**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from ~~on~~ other ATC~~Posted~~ Paths of the Transmission Service Provider as ~~described~~ specified in the ATCID.

**R11.** When calculating f~~F~~irm ATC for an ~~Posted~~ ATC Path for a specified period, the Transmission Service Provider shall utilize the following algorithm: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

$$ATC_F = TTC – ETC_F – CBM – TRM + Postbacks_F + Counterflows_F$$

**Where:**

**$ATC_F$** is the firm Available Transfer Capability for the ~~Posted~~ ATC Path for that period~~,~~.

**TTC** is the Total Transfer Capability of the ~~Posted~~ ATC Path for that period~~,~~.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ~~Posted~~ ATC Path during that period~~,~~.

**CBM** is the Capacity Benefit Margin for the ~~Posted~~ ATC Path during that period~~,~~.

**TRM** is the Transmission Reliability Margin for the ~~Posted~~ ATC Path during that period~~,~~ .

**$Postbacks_F$** are ~~adjustments~~ changes to firm ATC due to a change in the use of Firm Transmission Service~~postbacks~~ for that period, as defined in Business Practices~~, and~~.

**$Counterflows_F$** are adjustments to firm ATC as determined by the Transmission Service Provider and ~~described~~ specified in the~~ir~~ ATCID.

**R12.** When calculating ~~N~~non-f~~F~~irm ATC for a ~~Posted~~ ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_{NF} = TTC – ETC_F - ETC_{NF} – CBM_S – TRM_U + Postbacks_{NF} + Counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ~~Posted~~ ATC Path for that period~~,~~.

**TTC** is the Total Transfer Capability of the ~~Posted~~ ATC Path for that period~~,~~.

**$ETC_{F}$** is the sum of existing firm Transmission commitments for the ~~Posted~~ ATC Path during that period~~,~~.

**$ETC_{NF}$** is the sum of existing non-firm Transmission commitments for the ~~Posted~~ ATC Path during that period~~,~~.

**$CBM_{S}$** is the Capacity Benefit Margin for the ~~Posted~~ ATC Path that has been scheduled without a separate reservation ~~on~~ during that period~~,~~.

**$TRM_{U}$** is the Transmission Reliability Margin for the ~~Posted~~ ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period~~,~~.

**$Postbacks_{NF}$** are ~~adjustments~~ changes to non-firm ATC due to a change in the use of Non-Firm Transmission Service~~postbacks~~ for that period, as defined in Business Practices~~, and~~.

**$Counterflows_{NF}$** are adjustments to non-firm ATC as determined by the Transmission Service Provider and ~~described~~ specified in the~~ir~~ ATCID.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its current ATCID that has the information described in R1 to show compliance with R1. (R1)

**M2.** Each~~The~~ Transmission Operator shall provide evidence including the model used to calculate TTC as well as other evidence (such as Facility Ratings provided by facility owners, written documentation, logs, and data) to show that the modeling requirements in R2 were met. (R2)

**M3.** Each~~The~~ Transmission Operator shall provide evidence, including scheduled outages, facility additions and retirements, (such as written documentation, logs, and data) that the data described in R3 and R4 were included in the determination of TTC as specified in the ATCID. (R3) (R4)

**M4.** Each~~The~~ Transmission Operator shall provide the contingencies used in determining TTC and its ATCID as evidence to show that the contingencies described in the ATCID were included in the determination of TTC. (R5)

**M5.** Each~~The~~ Transmission Operator shall provide copies of contracts that contain requirements to allocate TTCs and TTC values to show that any contractual allocations of TTC were respected as required in R5.2. (R5)

**M6.** Each~~The~~ Transmission Operator shall provide evidence (such as copies of coordination agreements, reservations, interchange transactions, or other documentation) to show that ~~monthly or longer~~firm reservations were used to estimate scheduled interchange, the modeling of scheduled interchange was based on the rules described in R5.3, and that estimated scheduled interchange was included in the determination of TTC. (R5)

**M7.** Each~~The~~ Transmission Operator shall provide evidence (such as logs and data and dated copies of requests from the Transmission Service Provider to calculate TTCs at specific intervals) that TTCs have been calculated at least once ~~per~~ in the calendar week prior to the specified period for TTCs used in hourly~~,~~ and daily ATC calculations, ~~and~~ at least once per calendar month for TTCs used in monthly ATC calculations, and within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a autotransformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage; provided such outage is expected to last 24 hours or longer in duration per the specifications in R6.(R6)

**M8.** Each~~The~~ Transmission Operator shall provide evidence (such as written documentation) that TTCs have been calculated using the process described in R7. (R7)

**M9.** Each ~~The~~ Transmission Operator shall have evidence including a copy of the latest calculated TTC values along with a dated copy of email notices or other equivalent evidence to show that it~~s~~ provided its Transmission Service Provider with the most current values for TTC in accordance with R8. (R8)

**M10.** Each~~The~~ Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of f~~F~~irm ETC used the algorithm and elements described in R9 and did not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R9)

**M11.** Each~~The~~ Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of n~~N~~on-f~~F~~irm ETC used the algorithm and the elements described in R10 and did not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R10)

**M12.** Each~~The~~ Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of ~~F~~firm ATC used the algorithm and the elements described in R11 and does not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R11)

**M13.** Each~~The~~ Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of n~~N~~on-f~~F~~irm ATC used the algorithm and the elements described in R12 and does not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R12)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset

Not applicable.

#### 1.3. Data Retention

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2.
- The Transmission Operator shall retain evidence to show compliance with R3 and R4 for the most recent 12 months or until the model used to calculate TTC is updated, whichever is longer.
- The Transmission Operator shall retain evidence to show compliance with R5, R6, R7 and R8 for the most recent12 months.
- The Transmission Service Provider shall retain evidence to show compliance with R9, R10, R11 and R12 for the most recent12 months.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider has an ATCID that meets the intent of Requirement 1 but the ATCID is missing some minor information. | The Transmission Service Provider has an ATCID but it is missing one of the four required elements in R1. | The Transmission Service Provider has an ATCID but it is missing two of the four required elements in R1. | The Transmission Service Provider has an ATCID but it is missing three or more of the four required elements in R1. |

# Implementation Plan for Standard MOD-028-1; ATC/TTC/AFC and CBM/TRM Revisions (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-028-1, which describes the Area Interchange methodology (previously referred to as the Network Response ATC methodology) for determining ATC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs) that must be implemented before this standard can be implemented.

## Modified Standards

This standard incorporates the following requirements from FAC-012-1:

– R1 (Documentation of the Transfer Capability Methodology)

– R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).

– R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired.

This standard incorporates the following requirements from FAC-013-1:

– R1 (Calculation of the Transfer Capabilities)

– R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-028-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1 are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1 are approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

## Summary Consideration of Comments:

The Drafting Team has reviewed the comments and made some changes to the standard to address these comments.

1. All VRFs were set to "Lower" in response to industry comments.. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.
2. A more graded approach was applied to the VSLs where appropriate.
3. During the review of the VSLs and Measures, it was determined that the measures for R8, R9, R10, and R11 did not adequately measure compliance with the requirements. The drafting team updated the measures and VSLs to ensure that they captured the need to have accurate and valid numbers used in the requirements.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedure: http://www.nerc.com/standards/newstandardsprocess.html.

| Entity | Comment |
|---|---|
| CenterPoint Energy | ERCOT's filed comments to the SDT that ATC, TTC, CBM, and TRM are not applicable within ERCOT operations and that these Standards should have provisions that make it clear that these requirements apply only within market structures in which they are pertinent were ignored by the SDT. These standards should not apply to ERCOT, thus our negative vote. |
| Response: MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to be any path for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. Assuming ERCOT does not calculate ATC and has no directive to do so, MOD-001 R1 (and therefore also R2, R6, R7, R8) would not be applicable to ERCOT, and would not require implementation of any methodology, including this standard. | |
| Consolidated Edison Co. of New York | R2 applies to TOP, but R2.1 refers to RC - why the switch? R2.1 should address TOP. |
| Response: It is not a switch; R2 and all of its sub-requirements specify how the Transmission Operator will model the Transmission Operator's Reliability Coordinator area and adjacent Reliability Coordinator areas. There is no action for the Reliability Coordinator in R2; R2.1 intends to covers the Reliability Coordinator's area for modeling purposes by the Transmission Operator, not the RC. The drafting team does not believe any change is necessary. | |
| Duke Energy Carolina | The RC's SOL methodology in FAC-011 is required to include generator contingencies. MOD-028 requires the TO to calculate incremental TTC without exceeding SOLs. If the TTC calculation is performed by scaling generation, then generator contingencies should not have to be considered in addition to the scaling, for the purpose of assuring SOLs are not exceeded. |
| Response: When scaling generation, you are not simulating a contingency – you are just changing dispatch to simulate a transaction. The SDT does not see a conflict. | |
| Great River Energy | GRE does nor support this standard. GRE has concerns with the application of the standard for transmission providers that use flowgates. |
| Response: The SDT does not understand the concern expressed. This standard would not apply to entities that elected to use the flowgate methodology. We do not believe there is any conflict between methodologies. | |
| Hydro One Networks, Inc. | Hydro One Networks Inc. is casting a negative vote on the 6 MOD standards (MOD-001, MOD-004, MOD-008, MOD-28, MOD-029 and MOSD-030) We believe there is a fundamental issue related with effective dates, that is, the dates in which Reliability Standards become effective and enforceable. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in the MOD Standards in ballot as they have implications on neighbouring areas. The words inserted in the Effective Date of the Standards as well as in the Implementation Plan document permit that these Standards are effective in some jurisdictions and not others. These Standards should be modified to ensure that they become effective in all jurisdiction at the same time, including those where such regulatory approval in not required that is, only when all regulatory approvals have been obtained, In addition we offer the following comments to the specific Standard MOD-028: Requirement R2.1 introduces a threshold for allowing equivalent representation of radial lines and facilities. The chosen value of "161 kV or below" needs justification. |
| Response: Based on the need to support data exchange dependencies, the drafting team has modified the language to read as follows: First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.<br>The 161kV threshold was chosen based on Drafting Team experience for its potential impact on ATC. 161 kV facilities and above are generally | |

| Entity | Comment |
|---|---|
| accepted to be responsive to transfers, but the drafting team felt it would be too prescriptive to define which facilities below 161 kV would be responsive. The 161kV threshold doesn't preclude using a lower threshold for equivalencing if desired. | |
| Kansas City Power & Light Co. | Requirements state that the Transmission Operator is to perform functions that are currently performed by the SPP Transmission Service Provider for KCPL. Suggest adding "or Transmission Service Provider" after "Transmission Operator" in all requirements so that either entity could perform these tasks. |
| Response: The SDT believes it that in the case described, the Transmission Operator can delegate these functions to their Transmission Service Provider. | |
| National Grid | The standard allows when calculating TTC, the Transmission Operator shall use a model that contains the equivalent representation of radial lines and facilities 161kV or below. The 161kV seems arbitrary. We would like clarification as to why "161kV or below" was chosen in section R2.1 for being the threshold for allowing equivalent representation of radial lines and facilities. |
| Response: The 161kV threshold was chosen based on Drafting Team experience for its potential impact on ATC. 161 kV facilities and above are generally accepted to be responsive to transfers, but the drafting team felt it would be too prescriptive to define which facilities below 161 kV would be responsive. The 161kV threshold doesn't preclude using a lower threshold for equivalencing if desired. | |
| New Brunswick Power Transmission Corporation | Would like clarification on why "161kV or below" was chosen in section R2.1 as being the threshold? |
| Response: The 161kV threshold was chosen based on Drafting Team experience for its potential impact on ATC. 161 kV facilities and above are generally accepted to be responsive to transfers, but the drafting team felt it would be too prescriptive to define which facilities below 161 kV would be responsive. The 161kV threshold doesn't preclude using a lower threshold for equivalencing if desired. | |
| Northeast Utilities | Would like clarification as to why "161kV or below" was chosen in section R2.1 for being the threshold for allowing equivalent representation of radial lines and facilities. |
| Response: The 161kV threshold was chosen based on Drafting Team experience for its potential impact on ATC. 161 kV facilities and above are generally accepted to be responsive to transfers, but the drafting team felt it would be too prescriptive to define which facilities below 161 kV would be responsive. The 161kV threshold doesn't preclude using a lower threshold for equivalencing if desired. | |
| Potomac Electric Power Co. | Potomac Electric agrees with the comments of PJM distributed to the ballot body. I will not repeat them here, but do include the headings: I. The ATC MOD standards should have been sent out for comment not pre-ballot posting. II. Depth of the ATC MOD standards is excessive. III. Determining Violation Risk Factors is incorrect. IV. Determining Violation Severity Levels is incomplete. |
| Response: Please see PJM response. | |
| PP&L, Inc. | Confirmed TSR's affect non-firm ATC rather than schedules affecting Non-firm ATC. |
| Response: Confirmed firm TSR's affect Non-firm ATC and unscheduled firm TSR's affect non-firm ATC consistent with postback processes being developed by NAESB. | |
| Public Service Electric and Gas Co. | PSE&G votes NO for the reasons expressed in PJM's comments. |
| Response: Please see PJM response. | |
| Sierra Pacific Power Co. | Not used as a methodology. |
| Response: No response needed. | |
| Southern Company | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making |

| Entity | Comment |
| --- | --- |
| Services, Inc. | minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| | Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. |
| Western Area Power Administration | No Western office uses the Area Interchange model. |
| | Response: No response needed. |
| ISO New England, Inc. | Would like clarification as to why "161 kV or below" is the threshold for equivalence in R2.1. |
| | Response: The 161kV threshold was chosen based on Drafting Team experience for its potential impact on ATC. 161 kV facilities and above are generally accepted to be responsive to transfers, but the drafting team felt it would be too prescriptive to define which facilities below 161 kV would be responsive. The 161kV threshold doesn't preclude using a lower threshold for equivalencing if desired. |
| New York Independent System Operator | In its December 14 Comments, the NYISO asked that requirements R3, R4, and R6 under MOD-028 be revised so that TTC would not have to be recalculated when the underlying TTC inputs have not changed. The SDT did not make this revision even though it accepted a similar proposal with respect to the ATC recalculation frequency requirements in what is now R7 under MOD-001 (which the NYISO supports). The NYISO respectfully renews its request that the STD make the requested changes to MOD-028. Under the NYISO system, TTC values do not change often. Accordingly, the proposed MOD-028 requirements would force the NYISO to adopt costly compliance measures that would offer no benefit to its customers.<br>Response: The drafting team did modify requirement R6 under MOD-028 and changed "calculate" to "establish" the TTC values, which allows TTC not to be recalculated when the underlying TTC inputs have not changed but allows the same values with a different time stamp. The drafting team did not modify requirement R3 or R4 under MOD-028 because R3 and R4 do not have any frequency requirements and deal with what is required when TTC is calculated.<br><br>Consistent with the comments provided for MOD I, all of the violation risk factors in MOD-028 should have a rating beyond "Lower," the proposed violation severity levels should be reviewed to ensure so that they include appropriate gradations, and reliability requirements should not be adopted in areas that are better left to NAESB or to the individual practices of Reliability Coordinators, Transmission Operators, Transmission Service Providers and/or Transmission Planners, etc. .<br>Response: The Drafting Team has modified the standard to set all VRFs to Lower. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling. The drafting team has also modified many of the VSLs to have more than one level. The Drafting Team believes that ATC calculations are reliability related. While the Drafting Team does agree that the sale of transmission service and that the underutilization of the transmission system is not a reliability issue, the over-scheduling of the transmission system can have significant reliability implications. An overscheduled condition can require operator |

| Entity | Comment |
|---|---|
| | intervention; ATC or AFC calculations can provide indicators of the effect planned transfers will have on the transmission system and allows the associated reliability entities to plan accordingly.<br><br>The NYISO's December 14 Comments also explained that it was critically important that the definition of "Existing Transmission Commitments" ("ETC") in MOD-028 and -029 be interpreted flexibly. Many of the variables in the proposed ETC algorithm will not be applicable (or will always have a value of zero) in the NYISO's case. On the other hand, the most important input into the NYISO's ATC calculations is "Transmission Flow Utilization," which is based on the security constrained network powerflow solutions determined by the NYISO's day-ahead and real-time market software. The NYISO described how the OS(F) variable in the proposed ETC algorithm appeared to be broad enough for the NYISO to include Transmission Flow Utilization information when calculating ETC (and thus ATC). The NYISO added that it could provide additional information concerning its market software's computation of Transmission Flow Utilization and its role in the ETC calculation in its Available Transfer Capability Implementation Document ("ATCID"). The NYISO requested further that if its interpretation were incorrect that the MOD-028 and MOD-029 definition of ETC (and/or OS(F)) be revised to expressly allow ISO/RTO market software results, such as the NYISO's Transmission Flow Utilization information, to be considered in ETC calculations. Otherwise, the NYISO's existing method of calculating and posting ATC using market software outputs, which is a core feature of its FERC-approved market design, would be in conflict with NERC's standard. The SDT has subsequently made certain revision to the OS(F) definitions in MOD-028 and -029. None of the revisions responds to the NYISO's comments. Therefore, absent some contrary statement from NERC, the NYISO will assume that it has correctly interpreted the OS(F) definition as sufficiently broad to allow for the inclusion of Transmission Flow Utilization information when calculating ETC and ATC.<br>Response: The SDT does not disagree with NYISO's understanding; however, interpretation of a standard has its own due process established in NERC and NYISO should pursue that process if it wants more certainty. |
| Response: Please see in-line responses. | |
| PJM Interconnection, L.L.C. | While PJM will not choose the method specified in MOD-028 PJM believes changes needed to make MOD-030 acceptable would cause the need for changes to similar requirements in MOD-028. |
| Response: The Drafting Team has endeavored to make MOD-028 consistent with any changes made to MOD-030. | |
| Alabama Power Company | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |
| Consolidated Edison Co. of New York | R2 applies to TOP, but R2.1 refers to RC - why is there a switch from TOP to RC? R2.1 should address TOP. |
| Response: It is not a switch; R2 and all of its sub-requirements specify how the Transmission Operator will model the Transmission Operator's Reliability Coordinator area and adjacent Reliability Coordinator areas. There is no action for the Reliability Coordinator in R2; R2.1 intends to covers the Reliability Coordinator's area for modeling purposes by the Transmission Operator, not the RC. The drafting team does not believe any change is necessary. | |
| Dominion Resources, Inc. | In support of PJM comments |
| Response: Please see PJM response. | |
| Florida Municipal | Many small Transmission Operators are network service customers of, and are wholly enclosed by, a much larger |

| Entity | Comment |
|---|---|
| Power Agency | TOP/TSP. They have no viable paths or customers in and of themselves and currently their neighboring TOP/TSP handles all of the ATC-related data and calculations mentioned in this standard. In its current draft, this standard puts the onus of calculating TTC squarely on them, when in fact they are not the most appropriate entity for this task. We would suggest changing the Applicability section of this standard (and related standards) to exclude TOP's who are wholly enclosed by a single other TOP, or allow them the choice of deferring to the larger TOP's TTC calculations. We also believe that this standard needs an additional commenting period. |
| Response: The Drafting Team has modified the definition of ATC path, which may address some of your concerns. Additionally, Transmission Operators may delegate tasks to other parties. | |
| Georgia Power Company | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |
| Gulf Power Company | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |
| Hydro One Networks, Inc. | Hydro One Networks Inc. is casting a negative vote on the 6 MOD standards (MOD-001, MOD-004, MOD-008, MOD-28, MOD-029 and MOSD-030) We believe there is a fundamental issue related with effective dates, that is, the dates in which Reliability Standards become effective and enforceable. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in the MOD Standards in ballot as they have implications on neighbouring areas. The words inserted in the Effective Date of the Standards as well as in the Implementation Plan document permit that these Standards are effective in some jurisdictions and not others. These Standards should be modified to ensure that they become effective in all jurisdiction at the same time, including those where such regulatory approval in not required that is, only when all regulatory approvals have been obtained. In addition we offer the following comments to the specific Standard MOD-0028: Requirement R2.1 introduces a threshold for allowing equivalent representation of radial lines and facilities. The chosen value of "161 kV or below" needs justification. |
| Response: Based on the need to support data exchange dependencies, the drafting team has modified the language to read as follows: First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.<br>The 161kV threshold was chosen based on Drafting Team experience for its potential impact on ATC. 161 kV facilities and above are generally accepted to be responsive to transfers, but the drafting team felt it would be too prescriptive to define which facilities below 161 kV would be responsive. The specification of 161 kV doesn't preclude using a lower threshold for equivalencing if desired. | |
| MidAmerican Energy Co. | The Transmission Service Provider should be allowed to post contract path quantities for CA to CA paths when reliability means are met with flowgates with ATCs calculated in accordance with MOD-030-1. |
| Response: These standards don't attempt to mandate what may or may not be posted. The Drafting Team is also not clear on what the specific question or comment is with regards to the MOD 28 standard. If we have not answered your questions please rephrase it so that we can respond to it in the upcoming comment period. | |
| Mississippi Power | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |

| Entity | Comment |
|---|---|
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |
| New York Power Authority | 4) MOD-028-1--recommendation to vote YES to accept, but would like a clarification as to why "161kV or below" was chosen in section R2.1 for being the threshold for allowing equivalent representation of radial lines and facilities. |
| Response: The 161kV threshold was chosen based on Drafting Team experience for its potential impact on ATC. 161 kV facilities and above are generally accepted to be responsive to transfers, but the drafting team felt it would be too prescriptive to define which facilities below 161 kV would be responsive. The specification of 161 kV doesn't preclude using a lower threshold for equivalencing if desired. | |
| Orlando Utilities Commission | This standard should not include any VRF's with a rating above 'lower'. |
| Response: The Drafting Team has modified the standard to set all VRFs to Lower. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling. | |
| Public Service Electric and Gas Co. | PSE&G votes NO for the reasons expressed in PJM's comments. |
| Response: Please see PJM response. | |
| Wisconsin Public Service Corp. | WPSC does not support this standard. Certain MRO members have concerns with the application of the standard for transmission providers who use flowgates. |
| Response: The SDT does not understand the concern expressed. This standard would not apply to entities that elected to use the flowgate methodology. We do not believe there is any conflict between methodologies. | |
| Florida Municipal Power Agency | Many small Transmission Operators are network service customers of, and are wholly enclosed by, a much larger TOP/TSP. They have no viable paths or customers in and of themselves and currently their neighboring TOP/TSP handles all of the ATC-related data and calculations mentioned in this standard. In its current draft, this standard puts the onus of calculating TTC squarely on them, when in fact they are not the most appropriate entity for this task. We would suggest changing the Applicability section of this standard (and related standards) to exclude TOP's who are wholly enclosed by a single other TOP, or allow them the choice of deferring to the larger TOP's TTC calculations. We also believe that this standard needs an additional commenting period. |
| Response: The Drafting Team has modified the definition of ATC path, which may address some of your concerns. Additionally, Transmission Operators may delegate tasks to other parties. | |
| Madison Gas and Electric Co. | The MRO does not support this standard. Certain MRO members have concerns with the application of the standard for transmission providers that use flowgates. |
| Response: The SDT does not understand the concern expressed. This standard would not apply to entities that elected to use the flowgate methodology. We do not believe there is any conflict between methodologies. | |
| Calpine Corporation | The former NERC standard for ATC required that TSPs have and publish their methodology for calculation of ATC. Such a standard has clearly been rejected by FERC, instead opting for much greater transparency. However, we note that |

<table>
<tr><th>Entity</th><th>Comment</th></tr>
<tr><td></td><td>amongst the redlined changes in the version of MOD-001 that is being balloted, the word "transparency" has been deleted from the purpose. We also note that Requirement R3.1 requires that sufficient data will be exchanged to allow for validation of the ATC calculation but in response to EPSA and many others it is clear that NERC will not mandate what if any of this data will be shared with market participants. By deferring that question to NAESB, it makes it very difficult for market participants to evaluate whether this standard provides sufficient transparency. The notion of an ATCID document is a positive step. To have a single document with a comprehensive list of assumptions represents a substantial improvement over the status quo. However, the utility of this document is difficult to evaluate if it is not yet determined which parties will have access to the document. Furthermore, while flexibility is necessary in order to create a standard with applicability across many jurisdictions, allowing undue flexibility as long as assumptions are captured in the ATCID cannot assure market participants of a sufficient degree of standardization. In calculating the ATC or AFC as applicable, a significant factor in the calculations will be the assumed counterflows and postbacks. The standards provide no guidance on these terms, but rather leave them entirely to the discretion of the TSP, subject only to documentation of their assumptions in the ATCID, which might not be visible to market participants</td></tr>
<tr><td colspan="2">Response: Response: NAESB is responsible for determining which information will be shared with market participants. While the standard does promote enhanced transparency, the purpose has been reworded to focus more on the reliability aspects of the standard. The Drafting Team believes that the standard provides an appropriate balance between flexibility and standardization. Where possible, the next posting will provide the links to available draft NAESB documentation.</td></tr>
<tr><td>Duke Energy</td><td>The RC's SOL methodology in FAC-011 is required to include generator contingencies. MOD-028 requires the TO to calculate incremental TTC without exceeding SOLs. If the TTC calculation is performed by scaling generation, then generator contingencies should not have to be considered in addition to the scaling, for the purpose of assuring SOLs are not exceeded.</td></tr>
<tr><td colspan="2">Response: When scaling generation, you are not simulating a contingency – you are just changing dispatch to simulate a transaction. The SDT does not see a conflict.</td></tr>
<tr><td>Electric Power Supply Association</td><td>The former NERC standard for ATC required that TSPs have and publish their methodology for calculation of ATC. Such a standard has clearly been rejected by FERC, instead opting for much greater transparency. However, we note that amongst the redlined changes in the version of MOD-001 that is being balloted, the word "transparency" has been deleted from the purpose. The drafting team does not believe any change is necessary. | |
| MidAmerican Energy Co. | Although this standard leaves much to be desired, it is better than the current standard. I hope NERC continues to work towards consistency in the arena of transfer capability. |
| Response: Thank you for your comment, the drafting team will continue its work in developing reliability standards. | |
| PP&L, Inc. | Confirmed TSR's affect non-firm ATC rather than schedules affecting Non-firm ATC. |
| Response: Confirmed firm TSR's affect Non-firm ATC and unscheduled firm TSR's affect non-firm ATC consistent with postback processes being developed by NAESB. | |
| PSEG Energy Resources & Trade LLC | PSEG Energy Resources & Trade votes NO for the reasons expressed by PJM in its ballot. |
| Response: Please see PJM response. | |
| Commonwealth of Massachusetts Department of Public Utilities | The Massachusetts DPU would like a clarification as to why "161kV or below" was chosen in section R2.1 for being the threshold for allowing equivalent representation of radial lines and facilities. |
| Response: The 161kV threshold was chosen based on Drafting Team experience for its potential impact on ATC. 161 kV facilities and above are generally accepted to be responsive to transfers, but the drafting team felt it would be too prescriptive to define which facilities below 161 kV would be responsive. The specification of 161 kV doesn't preclude using a lower threshold for equivalencing if desired. | |
| Wyoming Public Service Commission | [i] Nothing in this Methodology should prevent the use of diversity interchange (such as ADI) to improve overall grid efficiency. [ii] In R6.3, remove the words "in duration" from the end of the sentence, viz: "provided such outage is expected to last 24 hours or longer in duration." "In duration" is redundant. |
| Response: The Drafting Team does not believe the standard prohibits the use of ACE Diversity Interchange (ADI) or similar enhancements. If Wyoming Public Service Commission believes otherwise, please detail the potential conflicts in future comments.<br>The Drafting Team has removed the redundant language as suggested. | |
| Midwest Reliability Organization | The MRO does not support this standard. Certain MRO members have concerns with the application of the standard for transmission providers that use flowgates. |
| Response: The SDT does not understand the concern expressed. This standard would not apply to entities that elected to use the flowgate methodology. We do not believe there is any conflict between methodologies. | |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007
5. SDT posted second draft for comment from October 31–December 14, 2007.

**Description of Current Draft:**

This is the third and final draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. First ballot of standard. | March 7, 2008 |
| 2. Respond to comments. | April 22, 2008 |
| 3. Recirculation ballot. | April 22, 2008 |
| 4. 30 Day posting before board adoption. | March 7, 2008 |
| 5. Board adoption. | May 5, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Transmission Reliability Margin Implementation Document (TRMID):** A document that describes the implementation of a Transmission Reliability Margin methodology.

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**
2. **Number:** **MOD-008-1**
3. **Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to support analysis and system operations.
4. **Applicability:**
   **4.1.** Transmission Operator.
   **4.2.** Transmission Service Provider.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R1.1.** Identification of (on each of its respective ATC Paths or Flowgates) each of the following components of uncertainty if used in calculating TRM, and a description of how that component is used to calculate a TRM value:

- Aggregate Load forecast uncertainty (not included in determining generation reliability requirements for CBM).
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window).
- Reserve sharing requirements.
- Inertial response and frequency bias.

**R1.2.** A statement to confirm that it shall use assumptions in calculating TRM that are consistent with those assumptions that are used in the Transmission planning process for the time period studied .

**R1.3.** The description of the method used to allocate TRM across ATC Paths or Flowgates.

**R1.4.** The identification of the TRM calculation used for the following time periods:

**R1.4.1.** Same day and real-time.

**R1.4.2.** Day-ahead and pre-schedule.

**R1.4.3.** Beyond day-ahead and pre-schedule, up to thirteen months ahead.

**R1.5.** If TRM is not used, a statement of that practice.

**R2.** Each Transmission Operator shall only use the components of uncertainty from R1.1 to calculate TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R3.** Each Transmission Operator shall make available its TRMID, and any underlying documentation, work papers and load flow base cases used to determine TRM, to any of the following who make a written request no more than 30 calendar days after receiving the request. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- Transmission Service Providers
- Reliability Coordinators
- Planning Coordinators
- Transmission Operators

**R4.** Each Transmission Operator using TRM shall recalculate TRM values in accordance with the TRMID at least once every 13 months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

**R5.** The Transmission Operator using TRM shall provide the TRM values to its Transmission Service Provider(s) and Transmission Planner(s) no more than seven calendar days after they change. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

## C. Measures

**M1.** Each Transmission Operator shall produce its TRMID evidencing inclusion of all specified information in R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, and CBMID , or other evidence, (such as written documentation, study reports, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

**M3.** Each Transmission Operator shall provide a dated copy of any request for its TRMID or associated documentation, and evidence such as copies of emails or postal receipts that show the recipient, date and contents as evidence that the requested documentation was provided within the specified timeframe to the entities described in R3. (R3)

**M4.** Each Transmission Operator shall provide evidence (such as logs, study report, review notes, or data) that it recalculated TRM values at least once every thirteen months for each of the TRM time periods. (R4)

**M5.** Each Transmission Operator shall provide evidence (such as logs, email, website postings) that it provided their Transmission Service Provider(s) and Transmission Planner(s) with the updated TRM value as described in R5. (R5)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

- The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.
- The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes

Any of the following may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

#### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator has a TRMID that does not incorporate changes made up to three months ago. | The Transmission Operator has a TRMID that does not incorporate changes that have been made three or more months ago but less than six months ago.<br>**OR**<br>The Transmission Operator's TRMID does not address one of the sub requirements. | The Transmission Operator has a TRMID that does not incorporate changes that have been made six or more months ago but less than one year ago.<br>**OR**<br>The Transmission Operator's TRMID does not address two or three of the sub requirements. | The Transmission Operator has a TRMID that does not incorporate changes that have been made more than one year ago.<br>**OR**<br>The Transmission Operator does not have a TRMID;<br>**OR**<br>The Transmission Operator's TRMID does not address 4 or more of the sub requirements. |
| R2. | N/A | N/A | N/A | The Transmission Operator included elements of uncertainty not defined in R1 in their calculation of TRM.<br>**OR**<br>The Transmission Operator included components of CBM in TRM. |
| R3. | The Transmission Operator provided the TRMID to a requesting entity specified in R3 but provided TRMID in more than 30 days but less than 45 days. | The Transmission Operator provided the TRMID to a requesting entity specified in R3 but provided TRMID in 45 days or more but less than 60 days. | The Transmission Operator provided the TRMID to a requesting entity specified in R3 but provided TRMID in 60 days or more but less than 90 days. | The Transmission Operator did not provide the TRMID for 90 days or more. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R4 | N/A | The Transmission Operator did not determine TRM within thirteen months of the previous determination, and the last determination was not more than 15 months ago. | The Transmission Operator determined TRM 15 months ago or more, but not more than 18 months ago. | The Transmission Operator did not determine TRM<br>OR<br>The last determination of TRM was 18 months ago or more. |
| R5 | The Transmission Operator did provide the TRM to all entities specified in more then 7 days but less than 14 days. . | The Transmission Operator did provide the TRM to all entities specified in 14 days or more, but less than 30 days. | The Transmission Operator did provide the TRM to all entities specified in 30 days or more, but less than 60 days. | The Transmission Operator did not provide the TRM to all entities specified within 60 days of the change. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007
5. SDT posted second draft for comment from October 31–December 14, 2007.

**Description of Current Draft:**

This is the third and final draft of the proposed standard posted for stakeholder comments. This draft includes ~~the modifications identified in the SAR with~~ consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| 4. 30 Day posting before board adoption. | March 7, 2008 |
| 5. Board adoption. | May 5, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Transmission Reliability Margin Implementation Document (TRMID):** A document that describes the implementation of a Transmission Reliability Margin methodology.

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**

2. **Number:** **MOD-008-1**

3. **Purpose:** To promote the consistent and ~~transparent~~ reliable calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to ~~ensure~~ support ~~reliable~~ analysis and system operations.

4. **Applicability:**

   **4.1.** Transmission Operator.

   **4.2.** Transmission Service Provider.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date ~~that all six (MOD-001-1, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1, MOD-030-1)ATC-related standards are~~this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date th~~e set of~~is standard~~s~~ is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** Identification of (on each of its respective ~~Posted~~ ATC Paths or Flowgates) each of the following components of uncertainty if used in calculating TRM, and a description of how that component is used to calculate a TRM value:

- Aggregate Load forecast uncertainty (not included in determining generation reliability requirements for CBM).
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window).
- Reserve sharing requirements.
- Inertial response and frequency bias.

**R1.2.** A statement to confirm that it shall use assumptions in calculating TRM that are consistent with those assumptions that are used in ~~any associated~~

~~operations studies or~~the Transmission planning ~~studies~~process for the ~~corresponding~~ time period studied .

~~**R1.2.**periods.~~

**R1.3.** The description of the method used to allocate~~of~~ TRM ~~allocation~~ across ATC~~Posted~~ Paths or Flowgates.

**R1.4.** The identification of the TRM calculation used for the following time periods:

**R1.4.1.** Same day and real-time.

**R1.4.2.** Day-ahead and pre-schedule.

**R1.4.3.** Beyond day-ahead and pre-schedule, up to thirteen months ahead.

**R1.5.** If TRM is not used, ~~zero for all the time periods listed in R1.4,~~ a statement of that practice.

**R2.** ~~The~~ Each Transmission Operator shall only use the components of uncertainty from R1.1 to calculate TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. ~~Transmission capacity required for the period immediately following a contingency and up to 59 minutes following the contingency is included in TRM.~~ [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.** Each Transmission Operator shall make available ~~provide~~ its TRMID, and any underlying documentation, work papers and load flow base cases used to determine TRM, to any~~all~~ of the following who make a written ~~within seven calendar days of a~~ request no more than 30 calendar days after receiving the request. ~~:~~ [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- ~~The Transmission Service Provider responsible for tariff administration over the Facilities operated by the Transmission Operator~~
- ~~The Reliability Coordinator responsible for oversight of the Facilities for which the Transmission Service Provider offers service.~~
- Transmission Service Providers
- Reliability Coordinators
- Planning Coordinators
- Transmission Operators

~~**R4.**Each Transmission Service Provider shall make available within seven calendar days of a documented request for such information the TRMIDs used by its Transmission Operator(s), and any underlying documentation, work papers and load flow base cases used to determine TRM, to Transmission Service Providers who have made a request for such information. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]~~

~~**R5.** Each Transmission Operator shall calculate, at least once every 13 months (in accordance with the definitions in its TRMID), a TRM value for the following time periods (on each Posted Path or Flowgate) and shall provide these TRM values to its Transmission Service Provider(s) and Transmission Planner(s) within seven calendar~~

~~days of the calculation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]~~

~~**R5.1.**R4.1 Same day and real-time.~~

~~**R5.2.**R4.2 Day-ahead and pre-schedule.~~

**R4.** Each Transmission Operator using TRM shall recalculate TRM values in accordance with the TRMID at least once every 13 months. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

**R5.** The Transmission Operator using TRM shall provide the TRM values to its Transmission Service Provider(s) and Transmission Planner(s) no more than seven calendar days after the~~ir~~y changing~~e~~. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

## C. Measures

**M1.** Each~~The~~ Transmission ~~Service Provider~~Operator shall produce its ~~current~~ TRMID evidencing inclusion of all specified information ~~described~~ in ~~R1to show its compliance with~~ R1. ~~.~~(R1)

**M2.** ~~The~~ Each Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, and CBMID , or other evidence, (such as written documentation, study reports, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

**M3.** ~~The~~ Each Transmission Operator shall provide a dated copy of any request for its TRMID or associated documentation, and evidence such as copies of emails or postal receipts that show the recipient, date and contents as evidence that the requested documentation was provided within the specified timeframe to the entities described in R3. (R3)

~~**M4.**The Transmission Service Provider shall provide a dated copy of any request for its Transmission Operator's TRMID or associated documentation, and evidence such as copies of emails or postal receipts that show the recipient, date and contents as evidence that the requested documentation was provided within the specified timeframe to the requesting entity as described in R4. (R4)~~

~~**M5.**The Transmission Operator shall provide evidence (such as logs and data that it determined TRM at least once every thirteen months for each of the listed time periods and provided it to their Transmission Service Provider(s) and Transmission Planner(s) as described in R5. (R5)~~

**M4.** ~~The~~Each Transmission Operator shall provide evidence (such as logs, study report, review notes, or data) that it recalculated TRM values at least once every thirteen months for each of the TRM time periods. (R4)

**M5.** ~~The~~Each Transmission Operator shall provide evidence (such as logs, email, website postings) that it provided their Transmission Service Provider(s) and Transmission Planner(s) with the updated TRM value as described in R5. (R5)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

- The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.
- The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes

Any of the following may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

#### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |

# Implementation Plan for Standard MOD-008-1; ATC/TTC/AFC and CBM/TRM Revisions (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-008-1, which describes the reliability aspects of determining and maintaining a Transmission Reliability Margin and what components of uncertainty may be considered when making that determination.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs) that must be implemented before this standard can be implemented.

## Modified Standards

This standard supersedes MOD-008-1. MOD-009-0 has been incorporated into this standard, made irrelevant by this standard, or is being addressed by the North American Energy Standards Board, and should be retired.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-008-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

## Summary Consideration of Comments:

The Drafting Team has reviewed the comments and made some changes to the standard to address these comments.

1. The Drafting Team changed the language to specify the TRM be “established” instead of “calculated” in requirement 4 and all subsequent references to the number.

2. The drafting team removed the requirement that the assumptions used in Transmission Reliability Margin studies be consistent with those used in "associated" operations or planning studies. Studies used for TRM are based on non-standard scenarios, and would be inappropriate to make consistent with “normal” studies.

3. All VRFs were set to “Lower” in response to industry comments. A medium risk factor is appropriate for “a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures.” A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator’s existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.

4. A more graded approach was applied to the VSLs where appropriate.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedure: http://www.nerc.com/standards/newstandardsprocess.html.

| Entity | Comment |
|---|---|
| Associated Electric Cooperative, Inc. | AECI does not understand why there can not be an option to continue to use the conservative 5% option that the NERC white paper dated 7/14/1999 suggest is reasonable. It takes a lot of effort to provide the document being requested for TRM. If we are currently using the rule of thumb method (i.e. 5%) this should be and option. If an entity want to go less than 5% the entity should provide all the basis for the justification as noted in the standard. The VSLs are also high. |
| Response: The standard does allow the use of 5%, but requires an explanation of what the percentage represents. In addition the Drafting Team added language to Requirement 3 to be clear that entities only have to provide information that was used, not create information to support a request. Members of the Drafting Team reviewed the white paper referenced and other resources and do not, at this time, have sufficient technical information to establish a default or recommended TRM that would adequately balance reliability and market availability for all parts of North America.<br>The Drafting Team has redrafted the VSLs to include more gradation criteria | |
| CenterPoint Energy | ERCOT's filed comments to the SDT that ATC, TTC, CBM, and TRM are not applicable within ERCOT operations and that these Standards should have provisions that make it clear that these requirements apply only within market structures in which they are pertinent were ignored by the SDT. These standards should not apply to ERCOT, thus our negative vote. |
| MOD-008 only applies to Transmission Operators that maintain TRM. | |
| FirstEnergy Energy Delivery | FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. We offer the following general comments in addition to our specific standard comments presented below.<br>CBM & TRM - MARKET AREAS: FE supports the drafting team's approach of three ATC methodologies presented in MOD-028, MOD-029 and MOD-030 to account for differences in calculating ATC in various geographic areas of the bulk electric system. However, the use of a single standard methodology for CBM and TRM as currently written does not meet the needs for entities operating within a market area such as MISO, PJM etc.<br>FE suggests that various requirements in the proposed standards that are currently applicable to the TP and TOP are actually handled by the RTO and within a market area would more appropriately be assigned to the Planning Coordinator (PC) and Reliability Coordinator (RC), respectively. This change would allow the proposed standards for CBM and TRM to be used largely "as is" within both market and non-market areas as the PC and RC would be appropriate in both.<br>Our comments below on specific MOD standards elaborate on this point and provide examples where we feel the applicability is inappropriately assigned to TP or TOP responsible entities within a transmission market construct.<br>DECISION TO BALLOT: While the MOD standards presented are improving in content FE believes the standards should have been issued for one more comment period prior to ballot per the NERC Standard Development Procedures (SDP). In many cases this is only the 2nd draft version being reviewed by industry. The objective during the "Solicit Public Comments on Draft Standard (Step 6)" of the NERC SDP is to "Receive stakeholder inputs on the draft standard for the purpose of assessing consensus on the draft standard, and modifying the draft standard as needed to improve consensus." Based on the 200+ pages of comments of the prior draft version it is hard to conclude that the industry was near consensus. Additionally, per the SDP, now that the standards have gone to First Ballot (Step 9), the standard drafting team is not permitted to make any changes to the standards based on comments received during this First Ballot. The drafting team will now be required to rely on their responses to industry feedback to try and improve consensus during a re-circulation ballot. |

<table>
<tr><th>Entity</th><th>Comment</th></tr>
<tr><td></td><td>FE has concerns with the consequences of this decision with regard to the integrity of the standard development process and substantive registered entity perspectives. FirstEnergy Corp.<br>Response: The Drafting Team has withdrawn the standard from the balloting process and will be posting it again for industry comment.<br><br>(FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. However, at this time, FE is voting Negative to this standard with the following comments and suggestions:<br>– For utilities involved in market structures, the Transmission Service Provider (TSP) is ultimately responsible for calculating and assuring proper ATC for its footprint. Therefore in these instances it would not be appropriate that the Transmission Operator (TOP) be responsible for maintaining a TRMID. For example, in the MISO footprint, MISO maintains and implements a single TRMID for all of its member companies. The standard should reflect these alternative industry situations through either changes in the requirements or addition of market or regional variances specifically stated in the standard.<br>– Additionally, per MOD-004 R1, the TSP is responsible for maintaining a CBMID, and then it should follow that the TSP and not the TOP would be responsible for maintaining a TRMID.<br>Response: In order for the standard to be audited one entity alone must be accountable for a requirement. In the case of TRM the team decided for two reasons to assign this to the Transmission Operator. The first reason was the Transmission Operator is the ultimate customer of this value since the Transmission Operator is the one who has deal with the results of the TRM selection. The second is that the Transmission Operator is the lowest entity in the hierarchy, and in some cases the Transmission Operator may not wish to relegate this authority to someone else, and by not assigning it to them the team would have limited their options in that regard. Ultimately the team believes that in cases where TRM is used, the Transmission Operator is responsible for either developing the TRM or insuring that it is developed. Nothing in the standard prevents the Transmission Operator from contracting the responsibility and accepting another parties TRMID and TRM values.</td></tr>
<tr><td colspan="2">Response: Please see in-line responses.</td></tr>
<tr><td>Great River Energy</td><td>GRE agrees with the PJM and MISO recommendation that the standard needs an additional commenting period based on the significance of the comments submitted during the previous commenting periods.</td></tr>
<tr><td colspan="2">Response: The Drafting Team has withdrawn the standard from the balloting process and will be posting it again for industry comment.</td></tr>
<tr><td>Hydro One Networks, Inc.</td><td>Hydro One Networks Inc. is casting a negative vote on the 6 MOD standards (MOD-001, MOD-004, MOD-008, MOD-28, MOD-029 and MOSD-030) We believe there is a fundamental issue related with effective dates, that is, the dates in which Reliability Standards become effective and enforceable. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in the MOD Standards in ballot as they have implications on neighbouring areas. The words inserted in the Effective Date of the Standards as well as in the Implementation Plan document permit that these Standards are effective in some jurisdictions and not others. These Standards should be modified to ensure that they become effective in all jurisdiction at the same time, including those where such regulatory</td></tr>

| Entity | Comment |
|---|---|
| | approval in not required that is, only when all regulatory approvals have been obtained, |
| Response: The Drafting Team does not believe this standard must be implemented at the same time throughout North America. | |
| Kansas City Power & Light Co. | Requirements state that the Transmission Operator is to perform functions that are currently performed by the SPP Transmission Service Provider for KCPL. Suggest revising requirements by adding "or Transmission Service Provider" after "Transmission Operator" so that either entity could perform these tasks. |
| Response: In order for the standard to be audited one entity alone must be accountable for a requirement. In the case of TRM the team decided for two reasons to assign this to the Transmission Operator. The first reason was the Transmission Operator is the ultimate customer of this value since the Transmission Operator is the one who has deal with the results of the TRM selection. The second is that the Transmission Operator is the lowest entity in the hierarchy, and in some cases the Transmission Operator may not wish to relegate this authority to someone else, and by not assigning it to them the team would have limited their options in that regard. Ultimately the team believes that in cases where TRM is used, the Transmission Operator is responsible for either developing the TRM or insuring that it is developed. Nothing in the standard prevents the Transmission Operator from contracting the responsibility and accepting another parties TRMID and TRM values. | |
| Potomac Electric Power Co. | Potomac Electric agrees with the comments of PJM distributed to the ballot body. I will not repeat them here, but do include the headings:<br>I. The ATC MOD standards should have been sent out for comment not pre-ballot posting.<br>II. Depth of the ATC MOD standards is excessive.<br>III. Determining Violation Risk Factors is incorrect. I<br>IV. Determining Violation Severity Levels is incomplete. |
| Response: Please see response to PJM. | |
| Public Service Electric and Gas Co. | PSE&G votes NO for the reasons expressed in PJM's comments. |
| Response: Please see response to PJM. | |
| Southern Company Services, Inc. | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| Response: Thank you for your support. However, based on industry response, the drafting team has made modifications to the standard and is reposting for another comment period. | |
| Westar Energy | Should also apply to Transmission Planners and Planning Authorities |
| Response: The TRM value is developed by the Transmission Operator so there are no requirements placed on the Transmission Planner or Planning Coordinator, and therefore they are not listed in the applicability section. As part of the review regarding your comment, the Drafting Team removed the Transmission Service Provider since they no longer have requirements under MOD 008. The team extensively discussed | |

| Entity | Comment |
|---|---|
| adding a new requirement addressing the Transmission Planner and Planning Coordinator; however the drafting team determined that they could not draft language to tie the TRM to operational and planning studies without essentially creating another planning or operational planning standard in addition to the existing one. From a reliability perspective, if the entity is meeting the operational and planning requirements then they are by definition planning a reliable system regardless of their inclusion or exclusion of TRM from those studies. If an entity is using an overly restrictive TRM or using a TRM that is inconsistent with their planning practices this is a commercial or hoarding issue, and not a transmission reliability issue (which is the focus of NERC standards). Additionally, since TRM is based on studies that go beyond the "normal" operations of the system, the drafting team felt it would be inappropriate to require these "what if" scenarios to be limited by those studies used in normal operations planning. | |
| New York Independent System Operator | The NYISO agrees with PJM that:<br>– the assumptions used in Transmission Reliability Margin studies need not necessarily be consistent with those used in "associated" operations or planning studies and that R1 should be modified accordingly (including to clarify what counts as an "associated" study;<br>Response: The drafting team has eliminated this requirement from the standard.<br><br>– R3 should allow a default percentage to be used without requiring underlying documentation, work papers, or load flow base cases if they are not used to determine that percentage;<br>Response: Nothing in the standard precludes the use of a percentage. Although the standard does require an explanation of what the percentage represents, it no longer explicitly requires any specific underlying documentation.<br><br>– revised requirements R4 and R5 are overly prescriptive,<br>– establish TRM recalculation frequency requirements that should be left to NAESB,<br>– and have been assigned an inappropriately severe violation risk factor that (Medium) that is not consistent with NERC's own rules on defining risk factors; and<br>– revised R5's proposed violation severity levels that do not recognize that there may be differing level of non-compliance.<br>– The NYISO is also concerned that revised requirement R4 would require TRM to be recalculated more frequently than necessary for Transmission Operators whose TRM assumptions do not change frequently. At a minimum, the NYISO requests that the SDT modify R4 in the same way that MOD-001 requirement R7 was revised, i.e., so that TRM need not be recalculated every 13 months to the extent that none of the underlying inputs change.<br>Response: The Drafting Team changed the language to specify "establishing" of the TRM values once every 13 months. The change to "establish" was made to emphasize that simply affirming the current value should continue to be used is sufficient for compliance. The Drafting Team believes that this is appropriate to be assigned to NERC. The team has moved all the violation risk factors to low, and has redrafted the VSLs to include more gradation criteria. The team has determined that if entities are using these values to allow transactions, then the ATC value (including its components such as TRM) is important to reliability. |
| Response: Please see in-line responses. | |

| Entity | Comment |
| --- | --- |
| PJM Interconnection, L.L.C. | MOD-008 Specific Comments:<br>PJM believes no requirement from the set of ATC standards should have an assigned Risk Factor exceeding "Lower". A Lower Risk Factor requirement is administrative in nature and<br>(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or<br>(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system. The ATC MOD standards should have been sent out for comment not pre-ballot posting.<br>Response: The Drafting Team in response to the industry comments has set the VRF's to lower for all requirements. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.<br><br>Requirement 1<br>– R1.2 requires the use of assumptions consistent with those used in the Transmission planning process, while MOD-001 R6 requires the use of assumptions consistent with those used in associated operations studies or planning studies. This difference needs to be clarified and consistent among all the MOD standards where applicable. PJM believes that the language should be modified because there are many studies that are performed within the different Functions and can serve different purposes. Therefore, ATC calculations assumptions need not be consistent with this diverse array of studies.<br>– The phrase "associated studies" can be ambiguous and subject to interpretation without more clarity. PJM proposes that TRM standards follow the same type exclusion as mentioned for MOD-001 R6: TRM assumptions need not be consistent with assumptions used in Transmission planning process not associated with calculating TTC, AFC, and ATC.<br>Response: The Drafting Team has eliminated R1.2.<br><br>Requirement 3<br>– R3 should allow a default percentage to be used without requiring specific documentation, work papers and load flow cases if a straight percentage like 5% is used. Additional information would be required only if a greater |

| Entity | Comment |
|---|---|
| | amount is used. This requirement is burdensome for a component of ATC that should be easy to assess its reasonableness.<br>Response: The standard does allow the use of 5%, but requires an explanation of what the percentage represents. In addition the Drafting Team added language to Requirement 3 to be clear that entities only have to provide information that was used, not create information to support a request. Members of the Drafting Team reviewed the white paper referenced by AECI and other resources and do not, at this time, have sufficient technical information to establish a default or recommended TRM that would adequately balance reliability and market availability for all parts of North America.<br><br>Requirement 4<br>– R4 is NAESB scope because the requirements address timeframes to provide information and the frequency of recalculation. These requirements at best are minor requirements that will not affect reliability because a TSP can assign a reasonable TRM per R1.2 whether they own the facilities or not and the TRM changes infrequently. These reasons indicate that the requirements should not have a Violation Risk factor of Medium but should not even be requirements.<br>Response: The Drafting Team changed the language to specify "establishing" of the TRM values once every 13 months. The change to "establish" was made to emphasize that simply affirming the current value should continue to be used is sufficient for compliance. The team has moved all the violation risk factors to low. The team has determined that if entities are using these values to allow transactions, then the ATC value (including its components such as TRM) is important to reliability.<br><br>– The "Medium" risk factor is inconsistent with NERC's definition of risk factors and should be changed to "Lower" if the requirement is to be retained.<br>Response: The Drafting Team has modified this risk factor to Lower in response to industry concerns.<br><br>Requirement 5<br>– The "Medium" risk factor is inconsistent with NERC's definition of risk factors and should be changed to "Lower" if the requirement is to be retained.<br>Response: The Drafting Team has modified this risk factor to Lower in response to industry concerns.<br><br>– R5, the measure M5, and the Violation Severity Level should be graded to include the number of facilities or flowgates not provided. Example is if the TSP missed providing TRM information to a requestor on one of the 300 coordinated flowgates and the requestor didn't spot it, but an auditor did 90 days later it is a severe reliability threatening violation. If 5 flowgates were missed that could be considered five separate severe violations for something that can be assigned by TSP for their process, but not easy to determine if the value they used was actually provided by the flowgate owner TSP.<br>Response: The drafting team has modified the VSLs to be more graded. |

