described in R5. (R5)

**M8.** The Transmission Planner shall provide evidence (such as written documentation of studies and supporting study models that model, in base loadflows, the GCIRs as identified in R3.1.1 by Load-Serving Entities) that demonstrates that the CBM has been used to determine a margin to decrement Firm Transfer Capability in planning processes as specified in R5.1. (R5)

**M9.** The Transmission Service Provider shall provide copies of the reports sent to Load-Serving Entities and Balancing Authorities along with other evidence (such as logs and data, copies of electronic messages, or other equivalent evidence) to show that within five days of the determination of CBM, a report meeting the requirements described in R6 was provided as specified. (R6).

**M10.** The Transmission Service Provider and Transmission Planner shall each provide evidence including copies of dated requests for data supporting the calculation of CBM along with other evidences such as copies of electronic messages or other evidence to show that it provided the required entities with copies of the supporting data, including any models, used for allocating CBM as specified in R7. (R7)

**M11.** The Load-Serving Entity that scheduled CBM shall provide evidence (such as logs, copies of tag data, or other data from its Reliability Coordinator) that at the time they requested a schedule using CBM, they were in an EEA2. (R8)

**M12.** Balancing Authorities and Transmission Service Providers shall provide evidence (such as operating logs and tag data) that they did not deny an Interchange Schedule using CBM based on the request not meeting timing or ramping requirements. (R9)

**M13.** The Transmission Service Provider shall provide evidence including copies of CBM values along with other evidence (such as tags, reports, and supporting data) to show that it approved any Interchange Transaction Tag using CBM for any energy deficient entity where the total CBM available was greater than the amount of CBM requested in the Tag. (R10)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority (CEA)

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

- The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7 and R10 for three calendar years.
- The Load-Serving Entity shall maintain evidence to show compliance with R3, and R8 for three calendar years.
- The Transmission Planner shall maintain evidence to show compliance with R5 and R7 for three calendar years.
- The Balancing Authority shall maintain evidence to show compliance with R9 for three calendar years.
- If an entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits

- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

**None.**

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider has a CBMID that does not incorporate changes that have been made within the last three months. | The Transmission Service Provider has a CBMID that does not incorporate changes that have been made more than three, but not more than six, months ago. | The Transmission Service Provider has CBMID that does not incorporate changes that have been made more than six, but not more than twelve, months ago. | The Transmission Service Provider does not have a CBMID, or has a CBMID that does not incorporate changes that have been made more than twelve months ago. |
| R2. | The Transmission Service Provider makes available the CBMID and any changes to the CBID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator eight (8) or more days but not more than 14 days after a change was made. | The Transmission Service Provider makes available the CBMID and any changes to the CBID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator 14 or more days but not more than 21 days after a change was made. | The Transmission Service Provider makes available the CBMID and any changes to the CBID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator 21 or more days but not more than 28 days after a change was made. | The Transmission Service Provider makes available the CBMID and any changes to the CBID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator more than 28 days after a change was made. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R3. | The Load Serving Entity did not update their request for CBM, or indicate that no update was needed, as described in R3.2. | The Load Serving Entity desiring CBM did not submit the information described in any one of the following: R3.1.2, R3.1.3, or R3.1.4.<br>**OR**<br>The Load Serving Entity did not update their request for CBM, or indicate that no update was needed, as described in R3.2, and their Generation Capability Import Requirement had changed by more than 20MW or 10%, whichever is smaller, and not more than 30MW or 20%, whichever is smaller. | The Load Serving Entity desiring CBM did not submit the information described in any one of the following: R3.1.2, R3.1.3, or R3.1.4.<br>**OR**<br>The Load Serving Entity did not update their request for CBM, or indicate that no update was needed, as described in R3.2, and their Generation Capability Import Requirement had changed by more than 20MW or 10%, whichever is smaller, and not more than 40MW or 30%, whichever is smaller. | The Load Serving Entity desiring CBM did not include one or more of the items specified in R3.1.1 in their request.<br>**OR**<br>The Load Serving Entity desiring CBM did not submit any of the information described in R3.1.2, R3.1.3, or R3.1.4.<br>**OR**<br>The Load Serving Entity did not update their request for CBM, or indicate that no update was needed, as described in R3.2, and their Generation Capability Import Requirement had changed by more than 40MW or 30%, whichever is smaller.<br>**OR**<br>The Load Serving Entity requested GCIR greater than its needs for imports to meet reserve margin or resource adequacy requirements (not to include the incremental power flows from reserve sharing requirements), and the additional GCIR requested was more than 10MW in excess of the needed amount. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R4. | N/A | N/A | The Transmission Service Provider set CBM for the months requested as described in R3.1.1.2 more than 14, but not more than 30, days after receiving a request for CBM.<br>**OR**<br>The Transmission Service Provider did not follow the process described in R4.1, R4.2, and R4.3. | The Transmission Service Provider set CBM for the months requested as described in R3.1.1.2 more than 30 days after receiving a request for CBM.<br>**OR**<br>The Transmission Service Provider did not follow the process described in R4.1, R4.2, and R4.3, and the resource adequacy requirements of one or more Load Serving Entities requesting CBM were not met. |
| R5. | N/A | N/A | The Transmission Planner set CBM for the years requested as described in R3.1.1.3 more than 60, but not more than 120, days after receiving a request for CBM.<br>**OR**<br>The Transmission Planner did not follow the process described in R5.1, R5.2, R5.3, and R5.4. | The Transmission Planner set CBM for the years requested as described in R3.1.1.3 more than 120 days after receiving a request for CBM.<br>**OR**<br>The Transmission Planner did not follow the process described in R5.1, R5.2, R5.3, and R5.4, and the resource adequacy requirements of one or more Load Serving Entities requesting CBM were not met. |
| R6. | The Transmission Service Provider provided the report to the requesting entities within 7 days (up to 2 days late) of determining the CBM | The Transmission Service Provider provided the report to the requesting entities within 12 days (up to 7 days late) of determining CBM | The Transmission Service Provider provided the report to the requesting entities within 19 days (up to 14 days late) of determining CBM | The Transmission Service Provider provided the report to the requesting entities within 20 or more days of determining CBM OR did not provide the report. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R7. | The Transmission Service Provider or Transmission Planner did not provide a requester specified in R5 with the supporting data, including models, used to allocate CBM in more than seven, but not more than fourteen, days after the submission of the request. | The Transmission Service Provider or Transmission Planner did not provide a requester specified in R5 with the supporting data, including models, used to allocate CBM in more than fourteen, but not more than thirty, days after the submission of the request. | The Transmission Service Provider or Transmission Planner did not provide a requester specified in R5 with the supporting data, including models, used to allocate CBM more than thirty, but not more than sixty, days after the submission of the request. | The Transmission Service Provider or Transmission Planner did not provide a requester specified in R5 with the supporting data, including models, used to allocate CBM more than sixty days after the submission of the request. |
| R8. | N/A | N/A | N/A | A Load Serving Entity requested to schedule energy over CBM while not in an EEA2 |
| R9. | N/A | N/A | N/A | A Balancing Authority or Transmission Service Provider denied an Interchange Transaction Tag using CBM based on timing or ramping requirements. |
| R10. | N/A | N/A | N/A | The responsible entity has failed to demonstrate implementation or execution of the program/procedure requirement or directive |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR Development June 20 2005.
2. SAC Authorized the SAR to be development as a standard on February 14 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from February 15 – March 16, 2007.
5. SDT posted second draft for comment from May 25–June 25, 2007.

**Description of Current Draft:**

This is the third draft of the proposed standard posted for stakeholder comments. This draft represents consideration of stakeholder comments submitted with the second draft of the proposed revisions to MOD-001 as well as consideration of applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to comments. | February 1, 2008 |
| 2. Post for 30-day pre-ballot review. | February 1, 2008 |
| 3. First ballot of standard. | March 3, 2008 |
| 4. Respond to comments. | April 10, 2008 |
| 5. Recirculation ballot. | April 10, 2008 |
| 6. 30-day posting before board adoption. | March 2, 2008 |
| 7. Board adoption. | April 24, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Posted Path:**

1) Any Balancing Authority to Balancing Authority interconnection;
2) Any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months;
3) Any path for which a Transmission Customer requests to have Available Transfer Capability or Total Transfer Capability posted.

**Available Transfer Capability Implementation Document (ATCID):** A document that describes the implementation of an Available Transfer Capability methodology.

**Transmission Operator Area:** The collection of Transmission assets over which the Transmission Operator is responsible for operating.

**Existing Transmission Commitments (ETC):** Committed uses of a Transmission Service Provider's Transmission system considered when determining Available Transfer Capability.

**Planning Coordinator:** See Planning Authority.

## A. Introduction

1. **Title:** Available Transfer Capability
2. **Number:** MOD-001-1
3. **Purpose:** To promote the consistent and transparent application and documentation of Available Transfer Capability (ATC) calculations for reliable system operations.
4. **Applicability:**
   - **4.1.** Transmission Service Provider.
   - **4.2.** Transmission Operator.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all six (MOD-001-1, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1, MOD-030-1)ATC-related standards are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall select one ATC methodology[1] (Area Interchange methodology, Rated System Path methodology, or Flowgate methodology) for each Posted Path per time period for use in determining Transfer Capabilities of those Facilities within its Planning Coordinator's planning area. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R2.** Each Transmission Service Provider shall calculate ATC values for the time periods listed below using the selected ATC methodology or methodologies: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

- **R2.1.** Hourly ATC values for at least the next 168 hours.
- **R2.2.** Daily ATC values for at least the next 31 days.
- **R2.3.** Monthly ATC values for at least the current month plus the next 12 months.

**R3.** Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- **R3.1.** Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC calculations may be validated.
- **R3.2.** A description of the manner in which the Transmission Service Provider will account for counterflows or counter-schedules.
- **R3.3.** The identity of the Planning Coordinator and Transmission Operator associated with each Facility under the Transmission Service Provider's tariff.

[1] All Posted Paths do not have to use the same ATC Methodology and no particular Posted Path must use the same ATC Methodology for all time periods.

**R3.4.** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer capability.

**R3.5.** The identity of the Transmission Service Providers from which it receives data for use in calculating transfer capability.

**R3.6.** Allocation methodologies.

**R4.** When determining the impact of counterflows in the determination of firm ATC or AFC, the Transmission Service Provider shall use 0% of calculated counterflows based on reservations and/or schedules unless otherwise specified within the Transmission Service Provider's ATCID. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R5.** When determining the impact of counterflows in the determination of non-firm ATC or Available Flowgate Capability (AFC), the Transmission Service Provider shall apply the following: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**R5.1.** Use 0% of calculated counterflows based on reservations unless otherwise specified within the Transmission Service Provider's ATCID.

**R5.2.** Use 100% of calculated counterflows based on schedules unless otherwise specified within the Transmission Service Provider's ATCID.

**R6.** The Transmission Service Provider shall notify the following entities (via electronic mail) before implementing a new or revised ATCID: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** Each Planning Coordinator associated with the Transmission Service Provider's area.

**R6.2.** Each Reliability Coordinator associated with the Transmission Service Provider's area.

**R6.3.** Each Transmission Operator associated with the Transmission Service Provider's area.

**R6.4.** Each Planning Coordinator adjacent to the Transmission Service Provider's area.

**R6.5.** Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

**R6.6.** Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

**R7.** The Transmission Service Provider shall make available the ATCID and any changes to the ATCID to all of the entities specified in R6. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R8.** When calculating Total Transfer Capability (TTC), AFC and ATC, the Transmission Operator and Transmission Service Provider shall each use assumptions consistent with those used in any associated operations studies or planning studies for the time period studied. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R9.** Each Transmission Service Provider shall update ATC at a minimum on the following frequency: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**R9.1.** For hourly ATC, once per hour.

**R9.2.** For daily ATC, once per day.

**R9.3.** For monthly ATC, once a week.

**R10.** Within fourteen calendar days of a request of any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator, each Transmission Service Provider shall begin to make available on the schedule specified by the requester (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider), unless another request already specifies data on a more frequent basis, to each requester, current versions of the following data as requested in electronic format for use in ATC calculations, for up to 13 months into the future (subject to confidentiality and security requirements): *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R10.1.** Expected generation and Transmission outages, additions, and retirements.

**R10.2.** Peak Load forecasts.

**R10.3.** Unit commitments and dispatch orders, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:

- Dispatch order
- Participation factors
- Block dispatch

**R10.4.** Firm and non-firm Network Integration Transmission Service details.

**R10.5.** Confirmed firm and non-firm Transmission reservations.

**R10.6.** Grandfathered firm and non-firm contracted transmission capacity on an aggregated basis.

**R10.7.** Firm roll-over rights.

**R10.8.** Any firm and non-firm adjustments to reflect parallel path impacts.

**R10.9.** Power flow models and underlying assumptions.

**R10.10.** Contingencies, provided in one or more of the following formats:

- A list of Elements
- A list of Flowgates
- A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider

**R10.11.** Facility Ratings.

**R10.12.** Counterflows.

**R10.13.** Values of ATC, ETC, Capacity Benefit Margin (CBM), Transmission Reliability Margin), and TTC for all Posted Paths.

**R10.14.** Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider when selling Transmission service.

**R10.15.** Source and sink identification and mapping to the model.

## C. Measures

**M1.** The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one or more of the specified ATC methodologies for use in determining Transfer Capabilities of those

Facilities for each Posted Path per timeframe within the Planning Coordinator's planning area. (R1).

**M2.** The Transmission Service Provider shall provide ATC values and identification of the selected ATC methodologies along with other evidence (such as written documentation, processes, or data)to show it calculated ATC for the following using the selected methodology or methodologies chosen as part of R1 (R1):

- There has been at least 168 hours of hourly ATC values calculated at all times.
- There has been at least 31 days of daily ATC values calculated at all times.
- There has been at least 12 months plus the current month of monthly ATC values calculated at all times.

**M3.** The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

**M4.** The Transmission Service Provider shall provide its ATCID and other evidence (such as documentation and data) to show that it determined counterflows based on the rules in R4 and R5. (R4) (R5)

**M5.** The Transmission Service Provider shall provide copies of its dated electronic mail messages used to make notifications in accordance with R6 as evidence that it has notified the entities specified in R5 before a new or revised ATCID was implemented (R6)

**M6.** The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in R6, as required by R7. (R7)

**M7.** The Transmission Service Provider and Transmission Operator shall each provide a copy of the assumptions used to calculate TTC, ATC and AFC as well as copies of operations and planning studies and other evidence (such as written documentation, models, studies, supporting information, or data) to show that the assumptions used in determining TTC, ATC, and AFC were consistent with those used in operations or planning studies for the time period studied. (R8)

**M8.** The Transmission Service Provider shall provide evidence (such as logs or data) that it has updated the hourly, daily, and monthly ATC on at least the minimum frequencies specified in R9.

**M9.** The Transmission Service Provider shall provide a copy of the dated request for ATC data as well as evidence to show the its response to that request (such as logs or data,) to show that within fourteen calendar days of receiving a request, the requested data items specified in R10 were made available in accordance with R10.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

- The Transmission Operator shall maintain its current selected method(s) for calculating ATC and any methods in force since last compliance audit period to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R5 and R8 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.
- The Transmission Service Provider shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain evidence to show compliance with R7 for the most recent three calendar years plus the current year.
- The Transmission Operator shall maintain evidence to show compliance with R8 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain evidence to show compliance with R9 and R10 for the most recent calendar year plus the current year.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | N/A | N/A | N/A | The Transmission Operator did not select one or more of the specified methodologies. |
| R2. | N/A | N/A | N/A | The Transmission Operator or Transmission Provider did not calculate ATCs based on the time periods in R2.<br>**OR**<br>did not use the selected methodology(ies) to calculate ATC. |
| R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made up to three months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than three months but not more than six months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than six months but not more than one year ago.<br>**OR**<br>The Transmission Service Provider has an ATCID, but it does not include two or more of the information items described in R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made a year or more ago.<br>**OR**<br>The Transmission Service Provider does not have an ATCID, or its ATCID does not include any of the information described in R3. |
| R4. | N/A | N/A | N/A | The Transmission Service provider did not use counterflows in the determination of ATC as described in R4 or its ATCID. |
| R5. | N/A | N/A | N/A | The Transmission Service provider did not use counterflows in the determination of ATC as described in R5 or its ATCID. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R6. | The Transmission Service Provider did not notify one or more of the parties specified in R6 of a new or modified ATCID within 14 days of its effectiveness. | The Transmission Service Provider did not notify one or more of the parties specified in R6 of a new or modified ATCID within 30 days of its effectiveness. | The Transmission Service Provider did not notify one or more of the parties specified in R6 of a new or modified ATCID within 60 days of its effectiveness. | The Transmission Service Provider did not notify one or more of the parties specified in R6 of a new or modified ATCID within 90 days of its effectiveness. |
| R7. | N/A | N/A | N/A | The Transmission Service Provider did not make the ATCID available to the parties described in R7 |
| R8. | N/A | N/A | N/A | The Transmission Service Provider or Transmission Operator did not determine ATC using assumptions consistent with those used in planning and operations studies for the studied time period. |
| R9. | For Hourly, not calculated within 5hrs<br>**OR**<br>for Daily not calculated in 2 days,<br>**OR**<br>for Monthly- not calculated in 8 or more days, but less than 14 days | For Hourly, not calculated in more than 5 hours but not more than 10 hours,<br>**OR**<br>for Daily not calculated in 3 days,<br>**OR**<br>for Monthly- not calculated in 14 or more days, but less than 21 days | For Hourly, not calculated in10 hours or more, but not more than 15 hours,<br>**OR**<br>for Daily not calculated in 4 days,<br>**OR**<br>for Monthly- not calculated in 21 or more days, but less than 28 days | For Hourly, not calculated in15 hours or more,<br>**OR**<br>for Daily not calculated in 5 days or more,<br>**OR**<br>for Monthly- not calculated in 28 or more days. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R10 | N/A | The Transmission Service Provider took more than 14 calendar days but less than 28 calendar days from receiving a request, to make available the requested data items specified in R10 to the entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R10. | The Transmission Service Provider took 28 or more calendar days, but less than 60 calendar days from receiving a request, to make available the requested data items specified in R10 to the entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R10. | The Transmission Service Provider took 60 calendar days or more from receiving a request, to make available the requested data items specified in R10 to the entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R10. |

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared several standards related to the process of determining Available Transfer Capability (ATC). These standards are as follows:

- MOD-001-1 — Available Transfer Capability, which requires the selection of an ATC methodology and describes the parts of the ATC process that apply to all entities, regardless of methodology chosen.
- MOD-004-1 — Capacity Benefit Margin, which describes the reliability aspects of determining and maintaining a Capacity Benefit Margin and the conditions under which that margin may be used.
- MOD-008-1 — Transmission Reliability Margin Calculation Methodology, which describes the reliability aspects of determining and maintaining a Transmission Reliability Margin and what components of uncertainty may be considered when making that determination.
- MOD-028-1 — Area Interchange Methodology, which describes the Area Interchange methodology (previously referred to as the Network Response ATC methodology) for determining ATC.
- MOD-029-1 — Rated System Path Methodology, which describes the Rated System Path methodology for determining ATC.
- MOD-030-1 — Flowgate Methodology, which describes the Flowgate methodology (previously referred to as the Flowgate Network Response ATC methodology) for determining ATC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this set of standards can be implemented.

## Modified Standards

FAC-012 ,FAC-013, MOD-002, MOD-003, MOD-005, MOD-006, MOD-007, and MOD-009 should be retired when these standards become effective. These elements are either redundant, being addressed in the other standards, or are being handled by NAESB.