<tr><td colspan="2">Response: Please see response to PJM.</td></tr>
<tr><td>FirstEnergy Solutions</td><td>FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. We offer the following general comments in addition to our specific standard comments presented below.<br>CBM & TRM - MARKET AREAS: FE supports the drafting team's approach of three ATC methodologies presented in MOD-028, MOD-029 and MOD-030 to account for differences in calculating ATC in various geographic areas of the bulk electric system. However, the use of a single standard methodology for CBM and TRM as currently written does not meet the needs for entities operating within a market area such as MISO, PJM etc.<br>FE suggests that various requirements in the proposed standards that are currently applicable to the TP and TOP are actually handled by the RTO and within a market area would more appropriately be assigned to the Planning Coordinator (PC) and Reliability Coordinator (RC), respectively. This change would allow the proposed standards for CBM and TRM to be</td></tr>
</table>

| Entity | Comment |
|---|---|
| | used largely "as is" within both market and non-market areas as the PC and RC would be appropriate in both.<br>Our comments below on specific MOD standards elaborate on this point and provide examples where we feel the applicability is inappropriately assigned to TP or TOP responsible entities within a transmission market construct.<br>DECISION TO BALLOT: While the MOD standards presented are improving in content FE believes the standards should have been issued for one more comment period prior to ballot per the NERC Standard Development Procedures (SDP). In many cases this is only the 2nd draft version being reviewed by industry. The objective during the "Solicit Public Comments on Draft Standard (Step 6)" of the NERC SDP is to "Receive stakeholder inputs on the draft standard for the purpose of assessing consensus on the draft standard, and modifying the draft standard as needed to improve consensus." Based on the 200+ pages of comments of the prior draft version it is hard to conclude that the industry was near consensus. Additionally, per the SDP, now that the standards have gone to First Ballot (Step 9), the standard drafting team is not permitted to make any changes to the standards based on comments received during this First Ballot. The drafting team will now be required to rely on their responses to industry feedback to try and improve consensus during a re-circulation ballot. FE has concerns with the consequences of this decision with regard to the integrity of the standard development process and substantive registered entity perspectives.<br>Response: The Drafting Team has withdrawn the standard from the balloting process and will be posting it again for industry comment.<br><br>FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. However, at this time, FE is voting Negative to this standard with the following comments and suggestions:<br>– For utilities involved in market structures, the Transmission Service Provider (TSP) is ultimately responsible for calculating and assuring proper ATC for its footprint. Therefore in these instances it would not be appropriate that the Transmission Operator (TOP) be responsible for maintaining a TRMID. For example, in the MISO footprint, MISO maintains and implements a single TRMID for all of its member companies. The standard should reflect these alternative industry situations through either changes in the requirements or addition of market or regional variances specifically stated in the standard.<br>– Additionally, per MOD-004 R1, the TSP is responsible for maintaining a CBMID, and then it should follow that the TSP and not the TOP would be responsible for maintaining a TRMID.<br>Response: In order for the standard to be audited one entity alone must be accountable for a requirement. In the case of TRM the team decided for two reasons to assign this to the Transmission Operator. The first reason was the Transmission Operator is the ultimate customer of this value since the Transmission Operator is the one who has deal with the results of the TRM selection. The second is that the Transmission Operator is the lowest entity in the hierarchy, and in some cases the Transmission Operator may not wish to relegate this authority to someone else, and by not assigning it to them the team would have limited their options in that regard. Ultimately the team believes that in cases where TRM is used, the Transmission Operator is responsible for either developing the TRM or insuring that it is developed. Nothing in the standard prevents the Transmission Operator from contracting the responsibility and accepting another parties TRMID and TRM values. |

|---|---|
| Florida Municipal Power Agency | We believe this standard needs an additional commenting period. |
| | Response: The Drafting Team has withdrawn the standard from the balloting process and will be posting it again for industry comment. |
| Georgia Power Company | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| | Response: Thank you for your support. However, based on industry response, the drafting team has made modifications to the standard and is reposting for another comment period. |
| Gulf Power Company | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| | Response: Thank you for your support. However, based on industry response, the drafting team has made modifications to the standard and is reposting for another comment period. |
| Hydro One Networks, Inc. | Hydro One Networks Inc. is casting a negative vote on the 6 MOD standards (MOD-001, MOD-004, MOD-008, MOD-28, MOD-029 and MOSD-030) We believe there is a fundamental issue related with effective dates, that is, the dates in which Reliability Standards become effective and enforceable. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in the MOD Standards in ballot as they have implications on neighbouring areas. The words inserted in the Effective Date of the Standards as well as in the Implementation Plan document permit that these Standards are effective in some jurisdictions and not others. These Standards should be modified to ensure that they become effective in all jurisdiction at the same time, including those where such regulatory approval in not required that is, only when all regulatory approvals have been obtained. |
| | Response: The Drafting Team does not believe this standard must be implemented at the same time throughout North America. |
| Lincoln Electric System | LES agrees with the PJM and MISO recommendation that the standard needs an additional commenting period. |
| | Response: The Drafting Team has withdrawn the standard from the balloting process and will be posting it again for industry comment. |
| MidAmerican Energy Co. | I agree with the PJM recommendation that the standard needs an additional commenting period. |

| Mississippi Power | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| | Response: Thank you for your support. However, based on industry response, the drafting team has made modifications to the standard and is reposting for another comment period. |

| Entity | Comment |
| --- | --- |
| Orlando Utilities Commission | This standard should contain only 'lower' level VRF's. |
| Response: The drafting team has modified the VRFs to be Lower. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling. | |
| Public Service Electric and Gas Co. | PSE&G votes NO for the reasons expressed in PJM's comments. |
| Response: Please see response to PJM. | |
| Wisconsin Public Service Corp. | WPSC agrees with the PJM and MISO recommendation that the standard needs an additional commenting period |
| Response: The Drafting Team has withdrawn the standard from the balloting process and will be posting it again for industry comment. | |
| Florida Municipal Power Agency | We believe this standard needs an additional commenting period. |
| Response: The Drafting Team has withdrawn the standard from the balloting process and will be posting it again for industry comment. | |
| Madison Gas and Electric Co. | We agree with the PJM and MISO recommendation that the standard needs an additional commenting period . |
| Response: The Drafting Team has withdrawn the standard from the balloting process and will be posting it again for industry comment. | |
| WPS Resources Corp. | Need to include a definition of "TRM".<br>Response: TRM is defined in the NERC glossary of terms: "Transmission Reliability Margin (TRM) — That amount of transmission transfer capability necessary to ensure that the interconnected transmission network is secure under a reasonable range of uncertainties in system conditions. See Available Transfer Capability."<br><br>R3 - the TRM implementation document (TRMID) should be made available to all users, owners, and operators.<br>Response: R3 applies to the entities that may have a reliability need to review the material, access to the material by others would be established through other processes, for example NAESB. |

| Entity | Comment |
|---|---|
| | R1.1 - a subsection of R1.1 refers to CBM and "generation reliability requirements". CBM should be tied to "resource adequacy assessment requirements".<br>Response: The drafting team revised the wording to remove descriptors beyond CBM. |
| Response: Please see in-line responses. | |
| AEP Service Corp. | By definition TRM is a margin based largely upon the confidence in the accuracy of the calculation process for ATC, therefore its more of a TSP function that any other entity. Since TRM is an input to ATC determination, and not used in Operation of the system, the responsibility is misplaced. delegation of this 'responsibility' is not appropriate because TRM is not used in real time operation.<br>Response: In order for the standard to be audited one entity alone must be accountable for a requirement. Nothing in the standard prevents the Transmission Operator from contracting the responsibility and accepting another parties TRMID and TRM values.<br><br>There must also be an exclusion for those partiers that do not calculate ATC -- such as ERCOT, NEISO, AEP (we are a TOP in SPP and PJM)<br>Response: The TRM standard applicability has been modified to apply only to those entities that have elected to maintain a TRM. |
| Response: Please see in-line responses. | |
| Calpine Corporation | The former NERC standard for ATC required that TSPs have and publish their methodology for calculation of ATC. Such a standard has clearly been rejected by FERC, instead opting for much greater transparency. However, we note that amongst the redlined changes in the version of MOD-001 that is being balloted, the word "transparency" has been deleted from the purpose.<br>We also note that Requirement R3.1 requires that sufficient data will be exchanged to allow for validation of the ATC calculation but in response to EPSA and many others it is clear that NERC will not mandate what if any of this data will be shared with market participants. By deferring that question to NAESB, it makes it very difficult for market participants to evaluate whether this standard provides sufficient transparency.<br>The notion of an ATCID document is a positive step. To have a single document with a comprehensive list of assumptions represents a substantial improvement over the status quo. However, the utility of this document, is difficult to evaluate if it is not yet determined which parties will have access to the document. |

| Entity | Comment |
|---|---|
| | Furthermore, while flexibility is necessary in order to create a standard with applicability across many jurisdictions, allowing undue flexibility as long as assumptions are captured in the ATCID cannot assure market participants of a sufficient degree of standardization. |
| Response: These comments are related to the MOD 001 standard and not to the MOD 008 TRM standard; therefore the Drafting Team will not provide a specific response here. | |
| Electric Power Supply Association | EPSA supports the use of a TRMID document as a positive step toward greater transparency. To have a single document with a comprehensive list of assumptions represents a substantial improvement over the status quo. However, the ultimate use of such a document, cannot be evaluated if the document access has not been clarified.<br>Furthermore, while flexibility is necessary in order to create a standard with applicability across many jurisdictions, allowing undue flexibility as long as assumptions are captured in the TRMID cannot assure market participants of a sufficient degree of standardization. |
| Response: R3 applies to the entities that may have a reliability need to review the material, access to the material by others would be established through other processes, for example NAESB.<br>We recognize that at this time, the standard is more flexible than might be desired, and will recommend that NERC do additional work after the transparency issues have been addressed. Members of the Drafting Team do not, at this time, have sufficient technical information to establish a default or recommended TRM that would adequately balance reliability and market availability for all parts of North America. | |
| FirstEnergy Solutions | FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. We offer the following general comments in addition to our specific standard comments presented below.<br>CBM & TRM - MARKET AREAS: FE supports the drafting team's approach of three ATC methodologies presented in MOD-028, MOD-029 and MOD-030 to account for differences in calculating ATC in various geographic areas of the bulk electric system. | Response: The Drafting Team has withdrawn the standard from the balloting process and will be posting it again for industry comment. | |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007
5. SDT posted second draft for comment from October 31–December 14, 2007.

**Description of Current Draft:**

This is the third and final draft of the proposed standard posted for stakeholder comments. This draft includes the modifications with consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Oder 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. First ballot of standard. | March 7, 2008 |
| 2. Respond to comments. | April 22, 2008 |
| 3. Recirculation ballot. | April 22, 2008 |
| 4. 30-day posting before board adoption. | March 7, 2008 |
| 5. Board adoption. | May 5, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Generation Capability Import Requirement (GCIR):** The amount of generation capability from external sources requested by a Load-Serving Entity (LSE) (or group of LSEs with an aggregated need for Capacity Benefit Margin) to meet its generation reliability or resource adequacy requirements as an alternative to internal resources.

**Capacity Benefit Margin Implementation Document (CBMID):** A document that describes the implementation of a Capacity Benefit Margin methodology.

**Planned Resource Sharing Group (PRSG):** A group of Load-Serving Entities who have agreed to jointly meet their resource adequacy requirements.

## A. Introduction

1. **Title: Capacity Benefit Margin**

2. **Number: MOD-004-1**

3. **Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Capacity Benefit Margin (CBM) to support analysis and system operations.

4. **Applicability:**

   **4.1. Functional Entity:**

   **4.1.1** Load-Serving Entity.

   **4.1.2** Planned Resource Sharing Group.

   **4.1.3** Transmission Service Providers that maintain CBM.

   **4.1.4** Balancing Authority.

   **4.1.5** Transmission Planners, when their associated Transmission Service Provider has elected to maintain CBM.

5. **Facility Limitations/Specifications:**

   **5.1.** None.

6. **Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard become effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** The Transmission Service Provider shall prepare and keep current a "Capacity Benefit Margin Implementation Document" (CBMID) that includes, at a minimum, the following information: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Long-term Planning]*

**R1.1.** Its procedure for a Load-Serving Entity or Planned Resource Sharing Group within a Balancing Authority associated with the Transmission Service Provider to request the Generation Capability Import Requirement (GCIR) including the disposition and handling of deficient requests.

**R1.2.** Its procedure and assumptions for setting CBM for each ATC Path or Flowgate based on Load-Serving Entity or Planned Resource Sharing Group GCIR.

**R1.3.** Its procedure to request the use of Transfer Capability set aside as CBM.

**R1.4.** A statement of whether the Transmission Service Provider allows ATC or AFC to be less than zero due to CBM.

**R2.** The Transmission Service Provider shall make available its CBMID and any changes to the CBMID to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, and Planning Coordinators that are within or adjacent to the Transmission Service Provider's area prior to the effective date of a change. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R3.** A Load-Serving Entity or Planned Resource Sharing Group that wants Transfer Capability to be set aside in the form of CBM shall: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Long-term Planning]*

**R3.1.** Submit an annual GCIR request to the Transmission Service Provider and Transmission Planner per the specifications in the CBMID that includes:

**R3.1.1.** The GCIR, specifying:

3.1.1.1. A monthly GCIR value for each month for the next 24 months. If monthly values are not a requirement as per the applicable reserve margin and resource adequacy requirements documented in R3.1.2, a yearly GCIR value for the current and following year will be sufficient .

3.1.1.2. An annual GCIR value for each subsequent year for each Balancing Authority or Posted Path not to exceed 10 years into the future.

3.1.1.3. The location of the load served by the GCIR (e.g., Balancing Authority, zones, markets …).

3.1.1.4. Assumed external resources (e.g., Balancing Authority(ies), specific generators, markets …) from which generation supporting each GCIR value of 3.1.1.1 and 3.1.1.2 will be supplied or the specific ATC Paths to be used for import of the generation supporting the GCIR.

**R3.1.2.** Identification of all applicable reserve margin and resource adequacy requirements, and the entity(ies) responsible for establishing them, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities.

3.1.2.1. The process and periodicity of calculating or recalculating GCIR if the entities specified in R3.1.2 require calculating GCIR on a frequency different than specified in R3.1.1

**R3.1.3.** A summary of the results of resource studies performed to determine the amount of the request, not to include confidential information.

**R3.1.4.** All resource studies (and supporting information) performed to determine the amount of the request.

**R3.2.** Every thirty-one calendar days, each Load Serving Entity or Planned Resource Sharing Group shall adjust its GCIR request, if necessary per 3.1.1 or 3.1.2.1, to reflect any incremental increase or decrease in required GCIR by either simple adjustment or through recalculation. .

**R3.3.** Base the request provided per R3.1 on studies conducted in accordance with verifiable historical, state, regional transmission organization or regional entity criteria.

**R4.** Within fourteen calendar days of receiving a request or change to a GCIR request that meets the requirements defined in R3.1, the Transmission Service Provider shall set the CBM for the next 13 months requested as described in R3.1 as follows: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** Determine the amount of CBM (for use in R4.2) for each request by using one of the following:

**R4.1.1.** For the Area Interchange Methodology and the Rated System Path Methodology, using the requested Generation Capability Import Requirement for the appropriate ATC Path(s)

**R4.1.2.** For the Flowgate Methodology, determining the significant impacts of each request on each Flowgate

4.1.2.1. Determine impacts of a request by multiplying the requested GCIR by the Distribution Factor for the import relative to the Flowgate or model the GCIR explicitly in the AFC model per R3.1.1.3 and R3.1.1.4.

**R4.2.** For the Area Interchange Methodology and the Rated System Path Methodology, set CBM for each ATC Path equal to the sum of all requests such that all requests can be met simultaneously or all firm ATC has been allocated to CBM as follows:

**R4.2.1.** If the situation exists where there is insufficient capability on the ATC Path to satisfy the sum of all GCIR requests and the Transmission Service Provider, per R1.4, does not allow ATC to be less than zero, then the Transmission Service Provider shall set the CBM such that the monthly ATCs equal zero

**R4.2.2.** If the situation exists where there is insufficient capability on the ATC Path to satisfy the sum of all GCIR requests and the Transmission Service Provider, per R1.4, allows the ATC to be less than zero, then the Transmission Service Provider shall set the CBM equal to the sum of the requested GCIR for that ATC Path.

**R4.3.** For the Flowgate Methodology set CBM for each Flowgate equal to the sum of all requests on that Flowgate such that all requests can be met simultaneously or all firm ATC has been allocated to CBM as follows:

**R4.3.1.** If the situation exists where there is insufficient Flowgate AFC to satisfy the sum of all GCIR requests and the Transmission Service Provider, per R1.4, does not allow the Flowgate AFC to be less than zero, then the Transmission Service Provider shall set the CBM such that the monthly Flowgate AFCs equal zero

**R4.3.2.** If the situation exists where there is insufficient Flowgate AFC to satisfy the sum of all GCIR requests and the Transmission Service

Provider, per R1.4, allows the Flowgate AFC to be less than zero, then the Transmission Service Provider shall set the CBM equal to the sum of the requested GCIR for that Flowgate.

**R5.** Within sixty calendar days of receiving a request or change to a GCIR request that meets the requirements defined in R3.1, the Transmission Planner shall: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.1.** As per R3.1.1.3 and R3.1.1.4, model the GCIR explicitly in the ATC/AFC model or use the CBM calculated using requirements R4.1 through R4.3 for all years requested beyond 13 months not to exceed 10 years

**R5.2.** If so requested, provide the Transmission Service Provider with the following:

**R5.2.1.** The total amount of CBM for each ATC Path or Flowgate on the Transmission Service Provider's system in each of the years specified in the original CBM request not to exceed 10 years.

**R5.2.2.** If less than the sum of all requests was established as the CBM for any period, for each ATC Path or Flowgate, a list of the values of each GCIR used to set the CBM for each of the years specified in the original request not to exceed 10 years.

**R6.** Within seven calendar days of the determination of CBM as described in R4 or R5, the Transmission Service Provider shall provide each Load-Serving Entity or Planned Resource Sharing Group that requested CBM and the Balancing Authority hosting its (their) load with a report that includes: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.1.** The total amount of CBM for each ATC Path or Flowgate on the Transmission Service Provider's system in each of the months or years specified in the original request.

**R6.2.** If less than the sum of all requests was established as the CBM for any period:

- For each ATC Path or Flowgate, a list of the values of each GCIR used to set the CBM for each of the months and years specified in the original request
- The option to pursue alternatives, including expansion, with the Transmission Service Provider.

**R7.** The Transmission Service Provider and Transmission Planner shall each provide copies of the supporting data, including any models, used for allocating CBM over each ATC Path or Flowgate to the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Long-term Planning]*

**R7.1.** Each of its associated Transmission Operators within thirty calendar days of their making a request for the data.

**R7.2.** To any Transmission Service Provider, Reliability Coordinator, Transmission Planner, or Planning Coordinator within thirty calendar days of their making a request for the data.

**R8.** The Load-Serving Entity or Balancing Authority that wants to schedule energy over firm Transfer Capability set aside as CBM shall submit an Arranged Interchange, and shall not request to schedule energy over firm Transfer Capability set aside as CBM unless experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher. *[Violation Risk Factor: Lower] [Time Horizon: Same-day Operations]*

**R9.** When reviewing an Arranged Interchange using CBM, the Balancing Authority and Transmission Service Provider shall waive, within the bounds of reliable operation, any real-time timing and ramping requirements. *[Violation Risk Factor: Lower] [Time Horizon: Same-day Operations]*

**R10.** The Transmission Service Provider shall approve any Arranged Interchange using CBM that is submitted by an Energy Deficient Entity[1] under an EEA2 if the CBM is available. *[Violation Risk Factor: Medium] [Time Horizon: Same-day Operations]*

## C. Measures

**M1.** Each Transmission Service Provider shall produce its CBMID evidencing inclusion of all information specified in R1. (R1)

**M2.** Each Transmission Service Provider shall have evidence (such as dated logs and data, copies of dated electronic messages, or other equivalent evidence) to show that prior to the effective date of a change to its CBMID, it made the CBMID available to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, and Planning Coordinators specified in R2. (R2)

**M3.** Each Load-Serving Entity or Planned Resource Sharing Group that wants CBM shall provide a copy of its GCIR request with the supporting information specified in R3.1 to show that it is compliant with R3.1. (R3)

**M4.** Each Load-Serving Entity or Planned Resource Sharing Group that requests changes to its GCIR as per R3.2 shall provide dated copies of its updated GCIR along with studies or documentation of the changes that support its request; such as Transmission Service Requests, generator outage reports, and load-forecast changes that affect its resource adequacy requirements documented in R3.1.2. (R3).

**M5.** Each Load-Serving Entity or Planned Resource Sharing Group that wants CBM shall provide evidence (such as studies, historical data, copies of state or regional transmission organization reliability criteria, regional generation reliability criteria or other equivalent evidence) that it has based its GCIR request on verifiable historical, state, regional transmission organization, or regional generation reliability criteria in accordance with R3.3. (R3)

**M6.** Each Transmission Service Provider shall provide evidence including copies of GCIR requests and requests for GCIR changes and other evidence such as copies of the actual computations to set CBM, or other equivalent evidence to show that CBM for the months requested as described in R3.1.1 has been established using the process described in R4. (R4)

---

[1] See Attachment 1-EOP-002-0 for definition.

**M7.** Each Transmission Planner shall provide evidence including copies of GCIR requests and requests for GCIR changes and other evidence (such as written documentation of studies and supporting study models that model base load flow, copies of actual computations to set CBM, or other equivalent evidence) to show that the GCIR has been used to either model GCIR or calculate as per the process described in R5. (R5)

**M8.** Each Transmission Service Provider shall provide copies of the reports sent to Load-Serving Entities and Balancing Authorities along with other evidence (such as logs and data, copies of electronic messages, or other equivalent evidence) to show that within seven calendar days of the determination of CBM, a report meeting the requirements described in R6 was provided as specified. (R6).

**M9.** Each Transmission Service Provider and Transmission Planner shall each provide evidence including copies of dated requests for data supporting the calculation of CBM along with other evidences such as copies of electronic messages or other evidence to show that it provided the required entities with copies of the supporting data, including any models, used for allocating CBM as specified in R7. (R7)

**M10.** Each Load-Serving Entity that scheduled energy over firm Transfer Capability set aside as CBM shall provide evidence (such as logs, copies of tag data, or other data from its Reliability Coordinator) that at the time they requested the schedule using CBM, they were in an EEA2. (R8)

**M11.** Each Balancing Authority and Transmission Service Provider shall provide evidence (such as operating logs and tag data) that it waived real-time timing and ramping requirements when approving an Arranged Interchange using CBM (R9)

**M12.** Each Transmission Service Provider shall provide evidence including copies of CBM values along with other evidence (such as tags, reports, and supporting data) to show that it approved any Arranged Interchange using CBM for any Energy Deficient Entity[2] where the total CBM available was greater than the amount of CBM requested in the Arranged Interchange. (R10)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority (CEA)

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

- The Transmission Service Provider shall maintain its current, in force CBMID and any prior versions of the CBMID that were in force since the last compliance audit to show compliance with R1.

---

[2] See Attachment 1-EOP-002-0 for definition.

- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7 and R10 for the most recent three calendar years plus the current year.
- The Load-Serving Entity and Planned Resource Sharing Group shall each maintain evidence to show compliance with R3, and R8 for the most recent three calendar years plus the current year.
- The Transmission Planner shall maintain evidence to show compliance with R5 and R7 for three calendar years.
- The Balancing Authority shall maintain evidence to show compliance with R9 for three calendar years.
- If an entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

**None.**

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider has a CBMID that does not incorporate changes that have been made within the last three months. | The Transmission Service Provider has a CBMID that does not incorporate changes that have been made more than three, but not more than six, months ago.<br>**OR**<br>The Transmission Service Provider's CBMID does not address one of the sub requirements. | The Transmission Service Provider has CBMID that does not incorporate changes that have been made more than six, but not more than twelve, months ago.<br>**OR**<br>The Transmission Service Provider's CBMID does not address two of the sub requirements. | The Transmission Service Provider has a CBMID that does not incorporate changes that have been made more than twelve months ago.<br>**OR**<br>The Transmission Service Provider does not have a CBMID;<br>**OR**<br>The Transmission Service Provider's CBMID does not address three or more of the sub requirements. |
| R2. | The Transmission Service Provider makes available the CBMID and any changes to the CBMID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator 14 or more calendar days but not more than 30 calendar days after a change was made. | The Transmission Service Provider makes available the CBMID and any changes to the CBMID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator 30 or more calendar days but not more than 60 calendar days after a change was made. | The Transmission Service Provider makes available the CBMID and any changes to the CBMID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator 60 or more calendar days but not more than 90 calendar days after a change was made. | The Transmission Service Provider makes available the CBMID and any changes to the CBMID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator more than 90 calendar days after a change was made. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R3. | The Load Serving Entity or Planned Reserve Sharing Group did not update its request for CBM, or indicate that no update was needed, as described in R3.2. | The Load Serving Entity or Planned Reserve Sharing Group desiring CBM did not submit the information required by any one of the following: R3.1.2, R3.1.3, or R3.1.4.<br>**OR**<br>The Load Serving Entity or Planned Reserve Sharing Group did not update its request for CBM, or indicate that no update was needed, as described in R3.2, and their Generation Capability Import Requirement had changed by more than 20MW or 10%, whichever is smaller, and not more than 30MW or 20%, whichever is smaller. | The Load Serving Entity or Planned Reserve Sharing Group desiring CBM did not submit the information two or more of the following: R3.1.2, R3.1.3, or R3.1.4.<br>**OR**<br>The Load Serving Entity or Planned Reserve Sharing Group did not update its request for CBM, or indicate that no update was needed, as described in R3.2, and their Generation Capability Import Requirement had changed by more than 30MW or 20%, whichever is smaller, and not more than 40MW or 30%, whichever is smaller. | The Load Serving Entity or Planned Reserve Sharing Group desiring CBM did not include one or more of the items specified in R3.1.1 in its request.<br>**OR**<br>The Load Serving Entity or Planned Reserve Sharing Group desiring CBM did not submit any of the information described in R3.1.2, R3.1.3, or R3.1.4.<br>**OR**<br>The Load Serving Entity or Planned Reserve Sharing Group did not update its request for CBM, or indicate that no update was needed, as described in R3.2, and their Generation Capability Import Requirement had changed by more than 40MW or 30%, whichever is smaller.<br>**OR**<br>The Load Serving Entity or Planned Reserve Sharing Group requested GCIR greater than its needs for imports to meet reserve margin or resource adequacy requirements (not to include the incremental power flows from reserve sharing requirements), and the additional GCIR |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |

| | | | | requested was more than 10MW in excess of the needed amount. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R4. | N/A | N/A | The Transmission Service Provider set CBM for the months requested as described in R4 more than 14, but not more than 30 calendar days after receiving a request for CBM.<br>**OR**<br>The Transmission Service Provider did not follow the process described in R4. | The Transmission Service Provider set CBM for the months requested as described in R4 more than 30 calendar days after receiving a request for CBM.<br>**OR**<br>The Transmission Service Provider did not follow the process described in R4 and the resource adequacy requirements of one or more Load Serving Entities requesting CBM were not met. |
| R5. | N/A | N/A | The Transmission Planner set CBM for the years requested as described in R5 more than 60, but not more than 120, calendar days after receiving a request for CBM.<br>**OR**<br>The Transmission Planner did not follow the process described in R5. | The Transmission Planner set CBM for the years requested as described in R5 more than 120 calendar days after receiving a request for CBM.<br>**OR**<br>The Transmission Planner did not follow the process described in R5, and the resource adequacy requirements of one or more Load Serving Entities requesting CBM were not met. |
| R6. | The Transmission Service Provider provided the report to the requesting entities in more than 7 calendars days but not more than 9 calendar days of determining the CBM | The Transmission Service Provider provided the report to the requesting entities in 9 or more calendar days but not more than 14 calendar days of determining CBM | The Transmission Service Provider provided the report to the requesting entities in 14 or more calendar days but not more than 22 calendar days of determining CBM | The Transmission Service Provider provided the report to the requesting entities 22 or more calendar days after determining CBM or did not provide the report. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R7. | The Transmission Service Provider or Transmission Planner did not provide a requester specified in R5 with the supporting data, including models, used to allocate CBM in more than seven, but not more than fourteen, days after the submission of the request. | The Transmission Service Provider or Transmission Planner did not provide a requester specified in R5 with the supporting data, including models, used to allocate CBM in more than fourteen, but not more than thirty, days after the submission of the request. | The Transmission Service Provider or Transmission Planner did not provide a requester specified in R5 with the supporting data, including models, used to allocate CBM more than thirty, but not more than sixty, days after the submission of the request. | The Transmission Service Provider or Transmission Planner did not provide a requester specified in R5 with the supporting data, including models, used to allocate CBM more than sixty days after the submission of the request. |
| R8. | N/A | N/A | N/A | A Load Serving Entity requested to schedule energy over CBM while not in an EEA2 |
| R9. | N/A | N/A | N/A | A Balancing Authority or Transmission Service Provider denied an Arranged Interchange using CBM based on timing or ramping requirements. |
| R10. | N/A | N/A | N/A | The Transmission Service Provider failed to approve an Arranged interchange for CBM submitted by an Energy Deficient Entity under an EEA2 when CBM was available.” |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007
5. SDT posted second draft for comment from October 31–December 14, 2007.

**Description of Current Draft:**

This is the third and final draft of the proposed standard posted for stakeholder comments. This draft includes the modifications with consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Oder 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. First ballot of standard. | March 7, 2008 |
| 2. Respond to comments. | April 22, 2008 |
| 3. Recirculation ballot. | April 22, 2008 |
| 4. 30-day posting before board adoption. | March 7, 2008 |
| 5. Board adoption. | May 5, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Generation Capability Import Requirement (GCIR):** The amount of generation capability from external sources requested by a Load-Serving Entity (LSE) (or group of LSEs with an aggregated need for Capacity Benefit Margin) to meet its generation reliability or resource~~serve~~ adequacy requirements as an alternative to internal resources.

**Capacity Benefit Margin Implementation Document (CBMID):** A document that describes the implementation of a Capacity Benefit Margin methodology.

**Planned Resource Sharing Group (PRSG):** A group of Load-Serving Entities who have agreed to jointly meet their resource adequacy requirements~~.~~.

## A. Introduction

1. **Title:** **Capacity Benefit Margin**

2. **Number:** **MOD-004-1**

3. **Purpose:** To promote the consistent and ~~transparent~~ reliable calculation, verification, preservation, and use of Capacity Benefit Margin (CBM) to support ~~reliable~~ analysis and system operations.

4. **Applicability:**

   **4.1. Functional Entity:**

   **4.1.1** Load-Serving Entity.

   **4.1.2** Planned Resource Sharing Group.

   **~~4.1.2~~4.1.3** Transmission Service Providers that maintain CBM.

   **~~4.1.3~~4.1.4** Balancing Authority.

   **~~4.1.4~~4.1.5** Transmission Planners, when their associated Transmission Service Provider has elected to maintain CBM.

5. **Facility Limitations/Specifications:**

   **5.1.** None.

6. **Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that ~~all six~~ this standard~~s~~ ~~are~~ is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard ~~Reliability Standards~~ become effective on the first day of the first calendar quarter that is twelve months beyond the date ~~the set of~~this standard~~s~~ ~~are~~ is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** The Transmission Service Provider shall prepare and keep current a "Capacity Benefit Margin Implementation Document" (CBMID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning, Long-term Planning*]

**R1.1.** Its procedure for a Load-Serving Entity or Planned Resource Sharing Group within a Balancing Authority associated with the Transmission Service Provider to request ~~CBM to support its~~ the Generation Capability Import Requirement (GCIR) including the disposition and handling of deficient requests~~; and~~.

**R1.2.** Its procedure and assumptions for setting CBM for each ~~Posted~~ ATC Path or Flowgate based on Load-Serving Entity or ~~PRSG~~Planned Resource Sharing Group GCIR~~requests~~.

**R1.3.** Its procedure ~~for a Load-Serving Entity~~ to request the ~~scheduling of energy over~~ u~~tilizatio~~se~~n~~ of Transfer Capability set aside as CBM.

**R1.4.** A statement of whether the Transmission Service Provider allows ATC or AFC to be less than zero due to CBM.

**R2.** The Transmission Service Provider shall make available ~~the~~ its CBMID and any changes to the CBMID to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, and Planning Coordinators that are within or adjacent to the Transmission Service Provider's area prior to the effective date ~~within seven days~~ of a change. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R3.** A Load-Serving Entity ~~(~~or ~~PRSG~~Planned Resource Sharing Group~~group of Load-Serving Entities with an aggregated need for CBM)~~ that wants Transfer Capability to be set aside in the form of CBM shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning, Long-term Planning*]

**R3.1.** Submit an annual ~~request for CBM~~ GCIR request to the Transmission Service Provider and Transmission Planner per the specifications in the CBMID ~~identifying the amount of CBM requested for each month for each year for the next ten year period,~~ that includes:

**R3.1.1.** The GCIR, specifying:

~~3.1.1.1.The Balancing Authority(ies) from which generation supporting the GCIR will be supplied or the specific Posted Paths to be utilized for import of the generation supporting the GCIR.~~

~~3.1.1.2.~~3.1.1.1. A monthly GCIR value for each month for the next 24 months. If monthly values are not a requirement as per the applicable reserve margin and resource adequacy requirements documented in R3.1.2, a yearly GCIR value ~~will be sufficient~~ for the current ~~during the current year~~ and following year will be sufficient ~~for each Balancing Authority or Posted Path~~.

3.1.1.2. An annual GCIR value for each subsequent year for each Balancing Authority or Posted Path not to exceed 10 years into the future.

3.1.1.3. The location of the load ~~being~~ served by the GCIR (e.g., Balancing Authority, zones, markets ~~, etc~~…).

3.1.1.4. Assumed external resources (e.g., Balancing Authority(ies), specific generators, markets ~~, etc~~…) from which generation supporting each GCIR value of 3.1.1.1 and 3.1.1.2 will be supplied or the specific ATC Paths to be u~~tiliz~~sed for import of the generation supporting the GCIR.

**R3.1.2.** Identification of all applicable reserve margin and resource adequacy requirements, and the entity(ies) responsible for establishing them, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities.

3.1.2.1. The process and periodicity of calculating or recalculating GCIR if the entities specified in R3.1.2 require calculating GCIR on a frequency different than specified in R3.1.1

**R3.1.3.** A summary of the results of resource studies performed to determine the amount of the request, not to include confidential information.

**R3.1.4.** All resource studies (and supporting information) performed to determine the amount of the request.

**R3.2.** ~~At least e~~Every thirty-one calendar days, each Load Serving Entity or ~~PRSG~~Planned Resource Sharing Group shall ~~review its GCIR request and~~ adjust~~ that~~ its GCIR request, if necessary per 3.1.1 or 3.1.2.1, to reflect any incremental increase or decrease in required GCIR by either simple adjustment or through recalculation. ~~update the request provided per R3.1 to reflect any changes that alter future needs for CBM or indicate that no change is needed~~.

**R3.3.** Base the request provided per R3.1 on studies conducted in accordance with verifiable historical, state, regional transmission organization or regional entity criteria.

**R4.** Within fourteen calendar days of receiving a request or change to a ~~request for CBM~~ GCIR request that meets the requirements defined in R3.1, the Transmission Service Provider shall set the CBM for the next 13 months requested as described in R3.1~~.1.2~~ as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.1.** Determine the amount of CBM (for use in R4.2) for each request by using one of the following~~:~~:

**R4.1.1.** For the Area Interchange Methodology and the Rated System Path Methodology, using the requested Generation Capability Import Requirement for the appropriate ATC~~Posted~~ Path(s)

**R4.1.2.** For the Flowgate Methodology, determining the significant impacts of each request on each Flowgate

4.1.2.1. Determine impacts of a request by multiplying the requested GCIR by the Distribution Factor for the ~~transfer of that~~ import ~~from the specified Balancing Authority~~ relative to the Flowgate or model the GCIR explicitly in the AFC model per R3.1.1.3 and R3.1.1.4.

~~4.1.2.2.Classify each impacts based on a Distribution Factor of 3% or greater as a significant impact.~~

**R4.2.** For the Area Interchange Methodology and the Rated System Path Methodology, ~~S~~set CBM for each ~~Posted~~ ATC Path ~~or Flowgate based on~~ equal to the sum of all requests such that all requests can be met simultaneously or all firm ATC ~~or AFC~~ has been allocated to CBM as follows:

~~**R4.2.1.**For Posted Paths, set the CBM for each Posted Path equal to the lesser of:~~

**R4.2.1.** If the situation exists where there is insufficient capability on the ATC Path to satisfy ~~T~~the sum of all ~~requests for GCIR~~GCIR requests and the Transmission Service Provider, per R1.4, does not allow ATC to be less than zero, then the Transmission Service Provider ~~w~~shaiill set the CBM such that the monthly ATCs equal~~s~~ zero

**R4.2.2.** If the situation exists where there is insufficient capability on the ATC Path to satisfy the sum of all ~~requests for GCIR~~GCIR requests and the Transmission Service Provider, per R1.4, allows the ATC to be less than zero, then the Transmission Service Provider- ~~wi~~shall set the CBM equal to the sum of the requested GCIR for that ATC Path. ~~for that Posted Path, minus the transfer capability set aside for reserve sharing for that Posted Path or~~

~~-The firm Available Transfer Capability (ATC) for that Posted Path~~

**R4.3.** For the Flowgate Methodology~~s,~~ set ~~the~~ CBM for each Flowgate equal to the sum of all requests on that Flowgate such that all requests can be met simultaneously o~~f~~r all firm ATC has been allocated to CBM as follows~~:lesser of~~:

**R4.3.1.** If the situation exists where there is insufficient Flowgate AFC to satisfy the sum of all ~~requests for GCIR~~GCIR requests and the Transmission Service Provider, per R1.4, does not allow the Flowgate AFC to be less than zero, then the Transmission Service Provider ~~wi~~shall set the CBM such that the monthly Flowgate AFCs equal~~s~~ zero

**R4.3.2.** If the situation exists where there is insufficient Flowgate AFC to satisfy the sum of all ~~requests for GCIR~~GCIR requests and the Transmission Service Provider, per R1.4, allows the Flowgate AFC to be less than zero, then the Transmission Service Provider shall set the CBM equal to the sum of the requested GCIR for that Flowgate.

~~-The sum of the significant impacts of all requests for GCIR for that Flowgate minus the impact of transfer capability set aside for reserve sharing for that Flowgate, or~~

~~-The firm Available Flowgate Capability (AFC) for that Flowgate~~

~~**R4.4.**If the sum of all CBM requests can not be met simultaneously, and during the evaluation of monthly ATC or AFC, additional capacity becomes available, increase the CBM based on availability up to a maximum of the sum of all CBM requests.~~

**R5.** Within sixty calendar days of receiving a request or change to a ~~request for CBM~~ GCIR request that meets the requirements defined in R3.1, the Transmission Planner shall: ~~set the CBM for the years requested as described in R3.1.1.3 as follows:~~ [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** As per R3.1.1.3 and R3.1.1.4, model the GCIR explicitly in the ATC/AFC model or use the CBM calculated using requirements R4.1 through R4.3 for all years requested beyond 13 months not to exceed 10 years

~~**R5.1.**Use each GCIR to determine a margin to decrement Firm Transfer Capability for use in all future planning processes.~~

~~**R5.2.**Set the CBM for each Posted Path or Flowgate based on the sum of all CBM requests such that all requests can be met simultaneously or all available firm Transfer Capability has been allocated to CBM.~~

~~**R5.3.**If the sum of all requests can not be met simultaneously, and during the planning process, additional capacity becomes available, increase the CBM based on availability up to a maximum of the sum of all requests.~~

~~**R5.4.**~~**R5.2.** If so requested, ~~P~~provide the Transmission Service Provider with the following:

~~**R5.4.1.**~~**R5.2.1.** The total amount of CBM for each ~~Posted~~ ATC Path or Flowgate on the Transmission Service Provider's system in each of the years specified in the original CBM request not to exceed 10 years.

~~**R5.4.2.**~~**R5.2.2.** If less than the sum of all requests was established as the CBM for any period, for each ~~Posted~~ ATC Path or Flowgate, a list of the values of each GCIR used to set the CBM for each of the years specified in the original request not to exceed 10 years.

**R6.** Within ~~five~~ seven calendar days of the determination of CBM as described in R4 or R5, the Transmission Service Provider shall provide each Load-Serving Entity ~~(or group of Load-Serving Entities with an aggregated need for CBM)~~ or ~~PRSG~~Planned Resource Sharing Group that requested CBM and the Balancing Authority hosting its (their) load with a report that includes: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** The total amount of CBM for each ~~Posted~~ ATC- Path or Flowgate on the Transmission Service Provider's system in each of the months or years specified in the original request.

**R6.2.** If less than the sum of all requests was established as the CBM for any period:

- For each ~~Posted~~ ATC Path or Flowgate, a list of the values of each GCIR used to set the CBM for each of the months and years specified in the original request
- The option to pursue alternatives, including expansion, with the Transmission Service Provider~~request a system impact study~~.

**R7.** The Transmission Service Provider and Transmission Planner shall each provide copies of the supporting data, including any models, used for allocating CBM over each ~~Posted~~ ATC Path or Flowgate to the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning, Long-term Planning*]

**R7.1.** Each of its associated Transmission Operators within ~~seven~~ thirty calendar days of their making a request for the data~~a modification to the CBM~~.

**R7.2.** To any Transmission Service Provider, Reliability Coordinator, Transmission Planner, or Planning Coordinator within ~~seven~~ thirty calendar days of their making a request for the data.

**R8.** The Load-Serving Entity or Balancing Authority that wants to schedule energy over ~~Firm~~ firm Transfer Capability set aside as CBM shall submit an Arranged Interchange

~~Transaction Tagto the Interchange Authority~~, and shall not request to schedule energy over ~~F~~firm Transfer Capability set aside as CBM unless experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher. [*Violation Risk Factor: Lower*] [*Time Horizon: Same-day Operations ~~Planning~~*]

**R9.** When reviewing an Arranged Interchange ~~Transaction Tag~~ using CBM, the Balancing Authority and Transmission Service Provider shall waive, within the bounds of reliable operation, any real-time timing and ramping requirements. [*Violation Risk Factor: Lower*] [*Time Horizon: Same-day Operations ~~Planning~~*]

**R10.** The Transmission Service Provider shall approve any Arranged Interchange ~~Transaction Tag~~ using CBM that is submitted by an Energy Deficient Entity[1] under an EEA2 if the CBM is available. [*Violation Risk Factor: Medium*] [*Time Horizon: Same-day Operations ~~Planning~~*]

[1] See Attachment 1-EOP-002-0 for definition.

## C. Measures

**M1.** Each Transmission Service Provider shall produce ~~have~~ its CBMID evidencing inclusion of all ~~specified that includes the~~ information specified in ~~specified in~~ R1~~ as to show that it is compliant with R1~~. (R1)

**M2.** ~~The~~ Each Transmission Service Provider shall have evidence (such as dated logs and data, copies of dated electronic messages, or other equivalent evidence) to show that prior to the effective date ~~within seven days~~ of a change to its CBMID, it made the CBMID available to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, and Planning Coordinators specified in R2. (R2)

**M3.** ~~The~~ Each Load-Serving Entity or ~~PRSG~~Planned Resource Sharing Group that wants CBM shall provide a copy of its ~~CBM~~ GCIR request with the supporting information specified in R3.1 to show that it is compliant with R3.1. (R3)

**M4.** ~~The~~ Each Load-Serving Entity or ~~PRSG~~Planned Resource Sharing Group that requests changes to its GCIR~~wants CBM~~ as per R3.2 shall provide dated copies of its updated ~~CBM~~ GCIR along with studies or documentation of the changes ~~which~~that support ~~their~~its request; such as Transmission Service Requests, generator outage reports, and load-forecast changes ~~which~~that affect ~~their~~ its resource adequacy requirements documented in R3.1.2. ~~requests as evidence that it has updated its CBM request or confirmed no update was needed at least every thirty-one days, per R3.2~~ (R3).

**M5.** ~~The~~ Each Load-Serving Entity or ~~, PRSG~~Planned Resource Sharing Group that wants CBM shall provide evidence (such as studies, historical data, copies of state or regional transmission organization reliability criteria, regional generation reliability criteria or other equivalent evidence) that ~~they~~ it has based its ~~CBM~~GCIR request on verifiable historical, state, regional transmission organization, or regional generation reliability criteria in accordance with R3.3. (R3)

**M6.** ~~The~~ Each Transmission Service Provider shall provide evidence including copies of ~~requests for CBM~~ GCIR requests and requests for GCIR changes ~~to CBM GCIR~~ and other evidence such as copies of the actual computations to set CBM, or other equivalent evidence to show that CBM for the months requested as described in R3.1.1~~.2~~ has been established using the process described in R4. (R4)

**M7.** ~~The~~ Each Transmission Planner shall provide ~~evidence~~ evidence ~~(such as written documentation of studies and supporting study models that model base loadflow)~~ including copies of ~~requests for CBM~~ GCIR requests and requests for GCIR changes ~~to CBM GCIR~~ and other evidence (such as written documentation of studies and supporting study models that model base load flow, ~~such as~~ copies of actual computations to set CBM, or other equivalent evidence)~~-~~ to show that the GCIR has been used to either model GCIR or calculate as per the process ~~CBM for the years requested as described in R3.1.1.3 has been established using the process~~ described in R5. (R5)

~~**M8.** The Transmission Planner shall provide evidence (such as written documentation of studies and supporting study models that model, in base loadflows, the GCIRs as~~

~~identified in R3.1.1 by Load-Serving Entities) that demonstrates that the CBM has been used to determine a margin to decrement Firm Transfer Capability in planning processes as specified in R5.1. (R5)~~

**~~M9.~~M8.** ~~The~~Each Transmission Service Provider shall provide copies of the reports sent to Load-Serving Entities and Balancing Authorities along with other evidence (such as logs and data, copies of electronic messages, or other equivalent evidence) to show that within ~~five~~ seven calendar days of the determination of CBM, a report meeting the requirements described in R6 was provided as specified. (R6).

**~~M10.~~M9.** ~~The~~ Each Transmission Service Provider and Transmission Planner shall each provide evidence including copies of dated requests for data supporting the calculation of CBM along with other evidences such as copies of electronic messages or other evidence to show- that it provided the required entities with copies of the supporting data, including any models, used for allocating CBM as specified in R7. (R7)

**~~M11.~~M10.** ~~The~~ Each Load-Serving Entity that scheduled energy over firm Transfer Capability set aside as CBM shall provide evidence (such as logs, copies of tag data, or other data from its Reliability Coordinator) that at the time they requested ~~a~~ the schedule using CBM, they were in an EEA2. (R8)

**~~M12.~~M11.** Each Balancing ~~Authorities~~ Authority and Transmission Service Provider~~s~~ shall provide evidence (such as operating logs and tag data) that it waived real-time timing and ramping requirements when approving an ~~they did not deny an Interchange Schedule~~Arranged Interchange using CBM ~~based on the request not meeting timing or ramping requirements.~~ (R9)

**~~M13.~~M12.** ~~The~~ Each Transmission Service Provider shall provide evidence including copies of CBM values along with other evidence (such as tags, reports, and supporting data) to show that it approved any ~~Interchange Transaction Tag~~Arranged Interchange using CBM for any ~~energy~~ Energy ~~deficient~~ Deficient ~~entity~~ Entity[2] where the total CBM available was greater than the amount of CBM requested in the ~~Tag~~Arranged Interchange. (R10)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority (CEA)

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

[2] See Attachment 1-EOP-002-0 for definition.