## Compliance with Standards

Once this set of standards becomes effective, the responsible entities identified in the applicability section of each standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-001 | ■ | | ■ | | | |
| MOD-004 | | ■ | ■ | ■ | | ■ |

| | | | | | | |
|---|---|---|---|---|---|---|
| MOD-008 | ■ | ■ | ■ | ■ | ■ | ■ |
| MOD-028 | ■ | | ■ | | | |
| MOD-029 | ■ | | ■ | | | |
| MOD-030 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standards should become effective on the first day of the first calendar quarter that is twelve months beyond the date that all six standards are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standards become effective on the first day of the first calendar quarter that is twelve months beyond the date the standards are approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standards (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Directives in FERC Orders 890 and 693 and Corresponding ATC-Related Standards and Requirements

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| ATC | 890 | 211 | Standard AFC->ATC Calculation | MOD-030 R9 | As TDU Systems note, there is neither a definition of AFC in NERC's Glossary nor an existing reliability standard that discusses the AFC method. In order to achieve consistency in each component of the ATC calculation (discussed below), we direct public utilities, working through NERC, to develop an AFC definition and requirements used to identify a particular set of transmission facilities as a flowgate. However, we remind transmission providers that our regulations require the posting of ATC values associated with a particular path, not AFC values associated with a flowgate. Transmission providers using an AFC methodology must therefore convert flowgate (AFC) values into path (ATC) values for OASIS posting. In order to have consistent posting of the ATC, TTC, CBM, and TRM values on OASIS, we direct public utilities, working through NERC, to develop in the MOD-001 standard a rule to convert AFC into ATC values to be used by transmission providers that currently use the flowgate methodology. |
| ATC | 890 | 212 | Firm ATC uses only Firm Commitments | MOD-028 R9, R11<br>MOD-029 R5, R7<br>MOD-030 R5, R7 | The Commission also believes that further clarification is necessary regarding the calculation algorithms for firm and non-firm ATC.  Currently, NERC has no standards for calculating non-firm ATC. We find that the same potential for discrimination exists for non-firm transmission service as for firm service and that greater uniformity in both firm and non-firm ATC calculations will substantially reduce the remaining potential for undue discrimination. Therefore, we direct public utilities, working through NERC, to modify related ATC standards by implementing the following principles for firm and non-firm ATC calculations: (1) for firm ATC calculations, the transmission provider shall account only for firm commitments; and (2) for non-firm ATC calculations, the transmission provider shall account for both firm and non-firm commitments, postbacks of redirected services, unscheduled service, and counterflows. We understand that these principles are currently followed by most transmission providers and believe they should be clearly set forth in the ATC-related reliability standards. As described below, each transmission provider's Attachment C must include a detailed formula for both firm and non-firm ATC, consistent with the modified ATC-related reliability standards. |
| ATC | 890 | 212 | Non-Firm ATC uses firm and non-firm commitments, postbacks or redirected services, unscheduled service, and counterflows | MOD-028 R10, R12<br>MOD-029 R6, R8<br>MOD-030 R6, R8<br><br>Unscheduled service will be handled as a postback under the NAESB Business Practices. | |
| ATC | 890 | 237 | Develop consistent practices for calculating TTC/TFC | MOD-028 R1, R2, R3, R4, R5<br>MOD-029 R1<br>MOD-030 R2.3, R2.4, R9 | The Commission adopts the NOPR proposal and directs public utilities, working through NERC, to develop consistent practices for calculating TTC/TFC. We direct public utilities, working through NERC, to address, through the reliability standards process, any differences in developing TTC/TFC for transmission provided under the pro forma OATT and for transfer capability for native load and reliability assessment studies. |
| ATC | 890 | 237 | Address differences between Pro-Forma TTC and Native Load/Reliability Assessment TTC | MOD-001 R8<br>MOD-028 R1, R2, R3, R4, R5<br>MOD-029 R1<br>MOD-030 R2.3, R2.4, R9 | |

## Summary of Directives in FERC Orders 890 and 693 and Corresponding ATC-Related Standards and Requirements

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| ATC | 890 | 243 | Standard calc of native load use - include in MOD-001 | MOD-028 R3, R6, R7<br>MOD-029 R5<br>MOD-030 R6.1<br><br>Note this is not contained in MOD-001, as the methodologies each implement this differently for logistical reasons. | To achieve greater consistency in ETC calculations and further reduce the potential for undue discrimination, the Commission adopts the NOPR proposal and directs public utilities, working through NERC and NAESB, to develop a consistent approach for determining the amount of transfer capability a transmission provider may set aside for its native load and other committed uses. We expect that NERC will address ETC through the MOD-001 reliability standard rather than through a separate reliability standard. By using MOD-001, the ETC calculation can be adjusted to be applicable to each of the three ATC methodologies under development by NERC. |
| ATC | 890 | 244 | In the short-term ATC calculation, all reserved but unused transfer capability (non-scheduled) shall be released as non-firm ATC. | Unscheduled service will be handled as a postback under the NAESB Business Practices. | In order to provide specific direction to public utilities and NERC, we determine that ETC should be defined to include committed uses of the transmission system, including (1) native load commitments (including network service), (2) grandfathered transmission rights, (3) appropriate point-to-point reservations, (4) rollover rights associated with long-term firm service, and (5) other uses identified through the NERC process. ETC should not be used to set aside transfer capability for any type of planning or contingency reserve, which are to be addressed through CBM and TRM. In addition, in the short-term ATC calculation, all reserved but unused transfer capability (non-scheduled) shall be released as non-firm ATC. |
| ATC | 890 | 244 | ETC = Native load (including Network) | MOD-028 R11<br>MOD-029 R5<br>MOD-030 R8 | |
| ATC | 890 | 244 | ETC = Grandfathered | MOD-028 R11<br>MOD-029 R5<br>MOD-030 R8 | |
| ATC | 890 | 244 | ETC = Appropriate PTP | MOD-028 R11<br>MOD-029 R5<br>MOD-030 R8 | |
| ATC | 890 | 244 | ETC = Long-term Rollover rights | MOD-028 R11<br>MOD-029 R5<br>MOD-030 R8 | |
| ATC | 890 | 244 | Define any additional ETC components | MOD-028 R11<br>MOD-029 R5<br>MOD-030 R8 | |

## Summary of Directives in FERC Orders 890 and 693 and Corresponding ATC-Related Standards and Requirements

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| ATC | 890 | 245 | Reservations with Same POR whose SUM would exceed gen nameplate must be addressed | Not Addressed. The team does not believe this can be addressed any different that currently handled without compromising reliability. The customer has the right to schedule, and that right must be planned for. | We agree with TDU Systems that inclusion of all requests for transmission service in ETC would likely overstate usage of the system and understate ATC. We therefore find that reservations that have the same point of receipt (POR) (generator) but different point of delivery (POD) (load), for the same time frame, should not be modeled in the ETC calculation simultaneously if their combined reserved transmission capacity exceeds the generator's nameplate capacity at POR. This will prevent overly unrealistic utilization of transmission capacity associated with power output from a generator identified as a POR. We direct public utilities, working through NERC, to develop requirements in MOD-001 that lay out clear instructions on how these reservations should be accounted. One approach that could be used is examining historical patterns of actual reservation use during a particular season, month, or time of day. |
| ATC | 890 | 262 | CBM =0 in Non-Firm Calc | MOD-028 R11<br>MOD-029 R5<br>MOD-030 R8 | Concerning TAPS' proposal to remove the reservation decision from the sole discretion of transmission providers, we determine that LSEs should be permitted to call for use of CBM, if they do so pursuant to conditions established in the reliability standards development process. We direct public utilities working through NERC to modify the CBM-related standards to specify the generation deficiency conditions during which an LSE will be allowed to use the transfer capability reserved as CBM. In addition, we direct that transmission set aside as CBM shall be zero in non-firm ATC calculations. Finally, we order public utilities to work with NAESB to develop an OASIS mechanism that will allow for auditing of CBM usage. |
| ATC | 890 | 273 | TRM <> 0 in Non-Firm Calc | MOD-028 R11<br>MOD-029 R5<br>MOD-030 R8 | The Commission also adopts the NOPR proposal to establish standards specifying the appropriate uses of TRM to guide NERC and NAESB in the drafting process. Transmission providers may set aside TRM for (1) load forecast and load distribution error, (2) variations in facility loadings, (3) uncertainty in transmission system topology, (4) loop flow impact, (5) variations in generation dispatch, (6) automatic sharing of reserves, and (7) other uncertainties as identified through the NERC reliability standards development process. Because load, facility loading and other uncertainties constantly deviate, we will not require that TRM set aside capacity be set at zero in the non-firm ATC calculation. In other words, we will not require transfer capability that is set aside as TRM to be sold on a non-firm basis. We find that clear specification in this Final Rule of the permitted purposes for which entities may reserve CBM and TRM will virtually eliminate double-counting of TRM and CBM. |
| ATC | 890 | 292 | Planning Assumptions and ATC Assumptions should be the same | MOD-001 R8 | The Commission also adopts the NOPR proposal to require transmission providers to use data and modeling assumptions for the short- and long-term ATC calculations that are consistent with that used for the planning of operations and system expansion, respectively, to the maximum extent practicable. This includes, for example: (1) load levels, (2) generation dispatch, (3) transmission and generation facilities maintenance schedules, (4) contingency outages, (5) topology, (6) transmission reservations, (7) assumptions regarding transmission and generation facilities additions and retirements, and (8) counterflows. We find that requiring consistency in the data and modeling assumptions used for ATC |
| ATC | 890 | 292 | Load levels the same plan/ops vs. ATC | MOD-001 R8 | |
| ATC | 890 | 292 | Gen Dispatch the same plan/ops vs. ATC | MOD-001 R8 | |

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| ATC | 890 | 292 | TX and Gen Facilities maintenance the same plan/ops vs. ATC | MOD-001 R8 | calculations will remedy the potential for undue discrimination by eliminating discretion and ensuring comparability in the manner in which a transmission provider operates and plans its system to serve native load and the manner in which it calculates ATC for service to third parties. The Commission directs public utilities, working through NERC, to modify ATC standards to achieve this consistency. |
| ATC | 890 | 292 | Contingency outages the same plan/ops vs. ATC | MOD-001 R8 | |
| ATC | 890 | 292 | Topology the same plan/ops vs. ATC | MOD-001 R8 | |
| ATC | 890 | 292 | TX Reservations the same plan/ops vs. ATC | MOD-001 R8 | |
| ATC | 890 | 292 | Assumptions re: additions and retirements the same plan/ops vs. ATC | MOD-001 R8 | |
| ATC | 890 | 292 | Counterflows the same plan/ops vs. ATC | MOD-001 R8 | |
| ATC | 890 | 293 | Develop an approach for accounting for counterflows, in the relevant ATC standards and business practices. | MOD-001 R4, R5 | With regard to EPSA's request for the standardization of additional data inputs, we believe they are already captured in the Commission's proposal as adopted in this Final Rule. Xcel asks the Commission to require consistency in the determination of counterflows in the calculation of ATC. Counterflows are included in the list of assumptions that public utilities, working through NERC, are required to make consistent. We believe that counterflows, if treated inconsistently, can adversely affect reliability and competition, depending on how they are accounted for. Accordingly, we reiterate that public utilities, working through NERC and NAESB, are directed to develop an approach for accounting for counterflows, in the relevant ATC standards and business practices. We find unnecessary Xcel's request that we require a date certain for specific issues in the Western Interconnection to be addressed. Above we require public utilities, working through NERC, to modify the ATC standards within 270 days after the publication of the Final Rule in the Federal Register. |
| ATC | 890 | 295 | Load level modeling methodology the same | MOD-001 R8, R10<br>MOD-028 R3, R4<br>MOD-029 R5<br>MOD-030 R5.1 | We offer the following clarifications. In response to Southern, we clarify that we require consistent use of assumptions underlying operational planning for short-term ATC and expansion planning for long-term ATC calculation. We also clarify that there must be a consistent basis or approach to determining load levels. For example, one approach may be for transmission providers to calculate load levels using an on- and offpeak model for each month when evaluating yearly service requests and calculating yearly ATC. The same (peak- and off-peak) or alternative approaches may be used for monthly, weekly, daily and hourly ATC calculations. Regardless of the ultimate choice of approach, it is imperative that all transmission providers use the same approach to modeling load levels to enable the meaningful exchange of data among transmission providers. Accordingly, we direct public utilities, working through NERC, to develop consistent requirements for modeling load levels in MOD-001 for the services offered under the pro forma OATT. |

## Summary of Directives in FERC Orders 890 and 693 and Corresponding ATC-Related Standards and Requirements

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| ATC | 890 | 296 | Dispatch should include all DNRs and committed resources as expected to run, and uncommitted resources deliverable within CA, economically dispatched to meet balancing needs | MOD-001 R10<br>MOD-028 R3, R4<br>MOD-029 Not Applicable<br>MOD-030 R6.1 | With respect to modeling of generation dispatch, we direct public utilities, working through NERC, to develop requirements in NERC's MOD-001 reliability standard specifying how transmission providers shall determine which generators should be modeled in service, including guidance on how independent generation should be considered. We agree with Ameren that any modeling of base generation dispatch must model generators, including merchant generators, as they are expected to run. Accordingly, we direct public utilities, working through NERC, to revise reliability standard MOD-001 by specifying that base generation dispatch will model (1) all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run and (2) uncommitted resources that are deliverable within the control area, economically dispatched as necessary to meet balancing requirements. |
| ATC | 890 | 297 | How to model POR to POD without source/sink | MOD-028 R5<br>MOD-029 Not Applicable<br>MOD-030 R4.2 | Regarding transmission reservations modeling, we direct public utilities, working through NERC, to develop requirements in reliability standard MOD-001 that specify (1) a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown and (2) how to model existing reservations. |
| ATC | 890 | 297 | How to model existing reservations | MOD-028 R5.3<br>MOD-029 Not Applicable<br>MOD-030 R4.2 | |
| ATC | 890 | 301 | ATC to be recalculated by all transmission providers on a consistent time interval and in a manner that closely reflects the actual topology of the system, | MOD-001 R2, R9 | The Commission adopts the NOPR proposal and requires the development of reliability standards that ensure ATC is calculated at consistent intervals among transmission providers. The Commission thus directs public utilities, working through NERC and NAESB, to revise reliability standard MOD-001 to require ATC to be recalculated by all transmission providers on a consistent time interval and in a manner that closely reflects the actual topology of the system, e.g., generation and transmission outages, load forecast, interchange schedules, transmission reservations, facility ratings, and other necessary data. This process must also consider whether ATC should be calculated more frequently for constrained facilities. ATC-related requirements for OASIS posting are discussed below. |
| ATC | 890 | 310 | Mandatory Data Exchange for ATC | MOD-001 R10 | The Commission adopts the NOPR proposal and directs public utilities, working through NERC, to revise the related MOD reliability standards to require the exchange of data and coordination among transmission providers and, working through NAESB, to develop complementary business practices. The following data shall, at a minimum, be exchanged among transmission providers for the purposes of ATC modeling: (1) load levels; (2) transmission planned and contingency outages; (3) generation planned and contingency outages; (4) base generation dispatch; (5) existing transmission reservations, including counterflows; (6) ATC recalculation frequency and times; and (7) source/sink modeling identification. The Commission concludes that the exchange of such data is necessary to support the reforms requiring consistency in the determination of ATC adopted in this Final Rule. As explained above, transmission providers are required to coordinate the calculation of TTC/TFC and ATC/AFC with others and this requires a standard means of exchanging data. |
| ATC | 890 | 310 | DEX Load | MOD-001 R10 | |
| ATC | 890 | 310 | DEX TX Plan and Contingency outages | MOD-001 R10 | |
| ATC | 890 | 310 | DEX Gen Plan and Contingency outages | MOD-001 R10 | |
| ATC | 890 | 310 | DEX Base dispatch | MOD-001 R10 | |
| ATC | 890 | 310 | DEX existing reservations incl counterflows | MOD-001 R10 | |
| ATC | 890 | 310 | DEX ATC recalc frequencies and times | MOD-001 R10 | |

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| ATC | 890 | 310 | DEX Source sink modeling identification | MOD-001 R10 | |
| ATC | 890 | 389 | Unscheduled Reservation released on non-firm and posted on OASIS | Unscheduled service will be handled as a postback under the NAESB Business Practices. | We affirm our statement in the NOPR proposal acknowledging that transfer capability associated with transmission reservations that are not scheduled in real time is required to be made available as non-firm, and posted on OASIS. |
| ATC | 693 | 782 | Criteria used to calculate transfer capabilities for use in determining ATC must be identical to those used in planning and operating the system. | MOD-001 R8 | Although we are not proposing to approve or remand this proposed Reliability Standard, the Commission believes that it can be improved. The Commission believes that the process used to determine transfer capabilities should be transparent to the stakeholders, and agrees with International Transmission and MidAmerican that the results of those calculations should not be available for public disclosure but only for qualified entities on a confidential basis. In addition, the process and criteria used to determine transfer capabilities must be consistent with the process and criteria used for other users of the Bulk-Power System. Simply stated, the criteria used to calculate transfer capabilities for use in determining ATC must be identical to those used in planning and operating the system. The Commission directs the ERO to take this into account in its Reliability Standards development process, and to modify the Reliability Standard consistent with Order No. 890 in Docket No. RM05-25-000. |
| ATC | 693 | 1050 | TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. | Not addressed. The team believes that structuring TTC to be within each of the three methodologies is more appropriate. | We adopt the NOPR proposal and require that TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. The FAC series of standards contain the Reliability Standards that form the technical and procedural basis for calculating transfer capabilities. FAC-008-1 provides the basis for determining the thermal ratings of facilities while FAC-009-1 provides the basis for communicating those ratings. FAC-010-1 and FAC-011-1 provide the system operating limits methodologies for the planning and operational horizon respectively and FAC-014 provides for the communication of those ratings. |
| ATC | 693 | 1051 | Modify FAC-012-1 and any other appropriate Reliability Standards to assure consistency in the determination of TTC/TFC for services provided under the pro forma OATT | Not addressed. The team believes that structuring TTC to be within each of the three methodologies is more appropriate. | The Commission directs the ERO, through the Reliability Standards development process, to modify FAC-012-1 and any other appropriate Reliability Standards to assure consistency in the determination of TTC/TFC for services provided under the pro forma OATT, and requires that those processes be the same as those used in operation and planning for native load and reliability assessment studies. Changes to the process of calculating TTC are appropriate if implementation is coordinated with revisions to the other applicable operating or planning standards. We acknowledge that reliability regions have historically calculated transfer capability using different approaches, and we agree that regional differences should be respected. However, as already discussed above regarding ATC, TTC requirements will be determined in the ERO Reliability Standards development process, and any request for a regional difference from the Reliability Standards must take place through the ERO process. |
| ATC | 693 | 1057 | Develop non-fill-in-the-blank Standard | We have attempted to do this. | Accordingly, the Commission neither accepts nor remands MOD-001-0 until the ERO submits additional information. Although the Commission does not propose any action with |

# Summary of Directives in FERC Orders 890 and 693 and Corresponding ATC-Related Standards and Requirements

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| ATC | 693 | 1057 | Define information to be shared between TSPs for ATC calculations | MOD-001 R10 | regard to MOD-001-0, we address above a number of concerns regarding the Reliability Standard, consistent with those set forth in Order No. 890. We direct the ERO to develop modifications to the Reliability Standard through the Reliability Standards development process that: (1) provide a framework for ATC, TTC and ETC calculation, developing industry-wide consistency of all ATC components; (2) require disclosure of algorithms, for both firm and non-firm ATC and processes used in the ATC calculation; (3) identify a detailed list of information to be exchanged among transmission providers for the purposes of ATC modeling; (4) include a requirement that the assumptions used in ATC and AFC calculations should be consistent with those used for planning the expansion or operation of the Bulk-Power System to the maximum extent practicable; (5) include a requirement that ATC be updated by all transmission providers on a consistent time interval; (6) include a requirement that applicable entities make available assumptions and contingencies underlying ATC and TTC calculations; (7) address only ATC/AFC while TTC/TFC should be addressed under transfer capability standards such as FAC-012-1 and (8) identify the applicable entities in terms of users, owners and operators of the Bulk-Power System. |
| ATC | 693 | 1057 | Planning Assumptions and ATC Assumptions should be the same | MOD-001 R8 | |
| ATC | 693 | 1057 | ATC should be updated on a consistent schedule | MOD-001 R9 | |
| ATC | 693 | 1057 | ATC/TTC Assumptions and Contingencies must be made available | MOD-001 R3, R10 | |
| ATC | 693 | 1057 | Put TTC in FAC section | Not addressed. The team believes that structuring TTC to be within each of the three methodologies is more appropriate. | |
| ATC | 693 | 1057 | Identify applicable entities | We have done so. | |
| ATC | 693 | 1105 | CBM must be 0 in non-firm ATC | MOD-028 R12<br>MOD-029 R8<br>MOD-030 R8 | The Commission approves MOD-006-0 as mandatory and enforceable. In addition, the Commission directs the ERO to develop a modification to Reliability Standard MOD-006-0 through the Reliability Standards development process that: (1) includes a provision that will ensure that CBM and TRM are not used for the same purpose; (2) provides that CBM should be used for emergency generation deficiencies; (3) modifies Requirement R1.2 to define “generation deficiency” based on a specific energy emergency alert level; (4) includes a provision that CBM should have a zero value in the calculation of non-firm ATC and (5) expands the applicability section to include the entities that actually use CBM, such as LSEs. |
| CBM | 890 | 257 | Develop clear standards for how the CBM value shall be determined, allocated across transmission paths, and used. | MOD-004 R1, R3, R4, R9, R10 | The Commission therefore adopts a combination of the NOPR options one and two, and declines to adopt option three. First, we require public utilities, working through NERC and NAESB, to develop clear standards for how the CBM value shall be determined, allocated across transmission paths, and used. We understand that NERC has already begun the process of modifying several of the CBM-related reliability standards and that the drafting process is a joint project with NAESB. |
| CBM | 890 | 259 | CBM shall only used to allow LSE to meet its generation reliability criteria | MOD-004 R8 | To ensure CBM is used for its intended purpose, CBM shall only be used to allow an LSE to meet its generation reliability criteria. Consistent with Duke's statement, we clarify that each LSE within a transmission provider's control area has the right to request the transmission provider to set aside transfer capability as CBM for the LSE to meet its historical, state, RTO, or regional generation reliability criteria requirement such as reserve margin, loss of load probability (LOLP), the loss of largest units, etc. |