- The Transmission Service Provider shall maintain its current, in force ~~ATCID~~ CBMID and any prior versions of the ~~ATCID~~ CBMID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7 and R10 for the most recent three calendar years plus the current year.
- The Load-Serving Entity ~~or~~and ~~PRSG~~Planned Resource Sharing Group shall each maintain evidence to show compliance with R3, and R8 for the most recent three calendar years plus the current year.
- The Transmission Planner shall maintain evidence to show compliance with R5 and R7 for three calendar years.
- The Balancing Authority shall maintain evidence to show compliance with R9 for three calendar years.
- If an entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

**None.**

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider has a CBMID that does not incorporate changes that have been made within the last three months. | The Transmission Service Provider has a CBMID that does not incorporate changes that have been made more than three, but not more than six, months ago.<br>**OR**<br>The Transmission Service Provider's CBMID does not address one of the sub requirements. | The Transmission Service Provider has CBMID that does not incorporate changes that have been made more than six, but not more than twelve, months ago.<br>**OR**<br>The Transmission Service Provider's CBMID does not address two of the sub requirements. | The Transmission Service Provider ~~does not have a CBMID, or~~ has a CBMID that does not incorporate changes that have been made more than twelve months ago.<br>**OR**<br>The Transmission Service Provider does not have a CBMID;<br>**OR**<br>The Transmission Service Provider's CBMID does not address three or more of the sub requirements. |
| R2. | The Transmission Service Provider makes available the CBMID and any changes to the CBMID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator ~~eight (8)~~14 or more calendar days but not more than ~~14~~ 30 calendar days after a change was made. | The Transmission Service Provider makes available the CBMID and any changes to the CBMID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator ~~14~~ 30 or more calendar days but not more than ~~21~~ 60 calendar days after a change was made. | The Transmission Service Provider makes available the CBMID and any changes to the CBMID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator ~~21~~ 60 or more calendar days but not more than ~~28~~ 90 calendar days after a change was made. | The Transmission Service Provider makes available the CBMID and any changes to the CBMID to the Transmission Operator, Transmission Service Provider, Reliability Coordinator, Transmission Planner, and Planning Coordinator more than ~~28~~ 90 calendar days after a change was made. |

# Implementation Plan for Standard MOD-004-1; ATC/TTC/AFC and CBM/TRM Revisions (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-004-1, which describes the reliability aspects of determining and maintaining a Capacity Benefit Margin and the conditions under which that margin may be used.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs) that must be implemented before this standard can be implemented.

## Modified Standards

This standard supersedes MOD-004-0. MOD-005-0, MOD-006-0, and MOD-007-0 have been incorporated into this standard, made irrelevant by this standard, or are being addressed by the North American Energy Standards Board, and should be retired.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-004-1 | | ■ | ■ | ■ | | ■ |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

## Summary Consideration of Comments:

The Drafting Team has reviewed the comments and made some changes to the standard to address these comments.

1. Based on industry comments, as well as those of the Functional Model Working Group, the Planned Resource Sharing Group (PRSG) has been eliminated.  To address regional CBM processes, the Resource Planner was added as an applicable entity.  Entities still may elect to register as a Joint Registration Organization (JRO), as well as delegate tasks.

2. The drafting team has modified the standard to be less prescriptive and allow for more flexibility in how the need for CBM and CBM itself is determined.

3. The requirement to waive timing and ramping requirements was modified to have a VRF of medium, as it has a direct impact on current-day operations and can result in the inadvertent denial of an interchange transaction needed to maintain reliability.

4. The requirement for a Transmission Service Provider to approve transactions using CBM if the CBM is available was modified to apply additional criteria to the evaluation for approval.

5. A more graded approach was applied to the VSLs where appropriate.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.

| Entity | Comment |
|---|---|
| Bonneville Power Administration | The purpose statement for MOD-004 should be expanded, to describe the timeframe for which CBM is to be activated so as not to conflict with TRM, to include a statement that "CBM is to be scheduled by the Energy Deficient Entity experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher only in the hour following a generation forced outage event." |
| Response: The drafting team disagrees with this interpretation. TRM may be used within the current hour for reserve sharing, but is a margin used to respond to events. CBM may be used at any point, and for a period longer than the current hour, subject to existing scheduling rules and requirements. | |
| CenterPoint Energy | ERCOT's filed comments to the SDT that ATC, TTC, CBM, and TRM are not applicable within ERCOT operations and that these Standards should have provisions that make it clear that these requirements apply only within market structures in which they are pertinent were ignored by the SDT. These standards should not apply to ERCOT, thus our negative vote. |
| Response: The drafting team believes that the standards as written do largely exempt ERCOT if ERCOT does not use CBM. However, ERCOT is still required, if providing service related to another entity's use of CBM, to waive timing and ramping requirements if such waiver can be provided reliably. | |
| Consolidated Edison Co. of New York | PSRG is not an entity defined in the NERC functional Model, too many changes to requirements from last draft - this is not following standards development process - standard should be out for comments again, not up for approval vote. |
| Response: The drafting team has removed the PRSG from the standard, and is posting the standard for comment. | |
| Exelon Energy | R1.5. A statement should be added to confirm that it shall use assumptions in calculating CBM that are consistent with those assumptions that are used in the Transmission planning process " |
| Response: The drafting team believes that CBM can be based on studies and requirements outside the scope of the Transmission planning process defined in the TPL standards. | |
| FirstEnergy Energy Delivery | FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. We offer the following general comments in addition to our specific standard comments presented below.<br>CBM & TRM - MARKET AREAS: FE supports the drafting team's approach of three ATC methodologies presented in MOD-028, MOD-029 and MOD-030 to account for differences in calculating ATC in various geographic areas of the bulk electric system. However, the use of a single standard methodology for CBM and TRM as currently written does not meet the needs for entities operating within a market area such as MISO, PJM etc. FE suggests that various requirements in the proposed standards that are currently applicable to the TP and TOP are actually handled by the RTO and within a market area would more appropriately be assigned to the Planning Coordinator (PC) and Reliability Coordinator (RC), respectively. This change would allow the proposed standards for CBM and TRM to be used largely "as is" within both market and non-market areas as the PC and RC would be appropriate in both.<br>Our comments below on specific MOD standards elaborate on this point and provide examples where we feel the applicability is inappropriately assigned to TP or TOP responsible entities within a transmission market construct.<br>DECISION TO BALLOT: While the MOD standards presented are improving in content FE believes the standards should have been issued for one more comment period prior to ballot per the NERC Standard Development Procedures (SDP). In many cases this is only the 2nd draft version being reviewed by industry. The objective during the "Solicit Public Comments on Draft |

<table>
<tr><th>Entity</th><th>Comment</th></tr>
<tr><td></td><td>Standard (Step 6)" of the NERC SDP is to "Receive stakeholder inputs on the draft standard for the purpose of assessing consensus on the draft standard, and modifying the draft standard as needed to improve consensus." Based on the 200+ pages of comments of the prior draft version it is hard to conclude that the industry was near consensus. Additionally, per the SDP, now that the standards have gone to First Ballot (Step 9), the standard drafting team is not permitted to make any changes to the standards based on comments received during this First Ballot. The drafting team will now be required to rely on their responses to industry feedback to try and improve consensus during a re-circulation ballot. FE has concerns with the consequences of this decision with regard to the integrity of the standard development process and substantive registered entity perspectives.<br><br>Response: The standards are being posted for comment.<br><br>FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. However, at this time, FE is voting Negative to this standard with the following comments and suggestions:<br><br>– The Planning Coordinator (PC) should replace the Transmission Planner (TP) as the applicable entity. The requirements in R5 and R7 should be the ultimate responsibility of the PC who works with his associated TP to obtain the necessary information. Per the NERC functional model, the PC "coordinates and collects data for system modeling from the Transmission Planner and "coordinates total transfer capability with Transmission Planners.<br><br>Response: The drafting team agrees with the descriptions given from the functional model. However, we believe that the coordination functions of the Planning Coordinator do not apply here. CBM is the import capability of the local system to serve local needs. The Planning Coordinator’s role is to look at broader needs, and CBM by definition is a local need. Transmission Planners may, of course, delegate this task to the Planning Coordinator.<br><br>– This standard is too prescriptive with the detail into how CBM should be calculated across all interconnections and does not take into account all the different calculation methods currently used by various entities in the industry. It is suggested that the standard be more general and that some of the information contained is better suited with a guideline document for calculating CBM.<br><br>Response: The drafting team has modified the standard to be less prescriptive and allow for more flexibility in how the need for CBM and CBM itself is determined.</td></tr>
<tr><td colspan="2">Response: Please see in-line responses.</td></tr>
<tr><td>Great River Energy</td><td>GRE agrees with the PJM and MISO recommendation that the standard needs an additional commenting period based on the significance of the comments submitted during the previous commenting periods.</td></tr>
<tr><td colspan="2">Response: The drafting team is posting the standard for comment.</td></tr>
<tr><td>Hydro One Networks, Inc.</td><td>Hydro One Networks Inc. is casting a negative vote on the 6 MOD standards (MOD-001, MOD-004, MOD-008, MOD-28, MOD-029 and MOSD-030) We believe there is a fundamental issue related with effective dates, that is, the dates in which Reliability Standards become effective and enforceable. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in the MOD Standards in ballot as they have implications on neighboring areas. The words inserted in the Effective Date of the Standards as well as in the Implementation Plan document permit that</td></tr>
</table>

| Entity | Comment |
|---|---|
| | these Standards are effective in some jurisdictions and not others. These Standards should be modified to ensure that they become effective in all jurisdiction at the same time, including those where such regulatory approval in not required that is, only when all regulatory approvals have been obtained,<br>Response: The drafting team does not believe that it is necessary for all entities to implement this standard at the same time, because there are no interdependencies between entities implementing CBM.<br>In addition we offer the following comments to the specific Standard MOD-004-1:<br>(a) Requirement 1.1 introduces the concept of an entity called the Planned Resource Sharing Group. This entity is not defined and is not currently in the approved version of the NERC Functional Model (v.3). Adding this entity raises issues for registration and compliance.<br>(b) Requirements have been introduced for the first time in this version. None of these revisions have yet been posted for comments by the industry. New requirements should not be introduced in the final version of a standard without affording the industry some opportunity to comment. This bypasses the intent of the ANSI approved NERC RS process.<br>Response: The drafting team has removed the PRSG from the standard, and is posting the standard for comment. |
| Response: Please see in-line responses. | |
| Hydro-Quebec TransEnergie | Requirement 1.1 adds the concept of Planned Resource Sharing Group. This entity is not defined and is not currently in NERC Functional Model (v.3). Adding entity is risky and raises the issue of registration. Should such a Planned Resource Sharing Group register even if it's not an entity defined in NERC Functional Model<br>– If not, what are the consequences<br>– It seems that the idea was to address the situation where an ISO, for example, would do it for other entities. We oppose the idea of introducing new entities in a standard. Moreover, many requirements are introduced for the first time in this version. None of these have thus been circulated for comment in the previous rounds. New requirements can't be introduced in the final version of a standard. It doesn't respect the voting process. |
| Response: The drafting team has removed the PRSG from the standard, and is posting the standard for comment. | |
| Kansas City Power & Light Co. | The CBM calculation should not be applicable to the LSE. Suggest removing LSE from applicability. |
| Response: Load Serving Entities have certain reliability obligations if they wish to use CBM. The standard describes those responsibilities, and the LSE is expected to meet those obligations. | |
| Municipal Electric Authority of Georgia | The Requirement R.8 implies that this standard would require TSPs to furnish CBM to "entities" that never requested or funded CBM. This unreasonable interpretation is expected to cause reliability problems for LSEs that currently rely on CBM.<br>From the proposed standard, some may even infer that all "entities" affiliated with the TSP's BA have an entitlement to use the TSP's CBM even if, for example, such "entities" have no transmission service contract with the TSP or such "entities" are insolvent. An obvious alternative interpretation, consistent with the terminology used in R.10, is that TSPs may reasonably conclude that CBM is not AVAILABLE to entities that have not made a valid CBM request (except to extent CBM capacity is |

| Entity | Comment |
|---|---|
| | released and purchased non-firm).<br>Response: The drafting team has modified the standard to address this concern by only requiring a TSP to approve the transaction if the EEA 2 for which the CBM is being scheduled is within the Transmission Service Providers area. Issues related to creditworthiness are not within the scope of NERC.<br><br>Furthermore, the standard is silent on whether a TSP may prioritize competing requests to use CBM. Is the CBM first come, first served without any consideration of whether the requestor complied with the TSP's CBMID? If an LSE that reserved CBM loses a generator after all the CBM is in use by other "entities" that never requested CBM, does the TSP deny CBM to the LSE that requested and paid for it? Undoubtedly, if this standard is approved without changes, it would have to raise questions if the drafting team's interpretation comports with the Takings Clause of the Fifth Amendment to the U.S. Constitution.<br>Response: The drafting team believes that determinations such as those described are best left to business practices, as they are commercial in nature and deals primarily with equity between LSEs, rather than reliability. For this reason, the team took no position on the issue, and only required that use of CBM be approved if available – not denied if unavailable.<br><br>Finally, while some may argue that the drafting team's interpretation will improve reliability for customers of systems that are short on installed capacity (and this may be the case in the short-run), the unintended consequence is that entities that may already be irresponsibly under-resourced may further reduce their installed capacity investments once they learn they can free ride on their neighbors' CBM.<br>Response: The drafting team has modified the standard to address this concern by only requiring a TSP to approve the transaction if the EEA 2 for which the CBM is being scheduled is within the Transmission Service Providers area. |
| Response: Please see in-line responses. | |
| National Grid | This standard has added in the applicability section, an entity referred to as a Planned Resource Sharing Group. Requirement 1.1 adds this concept of an entity called the Planned Resource Sharing Group. This entity is not defined and is not currently in the latest approved version of the NERC Functional Model (v.3). Adding this entity raises issues for registration and compliance.<br>Additionally and more importantly, requirements have been introduced for the first time in this version of the standard. None of these revisions have yet been circulated for comment. New requirements should not be introduced in the final version of a standard without affording the industry some opportunity to comment. This, in our view bypasses the intent of the ANSI approved NERC RS process. |
| Response: The drafting team has removed the PRSG from the standard, and is posting the standard for comment. | |
| New Brunswick Power Transmission Corporation | There are new requirements introduced in this version that have not been circulated for comment. Requirement 1.1 adds and entity that has not been defined and is not in the current version of the NERC Functional model. |
| Response: The drafting team has removed the PRSG from the standard, and is posting the standard for comment. | |

|---|---|
| impact. Note that entities not using CBM are largely exempted from the standard. | |
| Southern Company Services, Inc. | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, it is recommended that only the LSE be applicable. There is not a PRSG function for which NERC can audit compliance. Additionally, the PRSG is a business arrangement and is not considered a reliability issue. |
| Response: The drafting team has removed the PRSG from the standard. However, the drafting team does believe entities other than the LSE are applicable. | |
| Westar Energy | Why not applicable to Planning Authority –<br>Response: The drafting team believes that the coordination functions of the Planning Coordinator/Planning Authority do not apply here. CBM is the import capability of the local system to serve local needs. The Planning Coordinator's role is to look at broader needs, and CBM by definition is a local need. Transmission Planners may, of course, delegate this task to the Planning Coordinator.<br>– R1.4 and 4.2.1 and 4.2.2 ATC or AFC should NEVER be allowed to be less than zero.<br>Response: The drafting team has removed this language to address the commenter's concerns.<br>– R3.1 should be Planning Authority instead of Transmission Planner.<br>Response: The drafting team believes that the coordination functions of the Planning Coordinator/Planning Authority do not apply here. CBM is the import capability of the local system to serve local needs. The Planning Coordinator's role is to look at broader needs, and CBM by definition is a local need. Transmission Planners may, of course, delegate this task to the Planning Coordinator.<br>– R3.2 Every 31 days not needed for many LSEs, this is onerous -<br>Response: The drafting team has removed this requirement. |
| Response: Please see in-line responses. | |
| Western Area Power Administration | Only those that post CBM need to document it. No Western office utilizes CBM. |
| Response: The standard does not require entities that do not use CBM to document anything. | |
| Independent Electricity System Operator | In the applicability section, there is an entity - "Planned Resource Sharing Group" that is not a defined term in the latest version of the Functional Model.<br>Additionally, there are a number of changes that have been made to the draft standard which have not been vetted with the industry but instead the SDT decided to go straight to the ballots instead. Hence we decided to vote against this standard |
| Response: The drafting team has removed the PRSG from the standard, and is posting the standard for comment. | |

<table>
<tr><th>Entity</th><th>Comment</th></tr>
<tr><td>ISO New England, Inc.</td><td>The applicability section indicates a planned resource sharing group which is not a functional entity identified in the latest version of the NERC Functional Model. Therefore, this Standard is not enforceable.<br><br>Also, a number of requirements were added after the last posting which were not reposted for comments. WE believe this is a violation of the established standard development process.</td></tr>
<tr><td colspan="2">Response: The drafting team has removed the PRSG from the standard, and is posting the standard for comment.</td></tr>
<tr><td>New York Independent System Operator</td><td>The NYISO does not use CBM and interprets the revised "Applicability" provision of MOD-004 as confirming that it will not be required to have or maintain a CBMID so long as that is the case. Nevertheless, the NYISO is voting against MOD-004 for the "general" reasons specified in its response to MOD-001, namely the fact that the proposed standard is overly detailed and addresses areas that are better left to NAESB or to the individual practices of individual practices of Reliability Coordinators, Transmission Operators, Transmission Service Providers, Transmission Planners, etc.<br><br>The NYISO also agrees with the NPCC that the latest version of MOD-004 inappropriately adds a new entity, and new requirements. Both additions raise issues that should be discussed more fully in comments before they are approved by NERC.</td></tr>
<tr><td colspan="2">Response: The drafting team agrees that Transmission Service Providers not using CBM are largely exempted from the standard (with the exception of R11). However, CBM itself is a margin established for reliability purposes. To the extent entities utilize it to meet reliability objectives, it has reliability impact, and is appropriate to be included in NERC's body of reliability standards. The drafting team has modified the standard to be less prescriptive and allow for more flexibility in how the need for CBM and CBM itself is determined.<br><br>The drafting team has removed the PRSG from the standard, and is posting the standard for comment.</td></tr>
<tr><td>PJM Interconnection, L.L.C.</td><td>MOD-004 Specific Comments: The ATC MOD standards should have been sent out for comment not pre-ballot posting.<br><br>Response: The drafting team is posting the standard for comment.<br><br>The SDT recognized that there were 3 different ways of calculating ATC and wrote MOD028-1, MOD029-1, and MOD030-1 as individual standards for each method. The SDT should be consistent in its approach and develop a second standard for CBM and cover both of the existing methods.<br><br>MOD004 as written assumes individual LSEs determine their emergency generation requirements and manage them with requests to the TSP. The standard was modified to recognize aggregating LSEs termed Planned Resource Sharing Group to recognize a different method of implementing CBM. This change falls short in that requirements still exist that are unique to the LSE method such as the processing of individual requests. The standard fails to recognize that individual instances of load import emergencies may be met through other means.<br><br>A second CBM standard should be written to represent the wider implementation of CBM on a regional basis and recognize the current practices used by ISO/RTOs or other regional entities. ISOs may manage the load emergencies using remote generation within its zone. This standard assumes all LSE GCIR is from outside the TSP zone by requiring the LSE to specify the GCIR and to match the request with transmission service set aside as CBM (imported from external resources). A single approach to CBM would result in a required methodology which does not represent how operations are conducted in large parts of the system.</td></tr>
</table>

| Entity | Comment |
|---|---|
| | Response: The drafting team has modified the standard to be less prescriptive and allow for more flexibility in how the need for CBM and CBM itself is determined.<br><br>PJM believes no requirement from the set of ATC standards should have an assigned Risk Factor exceeding "Lower". A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.<br>Response: The drafting team disagrees. While the majority of the requirements have a Violation Risk Factor of "Lower," R11 and R12 deal explicitly with the requirements for approving request for Interchange that use CBM. Such requests are made in response to an EEA 2, a reliability condition. Denial of such a request can have direct reliability implications; hence, the drafting team has set the VRFs for these requirements at "medium."<br><br>Requirement 1<br>– R1.3 should not be applicable in the event that a BA manages utilization of the transmission system and manages imports in emergency conditions on behalf of LSEs.<br>Response: This sub-requirement has been deleted.<br><br>– R1.4. A statement of whether the Transmission Service Provider allows ATC or AFC to be less than zero due to CBM has no meaning outside of R4.3 and should not be an independent requirement.<br>Response: This sub-requirement has been deleted.<br><br>Requirement 3<br>– R3 The timelines specified should be superseded by PRSG agreements. Existing processes should not be modified simply to meet requirements specified by this standard when reliability shortcomings do not exist. These timelines are best left as NAESB scope.<br>–<br>Response: These requirements have largely been eliminated from the standard.<br>– R3.1.1.1 is an awkward way of saying provide monthly values if your procedures are based on a monthly process or provided yearly if it's based on a yearly paradigm. Again this should be considered NAESB scope. ISOs that find it prudent to determine CBM on a planning timeline should not be required to respond to CBM changes on a short term basis. CBM should be determined on a timeline that allows the entities to respond to a condition of insufficient import capability. Building new infrastructure requires planning several years out. CBM could be evaluated on a short term basis to be released to the market for sale but this is NAESB scope. A second CBM standard should contain requirements that recognize this planning timeline focused method, or this requirement should be removed. |

| Entity | Comment |
|---|---|
| | Response: This sub-requirement has been deleted.<br><br>– R3.1.1.4 There are probabilistic methods that don't use a prescribed source for the evaluation. In ISOs the load requirements may be met by a mix of a number of generation sources several busses away. This standard should not restrict methods currently implemented that do not require the generator to be specified. Such a requirement may restrict markets and is not in line with NERC or FERC's intent in developing standards.<br>Response: This sub-requirement has been deleted.<br><br>– R3.1.2.1 This requirement recognizes there may be different implementations other than the requirement in R3.1.1. This underscores the fact that these requirements are written to achieve an objective, which is a calculated and respected CBM value verses a required process of exactly 'How' CBM must be calculated.<br>Response: This sub-requirement has been deleted.<br><br>– R3.2 In the context described above this monthly requirement is inappropriate. This requires a monthly re-evaluation of a yearly margin determined 5 years ago. If the requirement is to ensure a release of CBM to the market if the margin is not used then that is NAESB scope.<br>Response: This sub-requirement has been deleted.<br><br>Requirement 4<br>– R4 The timelines specified should not apply to entities with existing processes that determine CBM on a Planning timeframe. These timelines should be eliminated or a second CBM standard would address the appropriate timelines for such entities.<br>Response: The drafting team has modified the standard to be less prescriptive and allow for more flexibility in how the need for CBM and CBM itself is determined.<br><br>– R4.3.1, R4.3.2 This is a procedure and doesn't belong in a standard. This appears to codify a business practice regarding the treatment of a negative ATC if CBM is applied.<br>Response: This sub-requirement has been deleted.<br><br>Requirement 6<br>– R6 is inappropriate for BAs that manage emergency situations by redirecting or redispatching within their network. R6 should be eliminated.<br>Response: R6 has been greatly simplified and replaced with R7 and R8. |

| Entity | Comment |
|---|---|
| | Requirement 8<br>– R8 - A BA is not required to schedule energy. A BA may manage the import of energy during load emergencies. This requirement should be modified if a second CBM standard is not written.<br>Response: The requirement has been modified to remove the word "schedule" and references to Interchange. |
| Response: Please see in-line responses. | |
| Alabama Power Company | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, it is recommended that only the LSE be applicable. There is not a PRSG function for which NERC can audit compliance. Additionally, the PRSG is a business arrangement and is not considered a reliability issue. |
| Response: The drafting team has removed the PRSG from the standard. However, the drafting team does believe entities other than the LSE are applicable. | |
| Bonneville Power Administration | The purpose statement for MOD-004 should be expanded, to describe the timeframe for which CBM is to be activated so as not to conflict with TRM, to include a statement that "CBM is to be scheduled by the Energy Deficient Entity experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher only in the hour following a generation forced outage event." |
| Response: The drafting team disagrees with this interpretation. TRM may be used within the current hour for reserve sharing, but is a margin used to respond to events. CBM may be used at any point, and for a period longer than the current hour, subject to existing scheduling rules and requirements. | |
| Consolidated Edison Co. of New York | PSRG is not an entity defined in the NERC functional Model. |
| Response: The drafting team has removed the PRSG from the standard. | |
| Dominion Resources, Inc. | In support of PJM and NPCC comments |
| Response: Please see responses to PJM and NPCC. | |
| FirstEnergy Solutions | FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. We offer the following general comments in addition to our specific standard comments presented below.<br>CBM & TRM - MARKET AREAS: FE supports the drafting team's approach of three ATC methodologies presented in MOD-028, MOD-029 and MOD-030 to account for differences in calculating ATC in various geographic areas of the bulk electric system. However, the use of a single standard methodology for CBM and TRM as currently written does not meet the needs for entities operating within a market area such as MISO, PJM etc.<br>FE suggests that various requirements in the proposed standards that are currently applicable to the TP and TOP are actually handled by the RTO and within a market area would more appropriately be assigned to the Planning Coordinator (PC) and Reliability Coordinator (RC), respectively. This change would allow the proposed standards for CBM and TRM to be used largely "as is" within both market and non-market areas as the PC and RC would be appropriate in both. |

<table>
<tr><th>Entity</th><th>Comment</th></tr>
<tr><td></td><td>Our comments below on specific MOD standards elaborate on this point and provide examples where we feel the applicability is inappropriately assigned to TP or TOP responsible entities within a transmission market construct.<br><br>DECISION TO BALLOT: While the MOD standards presented are improving in content FE believes the standards should have been issued for one more comment period prior to ballot per the NERC Standard Development Procedures (SDP). In many cases this is only the 2nd draft version being reviewed by industry. The objective during the "Solicit Public Comments on Draft Standard (Step 6)" of the NERC SDP is to "Receive stakeholder inputs on the draft standard for the purpose of assessing consensus on the draft standard, and modifying the draft standard as needed to improve consensus." Based on the 200+ pages of comments of the prior draft version it is hard to conclude that the industry was near consensus. Additionally, per the SDP, now that the standards have gone to First Ballot (Step 9), the standard drafting team is not permitted to make any changes to the standards based on comments received during this First Ballot. The drafting team will now be required to rely on their responses to industry feedback to try and improve consensus during a re-circulation ballot. FE has concerns with the consequences of this decision with regard to the integrity of the standard development process and substantive registered entity perspectives.<br><br>Response: The drafting team is posting the standard for comment.<br><br>FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. However, at this time, FE is voting Negative to this standard with the following comments and suggestions:<br><br>The Planning Coordinator (PC) should replace the Transmission Planner (TP) as the applicable entity. The requirements in R5 and R7 should be the ultimate responsibility of the PC who works with his associated TP to obtain the necessary information. Per the NERC functional model, the PC "coordinates and collects data for system modeling from the Transmission Planner" and "coordinates total transfer capability with Transmission Planners".<br><br>Response: The drafting team agrees with the descriptions given from the functional model. However, we believe that the coordination functions of the Planning Coordinator do not apply here. CBM is the import capability of the local system to serve local needs. The Planning Coordinator’s role is to look at broader needs, and CBM by definition is a local need. Transmission Planners may, of course, delegate this task to the Planning Coordinator.<br><br>This standard is too prescriptive with the detail into how CBM should be calculated across all interconnections and does not take into account all the different calculation methods currently used by various entities in the industry. It is suggested that the standard be more general and that some of the information contained is better suited with a guideline document for calculating CBM.<br><br>Response: The drafting team has modified the standard to be less prescriptive and allow for more flexibility in how the need for CBM and CBM itself is determined.</td></tr>

| New York Power Authority | MOD-004-1--recommendation to vote NO not to accept. NPCC RSC found problems with the applicability section as it pertains to the planned resource sharing group. Requirement 1.1 adds this concept of an entity called the Planned Resource Sharing Group. This entity is not defined and is not currently in the latest approved version of the NERC Functional Model (v.3). Adding this entity raises issues for registration and compliance.<br>Additionally, requirements have been introduced for the first time in this version. None of these revisions have yet been circulated for comment. New requirements should not be introduced in the final version of a standard without affording the industry some opportunity to comment. This, in the view of the RSC bypasses the intent of the ANSI approved NERC RS process. |
| Response: The drafting team has removed the PRSG from the standard, and is posting the standard for comment. | |
| PECO Energy an Exelon Co. | R1.5. A statement should be added to confirm that it shall use assumptions in calculating CBM that are consistent with those assumptions that are used in the Transmission planning process. |
| Response: The drafting team believes that CBM can be based on studies and requirements outside the scope of the Transmission planning process defined in the TPL standards. | |
| Public Service Electric and Gas Co. | PSE&G votes NO for the reasons expressed in PJM's comments. |
| Response: Please see response to PJM. | |
| Santee Cooper | The drafting team's response to Entergy regarding MOD-004-1 Requirement 8 implies that this standard would require a Transmission Service Provider to furnish CBM to any LSE or "entity" that never requested or funded CBM. Another unintended consequence of Requirement 8 is that entities (some that may already be irresponsibly under-resourced) may further reduce their installed capacity investments once they learn they can free ride on their neighbors' CBM. |
| Response: The drafting team has modified the standard to address this concern by only requiring a TSP to approve the transaction if the EEA 2 for which the CBM is being scheduled is within the Transmission Service Providers area. | |
| Wisconsin Electric Power Marketing | GCIR definition - We are uncomfortable with the definition of GCIR, especially with no guidance on the determination or use of this quantity. Additionally it is not specified whether this is a maximum or average over the period in question.<br>Response: The definition provides a general explanation of what GCIR is. R3 and R4 describe options for its calculation. It is expected that Transmission Service Providers or others may develop business practices that describe in more detail how GCIR is to be determined and/or used.<br><br>PRSG definition - The definition states that this is an agreement to jointly meet a resource adequacy requirement, there are some PRSG's that are just doing a "joint study" to determine a requirement but how they meet that requirement may be |

| Entity | Comment |
|---|---|
| | unique to the LSE.<br>Response: The drafting team has removed the definition.<br><br>R4.1.2 - The determination of the CBM seems to be disconnected from the current resource adequacy methodology processes that are being used in most RTO's. I.e. a difference in models could induce inconsistencies in the CBM that is actually available and the reserve margins identified in the resource adequacy studies.<br>Response: The drafting team has modified the standard to be less prescriptive, allowing more flexibility for entities with regional processes for determining CBM, such as RTOs.<br><br>R4.3 - It is difficult to tell whether the process is a "first come first served" process or whether all CBM requests are evaluated on a common basis.<br>Response: The drafting team believes that determinations such as those described are best left to business practices, as they are commercial in nature and deals primarily with equity between LSEs, rather than reliability. For this reason, the team took no position on the issue, and only required that use of CBM be approved if available – not denied if unavailable.<br><br>R7 - There should be a consideration to providing these studies to LSE's to assist in coordination of methodologies etc.<br>Response: The drafting team believes that NAESB is the appropriate forum to develop business practices related to transparency and commercial needs.<br><br>Measures, M3 - The words "that wants CBM" could be better stated as "is requesting CBM to support the calculated reserve margin"<br>Response: The drafting team has modified the language to eliminate the phrase “that wants CBM,” and replaced it with “Each Load-Serving Entity that determined a need for Transmission Capacity to be set aside as CBM” |

|---|---|
| WPS Resources Corp. | Standard MOD-004 is confusing in that it mixes the use of Generation Capability Import Requirement (GCIR) and CBM. If GCIR and CBM are intended to reflect different quantities, the standard should provide a definition for CBM. The standard needs to clearly reference GCIR and CBM throughout the document, consistent with their definitions.<br>Response: The definition of CBM currently exists in the NERC glossary, and the drafting team is not suggesting modification to that definition. We have reviewed the standard to use these terms consistently.<br><br>The definition of PRSG should reflect the intent of a PRSG - to collectively assess the resource adequacy of a group of LSEs. The current definition inappropriately refers to a "resource adequacy requirement" which EPAct 2005 prohibits FERC and the ERO from establishing. Also, the current definition suggests a sharing of "planned resources" rather than a sharing of "planning reserves". Suggest the following definition for PRSG (consistent with MRO's approved Resource Adequacy Assessment standard): Planned Reserve Sharing Group ("PRSG") is defined as a group of Load Serving Entities ("LSEs") that agree to study their collective resources to assess the planned Resource Adequacy for the load of the PRSG as a whole.<br>Response: The drafting team has eliminated this definition, and believes that it is not necessary to specify the structure of any JRO beyond that which is defined in the registration process.<br><br>R2 - the CBMID should be made available to everyone, not just TOs, TPs, RCs, and transmission planners. In order to provide for transparency and consistency, the CBM Implementation Document should be available to all users, owners, and operators of the transmission system.<br>Response: The drafting team believes that NAESB is the appropriate forum to develop business practices related to transparency and commercial needs.<br><br>R7 - same comment as R2 - the allocation of CBM over different ATC/AFC paths must be available to all users, owners, and operators.<br>Response: The drafting team believes that NAESB is the appropriate forum to develop business practices related to transparency and commercial needs.<br><br>Requirement R3.1.2 references entities that do not have the ability to establish resource adequacy assessment requirements. Only the Regional Entities, through their ANSI approved standards setting process and delegated authority, can establish requirements for resource adequacy assessment. R3.1.2 should refer to FERC approved standards only.<br>Response: The drafting team disagrees. REs are not the only entities that can establish resource adequacy assessment criteria. FERC has also indicated in Order 890 that is believes other entities have the ability to establish these criteria.<br><br>R3.3 The request for CBM should be based on the resource adequacy assessment criteria of the REs only. Only the REs have the ANSI accredited processes and delegated authority to establish resource adequacy assessment criteria.<br>Response: The drafting team disagrees. REs are not the only entities that can establish resource adequacy assessment |

| Entity | Comment |
|---|---|
| | criteria. FERC has also indicated in Order 890 that is believes other entities have the ability to establish these criteria.<br><br>R4.2.1 and R4.3.1 - both of these requirements allow the TP to unilaterally reduce the CBM requested by LSEs. While TPs should have the ability to post negative ATC/AFC as zero, the TP should not have the right to reduce the CBM of the LSEs.<br>Response: The drafting team has eliminated this requirement. The drafting team has modified the standard to be less prescriptive and allow for more flexibility in how the need for CBM and CBM itself is determined.<br><br>M5 refers to "regional generation reliability criteria". Generation reliability criteria are different than resource adequacy assessment criteria. M5 should only reference the later.<br>Response: M5 has been modified and no longer includes this reference. |
| Response: Please see in-line responses. | |
| Bonneville Power Administration | The purpose statement for MOD-004 should be expanded, to describe the timeframe for which CBM is to be activated so as not to conflict with TRM, to include a statement that "CBM is to be scheduled by the Energy Deficient Entity experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher only in the hour following a generation forced outage event." |
| Response: The drafting team disagrees with this interpretation. TRM may be used within the current hour for reserve sharing, but is a margin used to respond to events. CBM may be used at any point, and for a period longer than the current hour, subject to existing scheduling rules and requirements. | |
| Calpine Corporation | The former NERC standard for ATC required that TSPs have and publish their methodology for calculation of ATC. Such a standard has clearly been rejected by FERC, instead opting for much greater transparency. However, we note that amongst the redlined changes in the version of MOD-001 that is being balloted, the word "transparency" has been deleted from the purpose.<br>Response: The drafting team believes that NAESB is the appropriate forum to develop business practices related to transparency and commercial needs.<br><br>We also note that Requirement R3.1 requires that sufficient data will be exchanged to allow for validation of the ATC calculation but in response to EPSA and many others it is clear that NERC will not mandate what if any of this data will be shared with market participants. By deferring that question to NAESB, it makes it very difficult for market participants to evaluate whether this standard provides sufficient transparency.<br>Response: The drafting team believes that NAESB is the appropriate forum to develop business practices related to transparency and commercial needs. NERC will work with NAESB to ensure that in future ballots and postings, entities are made more aware of the division of labor and coordination effort.<br><br>The notion of an ATCID document is a positive step. To have a single document with a comprehensive list of assumptions represents a substantial improvement over the status quo. However, the utility of this document, is difficult to evaluate if it is not yet determined which parties will have access to the document. |

| Entity | Comment |
|---|---|
| | Furthermore, while flexibility is necessary in order to create a standard with applicability across many jurisdictions, allowing undue flexibility as long as assumptions are captured in the ATCID cannot assure market participants of a sufficient degree of standardization. While TSPs are presumably expected to specify this in their CBMID, it should not be left to individual TSPs to determine that when CBM is requested beyond the existing capability of the system, such requests cannot take precedence over rollover rights previously granted to transmission customers.<br><br>Response: The drafting team believes that determinations such as those described are best left to business practices, as they are commercial in nature and deals primarily with equity between LSEs, rather than reliability. For this reason, the team took no position on the issue, and only required that use of CBM be approved if available – not denied if unavailable. |
| Response: Please see in-line responses. | |
| Electric Power Supply Association | Greater transparency is required for the CBMID. This can be achieved through the use of a single document with a comprehensive list of assumptions that improves the status quo. The document should be accessible by all market participants to ensure its utility. The document needs to be flexible enough to have applicability across jurisdictions so that assumptions are captured in the CBMID but not in a manner that undermines market participants having sufficient standardization. While TSPs are presumably expected to specify this in their CBMID, it should not be left to individual TSPs to determine that when CBM is requested beyond the existing capability of the system, such requests cannot take precedence over rollover rights previously granted to transmission customers. |
| Response: The drafting team believes that NAESB is the appropriate forum to develop business practices related to transparency and commercial needs. NERC will work with NAESB to ensure that in future ballots and postings, entities are made more aware of the division of labor and coordination effort.<br><br>The drafting team believes that determinations such as those described are best left to business practices, as they are commercial in nature and deals primarily with equity between LSEs, rather than reliability. For this reason, the team took no position on the issue, and only required that use of CBM be approved if available – not denied if unavailable. | |
| FirstEnergy Solutions | FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. We offer the following general comments in addition to our specific standard comments presented below.<br><br>CBM & TRM - MARKET AREAS: FE supports the drafting team's approach of three ATC methodologies presented in MOD-028, MOD-029 and MOD-030 to account for differences in calculating ATC in various geographic areas of the bulk electric system. However, the use of a single standard methodology for CBM and TRM as currently written does not meet the needs for entities operating within a market area such as MISO, PJM etc.<br><br>FE suggests that various requirements in the proposed standards that are currently applicable to the TP and TOP are actually handled by the RTO and within a market area would more appropriately be assigned to the Planning Coordinator (PC) and Reliability Coordinator (RC), respectively. This change would allow the proposed standards for CBM and TRM to be used largely "as is" within both market and non-market areas as the PC and RC would be appropriate in both.<br><br>Our comments below on specific MOD standards elaborate on this point and provide examples where we feel the applicability is inappropriately assigned to TP or TOP responsible entities within a transmission market construct.<br><br>DECISION TO BALLOT: While the MOD standards presented are improving in content FE believes the standards should have been issued for one more comment period prior to ballot per the NERC Standard Development Procedures (SDP). In many |

| Entity | Comment |
|---|---|
| | cases this is only the 2nd draft version being reviewed by industry. The objective during the "Solicit Public Comments on Draft Standard (Step 6)" of the NERC SDP is to "Receive stakeholder inputs on the draft standard for the purpose of assessing consensus on the draft standard, and modifying the draft standard as needed to improve consensus." Based on the 200+ pages of comments of the prior draft version it is hard to conclude that the industry was near consensus. Additionally, per the SDP, now that the standards have gone to First Ballot (Step 9), the standard drafting team is not permitted to make any changes to the standards based on comments received during this First Ballot. The drafting team will now be required to rely on their responses to industry feedback to try and improve consensus during a re-circulation ballot. FE has concerns with the consequences of this decision with regard to the integrity of the standard development process and substantive registered entity perspectives.<br>Response: The drafting team is posting the standard for comment.<br><br>FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. However, at this time, FE is voting Negative to this standard with the following comments and suggestions:<br>– The Planning Coordinator (PC) should replace the Transmission Planner (TP) as the applicable entity.<br>– The requirements in R5 and R7 should be the ultimate responsibility of the PC who works with his associated TP to obtain the necessary information. Per the NERC functional model, the PC "coordinates and collects data for system modeling from the Transmission Planner" and "coordinates total transfer capability with Transmission Planners".<br>Response: The drafting team agrees with the descriptions given from the functional model. However, we believe that the coordination functions of the Planning Coordinator do not apply here. CBM is the import capability of the local system to serve local needs. The Planning Coordinator's role is to look at broader needs, and CBM by definition is a local need. Transmission Planners may, of course, delegate this task to the Planning Coordinator.<br><br>– This standard is too prescriptive with the detail into how CBM should be calculated across all interconnections and does not take into account all the different calculation methods currently used by various entities in the industry. It is suggested that the standard be more general and that some of the information contained is better suited with a guideline document for calculating CBM.<br>Response: The drafting team has modified the standard to be less prescriptive and allow for more flexibility in how the need for CBM and CBM itself is determined. |
| Response: Please see in-line responses. | |

| Santee Cooper | The drafting team's response to Entergy regarding MOD-004-1 Requirement 8 implies that this standard would require a Transmission Service Provider to furnish CBM to any LSE or "entity" that never requested or funded CBM. Another unintended consequence of Requirement 8 is that entities (some that may already be irresponsibly under-resourced) may further reduce their installed capacity investments once they learn they can free ride on their neighbors' CBM. |
| Response: The drafting team has modified the standard to address this concern by only requiring a TSP to approve the transaction if the EEA2 for which the CBM is being scheduled is within the Transmission Service Providers area. | |
| Commonwealth of Massachusetts Department of Public Utilities | Massachusetts DPU found problems with the applicability section as it pertains to the planned resource sharing group. Requirement 1.1 adds this concept of an entity called the Planned Resource Sharing Group. This entity is not defined and is not currently in the latest approved version of the NERC Functional Model (v.3). Adding this entity raises issues for registration and compliance.<br>Requirements have been introduced for the first time in this version. None of these revisions have yet been circulated for comment. New requirements should not be introduced in the final version of a standard without affording the industry some opportunity to comment. This appears to bypass approved NERC RS process. |
| Response: The drafting team has removed the PRSG from the standard, and is posting the standard for comment. | |
| National Association of Regulatory Utility Commissioners | Due to the extensive revisions in the final draft, industry input should have been solicited before setting this revised standard for a vote. |
| Response: The drafting team is posting the standard for comment. | |
| Wyoming Public Service Commission | Should not prevent the inclusion of intermittent resources if they exhibit sufficient diversity and can be successfully integrated. |
| Response: The drafting team does not believe the scope of this standard addresses specific types of resources. If the Commission has specific concerns with the language, please provide more detail regarding how you believe the language should be modified. | |
| Midwest Reliability Organization | The MRO agrees with the PJM and MISO recommendation that the standard needs an additional commenting period. |
| Response: The drafting team is posting the standard for comment. | |
| Northeast Power | A new entity, a Planned Resource Sharing Group, that is not identified in the functional model, is included. A re-posting of the standard is recommended to allow for industry comments. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR Development June 20 2005.
2. SAC Authorized the SAR to be development as a standard on February 14 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from February 15–March 16, 2007.
5. SDT posted second draft for comment from May 25–June 25, 2007.
6. SDT posted third draft for comment from October 31–December 15, 2007.

**Description of Current Draft:**

This is the fourth and final draft of the proposed standard posted for stakeholder comments. This draft represents consideration of stakeholder comments submitted with the third draft of the proposed revisions to MOD-001 as well as consideration of applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. First ballot of standard. | March 7, 2008 |
| 2. Respond to comments. | April 22, 2008 |
| 3. Recirculation ballot. | April 22, 2008 |
| 4. 30-day posting before board adoption. | March 7, 2008 |
| 5. Board adoption. | May 5, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**ATC Path:** Any combination of Point of Receipt and Point of Delivery for which ATC is calculated.

**Available Transfer Capability Implementation Document (ATCID):** A document that describes the implementation of an Available Transfer Capability methodology.

**Transmission Operator Area:** The collection of Transmission assets over which the Transmission Operator is responsible for operating.

**Existing Transmission Commitments (ETC):** Committed uses of a Transmission Service Provider's Transmission system considered when determining Available Transfer Capability.

**Planning Coordinator:** See Planning Authority.

**Postback:** Positive adjustments to ATC or AFC as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.

**Business Practices:** Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization business practices; or NAESB Business Practices**.**

**Block Dispatch:** A simplification of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).

**Dispatch Order:** A simplification of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.

**Participation Factors:** A simplification of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.

## A. Introduction

1. **Title:** **Available Transfer Capability**

2. **Number:** **MOD-001-1**

3. **Purpose:** To promote the consistent and reliable application and documentation of Available Transfer Capability (ATC) calculations for analysis and system operations.

4. **Applicability:**

   **4.1.** Transmission Service Provider.

   **4.2.** Transmission Operator.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1 are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall select one ATC methodology[1] (Area Interchange methodology, Rated System Path methodology, or Flowgate methodology) for each ATC Path per time period identified in R2 for use in determining Transfer Capabilities of those Facilities within its Transmission operating area. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

**R2.** Each Transmission Service Provider shall calculate ATC values as listed below using the ATC methodology or methodologies selected by its Transmission Operator(s): [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R2.1.** Hourly ATC values for at least the next 168 hours.

**R2.2.** Daily ATC values for at least the next 31 calendar days.

**R2.3.** Monthly ATC values for at least the next 12 months (months 2-13).

**R3.** Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R3.1.** Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC calculations can be validated.

**R3.2.** A description of the manner in which the Transmission Service Provider will account for counterflows including:

---

[1] All ATC Paths do not have to use the same ATC Methodology and no particular ATC Path must use the same ATC Methodology for all time periods.

**R3.2.1.** How confirmed Transmission reservations, expected Interchange and internal counterflow are addressed in firm and non-firm ATC calculations.

**R3.2.2.** A rationale for the defined accounting.

**R3.3.** The identity of the Transmission Operators from which the Transmission Service Provider receives data for use in calculating ATC.

**R3.4.** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer capability.

**R3.5.** The identity of the Transmission Service Providers from which it receives data for use in calculating transfer capability.

**R3.6.** A description of the allocation processes listed below that are applicable to the Transmission Service Provider:

- Processes used to allocate Transfer Capability among multiple lines or sub-paths within a larger ATC Path or Flowgate.
- Processes used to allocate Transfer Capabilities among multiple owners or users of a single path or Flowgate.
- Processes used to allocate AFC between Transmission Service Providers to address issues such as forward looking congestion management and seams coordination.

**R3.7.** A description of how outage durations are considered in ATC calculations, including:

**R3.7.1.** The criteria used to determine when an outage impacts a daily ATC calculation.

**R3.7.2.** The criteria used to determine when an outage impacts a monthly ATC calculation.

**R4.** The Transmission Service Provider shall notify the following entities (via electronic mail) before implementing a new or revised ATCID: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** Each Planning Coordinator associated with the Transmission Service Provider's area.

**R4.2.** Each Reliability Coordinator associated with the Transmission Service Provider's area.

**R4.3.** Each Transmission Operator associated with the Transmission Service Provider's area.

**R4.4.** Each Planning Coordinator adjacent to the Transmission Service Provider's area.

**R4.5.** Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

**R4.6.** Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

**R5.** The Transmission Service Provider shall make available the current ATCID to all of the entities specified in R4. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.** When calculating TTC, AFC and ATC, the Transmission Operator and Transmission Service Provider shall each use assumptions consistent with those used in any associated operations studies or planning studies for the time period studied. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.** Each Transmission Service Provider shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.1.** For hourly ATC, once per hour.

**R7.2.** For daily ATC, once per day.

**R7.3.** For monthly ATC, once a week.

**R8.** Within thirty calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below for use in ATC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R8.1 and R8.2: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Expected generation and Transmission outages, additions, and retirements.
- Load forecasts.
- Unit commitments and order of dispatch, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:
  - Dispatch Order
  - Participation Factors
  - Block Dispatch
- Aggregated firm capacity set-aside for Network Integration Transmission Service and aggregated non-firm capacity set aside for Network Integration Transmission Service (i.e. Secondary Service).
- Confirmed firm and non-firm Transmission reservations.
- Aggregated capacity set-aside for Grandfathered obligations
- Firm roll-over rights.
- Any firm and non-firm adjustments applied by the Transmission Service Provider to reflect parallel path impacts.

- Power flow models and underlying assumptions.
- Contingencies, provided in one or more of the following formats:
  - A list of Elements
  - A list of Flowgates
  - A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider
- Facility Ratings.
- Any other services that impact Existing Transmission Commitments (ETCs).
- Values of Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM), and TTC for all ATC Paths or Flowgates.
- Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider receiving the request when selling Transmission service.
- Values of TTC and ATC for all ATC Paths for those Transmission Service Providers receiving the request that do not consider Flowgates when selling Transmission Service.
- Source and sink identification and mapping to the model.

**R8.1.** The Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months into the future (subject to confidentiality and security requirements).

**R8.2.** This data shall be made available by the Transmission Provider on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider).

## C. Measures

**M1.** The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one or more of the specified ATC methodologies per time period in R2 for use in determining Transfer Capabilities of those Facilities for each ATC Path within the Transmission Operator's operating area. (R1).

**M2.** The Transmission Service Provider shall provide ATC values and identification of the selected ATC methodologies along with other evidence (such as written documentation, processes, or data) to show it calculated ATC for the following using the selected methodology or methodologies chosen as part of R1 (R2):

- There has been at least 168 hours of hourly ATC values calculated at all times. (R2.1)
- There has been at least 31 consecutive calendar days of daily ATC values calculated at all times. (R2.2)
- There has been at least the next 12 months of monthly ATC values calculated at all times (Months 2–13). (R2.3)

**M3.** The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

**M4.** The Transmission Service Provider shall provide evidence (such as dated electronic mail messages) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)

**M5.** The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in R4, as required by R5. (R5)

**M6.** The Transmission Service Provider and Transmission Operator shall each provide a copy of the assumptions (such as loop flow, generation re-dispatch, switching operating guides, load shedding or data sources for load forecast and facility outages) used to calculate TTC, ATC and AFC as well as other evidence (such as copies of operations and planning studies, models, supporting information, or data) to show that the assumptions used in determining TTC, ATC, and AFC were consistent with those used in operations or planning studies for the time period studied. (R6)

**M7.** The Transmission Service Provider calculating ATC shall provide evidence (such as logs or data) that it has calculated the hourly, daily, and monthly ATC on at least the minimum frequencies specified in R7 or provide evidence (such as data, procedures, or software documentation) that the calculated values identified in the ATC equation have not changed. (R7)

**M8.** The Transmission Service Provider shall provide a copy of the dated request for ATC data as well as evidence to show it responded to that request (such as logs or data) within thirty calendar days of receiving the request, and the requested data items were made available in accordance with R8. (R8)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

- The Transmission Operator shall maintain its current selected method(s) for calculating ATC and any methods in force since last compliance audit period to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7, and R8 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.

- The Transmission Service Provider shall maintain evidence to show compliance with R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | N/A | N/A | N/A | The Transmission Operator did not select one or more of the specified methodologies. |
| R2. | N/A | N/A | N/A | The Transmission Service Provider did not calculate ATCs based on the time periods in R2.<br>**OR**<br>Did not use the selected methodology(ies) to calculate ATC. |
| R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made up to three months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than three months but not more than six months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than six months but not more than one year ago.<br>**OR**<br>The Transmission Service Provider has an ATCID, but it does not include two or more of the information items described in R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made a year or more ago.<br>**OR**<br>The Transmission Service Provider does not have an ATCID, or its ATCID does not include any of the information described in R3. |
| R4. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 14, but not more than 30, calendar days after its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 30, but not more than 60, calendar days after its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 60, but not more than 90, calendar days after its implementation. | The Transmission Service Provider did not notify one or more of the parties specified in R4 of a new or modified ATCID for more than 90 calendar days after its implementation. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R5. | N/A | N/A | N/A | The Transmission Service Provider did not make the ATCID available to the parties described in R5 |
| R6. | N/A | N/A | N/A | The Transmission Service Provider or Transmission Operator did not determine ATC using assumptions consistent with those used in planning or operations studies for the studied time period. |
| R7. | For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 12 hours but not more than 15 hours,<br>**OR**<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 2 calendar days but not more than 3 calendar days,<br>**OR**<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 8 or more calendar days, but less than 14 calendar days. | For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 15 hours but not more than 20 hours,<br>**OR**<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 3 calendar days but not more than 4 calendar days,<br>**OR**<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 14 or more calendar days, but less than 21 calendar days. | For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 20 hours but not more than 25 hours,<br>**OR**<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 4 calendar days but not more than 5 calendar days,<br>**OR**<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 21 or more calendar days, but less than 28 calendar days. | For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 25 hours,<br>**OR**<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 5 calendar days,<br>**OR**<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 28 or more calendar days. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R8 | N/A | The Transmission Service Provider made the requested data items specified in R8 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R8, available more than 30 calendar days but less than 45 calendar days after receiving a request. | The Transmission Service Provider made the requested data items specified in R8 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R8, available 45 calendar days or more but less than 60 calendar days after receiving a request. | The Transmission Service Provider did not make the requested data items specified in R8 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R8, available for 60 calendar days or more after receiving a request. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR Development June 20 2005.
2. SAC Authorized the SAR to be development as a standard on February 14 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from February 15–March 16, 2007.
5. SDT posted second draft for comment from May 25–June 25, 2007.
6. SDT posted third draft for comment from October 31–December 15, 2007.

**Description of Current Draft:**

This is the fourth and final draft of the proposed standard posted for stakeholder comments. This draft represents consideration of stakeholder comments submitted with the third draft of the proposed revisions to MOD-001 as well as consideration of applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. First ballot of standard. | March 7, 2008 |
| 2. Respond to comments. | April 22, 2008 |
| 3. Recirculation ballot. | April 22, 2008 |
| 4. 30-day posting before board adoption. | March 7, 2008 |
| 5. Board adoption. | May 5, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

~~**Posted Path:**~~

~~1)Any Balancing Authority to Balancing Authority interconnection;~~

~~2)Any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months;~~

~~3)Any path for which a Transmission Customer requests to have Available Transfer Capability or Total Transfer Capability posted.~~

**ATC Path:** Any combination of Point of Receipt and Point of Delivery for which ATC is calculated.

**Available Transfer Capability Implementation Document (ATCID):** A document that describes the implementation of an Available Transfer Capability methodology.

**Transmission Operator Area:** The collection of Transmission assets over which the Transmission Operator is responsible for operating.

**Existing Transmission Commitments (ETC):** Committed uses of a Transmission Service Provider's Transmission system considered when determining Available Transfer Capability.

**Planning Coordinator:** See Planning Authority.

**Postback:** Positive adjustments to ATC or AFC as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.

**Business Practices:** Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization business practices; or NAESB Business Practices.

**Block Dispatch:** A simplification of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).

**Dispatch Order:** A simplification of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.

**Participation Factors:** A simplification of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.

## A. Introduction

1. **Title:** **Available Transfer Capability**

2. **Number:** **MOD-001-1**

3. **Purpose:** To promote the consistent and ~~transparent~~ reliable application and documentation of Available Transfer Capability (ATC) calculations for ~~reliable~~ analysis and system operations.

4. **Applicability:**

   **4.1.** Transmission Service Provider.

   **4.2.** Transmission Operator.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that ~~all six (~~MOD-001-1, ~~MOD-004-1, MOD-008-1,~~ MOD-028-1, MOD-029-1, and MOD-030-1~~)ATC-related standards~~ are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall select one ATC methodology[1] (Area Interchange methodology, Rated System Path methodology, or Flowgate methodology) for each ~~Posted~~ ATC Path per time period identified in R2 for use in determining Transfer Capabilities of those Facilities within its Transmission ~~Planning Coordinator's planning~~operating area. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R2.** Each Transmission Service Provider shall calculate ATC values ~~for the time periods~~as listed below using the ~~selected~~ ATC methodology or methodologies selected by its Transmission Operator(s): [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

**R2.1.** Hourly ATC values for at least the next 168 hours.

**R2.2.** Daily ATC values for at least the next 31 calendar days.

**R2.3.** Monthly ATC values for at least ~~the current month plus~~ the next 12 months (months 2-13).

**R3.** Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC calculations ~~may~~ can be validated.

**R3.2.** A description of the manner in which the Transmission Service Provider will account for counterflows ~~or counter-schedules~~including:

**R3.2.1.** How confirmed Transmission reservations, expected Interchange and internal counterflow are addressed in firm and non-firm ATC calculations.

---

[1] All ~~Posted~~ ATC Paths do not have to use the same ATC Methodology and no particular ~~Posted~~ ATC Path must use the same ATC Methodology for all time periods.

**R3.2.2.** A rationale for the defined accounting.

**R3.3.** The identity of the ~~Planning Coordinator and~~ Transmission Operators ~~associated with each Facility under the Transmission Service Provider's tariff~~from which the Transmission Service Provider receives data for use in calculating ATC.

**R3.4.** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer capability.

**R3.5.** The identity of the Transmission Service Providers from which it receives data for use in calculating transfer capability.

**R3.6.** A description of the a~~A~~llocation ~~methodologies~~processes listed below that are applicable to the Transmission Service Provider:

- Processes used to allocate Transfer Capability among multiple lines or sub-paths within a larger ATC Path or Flowgate.
- Processes used to allocate Transfer Capabilities among multiple owners or users of a single path or Flowgate.
- Processes used to allocate AFC between Transmission Service Providers to address issues such as forward looking congestion management and seams coordination.

**R3.7.** A description of how outage durations are considered in ATC calculations, including:

**R3.7.1.** The criteria used to determine when an outage impacts a daily ATC calculation.

**R3.7.2.** The criteria used to determine when an outage impacts a monthly ATC calculation.

~~**R4.**When determining the impact of counterflows in the determination of firm ATC or AFC, the Transmission Service Provider shall use 0% of calculated counterflows based on reservations and/or schedules unless otherwise specified within the Transmission Service Provider's ATCID. [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]~~

~~**R5.**When determining the impact of counterflows in the determination of non-firm ATC or Available Flowgate Capability (AFC), the Transmission Service Provider shall apply the following: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]~~

~~**R5.1.**Use 0% of calculated counterflows based on reservations unless otherwise specified within the Transmission Service Provider's ATCID.~~

~~**R5.2.**Use 100% of calculated counterflows based on schedules unless otherwise specified within the Transmission Service Provider's ATCID.~~

**~~R6.~~R4.** The Transmission Service Provider shall notify the following entities (via electronic mail) before implementing a new or revised ATCID: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**~~R6.1.~~R4.1.** Each Planning Coordinator associated with the Transmission Service Provider's area.

**~~R6.2.~~R4.2.** Each Reliability Coordinator associated with the Transmission Service Provider's area.

~~R6.3.~~R4.3. Each Transmission Operator associated with the Transmission Service Provider's area.

~~R6.4.~~R4.4. Each Planning Coordinator adjacent to the Transmission Service Provider's area.

~~R6.5.~~R4.5. Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

~~R6.6.~~R4.6. Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

~~R7.~~R5. The Transmission Service Provider shall make available the current ATCID ~~and any changes to the ATCID~~ to all of the entities specified in ~~R6~~R4. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

~~R8.~~R6. When calculating ~~Total Transfer Capability (~~TTC~~)~~, AFC and ATC, the Transmission Operator and Transmission Service Provider shall each use assumptions consistent with those used in any associated operations studies or planning studies for the time period studied. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

~~R9.~~R7. Each Transmission Service Provider shall ~~update~~ recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

~~R9.1.~~R7.1. For hourly ATC, once per hour.

~~R9.2.~~R7.2. For daily ATC, once per day.

~~R9.3.~~R7.3. For monthly ATC, once a week.

~~R10.~~R8. Within ~~fourteen~~ thirty calendar days of receiving a request ~~of~~ by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below for use in ATC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R8.1 and R8.2:~~available on the schedule specified by the requester (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider), unless another request already specifies data on a more frequent basis, to each requester, current versions of the following data as requested in electronic format for use in ATC calculations, for up to 13 months into the future (subject to confidentiality and security requirements):~~ *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- ~~P10.1.~~ Expected generation and Transmission outages, additions, and retirements.
- ~~P10.2.~~ ~~Peak~~ Load forecasts.
- ~~P10.3.~~ Unit commitments and ~~dispatch~~ order~~s~~ of dispatch, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:
  - Dispatch O~~o~~rder
  - Participation F~~f~~actors
  - Block D~~d~~ispatch

- Aggregated firm capacity set-aside for Network Integration Transmission Service and aggregated non-firm capacity set aside for Network Integration Transmission Service (~~i.e~~i.e. Secondary Service).
- ~~Firm and non-firm Network Integration Transmission Service details.~~

~~P10.5.~~ Confirmed firm and non-firm Transmission reservations.

- Aggregated capacity set-aside for Grandfathered obligations
- ~~Grandfathered firm and non-firm contracted transmission capacity on an aggregated basis.~~

~~P10.7.~~ Firm roll-over rights.

~~P10.8.~~ Any firm and non-firm adjustments applied by the Transmission Service Provider to reflect parallel path impacts.

~~P10.9.~~ Power flow models and underlying assumptions.

~~P10.10.~~ Contingencies, provided in one or more of the following formats:

- A list of Elements
- A list of Flowgates
- A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider

~~P10.11.~~ Facility Ratings.

- Any other services that impact Existing Transmission Commitments (ETCs).
- ~~Counterflows.~~

~~P10.13.~~ Values of ~~ATC, ETC,~~ Capacity Benefit Margin (CBM~~),~~) and Transmission Reliability Margin (TRM), and TTC for all ~~Posted~~ ATC Paths or Flowgates.

~~P10.14.~~ Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider receiving the request when selling Transmission service.

- Values of TTC and ATC for all ATC Paths for those Transmission Service Providers receiving the request that do not consider Flowgates when selling Transmission Service.

~~P10.15.~~ Source and sink identification and mapping to the model.

**R8.1.** The Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider, -for up to 13 months into the future (subject to confidentiality and security requirements).

**R8.2.** This data shall be made available by the Transmission Provider on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider).

## C. Measures

**M1.** The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one or more of the specified ATC methodologies per time period in R2 for use in determining Transfer Capabilities of those Facilities for each ~~Posted~~ ATC Path within the ~~Planning Coordinator's planning~~Transmission Operator's operating area. (R1).

**M2.** The Transmission Service Provider shall provide ATC values and identification of the selected ATC methodologies along with other evidence (such as written documentation, processes, or data) to show it calculated ATC for the following using the selected methodology or methodologies chosen as part of R1 (R2~~1~~):

- There has been at least 168 hours of hourly ATC values calculated at all times. (R2.1)
- There has been at least 31 consecutive calendar days of daily ATC values calculated at all times. (R2.2)
- There has been at least the next 12 months ~~plus the current month~~ of monthly ATC values calculated at all times (Months 2-13). (R2.3)

**M3.** The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

**M4.** ~~The Transmission Service Provider shall provide its ATCID and other evidence (such as documentation and data) to show that it determined counterflows based on the rules in R4 and R5. (R4) (R5)~~

~~**M5.**~~ The Transmission Service Provider shall provide evidence (such as ~~copies of its~~ dated electronic mail messages) ~~used to make notifications in accordance with R6 as evidence~~ that it has notified the entities specified in ~~R5~~ R4 before a new or revised ATCID was implemented. (~~R6~~R4)

**~~M6~~M5.** The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in ~~R6~~R4, as required by ~~R7~~R5. (~~R7~~R5)

**~~M7~~M6.** The Transmission Service Provider and Transmission Operator shall each provide a copy of the assumptions (such as loop flow, generation re-dispatch, switching operating guides, load shedding or data sources for load forecast and facility outages) used to calculate TTC, ATC and AFC as well as ~~copies of operations and planning studies and~~ other evidence (such as copies of operations and planning studies, ~~written documentation,~~ models, ~~studies,~~ supporting information, or data) to show that the assumptions used in determining TTC, ATC, and AFC were consistent with those used in operations or planning studies for the time period studied. (~~R8~~R6)

**~~M8~~M7.** The Transmission Service Provider calculating ATC shall provide evidence (such as logs or data) that it has ~~updated~~ calculated the hourly, daily, and monthly ATC on at least the minimum frequencies specified in ~~R9~~R7 or provide evidence (such as data, procedures, or software documentation) that the calculated values identified in the ATC equation have not changed. (R7)

**~~M9~~M8.** The Transmission Service Provider shall provide a copy of the dated request for ATC data as well as evidence to show ~~the its~~it ~~response~~ responded to that request (such as logs or data~~,~~) ~~to show that~~ within ~~fourteen~~ thirty calendar days of receiving ~~a~~ the request, and the requested data items ~~specified in R10~~ were made available in accordance with R~~10~~8. (R8)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

### 1.3. Data Retention

- The Transmission Operator shall maintain its current selected method(s) for calculating ATC and any methods in force since last compliance audit period to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, ~~R4, R5 and R8~~ R6, R7, and R8 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.
- ~~The Transmission Service Provider shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.~~
- The Transmission Service Provider shall maintain evidence to show compliance with ~~R7~~ R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall maintain evidence to show compliance with ~~R8~~ R6 for the most recent calendar year plus the current year.
- ~~The Transmission Service Provider shall maintain evidence to show compliance with R9 and R10 for the most recent calendar year plus the current year.~~
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

### 1.5. Additional Compliance Information

None.

# Implementation Plan for Standard MOD-001-1; ATC/TTC/AFC and CBM/TRM Revisions (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-001-1, which requires the selection of an ATC methodology and describes the parts of the ATC process that apply to all entities, regardless of methodology chosen.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs) that must be implemented before this standard can be implemented.

## Modified Standards

This standard supersedes the current MOD-001-1.

This standard incorporates the following requirements from FAC-012-1:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired.

This standard incorporates the following requirements from FAC-013-1:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-001-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1 are approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1 are approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

**Summary Consideration of Comments:**

The Drafting Team has reviewed the comments and made some changes to the standard to address these comments.

1. As requested by BPA and others, the standard was modified to be clear that MOD-001 does not require conversion of AFC to ATC. While the OASIS Requirements require that ATC be posted, the Drafting Team could not find any reason that AFC must be converted to ATC for reliability. MOD-030 continues to provide the equation to convert AFC to ATC, that shall be used 'when' the conversion occurs, but the NERC standards do not define 'when' that conversion must occur. The standard now uses the phrase "ATC or AFC", where applicable. While the use of 'or' is not typically used in standards, since any Transmission Service Provider is only required to calculated either AFC or ATC, based on method that was selected, the use of 'or' is appropriate.
2. The title and purpose were modified to more clearly reflect the reliability aspects of 'why' ATC and AFC are calculated
3. All VRFs were set to "Lower" in response to industry comments. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.
4. R2 has changed such that only 48 Hourly values are required instead of 168 Hourly values. It is necessary for reliability to know the hourly information for the next 1-2 days. However, while OASIS posting is required for 168 hours, the Drafting Team does not see any reliability benefit to calculating more than 48 hours of Hourly data. Daily values provide the necessary reliability information for time periods more than 48 hours in the future.
5. In R6 (and R7) we clarified that assumptions need to be 'no more limiting' rather than 'consistent'. In addition, the existing R6 was split to clarify which aspects the Transmission Operator and Transmission Service Provider are responsible for. Measures were expanded to be more clear.
6. A more graded approach was applied to the VSLs where appropriate
7. The Transmission Service Provider was given an 80-hour-per-year grace period in R8 for scheduled or unscheduled outages of any ATC calculation software that impact the hourly calculation.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

---

[1] The appeals process is in the Reliability Standards Development Procedure: http://www.nerc.com/standards/newstandardsprocess.html.

|---|---|
| Alabama Power Company | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |
| American Electric Power | 1. This standard places obligations on the registered "Transmission Operator" however, in many cases around the continent, there are 'registered' TOPs that do not calculate ATC both by tariff (ERCOT for example) or SPP where ATC is calculated, but not by the TOPs, but by the RTO. This standard must have an exemption for TOPs that do not calculate ATC. Delegation to the party that does calculate it is not an appropriate solution, because the TO does not have the responsibility to calculate, therefore it cannot delegate.<br>Response: The Transmission Operator is responsible for handling the issues on the real-time system. Therefore, the Drafting Team believes the Transmission Operator is the appropriate entity to select the methodology, rather than be forced to implement the method selected by the Transmission Service Provider. For similar reasons, the Drafting Team believes that the Transmission Operator does have an obligation to calculate TTC or TFC. The Transmission Operator has the ability to delegate these responsibilities to the Transmission Service Provider if desired.<br><br>2. As this standard is written, the Transmission Operat or has only 2 responsibilities -- R1 to pick a calculation method for the TSP to use to calculate ATC, and R6 where the TOP must calculate consistent with planning studies. If the TOP doesn't calculate ATC, why this obligation? Even so, how would 'compliance' be measured.<br>Response: The Transmission Operator is responsible for handling the issues on the real-time system. Therefore, the Drafting Team believes the Transmission Operator is the appropriate entity to select the methodology, rather than be forced to implement the method selected by the Transmission Service Provider. For similar reasons, the Drafting Team believes that the Transmission Operator does have an obligation to calculate TTC or TFC, which is incorporated in the individual methodology standards. We have modified the standard to make this more clear. The Transmission Operator has the ability to delegate these responsibilities to the Transmission Service Provider if desired.<br><br>3. All ATC calculation issues should be on the TSP, there should be no obligation on this subject placed on the TOP.<br>Response: The Drafting Team has modified R6 and the associated measure and VSL to be clear that the responsibility of the Transmission Operator is to determine TTC or TFC, not to calculated ATC.<br>4. When this is accepted, MOD-013 is retired because those requirements are within this MOD-001 standard. TTC (FAC-012) is a reliability number and should not fall under ATC related standards.<br>Response: These ATC standards are also reliability standards, therefore, the inclusion of the TTC requirements is appropriate within these standards. |
| AEP Marketing | 1. This standard places obligations on the registered "Transmission Operator" however, in many cases around the continent, there are 'registered' TOPs that do not calculate ATC both by tariff (ERCOT for example) or SPP where ATC is calculated, but not by the TOPs, but by the RTO. | Response: Please see in-line responses. Note that similar comments have been grouped and responded to once. | |
| Associated Electric Cooperative, Inc. | The VSLs are very high for something that may be minor. If an entity is typically calculating AFC or ATC every hour, however due to some software or maintenance issue misses one on the hours why would the severity level be so high? I think it is inappropriate to have the VSL be high. It should be minor in this case. |
| Response: The Drafting Team has reviewed the quantity of ATCs that were required in R2 and has changed the requirement from 168 Hourly values to 48 Hourly values. It is necessary for reliability to know the hourly information for the next 1-2 days. However, while OASIS posting is required for 168 hours, the Drafting Team does not see any reliability benefit to calculating more than 48 hours of Hourly data. Daily values provide the necessary reliability information for time periods more than 48 hours in the future.<br>The VSLs have been modified to include a graduated approach. | |
| Barry Green Consulting Inc. | Transparency: The former NERC standard for ATC required only that TSPs have and publish their methodology for calculation of ATC. Such a standard has clearly been rejected by FERC, instead opting for much greater transparency. However, we note that amongst the redlined changes in the version of MOD-001 that is being balloted, the word "transparency" has been deleted from the purpose.<br>We also note that Requirement R3.1 requires that sufficient data will be exchanged to allow for validation of the ATC calculation but in response to EPSA and many others it is clear that NERC will not mandate what if any of this data will be |

In Order 890 P 211, Order 890-A P 41 and 51, and Order 639 P 1031, FERC clearly indicated that the requirement to convert AFC to ATC is an OASIS posting requirement. In order to ensure that transmission providers were consistent in how AFC was converted to ATC, FERC directed NERC to develop a standard conversion formula. The use of "ATC" and the omission of "AFC" in MOD-001 could be interpreted to require conversion. |
| Response: The Drafting Team modified the standard to ensure that MOD-001 does not require the conversion from AFC to ATC, as it does not seem to serve a reliability purpose. Note that similar comments have been grouped and responded to once. | |
| Calpine Corporation | The former NERC standard for ATC required that TSPs have and publish their methodology for calculation of ATC. Such a standard has clearly been rejected by FERC, instead opting for much greater transparency. However, we note that amongst the redlined changes in the version of MOD-001 that is being balloted, the word "transparency" has been deleted from the purpose.<br>We also note that Requirement R3.1 requires that sufficient data will be exchanged to allow for validation of the ATC calculation but in response to EPSA and many others it is clear that NERC will not mandate what if any of this data will be shared with market participants. | Entity | Comment |
|---|---|
| appropriate balance between flexibility and standardization. Where possible, the next posting will provide the links to available draft NAESB documentation. | |
| CenterPoint Energy | ERCOT's filed comments to the SDT that ATC, TTC, CBM, and TRM are not applicable within ERCOT operations and that these Standards should have provisions that make it clear that these requirements apply only within market structures in which they are pertinent were ignored by the SDT. These standards should not apply to ERCOT, thus our negative vote. |
| Response: | MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to be any path for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. Assuming ERCOT does not calculate ATC and has no directive to do so, MOD-001 R1 (and therefore also R2, R6, R7, R8) would not be applicable to ERCOT. R3, R4, and R5 will apply to ERCOT, but the requirements are documentation related and do not seem to be onerous. R9 is intended to support neighboring entities, and ERCOT is expected to comply with this requirement. |
| City of Tallahassee | Calculating/reporting requirements are too burdensome for smaller systems with little or no real TTC (or ATC) for posting. This standard will require substantial commitment of resources to implement with little benefit to the TP or the surrounding grid. |
| Response: | The Drafting Team has reviewed the quantity of ATCs that were required in R2 and has changed the requirement from 168 Hourly values to 48 Hourly values. It is necessary for reliability to know the hourly information for the next 1-2 days. However, while OASIS posting is required for 168 hours, the Drafting Team does not see any reliability benefit to calculating more than 48 hours of Hourly data. Daily values provide the necessary reliability information for time periods more than 48 hours in the future. |

| | it is not yet determined which parties will have access to the document. Furthermore, while flexibility is necessary in order to create a standard with applicability across many jurisdictions, allowing undue flexibility as long as assumptions are captured in the ATCID cannot assure market participants of a sufficient degree of standardization. |
| Response: The standard in R4 and R5 specifies the reliability entities to which the ATCID will be supplied, and NAESB is responsible for determining which information will be shared with market participants. The Drafting Team believes that the standard provides an appropriate balance between flexibility and standardization. Where possible, the next posting will provide the links to available draft NAESB documentation. | |
| Florida Municipal Power Agency | We believe this standard needs an additional commenting period. |
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |

| FirstEnergy Energy Delivery | FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. We offer the following general comments in addition to our specific standard comments presented below.<br>CBM & TRM - MARKET AREAS: FE supports the drafting team's approach of three ATC methodologies presented in MOD-028, MOD-029 and MOD-030 to account for differences in calculating ATC in various geographic areas of the bulk electric system. However, the use of a single standard methodology for CBM and TRM as currently written does not meet the needs for entities operating within a market area such as MISO, PJM etc.<br>Response: Please see responses contained in the CBM and TRM comment reports.<br><br>FE suggests that various requirements in the proposed standards that are currently applicable to the TP and TOP are actually handled by the RTO and within a market area would more appropriately be assigned to the Planning Coordinator (PC) and Reliability Coordinator (RC), respectively. This change would allow the proposed standards for CBM and TRM to be used largely "as is" within both market and non-market areas as the PC and RC would be appropriate in both. Our comments below on specific MOD standards elaborate on this point and provide examples where we feel the applicability is inappropriately assigned to TP or TOP responsible entities within a transmission market construct.<br>DECISION TO BALLOT: While the MOD standards presented are improving in content FE believes the standards should have been issued for one more comment period prior to ballot per the NERC Standard Development Procedures (SDP). In many cases this is only the 2nd draft version being reviewed by industry. The objective during the "Solicit Public Comments on Draft Standard (Step 6)" of the NERC SDP is to "Receive stakeholder inputs on the draft standard for the purpose of assessing consensus on the draft standard, and modifying the draft standard as needed to improve consensus." Based on the 200+ pages of comments of the prior draft version it is hard to conclude that the industry was |

| Entity | Comment |
|---|---|
| | near consensus. Additionally, per the SDP, now that the standards have gone to First Ballot (Step 9), the standard drafting team is not permitted to make any changes to the standards based on comments received during this First Ballot. The drafting team will now be required to rely on their responses to industry feedback to try and improve consensus during a re-circulation ballot. FE has concerns with the consequences of this decision with regard to the integrity of the standard development process and substantive registered entity perspectives.<br>Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes.<br><br>FirstEnergy Corp. (FE) appreciates the hard work put forth by NERC's ATC Standard Drafting Team. However, at this time, FE is voting Negative to this standard with the following comments and suggestions:<br>– We do not agree with the Transmission Operator (TOP) having the ultimate responsibility in selection of the ATC methodology. This should be the responsibility of either the Planning Coordinator (PC) or Transmission Service Provider (TSP). This is especially true when a TSP is providing service that crosses multiple TOP systems such as market areas. In these situations, it is not practical for a TOP to be selecting an ATC methodology. Additionally, per Requirement R1 the standard allows for the selection of different ATC methodologies for each ATC Path for various time periods.<br>Response: Since these standards only deal with the 13 month timeframe, the Drafting Team does not agree that the Planning Coordinator is appropriate. In addition, the Transmission Operator is responsible for handling the issues on the real-time system. Therefore, the Drafting Team believes the Transmission Operator is the appropriate entity to select the methodology, rather than be forced to implement the method selected by the Transmission Service Provider. The Transmission Operator has the ability to delegate the responsibility to the Transmission Service Provider if desired.<br><br>– Although we agree with allowing for three different methodologies to match the way different areas of the bulk electric system perform ATC calculations, throughout a single area one specific ATC methodology should be used for all of the paths and time periods. This would result in more consistent ATC calculations. At minimum, it is expected that all participants within a market area would conform to a single ATC methodology.<br>Response: The Drafting Team disagrees. The Drafting Team has seen specific examples where there are valid reasons to use different methods internally versus on external interfaces. Seams management may result in needs for different methodologies on external interfaces than those used for internal paths. In addition, there are valid reasons for using different methods for different timeframes. For example, timeframes that are farther out allow for a more computationally intensive method than can be used in a shorter timeframe.<br><br>– The standard should be clear on how often and what periodicity the ATC methodology is chosen. It would be a reasonable expectation for an entity to use a given methodology for a minimum period of time before a different methodology can be chosen. FE suggests that the methodology be chosen on an annual basis, or even less often if the team feels that would be appropriate.<br>Response: The Drafting Team does not believe it is appropriate for the standards to define how long a selected method |

| Entity | Comment |
|---|---|
| | must be utilized. The ATCID must be updated and distributed before any change in method is applied. Also, there are business processes and software requirements involved such that it is not likely that entities will alternate between methodologies.<br><br>– With regard to Requirement R6, this requirement requires the TSP and TOP to provide consistent ATC calculations based on assumptions consistent with those used in any associated operations studies or planning studies for the time period studied. This requirement is aimed at the calculation (end result), which is the responsibility of the TSP and FE believes it is appropriate to remove the TOP from this requirement.<br>Response: R6 (and its corresponding Measure and VSL) was separated into two requirements to address the specific aspects applicable to the Transmission Service Provider and the Transmission Operator.<br><br>– The TOP's requirement for providing support via modeling data for use by the TSP is already addressed in the applicable methodology standard (for example, refer to R3 of MOD-030).<br>Response: The Drafting Team agrees that MOD-028, MOD-029, and MOD-030 include details with the Transmission Operator responsibilities, but this requirement is addressing the consistency of assumptions and is common to all three MODs, so it is located in MOD-001. |

| Hydro One Networks, Inc. | Hydro One Networks Inc. is casting a negative vote on the 6 MOD standards (MOD-001, MOD-004, MOD-008, MOD-28, MOD-029 and MOSD-030) We believe there is a fundamental issue related with effective dates, that is, the dates in which Reliability Standards become effective and enforceable. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in the MOD Standards in ballot as they have implications on neighboring areas. The words inserted in the Effective Date of the Standards as well as in the Implementation Plan document permit that these Standards are effective in some jurisdictions and not others. These Standards should be modified to ensure that they become effective in all jurisdiction at the same time, including those |

| Response: Based on the need to support data exchange dependencies, the drafting team has modified the language to read as follows: First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. | |
| Independent Electricity System Operator | While we are in general support of this substantially improved standard and the efforts of the standards drafting team (SDT) and have voted YES to MOD-001. We nonetheless, believe that the fundamental purpose of these MOD standards, which is to promote a "consistent" and "reliable" application of Available Transfer Capability (ATC) calculations between BA Areas, is being compromised due to the proposed effective dates. In principle, we believe the effective date of all standards must be the same for all jurisdictions in North America. This is particularly important in the MOD Standards in ballot as they have implications on neighboring areas with varying implementation dates. |
| Response: Based on the need to support data exchange dependencies, the drafting team has modified the language to read as follows: First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. | |

| Madison Gas and Electric Co. | We support BPA's position, and agrees with the PJM and MISO recommendation that the standard needs an additional commenting period. |
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |
| MidAmerican Energy Co. | I support the BPA position for changes to take AFC to ATC and TFC to TTC conversions out of this standard. I also support the PJM recommendation that this standard needs an additional commenting period. |
| Response: Please see BPA and PJM responses. | |
| MidAmerican Energy Co. | Although this standard leaves much to be desired, it is better than the current standard. I hope NERC continues to work towards consistency in the arena of transfer capability. |
| Response: Thank you for your comments; the Drafting Team will consider them in subsequent revisions to the standards. | |
| Midwest Reliability Organization | The MRO supports BPA position, and agrees with the PJM and MISO recommendation that the standard needs an additional commenting period. |
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |
| Mississippi Power | We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team. |
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |
| New York Independent System Operator | As an initial matter, the NYISO supports, and incorporates by reference, the five "general" objections to proposed standards MOD-001, MOD-004, MOD-008, and MOD-030, that were raised by the PJM Interconnection, LLC in Sections I-V of its February 29 pre-ballot comments. The NYISO also raises these general objections in its comments on proposed MOD standards -028 and -029 notwithstanding the fact PJM intends to abstain from voting on those standards. Specifically:<br>– The proposed standards should have been sent out for comment not pre-ballot posting. Because there are still a number of significant questions about them and because there are instances where the proposed standards may not be broad enough to accommodate alternative means of compliance.<br>Response: The Drafting Team is posting the standards for an industry comment period<br><br>– The proposed standards are overly detailed. They contain requirements that should be left for "Business Practices" as that term is defined in MOD-001, creating an unnecessary likelihood of conflict with applicable tariffs, rules, procedures and/or market rules.<br>Response: The Drafting Team disagrees that the standards are too detailed and does not understand which requirements you see that would conflict with tariffs or market rules. When these standards are published for comment again, please provide specific suggestions on what you believe should be modified.<br><br>– The proposed violation risk factors are too severe. None of the ATC standards should have a risk factor beyond |

| Entity | Comment |
| --- | --- |
| | "Lower" under NERC's own violation risk factor definitions, since violations should not be expected to affect the reliability of the bulk power system.<br>Response: The Drafting Team has modified the standard to set all VRFs to Lower. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.<br><br>– The proposed violation severity levels are not complete and several proposed levels should be revised to include gradations that reflect the fact that substantial compliance should not be treated as harshly as total non-compliance.<br>Response: Where possible, the VSLs have been broken into graduated levels rather than only one level.<br><br>The description of how system outages are applied and the requirement to include all of those outages has a high chance of resulting in noncompliance findings that are unreasonable. The NYISO's December 14 Comments on the third draft of the proposed MOD standards explained in detail how ATC serves a fundamentally different purpose and is calculated differently, with respect to interfaces internal to New York, under the NYISO's Commission-approved "financial reservation" transmission model. Under that system, there are no express physical transmission reservations, all desired uses of the grid are accommodated to the extent that customers are willing to pay congestion, i.e., customers' ability to schedule transactions is not limited by a pre-defined amount of ATC. Instead, ATC postings are really "advisory projections" based on schedules calculated by the NYISO's day-ahead and real-time market software. The Commission has granted the NYISO a number of waivers from its OASIS regulations that reflect these differences. The December 14 Comments further explained that the NYISO believed that its form of financial reservation service would fit within the framework of NERC's proposed definitions and standards provided that NERC interpreted them with reasonable flexibility. The NYISO does not believe that there is anything in the latest version of the proposed MOD standards that is inconsistent with this interpretation.<br>The NYISO notes, however, that the latest version of MOD-001 replaces the definition of "Posted Path" with a new term "ATC Path" that is then used throughout the proposed MOD standards. The definition of "ATC Path," i.e., "[a]ny combination of Point of Receipt or Point of Delivery for which ATC is calculated," is broader than the definition of "Posted Path," which is comparable to the definition used in FERC's OASIS regulations. The broader definition has the potential to come into conflict with waivers the NYISO has previously been granted by FERC that exempt it from the requirement to post ATC values beyond the day-ahead period for its internal interfaces. |

| Entity | Comment |
|---|---|
| | This potential for conflict was much less significant when the MOD standards were focused on "Posted Paths" because the NYISO's internal interfaces normally would not be counted as Posted Paths. The NYISO respectfully requests that the SDT either return to its use of the term "Posted Path" or that NERC clarify that it will not seek to enforce MOD requirements against entities that have waivers from FERC that conflict with them.<br>Response: The Drafting Team changed the definition from Posted Path to ATC Path because the definition of Posted Path did not completely capture where ATC should be calculated for reliability, and will not be reverting back to the use of Posted Path.  The Drafting Team does not understand how the change in use of "ATC Path" versus "Posted Path" will impact the NYISO.  If you are calculating ATC for internal paths, it is not clear how this standard will conflict with your current practice.<br><br>The NYISO has a similar concern with respect to M2 under MOD-001 which assumes that all Transmission Service Providers are required to post ATC beyond the day-ahead period on all of their interfaces.<br>Response: This standard is only discussing the calculation of ATC, not the posting of ATC.<br><br>The NYISO respectfully asks that NERC clarify that it will not seek to enforce this rule against entities that have FERC waivers of the relevant underlying OASIS regulation.<br>Response: These standards are written for reliability purposes and are not related to OASIS regulations.  It is outside the Drafting Team's scope of responsibility to make interpretations on how these standards will be enforced.<br><br>The December 14 Comments asked the SDT to revise requirements R10.3 through R10.8, and R10.14, which have now been renumbered under R8, or in the alternative, clarify that they do not apply to transmission providers, such as the NYISO, that use financial reservation models and thus will not have the information that the proposed requirements direct them to make available on request. Otherwise, these information requirements would effectively call on the NYISO to perform functions that FERC's waiver orders excuse it from performing and that would serve no purpose under the NYISO model. The SDT has not made the requested clarifications or revisions. The NYISO therefore respectfully renews its request that the SDT do so.<br>Response:  R9.1 states "Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider". The Drafting Team believes this addresses the NYISO concern without additional changes being required.<br><br>Consistent with Sections I above and with PJM's specific comments on this issue, none of the violation risk factors in MOD-001 should have a rating beyond "Lower," the proposed violation severity levels should be reviewed so that they include appropriate gradations, and the requirements that PJM has identified as being overly detailed should be eliminated and the underlying issues left for NAESB or to the individual practices of Transmission Service Providers and other entities.<br>Response: Please see responses above and responses to PJM. |

<tr><td>PJM Interconnection, L.L.C.</td><td>– PJM believes no requirement from the set of ATC standards should have an assigned Risk Factor exceeding "Lower". A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system.<br><br>Response: The Drafting Team has modified the standard to set all VRFs to Lower. A medium risk factor is appropriate for “a requirement that, if violated, could directly affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures.” A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator’s existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.<br><br>– The ATC MOD standards should have been sent out for comment not pre-ballot posting.<br><br>Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes.<br><br>– PJM believes that the MOD standards go too far in areas that should be covered and addressed by Business Practices (as defined in MOD-001 Definitions). The frequency of postings and frequency of AFC/ATC calculations should be NAESB Business Practices not in NERC standards as reliability based requirements (see specific details for MOD-001 R2 and R7 and MOD-030 R10 in Specific Comments sections below). Not recognizing the clear</td></tr>
</table>

| Entity | Comment |
| --- | --- |
| | distinction between the reliability scope to be addressed by these standards and the NAESB business practices could cause inconsistencies in interpretation.<br>Response: The Drafting Team believes that ATC calculations are reliability related. While the Drafting Team does agree that the sale of transmission service and that the underutilization of the transmission system is not a reliability issue, the over-scheduling of the transmission system can have significant reliability implications. An overscheduled condition can require operator intervention; ATC or AFC calculations can provide indicators of the effect planned transfers will have on the transmission system and allows the associated reliability entities to plan accordingly. As such, the standards must provide clear requirements on how many and how often the calculations must occur to be measurable. The number of required hourly values was reduced from 168 from 48 to reflect the reliability need for the ATC calculations.<br><br>The Drafting Team agrees that the frequency of posting should be a NAESB business practice.<br><br>– NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards need to be developed with a more graded implementation for several requirements. The VSLs for several requirements do not consistently include the graded degree of achieving compliance. To the extent that reliability and transparency can be maintained in the event that the entity does not meet the measures the VSL is often excessive. Some VSLs do not recognize the potential varying level of non-compliance with the requirement. With these requirements there are several instances where the VSLs should have incorporated the following distinctions:<br>a. Recognizing gross violation of the requirement - for example the entity's program ignores the requirement.<br>b. Recognizing programmatic issues exist with the implementation of the requirement leading failure to meet some of the requirement. For example if only 167 hours of hourly ATC values instead of 168 hours are calculated it would be a violation with a severe sanction indicating that reliability was severely affected. The actual impact being minimal since customers can only reserve hourly ATC for 24 to 48 hours in the future out of the 168 hours. It is clear that the SDT recognized differences in severity levels in some of the requirements such as MOD001 requirement 7. This was accomplished by specifying timeframes and numbers of instances of not meeting the requirements. However the VSLs in several instances throughout the standard(s) do not reflect this approach.<br>The SDT should continue with a more graded implementation of VSLs for:<br>– MOD001-1:<br>o R2, R5, and R6 Requirement 1 The violation risk factor should be "Lower."<br>Response: The Drafting Team has modified the standard to set all VRFs to Lower. A medium risk factor is appropriate for “a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures.” A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other |

| Entity | Comment |
| --- | --- |
| | processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.<br>o Requirement 2 1.<br>▪ The requirements listed in R2 are business practices and should be considered NAESB scope and eliminated.<br>Response: ATC is reliability related and as such, requirements must be defined on the timing of the ATC calculations that are measurable. The quantity of hours required for hourly has been modified to reflect the data required for reliability<br>▪ 2. The medium risk factor is inconsistent with NERC's definition of risk factors and should be changed to lower if the requirement is to be retained.<br>Response: The Drafting Team has modified the standard to set all VRFs to Lower. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.<br>▪ 3. The Violation Severity Level should be more thorough. If only 167 hours of hourly ATC values instead of 168 hours are calculated it would be a violation with a severe sanction indicating that reliability was severely affected. Customers can only reserve hourly ATC for 24 to 48 hours in the future of the 168 hours. Since fines are a function of both risk factors and Violation Severity Levels the entity would again be fined inconsistent with the reliability impact.<br>Response: The Drafting Team has modified the VSL to have more than one level.<br>o Requirements 3 and 8<br>▪ R3.2.1 and R8 fifth bullet PJM believes reservations that are in "Accepted ", as well as, "Confirmed" status should be included. Once service is "Accepted" by a TSP it cannot be retracted. Using reservations that are in "Accepted" and "Confirmed" status should also be included in MOD-030 R6.3.<br>Response: Only Confirmed request are to be taken out in the ATC calculations under these standards, since reservations |

| Entity | Comment |
| --- | --- |
| | in an Accepted state (that were not pre-confirmed) may be withdrawn by the customer. However, R8 has been modified to remove the term 'confirmed' so that parties may ask for data exchange of additional statuses.<br><br>▪ The description of how system outages are applied and the requirement to include all of those outages has a high chance of noncompliance. A suggestion is to add a time duration for how long an outage can be temporarily excluded due to naming or modeling issue. Another exemption would be to block non-critical outages that cause problems arriving at a loadflow solution (see MOD001-R3.7 and MOD030 R5.2).<br>Response: The ATCID is intended to allow entities to document how to handle these scenarios. R3.6 was modified to remove the term 'duration', indicating a more detailed description is required of how outages are handed.<br><br>o Requirement 6<br>▪ This requires the use of assumptions consistent with those used in associated operations studies or planning studies. PJM believes language should be added as follows: Assumptions used in studies not associated with calculating TTC, AFC, and need not be used.<br>Response: This requirement has been separated to clearly address the Transmission Service Provider versus the Transmission Operators responsibilities. In addition, the phrase 'consistent' was replaced with 'no more limiting than'.<br><br>▪ The requirement should be modified to recognize allocation processes as acknowledged in R3.6. The allocation process may affect the value of ATC. The intent of the requirement would be met but not the requirement itself as written.<br>Response: The Drafting Team has addressed this issue by modifying that the assumptions shall be 'no more limiting than' rather than 'consistent'.<br><br>o Requirement 7<br>▪ The requirement is a business practice and should be NAESB scope. This requirement also makes no distinction between firm and non-firm service and assumes the reliability risk is the same.<br>Response: ATC is reliability related and as such, these standards must include measurable requirements on how often the values must be calculated to ensure the data is not stale. The VRF is already lower, whether it applies to firm or non-firm, so there is no way to reflect that not meeting this requirement for non-firm may have a lower reliability risk that firm.<br><br>o Requirement 8<br>▪ R8 should not require the entities to supply data that is not specifically part of the ATC calculation. The requirement should state the entity is to provide information in the form that it has been used. |

<tr><th>Entity</th><th>Comment</th></tr>
<tr><td></td><td>Response: R9.1 (previously 8.1) currently states this.<br><br>▪ R8 fifth bullet--PJM believes reservations in "Accepted", as well as, "Confirmed" status should be included.<br>Response: The status of the reservations was removed to allow the requestor to define what status reservations they want to receive</td></tr>
<tr><td colspan="2">Response: Please see in-line responses.</td></tr>
<tr><td>Portland General Electric Co.</td><td>The SDT made modifications to MOD-030-1 to no longer require conversion of AFC to ATC and TFC to TTC, but failed to make the necessary modifications to MOD-001-1 to reflect the removal of the conversion requirement. BPA would vote "Yes", if the following modifications were made to MOD-001-1:<br>– Change the following Requirements, Measures, and Violation Severity Levels to replace each "ATC" with "ATC or AFC": first use in R2, R2.1-R2.3, R3.1, R3.2.1, R3.3, R3.7-R3.7.2, R7-R.8, M2 (including the three dashes), M7, M8, R2 Severe VSL, R6 Severe VSL, and R7 Lower VSL - Severe VSL.<br>– Change the following Requirements and Measures to include the missing "TFC" term: R6 and M6.<br>– Change the Data Retention requirement in the first dash of 1.3 to replace "ATC" with "ATC or AFC".</td></tr>
<tr><td colspan="2">Response: Please see response to BPA</td></tr>
<tr><td>Potomac Electric Power Co.</td><td>Potomac Electric agrees with the comments of PJM distributed to the ballot body. I will not repeat them here, but do include the headings:<br>– The ATC MOD standards should have been sent out for comment not pre-ballot posting.<br>– Depth of the ATC MOD standards is excessive.<br>– Determining Violation Risk Factors is incorrect.<br>– Determining Violation Severity Levels is incomplete.</td></tr>
<tr><td colspan="2">Response: Please see response to PJM.</td></tr>
<tr><td>Public Service Electric and Gas Co.</td><td>PSE&G votes NO for the reasons expressed in PJM's comments.</td></tr>
<tr><td colspan="2">Response: Please see response to PJM.</td></tr>
<tr><td>Public Service Electric and Gas Co.</td><td>PSE&G votes NO for the reasons expressed in PJM's comments.</td></tr>
<tr><td colspan="2">Response: Please see response to PJM.</td></tr>
<tr><td>PSEG Power LLC</td><td>PSEG Power LLC votes no for the reasons expressed in PJM's comments.</td></tr>
<tr><td colspan="2">Response: Please see response to PJM.</td></tr>
</table>

<table>
<tr><th>Entity</th><th>Comment</th></tr>
<tr><td>PSEG Energy Resources & Trade LLC</td><td>PSEG Energy Resources & Trade LLC votes NO for the reasons expressed in PJM's ballot.</td></tr>
<tr><td colspan="2">Response: Please see response to PJM.</td></tr>
<tr><td>Sierra Pacific Power Co.</td><td>While much great work was undertaken by the SDT in preparing this Standard, I am voting Negative on this Standard primarily for two reasons:<br>– First, I disagree with the assertion in this Standard that any of the Requirements are a Reliability matter. As per our previous comments, ATC is a commercial product, a commodity that is offered by transmission service providers, sold to transmission customers, and perhaps traded among such customers. The body of NERC Standards should be restricted to those that have an impact upon the reliability of the Bulk Electric System.<br>Response: The Drafting Team has adjusted the quantity of ATC or AFC data that must be calculated to better reflect the reliability need for the data, such that only 48 hours of hourly values are required instead of 168 hours. While the Drafting Team does agree that the sale of transmission service and that the underutilization of the transmission system is not a reliability issue, the over-scheduling of the transmission system can have significant reliability implications. An overscheduled condition can require operator intervention; ATC or AFC calculations can provide indicators of the effect planned transfers will have on the transmission system and allows the associated reliability entities to plan accordingly.<br><br>– Second, and related, is that the Violation Risk Factors are incorrect on R1, R2, and R4 at "medium". As the entire Standard pertains only to non-reliability matters, there is no reason for a VRF higher than "lower".<br>Response: The Drafting Team has modified the standard to set all VRFs to Lower. A medium risk factor is appropriate for “a requirement that, if violated, could directly affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures.” A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator’s existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.</td></tr>
<tr><td colspan="2">Response: Please see in-line responses.</td></tr>
<tr><td>Southern Company Services, Inc.</td><td>We applaud the great work of the standard drafting team. While the current version is "workable" by Industry, making minor changes to the current draft could undermine the integrity of the good work of the drafting team.</td></tr>
<tr><td colspan="2">Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes.</td></tr>
<tr><td>Westar Energy</td><td>R2. Should be ONLY one method for each Transmission Provider, not different method for each Transmission Owner.<br>R8. Certain information, i.e. Power flow models will not be supplied to ANY/ALL requestors; R8 should specify "Qualified"</td></tr>
</table>

| Entity | Comment |
|---|---|
| | requestors. |
| Response: The Transmission Operator is responsible for handling the issues on the real-time system. Therefore, the Drafting Team believes the Transmission Operator (not the Transmission Owner) is the appropriate entity to select the methodology, rather than be forced to implement the method selected by the Transmission Service Provider. The Transmission Operator has the ability to delegate the responsibility to the Transmission Service Provider if desired.<br>All entities that can request information in R8 (R9) are NERC registered functional entities and by definition they are all 'qualified' requestors. | |
| Wisconsin Public Service Corp. | The WPSC supports BPA position, and agrees with the PJM and MISO recommendation that the standard needs an additional commenting period. |
| Response: The Drafting Team has made changes in response to this ballot and will be soliciting comments from the industry on these changes. | |
| WPS Resources Corp. | R5 – The ATCID of the Transmission Service Provider should also be publicly available. Making the ATCID only available to TOs, TPs, RC, and Planning Authorities defeats the purpose of the ATCID document - transparency in the implementation of an ATC methodology. |
| Response: NAESB is responsible for the dissemination of publicly available information. | |
| Wyoming Public Service Commission | This standard should be read as not preventing the use of ADI or similar enhancements. It should be applied to give maximum flexibility to regional and sub-regional entities in dealing with the particular and sometimes localized challenges of the Western Interconnection. |
| Response: The Drafting Team does not believe the standard prohibits the use of ACE Diversity Interchange (ADI) or similar enhancements. If Wyoming Public Service Commission believes otherwise, please detail the potential conflicts in future comments. | |

# Standards Announcement

## Ballot Windows Open
## March 3–12, 2008

**Now available at: http://www.nerc.com/~filez/standards/MOD-V0-Revision.html**

### Six Ballot Windows for Project 2006-07 — ATC/TTC and CBM/TRM Open March 3, 2008

The initial ballot for each of the six ATC-related standards (and its associated implementation plan) is open and will remain open until 8 p.m. (EDT) on March 12, 2008. Each standard has its own ballot as shown in the following table.