# Summary of Directives in FERC Orders 890 and 693 and Corresponding ATC-Related Standards and Requirements

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| CBM | 890 | 260 | Define flowgate/path allocation process for CBM | MOD-004 R4.1 | We direct public utilities, working through NERC, to develop clear requirements for allocating CBM over transmission paths and flowgates. While we do not mandate a particular methodology for allocating CBM to paths and flowgates, one approach could be based on the location of the outside resources or spot market hubs that an LSE has historically relied on during emergencies resulting from an energy deficiency. |
| CBM | 890 | 262 | CBM Must be used only for generation deficiencies | MOD-004 R8, R10 | Concerning TAPS' proposal to remove the reservation decision from the sole discretion of transmission providers, we determine that LSEs should be permitted to call for use of CBM, if they do so pursuant to conditions established in the reliability standards development process. We direct public utilities working through NERC to modify the CBM-related standards to specify the generation deficiency conditions during which an LSE will be allowed to use the transfer capability reserved as CBM. In addition, we direct that transmission set aside as CBM shall be zero in non-firm ATC calculations. Finally, we order public utilities to work with NAESB to develop an OASIS mechanism that will allow for auditing of CBM usage. |
| CBM | 890 | 354 | Commission requires transmission providers to make any transfer capability set aside for CBM but unused for such purpose available on a non-firm basis and to post this availability on OASIS. | MOD-028 R12<br>MOD-029 R8<br>MOD-030 R8 | The Commission adopts the CBM posting requirements proposed in the NOPR. In doing so, we amend our OASIS regulations to incorporate the directives established in the CBM Order. Accordingly, we require transmission providers to post (and update) the CBM amount for each path. In addition, the Commission requires transmission providers to make any transfer capability set aside for CBM but unused for such purpose available on a non-firm basis and to post this availability on OASIS. Furthermore, the Commission requires transmission providers to post (and update) the TRM values for the paths on which the transmission provider already posts ATC, TTC, and CBM. |
| CBM | 890 | 358 | yearly CBM studies | MOD-004 R3.1, R3.2, R4, R5 | The Commission incorporates into its regulations the requirement in the CBM Order for a transmission provider to periodically reevaluate its transfer capability setaside for CBM. With respect to TAPS' concerns over the effort involved in the reevaluation process, we will require CBM studies to be performed at least every year. This requirement is consistent with the CBM Order, in which the Commission stated that the level of ATC set aside for CBM should be reevaluated periodically to take into account more certain information (such as assumptions that may not have, in fact, materialized). While changes requiring a reevaluation of CBM are longer-term in nature (e.g., installation of a new generator or a long-term outage), quarterly may be too frequent, though two years may be too long and may prevent a portion of the CBM setaside from being released as ATC. Moreover, annual reevaluation is consistent with the current NERC standard being developed in MOD-005. The requirement to evaluate CBM at least every year also is consistent with the CBM Order in that the Commission directed transmission providers to periodically reevaluate their generation reliability needs so as to make known the need for CBM and to post on OASIS their practices in this regard. |

## Summary of Directives in FERC Orders 890 and 693 and Corresponding ATC-Related Standards and Requirements

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| CBM | 693 | 1081 | What to do if CBM exceeds ATC? | MOD-004 R4.2 | We agree with TAPS that there is a need for clearer requirements in the standard regarding to whom and how to submit a request for CBM set-aside, and what the transmission service provider should do if the sum of all CBM requirements exceeds the amount of available transfer capability. We direct the ERO to address the reliability aspects in the Reliability Standards development process and explore with NAESB whether business practices would be required. |
| CBM | 693 | 1082 | CBM set aside at verified request of LSE | MOD-004 R3, R4, R5 | Accordingly, the Commission neither accepts nor remands MOD-004-0 until the ERO submits additional information. In the interim, compliance with MOD-004-0 should continue on a voluntary basis, and the Commission considers compliance with the Reliability Standard to be a matter of good utility practice. Although the Commission did not propose any action with regard to MOD-004-0, it addressed above a number of concerns regarding the Reliability Standard, consistent with those set forth in Order No. 890. Therefore, we direct the ERO to develop modifications to the Reliability Standard through the Reliability Standards development process to: (1) clarify that CBM shall be set aside upon request of any LSE within a balancing area to meet its verifiable historical, state, RTO or regional generation reliability criteria; (2) develop requirements regarding transparency of the generation planning studies used to determine CBM value; (3) modify the current Requirements to make clear the process for how CBM is allocated across transmission paths or flowgates; (3) modify its standard in order to prevent setting aside CBM and TRM for the same purposes; (4) modify the standard by adding LSE as an applicable entity and (5) coordinate with NAESB business practice standards. |
| CBM | 693 | 1082 | Require disclosure of CBM studies | MOD-004 R3.1.2, R3.1.3, R3.1.4, R7 | |
| CBM | 693 | 1082 | Define flowgate/path allocation process for CBM | MOD-001 R4.1 | |
| CBM | 693 | 1082 | No double counting | MOD-008 R2 | |
| CBM | 693 | 1082 | Add LSE, BA as applicable entity where necessary | MOD-004 R3, R8, R9 | |
| CBM | 693 | 1105 | CBM Must be used only for generation deficiencies | MOD-004 R8 | The Commission approves MOD-006-0 as mandatory and enforceable. In addition, the Commission directs the ERO to develop a modification to Reliability Standard MOD-006-0 through the Reliability Standards development process that: (1) includes a provision that will ensure that CBM and TRM are not used for the same purpose; (2) provides that CBM should be used for emergency generation deficiencies; (3) modifies Requirement R1.2 to define "generation deficiency" based on a specific energy emergency alert level; (4) includes a provision that CBM should have a zero value in the calculation of non-firm ATC and (5) expands the applicability section to include the entities that actually use CBM, such as LSEs. |
| CBM | 693 | 1105 | Generation Deficiency must be stated as an EEA level | MOD-004 R8 | |
| TRM | 890 | 273 | Explicit definition of what goes into TRM | MOD-008 R1 | The Commission also adopts the NOPR proposal to establish standards specifying the appropriate uses of TRM to guide NERC and NAESB in the drafting process. Transmission providers may set aside TRM for (1) load forecast and load distribution error, (2) variations in facility loadings, (3) uncertainty in transmission system topology, (4) loop flow impact, (5) variations in generation dispatch, (6) automatic sharing of reserves, and (7) other uncertainties as identified through the NERC reliability standards development process. Because load, facility loading and other uncertainties constantly deviate, we will not require that TRM set aside capacity be set at zero in the non-firm ATC calculation. In other words, we will not require transfer capability that is set aside as TRM to be sold on a non-firm basis. We find that clear specification in this Final Rule of the permitted purposes for which entities may reserve CBM and TRM will virtually eliminate double-counting of TRM and CBM. |
| TRM | 890 | 273 | TRM = Load Forecast and Load Distribution Error | MOD-008 R1 | |
| TRM | 890 | 273 | TRM = Variation in facility loading | MOD-008 R1 | |
| TRM | 890 | 273 | TRM = uncertainty in tx topology | MOD-008 R1 | |
| TRM | 890 | 273 | TRM = loop flow | MOD-008 R1 | |
| TRM | 890 | 273 | TRM = variations in dispatch | MOD-008 R1 | |

## Summary of Directives in FERC Orders 890 and 693 and Corresponding ATC-Related Standards and Requirements

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| TRM | 890 | 273 | TRM = ARS | MOD-008 R1 | |
| TRM | 890 | 273 | Define any additional uses | MOD-008 R1 | |
| TRM | 890 | 273 | No double counting | MOD-008 R2 | |
| TRM | 890 | 275 | Max TRM Calc | Not addressed. We have not been able to identify any maximum calculation that stands out as a leading example to be made into a standard. TRM is a risk management tool, and its calculation may be legitimately different for various systems, regions, and companies. | In addition, we direct public utilities, working through NERC, to establish an appropriate maximum TRM. One acceptable method may be to use a percentage of ratings reduction, i.e., model the system assuming all facility ratings are reduced by a specific percentage. This is a relatively simple method and, if adopted as the reliability standard's method, should not restrict a transmission provider from using a more sophisticated method that may allow for greater ATC without reducing overall reliability. |
| TRM | 693 | 1082 | No double counting | MOD-008 R2 | Accordingly, the Commission neither accepts nor remands MOD-004-0 until the ERO submits additional information. In the interim, compliance with MOD-004-0 should continue on a voluntary basis, and the Commission considers compliance with the Reliability Standard to be a matter of good utility practice. Although the Commission did not propose any action with regard to MOD-004-0, it addressed above a number of concerns regarding the Reliability Standard, consistent with those set forth in Order No. 890. Therefore, we direct the ERO to develop modifications to the Reliability Standard through the Reliability Standards development process to: (1) clarify that CBM shall be set aside upon request of any LSE within a balancing area to meet its verifiable historical, state, RTO or regional generation reliability criteria; (2) develop requirements regarding transparency of the generation planning studies used to determine CBM value; (3) modify the current Requirements to make clear the process for how CBM is allocated across transmission paths or flowgates; (3) modify its standard in order to prevent setting aside CBM and TRM for the same purposes; (4) modify the standard by adding LSE as an applicable entity and (5) coordinate with NAESB business practice standards. |
| TRM | 693 | 1122 | Define flowgate/path allocation process for TRM | MOD-008 R1.3 | Consistent with the NOPR proposal and Order No. 890, the Commission directs the ERO to modify standard MOD-008-0 to clarify how TRM should be calculated and allocated across paths or flowgates. We understand that the standards drafting process is underway as a joint project with NAESB. We agree with International Transmission, MidAmerican and MISO about the need for more uniformity and transparency in TRM calculation methodology and use, in order to eliminate potential reliability and discrimination concerns. Consistent with Order No. 890, the Commission directs the ERO to specify the parameters for entities to use in determining uncertainties for which TRM can be set aside and used, such as: (1) load forecast and load distribution error; (2) variations in facility loadings; (3) uncertainty in transmission system topology; (4) loop flow impact; (5) variations in generation dispatch; (6) automatic reserve sharing and (7) other uncertainties as identified through the NERC Reliability Standards development process. We find that clear specification in this Final Rule |
| TRM | 693 | 1122 | TRM = Load Forecast and Load Distribution Error | MOD-008 R1 | |
| TRM | 693 | 1122 | TRM = Variation in facility loading | MOD-008 R1 | |
| TRM | 693 | 1122 | TRM = uncertainty in transmission topology | MOD-008 R1 | |
| TRM | 693 | 1122 | TRM = loop flow | MOD-008 R1 | |

| Topic | Order | Cite | Brief Description | Addressed By | Detailed Citation |
|---|---|---|---|---|---|
| TRM | 693 | 1122 | TRM = variations in dispatch | MOD-008 R1 | of the permitted purposes for which entities may reserve CBM and TRM will also virtually eliminate double-counting of TRM and CBM. Therefore, we direct the ERO to determine clear requirements regarding permitted uses for TRM through its Reliability Standards development process. |
| TRM | 693 | 1122 | TRM = ARS | MOD-008 R1 | |
| TRM | 693 | 1122 | Define any additional uses | MOD-008 R1 | |
| TRM | 693 | 1126 | Explicit definition of what goes into TRM | MOD-008 R1 | The Commission neither accepts nor remands MOD-008-0 until the ERO submits additional information. In the interim, compliance with MOD-008-0 should continue on a voluntary basis, and the Commission considers compliance with the Reliability Standard to be a matter of good utility practice. Although the Commission did not propose any action with regard to MOD-008-0, it addressed above a number of concerns regarding the Reliability Standard, consistent with those proposed in Order No. 890. Accordingly, we direct the ERO to develop modifications to the Reliability Standard through the Reliability Standards development process including: (1) clear requirements on how TRM should be calculated, including a methodology for determining the maximum TRM value, and allocated across paths; (2) clear requirements for permitted purposes for which TRM can be set aside and used; (3) clear requirements for availability of documentation that supports TRM determination and (4) expanding the applicability to add planning authorities and reliability coordinators and any other appropriate entity identified in the Reliability Standards development process. |
| TRM | 693 | 1126 | Max TRM Calc | Not addressed. We have not been able to identify any maximum calculation that stands out as a leading example to be made into a standard. TRM is a risk management tool, and its calculation may be legitimately different for various systems, regions, and companies. | |
| TRM | 693 | 1126 | Standard on How TRM to be calculated | Not addressed. We have not been able to identify any single methodology that stands out as a leading example to be made into a standard. TRM is a risk management tool, and its calculation may be legitimately different for various systems, regions, and companies. | |
| TRM | 693 | 1126 | Add PC, RE to applicable entities | Not addressed. We do not find that these entities need to be added to the TRM standard. | |

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

## Announcement: Comment Period Opens

**The Standards Committee (SC) announces the following standards action:**

### Draft Standards for Available Transfer Capability (Project 2006-07) Posted for 45-day Comment Period October 31–December 14, 2007

The ATC Standard Drafting Team has posted a revised set of standards related to the determination of Available Transfer Capability (ATC) and an associated implementation plan for a 45-day comment period. This set of standards is aimed at ensuring the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). The standards have been revised based on stakeholder comments, coordination with NAESB, and the directives in the FERC Orders 693 and 890. The six standards posted for review include:

- MOD-001 — Available Transfer Capability — An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.
- MOD-004 — Capacity Benefit Margin — A standard that describes the requesting, calculation, and use of CBM.
- MOD-008 — Transmission Reliability Margin — A standard that describes the calculation and use of TRM.
- MOD-028 — Area Interchange Methodology (formerly called the Network Response ATC Methodology) — A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.
- MOD-029 — Rated System Path Methodology — A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection
- MOD-030 — Flowgate Methodology (formerly called the Network Response Flowgate Methodology) — A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC

Because the modifications made to the standards are so extensive, no “redline” versions of the standards have been developed. Many of the changes made to the standards added details to comply with the directives in FERC Orders 693 and 890. To assist in reviewing the standards, the drafting team has assembled a table that includes the relevant FERC directives and identifies the standard and requirement that addresses that directive. Please use the comment form to provide comments on this set of standards and the associated implementation plan.

**Standards Development Process**

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

### Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

# Arrangement of Requirements within the Proposed Set of 'ATC' Standards

## MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability**
**(ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin**
**(CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin**
**(TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

## Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
  - TFC
  - AFC (firm and non-firm)
  - ETC (firm and non-firm)
  - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☐ No

If "Yes," please identify your concerns. Comments:

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☐ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
  - TFC
  - AFC (firm and non-firm)
  - ETC (firm and non-firm)
  - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☒ No

If "Yes," please identify your concerns. Comments:

We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition: We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments:

1) We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

2) In reference to MOD-030-1/R10, the requirement should be altered as follows: "The Transmission Service Provider shall [insert] provide a tool to [end insert] convert Flowgate AFCs to ATCs (and TFCs to TTCs) for Posted Paths. . . ." BPA calculates flowgate AFC's for its network and provides a tool for AFC-to-ATC conversion (in BPA's case, Power Utilization Factor Calculators). We believe at this time that this is sufficient for transmission customer needs and that the posting of ATCs, as opposed to AFCs, would result in less transparency due to the sheer number of combinations that could be required to be posted.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

> **MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.
>
> **MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.
>
> **MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.
>
> **MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.
>
> **MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.
>
> **MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information ‘publicly available’ – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability**
**(ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin**
**(CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin**
**(TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☐ No

If "Yes," please identify your concerns. Comments:

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☐ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments:

MOD-001-1

R1

1.Is it correct that R1 assumes that all the Transmission Operators within the Tariff footprint of a Transmission Providers shall agree upon the applicable ATC Methodology for the Tariff footprint and the TSP shall base the ATC Calculations and the ATCID document on the selected ATC methodology or methodologies. Meaning R1 and R2 are related.

2.Is it correct R1 assumes that a TSP can only have one methodology for the time frame specified in R2.1. Same for R2.2 and R2.3. They can be different for R2.1 and R2.2 or R2.3.

3.The MOD-001-1 responsibilities of Transmission Operator are not fully clear. Is MOD-001-1 assuming that a Transmission Operator can calculate ATC based on his selected ATC Methodology for his Operator Area independent from TSP for purpose of evaluating some of his internal Service Requests and that TSP can have a different Methodology for the Tariff footprint that includes Operator Area of TOP. Meaning no relation between R1 and R2, TOP and TSP can have different methodologies for ATC Calculations.

R8

1.Is MOD -001-1 assuming that somehow the Transmission Operator is calculating TTC, AFC or ATC or any other data that will be used for purpose of evaluating Service Requests.

2. What is the list of assumptions that are referred to in R8.

R10.13

1.If a TSP uses flow gate Methodology (MOD-030-1) what ETC need to be posted, the ETC on flow gate basis as specified in R7 MOD-030-1 or a ETC on path basis converted from ETC flow gate basis to ETC path basis using conversion specified in R9 MOD-030-1.

2.Is it a correct assumption that ATC, ETC and TTC posted for a path can be values from 3 different constraints, so the numbers itself don't add up. Is this in line with what FERC had in mind when requesting posting of TTC, ATC and ETC.

3.There are "rumors" that Scenario Analyzer is not considered being compliant by FERC with R10.3 standards . Are you aware of any additional NERC or NAESB requirements that describe what is considered being compliant with R10.13, posting ATC, ETC, TTC. Not the "what" requirement but the "how" requirement.

M2

1.Do we need to be compliant with the requirements of MOD-030 (selected ATC Methodology) or are we audit against the description of ATCID Document

M7

1. Same question as listed under R8.

.

MOD-004-1

R5

1.We think this should be a TSP responsibility and not a TP responsibility. What is reason this was assigned to Transmission Planner.

MOD-008-1

R1 and R2

1.What is the reasoning behind making TSP responsible for the ATCID Document and CBMID document and making TOP responsible for TRMID Document. We think TRMID should be a TSP responsibility also.

MOD-030-1

R2

1.What is the reasoning behind making TOP solely responsible to identify flow gates. We think both TSP and TOP are responsible, TOP for his Operating Area and TSP for the Tariff footprint and neighboring footprints.

R3

1.What is the reasoning behind making TOP responsible to maintain a transmission model to determine AFC. We think TSP should be responsible, to model the Tariff footprint and neighboring footprints as complete as possible.

R4.2

1.What is the reasoning behind requirement of higher granularity for AFC Calculations. (using Source and not POR). We think it should be allowed to calculate impacts on POR / POD basis (grouping of commonly dispatched resources within BA Area) and not with higher granularity. (Source) It is not required to schedule the Confirmed Reservation with same granularity.

2.What is meant with "interface points with adjacent TSP". The 1tier BA Area of TSP?

R5.2

1.What is definition of external (third party) flow gate. Is it something like: third party flow gate is flow gate for which the limiting equipment of the monitored element is not in one of the TOP Areas of the Tariff footprint of the TSP.

2.What if RC footprint doesn't match the Tariff footprint. Are we required to use AFC overwrite from some one else if it is our RC flow gate however not our Tariff flow gate.

R6.2

1.What is the definition of "expected to be scheduled". Does this mean TSP can use judgement ?

2.What is the definition of "Included in de model ", probably refers to included in calculations referred to in R6.1.1 – R6.1.4

R9

1.MOD-001-1 requires posting of ETC. If a TSP uses Flowgate Methodology does he need to convert ETC (flow gate based) to ETC (path based) using same formula as R9. Or does he need to post ETC flow gate based, result of R7 and R8 requirements of MOD-030-1.

M2

1. See R2 question..

M7

1. See R3 question.

M10

1. What about using outages for Monthly time frame? We only use outages if they last more than 15 days in that Month.

Please use this form to submit comments on the proposed set of ATC standards (MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, and MOD-030). Comments must be submitted by **December 14, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the abbreviation "ATC Standards" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability**
**(ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin**
**(CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin**
**(TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
  - TFC
  - AFC (firm and non-firm)
  - ETC (firm and non-firm)
  - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☐ No

If “Yes,” please identify your concerns. Comments:

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☐ No

If “Yes,” please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: The AESO currently does not use OASIS for transmission services but is sharing information with the British Columbia Transmission Corporation for posting transmission services on the only one shared tie line. To meet some of the requirements in these standards that require the entity to post transmission information (such as ATCID) on OASIS, would it be acceptable for such entity to post the information on its website instead? Could this provision be added to the requirements?

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
  - TFC
  - AFC (firm and non-firm)
  - ETC (firm and non-firm)
  - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☒ Yes

☐ No

If "Yes," please identify your concerns. Comments: Avista strongly supports the inclusion of a 12-month implementation period for these standards. A 12-month implementation period is particularly important for MOD-29. MOD-29, as drafted, will require that numerous paths not previously exposed to the high rigors of the MOD-29 TTC determination process will have to be examined. Avista anticipates that it will elect the Rated System Path Methodology for certain Posted Paths on Avista's system. Avista will, at a minimum, require a 12-month implementation period to assure proper review of the Posted Paths under the methodology. It will be difficult, if not impossible, to fully implement MOD-29 in the absence of the recommended 12-month implementation period.

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition: In MOD-001, "Posted Path" is included as a defined term. "Posted path" is also defined in 18 CFR § 37.6 (b)(1)(i). Using a term that is already defined in the CFR may create confusion. Accordingly, Avista suggests that throughout the MOD standards, NERC replace the term "Posted Path" with a different defined term, such as "paths required to be posted", "paths requiring posting" or "paths for which ATC is calculated."

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☐ No

If "Yes," please explain why and provide supporting information.

Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: MOD-001-1, A., 3. the stated purpose contains goals that are not required for reliable system operation, but rather are for viable commercial activity. Reliable system operations are impacted by incorrect TTC values and uncoordinated transaction scheduling activities.

MOD-001-1, A., 4. Applicability, Transmission Service Providers calculate ATC. Transmission Operators (in the near term) and Transmission Planners (in the longer term) calculate TTC.

MOD-001-1, B., R1, Transmission Operators calculate transfer capability (TTC) of facilities within their TO areas. Transmission Planners calculate transfer capability (TTC) of facilities within their TP areas. Transmission Service Providers calculate ATC for those paths that they are required to, choose to, or are asked to post.

MOD-001-1, B., R3 Transmission Service Providers are already required by FERC to file and post Attachment C - Methodology To Assess Available Transfer Capability. This requirement to create a separate document creates an undue burden on the industry - transmission customers will have two different documents to review, and transmission service providers will have two different documents to maintain.

MOD-001-1, B., R3.3 the term “Facility” should say "Posted Path" (but see the comment above regarding definition of "Posted Path"). The term facility in the NERC glossary says facility is “A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.).”

MOD-001-1, B., R3.6 “Allocation methodologies” – it is not clear to what this means? Perhaps the following: "For paths where multiple Transmission Service Providers share capacity or have rights, describe how the capacity is allocated among providers," or words to that effect.

MOD-001-1, B., R4 is not needed, it is already covered in R3.2.

MOD-001-1, B., R5 is not needed, it is already covered in R3.2.

MOD-001-1, B., R6 is not necessary. Revisions to Attachment C are to be filed and posted.

MOD-001-1, B., R7 Attachment C is already required to be posted (available) for any entity to review, subject to CEII concerns.

MOD-001-1, B., R9 is not a reliability concern. In addition, it is unduly burdensome. Current and accurate ATCs are a commercial concern. In addition, performing 168 hourly calculations every hour when neither TTC nor ETC has changed, benefits no one and is costly. The commercial requirement should be to require the recalculation of hourly ATC once a day and whenever either TTC or ETC changes for any period of time between this hour and the next 168 hours.

MOD-001-1, B., R10, this requirement for data sharing between reliability entities is a good concept. However, as currently worded, all the burden to supply data is incorrectly placed totally upon the TSP and not on the Transmission Operator or Transmission Planner. Much of the data listed is critical for proper TTC calculation which the TSP may not have access to. The TSP calculates ATC based on upon TTC supplied by the Transmission Operator and/or Transmission Planner. This requirement does not specify how the request is made or how the response or provision of data is dated. The corresponding measurement, M9, implies that all data items requested will be supplied within 14 days, but requirement states that the TSP will begin to make available at the 14 day mark. In addition, change first sentence words "…days of a request of any Transmission…" to "…days of a request made by any Transmission…" to read more in-line with the intent.

MOD-004-1, A., Capacity Benefit Margin is a use of the transmission system that is requested by a load serving entity. This standard contains requirements for the interactions between the LSE and the transmission provider. These requirements are largely commercial in nature and should be under NAESB development. Reliability standards concerning CBM should only require LSEs to acquire minimum CBM to ensure service to load.

MOD-004-1, B., R1 transmission service providers are already required by FERC to file and post Attachment C - Methodology To Assess Available Transfer Capability – which includes discussion of the provider's CBM methodology. This requirement to create a separate document creates an undue burden on the industry. In addition, transmission customers will have two different documents to review and providers would have to maintain two different documents.

MOD-004-1, B., R2 is not necessary. Revisions to Attachment C are to be filed and posted (available) for any entity to review, subject to CEII concerns.

MOD-004-1, B., combine R3.3 language into R3.1.

MOD-004-1, B., R3.2 it seems more reasonable for the requirement to read "LSE shall review any active CBM requests at least every six months and submit updates as required."

MOD-004-1, B., R8, R9, R10, M11, M12, M13 use of the terms "tag" or "Interchange Transaction Tag" which is inconsistent with NERC INT and NAESB CI BP standards where specific reference to "tag" or "e-Tag" has purposefully been avoided in those standards. The term Request For Interchange (RFI) refers to a collection of data as defined in the NAESB RFI Datasheet, to be submitted to the Interchange Authority for the purpose of implementing bilateral Interchange between a Source and Sink BA. Or the term Arranged Interchange refers to The state where the Interchange Authority has received the Interchange information (initial or revised) and has distributed that information for reliablity assessment. I believe that in these requirements, Arranged Interchange is the more appropriate langauge.

MOD-008-1, B., R1 transmission service providers are already required by FERC to file and post Attachment C - Methodology To Assess Available Transfer Capability – which includes discussion of the provider's TRM methodology. This requirement to create a separate document creates an undue burden on the industry. In addition, transmission customers will have two different documents to review and TSPs two different documents to maintain.

MOD-008-1, B., R1.1 suggest modifying to read: "For each path or flowgate that ATC or AFC is calculated, describe how each of the following components of uncertainty are used in calculating TRM for each of the ATC time horizons (if not applicable, indicate as such):" The words "ATC time horizons" could be used to eliminate the need for R1.4.

MOD-008-1, B., R1.1 suggest adding another item to the list. Variability and uncertainty in determining Transmission losses across Posted Paths.

MOD-029-1, B., R1 (modeling requirements) should include the statement that the data listed below should relfect the expected conditions for the applicable time period.

MOD-029-1, B., 1.6 Suggests this bullet be deleted. This is already addressed in R2 wherein the modeling process is dictated. In the RSP methodology, "peak load forecasts" are not used to stress the system; rather, load and generation are simulated to stress the system to its greatest capacity. There are cases when the highest forecasted load may not stress the system to its greatest utilization – which is the goal of the R2 under the RSP.

MOD-029-1 B., R5 definition of GF - The language describing Grandfathered capacity includes the defined terms "Firm" and "Transmission Service." Use of these words as defined terms is inconsistent throughout the proposed standards. They should either be changed here to a lower case or all applicable areas in each proposed standard should be changed to the defined term.

MOD-029-1 in R6, is the "non-firm capacity reserved for NITS" the same as Secondary Network Service (i.e., NN-6)?

MOD-029-1 in R7 & R8, what are "Postbacks"? This term is not used in the west. The term Postback should not be used in the RSP methodology.

MOD-029-1 in R5, R6, R7, & R8, calculation of ETC and ATC are commercial concerns and should be addressed in business practice standards NAESB and enforced through FERC's adoption of those business practice standards into the CFR.

MOD-029-1 in R8 ETC (Firm) definition, it uses the word "non-firm" and it should state "firm". We are assuming this is a typo.

MOD-029-1 in R8 the requirement says we are to use the same formula for all horizons – this is incorrect. For the real-time, same-day time frame, we release all unscheduled capacity as non-firm ATC. As such, the formula would read:

ATCNF = TTC – Scheduled ETCF – Scheduled ETCNF – CBMS – TRMU + Counter-schedulesF + Counter-schedulesNF

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

# Arrangement of Requirements within the Proposed Set of 'ATC' Standards

## MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

## Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

   ☐ Yes

   ☒ No

   If "Yes," please identify your concerns. Comments:

   Arizona Public Service Co. strongly supports the inclusion of a 12 month implementation period for these standards.

2. If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

   Incorrect Definition: Arizona Public Service Co. agrees with the WECC's Comment that the NERC ATC Drafting team should clarify the meaning of the term counterflows.

   In addition the NERC ATC Drafting team should clarify what is meant by the term post back.

3. If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

   Incorrect Requirement: • Arizona Public Service Co. is in agreement with the WestConnect Comments and in general agreement with the WECC Comments.

4. The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

   Incorrect Measure or Compliance Element:
   Arizona Public Service Co. is in agreement with the WestConnect Comments and in general agreement with the WECC Comments.

   In addition the Arizona Public Service Co. adds the following comment.

   MOD-001
   The use of Counter Schedules to create firm ATC is of concern to APS. This practice could result in unreliable conditions to the interconnection if the counter flows do not occur. Due to the reliability concerns there should be a requirement for the Transmission Provider to provide documentation of actions that it will take if the Counter Flows do not occur.

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: Arizona Public Service Co. is in agreement with the WestConnect Comments and in general agreement with the WECC Comments.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability**
**(ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin**
**(CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin**
**(TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

   ☐ Yes

   ☒ No

   If "Yes," please identify your concerns. Comments:

2. If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

   Incorrect Definition:

3. If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

   Incorrect Requirement: MOD-004-1

- R4.2. This is a fundamental mathematical analytical dichotomy. The CBM component is based on probabilistic LOLE/LOLP style analyses that look at aggregate probability loss. The reserve sharing component of TRM is deterministic. It is imprudent to combine these as they are not derived from the same methodology except in the rare case where the generation is sufficiently constrained that the only resulting generation left after CBM event is the reserve sharing generation.

- R4.2.2. Since AFC is determined from CBM, CBM for each Flowgate should not be dependent on AFC. CBM can be big enough to drive AFC to zero or negative. This simply means that resource adequacy criteria can't be met, and no capacity will be available on that Flowgate (which is what the original wording of this requirement was trying to do anyway). Therefore CBM should not be set to AFC, it should be left at whatever value was calculated. This concept applies to R4.2.1 and R5.2 as well.

  R4.3 and R5.3 Not necessary. Refer to R4.2.2 for explanation.

4. The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

   Incorrect Measure or Compliance Element: MOD-004-1
   M8. "CBM has been used to determine a margin" should be reworded. CBM is a margin. Suggest eliminating "to determine a margin".

   D.1.3. R1 refers to CBMID not ATCID.

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: MOD-004-1

6. Effective Date: "all six standards are approved" MOD-001-1 lists the six standards, should list here as well.

R4.1.2.2. "each impacts" => "each impact"

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability**
**(ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin**
**(CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin**
**(TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

☐ Yes

☒ No

If "Yes," please identify your concerns. Comments:

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: MOD-001-1 – Available Transfer Capability

R1: Potential source of problems – the Transmission Operator (American Transmission Co.) selects an ATC methodology that the Transmission Service Provider (Midwest Independent System Operator) must use for calculations even if it is not equipped to use the methodology chosen. May want to add language that urges agreement between TO and TSP.

MOD-004-1 – Capacity Benefit Margin

R2: Typo in line two, "CBID" should be "CBMID"

R4.1.2.2: Should be rewritten. Suggestion: "Impacts with a Distribution Factor of 3% or greater relative to OTDF Flowgates and 5% or greater relative to PTDF Flowgates will be classified as significant."

R4.2: CBM should not be based on the sum of all requests – we don't need to plan for a simultaneous capacity emergency in every area impacted by a Flowgate. Rather, CBM should be based on the maximum of all requests. By reserving the maximum CBM of all requests, a single capacity emergency in any one area impacted by the Flowgate will be covered.

R4.2.2: Setting CBM to the lesser of the GCIR impacts or the firm AFC for a Flowgate is not correct, because setting CBM based on AFC or ATC is an invalid circular argument. Consider the following simple example:

The definition of AFC:TFC – EFC – CBM –TRM + Postbacks + Counterflows = AFC

So, if the rating on a Flowgate is 100 MW (TTC = 100),

there are no existing transmission commitments (ETC = 0),

the calculated GCIR impacts is 25 MW (CBM = 25),

and for the sake of this example there is no Transmission Reliability Margin (TRM = 0),

and no Postbacks or Counterflows.

Our AFC:

$$100 - 0 - 25 - 0 + 0 + 0 = 75$$

Now assume that firm sales account for 75 MW of flow across the Flowgate, so ETC = 75.

New AFC:

$$100 - 75 - 25 - 0 + 0 + 0 = 0$$

So in this case, we've got an AFC of zero, which is less than the calculated GCIR, so we would set CBM to zero even though we previously set aside 25MW for CBM that is being unused!

CBM should be set to the calculated maximum GCIR value for the impacted LSE's. As CBM fluctuates up and down year-by-year the AFC will be affected and may sometimes go negative, but this is a necessary by-product of selling transmission service (ETC) far into the future.

R4.3: CBM should not be reduced based on insufficient capacity. If AFC/ATC happens to be negative when a request to use CBM is issued, the CBM transactions should be granted and then all transactions across the constrained element, including the CBM transactions, should be curtailed on a pro-rata basis, which will result in load shedding procedures for the capacity deficient entity. This is the next step in an Energy Emergency Alert. CBM is the last attempt in EEA2 to prevent EEA3 and firm load curtailment.

R5.2: Change sum to maximum, see note for R4.2.

MOD-008-1 – Transmission Reliability Margin

R1.5: Typo in line one, change "all" to "any."

R4: Shouldn't the Transmission Operator also have the right to request this information? This requirement only allows other TSP's to receive the TRM calculation info.

MOD-030-1 – Flowgate Methodology

R2.1: Typo in line one, change "used" to "use."

R3: Change "Transmission Operator" to "Transmission Service Provider" because MOD-001 requires the TSP to calculate ATC/AFC values.\

R8: Typo in counterflows section, change "ATC" to "AFC"

R9: Typo, "ATCNF" should be "AFCNF"

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability**
**(ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin**
**(CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin**
**(TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.
- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.
- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.
- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.
- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.
- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004
- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004
- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☒ No

If "Yes," please identify your concerns. Comments: This allotted time is sufficient and if shortened, would be a burden, especially for those entities electing to use the Rated System Path methodology that will require a much more rigorous TTC determination process than has historically been used.

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

- Incorrect Definition:
- a. A definition for counterflow should be provided and used consistently in MOD-028, -029, and -030. A suggested definition follows: "Counterflow: the impact of schedules, reservations, or actual flows of energy in the direction opposite to the constraint."
- b. MOD-004 – In Order 890, FERC limited the use of CBM to meet generation reliability criteria – please clarify what is meant by "reserve adequacy requirements"

c. MOD-029 – The definition of Rated System Path Methodology incorrectly refers to ATC as "Available Transmission Capability" – this should be corrected to "Available Transfer Capability"

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

- Incorrect Requirement:
- a. MOD-001
- i. R1 and R2 – "time periods" should be replaced with "time horizons"
- ii. R3.2 – "counter-schedules" should be deleted and "counterflows" should be capitalized with the definition supplied above [Counterflow: the impact of schedules, reservations, or actual energy flows in the direction opposite to the constraint
- iii. R3.3 – BPA suggests removal of this requirement, as it would require extensive modification to existing databases without serving a great need.
- iv. R4 and R5 – should be cut from MOD-001 and placed in MOD-028, -029, and -030

- v. R10 – The wording is confusing and should be modified to the following: "…current versions of the following data, limited to that data requested, in electronic format…"
- vi. R10.2 – "Peak" should be deleted, as non-peak load forecasts may be used in ATC calculations
- vii. R10.3 – BPA requests that the term "Block dispatch" be defined
- viii. R10.4 – Should be modified to the following, to be less vague and more consistent with the pro-forma OATT: "Aggregated capacity encumbered for Network Integration Transmission Service and Secondary Service"
- ix. R10.6 – Should be modified to the following, to allow for the inclusion of Grandfathered service or other statutory obligations that have not been contracted for: "Aggregated capacity encumbered for Grandfathered obligations"
- x. R10.13 – It appears as though the following is missing from the last right parenthesis: "(TRM"
- b. MOD-004
- i. R1 – Should have a fourth sub-requirement added to explain that if there is insufficient capacity available to satisfy all requests for CBM, the Transmission Service Provider shall explain in its CBMID how allocation of CBM will occur
- ii. R2 – Should be modified to the following: "…CBMID to the Transmission Operator, adjacent Transmission Service Provider…"
- iii. R8 – Should be modified to the following: "…set aside as CBM unless affected by a declared NERC Energy Emergency Alert (EEA) 2 or higher"
- c. MOD-029
- i. R1.4 – "Non-regulating" should not be capitalized
- ii. R1.6 – "peak" should be deleted, as non-peak load forecasts may be used in TTC calculations
- iii. R1.12 – "ACTID" should be changed to "ATCID"
- iv. R2.2 – There appears to be a potential discrepancy between this requirement and other reliability requirements for establishing System Operating Limits.
- v. R2.3 – "R1.2.1" should be changed to "R2.1"
- vi. R5 – "reserved" should be changed to "encumbered" in the description of NL, GF, and OS, as these obligations may not have been reserved via an OASIS transaction – Additionally, the "Firm Transmission Service" in the description of GF should not be capitalized
- vii. R6 – "reserved" should be changed to "encumbered" in the description of GF and OS, as these obligations may not have been reserved via an OASIS transaction –

Additionally, the "Transmission Service" in the description of GF should not be capitalized

- viii.R7 and R8 – "Counter-schedules" should be changed to "Counterflows" with the definition supplied above [Counterflow: the impact of schedules, reservations, or actual flows of energy in the direction opposite to the constraint]

- ix. R8 – "non-" should be deleted from the description of ETC

- d. MOD-030

- i. R2.1 – Delete "for" after "Flowgates"

- ii. R2.1.1 – BPA suggests the following clarification to this requirement, to avoid posting unnecessary data: "Any Facility within the Transmission Operator's area based on thermal, stability or voltage limits is a Flowgate if such limits reduce transfer capability on a Posted Path

- iii. MOD-001 allows an entity to select multiple methodologies to determine ATC. For example, an entity may elect to use Flowgates inside their affected area whereas they may also elect to use the Rated System Path Methodology at the interface of their affected area. Under this scenario, the applicable entity need not study Flowgates beyond the intercepting cut plane of its interface as the ATC at the interface falls not under MOD-030, but MOD-029. To prevent unneeded seams issues, the following rewrites are suggested:

- 1. R2.1.2 – All first Contingency transfer analyses from all adjacent Balancing Authority source sink combinations such that at a minimum the first three limiting Elements/Contingency combinations within the Transmission Operator's system are included as Flowgates, unless the interface between such adjacent Balancing Authorities is accounted for using the Rated System Path Methodology

- 2. If adopted, similar language should be applied to R3.5, R3.6, R5.1, R6.1, R6.3, R6.4, R7.2, and R7.4

- iv. R4 – "Use" should not be capitalized – Additionally, two sub-requirements should be added to allow for the modeling of impacts of Network Integration Transmission Service and Grandfathered service in the base AFC calculations.

- v. R6.1 – "Firm Network" should be changed to "Network Integration Transmission Service" to be consistent with how this service is identified in the OATT

- vi. R6.1.1.1, R6.1.2.1, R6.1.3.1, and R6.1.4.1 – "Peak" should be deleted, as non-peak load forecasts may be used in ETC calculations – Additionally R6.1.3.1 is incorrectly identified as "R6.1.3.1.1"

- vii. R6.3 – The last sentence should be a separate requirement, similar to R7.3 – this would result in the final sentence of R6.3 becoming R6.4 and the current R6.4 becoming R6.5. The new R6.4 and R6.5 should also be modified to the following to accommodate Grandfathered service or other statutory obligations for which a contract does not exist or scheduling requirements are not in place: "The impact of any firm Grandfathered obligations expected to be utilized…"

- viii.R7.3, and R7.4 – Each should have the word "contracts" replaced with "obligations" to accommodate GF service that does not hold a contract.

  ix. R7 – A sub-requirement should be added to allow for the inclusion of the impacts of Network Integration Transmission Service and Secondary Service

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:
a. MOD-01
i. M9 – There is an unnecessary word "the" following the word "show" in the second line of the measure. Additionally, the timeline(s) for responding to a request for data in R10 and M9 should be made consistent with one another – is it a requirement to respond to the request for data w/in 14 days or to begin to respond?
ii. VSL for R4 – The word "Firm" should be inserted before the word ATC as R4 only refers to Firm ATC.
iii. VSL for R5 – The word "Non-Firm" should be inserted before the word ATC as R5 only refers to Non-Firm ATC.
b. MOD-04
i. M1 – Suggested rewording: "Each Transmission Service Provider shall produce its CBMID evidencing inclusion of all specified information in R1." This approach should also be taken at M1 for MOD-08.
ii. M5 – line 3 states "…they it has based its CBM…" Please change to "…that it has based its CBM…"
iii. VSL for R2 – The acronym "CBID" should be changed to "CBMID."
iv. VSL for R10 – The VSL is unclear. The Team suggests it be rewritten to state, "The Transmission Service Provider failed to approve an Interchange Transaction Tag for CBM submitted by an Energy Deficient Entity under an EEA2 when CBM was available."
v. D1.3 Data Retention – For clarity, the phrase "three calendar years" in the second through fifth bullets should be changed to "most recent three calendar years plus the current year."
c. MOD-08
i. M5 – M5 is missing he right parenthesis after the word "data" on the first line.
ii. VSL for R1 – In the Moderate Level column, change the phase "changes been" to "changes that have been".
d. MOD-29
i. M1 – M1 inaccurately calls for production of "models" used to derive TTC. As there are multiple conditions under MOD-29, R2 where a model does not dictate the predicate for TTC, M1 should be reworded to state "…shall produce the models, contracts, nomograms, reports or study results…" – this corresponding to:
1. Models in R2.1, R2.2. and R2.5
2. Contracts in R.2.3 and R2.6
3. Nomograms in R2.4
4. Reports or studies in R2.7 and R2.8
ii. M1.3 – The Team suggests correcting M1.3 from "…as stated in R1.1 through R.12…" to "…as stated in R1.1 through R1.12…"
iii. M4 – If "M1" above is adopted, M4 is duplicative of M1 and should be deleted.
iv. VSL for R4 – An SOL does not exist for every Posted Path. This VSL should be amended by changing the words "the SOL" in the High and Severe columns to read "any

SOL". This makes the wording of the Requirement consistent with the wording of the Measure.

v. VSL R5, R6, R7, R8 – These VSLs call for only a "severe" determination. They also mandate that the TSP "use" all the elements defined. However, the TSP will not "use" all the defined elements if they are not applicable. Thus, if a TSP does not "use" all elements defined because all the elements were not applicable – the TSP is in violation for not including null elements in its calculation. The Team suggests these be rewritten to state: "The Transmission Service Provider did not use all affected elements as defined in…." This approach should help clarify that "zero" as an integer is an acceptable entry and that only those variables "affected" need be reported or acted upon.