This set of standards is aimed at consistent and transparent calculation, verification, and use of Capacity Benefit Margin (CBM), Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). NERC has a commitment to deliver these standards to FERC by May 9, 2008.

| Standard | Description | Ballot |
|---|---|---|
| MOD-001-1<br>Available Transfer Capability | An "umbrella" standard with requirements for the selection of a methodology, the updating of values, and the sharing of procedures and data related to ATC. | ATC-TTC-CBM-MOD-001 |
| MOD-004-1<br>Capacity Benefit Margin | A standard with requirements for requesting, calculation, and use of CBM. | ATC-TTC-CBM-MOD-004 |
| MOD-008-1<br>Transmission Reliability Margin | A standard with requirements for the calculation and use of TRM. | ATC-TTC-CBM-MOD-008 |
| MOD-028-1<br>Area Interchange Methodology | A standard with requirements for the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection. | ATC-TTC-CBM-MOD-028 |
| MOD-029-1<br>Rated System Path Methodology | A standard with requirements for the calculation of TTC and ATC, as performed primarily in the Western Interconnection. | ATC-TTC-CBM-MOD-029 |
| MOD-030-1<br>Flowgate Methodology | A standard with requirements for the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC. | ATC-TTC-CBM-MOD-030 |

### Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

*For more information or assistance, please contact Maureen Long, Standards Process Manager, at maureen.long@nerc.net or at (813) 468-5998.*

# Standards Ballot Reminder

## Initial Ballot Results

**Now available at: http://www.nerc.com/~filez/standards/MOD-V0-Revision.html**

**Initial Ballot Results for Six ATC-related Standards**

The initial ballot for each of the six ATC-related standards (and its associated implementation plan) was conducted from March 3–12, 2008 and the results are shown below. Approval requires both:

- A quorum, which is established by at least 75% of the members of the ballot pool for submitting either an affirmative vote, a negative vote, or an abstention; and
- A two-thirds majority of the weighted segment votes cast must be affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and non responses.

The Ballot Results standards Web page provides a link to the detailed results of each of these ballots. All of the ballots received some negative ballots with comments, and the drafting team will review the comments before determining its next step.

| Title | Initial Ballot | |
|---|---|---|
| | Quorum | Approval |
| MOD-001-1 Available Transfer Capability | 93.12 % | 59.63 % |
| MOD-004-1 Capacity Benefit Margin | 93.01 % | 38.80 % |
| MOD-008-1 Transmission Reliability Margin | 93.12 % | 63.90 % |
| MOD-028-1 Area Interchange Methodology | 92.74 % | 63.05 % |
| MOD-029-1 Rated System Path Methodology | 92.86 % | 57.56 % |
| MOD-030-1 Flowgate Methodology | 93.01 % | 44.19 % |

**Standards Development Procedure**

The *Reliability Standards Development Procedure Manual* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

*For more information or assistance, please contact Maureen Long, Standards Process Manager, at maureen.long@nerc.net or at (813) 468-5998.*

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Flowgate:**

1.) A portion of the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.

**Total Flowgate Capability (TFC):** The maximum flow capability on a Flowgate, is not to exceed its thermal rating, or in the case of a flowgate used to represent a specific operating constraint (such as a voltage or stability limit), is not to exceed the associated System Operating Limit.

**Available Flowgate Capability (AFC):** A measure of the flow capability remaining on a Flowgate for further commercial activity over and above already committed uses. It is defined as TFC less Existing Transmission Commitments (ETC), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, and plus counterflows.

**Power Transfer Distribution Factor (PTDF):** In the pre-contingency configuration of a system under study, a measure of the responsiveness or change in electrical loadings on transmission system facilities due to a change in electric power transfer from one area to another, expressed in percent (up to 100%) of the change in power transfer .

**Outage Transfer Distribution Factor (OTDF):** In the post-contingency configuration of a system under study, the electric Power Transfer Distribution Factor (PTDF) with one or more system facilities removed from service (outaged).

**Flowgate Methodology:** The Flowgate methodology is characterized by identification of key Facilities as Flowgates. Total Flowgate Capabilities are determined based on Facility Ratings and voltage and stability limits. The impacts of Existing Transmission Commitments (ETCs) are determined by simulation. The impacts of ETC, Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) are subtracted from the Total Flowgate Capability, and Postbacks and counterflows are added, to determine the Available Flowgate Capability (AFC) value for that Flowgate. AFCs can be used to determine Available Transfer Capability (ATC).

## A. Introduction

1. **Title:** **Flowgate Methodology**

2. **Number:** **MOD-030-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.1** Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Transfer Capabilities (ATCs) for ATC Paths.

   **4.1.2** Each Transmission Service Provider that uses the Flowgate Methodology to calculate ATCs for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** The Transmission Service Provider shall include in its "Available Transfer Capability Implementation Document" (ATCID). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R1.1.** The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.

**R1.2.** The following information on how source and sink for transmission service is accounted for in AFC calculations including:

**R1.2.1.** Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.

**R1.2.2.** Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.

**R1.2.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.2.4.** If the Transmission Service Provider's AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.

**R2.** The Transmission Operator shall perform the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R2.1.** Identify Flowgates used in the AFC process based, at a minimum, on the following criteria:

**R2.1.1.** Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability such that at a minimum the first three limiting Elements and their worst associated

Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates.

2.1.1.1. Use first Contingency assumptions consistent with those first Contingencies used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems.

2.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.2.** Results of a first Contingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

2.1.2.1. Use first Contingency assumptions consistent with those first Contingencies used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems.

2.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.3.** Any limiting Element/Contingency combination within the Transmission model that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months.

**R2.1.4.** Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

2.1.4.1. If the coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or
- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.
- The Transmission Operator may utilize distribution factors less than 5% if desired.

2.1.4.2. If the limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

**R2.2.** At a minimum, establish the list of Flowgates to create, modify, or delete internal Flowgates definitions at least once per calendar year.

**R2.3.** At a minimum, establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested within thirty calendar days from the request.

**R2.4.** Establish the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and facilities161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority

associated with the Transmission Service Provider from which the power is to be received as the source.

- If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider’s Transmission model, use the discretely modeled point as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an “equivalence” or “aggregate” representation in the Transmission Service Provider’s Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an “equivalence” representation in the Transmission Service Provider’s Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

**R5.** When calculating AFCs, the Transmission Service Provider shall: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.1.** Use the models provided by the Transmission Operator.

**R5.2.** Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the period calculated for the Transmission Service Provider’s area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

**R5.3.** For external Flowgates, identified in R2.1.3, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

**R6.** When calculating the impact of ETC for firm commitments ($ETC_{Fi}$) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider’s area, based on:

**R6.1.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.1.2.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage[1] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.2.2.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider's area.

**R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage[2] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[3] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.7.** The impact of other firm services determined by the Transmission Service Provider.

**R7.** When calculating the impact of ETC for non-firm commitments ($ETC_{NFi}$) for all time periods for a Flowgate the Transmission Service Provider shall sum: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled for the Transmission Service Provider's area.

**R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions

[1] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[2] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[3] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

using Transmission service from multiple Transmission Service Providers, that have a distribution factor equal to or greater than the percentage[4] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.3.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R7.4.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[5] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers, and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.5.** The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider's area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**R7.6.** The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage[6] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.7.** The impact of other non-firm services determined by the Transmission Service Provider.

**R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$AFC_F = TFC - ETC_{Fi} - CBM_i - TRM_i + Postbacks_{Fi} + counterflows_{Fi}$$

**Where:**

**$AFC_F$** is the firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$CBM_i$** is the impact of the Capacity Benefit Margin on the Flowgate during that period.

---

[4] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[5] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[6] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**$TRM_i$** is the impact of the Transmission Reliability Margin on the Flowgate during that period.

**$Postbacks_{Fi}$** are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{Fi}$** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC – ETC_{Fi} – ETC_{NFi} – CBM_{Si} – TRM_{Ui} + Postbacks_{NFi} + counterflows$$

**Where:**

**$AFC_{NF}$** is the non-firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$ETC_{NFi}$** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**$CBM_{Si}$** is the impact of any schedules during that period using Capacity Benefit Margin.

**$TRM_{Ui}$** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.3, R3.4, and R5, at a minimum on the following frequency: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R10.1.** For hourly AFC, once per hour.

**R10.2.** For daily AFC, once per day.

**R10.3.** For monthly AFC, once per week.

**R11.** When converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$\mathbf{TC = min(P)}$$

$$\mathbf{P = \{PTC_1, PTC_2, \ldots PTC_n\}}$$

$$PTC_n = \frac{FC_n}{DF_{np}}$$

**Where:**

**TC** is the Transfer Capability (either 'Available' or 'Total').

**P** is the set of partial Transfer Capabilities (either available or total) for all "impacted" Flowgates honored by the Transmission Service Provider; a Flowgate is considered "impacted" by a path if the Distribution Factor for that path is greater than the percentage[7] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.

$\mathbf{PTC_n}$ is the partial Transfer Capability (either 'Available' or 'Total') for a path relative to a Flowgate *n.*

$\mathbf{FC_n}$ is the Flowgate Capability ('Available' or 'Total') of a Flowgate *n*.

$\mathbf{DF_{np}}$ is the distribution factor for Flowgate *n* relative to path *p*.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in AFC calculations. (R1)

**M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

**M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)

**M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)

**M5.** The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

**M6.** The Transmission Operator shall provide evidence (such as logs) that it updated the TFCs for each Flowgate at least once per calendar year. (R2.5)

**M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)

**M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

**M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

[7] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)

**M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)

**M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)

**M13.** The TSP must be capable of demonstrating that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the firm ETC for a specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R6)

**M14.** The TSP must be capable of demonstrating that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the non-firm ETC for a specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R7)

**M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

**M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)

**M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated ATC on the frequency defined in R10. (R10)

**M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of Transfer Capabilities follows the procedure described in R11. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

**1.1. Compliance Enforcement Authority**

Regional Entity.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Data Retention**

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to to determine flowgates and TFC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R8, R9, R10, and R11 for the most recent calendar year plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R6 and R7 for the most recent sixty days.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Flowgate:**

1.) A portion of the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.

**Total Flowgate Capability (TFC):** The maximum flow capability on a Flowgate, is not to exceed its thermal rating, or in the case of a flowgate used to represent a specific operating constraint (such as a voltage or stability limit), is not to exceed the associated System Operating Limit.

**Available Flowgate Capability (AFC):** A measure of the flow capability remaining on a Flowgate for further commercial activity over and above already committed uses. It is defined as TFC less ~~existing~~ Existing ~~t~~Transmission ~~c~~Commitments (~~including retail customer service~~ETC), less a Capacity Benefit Margin, ~~and~~ less a Transmission Reliability Margin, plus Postbacks, and plus counterflows.

**Power Transfer Distribution Factor (PTDF):** In the pre-contingency configuration of a system under study, a measure of the responsiveness or change in electrical loadings on transmission system facilities due to a change in electric power transfer from one area to another, expressed in percent (up to 100%) of the change in power transfer .

**Outage Transfer Distribution Factor (OTDF):** In the post-contingency configuration of a system under study, the electric Power Transfer Distribution Factor (PTDF) with one or more system facilities removed from service (outaged).

**Flowgate Methodology:** The Flowgate methodology is characterized by identification of key Facilities as Flowgates. Total Flowgate Capabilities are determined based on Facility Ratings and voltage and stability limits. The impacts of Existing Transmission Commitments (ETCs) are determined by simulation. The impacts of ETC, Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) are subtracted from the Total Flowgate Capability, and Postbacks and counterflows are added, to determine the Available Flowgate Capability (AFC) value for that Flowgate. AFCs ~~are~~ can be used to determine Available Transfer Capability (ATC).

## A. Introduction

1. **Title:** **Flowgate Methodology**

2. **Number:** **MOD-030-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.1** Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Transfer Capabilities (ATCs) for ATC Paths.

   **4.1.2** Each Transmission Service Provider that uses the Flowgate Methodology to calculate ATCs for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-1) are approved by all applicable regulatory authorities~~, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees~~.

## B. Requirements

**R1.** The Transmission Service Provider shall include in its "Available Transfer Capability Implementation Document" (ATCID). ***[****Violation Risk Factor: Lower****]*** ***[****Time Horizon: Operations Planning****]***

**R1.1.** The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.

**R1.2.** The following information on how source and sink for transmission service is accounted for in ~~ATC~~ AFC calculations including:

**R1.2.1.** Define if the source used for ~~ATC~~ AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.

**R1.2.2.** Define if the sink used for ~~ATC~~ AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.

**R1.2.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.2.4.** If the Transmission Service Provider's ~~ATC~~ AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.

**R2.** The Transmission Operator shall perform the following: ***[****Violation Risk Factor: Lower~~Medium~~****]*** ***[****Time Horizon: Operations Planning****]***

**R2.1.** Identify Flowgates used in the AFC process based, at a minimum, on the following criteria:

**R2.1.1.** Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability such that at a minimum the first three limiting Elements~~/~~ and their worst associated ~~Contingency~~ Contingency combinations with an OTDF ~~greater than 3~~of at least 5% and within the Transmission Operator's system are included as Flowgates.

2.1.1.1. Use first Contingency assumptions consistent with those first Contingencies used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems.

2.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.2.** Results of a first C~~c~~ontingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements~~/~~ and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) ~~greater than 3~~of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

2.1.2.1. Use first Contingency assumptions consistent with those first Contingen~~en~~cies used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems.

2.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.3.** Any limiting Element/Contingency combination within the Transmission model that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months.

**R2.1.4.** Any limiting E~~e~~lement/~~c~~Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

2.1.4.1. If the coordination of the limiting E~~e~~lement/~~c~~Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or
- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.

- The Transmission Operator may utilize distribution factors less than 5% if desired.

2.1.4.2. If the limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

**R2.2.** At a minimum, ~~update~~ establish the list of Flowgates to create, modify, or delete internal Flowgates definitions at least once per calendar year.

**R2.3.** At a minimum, ~~update~~establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested within thirty calendar days from the request.

**R2.4.** ~~Determine~~ Establish the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, ~~update~~ establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the ~~updated~~ TFCs within seven calendar days of their ~~determination~~establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: *[Violation Risk Factor: Lower~~Medium~~] [Time Horizon: Operations Planning]*

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the ~~Transmission Owners and~~ Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and facilities161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation

in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.

- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

**R5.** When calculating AFCs, the Transmission Service Provider shall: ***[****Violation Risk Factor: Lower~~Medium~~****]*** ***[****Time Horizon: Operations Planning****]***

**R5.1.** Use the models provided by the Transmission Operator.

**R5.2.** Include ~~all~~ in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the period calculated for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

**R5.3.** For external Flowgates, identified in R2.1.3, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

**R6.** When calculating the impact of ETC for firm commitments ($ETC_{Fi}$) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: ***[****Violation Risk Factor: Lower~~Medium~~****]*** ***[****Time Horizon: Operations Planning****]***

**R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of ~~base~~ generation to load, in the model referenced in R5.2 for the Transmission Service Provider's area, ~~all adjacent Transmission Service Providers, and any other Transmission Service Providers with which coordination agreements have been executed,~~ based on:

~~R6.1.1.For on-peak intra-day and on-peak next-day AFCs:~~

~~6.1.1.1.~~**R6.1.1.** Load forecast for the ~~on-peak~~time period being calculated, ~~consistent with that used for planning and operations for applicable time periods,~~ including Native Load and ~~n~~Network S~~s~~ervice ~~L~~load

~~6.1.1.2.~~**R6.1.2.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run as~~, as they are expected to run as~~ specified ~~by~~ in the Transmission Service Provider's ATCID.

~~R6.1.4.For off-peak intra-day and off-peak next-day AFCs:~~

~~6.1.4.1.Load forecast for the off-peak period calculated, consistent with that used for planning and operations for applicable time periods, including Native Load and network service Load.~~

~~6.1.4.2.Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run as specified by the Transmission Service Provider's ATCID.~~

~~R6.1.5.For days two through 31AFCs:~~

~~6.1.5.1.Load forecast for the day calculated, consistent with that used for planning and operations for applicable time periods, including Native Load and network service Load.~~

~~6.1.5.2.Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run as specified by the Transmission Service Provider's ATCID.~~

~~R6.1.6.For months two through 13 AFCs:~~

~~6.1.6.1.Load forecast for the month calculated, consistent with that used for planning and operations for applicable time periods, including Native Load and network service Load.~~

~~6.1.6.2.Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run as specified by the Transmission Service Provider's ATCID.~~

**R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of ~~base~~ generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage[1] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

[1] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.2.2.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider's area ~~not included in the model~~.

**R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts~~, not included in the model and~~ having a distribution factor equal to or greater than the percentage[2] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area ~~not included in the model~~.

**R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that ~~are not included in the model and having~~have a distribution factor equal to or greater than the percentage[3] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.7.** The impact of other firm services determined by the Transmission Service Provider.

**R7.** When calculating the impact of ETC for non-firm commitments ($ETC_{NFi}$) for all time periods for a Flowgate the Transmission Service Provider shall sum: ***[****Violation Risk Factor: Lower****]*** ***[****Time Horizon: Operations Planning****]***

**R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled ~~that are not included in the model~~ for the Transmission Service Provider's area.

**R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, that ~~are not included in the model and~~ have a distribution factor equal to or greater than the percentage[4] used to curtail in the Interconnection-wide congestion management

[2] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[3] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[4] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.3.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow ~~that are not included in the model~~ for the Transmission Service Provider's area.

**R7.4.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that ~~are not included in the model and~~ have a distribution factor equal to or greater than the percentage[5] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider for all adjacent Transmission Service Providers, and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.5.** The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider's area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**R7.6.** The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage[6] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.7.** The impact of other non-firm services determined by the Transmission Service Provider.

**R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower~~Medium~~] [Time Horizon: Operations Planning]*

$$AFC_F = TFC - ETC_{Fi} - CBM_i - TRM_i + Postbacks_{Fi} + \cancel{Counterflow}counterflows_{Fi}$$

**Where:**

**$AFC_F$** is the firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$CBM_i$** is the impact of the Capacity Benefit Margin on the Flowgate during that period.

**$TRM_i$** is the impact of the Transmission Reliability Margin on the Flowgate during that period.

[5] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[6] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**$Postbacks_{Fi}$** are changes to firm AFC due to a change in the use of ~~Firm~~ Transmission Service for that period, as defined in Business Practices.

~~**Counterflow**~~**counterflows$_{Fi}$** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC - ETC_{Fi} - ETC_{NFi} - CBM_{Si} - TRM_{Ui} + Postbacks_{NFi} + \cancel{Counterflow}counterflows$$

**Where:**

~~**$ATC_{NF}$**~~ **$AFC_{NF}$** is the non-firm Available Flowgate Capability for the ~~ATC Path~~Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$ETC_{NFi}$** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**$CBM_{Si}$** is the impact of any schedules during that period using Capacity Benefit Margin.

**$TRM_{Ui}$** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Flowgate Capability due to a change in the use of ~~Non-Firm~~ Transmission Service for that period, as defined in Business Practices.

~~**Counterflow**~~**counterflows$_{NF}$** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.3, R3.4, and R5, ~~-~~at a minimum on the following frequency: ***[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]***

**R10.1.** For hourly AFC, once per ~~day~~hour.

**R10.2.** For daily AFC, once per ~~week~~day.

**R10.3.** For monthly ~~ATC~~AFC, once ~~a~~ per ~~month~~week.

**R11.** When converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$\mathbf{TC = min(P)}$$

$$\mathbf{P = \{PTC_1, PTC_2, \ldots PTC_n\}}$$

$$PTC_n = \frac{FC_n}{DF_{np}}$$

**Where:**

**TC** is the Transfer Capability (either 'Available' or 'Total').

**P** is the set of partial Transfer Capabilities (either available or total) for all "impacted" Flowgates honored by the Transmission Service Provider; a Flowgate is considered "impacted" by a path if the Distribution Factor for that path is greater than the percentage[7] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider~~3%~~ on an OTDF Flowgate or PTDF Flowgate.

$\mathbf{PTC_n}$ is the partial Transfer Capability (either 'Available' or 'Total') for a path relative to a Flowgate *n*.

$\mathbf{FC_n}$ is the Flowgate Capability ('Available' or 'Total') of a Flowgate *n*.

$\mathbf{DF_{np}}$ is the distribution factor for Flowgate *n* relative to path *p*.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in AFC calculations. (R1)

**M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

**M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)

**M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)

**M5.** The Transmission Operator shall provide evidence (such as data ~~and~~ or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

**M6.** The Transmission Operator shall provide evidence (such as logs) that it updated the TFCs for each Flowgate at least once per calendar year. (R2.5)

**M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)

**M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

**M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

[7] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)

**M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)

**M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)

**M13.** The TSP must be capable of demonstrating that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the firm ETC for a specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R6)

**M14.** The TSP must be capable of demonstrating that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the non-firm ETC for a specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R7)

**M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

**M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)

~~**M13.**The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of firm ETC included the elements described in R6. (R6)~~

~~**M14.**The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of non-firm ETC included the elements described in R7. (R7)~~

~~**M15.**The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of firm AFC used the algorithm and the elements described in R8 and~~

~~did not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R8)~~

~~**M16.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of non-firm AFC used the algorithm and the elements described in R9 and did not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R9)~~

**M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated ATC on the frequency defined in R10. (R10)

**M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of Transfer Capabilities follows the procedure described in R11. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to to determine flowgates and ~~calculate~~ T~~T~~FC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate ~~TTC~~ AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, ~~R6, R7,~~ R8, R9, R10, and R1~~0~~1 for the most recent calendar year plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R6 and R7 for the most recent sixty days.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits

- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |

# Implementation Plan for Standard MOD-030-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-030-1 — Flowgate Methodology, which describes the Flowgate methodology (previously referred to as the Flowgate Network Response ATC methodology) for determining AFC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Retired Standards

FAC-012-1 — Transfer Capability Methodology includes four requirements. MOD-030-1 incorporates the following requirements from FAC-012-1:

– R1 (Documentation of the Transfer Capability Methodology).

– R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).

– R4 (Responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired.

FAC-013-1 — Establish and Communicate Transfer Capabilities, includes two requirements. MOD-030-1 incorporates the following requirements from FAC-013-1:

– R1 (Calculation of the Transfer Capabilities).

– R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-030-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

## Implementation Plan for Standard MOD-030-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-030-1 — Flowgate Methodology, which describes the Flowgate methodology (previously referred to as the Flowgate Network Response ATC methodology) for determining ~~ATC~~AFC.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### ~~Modified~~ Retired Standards

FAC-012-1 — Transfer Capability Methodology includes four requirements. MOD-030-1 ~~This standard~~ incorporates the following requirements from FAC-012-1:

- R1 (Documentation of the Transfer Capability Methodology).
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (Responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired.

FAC-013-1 — Establish and Communicate Transfer Capabilities, includes two requirements. MOD-030-1 ~~This standard~~ incorporates the following requirements from FAC-013-1:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-~~012~~ 013-1 is no longer needed and is being retired.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-030-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities~~, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date MOD-001, MOD-028, MOD-029, and MOD-030 are approved by the NERC Board of Trustees~~. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

Please **DO NOT** use this form to submit comments on the current draft of MOD-030. Comments must be submitted by **May 15, 2008.**

If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-452-8060.

## Background Information — MOD-030 — Flowgate Methodology

(A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC.)

An initial ballot of MOD-030-1 — Flowgate Methodology was conducted March 3-12, 2008 and there were several suggestions for modifying the standard that were submitted with ballots. The drafting team withdrew the standard from the ballot process, and made several changes to the standard based on stakeholder comments, including the following:

1. Clarified that MOD-030 does not require conversion of AFC to ATC. While the OASIS Requirements require that ATC be posted, the Drafting Team could not find any reason that AFC must be converted to ATC for reliability. MOD-030 continues to provide the equation to convert AFC to ATC, that shall be used 'when' the conversion occurs, but the NERC standards do not define 'when' that conversion must occur.
2. Changed several VRFs from "Medium" to "Lower" in response to industry comments. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.
3. Applied a more graded approach to the VSLs where appropriate.
4. During the review of the VSLs and Measures, it was determined that the measures for R6, R7, R8, and R9 did not adequately measure compliance with the requirements. The drafting team updated the measures and VSLs to ensure that they captured the need to have accurate and valid numbers used in the requirements.
5. The standard drafting team has added language to 2.1.1 and 2.1.2 to clarify what is meant by first three limiting element/contingency combinations.
6. The SDT has modified R2.1.1.1 and R2.1.2.1 to respond to the suggestions to acknowledge the use of SPS and has added a new R2.1.4.2 to further define a "credible" limiting Element/Contingency combinations that may be requested for inclusion.
7. The Drafting Team has modified the subrequirements in R2 to change all uses of "3%" to "5%."

**Please review the revised version of MOD-030 and then answer the following questions. You do not have to answer all questions. Enter All Comments in Simple Text Format.**

1. **The drafting team modified some requirements and associated measures in MOD-030 to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct.**

   Incorrect Requirement(s) or Measure(s):

2. **The drafting team has modified the Violation Risk Factors for MOD-030 to reflect industry concerns that they did not match NERC's VRF definitions. NERC's VRF definitions are listed below:**

   **High Risk Requirement**:
   (a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or
   (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

   **Medium Risk Requirement**:
   (a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or
   (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

   **Lower Risk Requirement**: is administrative in nature and
   (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or
   (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

   **Are the current VRFs established correctly?**

   ☐ Yes

☐ No

**If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification.**
Comments:

3. **The drafting team has modified the Violation Severity Levels for MOD-030 to reflect industry concerns that they were too "pass/fail" oriented. Are the current VSLs established correctly?**

   ☐ Yes
   ☐ No

   **If "No," please identify specific VSLs and suggest changes to the language.**
   Comments:

4. **Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-030.**

| | | | | | | | Flowgate for a specified period, the Transmission Service Provider with ATC Path(s) shall use the following algorithm:" Requirement 9: I suggest modifying the requirement to state: "When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider with ATC Path(s) shall use the following algorithm:" Requirement 10: I suggest modifying the requirement to state: "Each Transmission Service Provider with ATC Path (s) shall recalculate AFC, utilizing the updated models described in R3.3, R3.4, and R5, at a minimum on the following frequency:" Requirement 11: I suggest modifying the requirement to state: "When converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, the Transmission Service Provider with ATC Path(s) shall convert those values based on the following algorithm:" | | | | | |
| | Individual | Frank Cumpton | California ISO | | | | | | | | | R 3 – Should the actual Flowgate model made available to TSP upon request ONLY under NDA??? Confidential Model and access??? R 11 – SDT should clarify that MOD 30 R11 only specifies HOW AFC be converted and DOES NOT REQUIRE that it must be converted, as intent of SDT. MOD 30 does not REQUIRE that all AFCs be converted and posted to OASIS, irrespective of whether or not the ATC Path definition applies to internal lines for those with a flow based model. |
| | Individual | Maria Neufeld | Manitoba Hydro | | | | | Yes | | Yes | | MH echoes the concerns raised and documented by MISO that MOD-030 requirements are generally more stringent than those outlined for MOD-028 and MOD-029. |
| | Group | | | NPCC Regional Standards Committee | Guy V. Zito | Northeast Power Coordinating Council | None | Yes | | Yes | | |
| | | | | | | | Requirement 2, Applicable Entity: FE believes that this requirement and its associated sub-requirements are incorrectly assigned to the Transmission Operator. In reviewing the presently approved Functional Model (FM) Version 3 and its associated Technical Document, the determination of total transfer capability clearly falls to | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | FirstEnergy | Doug Hohlbaugh | FirstEnergy Corp. | a planning function. In FM Version 3, task 3c of the Function – Planning Reliability states "Review and determine total transfer capability (generally one year and beyond) as appropriate." This is the only area that explicitly states "determine" as it relates to total transfer capability. The FM Version 3 later describes the responsibilities of the Planning Coordinators and Transmission Planners as having a role in coordinating total transfer capability. Nowhere within the Functional Model is this assignment relegated to the real-time aspect of the Transmission Operator. Additionally, since R2.5 allows the responsible entity to establish Total Flowgate Capabilities once per year, it would seem reasonable that this would be applicable to a planning function. FirstEnergy believes the appropriate responsible entity is the Planning Coordinator or Transmission Planner since this entity would likely have the same wide-area view that is covered by the corresponding Transmission Service Provider who is determining the Available Flowgate Capacity. Assigning the determination of total transfer capability to the Planning Coordinator would also better align the standard for implementation within the RTO construct as well as non-market areas. The tasks described within R2 are completed by FE's RTO organizations – MISO and PJM – for the transmission facilities owned and operated by FirstEnergy. The standard should not be written in a way that would knowingly require some sort of delegation assignment for a large portion of the transmission system. R2 - MOD-030 does not appear to be consistent with MOD-028 and MOD-029 with respect to the criterion on which contingencies must be analyzed to determine Total Transfer Capability. In MOD-030 R2 is very prescriptive on how TFC is determined with regard to the contingencies that must be analyzed and the distribution factor thresholds that lead to a flowgate definition. However, MOD-028 and MOD-029 simply require the ATCID to | Yes | FE supports the SDT's adjustment of VRFs such that no VRF within the ATC standards exceeds a "Lower" rating. We concur with the team's reasoning and rationale provided in response to ballot comments in making this change. | No | In the Severe category VSLs for requirement R3, we suggest removing the word "detailed" when referring to detailed modeling data as it is ambiguous and subjective. | FirstEnergy appreciates the Standard Drafting Team's decision to move to a formal comment period based on the prior initial ballot feedback. We commend the team for moving quickly to respond to the ballot comments and providing the industry a revised set of standards to review and comment. We suggest striking the words "short term use" from the purpose statement as we believe this methodology should also be valid in the planning horizon as a longer term projection of TFC and AFC. Regarding the revision to the Effective Date, while FirstEnergy agrees that there is a need to ensure that the standard is implemented consistently across the entire continent we are concerned with the Effective Date being subject to approval of ALL regulatory authorities. We believe an appropriate Implementation Plan should reflect a period of time beyond the NERC Board of Trustee approval date that would reflect when the requirements are considered mandatory and enforceable. The timeline should allow sufficient time for regulatory authority reviews, with the intent of sanctions also being enforced in conjunction with the conclusion of the implementation period. However, a delay from a given regulatory agency should not impact when the requirements are considered mandatory and enforceable for the bulk electric system. |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | describe the "how". For example, in MOD-028 R1.4 states that the ATCID include "A description of the manner in which Contingencies are identified for use in the TTC [Total Transfer Capability] process." FE suggest changes are needed to R2 to align with the MOD-028 and MOD-029 standards. R2.4 – The first bullet of R2.4 should state that when a TFC is based on a thermal rating that it reflects the lowest facility rating for the monitored facility(ies) considered in the flowgate. The reference to the SOL should be reserved to only the second bullet which would appropriately account for a voltage or stability limit. R10 – As stated in FE's MOD-001 comments, it is suggested that the requirements for frequency of recalculating ATC be dealt with in MOD-001 (R8) to ensure a consistent application across MOD-028, MOD-029 and MOD-030 that presently does not exist. If MOD-001 R8 is revised as suggested, R10 in MOD-030 can be deleted. | | | | | |
| | Individual | Thad Ness | AEP | | | | | | | | | The Purpose statement is unclear and perhaps nonsensical. Is the purpose "to increase consistency and reliability in the development of documentation…." or "to support analysis and system operation"? What entities' "short term use"? Suggestion: Purpose: To ensure consistency of calculation of those entities employing Flowgate Methodology pursuant to MOD-001 R1. |
| | Group | | | Public Service Commission of South Carolina | Phil Riley | Public Service Commission of South Carolina | | Yes | | Yes | | |
| | | | | | | | Requirement 1 • Add to the end of R1 "provided that the data is not market sensitive." Requirement 2 • R2.1.3 – The interconnection wide congestion management procedures should be listed for each Interconnection. For the Eastern Interconnection this is the TLR process. Requirement 3 • R3.2 and R3.3 -The update frequency for AFC calculations should be addressed by NAESB Business Practices. • R3.4 – The last sentence in R3. 4 should be replaced with; "Equivalent representation of radial lines and facilities is allowed consistent | | PJM supports | | NERC states that a VSL defines the degree to which | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Patrick Brown | PJM | | | | with the Bulk Electric System standards." Requirement 5 • R5.2 - R3.6 in MOD 001 requires outages to be included in the daily and monthly calculations. R5.2 in MOD 30 requires outages to be included in the hourly calculations. A single requirement should be placed in MOD-001and applied consistently across MODS 28, 29 and 30. Requirement 6 • R6.3 - PJM understands the SDT's reasons for using "Confirmed" reservations in accordance with the FERC regulations. Reservations that are in "Accepted", as well as, "Confirmed" status should be included. Once service is "Accepted" by a TP it cannot be retracted. Using reservations that are in "Accepted" and "Confirmed" status should also be included in MOD-030 R6.3, R6.4, R7.1, and R7.2. This does not prevent the TP from decrementing for accepted and confirmed TSRs. We understand that some TPs maintain two sets of ATCs. One set is maintained internally and accounts for accepted and confirmed TSRs. The other set of ATC values is maintained externally and only accounts for confirmed TSRs. It is important for TPs who maintain two sets of ATC values to post the "internal" ATC values to provide greater transparency and give customers a more accurate picture of capability available to new requests. Requirements 7 and 9 • R7 and R9 Non-firm should be removed from this Reliability Standard and be considered NAESB scope. Requirement 10 • The periodic requirements of R10 are NAESB scope. This requirement should be eliminated. | Yes | NERC's position to revise all Violation Risk Factors to have an assigned risk factor of "Lower." A Lower Risk Factor requirement is administrative in nature and is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system. | No | compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but PJM has a concern regarding the possibility of multiple violations resulting from a single event. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations –this language to be added to the standard. Add a new item 6 to section A of MOD-001. For example a review of MOD-001 R2 and R8 and MOD-30 R10 should be performed for determination of multiple violations resulting from one event. | The MOD standards extend into areas that should be covered and addressed by NAESB Business Practices (as defined in MOD-001 Definitions). The frequency of postings and frequency of AFC/ATC calculations should be NAESB Business Practices, and not included in the NERC Standards as reliability based requirements (see specific details for MOD-001 R2 and R7 and MOD-030 R10 in the Specific Comments sections below). Non-firm should be removed from this reliability standard. • Reservations in "Accepted", as well as, "Confirmed" status should be included in ATC calculation (see MOD030 R6.3). Once the transmission provider has accepted the request, the provider is now required to provide service; therefore, not decrementing for accepted TSRs could result in over commitment. |
| | Individual | Greg Rowland | Duke Energy Corporation | | | | R1 – Need to ensure that comparable information should be required in either the study report or the ATCID in MOD-028, MOD-029 and MOD-030. R2.1.1.1 - Replace phrase "operations studies and planning studies" with the phrase "planning of operations", to be consistent with the wording in MOD-001 R6. R2.1.2.1 - Replace phrase "operations studies and planning studies" with the phrase "planning of operations", to be consistent with the wording in MOD-001 R6. R3.4 - | Yes | | Yes | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | Bulk electric system facilities 161kV and below may have significant network response. Since these facilities may have significant impact on AFC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders. | | | | | |
| | Individual | Greg Ward / Darryl Curtis | Oncor Electric Delivery | | | | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). | Yes | | Yes | | This standard should not apply to ERCOT for the reason expressed in question 1. |
| | | | | | | | | | | | | BPA thanks the drafting team for clarifying that MOD-030 does not require the conversion of AFC to ATC and agrees with your assessment that there is no reliability need for such conversion. In addition, BPA respectfully submits the following observations and suggestions: a. There appears to be some conflicting overlap between R2.1.-R2.1.4.2. in MOD-030-1 and the System Operating Limits (SOL) Standards (FAC-010-1 and FAC-011-1). It is unclear to BPA that there is any reliability-based need for the identification of more Flowgates than are needed to protect SOLs. To that end, BPA suggests the following modifications to and renumbering of the above mentioned requirements: R2.1. Identify Flowgates used in the AFC process based, at a minimum, on the following criteria: R2.1.1. As necessary to protect established System Operating Limits (SOLs) or 2.1.1.1 Results of a first Contingency transfer analysis for ATC Paths internal to a |

|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | Bonneville Power | Denise Koehn | Transmission Reliability Program | BPA does not believe any of the requirements are incorrect, though some are too prescriptive. See our response to question 4. | Yes | | Yes | | Transmission Operator's system up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates. 2.1.1.1.1. Use first Contingency assumptions consistent with those first Contingencies used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems. 2.1.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate. 2.1.1.2. Results of a first Contingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology. 2.1.1.2.1. Use first Contingency assumptions consistent with those first Contingencies used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems. 2.1.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate. R2.1.2. Any limiting Element/Contingency combination within the Transmission model that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology. R2.1.3. Any limiting Element/Contingency combination within the Transmission model that has been requested to be included |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where: 2.1.3.1. If the coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and - Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or - A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate. - The Transmission Operator may utilize distribution factors less than 5% if desired. 2.1.3.2. If the limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology. b. R2.4 has two bulletized sub-requirements that should either be numbered with a brief description provided as to how one would "respect the SOL" vs. simply setting the TFC equal to the SOL; or collapsed into R2.4 as follows: R2.4. Establish the TFC of each of the defined Flowgates as equal to: the System Operating Limit (SOL) of the Flowgate. c. The Time Horizons listed for all requirements should include the "Long-term Planning" Horizon, as ATC or AFC is to be calculated beyond the seasonal window. d. Balancing Authorities may be appropriately identified as Applicable Entities in this MOD and request that the Standards Drafting Team provide an explanation as to why they are not listed. |
| | Individual | Richard Kafka | Pepco Holdings, Inc | | | | PHI supports the comments of PJM and will not submit duplicate comments. | | | | | |
| | | | | | | | Requirement 1 Add to the end of R1 "provided that the data is not market sensitive." Requirement 2 R2.1 addresses criteria for identifying flowgates used in the AFC process. Certain operating conditions cause the use of | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | ISO RTO Council/Standards Review Committee (SRC) | Charles Yeung | Southwest Power Pool | temporary flowgates. Coordination tests may be executed between entities for a temporary flowgate which will be included in AFC calculations and congestion management systems. Would these situations require these temporary flowgates to remain in AFC processes even after the temporary conditions return to normal (transmission elements return to service)? In some cases, temporary flowgates created for short-term may not necessarily fall under the criteria established in R2.1 but should be allowed because of their immediate need in reliably operating the transmission system. R2.3 stipulates that: "At a minimum, establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested within thirty calendar days from the request." The requirement is unclear on how a Flowgate gets removed merely through a request if the criteria applied to R2 and its sub-requirements remain in effect to justify keeping the Flowgate in the AFC list. Further, who has the authority to make this request and on what basis the request can be granted? The standard is silent on these issues. This requirement is very loose which needs tightening up. Requirement 3 R3.2 and R3.3 - The update frequency for AFC calculations should be addressed by NAESB Business Practices. R3.4 – The last sentence in R3. 4 should be replaced with; "Equivalent representation of radial lines and facilities is allowed consistent with the Bulk Electric System definition." Requirement 5 R5.2 - R3.6 in MOD 001 requires outages to be included in the daily and monthly calculations. R5.2 in MOD 30 requires outages to be included in the hourly calculations. A single requirement should be placed in MOD-001 and applied consistently across MODS 28, 29 and 30. Requirement 6 R6.3 - The IRC understands the SDT's reasons for using "Confirmed" reservations in accordance with the FERC regulations. Reservations that are in "Accepted", as well as, "Confirmed" status should be included. Once service is | Yes | The MOD standards assess the correct amount of reliability risk in areas that do not affect reliability. The IRC supports the position that no requirement from this set of ATC standards should have an assigned Risk Factor exceeding "Lower". A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but the IRC has a concern regarding the possibility of multiple violations resulting from a single event. The IRC requests that the potential for double counting of violations for a single event be eliminated. | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | "Accepted" by a TSP it cannot be retracted. Using reservations that are in "Accepted" and "Confirmed" status should also be included in MOD-030 R6.3, R6.4, R7.1, and R7.2. This does not prevent the TSP from decrementing for accepted and confirmed TSRs. We understand that some TSPs maintain two sets of ATCs. One set is maintained internally and accounts for accepted and confirmed TSRs. The other set of ATC values is maintained externally and only accounts for confirmed TSRs. It is important for TSPs who maintain two sets of ATC values to post the "internal" ATC values to provide greater transparency and give customers a more accurate picture of capability available to new requests. Requirements 7 and 9 R7 and R9 Non-firm should be removed from this Reliability Standard and be considered NAESB scope. Requirement 10 The periodic requirements of R10 are NAESB scope. This requirement should be eliminated. | | preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system. | | | |
| | | | | | | | | | | | We have the following comments on the VSLs: a. R1: The VSLs are proper for this requirement. However, the Measure needs to be fixed so that they correspond to the VSLs. Please see our comments on M1 under Q1. b. R2: We suggest the VSLs for R2 be rewritten, and where necessary, restructure R2 altogether to facilitate development of VSLs. For example, R2.1 is only one of the 6 subrequirements of R2, yet a condition that "The Transmission Operator did not include six or more Flowgates in their its AFC calculations that met the criteria described in R2.1." would put the TOP | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Ron Falsetti | Ontario IESO | | | | We have the following comments on the Requirements and Measures: a. R2.3 stipulates that: “At a minimum, establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested within thirty calendar days from the request.” The requirement is unclear on how a Flowgate gets removed merely through a request if the criteria applied to R2 and its sub-requirements remain in effect to justify keeping the Flowgate in the AFC list. Further, who has the authority to make this request and on what basis the request can be granted? The standard is silent on these issues. This requirement, to say the least, is very loose. b. R2.5 does not cover the situations when transmission configuration changes occur that results in a change to the SOL and hence the Flowgate TTC. c. The term “Transmission Service” in R4 is unclear. Does it mean transmission service reservations, or commitments? This needs to be clarified. d. The last bullet in R2.1.4.1 and the footnote to R6.2, R6.4, R7.2, R7.4 and R7.6 allow the use of threshold lower than 5%. This makes the 5% threshold stipulated in R2.1.1, R2.1.2 and R2.1.4 not enforceable. If lower threshold can be used, why stipulate a 5% in the first place? e. M1: This measure assesses compliance of R1.1; there is no | No | R2 should be assigned a Medium VRF since TFCs set the reliability boundary, like an SOL or IROL, within which the TSP may provide transmission services. Failure to establish TFCs may result in the TSP over- | No | to a Severe violation despite the TOP might have met all the remaining 5 subrequirements. Another example is that the TOP is more than 9 month late in establishing the list of internal Flowgates but has otherwise met all the other subrequirements. Further, there are far too many single condition that would put a TOP to Severe violation despite it may have et all the other conditions, and there is no violation level assigned to failing R2.5.1, which is to update TFC when notified of a rating change. A major rewrite of this set of VSL in conjunction with restructuring R2 appears to be an appropriate course for the SDT. c. R3: Similar situation as in R2. R3 has 5 subrequirements and hence failing just one of them (except R3.1 for which VSLs are progressive (graded)) should not be assigned a Severe level. There needs to be consideration given to failing some combination of them for which Low, Moderate and High VSLs should be assigned. Unlike R2, R3 has a simpler structure and hence may not need to be restructured to facilitate proper assignments of VSLs. d. R5: This requirement has 3 subrequirements. It is generally expected that failing one of the 3 subrequirements would result in a | We commend the SDT for having worked very hard to try to meet FERC's earlier deadline, and for taking very positive steps responding to industry comments received from previous round of posting for comment and from the failed balloting process. However, owing to the number and size of the standards, there is a great potential for inconsistent treatment to the requirements, measures and VSLs among the standards. After reviewing all 6 standards and offering comments, we've found that there is quite a bit of inconsistency among the standards. For example, for a similar process, some requirements in a standard have only one level of subrequirements while in another standard there are two levels. In some standards that have requirements that contain subrequirements, there is only one measure while in another standard, similar process having similar requirement structure may have multiple measures. Still the vast majority of inconsistency is found in the VSLs: for similar requirement structure and content, some have appropriately graded VSLs while some have binary (none or Severe) VSLs; some have graded VSLs that is a function of the number of |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | measure for R1.2. f. M13 for R6: R6 stipulates the algorithm to establish AFCs. However, M13 provides the requirement for certain accuracy, which leads to the following questions: i. Is R6 about the use of an algorithm only or is it also about the proper or consistent setting of the variables within that algorithm? ii. If it is also the proper or consistent setting of the variables, the requirement should stipulate the conditions rather than leaving the assessment to a recalculation process (stipulated in M13) to determine if the algorithm and its settings have been properly used. ii. If accuracy is to be a criterion for having proper and consistent setting of the variables, it becomes a requirement and hence should be stipulated in the requirement section, not in the measure. g. M14 for R7: The same comment on M13 also applies here for R7. h. M18 for R11: Suggest to revised M18 to: “The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, it follows the procedure described in R11.” | | selling transmission services beyond the reliability bounds, risking the BES to unreliable operation | | Moderate VSL, 2 for a High VSL and all 3 for a Sever VSL as opposed to seeing only the graded VSL for failing R5.2. Furthermore, there may not be a large number of outages/retirements (for example 26-50) occurring during a modeling period within the total area that a TSP needs to model. Some VSLs for R5.2 may not be applicable for some TSPs even they may miss all the outages/retirements within the total area that it needs to model. Suggest the SDT revise this set of VSLs to take into account failing any combination of the 3 subrequirements, and the range of area size (and hence the total number of possible outages within a period) that a TSP needs to model. e. R6: For these VSLs to be appropriate, please see our comments and suggestion for changes on M13 under Q1. f. R7: For these VSLs to be appropriate, please see our comments and suggestion for changes on M14 under Q1. g. R8: The VSL has a condition that there is a violation if additional elements are used in the calculation of firm AFCs. Not allowing the use of additional elements is not stipulated in the requirement. Suggest to remove this condition from the VSL, or add this requirement to R8. h. R9: Same comment on R8 also applies here for calculating non-firm | subrequirements violated while others have VSLs that is determined by the extent of violation of any one of the subrequirements. The inconsistent wording among the requirements, their measures and VSLs is another area of concern. We realize the SDT is still working with a tight timeline. Nonetheless, we feel that the needed time must be spent to review the structure and quality of these standards to support measurability and the ability to develop proper VSLs. Unlike the development of VSLs for the approved standards – a process that did not allow for changing the requirements, the ATC SDT has the freedom to change the requirements as it sees necessary to facilitate proper development of measures and ease of VSL development thereby achieving a set of quality standards that are measurable and enforceable. We therefore suggest the SDT do spend some time to refine these standards to improve their quality rather than trying to post them in short order to get ahead on the timeline. |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | AFCs. i. R10: The VSLs as written indicates that failing any one of the 3 beyond some threshold levels would constitute a Severe violation. This is not consistent with the general principle that failing all subrequirements would result in a Severe violation. Suggest the SDT revise this set of VSLs to achieve consistency with the general principle. j. R11: Please see our comment on M18 under Q1. If the wording to M18 is revised as suggested, the wording for the VSL condition should be changed accordingly. | |
| | | | | | | | •In the Purpose field, why specify for short term use only? The Midwest ISO believes this methodology is valid for the planning horizon also. •R2 – In general, we believe this is not treated equally comparing to MOD-028 and MOD-029. There isn't a minimum criterion on what contingencies have to be included in MOD-028 or MOD-29. All they need to do is to include in their ATCID. Why can't flowgate methodology do the same thing? •R2.1.1/R2.1.2 – Below are a couple of comments related to these requirements. oR2.1.1.1/R2.1.2.1 – Overall, both requirements as written are unclear. The Midwest ISO questions what assumptions are referenced in these requirements and how would an auditor be able to verify that the TO is compliant. The Midwest ISO requests the requirement to either list specific assumptions or be deleted and leave it to FERC to address the issues on a case by case basis. oR2.1.1.2/R2.1.2.2 – The Midwest ISO requests that an example of the limiting element in series be provided. •R2.1.3 – The Midwest ISO believes that this requirement is too burdensome and stringent, and | | | | | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Individual | John Harmon | The Midwest ISO | | | | sometimes will have no effect on a TO or TSP. If a TO chooses to model the topology for a TO or TSP far removed from its respective region, why is it mandated that all flowgates with TLR be honored. This requirement also gives no service for an instance where a TLR may occur due to a temporary condition such as a forced outage. This will greatly increase the number of flowgates that each TO will have to account for in their load flow calculations without much perceived benefit. •R2.2 – Edited the statement to read: "At a minimum, establish the list of Flowgates at least once per calendar year." The Midwest ISO believes that this would be a clearer requirement. •R2.3 – Edit the statement to read: "At a minimum, establish the list of external Flowgates that have been requested within thirty calendar days from the request." The Midwest ISO believes that this would be a clearer requirement. •R2.4 – The Midwest ISO believes that this requirement is identical to R12 in TOP-002. Since TOP-002 R12 will not be retired, R2.4 in MOD-030 is redundant and should be removed. However, if the DT does not agree, The Midwest ISO would then comment that for thermal limits, the thermal rating of the Flowgate should be used and not the SOL. •R4 – The Midwest ISO has two comments related to this requirement: oThe Midwest ISO has observed that a similar requirement is not in MOD-029. We feel that TSPs that follow the Rated System Path methodology should also be subjected to this requirement. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies. oThe sub-requirements (identified with a dash in the standard) seem to be written as though they are mutually exclusive. The Midwest ISO believes that a Source or Sink identified in a reservation that is discretely modeled can still be mapped to an "equivalence" or "aggregate" representation in the model. Background: For the Midwest ISO, although the internal Local Balancing Authorities are | Yes | | No | The tolerances included in the VSLs for R10 should be moved into the requirement itself. | The Midwest ISO believes that MOD-030 continues to be more stringent than MOD-028 and MOD-029. |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | discretely modeled, we would still like to map it to an “aggregate” – MISO – to be consistent with what is expected to be scheduled in real time. •R5.2 – Language should be added to say that this requirement applies if the data is supplied by the entities owning the information. •R6.2/R6.4/R6.6/R7.2/R7.4/R7.6 – The Midwest ISO has two comments related to these requirements: oLanguage should be added to state that the requirements are applicable only if the other TSPs provide necessary information. oThe Midwest ISO has observed that similar requirements are not in MOD-028 nor MOD-029. We feel that TSPs that use MOD-028 and MOD-029 should also be subjected to this requirement. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies. •R10 –First, the Midwest ISO believes that this requirement should be removed because there is no companion requirement in MOD-028 and MOD-029. Second, any forgiveness/tolerance for error should be included in the requirement instead of the VSL table because it is the requirement that determines whether the entities are in compliance, NOT the VSL table. Third, if this requirement has to stay, it should include similar outage/maintenance allowances for hourly values as in MOD-001. •R11 – The formula, as it is written, would result in using different flowgates to convert AFC to ATC and TFC to TTC. The Midwest ISO believes that we should use the same flowgate for both conversions. The formula should be used only for AFC-ATC conversion. TTC should be calculation by dividing TFC by DF for the same most ATC-limiting flowgate, •M11 – Revise the language to match revisions in R5.2 •M13&M14 – The Midwest ISO feels that both of these requirements are too burdensome for TSPs and ISOs/RTOs. The amount of data that would have to be retained for a 60 day period is too great. The Midwest ISO also questions the basis for a 60 day period and why these requirements were | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | greatly expanded from their original wording. If the point of the requirement is to audit calculated values for compliance, how is the specific number of days of data relevant? The requirements from the previous version were appropriate. •M17 – Should reference calculating AFC not ATC. •Compliance 1.3 – The Midwest ISO questions the value in requiring that the list of Flowgates and their ratings be retained for 3 years when all other requirements are only 12 months? | | | | | |
| | | | | | | | R1.2 Add "definitions" to the requirement to read: "source and sink definitions". Similar to a comment provided for MOD-001, R2.1.1.1 and 2.1.2.1 use the term "operations studies and planning studies." Again, we believe that the intent is to tie reliability focused studies to the commercial ATC type studies. we think the inclusion of "reliability" with these terms helps to clarify the intent. Also, if the terms can be stadardized for both MOD-001 and MOD-030, then that would be optimum. MOD-028 and 029 do not specifically try to make this correlation and raises a question of why that is not done. R2.1.1 - needs rewording for clarification: From the results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability, as a minimum the first three limiting Elements and their worst associated Contingency combinations with an OTDF of 5% or less and within the Transmission Operator's system shall be included as Flowgates. R2.1.1.1 - The specific reference to SPS is misleading. There is nothing in the standards that preclude the use of SPSs, so being silent is better than pointing out just one technology. The use or non-use of SPSs could be presented in the assumptions/evidence documented per MOD-001 M Throughout - There are several references to the limiting element and contingency combinations. However, some flowgates are so sensitive to transfers that they need to be included for PTDF vs. OTDF. R2.1.4.1 & 2.1.4.2 - Delete "If" at the beginning of the | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | Entergy Services Inc. | Narinder K. Saini | Entergy Services Inc. | requirements statements. R2.1.2 - needs rewording for clarification. From the results of a first Contingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability, a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of 5% or less and within the Transmission Operator's system shall be included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology. 2.1.3 - How often does this update have to occur? R2.1.3 & 2.1.4 - Insert "Include" at the beginning of the requirements statements. R2.2 - Reword to "At a minimum create, modify, or delete the list of internal Flowgate definitions at least once per calendar year." R2.3 - Reword similar to R2.2. R5.2 Replace "during the period calculated" with "during the applicable period of the AFC calculation". R3.5 - the phrase "and beyond" seems very open-ended. For the very near timeframes where state estimator models are used, this is the biggest concern. We cannot model neighboring systems in great detail because they do not allow that use of their CEII since we post these cases on our OASIS site. R5.3 - The reference should be to R2.1.4 rather than R2.1.3 R6.3, 6.4, 6.5, and 6.6 - These requirements should not refer to only "all confirmed firm Point-to-Point Transmision Service expected to be scheduled". All confirmed firm Point-to-Point Transmission Service should be included for determining the impacts of ETC for firm commitments. The wording for R6.2 needs "based on:" added to the end to read like R6.1. R6.2 & 6.4 & 6.6 - Add a requirement that requires your neighbors to tell you about their NITS. If these requirements are going to stand, you need a way to ensure that you can get the appropriate data from neighbors in order to be compliant. The footnotes in R6.2, 6.4, 6.6, 7.2, 7.6, & 11 should be deleted with the | Yes | | Yes | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | suggested rewording of R2.1.1 and R2.1.2. R6.4 and 7.2 - how do you accomplish "filtered to reduce or eliminate duplicate impacts" especially as it relates to neighboring TSPs PTP reservations? The formula in R9 should be modified to replace ETCFi by a new term to reflect Firm commitments expected to be scheduled. TRMui definition should not use the term "Transmission Reliability Margin that has not been released (unreleased) for sale as TRM is not expected to be released. Only different values of TRM can be used for non firm ATC/AFC calculations different/lower than those used for firm. R10 - recalculation frequency in this requirement should be similar that included in MOD-001 R8. R10.1 - Entergy recommends to modify the language to "For Hourly, once per hour at least 99% of hours every calendar year." | | | | | |
| | | | | | | | | | | | | 1. The MRO continues to have issues with the overall approach on this standard in combination with the MOD-028. As previously indicated in prior comment periods, the MRO has Transmission Service Providers that manage the levels of transmission service to a reliable level with flowgates and then establishes border control area-to-control area flows to contract path levels so that contractual rights are not exceeded. The MRO reads the MOD-028 standard to require the application of the MOD-028 methodology for its control area-to-control area path postings while MOD-030 standard is used for the flowgate postings. The MRO understands from a discussion with a member of the SDT that in actuality the intent is that the MOD-030 would be used for flowgate calculations and that these quantities could be converted into the ATC path quantities for the control area to control area paths from border companies to outside the Transmission Service Providers area. This application of the flow gate methodology to possibly generate all postings in for a Transmission Service Provider including drive out is not clear from the standards |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | MRO NERC Standards Review Subcommittee | Tom Mielnik | MidAmerican Energy Company (MEC) | 1. The MRO commends the SDT on revising R2.1.1 resulting in an improved description of contingency combinations to be included as flowgates. 2. The MRO commends the SDT on making numerous revisions to clarify that the standard provides the basis for AFC calculations not ATC. We believe that some additional changes in this regard are required. Under A. Introduction, 4. Applicability, 4.1.1 needs to be clarified by stating that the applicability of the standard is for "Each Transmission Operator that uses the Flowgate Methodology to support the calculation of AFCs on flowgates and when converting AFCs to ATCs." 4.1.2 needs to be clarified by stating that "Each Transmission Service Provider that uses The Flowgate Methodology to calculate AFCs on flowgates and when coverting AFCs to ATCs." 3. The MRO believes the words "all" should be deleted from R2.1.2, "any" from R2.1.3, three uses of "any" from R2.1.4, "all" from R5.2, "any" from R5.2, "all" from R6.1.2, two uses of "any" from R6.2, "all" from R6.2.2, "all" from R6.3, "any" and "all" from R6.4, "any" from R6.5, "any" and "alll" from R6.6, "all" from R7.1, "any" and "all" from R7.2, "any" from R7.3, "any" and "all" from R7.4, "any" and "all" from R7.6, "any" from R9. The MRO believes the use of these words are unnecessary and may lead to over-the-top auditing. We believe that the Measures, Compliance, and the VSLs should be changed to match these changes to the requirements. 4. R2.5.1 provides for only seven calendar days for updating the TFC once the Transmission Service Provider is notified of a change in a Rating. The MRO recommends that this be extended to 14 calendar days. 5. The MRO does not understand the need for R3.1 in requiring that generation Facility Ratings, such as generation maximum and mimum output levels must | Yes | The MRO commends the SDT on revising the VRFs to Lower. We believe the revised VRFs are in-line with the | Yes | | and should be clarified in MOD-030 and possibly MOD-028. 2. The MRO commends the SDT in making significant changes to this standard and reissuing it for comment. The MRO believes the eventual standard that is approved will serve the industry and customers better as a result. 3. The MRO acknowledges the consistant application of spelling out the full term followed by the abbreviation or acronym in brackets on the first time use. With the goal of consistancy across all the standards. 4. R6 and R7 – Overall, both requirements as written are unclear. The MRO asks that the standards drafting team specify what assumptions are referenced or else delete these requirements. The MRO notes that these requirements are covered by FERC order #890 anyway. 5. In the Purpose field, why specify for short term use only? The MRO believes this methodology is valid for the planning horizon also. 6. R2 – In general, we believe this is not treated equally comparing to MOD-028 and MOD-029. There isn't a minimum criterion on what contingencies have to be included in MOD-028 or MOD-29. All they need to do is to include in their ATCID. Why can't flowgate methodology do the same thing? 7. R2.1.3 – TheMRO believes that this requirement is too burdensome and stringent, and sometimes have no effect on a TO or TSP. If a TO chooses to model the topology for a TO or TSP far removed from its respective region, why is it mandated that all flowgates with TLR be honored. This requirement also gives no service for an instance where a TLR may occur due to a temporary condition such as a forced outage. This will greatly increase the number of flowgates that each TO will have to account for in their load flow calculations without much perceived benefit. 8. R2.2 – Edited the statement to read: At a minimum, establish the list of Flowgates at least once per calendar year. The MRO believes that this would be a clearer requirement. 9. R2.3 – Edit the statement to read: At a minimum, establish the list of |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | be included within the model. The MRO believes that there are instances where it would be inappropriate to base the AFC on the generation maximum or minimum output levels. Therefore, the MRO believes that this requirement should either be significantly revised to indicate what the SDT really means or else be deleted. 6. The MRO believes that the second sentence of R3.4 which specifies the extent to which equivalence is included in modeling be deleted. This seems to be micromanagement and could very well result in inappropriate models that result in worse AFCs. 7. The MRO urges the SDT to delete the new measures M13, M14, M15, and M16. We believe that these new measures are micromanagement of the Transmission Service Provider and encourage over-the-top auditing. The MRO considers these measures as written as being "deal-killers". 8. The MRO notices that MOD-028-1 provides in R6.3 provides for the use of "the lesser of the sum of incremental transfer capability and impacts of Firm Transmission Services" or the "sum of Facility Ratings of all ties comprising the ATC Path." It also provides in R6.4 for limiting TTC so that "TTC does not exceed that Transmission Operator's contractual rights." The MRO notes that similar provisions are missing from MOD-030-1. The MRO recommends that at a minimum, R11 provide that when flowgate AFCs are converted to ATCs that the ATCs have provisions for limiting ATCs to the sum of Facility Ratings of all ties comprising the ATC path and that such ATCs do not exceed Transmission Operator's contractual rights on the ATC path. | | NERC definitions of the VRF levels. | | | external Flowgates that have been requested within thirty calendar days from the request. The MRO believes that this would be a clearer requirement. 10. R2.4 – The MRO believes that this requirement is identical to R12 in TOP-002. Since TOP-002 R12 will not be retired, R2.4 in MOD-030 is redundant and should be removed. However, if the DT does not agree, The MRO would then comment that for thermal limits, the thermal rating of the Flowgate should be used and not the SOL. 11. R4 – The MRO has two comments related to this requirement: A. The MRO has observed that a similar requirement is not in MOD-029. We feel that TSPs that follow the Rated System Path methodology should also be subjected to this requirement. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies. B. The sub-requirements (identified with a dash in the standard) seem to be written as though they are mutually exclusive. The MRO believes that a Source or Sink identified in a reservation that is discretely modeled can still be mapped to an “equivalence” or “aggregate” representation in the model. 12. R5.2 – Language should be added to say that this requirement applies if the data is supplied by the entities owning the information. 13. R6.2/R6.4/R6.6/R7.2/R7.4/R7.6 – The MRO has two comments related to these requirements: A. Language should be added to state that the requirements are applicable only if the other TSPs provide necessary information. B. The MRO has observed that similar requirements are not in MOD-028 nor MOD-029. We feel that TSPs that use MOD-028 and MOD-029 should also be subjected to this requirement. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies. 14. R10 – First of all, All three methodologies should have the same calculation frequency and the same allowance for outages. The MRO believes that |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | a load flow for hourly values shall be conducted at least once per day. Lowering the requirement for all to once per hour is overly burdensome.this requirement should be removed as there is no companion requirement in MOD-028 and MOD-029. Second, any forgiveness/tolerance for error should be included in the requirement instead of the VSL table because it is the requirement that determines whether the entities are in compliance, NOT the VSL table. Third, if this requirement has to stay, it should use similar outage/maintenance allowances for hourly values as in MOD-001. 15. R11 – The formula, as it is written, would result in using different flowgates to convert AFC to ATC and TFC to TTC. The MRO believes that we should use the same flowgate for both conversions. The formula should be used only for AFC-ATC conversion. TTC should be calculation by dividing TFC by DF for the same most ATC-limiting flowgate. 16. M17 – Should reference calculating AFC not ATC. |
| | Group | | | Southwest Power Pool | Kevin Bates | Southwest Power Pool | | Yes | | | | R2.1.3. Any limiting Element/Contingency combination within the Transmission model that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months. R2.1 addresses criteria for identifying flowgates used in the AFC process. Certain operating conditions cause the use of temporary flowgates. Coordination tests may be executed between entities for a temporary flowgate which will be included in AFC calculations and congestion management systems. Would these situations require these temporary flowgates to remain in AFC processes even after the temporary conditions return to normal (transmission elements return to service)? In some cases, temporary flowgates created for short-term may not necessarily fall under the criteria established in R2.1 but should be allowed because of their immediate need in reliably operating the transmission system. |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Jason Shaver | American Transmission Company | | | | 1. A.3 Clarify whether "for short term use" refers to the Operating Horizon, short term (1-5 yr) Planning Horizon, or both. 2. R2.1.2/M2 Delete the word "all" to avoid being overly inclusive. 3. R2.1.3 Delete the word "any" to "applicable" and change the term "Transmission model" to "Transmission Operator's area" to avoid being overly inclusive. 4. R2.1.4 Delete the words "any" to "applicable" and change the terms "Transmission model" to "Transmission Operator's area" to avoid being overly inclusive. 5. R2.4, R2.5, & R2.6/M5, M6, & M7 Remove these requirments and measures because the are redundant with R11 and R12 of TOP-002-2. If R2.5.1 is retained, then change the "seven calendar days" to "fourteen calendar days". 6.R3 Change "Transmission model" to "Transmission model of the Transmission Operator's area" 7. R3.4 Change "within its Reliability Coordinator's area" to "within the Transmission Operator's area". 8. R3.5 Change "beyond Reliability Coordinator's Areas" to "beyond the Transmission Operator's area". 9. R6.3 Need to include "Accepted" transmission service in the determination of Existing Transmission Commitments or clarify the reasoning for not including it (otherwise how are they accounted for?) M13, M14 For consistency, spell out "Transmission Service Provider". | Yes | | Yes | | The first time that each abbreviation or acronym is introduced, the full terminology should be stated followed by the abbreviation or acronym in brackets (i.e. TFC). Modification to Applicability Section: 4.1.1 Each Transmission Operator that uses the Flowgate Methodology 4.1.2 Each Transmission Service Provided that uses the Flowgate Methodology We believe that the remaining language ("to support the calculation of ATC for ATC Paths) can be deleted because of the subsequent changes to MOD-001-1. The SDT changes MOD-001-1 to accommodate both ATC and AFC. Please see our comments to MOD-001-1 that if implemented by the SDT should make the deletion acceptable. Proposed Effective Date: Please see our comments in MOD-001-1 about the proposed effective date. |
| | Individual | Rex McDaniel | Texas-New Mexico Power Company | | | | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Texas-New Mexico Power Company is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, TNMP believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. TNMP strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). | Yes | | Yes | | This standard should not apply to ERCOT for the reason stated in Question 1. |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | These comments are filed on behalf of City of Austin d/b/a Austin Energy to address proposed NERC 5 MOD Standards. Austin Energy is a municipally owned electric utility and a transmission service provider with the Electric Reliability Council of Texas (ERCOT). ERCOT now operates as a Single Balancing Authority with no explicit transmission services being sold. Current ERCOT market rules allow open transmission access to all loads and resources. ERCOT will continue to operate as a Single Balancing Authority under Nodal market design. Accordingly, as explained in more detail below, the NERC 5 MOD Standards should not be applied to ERCOT and transmission service providers within ERCOT under its current or proposed Nodal market design. Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. Applicable definitions: According to NERC Reliability Standards Glossary of Terms, Available Transfer Capability (ATC) is defined as: "A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability (TTC) less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin (CBM), less a Transmission Reliability Margin (TRM), plus Postbacks, plus counterflows". TTC is defined as: the amount of electric power that can be transferred over the interconnected transmission network in a reliable manner while meeting all of a specific set of defined pre- and post-contingency system conditions. CBM is defined as the amount of transmission transfer capability reserved by load |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | Electric Service Delivery | Reza Ebrahimian | Austin Energy | | | | | | serving entities to ensure access to generation from interconnected systems to meet generation reliability requirements. TRM also is a component of ATC defined as: that amount of transmission transfer capability necessary to ensure that the interconnected transmission network is secure under a reasonable range of uncertainties in system conditions. Comments: ERCOT is an interconnection and a region with no synchronous AC ties with any other interconnections. In July 2001, based on a deregulated Retail and restructured Wholesale Markets, the ERCOT interconnection began acting as a Single Balancing Authority. The ERCOT market is designed such that there are no explicit transmission services being sold, hence, Available Transfer Capability (ATC) is not a measure used in a commercial activity within the ERCOT market. The current ERCOT market rules allow open transmission access to all eligible loads and resources without considering any specific Transmission Service Provider (TSP). Transmission facilities ratings are based upon individual branch element designs and in cases of dynamic ratings, ambient conditions are also considered. ERCOT has several DC ties and an asynchronous tie using a Variable Frequency Transformer (VFT); however, the associated interchange capabilities are planned and coordinated by the TSPs involved. The current ERCOT Zonal Market uses a flow based congestion management methodology to predict potential congestions in the Day Ahead and Adjustment Periods. During the operating period, generation shift factors are used to determine the dispatch needed to remain within the constrained limits. The local congestions are managed using full AC load flow analysis and unit specific redispatch. MOD-001-1 is entirely about methodology and calculation of ATC, therefore, this standard is not applicable to ERCOT. MOD-008-1 covers Transmission Reliability Margin (TRM) methodology calculation. |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | Mathematically, ATC is defined as Total Transfer Capability (TTC) less the TRM and Capacity Benefit Margin (CBM). Therefore, TRM also is not applicable to ERCOT. MOD-028-1 covers Area Interchange calculation Methodology. Since ERCOT is a single control area, Area Interchange calculation is not applicable. MOD-029-1 covers Rated System Path Methodology, which is used to calculate TTC and ATC calculations. Therefore MOD-029-1 is not applicable to ERCOT. MOD-030-1 covers Flowgate methodology calculation of ATC, and therefore, is not applicable to ERCOT. ERCOT is currently transitioning to a Nodal Market, with a scheduled start date of December 1, 2008. The Nodal Market uses a Security Constrained Economic Dispatch (SCED) approach to dispatch individual generating units and manage congestion. In the Nodal Market, ERCOT will still operate as a Single Balancing Authority. This again will not use ATC methodology, and aforementioned standards are not applicable to ERCOT in its ensuing Nodal Market. Therefore, Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. |
| | | | | | | | OTDF definition - capitalize "facilities" The Flowgate Methodology definition, like Area Interchange and Rated System Path, includes the text: "Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability." This text describes the derivation of ATC or AFC, and should not be part of a definition to differentiate between the AIM, RSP and Flowgate methods. R3.4 - I | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Allen Mosher | American Public Power Association | | | | support allowing "Equivalent representation of radial lines and facilities 161 kV or below" but equivalences for Elements included in the regional definition of the BES should be posted and explained in the TOP's and TSP's ATCID. R2.1.4.1, bullet #3 - This requirement states: "The Transmission Operator may utilize distribution factors less than 5% if desired." R6.2, R6.4, R6.6, R7.2, R7.4 and R7.6 and R11, definition of "P" each contain the following the following footnote: "A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized." MOD-28 AIM has similar language allowing use of alternative distribution factors, generally related to the use of differing local, subregional or regional TLR curtailment thresholds. Repetition of similar text in multiple requirements and identical footnotes indicates a single additional Requirement should be added to the Flowgate standard and Area Interchange standard. Alternatively, add the following sentence to R2.1.4.1 and to footnotes 1-7: "This lesser Distribution Factor shall be posted in the TSP's ATCID and coordinated with the applicable RC(s) and each adjacent TOP and TSP." R8 and R9 - Postbacks and counterflows: "Counterflows" should be a defined term. It is used in MOD-1, MOD-28, MOD-29 and MOD-30 and is an integral element in the calculation of ATC and AFC. The definition used in MOD-28-1 R10, for example, reads: "counterflowsF are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID." This definition does not in any way describe what a counterflow is. "Postbacks" should incorporate a working definition developed by NAESB, to be revised once due process is completed on this business practice. Alternatively, consider use of the following text to at minimum describe the nature of postbacks: "Postbacks[Firm] [Non-Firm] are changes to firm [non-firm] ATC [AFC] due to a change in the amount of Firm | Yes | | Yes | Yes - a major improvement | Great work - thanks to the SDT |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | [non-firm] Transmission Service reserved or scheduled for a period, as defined in Business Practices. Postbacks are generally a positive quantity." Also, include Postbacks in the "e.g." list of factors in M15 and M16. | | | | | |
| | Individual | Tony Kroskey | Brazos Electric Power Cooperative, Inc. | | | | | | | | | Brazos Electric believes that the concept of the Flowgate Methodology to support the calculation of Available Transfer Capabilities (ATCs) for ATC Paths is not applicable to a single-control area operation like ERCOT. To address this issue, the Applicability section could have a clarifying statement that only TOPs or TSPs conducting area to area operations and hence have responsibility for ATC Path(s) are subject to the requirements of MOD-030 if it uses a Flowgate Methodology. |

**Consideration of Comments on Draft Standard — MOD-030 — Project 2006-07**

The ATC Standards Drafting Team thanks all commenters who submitted comments on the draft standard MOD-030-1 – Flowgate Methodology. This standard was posted for a 30-day public comment period from April 16, 2008 through May 15, 2008. The stakeholders were asked to provide feedback on the standard through a special electronic Standard Comment Form. There were more than 28 sets of comments, including comments from 93 different people from approximately 55 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

There were some comments that led the drafting team to modify language to improve clarity, but none of the changes made by the drafting team changed the scope or intent of the requirements in the standard.

**Applicability**

- Several entities have continued to express concern regarding the applicability of the ATC, TRM, and CBM standards. While the drafting team has attempted to write the standards in ways that are flexible and allow for organizational diversity, we note that FERC Order 890 makes reference to the use of Variances. Entities with non-traditional physical transmission markets or that have alternative ATC methodologies that meet or exceed the NERC ATC standards may wish to consider requesting one or more Variances related to these standards.

- Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

**Requirements**

- R2.1.3 - Some entities pointed out that as written, the requirement to include flowgates that have been in TLR would require the inclusion of flowgates that might be outside the scope of the transmission model if an entity chose to model beyond the requirements in the standard. The drafting team modified R2.1.3 to require only inclusion of those flowgates that have been subjected to an interconnection wide congestion management procedure AND meet the minimum model scope requirements of R3.4 and R3.5. Therefore even if the TO chooses to model a larger area, those flowgates that have been subjected to an interconnection wide congestion management procedure that are in that wider area not specified by R3.4 and R3.5 do not have to be included.
- R2.1.4.1 - Some entities questioned the concept of allowing entities to use distribution factor thresholds lower than those specified. The SDT clarified that as written the requirements makes inclusion below 5% optional, inclusion 5% or greater mandatory.
- R3.4 - Some entities questioned the use of the 161kV threshold, requesting either a lower threshold or a requirement to document reasons for using equivalences. The SDT suggested that if such requirements are desired, the commenter should submit a request for a regional standard.
- R6 and R7 - The concept of only considering service "expected to be scheduled" was questioned. The SDT explained that the intent was to allow for (but not require) entities to exclude reservations based on historical experience or knowledge, such as

seasonal use of reservation. If entities believe all reservations will be scheduled, then the entity may consider all reservations.

- R8 and R9 – Some entities pointed out that although MOD-001 discussed including details regarding the honoring of contractual allocations of capacity, MOD-030 was silent on the topic. The SDT has modified MOD-030 R8 and R9 to require the respecting contractual allocations of capacity.
- R10 - Some entities suggested that the allowance for 80 hours described in the MOD-001 ATC calculation schedule should apply to MOD-030's R10 as well. The SDT has modified MOD-030 R10 to allow for the annual allowance specified in MOD-001 R8.

**Measures**

- M13 and M14 - Some entities expressed concern with the measures associated with the ETC calculation. The drafting team developed this measure so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measure and associated VSL from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to their documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not allow for subjective interpretation of the whether an entity is compliant. In response to concerns with data retention, the SDT has modified the data retention and the measures. The data retention now states that data to demonstrate compliance with hourly ETC calculations must be retained for 14 days, for daily calculations must be retained for 30 days, and for monthly calculations must be retained for 60 days. The measure has been rephrased to clarify that the intent is to verify that the requirements for calculating ETC were used.

**Compliance**

- Most entities agree with the VRFs.
- One entity suggested that the VRF for R2 be raised. The majority of the team and the industry believes that a violation of R2 would not directly affect the electrical state or the capability of the bulk power system.
- Some commenter's expressed concern with potential for multiple violations of the standard due to a single event. The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.
- Some suggestions were made to change specific VSLs or measures. The SDT modified VSLs for R3 and R10, but did not modify the other measures or VSLs.

- The drafting team provided a summary of the use of time horizons to address some comments.

**Concepts**

- Some entities expressed concern that MOD-030 was more stringent than MOD-028 and MOD-029. The SDT explained that the methodologies were different, and therefore had different ways of documenting requirements, or different processes for meeting reliability goals, but in general, were consistent. A question was raised regarding whether the information required to be documented in each of the methodologies was consistent. The SDT reviewed this and confirmed that the requirements are equivalent across the methodologies.
- Several entities did not understand why MOD-001 and MOD-030 both had requirements related to recalculation frequency. The SDT explained that these two requirements are different, and address fundamental differences between the methodologies.
- Some entities suggested that the standard should not apply to non-firm ATC. The SDT stated that removal of non-firm from the standard could allow for unchecked selling of non-firm service, which could lead to concerns within real-time.
- Some entities suggested that the standard should define how AFC is calculated, but not that it should be calculated. The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives.
- The concept of "temporary" flowgates was raised, and whether or not the standard required temporary flowgates to be maintained indefinitely. The SDT stated that provided the conditions that cause the temporary flowgate to meet the criteria in R2.1 are no longer in existence, the flowgate could be removed immediately. Note that if the temporary flowgate had an interconnection-wide congestion management procedure invoked, the 12-month criteria would apply.
- Some entities questioned if the standard was in conflict with TOP-002 R12. The SDT believes that the MOD standards are the appropriate location for the reference to SOLs with regard to transfer capability. Additionally, TOP-002 R12 applies to the Transmission Service provider while R2.4 applies to the Transmission Operator. The drafting team believes that the TFC will be based on the most constrained facility's SOL (thermal, voltage, or stability based) for the monitored facilities considered in the flowgate, so no change is needed.
- One entity questioned the structure of the source/sink modeling requirements. The SDT explained the intent of the requirements, and provided examples of the manner in which various market models could be accommodated.
- Several entities identified a concern with requiring "all" or "any" data. The SDT clarified that providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC.
- Some entities suggested reducing the size of the modeling requirements. The SDT believes the current model size requirements are appropriate.
- Some entities expressed concern with the ability to share data without non-disclosure agreements in place. In general, the SDT expects that a Transmission Operator should already have appropriate agreements in place with its Transmission Service Provider to address this. If such contracts are not in place, the standard does not prohibit nor require them, but entities are still responsible for meeting the requirements in the standard.

- Some entities questioned whether the standard should be modified to address "accepted" reservations, in addition to confirmed reservations. The SDT responded that the standard does not prohibit the TSP from maintaining an "internal" ATC value for use in approving reservation requests that includes these Accepted reservation. This is the manner FERC has indicated to be an appropriate way for dealing with "Accepted" reservation in its regulations. To the extent ATC believes these numbers should be posted, the SDT believes ATC should develop a NAESB request for the posting of this information.
- Some entities did not understand the establishment of TFC for non-thermal limits. The SDT explained that, for example, the SOL limit could actually be a voltage limit, and this limit would have to be translated into a MW value to be assigned to a Flowgate in order to "respect the SOL".
- The concept of "filtering to reduce or eliminate duplicate impacts" was questioned. The SDT explained this can be accomplished by jointly developing an exclusion list with neighboring TSPs to identify duplicate reservations (i.e., reservations on both sides of an interface for one transaction).

**Implementation**

- Some entities expressed concern with the effective date and the "concurrent" implementation being dependent on "all" regulatory authorities. The SDT notes that the language indicates that it is dependent on all applicable regulatory authorities. The intent is that the standards all become effective on the same date across North America; that date will be established one year following all the needed regulatory approvals.

**Variances**

The SDT believes it may be helpful to the industry to review the process for Variances. The Variance process can work either concurrent with or independent of the development of a standard. Because the drafting team working on a particular standard is likely to already have the necessary expertise to participate in the development of the Variance, concurrent development is generally more efficient. However, this may not always be practical; in this case, standards drafting may proceed, and even complete, prior to the development and approval of Variances. In this case, entities should seek to develop those Variances and seek their approval prior to the effective date of the standard. An entity is not exempt from meeting the requirements of the standard if the effective date has passed and that entity is in the process of developing a Variance.

The NERC process allows for three different types of variances:

- An Entity Variance
- A Regional Variance less than an Interconnection
- A Regional Variance on Interconnection-Wide basis

The NERC Rules of Procedure describe an Entity Variance as follows:

> Entity Variance — Any variance from a NERC reliability standard that is proposed to apply to one entity or a subset of entities within a limited portion of a regional entity, such as a variance that would apply to a regional transmission organization or particular market or to a subset of bulk power system owners, operators, or users, shall be approved through the regular standards development process defined in the NERC Reliability Standards Development Procedure and shall be made part of the applicable NERC reliability standard.

Entities seeking an Entity Variance should draft a SAR to request that Variance. In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately). In both cases, the Variance will be compared to the standard to ensure the requester is addressing the reliability goals of the standard. The ballot body is comprised of any member of the Registered Ballot Body that is interested and registers to join the ballot pool. Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe a Regional Variance Less Than an Interconnection as follows:

> Any regional variance from a NERC reliability standard that is proposed to apply for a regional entity, but not for an interconnection, shall be approved through the NERC Reliability Standards Development Procedure, except that only members of the registered ballot body located in the affected interconnection shall be permitted to vote; and the variance shall be made part of the applicable NERC reliability standard.

Entities seeking a Regional Variance Less Than an Interconnection should draft a SAR to request that Variance. In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately). In both cases, the Variance will be compared to the standard to ensure the requestor is addressing the reliability goals of the standard. The ballot body is comprised of any interested entities that that have registered with NERC and is a user, owner, or operator of facilities located within the interconnection in which the region requesting the Variance is located. Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe an Regional Variance on an Interconnection-wide Basis as follows:

> An interconnection-wide regional variance from a NERC reliability standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with other applicable standards of governmental authorities shall be made part of the NERC reliability standard. NERC shall rebuttably presume that a regional variance from a NERC reliability standard that is developed, in accordance with a procedure approved by NERC, by a regional entity organized on an interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest.

Entities seeking a Regional Variance on an Interconnection-wide Basis should draft that Variance using the regional standards development process described in the region's delegation agreement. In that Variance, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Once approved through the regional standards development process, the Variance should be brought to NERC for filing with the appropriate regulatory authorities.

Based on the comments received, the drafting team is recommending that the Standards Committee authorize moving these standards forward to posting for pre-ballot review.

In this “Consideration of Comments” document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standard can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. **The drafting team modified some requirements and associated measures in MOD-030 to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct. Incorrect Requirement(s) or Measure(s):**

**Summary Consideration:**

Some entities requested that either the Transmission Operator or the Transmission Service Provider be applicable. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity “or” another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate.

Several entities expressed concern with ERCOT’s applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

Some entities expressed concern that MOD-030 was more stringent than MOD-028 and MOD-029. The SDT explained that the methodologies were different, and therefore had different ways of documenting requirements, or different processes for meeting reliability goals, but in general, were consistent. A question was raised regarding whether the information required to be documented in each of the methodologies was consistent. The SDT reviewed this and confirmed that the requirements are equivalent across the methodologies.

Several entities did not understand why MOD-001 and MOD-030 both had requirements related to recalculation frequency. The SDT explained that these two requirements are different, and address fundamental differences between the methodologies.

Some entities suggested that the standard should not apply to non-firm ATC. The SDT stated that removal of non-firm from the standard could allow for unchecked selling of non-firm service, which could lead to concerns within real-time.

Some entities suggested that the standard should define how AFC is calculated, but not that it should be calculated. The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives.

Some entities questioned the use of the 161kV threshold, requesting either a lower threshold or a requirement to document reasons for using equivalences. The SDT suggested that if such requirements are desired, the commenter should submit a request for a regional standard.

The concept of “temporary” flowgates was raised, and whether or not the standard required temporary flowgates to be maintained indefinitely. The SDT stated that provided the conditions that cause the temporary flowgate to meet the criteria in R2.1 are no longer in existence, the flowgate could be removed immediately. Note that if the temporary flowgate had an interconnection-wide congestion management procedure invoked, the 12-month criteria would apply.

Some entities questioned the concept of allowing entities to use distribution factor thresholds lower than those specified. The SDT clarified that as written the requirements makes inclusion below 5% optional, inclusion 5% or greater mandatory.

Some entities expressed concern with the measures associated with the ETC calculation. The drafting team developed this measure so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measure and associated VSL from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to their documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not allow for subjective interpretation of the whether an entity is compliant. In response to concerns with data retention, the SDT has modified the data retention and the measure. The data retention now states that data to demonstrate compliance with hourly ETC calculations must be retained for 14 days, for daily calculations must be retained for 30 days, and for monthly calculations must be retained for 60 days. The measure has been rephrased to clarify that the intent is to verify that the algorithm was used.

Some entities pointed out that as written, the requirement to include flowgates that have been in TLR would require the inclusion of flowgates that might be outside the scope of the transmission model if an entity chose to model beyond the requirements in the standard. The drafting team modified R2.1.3 to require only inclusion of those flowgates that have been subjected to an interconnection wide congestion management procedure AND meet the minimum model scope requirements of R3.4 and R3.5. Therefore even if the TO chooses to model a larger area, those flowgates that have been subjected to an interconnection wide congestion management procedure that are in that wider area not specified by R3.4 and R3.5 do not have to be included.

Some entities questioned if the standard was in conflict with TOP-002 R12. The SDT believes that the MOD standards are the appropriate location for the reference to SOLs with regard to transfer capability. Additionally, TOP-002 R12 applies to the Transmission Service provider while R2.4 applies to the Transmission Operator. The drafting team believes that the TFC will be based on the most constrained facility's SOL (thermal, voltage, or stability based) for the monitored facilities considered in the flowgate, so no change is needed.

One entity questioned the structure of the source/sink modeling requirements. The SDT explained the intent of the requirements, and provided examples of the manner in which various market models could be accommodated.

The concept of only considering service "expected to be scheduled" was questioned. The SDT explained that the intent was to allow for (but not require) entities to exclude reservations based on historical experience or knowledge, such as seasonal use of reservation. If entities believe all reservations will be scheduled, then the entity may consider all reservations.

The concept of "filtering to reduce or eliminate duplicate impacts" was questioned. The SDT explained this can be accomplished by jointly developing an exclusion list with neighboring TSPs to identify duplicate reservations (i.e., reservations on both sides of an interface for one transaction).

Some entities suggested that the allowance for 80 hours described in the MOD-001 ATC calculation schedule should apply to MOD-030's R10 as well. The SDT has modified MOD-030 R10 to allow for the annual allowance specified in MOD-001 R8.

Several entities identified a concern with requiring "all" or "any" data. The SDT clarified that providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC.

Some entities pointed out that although MOD-001 discussed including details regarding the honoring of contractual allocations of capacity, MOD-030 was silent on the topic. The SDT has modified MOD-030 R8 and R9 to require the respecting contractual allocations of capacity.

Some entities suggested reducing the size of the modeling requirements. The SDT believes the current model size requirements are appropriate.

| **Organization/Group** | **Question 1 - Incorrect Requirement(s) or Measure(s):** |
|---|---|
| WECC Market Interface Committee / Sub Commtt ATC Task Force | MOD-30, M13 and M14 as drafted require the TSP to be "capable" of demonstration but do not require actual demonstration. The WECC Team suggests a minor rewrite to state, "The TSP shall demonstrate that..." This shifts the measurement from the TSP's mere capability to an actual performance. |
| **Response:** The drafting team has made this change. | |
| WECC Market Interface Committee ATC Task Force | MOD-30, M13 and M14 as drafted require the TSP to be "capable" of demonstration but do not require actual demonstration. The WECC Team suggests a minor rewrite to state, "The TSP shall demonstrate that..." This shifts the measurement from the TSP's mere capability to an actual performance. |
| **Response:** The drafting team has made this change. | |
| EPSA | Through this revision process, some of the MOD standards have included an explicit requirement for consistency between planning assumptions and modeling assumptions used in calculation of ATC. In particular, requirement 6.1 of the previous version of MOD 030 included such a requirement and we believe it should be retained. |
| **Response:** This requirement is located in MOD-001 which applies to all MOD-028, MOD-029 and MOD-030. | |
| ERCOT ISO | Requirement 1:I suggest modifying the requirement to state: "The Transmission Service Provider with ATC Path(s) shall include in its ?Available Transfer Capability Implementation Document? (ATCID).<br><br>Requirement 2:I suggest modifying the requirement to state: "The Transmission Operator with ATC Path(s) shall perform the following:<br><br>Requirement 3:I suggest modifying the requirement to state: "The Transmission Operator with ATC Path(s) shall make available to the Transmission Service Provider with ATC Path(s) a Transmission model to determine |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | Available Flowgate Capability (AFC) that meets the following criteria:<br><br>Requirement 4:I suggest modifying the requirement to state: "When calculating AFCs, the Transmission Service Provider with ATC Path(s) shall represent the impact of Transmission Service as follows:<br><br>Requirement 5:I suggest modifying the requirement to state: "When calculating AFCs, the Transmission Service Provider with ATC Path(s) shall:<br><br>Requirement 6:I suggest modifying the requirement to state: "When calculating the impact of ETC for firm commitments (ETCFi) for all time periods for a Flowgate, the Transmission Service Provider with ATC Path(s) shall sum the following:<br><br>Requirement 7:I suggest modifying the requirement to state: "When calculating the impact of ETC for non-firm commitments (ETCNFi) for all time periods for a Flowgate the Transmission Service Provider with ATC Path(s) shall sum:<br><br>Requirement 8:I suggest modifying the requirement to state: "When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider with ATC Path(s) shall use the following algorithm:<br><br>Requirement 9:I suggest modifying the requirement to state: "When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider with ATC Path(s) shall use the following algorithm:<br><br>Requirement 10:I suggest modifying the requirement to state: "Each Transmission Service Provider with ATC Path(s) shall recalculate AFC, utilizing the updated models described in R3.3, R3.4, and R5, at a minimum on the following frequency:<br><br>Requirement 11:I suggest modifying the requirement to state: "When converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, the Transmission Service Provider with ATC Path(s) shall convert those values based on the following algorithm:" |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Flowgate methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard. | |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) “it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) “it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, “An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable.” *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance “Based on a justifiable difference between regions or between sub-regions within the Regional geographic area” could be pursued by ERCOT. *(Loc. Cit.)* | |
| Oncor Electric Delivery | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Flowgate methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. Cit.)* | |
| Kansas City Power & Light | The Transmission Service Provider should be added along with the TOP for these functions in all requirements. |
| Response: Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity "or" another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. | |
| FirstEnergy | Requirement 2, Applicable Entity: FE believes that this requirement and its associated sub-requirements are incorrectly assigned to the Transmission Operator. In reviewing the presently approved Functional Model (FM) Version 3 and its associated Technical Document, the determination of total transfer capability clearly falls to a planning function. In FM Version 3, task 3c of the Function — Planning Reliability states "Review and determine total transfer capability (generally one year and beyond) as appropriate." This is the only area that explicitly states "determine" as it relates to total transfer capability. The FM Version 3 later describes the responsibilities of the Planning Coordinators and Transmission Planners as having a role in coordinating total transfer capability. Nowhere within the Functional Model is this assignment relegated to the real-time aspect of the Transmission Operator. Additionally, since R2.5 allows the responsible entity to establish Total Flowgate Capabilities once per year, it would seem reasonable that this would be applicable to a planning function. FirstEnergy believes the appropriate responsible entity is the Planning Coordinator or Transmission Planner since this entity would likely have the same wide-area view that is covered by the corresponding Transmission Service Provider who is determining the Available Flowgate Capability. Assigning the determination of total transfer capability to the Planning Coordinator would also better align the standard for implementation within the RTO construct as well as non-market areas. The tasks described within R2 are completed by FE's RTO organizations — MISO and PJM — for the transmission facilities owned and operated by FirstEnergy. The standard should not be written in a way that would knowingly require some sort of delegation assignment for a large portion of the transmission system.<br>**Response:** R2 specifies how flowgates should be chosen for inclusion in AFC calculations and how their ratings |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | should be determined, not the actual AFC calculation. The drafting team believes the Transmission Operator is the appropriate entity for this task because they are responsible for keeping the system within its operating limits. Furthermore since this standard is applicable to a wide array of business models it would not be possible to avoid all possibility of delegation agreements.<br><br>R2 - MOD-030 does not appear to be consistent with MOD-028 and MOD-029 with respect to the criterion on which contingencies must be analyzed to determine Total Transfer Capability. In MOD-030 R2 is very prescriptive on how TFC is determined with regard to the contingencies that must be analyzed and the distribution factor thresholds that lead to a flowgate definition. However, MOD-028 and MOD-029 simply require the ATCID to describe the "how". For example, in MOD-028 R1.4 states that the ATCID include "A description of the manner in which Contingencies are identified for use in the TTC [Total Transfer Capability] process." FE suggess changes are needed to R2 to align with the MOD-028 and MOD-029 standards.<br>**Response:** MOD-028 and MOD-029 do not limit the subset of limiting elements and contingencies that are considered in ATC calculations; MOD-030, on the other hand, bases the calculation of AFC on a limited subset of limiting elements and contingencies; therefore R2 of MOD-030 must contain criteria for selecting this subset of flowgates.<br><br>R2.4 – The first bullet of R2.4 should state that when a TFC is based on a thermal rating that it reflects the lowest facility rating for the monitored facility(ies) considered in the flowgate. The reference to the SOL should be reserved to only the second bullet which would appropriately account for a voltage or stability limit.<br>**Response:** The drafting team believes that the TFC will be based on the most constrained facility's SOL (thermal, voltage, or stability based) for the monitored facilities considered in the flowgate, so no change is needed.<br><br>R10 – As stated in FE's MOD-001 comments, it is suggested that the requirements for frequency of recalculating ATC be dealt with in MOD-001 (R8) to ensure a consistent application across MOD-028, MOD-029 and MOD-030 that presently does not exist. If MOD-001 R8 is revised as suggested, R10 in MOD-030 can be deleted.<br>**Response:** These two requirements are different, and address fundamental differences between the methodologies. MOD-001 discusses the recalculation of ATC on a fixed schedule unless the components in the ATC equation change. MOD-030 R10 addresses calculation of AFC on a schedule consistent with the MOD-001 requirement. However, there is additional information in the MOD-030 requirement that is specific to that methodology. MOD-030 R10 does not require full recalculation of the distribution factors through an update of the transmission model; updates of the transmission model occur on a separate schedule as defined in MOD- |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | 030 R3. MOD-028 addresses this similarly through the recalculation of TTC on a separate schedule as defined in MOD-028 R5. MOD-029 addresses changes to topology through adjustments to TTC. Because of these technical differences between the methodologies, the SDT believes having the two requirements is appropriate. |
| **Response:** Please see in-line responses. | |
| PJM | Requirement 1? Add to the end of R1 ?provided that the data is not market sensitive.<br>**Response:** R1 does not require inclusion of data in the ATCID, only methodology information, so this caveat is not necessary.<br><br>“Requirement 2” R2.1.3 – The interconnection wide congestion management procedures should be listed for each Interconnection. For the Eastern Interconnection this is the TLR process.<br>**Response:** The titles of these procedures are listed in other standards and do not need to be repeated here. If the title changes in the other standard it may make this standard inconsistent.<br><br>Requirement 3? R3.2 and R3.3 -The update frequency for AFC calculations should be addressed by NAESB Business Practices.<br>**Response:** The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives.<br><br>R3.4 – The last sentence in R3. 4 should be replaced with; “Equivalent representation of radial lines and facilities is allowed consistent with the Bulk Electric System standards.”<br>**Response:** The drafting team does believe the suggested language is effective without the development of regional standards to support it. The Drafting Team notes that the language of R2.1 allows detailed modeling of 161 kV and below; the language does not require it.<br><br>Requirement 5? R5.2 – R3.6 in MOD 001 requires outages to be included in the daily and monthly calculations. R5.2 in MOD 30 requires outages to be included in the hourly calculations. A single requirement should be placed in MOD-001 and applied consistently across MODS 28, 29 and 30.<br>**Response:** MOD-001 R3.6 does not specify which calculations the outages have to be used in - it requests clarification of outage processing rules for outages that are in effect for partial days or months. We have clarified MOD-001 to make this more easily understood. MOD-030 R5.2 requires that the outages be included as described in the ATCID – it does not specify hourly. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | Requirement 6? R6.3 - PJM understands the SDT's reasons for using "Confirmed" reservations in accordance with the FERC regulations. Reservations that are in "Accepted", as well as, "Confirmed" status should be included. Once service is "Accepted" by a TP it cannot be retracted. Using reservations that are in "Accepted" and "Confirmed" status should also be included in MOD-030 R6.3, R6.4, R7.1, and R7.2. This does not prevent the TP from decrementing for accepted and confirmed TSRs. We understand that some TPs maintain two sets of ATCs. One set is maintained internally and accounts for accepted and confirmed TSRs. The other set of ATC values is maintained externally and only accounts for confirmed TSRs. It is important for TPs who maintain two sets of ATC values to post the "internal" ATC values to provide greater transparency and give customers a more accurate picture of capability available to new requests.<br>**Response:** The standard does not prohibit the TSP from maintaining an "internal" ATC value for use in approving reservation requests that includes these Accepted reservations. To the extent the PJM believes these numbers should be posted, the SDT believes the IRC should develop a NAESB request for the posting of this information.<br><br>Requirements 7 and 9 – R7 and R9 Non-firm should be removed from this Reliability Standard and be considered NAESB scope.<br>**Response:** Removal of non-firm from the standard could allow for unchecked selling of non-firm service, which could lead to concerns within real-time.<br><br>Requirement 10? The periodic requirements of R10 are NAESB scope. This requirement should be eliminated.<br>**Response:** The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives. |
| **Response:** Please see in line responses. | |
| Pepco Holdings, Inc | PHI supports the comments of PJM and will not submit duplicate comments. |
| **Response:** See response to PJM comments. | |
| Duke Energy Corporation | R1 – Need to ensure that comparable information should be required in either the study report or the ATCID in MOD-028, MOD-029 and MOD-030.<br>**Response:** The MOD-028 and MOD-030 standards have requirements for information to be located in the ATCID. MOD-029 has requirements for the comparable information to be included in the resulting study report. The SDT has reviewed and confirmed that the requirements are equivalent across the methodologies.<br><br>R2.1.1.1 – Replace phrase "operations studies and planning studies" with the phrase "planning of operations" to |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | be consistent with the wording in MOD-001 R6.<br>**Response:** The SDT has made this change as suggested.<br><br>R2.1.2.1 – Replace phrase "operations studies and planning studies? with the phrase ?planning of operations?, to be consistent with the wording in MOD-001 R6.<br>**Response:** The SDT has made this change as suggested.<br><br>R3.4 - Bulk electric system facilities 161kV and below may have significant network response. Since these facilities may have significant impact on AFC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders.<br><br>**Response:** The Drafting Team notes that the language of R2.1 allows detailed modeling of 161 kV and below; the language does not require it. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent. Requirements for Data Exchange in MOD-001 already address sharing of models to support reliability objectives; to the extent a reliability entity has concerns regarding the use of equivalences within the model, the SDT encourages those entities to work directly with each other. Disclosure of this information to Transmission Customers should be addressed through the use of the NAESB process. |
| **Response:** Please see in-line response. | |
| ISO RTO Council/Standards Review Committee (SRC) | Requirement 1 – Add to the end of R1 "provided that the data is not market sensitive. "<br>**Response:** R1 does not require inclusion of data in the ATCID, only methodology information, so this caveat is not necessary.<br><br>Requirement 2R2.1 addresses criteria for identifying flowgates used in the AFC process. Certain operating conditions cause the use of temporary flowgates. Coordination tests may be executed between entities for a temporary flowgate which will be included in AFC calculations and congestion management systems. Would these situations require these temporary flowgates to remain in AFC processes even after the temporary conditions return to normal (transmission elements return to service)?<br>Response: No, there is no minimum duration for which a flowgate must be considered. Provided the conditions that cause the temporary flowgate to meet the criteria in R2.1 are no longer in existence, the flowgate could be removed immediately. Note that if the temporary flowgate had a interconnection-wide congestion management procedure invoked, the 12-month criteria would apply. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | In some cases, temporary flowgates created for short-term may not necessarily fall under the criteria established in R2.1 but should be allowed because of their immediate need in reliably operating the transmission system.<br>**Response:** The minimum criteria specified in R2.1 do not preclude the use of additional flowgates.<br><br>R2.3 stipulates that: “At a minimum, establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested within thirty calendar days from the request.” The requirement is unclear on how a Flowgate gets removed merely through a request if the criteria applied to R2 and its sub-requirements remain in effect to justify keeping the Flowgate in the AFC list. Further, who has the authority to make this request and on what basis the request can be granted? The standard is silent on these issues. This requirement is very loose which needs tightening up.<br>**Response:** R2.3 has been clarified to specify that the requests are those referenced in R2.1.4 (by other Transmission Service Providers).<br><br>Requirement 3R3.2 and R3.3 -The update frequency for AFC calculations should be addressed by NAESB Business Practices.R3.4 – The last sentence in R3. 4 should be replaced with; “Equivalent representation of radial lines and facilities is allowed consistent with the Bulk Electric System definition.” Requirement 5R5.2 - R3.6 in MOD 001 requires outages to be included in the daily and monthly calculations. R5.2 in MOD 30 requires outages to be included in the hourly calculations. A single requirement should be placed in MOD-001 and applied consistently across MODS 28, 29 and 30.Requirement 6R6.3 - The IRC understands the SDT’s reasons for using “Confirmed” reservations in accordance with the FERC regulations. Reservations that are in “Accepted”, as well as, “Confirmed” status should be included. Once service is “Accepted” by a TSP it cannot be retracted. Using reservations that are in “Accepted” and “Confirmed” status should also be included in MOD-030 R6.3, R6.4, R7.1, and R7.2. This does not prevent the TSP from decrementing for accepted and confirmed TSRs. We understand that some TSPs maintain two sets of ATCs. One set is maintained internally and accounts for accepted and confirmed TSRs. The other set of ATC values is maintained externally and only accounts for confirmed TSRs. It is important for TSPs who maintain two sets of ATC values to post the “internal” ATC values to provide greater transparency and give customers a more accurate picture of capability available to new requests. Requirements 7 and 9 R7 and R9 Non-firm should be removed from this Reliability Standard and be considered NAESB scope. Requirement 10The periodic requirements of R10 are NAESB scope. This requirement should be eliminated.<br>**Response:** The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| **Response:** Please see in-line responses. | |
| Ontario IESO | We have the following comments on the Requirements and Measures: a. R2.3 stipulates that: ?At a minimum, establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested within thirty calendar days from the request.? The requirement is unclear on how a Flowgate gets removed merely through a request if the criteria applied to R2 and its sub-requirements remain in effect to justify keeping the Flowgate in the AFC list. Further, who has the authority to make this request and on what basis the request can be granted? The standard is silent on these issues. This requirement, to say the least, is very loose.<br>**Response:** R2.3 has been clarified to specify that the requests are those referenced in R2.1.4 (by other Transmission Service Providers).<br><br>b. R2.5 does not cover the situations when transmission configuration changes occur that results in a change to the SOL and hence the Flowgate TTC.<br>**Response:** R2.5 does not prevent changing the TFC more frequently than once per year and R2.5.1 specifies that it should be changed if the TFC changes. (The drafting team assumes the commenter meant Flowgate TFC).<br><br>c. The term "Transmission Service" in R4 is unclear. Does it mean transmission service reservations, or commitments? This needs to be clarified.<br>**Response:** The sub-bullet in R4 specifies that this is referring to reservations.<br><br>d. The last bullet in R2.1.4.1 and the footnote to R6.2, R6.4, R7.2, R7.4 and R7.6 allow the use of threshold lower than 5%. This makes the 5% threshold stipulated in R2.1.1, R2.1.2 and R2.1.4 not enforceable. If lower threshold can be used, why stipulate a 5% in the first place?<br>**Response:** As written the requirement makes inclusion below 5% optional, inclusion 5% or greater mandatory.<br><br>e. M1: This measure assesses compliance of R1.1; there is no measure for R1.2.<br>**Response:** The phrase, "and information on how sources and sinks are accounted for" was added to M1.<br><br>f. M13 for R6: R6 stipulates the algorithm to establish AFCs. However, M13 provides the requirement for certain accuracy, which leads to the following questions:<br>i. Is R6 about the use of an algorithm only or is it also about the proper or consistent setting of the variables within that algorithm? |