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.

Comments: This response, however, is based on the understanding that BPA's statutory requirements to serve the load of other federal entities (i.e. the Corp of Engineers and the Bureau of Reclamation) are sufficiently accommodated within the GF or OS components of the ETC calculation in MOD-029 and the GF component of the ETC calculations in MOD-030. If these variables were not intended to accommodate non-contracted statutory obligations of this nature, please modify the ETC calculations to accommodate these obligations (see suggested modifications provided in earlier comments).

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments:

a. GENERAL

i.BPA supports retention of the three methods recognizing the differences between the Rated System Path (MOD-029), Flowgate Methodology (MOD-030) and the Area Interchange Methodology (MOD-028).

ii.BPA supports the retention of the proposed one-year implementation period.

iii.BPA supports allowing NAESB to address all "posting" issues as they directly affect OASIS.

b. MOD-001

i.BPA supports allowing the use of more than one methodology for calculation of ATC by any one entity. For example, the Team supports allowing any entity to use the Flowgate methodology inside their affected area while also using the Rated System Path methodology at its boundaries.

ii.BPA supports allowing each entity to specify in its ATCID how it will treat counterflows.

iii.BPA supports the aggregation of transmission capacity for grandfathered contracts when shared with neighboring requestors.

iv.BPA supports the specifically limited universe of entities to which data sharing is required as prescribed in R10.

c. MOD-008

i. R2 – Add the following language to strengthen the distinction between TRM and CBM: "Transmission capacity required for the period immediately following a contingency and before the market can respond (up to 59 minutes following the contingency) are included in TRM"

d. MOD-029

i. BPA strongly supports retention of the requirement(s) in R2.2 that accommodate paths which are "flow limited" by allowing the rating in the flow limited direction to be equal to the rating in the reliability limited direction. This accommodates existing and functional practices without re-inventing the wheel where no such effort is required to meet FERC's goals of transparency and consistency.

ii. BPA strongly supports retention of the requirement(s) in R2.5 verifying that a given Posted Path does not adversely impact the TTC value of any existing path.

iii. BPA strongly supports retention of the requirement(s) in R2.7 allowing the retention of existing and operationally proven TTCs without requiring a superfluous and redundant re-rating.

iv. BPA strongly supports retention of the requirement(s) in R2.6 allowing for allocation of TTC via contract. This avoids the needless renegotiation of contracts and potentially their associated operational agreements while supporting FERC's mandate of transparency and consistency via MOD-01, R.3.6 wherein disclosure of allocation methodologies is required.

v. BPA strongly supports the adoption of the proposed Counterflow definition as its adoption clarifies the application of Counterflows in each equation.

e. MOD-030

i. R10 – It is assumed this requirement has been included to promote transparency, but will in fact have the opposite effect due to a flood of posted data being required that is not used to process requests, and therefore is not used by market participants, and should be modified to the following: "The Transmission Service Provider shall provide a tool to convert…"

BPA has heard from a number of its Customers and other impacted parties that the posting of ATC, rather than AFC, will not promote transparency in the Northwest market or across BPA's system. BPA provides several tools on its website and OASIS site to facilitate interested parties' access to AFC-to-ATC conversions. These tools are easy to use and since a smaller quantity of data is posted to our OASIS site (i.e. 10 AFCs as opposed to several thousand ATCs), our OASIS system is more responsive and therefore, also easier to use.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☒ Yes

☒ No

If "Yes," please identify your concerns. Comments: We have two concerns, discussed in our comments below, that if not addressed may be problematic for a 12 month implementation, as BCTC may have difficulty in achieving compliance with any of the three ATC methodologies within 12 months. Our first concern is discussed in our comment 6.3 below regarding MOD-028-1, R7. MOD-028-1 will not be an option for BCTC if we cannot continue to use interpolation between representative TTCs (that we calculate according to the process described in R7). It will take BCTC longer than 12 months, if it is even practical, to develop the systems to calculate TTC with the same level of accuracy as we do today without interpolation, given the complexity of our system, the range of variable, limitations, and contingencies we consider to determine TTCs. Our second concern is discussed in our comment 6.5 with respect to MOD-029-1 M-1. We believe that this requirement is redundant to M4. However, if it is retained as a specific requirement to produce models, BCTC will have a problem because it appears to retroactively require that models be produced for TTC calculations that were done in the past, and such models are no longer archived. BCTC does not use flowbased methods, so MOD-030-1 is not applicable to us. For these reasons, for BCTC to be compliant within 12 months, it is important to us that the concerns described above and discussed further in our comments 6.3 and 6.5 be accommodated within the standards.

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

1. MOD-001-1, R3.3 - The word "Facility" should be replaced with "Posted Path".

2. MOD-029-1, R1.6 - We suggest that the word "peak" be removed. Often maximum TTC occur at off-peak conditions when load near to the generation is lower.

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect,

please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

1. MOD-029-1, M4 and Compliance, 1.3 Data Retention, 4th bullet - The reference to R2.7 should be R2.6 (i.e. should be R2.1 through R2.6). There are no models, reports, or study results required by R2.7. Therefore, there is no point in having a Measure and a Compliance Process looking to see if models, reports, or study results have been produced and retained.

2. MOD-029-1, M7 - Should the reference be to R7 and R8? R6 does not require the use of TTC.

3. MOD-029-1, M7 - The reference to R.1.2 is not clear. Should this reference be to R2?

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments:

1. MOD-028-1, R3.1 - We believe we understand the meaning of intra-day but are unfamiliar with the term intra-peak. Does this mean hourly peak?

2. MOD-028-1, R3.1, R3.2, R4.1, R4.2 - The parenthetical "(at a minimum)" is subject to interpretation. Does it mean that this is the minimum list of parameters to model or does it mean that these are the most conservative values allowed? If additional parameters or some other values are used, the references need to be specified somewhere. For example, if Peak Load is not used (because a higher TTC can be made available in shoulder hours), the ATCID needs a section describing what load to use. We suggest that "(at a minimum)" be replaced with "(or other values and additional parameters as specified in the ATCID)".

3. MOD-028-1, R7 - The process for calculating TTC should also the Transmission Operator to calculate TTC by interpolating between TTC values that have been calculated according to the process outlined. In complex systems with many assumptions in variables (e.g. load forecast, ambient temperature, generation dispatch), many possible limitations (e.g. thermal, transient stability, voltage stability, minimum voltage), and many single and multiple contingencies to run, it becomes impractical to calculate TTCs as described in R7. BCTC currently runs up to N-3 contingencies. BCTC, as well as an adjacent Transmission Operator, calculate TTCs using the process described in R7 for representative conditions, which on there own can require thousands of studies. TTCs for other conditions are then found by interpolation between the representative cases. Any margin we need to allow for "interpolation error" is much less that the margin we would need to allow if we generalize generation dispatch, ignore transient stability, or

omit multiple contingency studies. Under no conditions do we extrapolate outside of the conditions bracketed by the studies. We propose an item f be added as follows:

f. When two or more transfer capabilities have been established according to the above procedure which bracket the requirements described above, the TTC can be determined by interpolation between these established transfer capabilities.

4. MOD-029-1, R4 - The double use of TTC is potentially confusing. At a minimum we suggest rephrasing R4 to be "at the lesser of the TTC calculated in R1".

5. MOD-029-1, M1 - This measure is redundant. M4 requires that the TO produce the models, reports, or study results that it used to establish TTC. Since M4 already addresses models, M1 is redundant.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information ‘publicly available’ – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☒ No

If "Yes," please identify your concerns. Comments:

We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition: We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments:

1) We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

2) In reference to MOD-030-1/R10, the requirement should be altered as follows: "The Transmission Service Provider shall [insert] provide a tool to [end insert] convert Flowgate AFCs to ATCs (and TFCs to TTCs) for Posted Paths. . . ." BPA calculates flowgate AFC's for its network and provides a tool for AFC-to-ATC conversion (in BPA's case, Power Utilization Factor Calculators). We believe at this time that this is sufficient for transmission customer needs and that the posting of ATCs, as opposed to AFCs, would result in less transparency due to the sheer number of combinations that could be required to be posted.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability**
**(ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin**
**(CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin**
**(TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☐ No

If "Yes," please identify your concerns. Comments: [Intentionally left blank.]

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition: [Intentionally left blank.]

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement: [Intentionally left blank.]

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element: [Intentionally left blank.]

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☐ No

If "Yes," please explain why and provide supporting information.
Comments: [Intentionally left blank.]

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: Please see the comments below.

GENERAL COMMENTS:

a) ColumbiaGrid, a non profit corporation formed to promote the efficient operation, planning and use of the Northwest transmission grid, is generally supportive of the ATC Reliability Standards comments prepared by WECC. ColumbiaGrid believes that it is important to recognize and address the distinctive characteristics of the Western interconnected transmission grid. It should be noted that ColumbiaGrid has not attempted to address or comment on questions one through five, which address the specific language of the individual standards. ColumbiaGrid submits these general comments on its own behalf, not on behalf of its members or other participating parties, each of whom may submit general or specific comments on its individual behalf.

b) ColumbiaGrid supports the inclusion and need for all three ATC methodologies, recognizing the differences between the Rated System Path (MOD-029), Flowgate Methodology (MOD-030) and the Area Interchange Methodology (MOD-028). ColumbiaGrid believes that retention of all three ATC methodologies is necessary to ensure that differences in structure and operation of regional and individual transmission systems are accurately and efficiently accommodated.

c) MOD-029 – ColumbiaGrid supports the need for this methodology, which is commonly utilized in the Western region.

d) MOD 030 - R10:

R10 states that the TSP shall convert Flowgate AFCs to ATCs for Posted Paths. Posted Paths is defined in MOD 1 as:

1. Any Balancing Authority to Balancing Authority interconnection;

2. Any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 month;

3. Any path for which a Transmission Customer requests to have Available Transfer Capability or Total Transfer Capability posted.

ColumbiaGrid is concerned that posted paths, as used in R10, could mean that AFCs must be converted to ATCs for any constrained POR/POD combination. ColumbiaGrid understands that this requirement has been included to promote transparency, but it may in fact have the opposite effect due to a flood of posted ATCs that are not used to process requests and of little value to transmission customers. BPA has provided a better alternative than converting AFCs to ATCs on constrained POR/POD combinations. BPA posts AFCs on internal flowgates and provides a tool for its customers to calculate the flow imposed on the flowgate relative to the POR/POD. ColumbiaGrid understands that BPA has heard from a number of its Customers and other impacted parties that the posting of ATC, rather than AFC, will not promote transparency in the Northwest market or across BPA’s system. Further, ColumbiaGrid understands that BPA provides several tools on its website and OASIS site to facilitate interested parties’ access to AFC-to-ATC conversions. These tools are easy to use and since a smaller quantity of data is posted to BPA’s OASIS site (e.g. approximately 10 AFCs as opposed to potentially several thousand ATCs), BPA’s OASIS system will likely be more responsive and therefore, also easier to use. ColumbiaGrid believes that this method eliminates burdensome postings of multiple POR/POD ATCs.

ColumbiaGrid proposes that R10 be modified as follows: “The Transmission Service Provider shall provide a tool to convert AFCs to ATCs for posted paths…”

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability**
**(ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin**
**(CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin**
**(TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☒ No

If "Yes," please identify your concerns. Comments:

We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition: We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments:

1) We support the comments of the WECC MIC MIS ATC Drafting Team in regard to this question.

2) In reference to MOD-030-1/R10, the requirement should be altered as follows: "The Transmission Service Provider shall [insert] provide a tool to [end insert] convert Flowgate AFCs to ATCs (and TFCs to TTCs) for Posted Paths. . . ." BPA calculates flowgate AFC's for its network and provides a tool for AFC-to-ATC conversion (in BPA's case, Power Utilization Factor Calculators). We believe at this time that this is sufficient for transmission customer needs and that the posting of ATCs, as opposed to AFCs, would result in less transparency due to the sheer number of combinations that could be required to be posted.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
  - TFC
  - AFC (firm and non-firm)
  - ETC (firm and non-firm)
  - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☒ Yes

☐ No

If "Yes," please identify your concerns. Comments: Increased recalculation frequencies will require implementation of new methods and tools. Suggest effective date of 18 months after applicable regulatory approvals.

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

- MOD-001-1, R5.2 should say "approved Interchange Transaction Tags" instead of "schedules".

- MOD-001-1, R9 should say "recalculate" rather than "update".

- MOD-001-1, R10 should allow 30 days instead of 14 days to make data available after a request, since setting up the required data exchange protocols will be time-consuming.

MOD-004-1, R3.1.1.2 should be revised to require a monthly GCIR value for each month during the current year and the following two years for each Balancing Authority or Posted Path.

MOD-004-1, R3.2 should be revised as follows: Pursuant to the frequency established in the Transmission Service Provider's CBMID, update the request provided per 3.1 to reflect any changes that alter future needs for CBM or indicate that no change is needed.

- MOD-004-1 Requirements:
- R3.2 At least every thirty-one days, update the request provided per R3.1 to reflect any changes that alter future needs for CBM or indicate that no change is needed.
- M4. The Load-Serving Entity that wants CBM shall provide dated copies of its updated CBM requests as evidence that it has updated its CBM request or confirmed no update was needed at least every thirty-one days, per R3.2 (R3).

- VSLs tied to this measure increase in severity due to change in GCIR. (e.g., Moderate VSL is tied to failure to update and Generation Capability Import Requirement had changed by more than 20MW or 10%, whichever is smaller, and not more than 30MW or 20%, whichever is smaller. Severe VSL is tied to failure to update and Generation Capability Import Requirement had changed by more than 40MW or 30%, whichever is smaller.)
- Duke Comments:
- 1. There is no basis in Order 890 for this requirement of updating every 31 days. This creates an unnecessary administrative burden on the Transmission Provider, the Transmission Planner, and the Load-Serving Entities.
- 2. The VSLs are too severe; If an LSE's GCIR is 5 MW when the initial request was submitted and it later rose to 7 MW (40% change), the LSE would be subject to penalty based on SEVERE VSL. Severity should reflect magnitudes of MW values that have a meaningful impact on reliability, not arbitrarily defined calculations.
- 3. The requirements and measure should be changed so that it more accurately reflects the VSLs and should require updating the CBM request if GCIR changes by more than xx MW.
- 4. The only required timing update should be annual updates in order to provide requirements for the new 10th year.
- MOD-004-1 Requirements:
- R3. A Load-Serving Entity (or group of Load-Serving Entities with an aggregated need for CBM) that wants Transfer Capability to be set aside in the form of CBM shall:
- R6. Within five days of the determination of CBM as described in R4 or R5, the Transmission Service Provider shall provide each Load-Serving Entity (or group of Load-Serving Entities with an aggregated need for CBM) that requested CBM and the Balancing Authority hosting its (their) load with a report that includes: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]
- R6.1. The total amount of CBM for each Posted Path or Flowgate on the Transmission Service Provider's system in each of the months or years specified in the original request. If less than the sum of all requests was established as the CBM for any period:
- - For each Posted Path or Flowgate, a list of the values of each GCIR used to set the CBM for each of the months and years specified in the original request
- - The option to request a system impact study.
- Duke Comments:
- 1. How shall penalties be assessed for a group of Load-Serving Entities? Is each LSE subject to the full penalty or is the penalty allocated to each LSE in the group? If allocated, how is that done? Are there NERC rules to addres this situation?
- 2. We forsee difficulties in groups of LSEs making a request for a system impact study and think this option should be removed. CBM is a margin and not a tranmission service

as defined by FERC, so there is no clearly defined mechanism for charging customers for such upgrades. The introduction of this option creates significant controversy which may delay approval of the standard.

- Typo in R2 – Replace CBID with CBMID

- R2. The Transmission Service Provider shall make available the CBMID and any changes to the CBMID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator within seven days of a change.

- MOD-004-1 Requirements: Evaluation deadlines do not consider other received requests

- R4. Within fourteen calendar days of receiving a request or change to a request for CBM that meets the requirements defined in R3.1, the Transmission Service Provider shall set the CBM for the months requested…

- R5. Within sixty calendar days of receiving a request or change to a request for CBM that meets the requirements defined in R3.1, the Transmission Planner shall set the CBM for the years requested…

- R4 High VSL: The Transmission Service Provider set CBM for the months requested as described in R3.1.1.2 more than 14, but not more than 30, days after receiving a request for CBM.

- R4 Severe VSL: The Transmission Service Provider set CBM for the months requested as described in R3.1.1.2 more than 30 days after receiving a request for CBM.

- R5 High VSL: The Transmission Planner set CBM for the years requested as described in R3.1.1.3 more than 60, but not more than 120, days after receiving a request for CBM.

- R5 Severe VSL: The Transmission Planner set CBM for the years requested as described in R3.1.1.3 more than 120 days after receiving a request for CBM.

- Duke Comments:

- CBM requests should be evaluated in queue order along with other Firm service requests and all rules that apply to evaluation timing of firm service request should apply to CBM requests. Monthly CBM requests should be have the same timing requirements as Monthly Firm Point-to-Point requests and Yearly CBM requests should have the same timing requirements as Yearly Firm Point-to-Point requests. Delays in processing CBM requests may legitimately be due to the need to fully process earlier queued requests but the NERC process does not make provisions for such delays. NAESB should revise these rules. Transmission Providers should not be subject to penalties for failure to evaluate on time by both NERC and NAESB rules.

- Modifying CBM after evaluations have been completed is not aligned with current request evaluation process and may cause billing issues

- MOD-004-1 Requirements:

- R4.3. If the sum of all CBM requests can not be met simultaneously, and during the evaluation of monthly ATC or AFC, additional capacity becomes available, increase the CBM based on availability up to a maximum of the sum of all CBM requests.

- R5.3. If the sum of all requests can not be met simultaneously, and during the planning process, additional capacity becomes available, increase the CBM based on availability up to a maximum of the sum of all requests.

- R4 High VSL: The Transmission Service Provider did not follow the process described in R4.1, R4.2, and R4.3.

- R4 Severe VSL: The Transmission Service Provider did not follow the process described in R4.1, R4.2, and R4.3, and the resource adequacy requirements of one or more Load Serving Entities requesting CBM were not met.

- R5 High VSL: The Transmission Planner did not follow the process described in R5.1, R5.2, R5.3, and R5.4.

- R5 Severe VSL: The Transmission Planner did not follow the process described in R5.1, R5.2, R5.3, and R5.4, and the resource adequacy requirements of one or more Load Serving Entities requesting CBM were not met.

- Duke Comments:

- 1. The current request evaluation process concludes with granting of capacity. If additional capacity becomes available, all parties with an interest in that capacity are permitted to request it and it is made available in queue order under established rules. These rules circumvent the current evaluation process and grant higher priority to unfulfilled CBM requests.

- 2. Once an LSE has been denied CBM, the LSE should make other arrangements to meet needs. For example, the LSE could request CBM on a different Posted Path. If other arrangements are made, the LSE no longer needs CBM on the requested path, even if capacity becomes available at a later time.

- 3. If these rules were applied and CBM changed after a rate filings had been submitted by the Transmission Provider (as required in FERC Order 890 paragraphs 257 & 258), the Transmission Provider's filing will be inaccurate.

  4. Duke recommends removing these requirements. If additonal ATC becomes available, LSEs should submit revised requests for CBM capacity.

  - MOD-008-1, Requirements R3 and R4 should allow the Transmission Operator and Transmission Service Provider 14 days instead of 7 days to make the information available after a request, since the responsible individual could be on vacation. The 7 day requirement could be especially burdensome on small entities.

  - MOD-028-1, This proposed change, and the corresponding change proposed below for MOD-030-1 (new R3.2) should both be made for consistency. The technical reason for the change is as follows: Each of the two methods needs to use a model large enough in scope to correctly evaluate TTC. The wording regarding equivalent representation of areas also needs to be refined. The base model that is used is already an equivalent model and the standard is allowing for further reduction of the model at greater distances from the region under study. The wording implies that the base model cannot have any reduction for the RC area under study – it should allow for some reduction in the RC area under study and further reduction for the adjacent RC areas and complete elimination for 2nd tier RC areas. To make this proposed change, delete R2.2 and reword R2.1 as follows: Modeling data and topology of its Reliability Coordinator's area of responsibility and immediately adjacent synchronously connected Reliability Coordination areas.

- MOD-028-1, R3.1 Delete the word "intra-peak"

- MOD-028-1, Add new R6.3 to read as follows: Upon the occurrence of a significant contingency such as the loss of 500 MW generation at any location, or loss of any transformer with low side rated greater than 200 kV, or loss of any other transmission facility rated 500 kV or above.

- MOD-030-1, Delete R3.2, R3.3, R3.4, R3.5 and R3.6 and add new R3.2 to read as follows: Contains modeling data and topology of its Reliability Coordinator's area of responsibility and immediately adjacent synchronously connected Reliability Coordination areas.

- MOD-030-1, Add new R3.3 as follows: Updated as defined below, unless otherwise requested by the Transmission Service Provider: R3.3.1 Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30. R3.3.2 Updated at least once per month for AFC calculations for months two through 13. R3.3.3 Updated upon the occurrence of a significant contingency such as the loss of 500MW generation at any location, or loss of any transformer with low side rated greater than 200 kV, or loss of any other transmission facility rated 500 kV or above.

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:
- MOD-001-1, M8 should say "recalculated" rather than "updated".
- MOD-001-1, VSLs for R10 should increase based upon increasing the time allowed to 30 days for making data available under R10 (see comment 3 above). Suggest Moderate VSL of 30 - 45 days, High VSL of 47 - 75 days, and Severe VSL of more than 75 days.
-

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☒ Yes

☐ No

If "Yes," please explain why and provide supporting information.
Comments: As proposed, MOD-004-1 would require monthly updates of CBM requests, and monthly reallocation of CBM upon changes that affect the amount of CBM available. Paragraphs 257 and 258 from FERC Order No. 890 require that CBM set-aside be

reflected in rates for point-to-point transmission service, such that point-to-point customers do not subsidize CBM for other customers. CBM values will have to be "locked down" to develop and make the rate filing, which FERC may take 60 days to approve. This defines a timing issue which suggests that CBM updates be made significantly less frequently than monthly, perhaps annually. Also, R6.1 includes a provision to request a system impact/facilities study, which suggests customers could pay for upgrades to create CBM. However CBM is a margin and not a tranmission service as defined by FERC, so there is no clearly defined mechanism for charging customers for such upgrades. Detailed observations and comments on MOD-004-1 are as follows:
Observations:

1. CBM requests should be evaluated in queue order, along with other OASIS requests for service and should be evaluated comparable with other firm requests (NAESB is developing these business practices).
2. In order to manage Rate filings to accommodate Order 890 paragraphs 257 and 263, CBM values must, at some point, be "locked in" prior to the filing.
3. Rates should not take effect until FERC approval is received, and at least 60 days should be set aside for the FERC to grant approval.
4. Rates should not change within a month (i.e., rates should be applied to all PTP reservations in full month intervals).
5. The tariff defines procedures for studies of firm point-to-point requests (Section 19) and of network integration transmission service requests (Section 32). These procedures are aligned with respect to response and study times, which are outlined below:
a. After receiving request for service, TSP has 30 days to tender a System Impact Study (SIS) agreement
b. Customer has 15 days execute SIS agreement and return it
c. TP has 60 days to complete SIS or, if unable, TSP must contact customer and provide estimated completion date and reason for delay
d. If all or part of the service can be accommodated, customer has 15 days to execute service agreement or request that it be filed unexecuted
e. If additional upgrades are needed, TSP has 30 days to tender a Facilities Study (FS) agreement
f. Customer has 15 days to execute and return the FS agreement
g. TP has 60 days to complete FS or, if unable, TSP must contact customer and provide estimated completion date and reason for delay
h. Customer provides letter of credit or other security equivalent to the cost of the new facilities or upgrades
i. Customer has 30 days to execute a service agreement or request that it be filed unexecuted
6. The procedure outlined in #5 is for transmission service, but CBM is a margin and not a transmission service. FERC has not provided a mechanism in the pro-forma tariff to charge customers for CBM and, also, FERC did not establish CBM as a separate service in Order 890. As such, there is no clearly defined mechanism for charging customers for transmission system upgrades specifically set aside for CBM.

7. MOD-004-1 establishes 14 days for setting CBM associated with monthly requests (R4.) and 60 days for setting CBM yearly requests (R5.). Requirement R6. establishes a procedure for requesting a system impact study after CBM has been established under Requirements R4. and R5.
8. It is impossible to apply the evaluation timing rules for both R4. and R5. whenever a single modification changes both monthly and yearly values (e.g., LSE submits an

update that requests increase of the monthly value 3 months from now and also requests increase of the yearly values for all subsequent years).

9. TPs must make rate filings to accommodate Order 890 paragraphs 257 and 263, CBM values must, at some point, be "locked in" prior to the filing.
10. Rates should not take effect until FERC approval is received, and at least 60 days should be set aside for the FERC to grant approval.
11. Rates should not change within a month (i.e., rates should be applied to all PTP reservations in full month intervals).

Recommendations:
The following changes are requested so that Transmission Service Providers may meet Order 890 requirement for filing Point-to-Point rates that do not include the cost of the CBM set-aside:

1. Monthly requests should be submitted for the current year and the following two years. (NERC)

a. This should constitute one request type which is only permitted to use available transmission capability (no upgrades). (NERC)
b. Evaluation shall be performed commensurate with reservation response timing rules for monthly firm Point-to-Point requests (NAESB)
c. During the evaluation of Monthly CBM requests, CBM requests should be assigned the same reservation priority as yearly firm PTP and designated network service. (NAESB) This will assure that these requests will be evaluated in queue order and will not be superseded by higher priority requests.
d. The TSP shall establish in its CBMID rules for queuing of monthly CBM requests in order to accommodate the TP's tariff filing needs (each TSP shall establish when Monthly CBM requests are no longer permitted to change). (NERC)

2. Yearly requests should be submitted for the remaining years of the 10 year period.(NERC)

a. This constitutes a second request type which is only permitted to use available transmission capability (no upgrades).(NERC)
b. Yearly requests shall be updated at least yearly, but may be submitted more frequently. (NERC)
c. During the evaluation of Yearly CBM requests, CBM requests should be assigned the same reservation priority as yearly firm PTP and designated network service. (NAESB) This will assure that these requests will be evaluated in queue order and will not be superseded by higher priority requests.
d. Evaluation shall be performed commensurate with reservation response timing rules for yearly firm Point-to-Point requests (NAESB)
e. The TSP shall establish in its CBMID any rules for queuing of yearly CBM requests in order to accommodate the TP's tariff filing needs (each TSP shall establish when Yearly CBM requests are no longer permitted to change). (NERC)

3. At no time shall the Monthly requests overlap the yearly requests. If overlap does occur, the monthly request shall take precedence over the overlapping yearly request. (NERC)
4. NERC should remove the last bullet in R6.1 (The option to request a system impact study.). This will streamline the evaluation process and simplify the Standards approval process (and subsequent FERC proceeding). NERC will not be forced to 1) develop a procedure similar to #5 in Duke Observations (above) or 2) defend why the proposed procedure is different.

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
  - TFC
  - AFC (firm and non-firm)
  - ETC (firm and non-firm)
  - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☒ No

If "Yes," please identify your concerns. Comments: The implementation plan for the standard is too long. EPSA has not objected to NERC's recent request to FERC to extend by several months, the date when these standards will be submitted to FERC given the amount of work involved in developing these standards. However, to require up to 15 months beyond the date of regulatory approval for implementation of this standard is excessive.

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☐ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: EPSA would like to provide the following additional comments:

1. MOD 001-1, R3.1 (similar language is used elsewhere) provides that information will be provided "in such detail that, given the same information used by the Transmission

Service Provider, the results of the ATC calculations may be validated." However it is also noted on page 4 of this document above, that all posting requirements will be as determined in the associated NAESB standards. While we are aware of the coordination with NAESB that is on-going and we are actively participating in it, EPSA's assessment of the appropriateness of this requirement can not be completed without knowing the outcome of the related NAESB standard drafting work that is on-going.

2. MOD 004-1, the CBM standard incorporates a number of principles with respect to allocation of CBM, both at the time of ATC calculation and at the time of scheduling deliveries, which EPSA summarizes as follows. CBM, by virtue of being determined as a "set-aside" has priority over all purchases of transmission service, even firm service. This extends into future time frames in that R4.3 states that, if there is initially insufficient CBM to meet all requests, any new interface capability coming available would be allocated first to unfilled CBM requests. Furthermore, when scheduling CBM, LSE's are entitled to utilize any available CBM, not just the quantity that they have requested.

EPSA accepts the notion of a set aside for CBM, contingent on acceptance of some additional principles.

CBM should be purchased by eligible LSEs at full embedded cost of the transmission. This is clearly a superior service that is being provided-it should not be available at a reduced cost.

In the event of an emergency at level EEA2 or higher, LSEs are granted access to all CBM reserved, even if reserved by other LSEs. EPSA acknowledges that under such emergency conditions, all possible accommodations should be made. However, this accommodation together with the charge for service as discussed above, provides considerable incentive to under-reserve CBM. As LSEs are required (R3.2) to update their CBM requirements at least every 31 days, scheduling beyond their reserved amount at the time of an emergency should be investigated, after the fact, for possible violation of this requirement.

R4.3 notes that CBM is made available as a set-aside, such that LSE's are granted priority access to available service, including service that becomes available in future if not all requests can be accommodated initially. Such priority access to future quantities should not receive priority over duly granted roll-over rights.

3. MOD 001-R4 and R5 define the default values for counterflows to be used in the calculations of firm and non-firm ATC. As stated, these values are extremely conservative. R4 and R5 should require an explanation, based on modelling or based on historical values, of whatever values of counterflows are adopted by the TSP.

Please use this form to submit comments on the proposed set of ATC standards (MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, and MOD-030). Comments must be submitted by **December 14, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the abbreviation "ATC Standards" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

> **MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.
>
> **MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.
>
> **MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.
>
> **MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.
>
> **MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.
>
> **MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
  - TFC
  - AFC (firm and non-firm)
  - ETC (firm and non-firm)
  - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☒ No

If "Yes," please identify your concerns. Comments:

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition: Definition of AFC in MOD-030-1 should be expanded to include CBM and TRM in addition to only committed uses similar to that for ATC in NERC standards.

MOD-028-1 R11 and R12 and MOD-030 R8 and R9 include a capitalized term Business Practices in Postback definition. The term Business Practices should either be defined, or clarified in the standard.

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement: MOD-001-R2.3 Monthly ATC time period is defined as lasting through month 12. This is not consistent with MOD-030-R3.3 which specifies monthly AFC calculations through month 13. Similar descriptions are included in MOD-028-1 and MOD-029-1. Add in parenthesis "(months 2 through 13)" at the end of this sentence for clarification.

MOD-001-1 R3.1 - replace "may' with "can" in 4th row of this requirement.

MOD-001-1 R3.6 - It is not clear what is expected under Allocation methodology and what needs to be allocated. This requirement should be deleted or Allocation methodology should be more clearly defined.

MOD-001-1 R5 along with R3.2 appears to be "fill in the blank standard" such that the TSP can use any counterflow percentage if they describe how they are accounting for counterflows in R3.2, then R5 is not applicable as it allows them to use their stated method. Therefore, either R5 should be strengthened to make it clear how counterflows and counter-schedules are to be accounted for, or TSP should be allowed to use their method of accounting for couterflows that is included in their ATCID per R3.2.

MOD-001-1 R6 - Minimum time of notification before implementing changes in ATCID should be included in this requirement. In addition, notification via electronic mail in parenthesis appears to be the only medium allowed which may not be reliable. Reference to electronic mail should either be removed or other mediums allowed for notification.

MOD-001-1 R9.3 - Minimum frequency to update monthly ATC should be once a month rather than once a week.

MOD-001-1 R10.12 - This requirement should be deleted as counterflows is not the data to be shared, these are percentage of reservations that are to be used for ATC calculations in a direction opposite to that of reservation that result in increase of the ATC/AFC values.

MOD-004-1 Effective Date should included "(MOD-001-1, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1)" between the words six and standards similar to other standards.

MOD-004-1 R1.3 - Words "request the" should be removed as there is no request for schedule, procedure for scheduling of energy is enough.

MOD-004-1 R2 - The Transmission Service Provider needs to make the CBMID available only to the TOs, TSPs, RCs, TPs, and PCs that are in the TSP area or that are adjacent to its network and not to all TOs, TSPs, RCs, TPs, and PCs.

MOD-004-1 R3.1 - CBM is on a Posted Path basis or Flowgate basis whereas GCIR is on an entity basis, therefore either LSE should submit CBM on Posted Path basis or Flowgate basis (LSEs are not expected to know the impact on Posted Paths, or Flowgates of their GCIR, therefore they should preferably just request GCIR and leave calculation of CBM impact to TSP to be determined based on their CBMID under R1.2) which should be included in R3.1, or they can submit GCIR with additional information required in R3.1.1 and TSP shall allocate CBM on Posted Paths or Flowgates based on their CBMID. These requirements need to be made "either Posted Path or Flowgate basis or GCIR" rather than R3.1.1 as additional information required for submitting CBM request.

MOD-004-1 R3.1.2 through R3.1.4 should be deleted or reworded as TSP is not a monitoring entity and they do not have any use for this information. LSE should have this information available for monitoring for compliance. Therfore, these requirements should be reworded accordingly.

MOD-004-1 R3.2 "every thirty-one days" should be changed to "once a month". MOD-004-1 R3.3 - Add "studies conducted in accordance with" between the words "and" and "verifiable".

MOD-004-1 R4.1.1 implies that LSE is going to request GCIR on each path which is not realistic for all methods. Since TSPs are required to allocate GCIR on each Posted Path based on their procedure included in CBMID, it should be reflected in this requirement.

MOD-004-1 R4.1.2 should be modified to be made similar to R4.1.1 such that entities using Flowgate methodology will allocate GCIR on Flowgates based on R1.2 in their CBMID. A cut off limit of 3% or greater for Distribution Factor is not substantiated and should not be included in the standard. TSPs may be required to include their cut off limit it in their CBMID.

MOD-004-1 R4.2.1 second bullet and R4.2.2 second bullet - since ATC is calculated after deducting the CBM, TRM and Existing Transmission Commitments from TTC, it is unclear which ATC has to be used as limit for allocating CBM.

MOD-004-1 R 6.1 - This requirement should be split in two separate sub requirements, the first finishing after the first sentence, and the second sub requirement starts with "If…" and bullets should be made further sub requirements under this new sub requirement as these are applicable only to the situation "If less than the sum of all requests was established as the CBM for any period." System Impact Study is not a viable option, this should be changed to Facility Study.

MOD-004-1 R7 - "within seven calendar days of their making a request" should also be applicable to sub requirements R7.1, since there is no requirements for Transmission Operators to do anything with this data. They can request the data if they need it.

MOD-004-1 R8 - There should be a limit for LSEs to be allowed to schedule only upto the limit of CBM set aside for them as FERC is requiring LSEs to pay for the CBM, if LSEs have not paid for the CBM, they should not be allowed to schedule against the CBM that has been set aside for others. If LSEs do not request enough GCIR and are later allowed to schedule it can adversely impact the reliability of the system.

MOD-004-1 R10 - This should be modified to limit the schedule up to the limit of the LSE's CBM reservation or impact of their GCIR on the CBM on the Posted Path or Flowgate. Setting aside CBM is like reserving the Firm Transmission Service, therefore an entity not reserving enough CBM to start with will impact the reliability of the system by overselling the Firm Transmission Service to others.

MOD-008-1 R1.1 - It may not be possible to identify the impact of each of the uncertainties on each of its respective Posted Paths or Flowgates as included in this requirement. It should be sufficient to include method of coming up with TRM values in terms of percentage or MW taking into account the uncertainties included in this requirement. The language in this requirement should be reworded accordingly.

MOD-008-1 R2 - The first phrase covers the intent to only use the components of uncertainty from R1.1, the second phrase "and shall not include any of the components of Capacity Benefit Margin (CBM)" is redundant and should be deleted.

MOD-008-1 R4 - Parenthesis around the parenthetical statement "within seven days….." should be removed.

MOD-008-1 R5 - There is no justification for the 13 months frequency, it should be changed to once a year or 12 months to be more consistent with business cycles.

MOD-028-1 R1.1 - Word "may" should be replaced by the word "can" in last line.

MOD-028-1 R3 and R4- Insert a word "of" between "all" and "the" in third line.

MOD-028-1 R3.1 and 3.2 - Subrequirements R3.1.1 through R3.1.3 are similar to the sub requirements R3.2.1 through R3.2.3 except using the Load Forecast for corresponding period. The only difference between R3.1 and R3.2 is that one is for the on-peak and the second is for the off-peak with very similar subrequirements. These requirements should be combined into one requirement to simplify the standard and to be specific. Similar approach should be used for R4 to be merged into one requirement with R3 as the only difference is the period of calculation and to use corresponding Load forecasts.

MOD-028-1 R5.3 - Sub requirements for using the sources and sinks included as bullets should be converted into numbered sub requirements.

MOD-028-1 R6.1 - Since forced outages during the week can impact Hourly and Daily TTCs, frequency of TTC calculations for hourly and Daily ATC calculations should be once a day rather than once a week.

MOD-028-1 R7 - It appears there is no consideration of contingencies in this process. Was this the intent of the SDT? If not, the incremental Transfer Capability should be changed to First Contingency Incremental Transfer Capability or impact of contingencies should be included in the language of the requirement.

MOD-028-1 R8 and R6.1 - If Transmission Operator calculates TTC once a week and provide those values to TSP within seven days of calculations, TTC used for Daily and hourly ATC calculations can be as old as 2 weeks, which is unrealistic. The time allowed to transfer TTC values from TO to TSP should be within one day of determination at the maximum, unless otherwise agreed to by the TSP.

MOD-028-1 R9 and R10 - Is Native Load included in NITS? If so, it should be included in the definition, otherwise, another term for Native Load should be included for ETC equation similar to that included in MOD-029-1 R5.

MOD-028-1 R11 and R12 - Postbacks in these requirements refer to as defined in Business Practices, are these NAESB Business Practices or TSP Business Practices? It should be clarified.

MOD-028-1 R12 - Unscheduled Firm reservation need to be offered as non firm, if schedules are not received upto the scheduling deadline. Are these included in the postback definition? If not, these should be included in the equation for non firm ATC calculations.

MOD-029-1 R1.10 - "Extra High Voltage (EHV)" should be defined.

MOD-029-1 R1.12 - "ACTID" is spelled incorrectly, it should be changed to "ATCID".

MOD-029-1 R2.7 - Regional Entity is indicated to have taken action to have the path rated using a different method. There is no requirement in NERC standards for Regional Entity to take action to rate the path, it should be clarified, or reference deleted.

MOD-029-1 R5 and R6 - Definitions of Native Load and NITS include "losses not otherwise included in TRM and CBM standards". There are no such provision to separately include losses in TRM or CBM calculations in current versions of MOD-004-1 and MOD-008-1. The difference should be reconciled or reference removed from this requirement.

MOD-029-1 R6 - There is no term for Native Load in this equation similar to that in R5. Is Native Load never served by a non-firm capacity reservation? If it can be served, the Native Load term should be included in R6 for consistency.

MOD-029-1 R7 and R8 - Postbacks use the term business practices with lower case in this standard. Which business practices this term refers to in this standard? Is it referring to the NAESB Business Practice Standards or TSP Business Practices? It should be clarified. If it means the same as in MOD-028-1 R11 and R12, it should be reconciled by capitalizing it and defining it.

MOD-030-1 R2.2 - Change "once per calendar quarter" to "once per calendar year" for the frequency of updating the list of Flowgates.

MOD-030-1 R3.4, R3.5, and R3.6 - The term "topology" should be replaced with "system topology" to reconcile it with the terms used in other NERC standards.

- MOD-030-1 R5.1 - Reword this requirement to allow the TSP to apply the outage rules defined in the TSP's ATCID and to include third party outage information "where available". It should read: "Include all expected generation and Transmission outages, additions, and retirements as modeled according to the Transmission Service Provider's outage rules defined in the ATCID during the period calculated for the Transmission Service Provider's area, and where available, for all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed".

- MOD-030-1 R5.2 - Reword this requirement to make it consistent with R2.1.3.1 by adding a statement on the threshold limit as follows: "For external (third-party) Flowgates with at least a 5% TDF, use any AFC for each specific Flowgate provided by that third party as the AFC for that flowgate."

MOD-030-1 R6.1.4.2 - Reword to use TSP's rules defined in the ATCID as follows: "Unit commitment and dispatch order, to include all designated network resources and other resources that are commiteted or have the legal obligation to run, as they are expected to run as defined by the Transmission Service Provider's ATCID."