| **Organization/Group** | **Question 1 - Incorrect Requirement(s) or Measure(s):** |
|---|---|
| | ii. If it is also the proper or consistent setting of the variables, the requirement should stipulate the conditions rather than leaving the assessment to a recalculation process (stipulated in M13) to determine if the algorithm and its settings have been properly used. ii. If accuracy is to be a criterion for having proper and consistent setting of the variables, it becomes a requirement and hence should be stipulated in the requirement section, not in the measure. g. M14 for R7: The same comment on M13 also applies here for R7.<br>**Response:** The drafting team developed this measure so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measure and associated VSL from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to their documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not allow for subjective interpretation of the whether an entity is compliant. In response to concerns with data retention, the SDT has modified the data retention and the measure. The data retention now states that data to demonstrate compliance with hourly ETC calculations must be retained for 14 days, for daily calculations must be retained for 30 days, and for monthly calculations must be retained for 60 days. The measure has been rephrased to clarify that the intent is to verify that the algorithm was used.<br>h. M18 for R11: Suggest to revised M18 to: "The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, it follows the procedure described in R11."<br>**Response:** The drafting team has made this change as suggested. |
| **Response:** Please see in-line responses. | |
| The Midwest ISO | In the Purpose field, why specify for short term use only? The Midwest ISO believes this methodology is valid for the planning horizon also.<br>**Response:** ATC is only required to be calculated for 13 months so it was not thought appropriate to mandate that this standard be used beyond that. However, it also does not preclude using this method in the planning horizon. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | R2 – In general, we believe this is not treated equally comparing to MOD-028 and MOD-029. There isn't a minimum criterion on what contingencies have to be included in MOD-028 or MOD-29. All they need to do is to include in their ATCID. Why can't flowgate methodology do the same thing?<br>**Response:** MOD-028 and MOD-029 do not limit the subset of limiting elements and contingencies that are considered in ATC calculations; MOD-030, on the other hand, bases the calculation of AFC on a limited subset of limiting elements and contingencies, therefore R2 of MOD-030 must contain criteria for selecting this subset of flowgates.<br><br>R2.1.1/R2.1.2. Below are a couple of comments related to these requirements. or 2.1.1.1/R2.1.2.1? Overall, both requirements as written are unclear. The Midwest ISO questions what assumptions are referenced in these requirements and how would an auditor be able to verify that the TO is compliant. The Midwest ISO requests the requirement to either list specific assumptions or be deleted and leave it to FERC to address the issues on a case by case basis.<br>**Response:** This requirement was designed to address consistency of AFC calculation and operational and planning studies. The drafting team believes this is the best place to address this. Because there is not a one-to-one correlation between TTC and TFC calculation R6 in MOD-001 does not fully address the consistency in this methodology. The drafting team has modified the requirement to reference "criteria" rather than assumptions to clarify that the explicit list of contingencies doesn't have to match, but the criteria for selecting contingencies does. For example, test all 230kV within a certain zone would be a criteria, as opposed to a listing of all the facilities tested.<br><br>oR2.1.1.2/R2.1.2.2 – The Midwest ISO requests that an example of the limiting element in series be provided.<br>**Response:** The drafting team believes that an example is not necessary in the standard as this is a commonly understood concept. The drafting team is referring to a series circuit made up of transmission facilities. For example, a 230kV line that comes into what is effectively a load distribution station that also has an additional 230kV line.<br><br>R2.1.3 – The Midwest ISO believes that this requirement is too burdensome and stringent, and sometimes will have no effect on a TO or TSP. If a TO chooses to model the topology for a TO or TSP far removed from its respective region, why is it mandated that all flowgates with TLR be honored. This requirement also gives no service for an instance where a TLR may occur due to a temporary condition such as a forced outage. This will greatly increase the number of flowgates that each TO will have to account for in their load flow calculations without much perceived benefit. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
| --- | --- |
| | **Response:** The drafting team has modified R2.1.3 to require only inclusion of those flowgates that have been subjected to an interconnection wide congestion management procedure AND meet the minimum model scope requirements of R3.4 and R3.5, therefore even if the TO chooses to model a larger area, those flowgates that have been subjected to an interconnection wide congestion management procedure that are in that wider area not specified by R3.4 and R3.5 do not have to be included.<br><br>R2.2 – Edited the statement to read: "At a minimum, establish the list of Flowgates at least once per calendar year." The Midwest ISO believes that this would be a clearer requirement.<br>R2.3 – Edit the statement to read: "At a minimum, establish the list of external Flowgates that have been requested within thirty calendar days from the request." The Midwest ISO believes that this would be a clearer requirement.<br>**Response:** The drafting team believes that "to create, modify or delete" appropriately adds to the clarity of these requirements.<br><br>R2.4 – The Midwest ISO believes that this requirement is identical to R12 in TOP-002. Since TOP-002 R12 will not be retired, R2.4 in MOD-030 is redundant and should be removed. However, if the DT does not agree, The Midwest ISO would then comment that for thermal limits, the thermal rating of the Flowgate should be used and not the SOL.<br>**Response:** The SDT believes that the MOD standards are the appropriate location for the reference to SOLs with regard to transfer capability. Additionally, TOP-002 R12 applies to the Transmission Service provider while R2.4 applies to the Transmission Operator. The drafting team believes that the TFC will be based on the most constrained facility's SOL (thermal, voltage, or stability based) for the monitored facilities considered in the flowgate, so no change is needed.<br><br>R4 – The Midwest ISO has two comments related to this requirement: o The Midwest ISO has observed that a similar requirement is not in MOD-029. We feel that TSPs that follow the Rated System Path methodology should also be subjected to this requirement. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies.<br>**Response:** R4 specifies how transmission service reservations shall be modeled. The Rated System Path method does not use simulation to analyze reservations, so a similar requirement would not make sense in MOD-029.<br><br>O The sub-requirements (identified with a dash in the standard) seem to be written as though they are mutually |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | exclusive. The Midwest ISO believes that a Source or Sink identified in a reservation that is discretely modeled can still be mapped to an "equivalence" or "aggregate" representation in the model. Background: For the Midwest ISO, although the internal Local Balancing Authorities are discretely modeled, we would still like to map it to an "aggregate" – MISO – to be consistent with what is expected to be scheduled in real time.<br>**Response:** They are mutually exclusive. However, the SDT believes that the scenario you describe is not problematic. In cases where MISO is modeling imports, we expect that the reservation would have a source outside MISO and a sink of MISO. This would be acceptable, as "MISO" would be discretely modeled as a system. In cases where MISO is modeling imports, we expect that the reservation would have a source of MISO and a sink outside MISO. This would also be acceptable. For internal transactions, we would expect that a source of MISO and a sink of MISO would be invalid from a modeling perspective, and effectively result in zero flow (a transfer distribution factor of zero). To the extent MISO wanted to model internal BA to BA flows, it could utilize the POR and POD, provided this convention was described in the ATCID. In some cases where entities use the source and sink fields for financial purposes, the SDT is aware that other entities use the POR or POD to address this as well, which is acceptable provided it has been so defined in their ATCID pursuant to R1.2.<br><br>R5.2 – Language should be added to say that this requirement applies if the data is supplied by the entities owning the information.<br><br>R6.2/R6.4/R6.6/R7.2/R7.4/R7.6 ? The Midwest ISO has two comments related to these requirements: o Language should be added to state that the requirements are applicable only if the other TSPs provide necessary information.<br>**Response:** The standard is requiring that entities request this information of their neighboring entities. To the extent entities do not provide it, the other entities would be out of compliance with R9 of MOD-001.<br><br>O The Midwest ISO has observed that similar requirements are not in MOD-028 nor MOD-029. We feel that TSPs that use MOD-028 and MOD-029 should also be subjected to this requirement. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies.<br>**Response:** Assuming that the comment refers to the previous requirements of R6.2, R6.4, R6.6, R7.2, R7.4, and R7.6, the SDT notes that similar language is found in MOD-028 R3, R8, and R9, and in MOD-029 R1, R5 and R6. The SDT notes that the unique nature of Flowgates (having to refer to the impact of a reservation, rather than the nominal value itself) can lead to much more verbose requirements. Additionally, many of the analyses of third-party impacts undertaken in the Flowgate methodology to determine AFC are also undertaken in the other methodologies – but as part of the determination of TTC. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | R10 – First, the Midwest ISO believes that this requirement should be removed because there is no companion requirement in MOD-028 and MOD-029. Second, any forgiveness/tolerance for error should be included in the requirement instead of the VSL table because it is the requirement that determines whether the entities are in compliance, NOT the VSL table. Third, if this requirement has to stay, it should include similar outage/maintenance allowances for hourly values as in MOD-001.<br>**Response:** These two requirements are different, and address fundamental differences between the methodologies. MOD-001 discusses the recalculation of ATC on a fixed schedule unless the components in the ATC equation change. MOD-030 R10 addresses calculation of AFC on a schedule consistent with the MOD-001 requirement. However, there is additional information in the MOD-030 requirement that is specific to that methodology. MOD-030 R10 does not require full recalculation of the distribution factors through an update of the transmission model; updates of the transmission model occur on a separate schedule as defined in MOD-030 R3. MOD-028 addresses this similarly through the recalculation of TTC on a separate schedule as defined in MOD-028 R5. MOD-029 addresses changes to topology through adjustments to TTC. Because of these technical differences between the methodologies, the SDT believes having the two requirements is appropriate.<br><br>The SDT has modified MOD-030 R10 to allow for the annual allowance specified in R8.<br><br>R11 – The formula, as it is written, would result in using different flowgates to convert AFC to ATC and TFC to TTC. The Midwest ISO believes that we should use the same flowgate for both conversions. The formula should be used only for AFC-ATC conversion. TTC should be calculation by dividing TFC by DF for the same most ATC-limiting flowgate,<br>**Response: T**he current formula is a valid approach for calculating TTC. Implementing as suggested would result in the TTC changing every time the most limiting flowgate changed.<br><br>M11 – Revise the language to match revisions in R5.2 –<br>**Response:** The SDT has not made revisions to R5.2 that require changes to M11.<br><br>M13&M14 – The Midwest ISO feels that both of these requirements are too burdensome for TSPs and ISOs/RTOs. The amount of data that would have to be retained for a 60 day period is too great. The Midwest ISO also questions the basis for a 60 day period and why these requirements were greatly expanded from their original wording. If the point of the requirement is to audit calculated values for compliance, how is the specific number of days of data relevant? The requirements from the previous version were appropriate. |

<table>
<tr><th>Organization/Group</th><th>Question 1 - Incorrect Requirement(s) or Measure(s):</th></tr>
<tr><td></td><td>Response: The drafting team developed this measure so that a benchmark could be developed to verify that an entity’s processes for calculating ETC are functioning correctly. The measure and associated VSL from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a “pass/fail” VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity’s process conforms to their documented process for determining ETC. The SDT focused the measure and VSL on how “repeatable” the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not allow for subjective interpretation of the whether an entity is compliant. The measure has been rephrased to clarify that the intent is to verify that the algorithm was used.<br><br>In response to concerns with data retention, the SDT has modified the data retention and the measure. The data retention now states that data to demonstrate compliance with hourly ETC calculations must be retained for 14 days, for daily calculations must be retained for 30 days, and for monthly calculations must be retained for 60 days. Entities are already required to retain data for longer than 60 days in order to meet OASIS regulations. As such, the SDT does not believe this to be an onerous requirement.<br><br>M17 – Should reference calculating AFC not ATC.<br>Response: This change has been made.<br><br>Compliance 1.3 – The Midwest ISO questions the value in requiring that the list of Flowgates and their ratings be retained for 3 years when all other requirements are only 12 months?<br>Response: 3 years is the default value for compliance data retention – there was not a strong argument for these particular requirements to deviate from the default.</td></tr>
<tr><td colspan="2">Response: Please see in-line responses.</td></tr>

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| Entergy Services Inc. | R1.2 Add "definitions" to the requirement to read: "source and sink definitions".<br>**Response:** The drafting team does not believe adding the word "definitions" is appropriate. The requirement is to define how the source and sink in a reservation is accounted for in the AFC process. The definitions of sources and sinks is required in R1.2.3.<br><br>Similar to a comment provided for MOD-001, R2.1.1.1 and 2.1.2.1 use the term "operations studies and planning studies." Again, we believe that the intent is to tie reliability focused studies to the commercial ATC type studies. we think the inclusion of "reliability" with these terms helps to clarify the intent. Also, if the terms can be standardized for both MOD-001 and MOD-030, then that would be optimum.<br>**Response:** The requirements have been modified to remove the word "studies" to ensure consistency with MOD-001 R6, so "reliability" is no longer needed.<br><br>MOD-028 and 029 do not specifically try to make this correlation and raises a question of why that is not done.<br>**Response:** R6 in MOD-001 fully addresses the issue of consistency for the Area Interchange and Rated System Path methodologies but since there is not a one-to-one correlation between TTC and TFC calculation R6 in MOD-001 does not fully address the consistency in this methodology.<br><br>R2.1.1 – needs rewording for clarification: From the results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability, as a minimum the first three limiting Elements and their worst associated Contingency combinations with an OTDF of 5% or less and within the Transmission Operator's system shall be included as Flowgates.<br>**Response:** The drafting team does not believe the suggested rewording adds any clarification.<br><br>R2.1.1.1 - The specific reference to SPS is misleading. There is nothing in the standards that preclude the use of SPSs, so being silent is better than pointing out just one technology. The use or non-use of SPSs could be presented in the assumptions/evidence documented per MOD-001 M.<br>**Response:** The SDT added the SPS language based on comments received during the ballot process.<br><br>Throughout – There are several references to the limiting element and contingency combinations. However, some flowgates are so sensitive to transfers that they need to be included for PTDF vs. OTDF.<br>**Response:** The drafting team reviewed the standard and determined that PTDF and OTDF have been used appropriately. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | R2.1.4.1 & 2.1.4.2 - Delete "If" at the beginning of the requirements statements.<br>**Response:** The SDT has made the change as suggested.<br><br>R2.1.2 – needs rewording for clarification. From the results of a first Contingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability, a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of 5% or less and within the Transmission Operator's system shall be included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.<br>**Response:** The drafting team does not believe the suggested rewording adds any clarification.<br><br>2.1.3 - How often does this update have to occur?<br>**Response:** R2.2 requires that the list of flowgates to be established at a minimum once per year and this includes those flowgates specified in R2.1.3<br><br>R2.1.3 & 2.1.4 - Insert "Include" at the beginning of the requirements statements.<br>**Response:** The word "identify" in R2.1 has been changed to "include".<br><br>R2.2 - Reword to "At a minimum create, modify, or delete the list of internal Flowgate definitions at least once per calendar year."<br>R2.3 - Reword similar to R2.2.<br>**Response:** The drafting team has reviewed this and did not believe the rewording improves the requirement.<br><br>R5.2 Replace "during the period calculated" with "during the applicable period of the AFC calculation".<br>**Response:** The SDT has made the change as suggested.<br><br>R3.5 - the phrase "and beyond" seems very open-ended. For the very near timeframes where state estimator models are used, this is the biggest concern. We cannot model neighboring systems in great detail because they do not allow that use of their CEII since we post these cases on our OASIS site.<br>**Response:** R3.5 does not require modeling details in areas beyond your own – it allows equivalent representation which does not need to include CEII. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | R5.3 - The reference should be to R2.1.4 rather than R2.1.3<br>**Response:** The SDT has made the change as suggested.<br><br>R6.3, 6.4, 6.5, and 6.6 - These requirements should not refer to only "all confirmed firm Point-to-Point Transmission Service expected to be scheduled". All confirmed firm Point-to-Point Transmission Service should be included for determining the impacts of ETC for firm commitments.<br>**Response:** The requirement does not prevent inclusion of all confirmed firm Point-to-Point Transmission Service. However, there are situations where inclusion of *all* would not be appropriate, such as when confirmed reservations exist that have impacts in opposing directions and only one would be expected to be scheduled at certain times while the other would be expected to be scheduled at other times.<br><br>The wording for R6.2 needs "based on:" added to the end to read like R6.1.<br>**Response:** The SDT has made the change as suggested.<br><br>R6.2 & 6.4 & 6.6 - Add a requirement that requires your neighbors to tell you about their NITS. If these requirements are going to stand, you need a way to ensure that you can get the appropriate data from neighbors in order to be compliant.<br>**Response:** This is contained in R9 of MOD-001.<br><br>The footnotes in R6.2, 6.4, 6.6, 7.2, 7.6, & 11 should be deleted with the suggested rewording of R2.1.1 and R2.1.2.<br>**Response:** Since R2.1.1 and R2.1.2 were not reworded, the footnotes should not be deleted.<br><br>R6.4 and 7.2 - how do you accomplish "filtered to reduce or eliminate duplicate impacts" especially as it relates to neighboring TSPs PTP reservations?<br>**Response:** This can be accomplished by jointly developing an exclusion list with neighboring TSPs to identify duplicate reservations (i.e., reservations on both sides of an interface for one transaction).<br><br>The formula in R9 should be modified to replace ETCFi by a new term to reflect Firm commitments expected to be scheduled.<br>**Response:** The unscheduled confirmed firm point to point transmission service will be accounted for through |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | the Postback term, so this change does not need to be made.<br><br>TRMui definition should not use the term "Transmission Reliability Margin that has not been released (unreleased) for sale as TRM is not expected to be released. Only different values of TRM can be used for non firm ATC/AFC calculations different/lower than those used for firm.<br>**Response:** The concept is the same – this is a phrasing difference only and would not change the substance of the requirement.<br><br>R10 - recalculation frequency in this requirement should be similar that included in MOD-001 R8.<br><br>R10.1 - Entergy recommends to modify the language to "For Hourly, once per hour at least 99% of hours every calendar year."<br>**Response:** The SDT has modified MOD-030 R10 to allow for the annual allowance specified in MOD-001 R8. |
| **Response:** | |
| MRO NERC Standards Review Subcommittee | 1. The MRO commends the SDT on revising R2.1.1 resulting in an improved description of contingency combinations to be included as flowgates.<br>**Response:** Thank you for your supportive comment.<br><br>2. The MRO commends the SDT on making numerous revisions to clarify that the standard provides the basis for AFC calculations not ATC. We believe that some additional changes in this regard are required. Under A. Introduction, 4. Applicability, 4.1.1 needs to be clarified by stating that the applicability of the standard is for "Each Transmission Operator that uses the Flowgate Methodology to support the calculation of AFCs on flowgates and when converting AFCs to ATCs." 4.1.2 need to be clarified by stating that "Each Transmission Service Provider that uses The Flowgate Methodology to calculate AFCs on flowgates and when converting AFCs to ATCs."<br>**Response:** The drafting team has modified the applicability to reference AFCs instead of ATCs.<br><br>3. The MRO believes the words "all" should be deleted from R2.1.2, "any" from R2.1.3, three uses of "any" from R2.1.4, "all" from R5.2, "any" from R5.2, "all" from R6.1.2, two uses of "any" from R6.2, "all" from R6.2.2, "all" from R6.3, "any" and "all" from R6.4, "any" from R6.5, "any" and "all" from R6.6, "all" from R7.1, "any" and "all" from R7.2, "any" from R7.3, "any" and "all" from R7.4, "any" and "all" from R7.6, "any" from R9. The MRO believes the use of these words are unnecessary and may lead to over-the-top auditing. We believe that the |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | Measures, Compliance, and the VSLs should be changed to match these changes to the requirements.<br>**Response:** Providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC. Use of the words of "any" and "all" prevents discretionary sets of data being provided and argued as being compliant.<br><br>4. R2.5.1 provides for only seven calendar days for updating the TFC once the Transmission Service Provider is notified of a change in a Rating. The MRO recommends that this be extended to 14 calendar days.<br>**Response:** 7 days is consistent with the duration allowed in MOD028 for providing TTC data and MOD-029 for providing the results of the TTC Study Report.<br><br>5. The MRO does not understand the need for R3.1 in requiring that generation Facility Ratings, such as generation maximum and minimum output levels must be included within the model. The MRO believes that there are instances where it would be inappropriate to base the AFC on the generation maximum or minimum output levels. Therefore, the MRO believes that this requirement should either be significantly revised to indicate what the SDT really means or else be deleted.<br>**Response:** The drafting team does not agree that there are instances where it would be inappropriate to base the AFC on these output levels because AFC should be based on the most realistic modeling possible.<br><br>6. The MRO believes that the second sentence of R3.4 which specifies the extent to which equivalence is included in modeling be deleted. This seems to be micromanagement and could very well result in inappropriate models that result in worse AFCs.<br>**Response:** If this sentence is removed then equivalencing would not be allowed at all – a fully detailed model would have to be used. The Drafting Team has included a fixed minimum of what cannot be equivalence to ensure too much equivalencing is not applied. The Drafting Team notes that the language allows detailed modeling of 161 kV and below; the language does not require it. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent .<br><br>7. The MRO urges the SDT to delete the new measures M13, M14, M15, and M16. We believe that these new measures are micromanagement of the Transmission Service Provider and encourage over-the-top auditing. The MRO considers these measures as written as being "deal-killers".<br>**Response:** The drafting team developed this measure so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measure and associated VSL from the |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to their documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not allow for subjective interpretation of the whether an entity is compliant. The measure has been rephrased to clarify that the intent is to verify that the algorithm was used.<br><br>In response to concerns with data retention, the SDT has modified the data retention and the measure. The data retention now states that data to demonstrate compliance with hourly ETC calculations must be retained for 14 days, for daily calculations must be retained for 30 days, and for monthly calculations must be retained for 60 days. Entities are already required to retain data for longer than 60 days in order to meet OASIS regulations. As such, the SDT does not believe this to be an onerous requirement.<br><br>8. The MRO notices that MOD-028-1 provides in R6.3 provides for the use of "the lesser of the sum of incremental transfer capability and impacts of Firm Transmission Services" or the "sum of Facility Ratings of all ties comprising the ATC Path." It also provides in R6.4 for limiting TTC so that "TTC does not exceed that Transmission Operator's contractual rights." The MRO notes that similar provisions are missing from MOD-030-1. The MRO recommends that at a minimum, R11 provide that when flowgate AFCs are converted to ATCs that the ATCs have provisions for limiting ATCs to the sum of Facility Ratings of all ties comprising the ATC path and that such ATCs do not exceed Transmission Operator's contractual rights on the ATC path.<br>**Response:** The SDT has modified MOD-030 R8 and R9 to require the respecting contractual allocations of capacity. |
| American Transmission Company | 1. A.3 Clarify whether "for short term use" refers to the Operating Horizon, short term (1-5 yr) Planning Horizon, or both.<br>**Response:** The parent standard, MOD-001, clearly requires ATC calculations out as far as 13 months; this timeframe is consistent with the current version of the MOD standards and has not been modified in this drafting |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | process. Since the 'horizon' terms are used differently throughout the industry the Drafting Team does not want to incorporate those specific terms.<br><br>2. R2.1.2/M2 Delete the word "all" to avoid being overly inclusive.<br><br>3. R2.1.3 Delete the word "any" to "applicable" and change the term "Transmission model" to "Transmission Operator's area" to avoid being overly inclusive.<br><br>4. R2.1.4 Delete the words "any" to "applicable" and change the terms "Transmission model" to "Transmission Operator's area" to avoid being overly inclusive.<br>**Response:** Removing these words would not change the substance of the requirements, therefore no change was made. Providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC. Use of the words of "any" and "all" prevents discretionary sets of data being provided and argued as being compliant.<br><br>5. R2.4, R2.5, & R2.6/M5, M6, & M7 – Remove these requirements and measures because they are redundant with R11 and R12 of TOP-002-2.<br>**Response:** The SDT believes that the MOD standards are the appropriate location for the reference to SOLs with regard to transfer capability. Additionally, TOP-002 R12 applies to the Transmission Service provider while R2.4 applies to the Transmission Operator.<br><br>If R2.5.1 is retained, then change the "seven calendar days" to "fourteen calendar days".<br>**Response:** 7 days is consistent with the duration allowed in MOD028 for providing TTC data and MOD-029 for providing the results of the TTC Study Report.<br><br>6.R3 Change "Transmission model" to "Transmission model of the Transmission Operator's area"<br>7. R3.4 Change "within its Reliability Coordinator's area" to "within the Transmission Operator's area".<br>8. R3.5 Change "beyond Reliability Coordinator's Areas" to "beyond the Transmission Operator's area".<br>**Response:** A model larger than that of the Transmission Operator's area is required to ensure the accuracy of the calculations.<br><br>9. R6.3 Need to include "Accepted" transmission service in the determination of Existing Transmission |

| **Organization/Group** | **Question 1 - Incorrect Requirement(s) or Measure(s):** |
|---|---|
| | Commitments or clarify the reasoning for not including it (otherwise how are they accounted for?)<br>**Response:** The standard does not prohibit the TSP from maintaining an "internal" ATC value for use in approving reservation requests that includes these Accepted reservation. This is the manner FERC has indicated to be an appropriate way for dealing with "Accepted" reservation in its regulations. To the extent ATC believes these numbers should be posted, the SDT believes ATC should develop a NAESB request for the posting of this information.<br><br>M13, M14 For consistency, spell out "Transmission Service Provider".<br>**Response:** The SDT has made this change as suggested. |
| **Response:** Please see in-line responses. | |
| American Public Power Association | OTDF definition - capitalize "facilities"<br>**Response:** This change has been made in both the OTDF and PTDF definitions, and in all other places in the standard where it was not capitalized.<br><br>The Flowgate Methodology definition, like Area Interchange and Rated System Path, includes the text: "Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability." This text describes the derivation of ATC or AFC, and should not be part of a definition to differentiate between the AIM, RSP and Flowgate methods.<br>**Response:** The derivation of AFC is part of the Area Interchange Methodology, it is not identical in all three methods and it is appropriate to be included.<br><br>R3.4 - I support allowing "Equivalent representation of radial lines and facilities 161 kV or below? but equivalences for Elements included in the regional definition of the BES should be posted and explained in the TOP's and TSP's ATCID.<br>**Response:** The Drafting Team notes that the language of R3.4 allows detailed modeling of 161 kV and below; the language does not require it. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent. Requirements for Data Exchange in MOD-001 already address sharing of models to support reliability objectives; to the extent a reliability entity has concerns regarding the use of equivalences within the model, the SDT encourages those entities to work directly with each other. Disclosure of this information to Transmission Customers should be addressed through the use of the NAESB process. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | R2.1.4.1, bullet #3 - This requirement states: – The Transmission Operator may utilize distribution factors less than 5% if desired? R6.2, R6.4, R6.6, R7.2, R7.4 and R7.6 and R11, definition of “P” each contain the following the following footnote: "A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized." MOD-28 AIM has similar language allowing use of alternative distribution factors, generally related to the use of differing local, subregional or regional TLR curtailment thresholds. Repetition of similar text in multiple requirements and identical footnotes indicates a single additional Requirement should be added to the Flowgate standard and Area Interchange standard.<br>**Response:** This language is not a requirement, it is clarification of the requirement; therefore it would not be appropriate to add a requirement attempting to avoid the repetition.<br><br>Alternatively, add the following sentence to R2.1.4.1 and to footnotes 1-7: This lesser Distribution Factor shall be posted in the TSP’s ATCID and coordinated with the applicable RC(s) and each adjacent TOP and TSP.?<br>**Response:** The SDT believes that the MOD-001 R 3.1 requirement would already require the TSP to document this information in the ATCID.<br><br>R8 and R9 – Postbacks and counterflows: Counterflows should be a defined term. It is used in MOD-1, MOD-28, MOD-29 and MOD-30 and is an integral element in the calculation of ATC and AFC. The definition used in MOD-28-1 R10, for example, reads: “counterflows” are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.? This definition does not in any way describe what a counterflow is.<br>“Postbacks” should incorporate a working definition developed by NAESB, to be revised once due process is completed on this business practice. Alternatively, consider use of the following text to at minimum describe the nature of postbacks: Postbacks [Firm] [Non-Firm] are changes to firm [non-firm] ATC [AFC] due to a change in the amount of Firm [non-firm] Transmission Service reserved or scheduled for a period, as defined in Business Practices. Postbacks are generally a positive quantity.<br>**Response:** The SDT has reviewed the standards, and finds that the Postbacks and counterflows definitions, the requirements for the ATCID, and the requirements and measures for calculating ATC in the methodologies address this sufficiently. MOD-001 indicates in the definition that Postbacks are defined by business practices, while the individual methodology standards indicate that Postbacks are “changes to firm (non-firm) ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.” Counterflows is an industry term, and the manner in which it applies to these standards is described in the methodologies (“adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID”), as well as in MOD-001 R3.2 |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | Also, include Postbacks in the "e.g." list of factors in M15 and M16.<br>**Response:** The example list in M15 and M16 is merely an example and not necessarily all inclusive. |
| **Response:** Please see in-line responses. | |
| Bonneville Power | BPA does not believe any of the requirements are incorrect, though some are too prescriptive. See our response to question 4. |
| **Response:** See response in question 4. | |
| NPCC Regional Standards Committee | None |

**2. The drafting team has modified the Violation Risk Factors for MOD-030 to reflect industry concerns that they did not match NERC's VRF definitions. NERC's VRF definitions are listed below. Are the current VRFs established correctly? If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification.**

High Risk Requirement:

(a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement:

(a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement: is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.?

**Summary Consideration:**

Most entities agree with the VRFs.

One entity suggested that the VRF for R2 be raised. The majority of the team and the industry believes that a violation of R2 would not directly affect the electrical state or the capability of the bulk power system.

| Organization/Group | Question 2: | Question 2 Comments: |
|---|---|---|
| Ontario IESO | No | R2 should be assigned a Medium VRF since TFCs set the reliability boundary, like an SOL or IROL, within which the TSP may provide transmission services. Failure to establish TFCs may result in the TSP over-selling transmission services beyond the reliability bounds, risking the BES to unreliable |

| Organization/Group | Question 2: | Question 2 Comments: |
|---|---|---|
| | | operation |
| **Response:** The Drafting Team disagrees.  The majority of the team and the industry believes that a violation of R2 would not directly affect the electrical state or the capability of the bulk power system. | | |
| MRO NERC Standards Review Subcommittee | Yes | The MRO commends the SDT on revising the VRFs to Lower.  We believe the revised VRFs are in-line with the NERC definitions of the VRF levels. |
| **Response:** Thank you for your supportive comment. | | |
| FirstEnergy | Yes | FE supports the SDT's adjustment of VRFs such that no VRF within the ATC standards exceeds a "Lower" rating.  We concur with the team's reasoning and rationale provided in response to ballot comments in making this change. |
| **Response:** Thank you for your supportive comment. | | |
| PJM | Yes | PJM supports NERC?s position to revise all Violation Risk Factors to have an assigned risk factor of ?Lower.? A Lower Risk Factor requirement is administrative in nature and is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system. |
| **Response:** Thank you for your supportive comment. | | |
| ISO RTO Council/Standards Review Committee (SRC) | Yes | The MOD standards assess the correct amount of reliability risk in areas that do not affect reliability. The IRC supports the position that no requirement from this set of ATC standards should have an assigned Risk Factor exceeding “lower”.  A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system. |
| **Response:** Thank you for your supportive comment. | | |
| SERC ATCWG | Yes | |
| WECC Market Interface Committee / Sub Commtt? ATC Task Force | Yes | |

**3. The drafting team has modified the Violation Severity Levels for MOD-030 to reflect industry concerns that they were too "pass/fail" oriented. Are the current VSLs established correctly? If "No," please identify specific VSLs and suggest changes to the language.**

**Summary Consideration:**

Some commenter's expressed concern with potential for multiple violations of the standard due to a single event. The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.

Some suggestions were made to change specific VSLs or measures. The SDT modified VSLs for R3 and R10, but did not modify the other measures or VSLs.

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| The Midwest ISO | No | The tolerances included in the VSLs for R10 should be moved into the requirement itself. |
| **Response:** The SDT has modified the VSL to be consistent with the corresponding VSL for MOD-001 R8 | | |
| FirstEnergy | No | In the Severe category VSLs for requirement R3, we suggest removing the word "detailed" when referring to detailed modeling data as it is ambiguous and subjective. |
| **Response:** The Severe VSLs for R3 were corrected to match the requirement. | | |
| PJM | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but PJM has a concern regarding the possibility of multiple violations resulting from a single event. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations — this language to be added to the standard. Add a new item 6 to section A of MOD-001. For example a review of MOD-001 R2 and R8 and MOD-30 R10 should be performed for determination of multiple violations resulting from one event. |
| **Response:** The SDT does not believe it is within the drafting teams scope to modify the standards template or create obligations upon compliance. In response, the drafting team has clarified many of the Violation Severity levels in an attempt to eliminate the potential for multiple violations due to single events. | | |
| ISO RTO Council/Standards Review Committee (SRC) | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but the IRC has a concern regarding the possibility of multiple violations resulting from a single event. The IRC requests that the potential for double counting of violations for a single event be eliminated. |
| **Response:** The SDT has clarified many of the Violation Severity levels in an attempt to eliminate the potential for multiple violations due to single | | |

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| events. | | |
| Ontario IESO | No | We have the following comments on the VSLs: a. R1: The VSLs are proper for this requirement. However, the Measure needs to be fixed so that they correspond to the VSLs. Please see our comments on M1 under Q1.<br>**Response:** The phrase, "and information on how sources and sinks are accounted for" was added to M1.<br><br>b. R2: We suggest the VSLs for R2 be rewritten, and where necessary, restructure R2 altogether to facilitate development of VSLs. For example, R2.1 is only one of the 6 subrequirements of R2, yet a condition that "The Transmission Operator did not include six or more Flowgates in its AFC calculations that met the criteria described in R2.1." would put the TOP to a Severe violation despite the TOP might have met all the remaining 5 subrequirements. Another example is that the TOP is more than 9 month late in establishing the list of internal Flowgates but has otherwise met all the other subrequirements. Further, there are far too many single condition that would put a TOP to Severe violation despite it may have et all the other conditions, and there is no violation level assigned to failing R2.5.1, which is to update TFC when notified of a rating change. A major rewrite of this set of VSL in conjunction with restructuring R2 appears to be an appropriate course for the SDT.<br>**Response:** The VSLs have been restructured such that the "OR" was replaced with a bulleted structure. In this manner, not ALL sub-requirements must be violated to receive a Severe VSL, but also ensures that violation of multiple sub-requirements will only result in a single Severe VSL. A VSL has been added for R2.5.1 and M6 had been modified to include it. One of the Severe VSLs has been removed because it was incorrect.<br><br>c. R3: Similar situation as in R2. R3 has 5 subrequirements and hence failing just one of them (except R3.1 for which VSLs are progressive (graded)) should not be assigned a Severe level. There needs to be consideration given to failing some combination of them for which Low, Moderate and High VSLs should be assigned. Unlike R2, R3 has a simpler structure and hence may not need to be restructured to facilitate proper assignments of VSLs.<br>**Response:** The VSLs for 3.2 and 3.3 have been graded and The VSLs have been restructured such that the "OR" was replaced with a bulleted structure which ensures that violation of multiple sub-requirements will only result in a single Severe VSL. The VSL for R3.5 has been corrected to match the requirement.<br><br>d. R5: This requirement has 3 subrequirements. It is generally expected that failing one of the 3 subrequirements would result in a Moderate VSL, 2 for a High VSL and all 3 for a Sever VSL as opposed to seeing only the graded VSL for failing R5.2. Furthermore, there may not be a large number of |

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| | | outages/retirements (for example 26-50) occurring during a modeling period within the total area that a TSP needs to model. Some VSLs for R5.2 may not be applicable for some TSPs even they may miss all the outages/retirements within the total area that it needs to model. Suggest the SDT revise this set of VSLs to take into account failing any combination of the 3 subrequirements, and the range of area size (and hence the total number of possible outages within a period) that a TSP needs to model.<br><br>**Response:** The VSLs have been structured this way to allow a graded approach for R5.2. There would be few instances where a VSL for R5.2 is not applicable for a TSP, and there is not a clear way to quantify the total number of possible outages within a period. The VSLs have been restructured such that the "OR" was replaced with a bulleted structure which ensures that violation of multiple sub-requirements will only result in a single Severe VSL.<br><br>e. R6: For these VSLs to be appropriate, please see our comments and suggestion for changes on M13 under Q1.<br>**Response:** Please see response to Q1.<br><br>f. R7: For these VSLs to be appropriate, please see our comments and suggestion for changes on M14 under Q1.<br>**Response:** Please see response to Q1.<br><br>g. R8: The VSL has a condition that there is a violation if additional elements are used in the calculation of firm AFCs. Not allowing the use of additional elements is not stipulated in the requirement. Suggest to remove this condition from the VSL, or add this requirement to R8.<br>**Response:** The condition is implied in R8; the requirement is to use the stated algorithm and if additional elements were used, it would be a different algorithm.<br><br>h. R9: Same comment on R8 also applies here for calculating non-firm AFCs.<br>**Response:** The condition is implied in R9; the requirement is to use the stated algorithm and if additional elements were used, it would be a different algorithm.<br><br>i. R10: The VSLs as written indicates that failing any one of the 3 beyond some threshold levels would constitute a Severe violation. This is not consistent with the general principle that failing all subrequirements would result in a Severe violation. Suggest the SDT revise this set of VSLs to achieve |

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| | | consistency with the general principle.<br>**Response:** The SDT has modified the VSL to be consistent with the corresponding VSL for MOD-001 R8<br>j. R11: Please see our comment on M18 under Q1. If the wording to M18 is revised as suggested, the wording for the VSL condition should be changed accordingly.<br>**Response:** The VSL has been changed accordingly. |

**4. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-030.**

**Summary Consideration:**

Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

Some entities expressed concern with the ability to share data without non-disclosure agreements in place. In general, the SDT expects that a Transmission Operator should already have appropriate agreements in place with its Transmission Service Provider to address this. If such contracts are not in place, the standard does not prohibit nor require them, but entities are still responsible for meeting the requirements in the standard.

Some entities expressed concern that MOD-030 was more stringent than MOD-028 and MOD-029. The SDT explained that the methodologies were different, and therefore had different ways of documenting requirements, or different processes for meeting reliability goals, but in general, were consistent.

Some entities expressed concern with the effective date and the "concurrent" implementation being dependent on "all" regulatory authorities. The SDT notes that the language indicates that it is dependent on all applicable regulatory authorities. The intent is that the standards all become effective on the same date across North America; that date will be established one year following all the needed regulatory approvals.

Some entities suggested that the standard should define how AFC is calculated, but not that it should be calculated. The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives.

Some entities suggested that the standard should not apply to non-firm ATC. The SDT stated that removal of non-firm from the standard could allow for unchecked selling of non-firm service, which could lead to concerns within real-time.

Some entities questioned whether the standard should be modified to address "accepted" reservations, in addition to confirmed reservations. The SDT responded that the standard does not prohibit the TSP from maintaining an "internal" ATC value for use in approving reservation requests that includes these Accepted reservation. This is the manner FERC has indicated to be an appropriate way for dealing with "Accepted" reservation in its regulations. To the extent ATC believes these numbers should be posted, the SDT believes ATC should develop a NAESB request for the posting of this information.

Some entities did not understand the establishment of TFC for non-thermal limits. The SDT explained that, for example, the SOL limit could actually be a voltage limit, and this limit would have to be translated into a MW value to be assigned to a Flowgate in order to "respect the SOL".

The drafting team provided a summary of the use of time horizons to address some comments.

Some entities pointed out that as written, the requirement to include flowgates that have been in TLR would require the inclusion of flowgates that might be outside the scope of the transmission model if an entity chose to model beyond the requirements in the standard. The drafting team modified R2.1.3 to require only inclusion of those flowgates that have been subjected to an interconnection wide congestion management procedure AND meet the minimum model scope requirements of R3.4 and R3.5. Therefore even if the TO chooses to model a larger area, those flowgates that have been subjected to an interconnection wide congestion management procedure that are in that wider area not specified by R3.4 and R3.5 do not have to be included.

Some entities questioned if the standard was in conflict with TOP-002 R12. The SDT believes that the MOD standards are the appropriate location for the reference to SOLs with regard to transfer capability. Additionally, TOP-002 R12 applies to the Transmission Service provider while R2.4 applies to the Transmission Operator. The drafting team believes that the TFC will be based on the most constrained facility's SOL (thermal, voltage, or stability based) for the monitored facilities considered in the flowgate, so no change is needed.

One entity questioned the structure of the source/sink modeling requirements. The SDT explained the intent of the requirements, and provided examples of the manner in which various market models could be accommodated.

Several entities did not understand why MOD-001 and MOD-030 both had requirements related to recalculation frequency. The SDT explained that these two requirements are different, and address fundamental differences between the methodologies.

Some entities suggested that the allowance for 80 hours described in the MOD-001 ATC calculation schedule should apply to MOD-030's R10 as well. The SDT has modified MOD-030 R10 to allow for the annual allowance specified in MOD-001 R8.

The concept of "temporary" flowgates was raised, and whether or not the standard required temporary flowgate to be maintained indefinitely. The SDT stated that provided the conditions that cause the temporary flowgate to meet the criteria in R2.1 are no longer in existence, the flowgate could be removed immediately. Note that if the temporary flowgate had an interconnection-wide congestion management procedure invoked, the 12-month criteria would apply.