MOD-030-1 R6.3 and 6.4, R7.2 and R7.3 - Threshold of 3% is specified in the requirement with a foot note that TSPs may use a lower than 3% threshold, if desired. The threshold appears to be at the discretion of the TSP, therefore, it should be stated clearly as such. TSPs may be required to disclose it and include it in their ATCID for transparency purposes.

MOD-030-1 R8 - The capitalized term Business Practices used in Postback seems to refer to some defined Business Practices like NAESB or TSP business practices. Either the term should be defined under definitions, or it should be clarified in the requirement. Also, this term is not capitalized in R9, does it mean it is different business practices. The difference should be reconciled.

MOD-030-1 R10 - To make this standard consistent with MOD-028-1 and MOD-029-1, there is no need to include an algorithm in this standard. In addition parenthetical "(and TFC to TTC)" should be deleted. The requirement can read "Transmission Service Providere shall convert or provide a tool to convert Flowgate AFCs to TTCs for Posted Paths by using appropriate distribution factors." and delete the remaining language from this requirement. In case this proposed change is not implemented by the SDT, Entergy proposes that the terms used in this requirement like OTDF Flowgate and PTDF Flowgate should either be defined or clarified.

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element: MOD-001-1 M5 - copies of dated electronic email for notification does not ensure that the email has been received by the receiving party. Other mediums should be included or receipt of the email notification should be required as a measure.
MOD-001-1 M6 - Reference to "such as demonstration" is unclear as to what is included in "demonstration" so parenthentical reference should be deleted.
MOD-001-1 M9 - Extra "the" from line 2 between the words "show" and "its" should be deleted.
MOD-004-1 M3 - The measure should also include group of LSEs with aggregated need for CBM as provided in R3.
MOD-004-1 First bullet under Data Retention should refer to CBMID rather than ATCID.
MOD-004-1 Violation Risk Factors - Correct typos in row for R2 "CBID" to be changed to "CBMID".
MOD-008-1 M2 - In case SDT removes reference to CBM as Entergy suggested above, SDT should remove reference to CBMID in this measure also.
MOD-080-1 M5 - In case SDT changes frequency or TRM calculation to 12 months as Entergy suggested above, SDT should make corresponding change in M5.
MOD-028-1 M9 - Correct typo in line 3 from "its" to "it".
MOD-029-1 M2 - Correct typo in line 3 from "ACTID" to "ATCID".
MOD-030-1 Violation Risk Factors - Correct typo in cells under Lower VSL, Moderate, and High VSL for R2 to change from "is" to "it" in last paragraph.

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☐ No

If "Yes," please identify your concerns. Comments:

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☐ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: For the entire ERCOT Interconnection, the market rules that govern establish, under Texas State Law, that the transmission system is to be operated in an open access process, much as a common carrier. As such, there is not a Transmission Service Market in the ERCOT Interconnection. Therefore, ATC, TTC, CBM, and TRM are not applicable within ERCOT operations. These Standards should have provisions that make it clear that these requirements apply only within market structures in which they are pertinent.

Please use this form to submit comments on the proposed set of ATC standards (MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, and MOD-030). Comments must be submitted by **December 14, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the abbreviation "ATC Standards" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☒ Yes

☐ No

If "Yes," please identify your concerns. Comments:

1. While we agree that the proposed Implementation Plan allows for sufficient time to achieve compliance with the various requirements, a successful implementation is reliant on tasks that must be completed in succession by NERC Responsible Entities who are not within the same organization. We encourage the standards drafting team to consider setting midpoint milestone dates, where appropriate, to allow sufficient time for entities that have tasks that are dependent upon the timely completion of other work prior to their own. Requirements for "implementation documentation" would be effective after 12 months, but then other data that relies on these documents should have additional time for implementation.

2. The Implementation Plan shows a table of the applicable entities for each proposed standard. In this table, the Purchasing-Selling Entity (PSE) is shown as applicable to MOD-008, but it is not listed as an applicable entity within the text of this standard or any of the proposed standards.

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

MOD-004-1 - GCIR Definition: This definition may incorrectly imply that this is merely another resource that an LSE can use to meet its Resource Adequacy Requirements (RAR). RAR, such as planning reserve requirements (PRM), cannot be met with the use of CBM. Also, the definition refers to GCIR as "an alternative to internal resources" which may be misleading. The definition needs to address the fact that GCIR (as CBM) can only be used in an emergency. It is a "contingency option" rather than a "resource alternative".

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

1. MOD-001-1:

- Applicability - Should include the Reliability Coordinator (RC). Per the NERC functional model, the RC is responsible for the "coordination of ATC with Transmission Service Providers".

- R1 - The Transmission Operator (TOP) should not be responsible for choosing an ATC methodology; any methodology should be coordinated with the TOP, but the ultimate responsibility should fall onto the TSP. Also, it should be made clear that the use of the three methodologies must be in accordance with the "MOD" standards. Therefore, we propose a rewording of R1 as follows: "The Transmission Service Provider, in coordination with the Reliability Coordinator and Transmission Operator, shall choose an ATC methodology [footnote 1] (Area Interchange methodology, Rated System Path methodology, or Flowgate methodology in accordance with MOD-028, MOD-029, and MOD-030, respectively) for each Posted Path per time period for use in determining Transfer Capabilities of those Facilities within its Planning Coordinator's planning area".

- R8 should not include the Transmission Operator. The TOP is not responsible for calculating the ATC, TTC, or AFC.

2. MOD-004-1:

- R3 - This requirement should either be eliminated or specified under R1, as applicable to TSPs. Where R1 requires the TSP to have a procedure for LSEs to request CBM, R3 prescribes part of that procedure. If R1 is intended to give TSPs full liberty to develop its CBM procedure, then R3 is an unnecessary requirement. If instead R3 is an element of the procedure that must be common to all, then it should be added as a requirement for TSPs to include in their procedures.

- R8 - This requirement should be included in a NAESB business standard. Any aspects of R8 as applicable to TSPs should remain.

- Effective Date: For consistency, the Effective Date section should be replaced to match what is in the other proposed standards under the Proposed Effective Date which references the other standards and is more complete that what is shown in MOD-004.

3. MOD-008-1:

- Applicability - Since TRM is a network-wide margin critical to calculating ATC, the TRM standard should also be applicable to the Reliability Coordinator (RC). Per the NERC functional model, the RC is responsible for the "coordination of ATC with Transmission Service Providers". Lastly, the RC must be included as an applicable entity as directed by FERC Order 693, Par. 1126.

- R1 - Since the Transmission Service Provider (TSP) is ultimately responsible for calculating and assuring proper ATC for its footprint, and since, per MOD-004-1 R1, the TSP is responsible for maintaining a CBMID, then it should follow that the TSP, and not the Transmission Operator (TOP), should be responsible for maintaining a TRMID. Plus, in R4 of MOD-008-1, the TSP has to make the TRMID available to other TSPs when requested. Wouldn't the process be smoother and more reliable if the TSP didn't first have to ask the TOP for the TRMID if the TSP already had and maintained its own

TRMID? Therefore R1 should be reworded as follows: "Each Transmission Service Provider, in coordination with the Transmission Operator and Reliability Coordinator, shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information:"

Then, if R1 is changed as suggested, the following changes to other requirements to MOD-008-1 must be considered:

- R2 & R3 - Replace "Transmission Operator" with "Transmission Service Provider"

- R3.1 - Reword as follows: "The Transmission Operators with Facilities governed by the Transmission Service Provider".

- R4 - Remove "used by its Transmission Operator(s)"

- R5 - "Each Transmission Service Provider shall calculate, at least once every 13 months (in accordance with the definitions in its TRMID), a TRM value for the following time periods (on each Posted Path or Flowgate) and shall provide these TRM values to its Transmission Operator(s) and Transmission Planner(s) within seven calendar days of the calculation:

4. MOD-030-1:

- Applicability - Since Flowgates are points within the Transmission system through which Interchange Distribution Calculations are performed by the Reliability Coordinator, this standard should also be applicable to the Reliability Coordinator (RC). Also, per the NERC functional model, the RC is responsible for the "coordination of ATC with Transmission Service Providers".

- R2 - Although the Transmission Operator assists with gathering this information, this requirement should ultimately be the responsibility of the Transmission Service Provider (TSP), since the TSP prepares and maintains the Available Transfer Capability Implementation Document (ATCID). Also, the Reliability Coordinator should assist in gathering this data since this entity is closely monitoring Flowgate capacities in its area. Therefore, we suggest rewording R2 as follows: "The Transmission Service Provider, in coordination with the Transmission Operator and Reliability Coordinator, shall perform the following:"

- R3 - Incorrectly states that the Transmission Operator (TOP) determines the AFC. R3 should be reworded as follows: "The Transmission Operator, in coordination with the Reliability Coordinator, shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria:”

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

1. MOD-001-1: Measure M2 - Change typographical error at the end of the measure that currently reads "(R1)" to "(R2)".

2. MOD-001-1: Measure M7 should not include the Transmission Operator. The TOP is not responsible for calculating the ATC, TTC, or AFC.

3. MOD-001-1: VSL-Severe for R2 incorrectly includes the Transmission Operator. This requirement is only applicable to the Transmission Service Provider.

4. Per our rewording suggestions in Question 3 and Question 6, several measures and compliance elements must be reviewed and revised by the SDT.

- E.g., MOD-030-1: Measure M7 - Per our rewording suggested in Question 3 for Requirement R3, M7 should be reworded as follows: "The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to support the AFC calculated by the Transmission Service Provider contains the information specified in R3."

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments:

1. MOD-001-1:

- R2 & R9 - There is no calculation requirement for yearly ATC in R2 or R9. Yet in MOD-004-1, R3.1 requires the identification of a CBM amount for, "each month for each year for the next ten year period."

- R6 - In addition to notification, before implementation of a new ATCID, the Transmission Service Provider should allow for a comment period. This will assure that all the affected entities have been given an opportunity to provide valuable clerical and technical input on the document.

- Counter-flow calculations in the past were difficult to justify and manage. This standard attempts to manage counter-flows by requiring TSPs to specify their accounting method in the ATCID, but does not require any justification of the method used for applying them. This situation could result in inconsistency in ATC calculations and application. Requirements should be developed that govern the calculation and application of counter-flows to ensure consistency and transparency.

2. MOD-004-1:

- The need for LSE involvement in setting CBM levels is completely dependent on the Resource Adequacy Requirement structure, and for some structures it would not be appropriate for LSEs to have input into the CBM calculation. For example, in PJM, an individual LSE (1) may not know if there is enough capacity in the market to meet reliability needs, or even what are the specific resources serving their load; (2) may have no responsibility to identify specific capacity resources beyond the obligation to purchase capacity credits from unspecified sources. Overall capacity management, short-term and long-term reliability responsibility, resides at the ISO level.

- In general, this standard may lead to situations that cause CBM reservations to be excessively higher than needed. There is no reference to a CBM calculation methodology, leaving LSEs free to request CBM on any basis. Many LSEs do not have the necessary tools needed to make proper CBM calculation, which could lead to simplistic and conservatively high CBM requests.

- Further compounding the problem of over-reserving CBM is the provision that calls for the TSP and TP to set the aggregate CBM level as the sum of all LSE requests such that all requests can be met simultaneously. It is unlikely all LSE adverse scenarios will occur. It is even more unlikely that all will occur at the same time. These provisions will result with too much CBM being set aside. Diversity is not taken into account.

- There are no provisions for the TP or TSP to challenge unreasonable CBM requests.

- This standard does not incorporate the resource adequacy criteria into the process of setting the total CBM value. The simple summation of CBM requests ignores the uncertainty associated with the scenarios behind the CBM requests.

- R2 - "CBID" should be "CBMID"

- R3 & R4 - A monthly value is extremely difficult to administrate and implement in the ATC calculation. Such a requirement will incur significant cost and subject the TSP to significant increases in cost. We suggest leaving it to each region to decide on the time intervals.

- R3.1 – This section should be clarified. It states "requested for each month for each year for the next ten year period." Do we really want 120 months worth of requests, or 12 monthly requests and 9 yearly? Also, the ATC postings only cover at most a 12 month period in MOD-001-1. Why is it necessary to have such a disparity in the period of coverage? R3.2 requires updating this CBM request at least every 31 days to reflect any changes that alter future needs. New development projects influence future needs for load growth. The probability that these projects will come to fruition can change from month to month. Is it reasonable to require a ten year look ahead to be revised on a 31 day cycle?

- R3.1.1 - In some areas it may not be possible that CBM can be determined from GCIR at the LSE level, especially if the standard will require data ten years in the future. In retail choice areas, an LSE has few load responsibilities (therefore resource responsibilities) for more than a couple years.

- R3.1.1.1 - CBM will be called upon in an emergency. We are not sure that it is feasible to identify the Balancing Authority or Posted Paths in all areas. We assume CBM would be used to bring in the most appropriate resources at any given time, but can that be known now for an emergency in the future?

- R3.1.2 - The basis for the request of CBM is not clearly defined. This requirement indicates that GCIR must be based on standards, criteria, established by other authorities. The LSE must document the Resource Adequacy Requirement (RAR) standards & authorities that form the basis of their request, and all details of the associated resource studies. This implies that it is a clear, objectively-determined parameter, yet it does not say how any particular elements of the results of the RAR study fit into the GCIR calculation.

- R4.1 either contains an extra colon that should be deleted, or is missing "(TRM"

- R4.3, R5.3, and R6 address the idea that the sum of all requests may be greater than the available capacity on the facility and directs the CBM to be increased based on availability up to the sum of all CBM requests. The standard is silent on what is to be done if the sum of all requests is greater and no additional capacity is made available on the facility. The standard should include the method for allocating the requests in this situation.

- R9 - Should be adjusted so that it explicitly states that only the timing requirements for the Real-Time market only will be waived. For example, the Day-Ahead Market timing requirements cannot be waived.

- R8, R9 & R10 - This standard refers to Interchange Transaction Tags. This has become problematic in that there are no requirements to tag interchange transactions in the NERC Standards posted on 10/23/07 with one exception. INT-004-1 still requires a modification to the tag for dynamic interchange transaction modifications. IRO-006 still relies heavily on interchange transaction tags for the TLR procedures, but without a requirement to tag a transaction, it is not clear how this procedure is accomplished under today’s standards. Until transaction tags are required by the standards, the references in R9 and R10 that rely on interchange transaction tagging should be revised.

3. MOD-008-1:

- R1.3. - Should be revised to state the description of the method used to allocate TRM across Posted Paths or Flowgates. As currently stated, it appears to be a list of Posted Paths or Flowgates with a TRM value or percentage assigned.

- R3 - Should be revised to state within seven calendar days of the receipt of a written request.

- R4 - Should be revised to state within seven calendar days of the receipt of a documented request for such information.

4. MOD-028-1:

- R5.3 - The requirement states, “If the source has not been specified, use the interface point with the adjacent upstream Transmission Service Provider as the source.” It may be difficult to determine the upstream Transmission Service Provider when the source has not been specified. The same is true for “If the sink has not been specified, use the interface point with the adjacent downstream Transmission Service Provider.” These statements should be revised to state, “If the source has not been specified and the sink has, use the interface point with the adjacent Transmission Service Provider upstream from the source as the source.” And “If the sink has not been specified and the source has, use the interface point with the adjacent Transmission Service Provider downstream from the sink as the sink.”

- R11 & R12 - Use the term “postbacks” that is not defined in the NERC Glossary nor is it well defined in this standard. It appears the requirement is communicating that it is defined in Business Practices. We suggest it be defined in the ATCID much like the Counterflows are described in the ATCID.

5. MOD-029-1:

- R7 & R8 - See our comments regarding "Postbacks" above.

6. MOD-030-1:

- R2.1.2 - The phrase "first three limiting" is too prescriptive and should be removed. For example, if the most limiting first contingency transfer is a large value, say 10,000, adding the first three limiting elements/contingency combinations is not necessary. If the requirement cannot be removed, we suggest adding wording that sets a transfer level such that the first three constraints that cause the FCITC to fall under that level will be captured. Also, "source sink combinations" needs to be further defined as a calculation; an entity of any size could have thousands of these possible combinations. Also, if this in-depth study is required, the frequency in R2.2 should be decreased (as this is a minimum standard to maintain the reliability of the BES).

- R4 - The requirement states, "If the source has not been specified, use the interface point with the adjacent upstream Transmission Service Provider as the source." It may be difficult to determine the upstream Transmission Service Provider when the source has not been specified. The same is true for "If the sink has not been specified, use the interface point with the adjacent downstream Transmission Service Provider." These statements should be revised to state, "If the source has not been specified and the sink has, use the interface point with the adjacent Transmission Service Provider upstream from the source as the source." And "If the sink has not been specified and the source has, use the interface point with the adjacent Transmission Service Provider downstream from the sink as the sink."

- R5.2 - It is not clear to us what the definition of a "third-party" is and how it is used in AFC calulcations. Please clarify.

- R8 & R9 - See our comments regarding "Postbacks" above.

- R9 - "Counterflows" is missing subscript "NFi" in the formula.

7. MOD-001-1 (R7, R10), MOD-004-1 (R2), MOD-008-1 (R4), and throughout other standards the drafting team uses the phrase, "make available." In addition, per FERC Order 693 (e.g. Par. 1023), wording should be added as to how it needs to be made available, such as on a website. Furthermore with regard to the sharing of information, requirements in these standards that require an entity provide information to another entity should have a standard method for providing the information or at a minimum require a negotiated method and format for providing the information. This will also require dispute resolution when two entities cannot agree on a method or format.

8. These standards do not address the market operation methods in use today. Currently, the Transmission Service Providers are the RTOs in some markets. These entities are also the market operators and not-for-profit organizations that have no vested financial interest in the amount of TTC assigned to a flow-gate or transmission facility. The modification of these standards to place the burden on the Transmission Operator for these calculations is a significant step backwards that should be revised to avoid the need for waivers or delegation agreements and to meet the needs of the old method of operation and the new market methodology.

9. Several requirements related to ATC have been incorporated into NAESB standards. It would be beneficial for these standards to be more transparent to the industry since it is challenging to find these standards on NAESB's website or some other means. It may help to have a direct link to these business practices on NERC's website in the future. Furthermore, it may help to incorporate these NAESB standards into NERC's standard review process for this and future projects in an effort to achieve full industry input on the development of these practices.

10. This set of ATC standards may need to go through a field test to determine how effective these calculations for ATC can be based on all the new requirements for Implementation Documents and Applicability to Transmission Operators and Load Serving entities that may not have ever dealt with these sorts of calculations in the past. If a field test is not an option due to time constraints, then the effective date should be pushed out another 12 months.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Please use this form to submit comments on the proposed set of ATC standards (MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, and MOD-030). Comments must be submitted by **December 14, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the abbreviation "ATC Standards" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

### Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

> **MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.
>
> **MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.
>
> **MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.
>
> **MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.
>
> **MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.
>
> **MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

## Arrangement of Requirements within the Proposed Set of 'ATC' Standards

### MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability**
**(ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin**
**(CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin**
**(TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

### Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

   ☐ Yes

   ☒ No

   If "Yes," please identify your concerns. Comments:

2. If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

   Incorrect Definition: MOD-001-1: What is the "Time Horizon: Operations Planning"?

   R8 specifies "associated operations studies or planning studies for the time period studied". In order to be consistent with Order 890, it should specify "associated operating horizon studies or planning horizon studies for the product time period being calculated" and further, since these horizons are being used in the context of ATC determination, the prefix "ATC" should be added to eliminate ambiguity, just as the TPL standards do with near-term planning horizon (year 1 to year 5) and longer term planning horizon (years 6 to 10)

   MOD-028-1: R5.3 – define "interface point" and "adjacent upstream TSP". This requirement is complex and it should include examples with pictures.

3. If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

   Incorrect Requirement:
   MOD 001: R9: This should be revised to indicate that updates are required only when data has changed. There are many entities whose ATC data may not change on a regular basis and requiring them to repost identical numbers on an hourly basis and maintain a log does not enhance reliability. Proposed wording "Each Transmission Service Provider shall update ATC at a minimum on the following frequency when the value has changed:"

   MOD-004-1: CBM: There does not seem to be a way to not have a CBMID even though the TSP policy is not to reserve CBM on any of its interfaces. Could the applicability be modified to exclude entities that do not use CBM?

   MOD-008-1: TRM: The sub-requirements in R1.4 and R5 describe the ATC Operating, ATC Scheduling, and ATC Planning horizons as specified by FERC in Order 890 and should be identified by name to be consistent with the other MOD standards.

   MOD-028-1: Area Interchange Methodology: R3 appears to require calculating TTCs for Posted Paths for intra-day and next day, on-peak and off-peak, R4 requires calculating

TTCs for time periods beyond next day, and then R6 specifies frequencies that don't correspond. For example, R4.1.2 requires use of peak load forecast for the day being calculated, but R6.1 says calculate TTC for daily only once per week – which day's peak load forecast gets used?

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:
MOD 001: M8 (referencing R9) should be revised to require proof of updates only when the information posted needs to be changed. For Example: "The Transmission Service Provider shall provide evidence (such as logs or data) that it has updated the hourly, daily and monthly ATC's on at least the minimum frequencies specified in R9 when those ATC values have changed.

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments:
MOD 28 Requirements, Measures and VSL's for R9-R12 are not explicit that setting a value to "Zero" is "using" the value. This could cause confusion on audits. R9-R12 should be revised to indicate that "Zero" is an acceptable value and qualifies as "using" the element. For example under each item where the elements are defined a line could be added stating. "The Transmission Service Provider shall show all elements of the calculation even those that have a value of zero for the path being calculated, and that value of zero for an element is considered using the element."

MOD-001-1: ATC: The frequency of calculation in R9 for the same products in R2 adds little or no accuracy or value to the results, particularly towards the end of the horizon. For example, hourly ATC must be re-calculated for three to seven days out every hour, the same as for two to four hours out. This should be relaxed to a tiered requirement. The postings should be made out to 168 hours, however, the frequency could be relaxed so that the outer bounds of the horizon are updated less frequently. (i.e. R9.1 For next 4 hours, once per hour, for hours beyond 4 hours out until end of next day (midnight), once every 6 hours, for hours beyond end of next day, once per day.)

MOD-001-1: ATC: R10 is exhaustive. The requester should be required to have cause to request such information and be required to pay for the administrative costs of collecting and transmitting the information. Much of the listed information is embedded within the power-flow models, and transmitting models electronically on an hourly basis to potentially multiple requesters would be very costly and time-consuming. If a requester has a grievance or dispute, then the historical data should be sufficient to provide for the calculations in question.

MOD-028-1: Area Interchange Methodology: R7 – In step 'a' the 5% distribution factor should be specified as OTDF or PTDF (should be OTDF).

MOD -028-1: R7 – in Step 'A' the 5% distribution factor appears to only apply to adjacent systems. This could result in a scenario where Utility B prudently limits ATC based on a facility in their system between them and Utility C, however Utility A allows a transaction to C that has the same impact on the same facility because of the 5% rule. We suggest that the ATCID should specify the handling of off system non path impacts.

MOD-028-1: In R7 step 'c', Please further define "all impacts of firm transmission service included in the study model" and/or provide an example. In our region this phrase was interpreted by some to mean "firm point to point only" and by others to include network and native service.

MOD-029-1 R1 This section should specifically say that all the BA-BA transactions are removed from the load flow model. These transactions are accounted for under ETC.

MOD-29-1 R1-6 This section implies that load is in the model which means the TTC calculated would be reduced due to the load. In MOD-29-1 R5 load is again accounted for under ETC. It appears that the equation for ATC in MOD-29-2 R7 double counts the effect of load because it is included in the TTC and in ETC.

Mod-29-1 R5 More detail is needed as to how the components of ETC are to be determined from a load flow model. Particularly, NLF, NITSF and GFF.

MOD-029-1 R7 C: Assuming no other changes this sentence should be revised to state "Determine the impacts of Firm Transmission Service that were included in the study model." The summing of this item with the incremental Transfer Capability occurs in Step D and mentioning it here in C is redundant.

Mod 28 R7c: This term should have a defined variable name or acronym.

Mod 28 R7c, R9, R10, R11, R12: In R7c the "impacting firm transmission service" is determined and summed to the ITC results to get the TTC. In R9 & R10 an ETC is determined then in R11 & R12 that is deducted from the TTC to get ATC. However there is no tie made between the undefined "impacting Firm Transmission Service" R7c and the ETC in R9 & R10. So there is no requirement that would prevent a service from being modeled in the model, not included in the "Impacting Firm Transmission Service" (IFTS) but then included in the ETC calculation, thereby effectively double counting the service. The service was on in the model, thereby reducing the capacity, the service was not added to the model in the IFTS but was deducted from the capacity in the ETC as if it wasn't running in the model.

We suggest that the drafting develop a set of examples to clearly explain the principles and calculations laid out in the standards to help insure uniformity in interpretation of the standards. See that attached example, which while basic, could be modified to emphasize specific concepts like CBM, Postbacks, Counter Flows, TRM, "Impacting Firm Transmission Service", etc.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

# Arrangement of Requirements within the Proposed Set of 'ATC' Standards

## MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

## Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
  - TTC
  - ETC (firm and non-firm)
  - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
  - TFC
  - AFC (firm and non-firm)
  - ETC (firm and non-firm)
  - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values.** To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values.** Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values.** Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin.** Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values.** Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

   ☐ Yes

   ☒ No

   If "Yes," please identify your concerns. Comments: GTC does not think that additional time is needed; however, GTC would like to point out that the implemetation period should not be shortened. The standards require development of extensive NAESB business practice standards. NAESB's working plan requires approximately six months after NERC approval of the NERC standards to create NAESB business practices that implement the NERC standards. Therefore, entities that must implement the NERC standards will only have approximately six months after the NAESB standards to implement the combination of NERC and NAESB standards.

2. If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

   Incorrect Definition: MOD-028, -029 and -030 refer to "Postbacks" with a definition that uses the term "postback". There is not a definition in the NERC Glossary for this term. The current NAESB draft definition (dated 9/12/07) is "The increase in ATC due to a change in status of a Transmission Service request or the release of unscheduled Transmission Service." The following definitions are suggested for MOD-028, -029 and -030:

   "Postbacks(F) are the changes in Firm ATC due to a change in Firm Transmission Service during that period, as defined in Business Practices";

   "Postbacks(NF) are the changes in non-firm ATC due to a change in non-firm Transmission Service, as defined in Business Practices".

3. If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

   Incorrect Requirement: In MOD-008-1, R5, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. An error in calculating TRM does not change the resulting TTC or TFC; therefore an error in calculating TRM cannot be a Medium or Severe Violation Risk Factor.

   In MOD-028-1, R2, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

In MOD-028-1, R3, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

MOD-028-1, R5 uses to the term "interface point" with the adjacent Transmission Service Provider; "interface point" is not defined. To meet MOD-028-1, R5 and MOD-030-1, R4, a Transmission Operator must define and simulate an artificial source or sink at the interface. The requirements should replace each occurrence of the phrase "use the interface point" with the phrase "use the adjacent Transmission Service Provider's area".

MOD-028-1, R8 is missing a Violation Risk Factor and a Time Horizon. They should be Violation Risk Factor: Lower and Time Horizon: Operations Planning.

In MOD-028-1, R9, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

In MOD-028-1, R11, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

In MOD-029-1, R1, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

In MOD-029-1, R2, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

In MOD-029-1, R5, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

In MOD-029-1, R7, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

In MOD-030-1, R2, the Violation Risk Factor is listed as Lower; it should be listed as Medium. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. MOD-030-1, R2 requires that the TFC be less than the SOL; therefore MOD-030-1, R2 should have a Medium Violation Risk Factor.

In MOD-030-1, R3, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

MOD-030-1,R4 uses the term "interface point" with the adjacent Transmission Service Provider; "interface point" is not defined. To meet MOD-028-1, R5 and MOD-030-1, R4, a Transmission Operator must define and simulate an artificial source or sink at the interface. The requirements should replace each occurrence of the phrase "use the interface point" with the phrase "use the adjacent Transmission Service Provider's area".

In MOD-030-1, R5, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

In MOD-030-1, R6, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

In MOD-030-1, R9, the Violation Risk Factor is listed as Medium; it should be listed as Lower. TTC or TFC calculations and values can only be Medium or Higher Violation Risk Factors if the resulting TTC or TFC is greater than the SOL or the IROL. Therefore, the only requirements in the proposed MOD-028-1, MOD-029-1 and MOD-030-1 that should be Medium are MOD-028-1, R7, MOD-029-1, R4, and MOD-030-1, R2 which require that the TTC or the TFC be less than the SOL.

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect,

please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element: MOD-001-1, R9, Lower VSL says "For Hourly, not calculated within 5hrs". MOD-001-1, R9, Medium VSL says "For Hourly, not calculated in more than 5 hours but not more than 10 hours". This language appears to allow a TSP to not calculate for 4:59 hours, while not calulating for 5 hours is a Lower VSL and more than 5 hours is a Medium VSL. We suggest that the MOD-001-1, R9, Lower VSL should be re-written to say "For Hourly, not calculated in more than 2 hours but not more than 5 hours".

MOD-028-1, M5 requires Transmission Operators to "provide copies of contracts" without stating the entities that can receive (potentially) commercially sensitive "copies of contracts". MOD-028-1, M5 should state "The Transmission Operator shall make available, only to authorized individuals that have executed a Confidentiality Agreement and that are performing official RRO audit activities, copies of contracts that contain requirements to allocate TTCs to show that any contractual allocations of TTC were respected as required in R5.2. Transmission Operators may redact the copies of the contracts to omit commercially sensitive information."

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If “Yes,” please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: MOD-001-1, R10 requires "within fourteen calendar days" for a TSP to begin supplying large amounts of data used in calculations. "Within thirty calendar days" is more realistic to supply large amounts data that could be extensive and detailed.

MOD-004-1, R2 requires a TSP to act within 7 calendar days, R6 requires a TSP to act within 5 calendar days, R7.1 and R7.2 require a TSP to act within 7 calendar days. R2, R6, R7.1 and R7.2 should be changed to match the 14 calendar days required by R4. 14 calendar days is more appropriate for data requests that are "reports", "supporting data", documentation, work papers, etc.

MOD-008-1 R3 and R4 require "seven calendar days" for a TSP to act. 14 calendar days is more appropriate for data requests that are "underlying documentation, work papers…", etc.

MOD-028-1, R5, it appear that the word "shall" is not needed in the following sentence. "-If the sink has been specified in the reservation and it is discretely modeled in the Transmission Service Provider’s Transmission model, use the discretely modeled point shall as the sink."

MOD-028-1, the VSL for R8 is missing a measurement: The Transmission Operator has not provided its Transmission Service Provider with its Posted Path TTCs within ___ (should be seven) calendar days of their determination, but is has not been more than 21 calendar days since their determination.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

**MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.

**MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.

**MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.

**MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.

**MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.

**MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

# Arrangement of Requirements within the Proposed Set of 'ATC' Standards

## MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

## Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☒ No

If "Yes," please identify your concerns. Comments:

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☐ No

If "Yes," please explain why and provide supporting information.
Comments:

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments: MOD-028-1(Area Interchange Methodology) VSL Requirement 2: The requirement talks about Facility ratings from both Transmission Owners and Generator Owners. The associated VSL description forgot to include Generator Owners. As well, this VSL talks about not using a certain number of Facility Ratings which I assume would result in some TTC error therefore I would propose changing how this requirement is measured:

Lower VSL: 1%<TTC error<5%

Moderate VSL:  5%<TTC error < 8%

High VSL: 8%< TTC error < 10%

Severe VSL: TTC error > 10%

As well this can be used for R3 and likely several other requirements were TTC and ATC errors can result from non-compliance.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

> **MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.
>
> **MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.
>
> **MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.
>
> **MOD-028 – Area Interchange Methodology (previously called the Network Response ATC Methodology).** A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.
>
> **MOD-029 – Rated System Path Methodology**. A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.
>
> **MOD-030 – Flowgate Methodology (previously called the Network Response Flowgate Methodology).** A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.

The diagram on the next page shows, at a very high level, the arrangement of requirements within the revised set of standards. The drafting team made many major changes to the standards based on feedback from stakeholders submitted in response to the last posting of these standards as well as feedback from NAESB and FERC. Major changes include:

- Defined several new terms – and changed the names of some of the methodologies. The most significant new term is, 'Posted Path' – this is used to define the boundaries for determining TTCs, TFCs, and ATCs.
- Changed the applicability so that the Transmission Operator determines TTC or TFC and the Transmission Service Provider determines ATC.
- Converted descriptive language into algorithms for calculating ETC and ATC.
- MOD-001 includes the basic requirement for the TSP to have an Available Transfer Capability Implementation Document (ATCID) – but if a particular method of calculating TTC or TFC requires that the TSP's ATCID have additional data or information, then the requirement for the TSP's ATCID to have that additional data or information is in the standard that includes the method for calculating TTC or TFC.

- Removed all requirements to make data or information 'publicly available' – the drafting team has been working cooperatively with NAESB and all posting requirements will be addressed in NAESB Business Practices.
- Added measures and compliance elements.

# Arrangement of Requirements within the Proposed Set of 'ATC' Standards

## MOD-001, MOD-004, MOD-008 Apply to All Methodologies

**MOD-001**
**Available Transfer Capability (ATC)**

- Identify ATC methodology used
- ATC Implementation Document
- Follow counterflow rules
- Calculate ATC at specified intervals
- Share ATC data and information

**MOD-004**
**Capacity Benefit Margin (CBM)**

- CBM Implementation Document
- Request CBM
- Allocate CBM
- Update CBM
- Share CBM data and information
- Real-time use of CBM

**MOD-008**
**Transmission Reliability Margin (TRM)**

- TRM Implementation Document
- Calculate TRM
- Share TRM data and information

## Choose One or More Methodologies

**MOD-028**
**Area Interchange Methodology**

- Method-specific ATCID elements
- Modeling requirements
- Basic Area Interchange calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-029**
**Rated System Path Methodology**

- Modeling requirements
- Basic Rated System Path calculations:
    - TTC
    - ETC (firm and non-firm)
    - ATC (firm and non-firm)
- Share TTCs

**MOD-030**
**Flowgate Methodology**

- Method-specific ATCID elements
- Identify Flowgates
- Modeling requirements
- Basic Flowgate calculations:
    - TFC
    - AFC (firm and non-firm)
    - ETC (firm and non-firm)
    - AFC to ATC
- Share TFCs

The implementation plan includes the proposed retirement of the following standards:

- **FAC-012 – Transfer Capability Methodology.** Now addressed in MOD-028, MOD-029, and MOD-030.

- **FAC-013 – Establish and Communicate Transfer Capabilities.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-002 – Review of TTC and ATC Calculations and Results.** Now addressed in MOD-028, MOD-029, and MOD-030. Also to be addressed in future NAESB Business Practices.

- **MOD-003 – Regional Procedure for Input on Total Transfer Capability and Available Transfer Capability Methodologies and Values**. To be addressed in future NAESB Business Practices.

- **MOD-005 – Procedure for Verifying Capacity Benefit Margin Values**. Now addressed in MOD-004.

- **MOD-006 – Procedures for the Use of Capacity Benefit Margin Values**. Now addressed in MOD-004

- **MOD-007 – Documentation of the Use of Capacity Benefit Margin**. Now addressed n MOD-004

- **MOD-009 – Procedure for Verifying Transmission Reliability Margin Values**. Now addressed in MOD-008

The standard drafting team was charged with revising the ATC-related modeling standards to comply with the FERC directives and industry participant consensus recommendations and is coordinating its efforts with NAESB to ensure that there are no gaps and no overlaps in the combined requirements. Please review the revised standards and the implementation plan and then answer the questions on the following pages. Please submit comments by **December 14, 2007.**

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** The drafting team has proposed an Implementation Plan for these standards. Should additional time be provided for successful implementation?

☐ Yes

☒ No

If "Yes," please identify your concerns. Comments:

**2.** If there are any proposed definitions that you believe are incorrect, please identify the term and provide a substitute definition.

Incorrect Definition:

**3.** If there is a requirement in any of the proposed standards that you believe is technically incorrect, please identify the standard and requirement and identify what is incorrect. If possible, provide alternate language that you believe would make the requirement technically correct.

Incorrect Requirement:

MOD-001

- 1. R1: The reference to the Planning Coordinator's planning area in R1 is not appropriate; the reference should be to the Transmission Operator's operating area.

- 2. R3.3: Since this standard deals with short-term Transmission Service, the reference to Planning Coordinator should be removed from R3.3, R6.1 and R6.4

- 3. R3.3: This should be reworded to be clear that the TOP is providing input (TTC or TFC) to the TSP to perform ATC calc. Also suggest removing reference to a 'tariff' since non-jurisdictional entities may not have a tariff. Suggest the following language: The identity of the Transmission Operators that provide data on each Posted Path for use by the Transmission Service Provider in calculating ATC. Acronyms TOP, TFC, and TSP need to be defined in the Background Information on p. 3. The abbreviation "calc." should be spelled out.

- 4. R4 and R5 should reference both the terms counter-schedules and counterflow throughout the requirements

  5. R9 (or at a minimum the Measure for R9) must be modified to be clear that if TSP can demonstrate that no inputs to the ATC calculation have changed that an update of a 'timestamp' on an ATC value is not required. Suggested options for the language in R9: "Each TSP shall update ATC at a minimum on the following frequency, except that if all inputs to ATC are unchanged no update is required:" OR "Each TSP shall update ATC at a minimum on the frequencies listed below. However, if all inputs to ATC are unchanged no update is required."

MOD-029

- 1. R1.10 refers to EHV without it being a defined term and different regions could define EHV to be different voltage levels; suggest one of the following actions be taken: (a) include the desired kV level of the BPS system in the standard, (b) remove the reference to EHV entirely, (c) add a NERC glossary term. EHV should be defined in the Background Information on p.3 and be understood to be applicable to and restricted to the BPS irrespective of that voltage level. That definition must also include the BPS voltage level it refers to.

  2. R2 language could be interpreted that all N-2 contingencies must be considered in a TTC study. If the intent that the TTC study should consider all currently required planning criteria, a general reference should be made to the planning standards rather than try to summarize and reiterate those requirements here.

  3. R2.1.5 contains a very specific consideration for EHV contingencies to be considered in the TTC. Is there a reliability need for ALL regions to consider EHVs in this manner? If not, we suggest removing this requirement from the NERC standard, where it can be added in a more detailed regional standard if required by a particular region. EHV should be defined in the Background Information on p. 3; the definition must include the BPS voltage level it refers to.

**4.** The drafting team has proposed a set of measures and compliance elements for the standards. If there is a measure or compliance element that you believe is incorrect, please identify this for us, being as specific as possible with a suggestion for revising the language so it is correct.

Incorrect Measure or Compliance Element:
1. VSL for MOD-028 R2 and R3 are is not clear if the 'errors' that are allowed are for a given TTC study or the allowed cumulative 'errors' since the last audit? (this language should also be clarified on comparable VSLs in MOD-029 and MOD-030). "Are is" in the first sentence needs to be corrected.

2. If suggestions in Question 3 and 6 are accepted, the associated Measures and VSLs will also need to be updated accordingly.

**5.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☒ No

If "Yes," please explain why and provide supporting information.
Comments: We would like confirmation from the Drafting Team that our interpretation of how the MOD-004 requirements can apply in areas that employ competitive wholesale markets in a manner that does not conflict with approved tariffs. In ISO/RTO markets where resource adequacy is performed by the ISO/RTO (i.e., an independent Balancing Authority), and by virtue of the market, the Transmission Service Provider does not offer transmission service in advance of physical flow, there is no ability for the LSE to 'request' CBM as defined in the standards. However, the reliability need for CBM by the LSE is satisfied by the market rules and associated tariffs. As such, the entities' CBMID would describe how the reliability needs of the LSEs, as relates to securing CBM is met and why there is no need for the LSE to 'request' CBM in the manner described in the standards. We would like confirmation from the Drafting Team that documentation of

CBMID in this manner – i.e., through specifying that an LSE need not "request" any particular transmission service – would satisfy the reliability requirements of MOD-004. LSE, and CBMID should be defined in the Background Information on p. 3.

**6.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standards.

Comments:

MOD-001

1.R1: While in many cases, the decision on which ATC methodology to use may be made jointly between the TSP and TOP. However, since you cannot have joint responsibility in the standard, the TOP is the appropriate Functional Model entity. Acronyms TSP, and TOP need to be defined in the Background Information on p. 3.

2.R8: Since this standard deals with short-term Transmission Service, the reference to planning studies should be removed from R8

3. R8 is an appropriate representation of the broad FERC requirement as-written that will force entities to make a conscious effort to ensure this consistency occurs. While the language is somewhat vague, we recognize that adding more detail would be unreasonably difficult. We would suggest that detail be added in the measures to provide examples of what a valid demonstration would be. For example, TOP/TSP may provide evidence to demonstrate that the source of the inputs used in the operational studies is the same as for the TTC/ATC studies. TOP and TSP need to be defined in the Background Information on p. 3.

MOD-028

1. R8 should be broken down into the different timeframes; sending TTC values used in hourly and daily ATC calculations seven days after being calculated is too late. Suggest: 8.1 within one calendar day of its determination for TTCs used in hourly and daily ATC calculations; 8.2 within seven calendar day of its determination for TTCs used in monthly ATC calculations.

MOD-030

1. R4 seems duplicative of MOD-001 R8

2. R6.3, 6.4 - The last sentence of R6.3 seems to belong in 6.4 not 6.3

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). Project 2006-07 requires specific reliability practices be incorporated into these standards. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency and transparency in how CBM, TRM, TTC, AFC and ATC are calculated and allocated. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those modeling standards related to the determination of ATC.

The drafting team has created the following proposed standards:

> **MOD-001 – Available Transfer Capability.** An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data.
>
> **MOD-004 – Capacity Benefit Margin**. A standard that describes the requesting, calculation, and use of CBM.
>
> **MOD-008 – Transmission Reliability Margin.** A standard that describes the calculation and use of TRM.