| WECC Market Interface Committee / Sub Commtt? ATC Task Force | Should the term "dispatch order" in MOD-30, R6.1.2 be a capitalized defined term? |
| **Response:** The SDT has capitalized the phrase as suggested. | |
| WECC Market Interface Committee ATC Task Force | Should the term "dispatch order" in MOD-030, R6.1.2 be a capitalized defined term? |
| **Response:** The SDT has capitalized the phrase as suggested. | |
| CenterPoint Energy | The group of standards is for ATC and TRM methodologies that are not used in ERCOT. CenterPoint Energy |

| Organization/Group | Question 4 Comments: |
|---|---|
| | is concerned that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these standards, which we believe would not add value to the ERCOT region and could increase congestion in the region. Accordingly, CenterPoint Energy previously submitted comments to these standards asking for an exemption for the ERCOT region. We find the proposed standards unacceptable unless the following provision is added to each standard: This standard does not apply to ERCOT or any other region that operates as a single control area. |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Flowgate methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT beleives that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| ERCOT ISO | I suggest modifying the Applicability section to state:"4.1.1 Each Transmission Operator with ATC Path(s) that uses the Flowgate Methodology to support the calculation of Available Transfer Capabilities (ATCs) for ATC Paths. "4.1.2 Each Transmission Service Provider with ATC Path(s) that uses the Flowgate Methodology to calculate ATCs for ATC Paths." |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Flowgate methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. <tr><td>Electric Service Delivery</td><td>These comments are filed on behalf of City of Austin d/b/a Austin Energy to address proposed NERC 5 MOD Standards. Austin Energy is a municipally owned electric utility and a transmission service provider with the Electric Reliability Council of Texas (ERCOT). ERCOT now operates as a Single Balancing Authority with no explicit transmission services being sold. Current ERCOT market rules allow open transmission access to all loads and resources. ERCOT will continue to operate as a Single Balancing Authority under Nodal market design. Accordingly, as explained in more detail below, the NERC 5 MOD Standards should not be applied to ERCOT and transmission service providers within ERCOT under its current or proposed Nodal market design. Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to</td></tr>
</table>

| Organization/Group | Question 4 Comments: |
|---|---|
| | regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations .Applicable definitions: According to NERC Reliability Standards Glossary of Terms, Available Transfer Capability (ATC) is defined as: ?A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability (TTC) less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin (CBM), less a Transmission Reliability Margin (TRM), plus Postbacks, plus counterflows?. TTC is defined as: the amount of electric power that can be transferred over the interconnected transmission network in a reliable manner while meeting all of a specific set of defined pre- and post-contingency system conditions. CBM is defined as the amount of transmission transfer capability reserved by load serving entities to ensure access to generation from interconnected systems to meet generation reliability requirements. TRM also is a component of ATC defined as: that amount of transmission transfer capability necessary to ensure that the interconnected transmission network is secure under a reasonable range of uncertainties in system conditions. Comments: ERCOT is an interconnection and a region with no synchronous AC ties with any other interconnections. In July 2001, based on a deregulated Retail and restructured Wholesale Markets, the ERCOT interconnection began acting as a Single Balancing Authority. The ERCOT market is designed such that there are no explicit transmission services being sold, hence, Available Transfer Capability (ATC) is not a measure used in a commercial activity within the ERCOT market. The current ERCOT market rules allow open transmission access to all eligible loads and resources without considering any specific Transmission Service Provider (TSP). Transmission facilities ratings are based upon individual branch element designs and in cases of dynamic ratings, ambient conditions are also considered. ERCOT has several DC ties and an asynchronous tie using a Variable Frequency Transformer (VFT); however, the associated interchange capabilities are planned and coordinated by the TSPs involved. The current ERCOT Zonal Market uses a flow based congestion management methodology to predict potential congestions in the Day Ahead and Adjustment Periods. During the operating period, generation shift factors are used to determine the dispatch needed to remain within the constrained limits. The local congestions are managed using full AC load flow analysis and unit specific redispatch.MOD-001-1 is entirely about methodology and calculation of ATC, therefore, this standard is not applicable to ERCOT.MOD-008-1 covers Transmission Reliability Margin (TRM) methodology calculation. Mathematically, ATC is defined as Total Transfer Capability (TTC) less the TRM and Capacity Benefit Margin (CBM). Therefore, TRM also is not applicable to ERCOT.MOD-028-1 covers Area Interchange calculation Methodology. Since ERCOT is a single control area, Area Interchange calculation is not applicable.MOD-029-1 covers Rated System Path Methodology, which is used to calculate TTC and ATC calculations. Therefore MOD-029-1 is not applicable to ERCOT.MOD-030-1 covers Flowgate methodology calculation of ATC, and therefore, is not applicable to ERCOT.ERCOT is currently transitioning to a Nodal Market, with a scheduled start date of December 1, 2008. The Nodal Market uses a Security Constrained Economic Dispatch (SCED) approach to dispatch individual |

| Organization/Group | Question 4 Comments: |
|---|---|
| | generating units and manage congestion. In the Nodal Market, ERCOT will still operate as a Single Balancing Authority. This again will not use ATC methodology, and aforementioned standards are not applicable to ERCOT in its ensuing Nodal Market. Therefore, Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Flowgate methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| Brazos Electric Power Cooperative, Inc. | Brazos Electric believes that the concept of the Flowgate Methodology to support the calculation of Available Transfer Capabilities (ATCs) for ATC Paths is not applicable to a single-control area operation like ERCOT. To address this issue, the Applicability section could have a clarifying statement that only TOPs or TSPs conducting area to area operations and hence have responsibility for ATC Path(s) are subject to the requirements of MOD-030 if it uses a Flowgate Methodology. |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Flowgate methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. Cit.)* | |

| Organization/Group | Question 4 Comments: |
|---|---|
| California ISO | R 3 – Should the actual Flowgate model made available to TSP upon request ONLY under NDA??? Confidential Model and access???<br>**Response:** In general, the SDT expects that a Transmission Operator should already have appropriate agreements in place with its Transmission Service Provider to address this. If such contracts are not in place, the standard does not prohibit nor require them, but entities are still responsible for meeting the requirements in the standard.<br><br>R 11 – SDT should clarify that MOD 30 R11 only specifies HOW AFC be converted and DOES NOT REQUIRE that it must be converted, as intent of SDT. MOD 30 does not REQUIRE that all AFCs be converted and posted to OASIS, irrespective of whether or not the ATC Path definition applies to internal lines for those with a flow based model.<br>**Response:** The drafting team has made R11 as clear as possible – it would not be appropriate in a requirement to specify what is not required. |
| **Response:** Please see in-line responses. | |
| Manitoba Hydro | MH echoes the concerns raised and documented by MISO that MOD-030 requirements are generally more stringent than those outlined for MOD-028 and MOD-029. |
| **Response:** Please see responses to MISO's comments. In general, the SDT believes the methodologies are different but not necessarily more stringent. | |
| FirstEnergy | FirstEnergy appreciates the Standard Drafting Team's decision to move to a formal comment period based on the prior initial ballot feedback. We commend the team for moving quickly to respond to the ballot comments and providing the industry a revised set of standards to review and comment .We suggest striking the words "short term use" from the purpose statement as we believe this methodology should also be valid in the planning horizon as a longer term projection of TFC and AFC.<br>**Response:** Transfer capability is only required to be calculated for 13 months so it was not thought appropriate to mandate that this standard be used beyond that, however, it also does not preclude using this method in the planning horizon.<br><br>Regarding the revision to the Effective Date, while FirstEnergy agrees that there is a need to ensure that the standard is implemented consistently across the entire continent we are concerned with the Effective Date being subject to approval of ALL regulatory authorities. We believe an appropriate Implementation Plan should reflect a period of time beyond the NERC Board of Trustee approval date that would reflect when the requirements are considered mandatory and enforceable. The timeline should allow sufficient time for |

| Organization/Group | Question 4 Comments: |
|---|---|
| | regulatory authority reviews, with the intent of sanctions also being enforced in conjunction with the conclusion of the implementation period. However, a delay from a given regulatory agency should not impact when the requirements are considered mandatory and enforceable for the bulk electric system.<br>**Response:** The SDT notes that the language indicates that it is dependent on all applicable regulatory authorities. The intent is that the standards all become effective on the same date across North America; that date will be established one year following all the needed regulatory approvals. |
| **Response:** Please see in-line responses. | |
| AEP | The Purpose statement is unclear and perhaps nonsensical. Is the purpose "to increase consistency and reliability in the development of documentation"? or "to support analysis and system operation?" What entities? "short term use"? Suggestion: Purpose: To ensure consistency of calculation of those entities employing Flowgate Methodology pursuant to MOD-001 R1. |
| **Response:** AEP has inaccurately quoted the language of the "Purpose" statement as being for "the development *of documentation*" (emphasis added); whereas the actual Purpose statement is to promote "the development and documentation *of transfer capability calculations*." (emphasis added). This statement clearly aligns with FERC's Order 693, P. 1015 wherein FERC states the purpose of the ATC suite is to promote "consistency and transparency for ATC calculations." As for the ambiguity of applicable entities in the Purpose statement, AEP is reminded that the Applicable entities are clearly stated in the Applicability section – not the Purpose section. As for short-term, FERC suggests that short-term is operational whereas long-term is planning in nature. Order 693, P. 1040. See also Order 890, P. 292 – 295. | |
| PJM | The MOD standards extend into areas that should be covered and addressed by NAESB Business Practices (as defined in MOD-001 Definitions). The frequency of postings and frequency of AFC/ATC calculations should be NAESB Business Practices, and not included in the NERC Standards as reliability based requirements (see specific details for MOD-001 R2 and R7 and MOD-030 R10 in the Specific Comments sections below).<br>**Response:** The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives.<br><br>Non-firm should be removed from this reliability standard.<br>**Response:** Removal of non-firm from the standard could allow for unchecked selling of non-firm service, which could lead to concerns within real-time. |

| Organization/Group | Question 4 Comments: |
|---|---|
| | – Reservations in "Accepted", as well as, "Confirmed" status should be included in ATC calculation (see MOD030 R6.3). Once the transmission provider has accepted the request, the provider is now required to provide service; therefore, not decrementing for accepted TSRs could result in over commitment.<br>**Response:** The standard does not prohibit the TSP from maintaining an "internal" ATC value for use in approving reservation requests that includes these Accepted reservation. To the extent the IRC believes these numbers should be posted, the SDT believes the IRC should develop a NAESB request for the posting of this information. |
| **Response:** Please see in-line responses. | |
| Bonneville Power | BPA thanks the drafting team for clarifying that MOD-030 does not require the conversion of AFC to ATC and agrees with your assessment that there is no reliability need for such conversion. In addition, BPA respectfully submits the following observations and suggestions:<br><br>a. There appears to be some conflicting overlap between R2.1.–R2.1.4.2. in MOD-030-1 and the System Operating Limits (SOL) Standards (FAC-010-1 and FAC-011-1). It is unclear to BPA that there is any reliability-based need for the identification of more Flowgates than are needed to protect SOLs. To that end, BPA suggests the following modifications to and renumbering of the above mentioned requirements: R2.1. – Identify Flowgates used in the AFC process based, at a minimum, on the following criteria: R2.1.1. – As necessary to protect established System Operating Limits (SOLs) or 2.1.1.1 Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates. 2.1.1.1.1. Use first Contingency assumptions consistent with those first Contingencies used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems. 2.1.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate. 2.1.1.2. Results of a first Contingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology. 2.1.1.2.1. Use first Contingency assumptions consistent with those first Contingencies used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems. 2.1.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate. R2.1.2. Any limiting Element/Contingency combination within the Transmission model that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, |

| Organization/Group | Question 4 Comments: |
|---|---|
| | unless the limiting Element/Contingency combination is accounted for using another ATC methodology. R2.1.3. Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where: 2.1.3.1. If the coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and – Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or – A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate. – The Transmission Operator may utilize distribution factors less than 5% if desired. 2.1.3.2. – If the limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.<br>**Response:** The requirement ": R2.1.1. – As necessary to protect established System Operating Limits (SOLs) or…" is too subjective to be used as an alternative to the criteria currently listed in the requirements. R2.1.3 has been corrected to be consistent with R2.1.2 as requested.<br><br>b. R2.4 has two bulleted sub-requirements that should either be numbered with a brief description provided as to how one would "respect the SOL" vs. simply setting the TFC equal to the SOL; or collapsed into R2.4 as follows: R2.4. Establish the TFC of each of the defined Flowgates as equal to: the System Operating Limit (SOL) of the Flowgate.<br>**Response:** R2.4 is a requirement for the establishment of a TFC for *each* Flowgate, so for each Flowgate you would select one or the other of the bullets, therefore the bullets should not be replaced with numbers. For the second bullet, the SOL limit could actually be a voltage limit, and this limit would have to be translated into a MW value to be assigned to a Flowgate in order to "respect the SOL".<br><br>c. The Time Horizons listed for all requirements should include the "Long-term Planning" Horizon, as ATC or AFC is to be calculated beyond the seasonal window.<br>**Response:** The use of "Time Horizons" in this standard is in the form of a compliance element, and refers to the manner in which compliance evaluates the implications of a violation of the standard. In this context, time horizon has to do with the urgency of addressing a violation, e.g., how quickly a violation needs to be rectified. Together, the Violation Risk Factor and Time Horizon aid a compliance auditor in determining sanctions. Accordingly, the SDT believes that the appropriate horizon for compliances does not include "Long-term Planning."<br><br>d. Balancing Authorities may be appropriately identified as Applicable Entities in this MOD and request that the |

| Organization/Group | Question 4 Comments: |
|---|---|
| | Standards Drafting Team provide an explanation as to why they are not listed.<br>**Response:** The SDT is uncertain what tasks BPA would assign to the Balancing Authority. To the extent that BPA has suggested requirements or tasks for the BAs to perform, the SDT suggests that BPA draft a SAR to incorporate those requirements in a future revision to the standard. |
| **Response:** Please see in-line responses. | |
| Ontario IESO | We commend the SDT for having worked very hard to try to meet FERC's earlier deadline, and for taking very positive steps responding to industry comments received from previous round of posting for comment and from the failed balloting process. However, owing to the number and size of the standards, there is a great potential for inconsistent treatment to the requirements, measures and VSLs among the standards. After reviewing all 6 standards and offering comments, we've found that there is quite a bit of inconsistency among the standards. For example, for a similar process, some requirements in a standard have only one level of subrequirements while in another standard there are two levels. In some standards that have requirements that contain subrequirements, there is only one measure while in another standard, similar process having similar requirement structure may have multiple measures. Still the vast majority of inconsistency is found in the VSLs: for similar requirement structure and content, some have appropriately graded VSLs while some have binary (none or Severe) VSLs; some have graded VSLs that is a function of the number of subrequirements violated while others have VSLs that is determined by the extent of violation of any one of the subrequirements. The inconsistent wording among the requirements, their measures and VSLs is another area of concern. We realize the SDT is still working with a tight timeline. Nonetheless, we feel that the needed time must be spent to review the structure and quality of these standards to support measurability and the ability to develop proper VSLs. Unlike the development of VSLs for the approved standards – a process that did not allow for changing the requirements, the ATC SDT has the freedom to change the requirements as it sees necessary to facilitate proper development of measures and ease of VSL development thereby achieving a set of quality standards that are measurable and enforceable. We therefore suggest the SDT do spend some time to refine these standards to improve their quality rather than trying to post them in short order to get ahead on the timeline. |
| **Response:** Many comments were received and were incorporated that improved the quality of the standards. | |
| The Midwest ISO | The Midwest ISO believes that MOD-030 continues to be more stringent than MOD-028 and MOD-029. |
| **Response:** Please refer to the responses to the comments that detailed specific examples of these concerns in question 1. | |
| MRO NERC Standards Review Subcommittee | 1. The MRO continues to have issues with the overall approach on this standard in combination with the MOD-028. As previously indicated in prior comment periods, the MRO has Transmission Service Providers that manage the levels of transmission service to a reliable level with flowgates and then establishes border control area-to-control area flows to contract path levels so that contractual rights are not exceeded. The |

| Organization/Group | Question 4 Comments: |
| --- | --- |
| | MRO reads the MOD-028 standard to require the application of the MOD-028 methodology for its control area-to-control area path postings while MOD-030 standard is used for the flowgate postings. The MRO understands from a discussion with a member of the SDT that in actuality the intent is that the MOD-030 would be used for flowgate calculations and that these quantities could be converted into the ATC path quantities for the control area to control area paths from border companies to outside the Transmission Service Providers area. This application of the flow gate methodology to possibly generate all postings in for a Transmission Service Provider including drive out is not clear from the standards and should be clarified in MOD-030 and possibly MOD-028.<br>**Response:** The SDT believes this to be clear. MOD-001 R1 allows for an entity to implement the methodology or methodologies of their choice, subject to the limitations describe. The applicability of MOD-028 and MOD030 indicates that they only apply to entities who have elected to use the methodologies. MOD-030 provides a mechanism for converting AFCs to path-based ATC values.<br><br>2. The MRO commends the SDT in making significant changes to this standard and reissuing it for comment. The MRO believes the eventual standard that is approved will serve the industry and customers better as a result.<br>Response: Thank you for your supportive comment.<br><br>3. The MRO acknowledges the consistent application of spelling out the full term followed by the abbreviation or acronym in brackets on the first time use. With the goal of consistency across all the standards.<br>Response: The SDT has attempted to apply this consistently throughout the standards.<br><br>4. R6 and R7 – Overall, both requirements as written are unclear. The MRO asks that the standards drafting team specify what assumptions are referenced or else delete these requirements. The MRO notes that these requirements are covered by FERC order #890 anyway.<br>**Response:** The SDT believes R6 and R7 are clear, and note that they do not refer to assumptions.<br><br>5. In the Purpose field, why specify for short term use only? The MRO believes this methodology is valid for the planning horizon also.<br>**Response:** ATC is only required to be calculated for 13 months so it was not thought appropriate to mandate that this standard be used beyond that. However, it also does not preclude using this method in the planning horizon. |

| Organization/Group | Question 4 Comments: |
|---|---|
| | 6. R2 – In general, we believe this is not treated equally comparing to MOD-028 and MOD-029. There isn't a minimum criterion on what contingencies have to be included in MOD-028 or MOD-29. All they need to do is to include in their ATCID. Why can't flowgate methodology do the same thing!.<br>**Response:** MOD-028 and MOD-029 do not limit the subset of limiting elements and contingencies that are considered in ATC calculations; MOD-030, on the other hand, bases the calculation of AFC on a limited subset of limiting elements and contingencies, therefore R2 of MOD-030 must contain criteria for selecting this subset of flowgates.<br><br>R2.1.3 – The MRO believes that this requirement is too burdensome and stringent, and sometimes have no effect on a TO or TSP. If a TO chooses to model the topology for a TO or TSP far removed from its respective region, why is it mandated that all flowgates with TLR be honored. This requirement also gives no service for an instance where a TLR may occur due to a temporary condition such as a forced outage. This will greatly increase the number of flowgates that each TO will have to account for in their load flow calculations without much perceived benefit.<br>**Response:** The drafting team has modified R2.1.3 to require only inclusion of those flowgates that have been subjected to an interconnection wide congestion management procedure AND meet the minimum model scope requirements of R3.4 and R3.5, therefore even if the TO chooses to model a larger area, those flowgates that have been subjected to an interconnection wide congestion management procedure that are in that wider area not specified by R3.4 and R3.5 do not have to be included.<br><br>8. R2.2 – Edited the statement to read: At a minimum, establish the list of Flowgates at least once per calendar year. The MRO believes that this would be a clearer requirement.<br><br>9. R2.3 – Edit the statement to read: At a minimum, establish the list of external Flowgates that have been requested within thirty calendar days from the request. The MRO believes that this would be a clearer requirement.<br>**Response:** The drafting team believes that "to create, modify or delete" appropriately adds to the clarity of these requirements.<br><br>10. R2.4 – The MRO believes that this requirement is identical to R12 in TOP-002. Since TOP-002 R12 will not be retired, R2.4 in MOD-030 is redundant and should be removed. However, if the DT does not agree, The MRO would then comment that for thermal limits, the thermal rating of the Flowgate should be used and |

| Organization/Group | Question 4 Comments: |
|---|---|
| | not the SOL.<br>**Response:** The SDT believes that the MOD standards are the appropriate location for the reference to SOLs with regard to transfer capability. Additionally, TOP-002 R12 applies to the Transmission Service provider while R2.4 applies to the Transmission Operator. The drafting team believes that the TFC will be based on the most constrained facility's SOL (thermal, voltage, or stability based) for the monitored facilities considered in the flowgate, so no change is needed.<br><br>11. R4 – The MRO has two comments related to this requirement: A. The MRO has observed that a similar requirement is not in MOD-029. We feel that TSPs that follow the Rated System Path methodology should also be subjected to this requirement. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies.<br>**Response:** R4 specifies how transmission service reservations shall be modeled. The Rated System Path method does not use simulation to analyze reservations, so a similar requirement would not make sense in MOD-029.<br><br>B. The sub-requirements (identified with a dash in the standard) seem to be written as though they are mutually exclusive. The MRO believes that a Source or Sink identified in a reservation that is discretely modeled can still be mapped to an "equivalence" or "aggregate" representation in the model.<br>**Response:** They are mutually exclusive. However, the SDT believes that the scenario you describe is not problematic. In cases where MISO is modeling imports, we expect that the reservation would have a source outside MISO and a sink of MISO. This would be acceptable, as "MISO" would be discretely modeled as a system. In cases where MISO is modeling imports, we expect that the reservation would have a source of MISO and a sink outside MISO. This would also be acceptable. For internal transactions, we would expect that a source of MISO and a sink of MISO would be invalid from a modeling perspective, and effectively result in zero flow (a transfer distribution factor of zero). To the extent MISO wanted to model internal BA to BA flows, it could utilize the POR and POD, provided this convention was described in the ATCID. In some cases where entities use the source and sink fields for financial purposes, the SDT is aware that other entities use the POR or POD to address this as well, which is acceptable provided it has been so defined in their ATCID pursuant to R1.2.<br><br>12. R5.2 – Language should be added to say that this requirement applies if the data is supplied by the entities owning the information.<br><br>13. R6.2/R6.4/R6.6/R7.2/R7.4/R7.6 – The MRO has two comments related to these requirements: A. |

| Organization/Group | Question 4 Comments: |
|---|---|
| | Language should be added to state that the requirements are applicable only if the other TSPs provide necessary information.<br>**Response:** The standard is requiring that entities request this information of their neighboring entities. To the extent entities do not provide it, the other entities would be out of compliance with R9 of MOD-001.<br><br>B. The MRO has observed that similar requirements are not in MOD-028 or MOD-029. We feel that TSPs that use MOD-028 and MOD-029 should also be subjected to this requirement. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies.<br>**Response:** The SDT notes that similar language is found in MOD-028 R3, R8, and R9, and in MOD-029 R1, R5 and R6. The SDT notes that the unique nature of Flowgates (having to refer to the impact of a reservation, rather than the nominal value itself) can lead to much more verbose requirements. Additionally, many of the analyses of third-party impacts undertaken in the Flowgate methodology to determine AFC are also undertaken in the other methodologies – but as part of the determination of TTC.<br><br>14. R10 – First of all, all three methodologies should have the same calculation frequency and the same allowance for outages. The MRO believes that a load flow for hourly values shall be conducted at least once per day. Lowering the requirement for all to once per hour is overly burdensome. This requirement should be removed as there is no companion requirement in MOD-028 and MOD-029. Second, any forgiveness/tolerance for error should be included in the requirement instead of the VSL table because it is the requirement that determines whether the entities are in compliance, NOT the VSL table. Third, if this requirement has to stay, it should use similar outage/maintenance allowances for hourly values as in MOD-001.<br>**Response:** These two requirements are different, and address fundamental differences between the methodologies. MOD-001 discusses the recalculation of ATC on a fixed schedule unless the components in the ATC equation change. MOD-030 R10 addresses calculation of AFC on a schedule consistent with the MOD-001 requirement. However, there is additional information in the MOD-030 requirement that is specific to that methodology. MOD-030 R10 does not require full recalculation of the distribution factors through an update of the transmission model; updates of the transmission model occur on a separate schedule as defined in MOD-030 R3. MOD-028 addresses this similarly through the recalculation of TTC on a separate schedule as defined in MOD-028 R5. MOD-029 addresses changes to topology through adjustments to TTC. Because of these technical differences between the methodologies, the SDT believes having the two requirements is appropriate.<br><br>The SDT has modified MOD-030 R10 to allow for the annual allowance specified in R8. |

| Organization/Group | Question 4 Comments: |
|---|---|
| | 15. R11 – The formula, as it is written, would result in using different flowgates to convert AFC to ATC and TFC to TTC. The MRO believes that we should use the same flowgate for both conversions. The formula should be used only for AFC-ATC conversion. TTC should be calculation by dividing TFC by DF for the same most ATC-limiting flowgate.<br>**Response: T**he current formula is a valid approach for calculating TTC. Implementing as suggested would result in the TTC changing every time the most limiting flowgate changed.<br><br>16. M17 – Should reference calculating AFC not ATC.<br>**Response:** This change has been made. |
| **Response:** Please see in-line responses. | |
| Southwest Power Pool | R2.1.3. Any limiting Element/Contingency combination within the Transmission model that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months.R2.1 addresses criteria for identifying flowgates used in the AFC process. Certain operating conditions cause the use of temporary flowgates. Coordination tests may be executed between entities for a temporary flowgate which will be included in AFC calculations and congestion management systems. Would these situations require these temporary flowgates to remain in AFC processes even after the temporary conditions return to normal (transmission elements return to service)? In some cases, temporary flowgates created for short-term may not necessarily fall under the criteria established in R2.1 but should be allowed because of their immediate need in reliably operating the transmission system. |
| **Response:** No, there is no minimum duration for which a flowgate must be considered. Provided the conditions that cause the temporary flowgate to meet the criteria in R2.1 are no longer in existence, the flowgate could be removed immediately. Note that if the temporary flowgate had a interconnection-wide congestion management procedure invoked, the 12-month criteria would apply. | |
| American Transmission Company | The first time that each abbreviation or acronym is introduced, the full terminology should be stated followed by the abbreviation or acronym in brackets (i.e. TFC).<br>**Response:** This change has been made.<br>Modification to Applicability Section: 4.1.1 Each Transmission Operator that uses the Flowgate Methodology4.1.2 Each Transmission Service Provided that uses the Flowgate Methodology. We believe that the remaining language ("to support the calculation of ATC for ATC Paths) can be deleted because of the subsequent changes to MOD-001-1. The SDT changes MOD-001-1 to accommodate both ATC and AFC. Please see our comments to MOD-001-1 that if implemented by the SDT should make the deletion acceptable. |

| Organization/Group | Question 4 Comments: |
| --- | --- |
| | **Response:** The Applicability section has been modified to reference AFCs and Flowgates.<br><br>Proposed Effective Date: Please see our comments in MOD-001-1 about the proposed effective date.<br>**Response:** Please see the response to the comments in MOD-001. |
| **Response:** Please see in-line responses | |
| American Public Power Association | Great work - thanks to the SDT |
| **Response:** Thank you for your supportive comment. | |
| EPSA | no comment |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adopts MOD-001-1. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Rated System Path Methodology:** The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities.

## A. Introduction

1. **Title:** **Rated System Path Methodology**

2. **Number:** **MOD-029-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Rated System Path Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

   **4.2.** Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** When calculating TTCs for ATC Paths, the Transmission Operator shall use a Transmission model which satisfies the following requirements: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The model utilizes data and assumptions consistent with the time period being studied and that meets the following criteria:

**R1.1.1.** Includes at least:

1.1.1.1. The Transmission Operator area. Equivalent representation of radial lines and facilities 161kV or below is allowed.

1.1.1.2. All Transmission Operator areas contiguous with its own Transmission Operator area. (equivalent representation is allowed).

1.1.1.3. Any other Transmission Operator area linked to the Transmission Operator's area by joint operating agreement. (equivalent representation is allowed).

**R1.1.2.** Models all system Elements as in-service for the assumed initial conditions.

**R1.1.3.** Models all generation Facilities larger than 20 MVA in the studied area.

**R1.1.4.** Models phase shifters in non-regulating mode, unless otherwise specified in the ATCID.

**R1.1.5.** Uses Load forecast by Balancing Authority.

**R1.1.6.** Uses Transmission Facility additions and retirements.

**R1.1.7.** Uses Generation Facility additions and retirements.

**R1.1.8.** Uses Special Protection System (SPS) models where currently existing or projected for implementation within the studied time horizon.

**R1.1.9.** Models series compensation for each line at the expected operating level unless specified otherwise in the ATCID.

**R1.1.10.** Includes any other modeling requirements or criteria specified in the ATCID.

**R1.2.** Uses Facility Ratings as provided by the Transmission Owner and Generator Owner

**R2.** The Transmission Operator shall use the following process to determine TTC: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Except where otherwise specified within MOD-029-1, adjust base case generation and Load levels within the updated power flow model to determine the TTC (maximum flow or reliability limit) that can be simulated on the ATC Path while at the same time satisfying all planning criteria contingencies as follows:

**R2.1.1.** When modeling normal conditions, do not model any Transmission Element above 100% of its continuous rating.

**R2.1.2.** When modeling contingencies the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its Emergency Rating.

**R2.1.3.** Uncontrolled separation shall not occur.

**R2.2.** Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependant on a Special Protection System (SPS), set the TTC for the non-prevailing flow direction equal to the greater of the maximum flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a SPS.

**R2.3.** For an ATC Path whose capacity is limited by contract, set TTC on the ATC Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R2.1.

**R2.4.** For an ATC Path whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.

**R2.5.** Verify that the TTC for the ATC Path being studied does not adversely impact the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1.

**R2.6.** Where multiple ownership of Transmission rights exists on an ATC Path, allocate TTC of that ATC Path in accordance with the contractual agreement made by the multiple owners of that ATC Path.

**R2.7.** For ATC Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and no action has been taken to have the path rated using a different method, set the TTC at that previously established amount.

**R2.8.** Create a study report that describes the steps above that were undertaken (R2.1 – R2.7), including the contingencies and assumptions used, when determining the TTC and the results of the study. Where three phase fault damping is used to determine stability limits, that report shall also identify the percent used and include justification for use unless specified otherwise in the ATCID.

**R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.** Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** When calculating ETC for firm Existing Transmission Commitments ($ETC_F$) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

**$NL_F$** is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**$NITS_F$** is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**$GF_F$** is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC.

**$PTP_F$** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$ROR_F$** is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**$OS_F$** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments ($ETC_{NF}$) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**$NITS_{NF}$** is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**$GF_{NF}$** is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

**R7.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_F = TTC – ETC_F – CBM – TRM + Postbacks_F + counterflows_F$$

**Where**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$Counterflows_F$** are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.

**R8.** When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_{NF} = TTC – ETC_F – ETC_{NF} – CBM_S – TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$Counterflows_{NF}$** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and specified in its ATCID.

## C. Measures

**M1.** Each Transmission Operator that uses the Rated System Path Methodology shall produce any Transmission model it used to calculate TTC for purposes of calculating ATC for each ATC Path, as required in R1, for the time horizon(s) to be examined. (R1)

**M1.1.** Production shall be in the same form and format used by the Transmission Operator to calculate the TTC used in its ATC calculations, as required in R1. (R1)

**M1.2.** The Transmission model produced must include the areas listed in R1.1.1 1 (or an equivalent representation, as described in the requirement) (R1.1)

**M1.3.** The Transmission model produced must show the use of the modeling parameters stated in R1.1.2 through R1.1.10; except that, no evidence shall be required to prove: 1) utilization of a Special Protection System where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred. (R1.1.2 through R1.1.10)

**M1.4.** The Transmission Operator must provide evidence that the models used to determine TTC included Facility Ratings as provided by the Transmission Owner and Generator Owner. (R1.2)

**M2.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (R1.1.4, R.1.1.9, and R1.1.10).

**M3.** Each Transmission Operator that uses the Rated System Path Methodology with paths with ratings established prior to January 1, 1994 shall provide evidence the path and its rating were established prior to January 1, 1994. (R2.7)

**M4.** Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)

**M5.** Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7and R8 for each ATC Path. (R3)

**M6.** Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R4)

**M7.** The Transmission Service Provider must be capable of demonstrating that for any calculation of firm ETC made in the previous 60 days, the Transmission Service Provider can recalculate the individual value of the firm ETC for a specific time period as described in (MOD-001 R2), using the algorithm defined in R5 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R5)

**M8.** The Transmission Service Provider must be capable of demonstrating that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the non-firm ETC for a specific time period as described in (MOD-001 R2), using the algorithm defined in R6 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R6)

**M9.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R7. Such documentation must show that only the variables allowed in R7 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc.). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R7)

**M10.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator shall have its latest models used to determine TTC for R1. (M1)

The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)

The Transmission Operator shall retain evidence of any path and its rating that was established prior to January 1, 1994. (M3)

The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M4)

The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R3 and R4. (M5 and M6)

The Transmission Service Provider shall retain evidence for the most recent sixty days to show compliance with R5 and R6. (M7 and M8)

The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R7 and R8. (M9 and M10)

If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits

- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator used a model that met all but one of the modeling requirements specified in R1.1.<br>**OR**<br>The Transmission Operator utilized one to ten Facility Ratings that were different from those specified by a Transmission Owner or Generation Owner in their Transmission model.<br>Note: A modeling error (a violation of the criteria in R1) is a single violation, regardless how many times that error has been modeled. | The Transmission Operator used a model that met all but two of the modeling requirements specified in R1.1.<br>**OR**<br>The Transmission Operator utilized eleven to twenty Facility Ratings that were different from those specified by a Transmission Owner or Generation Owner in their Transmission model.<br>Note: A modeling error (a violation of the criteria in R1) is a single violation, regardless how many times that error has been modeled. | The Transmission Operator used a model that met all but three of the modeling requirements specified in R1.1.<br>**OR**<br>The Transmission Operator utilized twenty-one to thirty Facility Ratings that were different from those specified by a Transmission Owner or Generation Owner in their Transmission model.<br>Note: A modeling error (a violation of the criteria in R1) is a single violation, regardless how many times that error has been modeled. | The Transmission Operator used a model that did not meet four or more of the modeling requirements specified in R1.1.<br>**OR**<br>The Transmission Operator utilized more than thirty Facility Ratings that were different from those specified by a Transmission Owner or Generation Owner in their Transmission model.<br>Note: A modeling error (a violation of the criteria in R1) is a single violation, regardless how many times that error has been modeled. |
| R2 | N/A | N/A | N/A | The Transmission Operator did not calculate TTC using the process described in R2. |
| R3. | The Transmission Operator did not specify the TTC as the lesser of the TTC calculated using the process described in R2 or any associated SOL for more than zero ATC Paths, ~~BUT~~**but**, not more than 1% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Operator did not specify the TTC as the lesser of the TTC calculated using the process described in R2 or any associated SOL for more than 1% of all ATC Paths or 1 ATC Path (whichever is greater), ~~**BUT**~~ **but** not more than 2% of all ATC Paths or 2 ATC Paths (whichever is | The Transmission Operator did not specify the TTC as the lesser of the TTC calculated using the process described in R2 or any associated SOL for more than 2% of all ATC Paths or 2 ATC Paths (whichever is greater), ~~**BUT**~~ **but** not more than 5% of all ATC Paths or 3 ATC Paths (whichever is | The Transmission Operator did not specify the TTC as the lesser of the TTC calculated using the process described in R2 or any associated SOL, for more than 5% of all ATC Paths or 3 ATC Paths (whichever is greater). |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| | | greater). | greater). | |
| R4. | The Transmission Operator provided the TTC and study report to the Transmission Service Provider more than seven, but not more than 14 calendar days after the report was finalized. | The Transmission Operator provided the TTC and study report to the Transmission Service Provider more than 14, but not more than 21 calendar days after the report was finalized. | The Transmission Operator provided the TTC and study report to the Transmission Service Provider more than 21, but not more than 28 calendar days after the report was finalized. | The Transmission Operator provided the TTC and study report to the Transmission Service Provider more than 28 calendar days after the report was finalized. |
| R5. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M7 for the same period, and the absolute value difference was more than 15% of the value calculated in the measure or 15 MW, whichever is greater, but not more than 25% of the value calculated in the measure or 25 MW, whichever is greater. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M7 for the same period, and the absolute value difference was more than 25% of the value calculated in the measure or 25 MW, whichever is greater, but not more than 35% of the value calculated in the measure or 35 MW, whichever is greater. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M7 for the same period, and the absolute value difference was more than 35% of the value calculated in the measure or 35 MW, whichever is greater, but not more than 45% of the value calculated in the measure or 45 MW, whichever is greater. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M7 for the same period, and the absolute value difference was more than 45% of the value calculated in the measure or 45 MW, whichever is greater. |
| R6. | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M8 for the same period, and the absolute value difference was more than 15% of the value calculated in the measure or 15 MW, whichever is greater, but not more than 25% of the value calculated in the measure or 25 | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M8 for the same period, and the absolute value difference was more than 25% of the value calculated in the measure or 25 MW, whichever is greater, but not more than 35% of the value calculated in the measure or 35 | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M8 for the same period, and the absolute value difference was more than 35% of the value calculated in the measure or 35 MW, whichever is greater, but not more than 45% of the value calculated in the measure or 45 | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M8 for the same period, and the absolute value difference was more than 45% of the value calculated in the measure or 45 MW, whichever is greater. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| | MW, whichever is greater. | MW, whichever is greater. | MW, whichever is greater. | |
| R7. | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |
| R8. | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adopts MOD-001-1. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Rated System Path Methodology:** The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities.

## A. Introduction

1. **Title:** **Rated System Path Methodology**

2. **Number:** **MOD-029-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Rated System Path Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

   **4.2.** Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities~~, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees~~.

## B. Requirements

**R1.** When calculating TTCs for ATC Paths, the Transmission Operator shall use a Transmission model which satisfies the following requirements: [*Violation Risk Factor: Lower~~Medium~~*] [*Time Horizon: Operations Planning*]

**R1.1.** The model utilizes data and assumptions consistent with the time period being studied and that meets the following criteria:

**R1.1.1.** Includes at least:

1.1.1.1. The Transmission Operator area. Equivalent representation of radial lines and facilities 161kV or below is allowed.

1.1.1.2. All Transmission Operator areas contiguous with its own Transmission Operator area. (equivalent representation is allowed).

1.1.1.3. Any other Transmission Operator area linked to the Transmission Operator's area by joint operating agreement. (equivalent representation is allowed).

**R1.1.2.** Models all system Elements as in-service for the assumed initial conditions.

**R1.1.3.** Models all generation Facilities larger than 20 MVA in the studied area.

**R1.1.4.** Models phase shifters in non-regulating mode, unless otherwise specified in the ATCID.

**R1.1.5.** Uses Load forecast by Balancing Authority.

**R1.1.6.** Uses Transmission Facility additions and retirements.

**R1.1.7.** Uses Generation Facility additions and retirements.

**R1.1.8.** Uses Special Protection System (SPS) models where currently existing or projected for implementation ~~-~~within the studied time horizon.

**R1.1.9.** Models series compensation for each line at the expected operating level unless specified otherwise in the ATCID.

**R1.1.10.** Includes any other modeling requirements or criteria specified in the ATCID.

**R1.2.** Uses Facility Ratings as provided by the Transmission Owner and Generator Owner

**R2.** The Transmission Operator shall use the following process to determine TTC: [*Violation Risk Factor: Lower~~Medium~~*] [*Time Horizon: Operations Planning*]

**R2.1.** Except where otherwise specified within MOD-029-1, adjust base case generation and Load levels within the updated power flow model to determine the TTC (maximum flow or reliability limit) that can be simulated on the ATC Path while at the same time satisfying all planning criteria contingencies as follows:

**R2.1.1.** When modeling normal conditions, do not model any Transmission Element above 100% of its continuous rating.

**R2.1.2.** When modeling contingencies the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its Emergency Rating.

**R2.1.3.** Uncontrolled separation shall not occur.

**R2.2.** Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependant on a Special Protection System (SPS), set the TTC for the non-prevailing flow direction equal to the greater of the maximum flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a SPS.

**R2.3.** For an ATC Path whose capacity is limited by contract, set TTC on the ATC Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R2.1.

**R2.4.** For an ATC Path whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.

**R2.5.** Verify that the TTC for the ATC Path being studied does not adversely impact the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1.

**R2.6.** Where multiple ownership of Transmission rights exists on an ATC Path, allocate TTC of that ATC Path in accordance with the contractual agreement made by the multiple owners of that ATC Path.

**R2.7.** For ATC Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and no action has been taken to have the path rated using a different method, set the TTC at that previously established amount.

**R2.8.** Create a study report that describes the steps above that were undertaken (R2.1 – R2.7), including the contingencies and assumptions used, when determining the TTC and the results of the study. Where three phase fault damping is used to determine stability limits, that report shall also identify the percent used and include justification for use unless specified otherwise in the ATCID.

**R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. [*Violation Risk Factor: Lower~~Medium~~*] [*Time Horizon: Operations Planning*]

**R4.** Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** When calculating ETC for firm Existing Transmission Commitments ($ETC_F$) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below: [*Violation Risk Factor: Lower~~Medium~~*] [*Time Horizon: Operations Planning*]

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

$\mathbf{NL_F}$ is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{NITS_F}$ is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{GF_F}$ is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC.

$\mathbf{PTP_F}$ is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

$\mathbf{ROR_F}$ is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

$\mathbf{OS_F}$ is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments ($ETC_{NF}$) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

$\mathbf{NITS_{NF}}$ is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**$GF_{NF}$** is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

**R7.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower~~Medium~~*] [*Time Horizon: Operations Planning*]

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + \cancel{Counterflow}counterflows_F$$

**Where**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm Available Transfer Capability due to a change in the use of ~~Firm~~ Transmission Service for that period, as defined in Business Practices.

**$Counterflows_F$** are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.

**R8.** When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + \cancel{Counterflow}counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Transfer Capability due to a change in the use of ~~Non-Firm~~ Transmission Service for that period, as defined in Business Practices.

**$Counterflows_{NF}$** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and specified in its ATCID.

## C. Measures

**M1.** Each Transmission Operator that uses the Rated System Path Methodology shall produce any Transmission model it used to calculate TTC for purposes of calculating ATC for each ATC Path, as required in R1, for the time horizon(s) to be examined. (R1)

**M1.1.** Production shall be in the same form and format used by the Transmission Operator to calculate the TTC used in its ATC calculations, as required in R1. (R1)

**M1.2.** The Transmission model produced must include the areas listed in R1.1.1 1 (or an equivalent representation, as described in the requirement) (R1.1)

**M1.3.** The Transmission model produced must show the use of the modeling parameters stated in R1.1.2 through R1.1.10; except that, no evidence shall be required to prove: 1) utilization of a Special Protection System where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred. (R1.1.2 through R1.1.10)

**M1.4.** The Transmission Operator must provide evidence that the models used to determine TTC included Facility Ratings as provided by the Transmission Owner and Generator Owner. (R1.2)

**M2.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (R1.1.4, R.1.1.9, and R1.1.10).

**M3.** Each Transmission Operator that uses the Rated System Path Methodology with paths with ratings established prior to January 1, 1994 shall provide evidence the path and its rating were established prior to January 1, 1994. (R2.7)

**M4.** Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)

**M5.** Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7and R8 for each ATC Path. (R3)

**M6.** Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R4)

**M7.** The Transmission Service Provider must be capable of demonstrating that for any calculation of firm ETC made in the previous 60 days, the Transmission Service Provider can recalculate the individual value of the firm ETC for a specific time period as described in (MOD-001 R2), using the algorithm defined in R5 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R5)

**M8.** The Transmission Service Provider must be capable of demonstrating that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the non-firm ETC for a specific time period as described in (MOD-001 R2), using the algorithm defined in R6 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R6)

**M9.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R7. Such documentation must show that only the variables allowed in R7 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc.). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R7)

**M10.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

~~**M7.**Each Transmission Service Provider shall produce the algorithms it used to calculate ETCs for Firm and Non-Firm Transmission Service, as required in R5 and R6, showing that only the variables allowed in R5 and R6 were used to calculate ETCs. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R5 and R6)~~

~~**M7.1.**Production of the algorithms shall be in the same form and format used by the Transmission Service Provider to calculate ETCs in R5 and R6. (R5 and R6)~~

~~**M8.**Each Transmission Service Provider shall produce the algorithms it used to calculate firm and non-firm ATCs, as required in R7 and R8, showing that only the variables allowed in R7 and R8 were used to calculate ATCs. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R7 and R8)~~

~~**M8.1.**Production of the algorithms shall be in the same form and format used by the Transmission Service Provider to calculate ATCs in R7 and R8. (R7 and R8)~~

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

**–The Transmission Operator shall have its latest models used to determine TTC for R1. (M1)**

-The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)

~~-~~The Transmission Operator shall retain evidence of any path and its rating that was established prior to January 1, 1994. (M3)

~~-~~The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M4)

~~-~~The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R3 and R4. (M5 and M6)

~~-~~The Transmission Service Provider shall retain evidence for the most recent ~~three calendar years plus the current year~~ sixty days to show compliance with R5 and~~,~~ R6~~, R7 and R8.~~. (M7 and M8)

The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R7 and R8. (M9 and M10)

~~-~~If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

~~-~~The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

**The following processes may be used:**

- **Compliance Audits**
- **Self-Certifications**
- **Spot Checking**
- **Compliance Violation Investigations**
- **Self-Reporting**
- **Complaints**

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

## Implementation Plan for Standard MOD-029-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-029-1 — Rated System Path Methodology, which describes the Rated System Path methodology for determining ATC.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Retired Standards

FAC-012-1 — Transfer Capability Methodology includes four requirements. MOD-029-1 incorporates the following requirements from FAC-012-1:

– R1 (Documentation of the Transfer Capability Methodology).

– R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).

– R4 (Responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-029-1 becomes effective.

FAC-013-1 — Establish and Communicate Transfer Capabilities, includes two requirements. MOD-029-1 incorporates the following requirements from FAC-013-1:

– R1 (Calculation of the Transfer Capabilities).

– R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-029-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-029-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Implementation Plan for Standard MOD-029-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-029-1 — Rated System Path Methodology, which describes the Rated System Path methodology for determining ATC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## ~~Modified~~ Retired Standards

FAC-012-1 — Transfer Capability Methodology includes four requirements. MOD-029-1 ~~This standard~~ incorporates the following requirements from FAC-012-1:

- R1 (Documentation of the Transfer Capability Methodology).
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (Responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-029-1 becomes effective.

FAC-013-1 — Establish and Communicate Transfer Capabilities, includes two requirements. MOD-029-1 ~~This standard~~ incorporates the following requirements from FAC-013-1:

- R1 (Calculation of the Transfer Capabilities).
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-~~012~~013-1 is no longer needed and is being retired when MOD-029-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-029-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities~~, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date MOD-001, MOD-028, MOD-029, and MOD-030 are approved by the NERC Board of Trustees~~. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

Please **DO NOT** use this form to submit comments on the current draft of MOD-029. Comments must be submitted by **May 15, 2008.**

If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-452-8060.

**Background Information — MOD-029 — Rated System Path Methodology**. (A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection.)

An initial ballot of MOD-029-1 — Rated System Path Methodology was conducted March 3-12, 2008 and there were several suggestions for modifying the standard that were submitted with ballots. The drafting team withdrew the standard from the ballot process, and made several changes to the standard based on stakeholder comments, including the following:

1. Several VRFs were changed from "Medium" to "Lower" in response to industry comments. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.
2. A more graded approach was applied to the VSLs where appropriate.
3. During the review of the VSLs and Measures, it was determined that the measures for R5, R6, R7, and R8 did not adequately measure compliance with the requirements. The drafting team updated the measures and VSLs to ensure that they captured the need to have accurate and valid numbers used in the requirements.
4. R2.2 has been modified to account for the situation where the TTC in the direction of prevailing flow is determined through the use of a Special Protection Scheme (SPS).
5. MOD-29 has been modified to reflect the "equivalents" language in MOD-28 (R2.1 & R2.2) and MOD-30 (R3.4) and the corresponding VSLs.

**Please review the revised version of MOD-029 and then answer the following questions. You do not have to answer all questions. Enter All Comments in Simple Text Format.**

1. **The drafting team modified some requirements and associated measures in MOD-029 to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct.**

   Incorrect Requirement(s) or Measure(s):

2. **The drafting team has modified the Violation Risk Factors for MOD-029 to reflect industry concerns that they were too high. NERC's VRF definitions are listed below:**

   **High Risk Requirement**:
   (a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or
   (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

   **Medium Risk Requirement**:
   (a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or
   (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

   **Lower Risk Requirement**: is administrative in nature and
   (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or
   (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

   **Are the current VRFs established correctly?**

   ☐ Yes

☐ No

**If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification.**
Comments:

3. **The drafting team has modified the Violation Severity Levels for MOD-029 to reflect industry concerns that they were too "pass/fail" oriented. Are the current VSLs established correctly?**

   ☐ Yes
   ☐ No

   **If "No," please identify specific VSLs and suggest changes to the language.**
   Comments:

4. **Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-029.**

   Comments:

| | Individual or group. | Name | Organization | Group Name | Lead Contact | Contact Organization | Question 1 | Question 2 | Question 2 Comments | Question 3 | Question 3 Comments | Question 4 Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | WECC Market Interface Committee / Sub Commtt / ATC Task Force | W. Shannon Black | SMUD | Errata: MOD-29, R.1.1.1.2 and R.1.1.1.3, the word equivalent should be capitalized. MOD-29, M7 and M8 as drafted require the TSP to be "capable" of demonstration but do not require actual demonstration. The WECC Team suggests a minor rewrite to state, "The TSP shall demonstrate that..." This shifts the measurement from the TSP's mere capability to an actual performance. | Yes | | Yes | | The WECC Team notes that changing the modeling equivalence threshold within MOD-29 to match that of the other methodologies creates a seamless and equal application across all methodologies for all of NERC. |
| | Individual | Jack Cashin/Barry Green | EPSA | | | | Through this revision process, some of the MOD standards have included an explicit requirement for consistency between planning assumptions and modeling assumptions used in calculation of ATC. We believe this is appropriate and should be included in MOD 029. | | no comment | | no comment | no comment |
| | Individual | Jim Useldinger | Kansas City Power & Light | | | | The Transmission Service Provider should be added along with the TOP for these functions in all requirements | Yes | | Yes | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Paul Rocha | CenterPoint Energy | | | | | | | | | The group of standards is for ATC and TRM methodologies that are not used in ERCOT. CenterPoint Energy is concerned that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these standards, which we believe would not add value to the ERCOT region and could increase congestion in the region. Accordingly, CenterPoint Energy previously submitted comments to these standards asking for an exemption for the ERCOT region. We find the proposed standards unacceptable unless the following provision is added to each standard: This standard does not apply to ERCOT or any other region that operates as a single control area. |
| | | | | WECC Market Interface | W. | | Errata: MOD-29, R.1.1.1.2 and R.1.1.1.3, the word equivalent should be capitalized. | | | | | | | | NPCC Participating Members have the following comments on the Requirements | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | NPCC Reliability Standards Committee | Guy V. Zito | Northast Power Coordinating Council | and Measures: a. M1.1: The term “in its ATC calculations” is inappropriate and “its” should be removed. b. M7: This measure corresponds to R5, which stipulates the use of a specific algorithm. However, M7 provides the requirement for certain accuracy, which leads to the following questions i. Is R5 about the use of an algorithm only or is it also about the proper or consistent setting of the variables within that algorithm? ii. If it is also the proper or consistent setting of the variables, the requirement should stipulate the conditions rather than leaving the assessment to a recalculation process (stipulated in M7) to determine if the algorithm and its settings have been properly used. iii. If accuracy is to be a criterion for having proper and consistent setting of the variables, it becomes a requirement and hence should be stipulated in the requirement section, not in the measure. c. M8: Same comment on M7 also applies here for R6. d. The current wording on R2.4 and R2.5 can be viewed as conflicting and the language should be modified. R2.4 implies that ATC Paths can impact each other, hence the | Yes | | Yes | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | purpose for a nomogram. However, then R2.5 says that the TTC on an ATC Path cannot adversely impact the TTC of an existing path – that would imply that nomograms would never be required. In addition, R2.5 requires one specific approach to handling the condition where a ‘new’ study impacts an existing path. When, in reality, there are often contractual arrangements that would govern how that issue would be resolved where that resolution could be different than the approach defined in R2.5 and just as reliable. An example of that is when a ‘new’ path has an impact on an ‘old’ path, where ‘old path’ has no requests for service and the ‘new path’ will be in high demand. The following is our suggested language. The additional detail that we are suggesting be removed, the default resolution process, can be added to local procedures. 2.5 Transmission Operator shall identify when the TTC for the ATC Path being studied adversely impacts the TTC value of any existing path. The Transmission Operator shall include their resolution of this adverse impact in the study report for the ATC Path. | | | | | |
| | | | | | | | | | | | | The Applicability of this Standard |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | R1.1.1 possible English issue, Does the requirement allow that all radial lines be equivalents and that ALL facilities 161 kV and lower voltage may also be equivalents? | | | | | should be solely upon the TSP, the Transmission Operator should not be subject to this Standard. From the previous set of responses, it is the apparent belief of the SDT that the calculation of ATC is needed for reliability (response to AECI for example). We disagree. Considering that ATC is a mathematical amalgamation of forecasted system conditions (load, outages, generation dispatch, others' transactions, etc) compounded and adjusted by margins (TRM and CBM of own entity and other systems), using the calculated ATC to assess real or near real time transmission reliability would be – at best – unwise. Transmission Reliability can be assessed by monitoring specific and individual Facility loadings and/or other parameters, for example. The calculation of ATC and the value of resultant ATC is exactly for the purpose stated in the definition of ATC: “A measure |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Thad Ness | AEP | | | | R.2.1.1 Was the intent that the 'base case' contain no loading above the respective normal rating, rather than the literal remove any overloaded line from the model? | | | | | of ... capability....for further commercial activity" – and note the definition does not infer ATC is a measure of reliability. Granted, ATC is calculated FROM reliability derived values and concepts (such as ratings, contingency analysis aspects, SOLs etc), BUT the resultant ATC values are not an assessment of transmission reliability – and therefore not a function for the Transmission Operators, but rather the Transmission Service Provider. In addition, the Purpose statement is unclear and perhaps nonsensical. Is the purpose "to increase consistency and reliability in the development of documentation...." or "to support analysis and system operation"? What entities' "short term use"? Suggestion: Purpose: To ensure consistency of calculation of those entities employing Rated System Path |

|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Rex McDaniel | Texas-New Mexico Power Company | | | | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Texas-New Mexico Power Company is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, TNMP believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. TNMP strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). | Yes | | Yes | | This standard does not apply to ERCOT for the reason stated in Question 1. |
| | | | | | | | | | | | | The extent to which standard MOD-029 is able to attain consistency in calculating ATC in-part depends on the definitions of terms used in the formulas. Unfortunately, the definition of the word “commitment” is not specific enough to be useful. In fact, the same phrase (“existing transmission |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | PPL Supply Group | Annette Bannon | PPL Generation | | | | | | commitment") is calculated differently in R5 than R6. For this reason, the term "ETC" should be dropped from standard MOD-029 and defined terms used. R6 defines PTP Non-Firm as including reserved capacity and should only include tagged or scheduled capacity. Capacity that is reserved but not scheduled should not affect NF ATC. It is also important that the same time periods be used to define the three time periods (scheduling horizon, operating horizon, and planning horizon) within an interconnect (i.e. the WECC) so that the same ATC algorithm is applied in all BA's across an interconnect for the same hour. |
| | | | | | | | PacifiCorp provided comments on March 12, 2008 related to the reference to counterflows in MOD-029, Rated System Path Methodology. In its comments, PacifiCorp relayed its concern that most transmission providers in the West, including PacifiCorp, using the Rated System Path Methodology do not | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | use counterflows as defined in the formula for calculating increment firm ATC. The April 16, 2008 modified version of MOD-029 appears to address this concern by including language in M9 and M10 stating that: “Such documentation must show that only the variables allowed in R7 [R8 in M10] were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc.).” In order to ensure consistency with the above, PacifiCorp recommends the below modifications to the associated violation severity levels for R7 and R8 and the definition of Rated System Path Methodology. The recommended recognizes that future utility personnel and audit staff that do not have the benefit of participation in this process and record can clearly understand that counterflows and postbacks may be used as determined by the Transmission Provider, and the necessary documentation only applies to components used in the ATC | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | PacifiCorp | Shay LaBray | PacifiCorp | calculation. Specifically, 1. The violation severity level for R7 and R8 should be revised to read: "The Transmission Service Provider did not use all the elements defined and applicable in R7 when determining firm ATC, or used additional elements" or our earlier suggested revision "The Transmission Service Provider did not use all the elements defined in R7 and as specified in the Transmission Service Provider's Available Transfer Capability Implementation Document required in MOD-001, when determining firm ATC, or used additional elements." 2. In order to ensure consistency with the way counterflows are addressed, the definition of Rated System Path Methodology should include the words “as applicable” after the new inserted language “and postbacks and counterflows are added.” The revised language would read as follows: Rated System Path Methodology: The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | Commitments are subtracted from TTC, and Postbacks and counterflows are added as applicable to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities. These changes ensure consistency and clarity of the standard that a utility is not required to apply counterflows to its firm ATC calculation. | | | | | |
| | | | | | | | | | | | | These comments are filed on behalf of City of Austin d/b/a Austin Energy to address proposed NERC 5 MOD Standards. Austin Energy is a municipally owned electric utility and a transmission service provider with the Electric Reliability Council of Texas (ERCOT). ERCOT now operates as a Single Balancing Authority with no explicit transmission services being sold. Current ERCOT market rules allow open transmission access to all loads and resources. ERCOT will continue to operate as a Single Balancing Authority under Nodal market |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | design. Accordingly, as explained in more detail below, the NERC 5 MOD Standards should not be applied to ERCOT and transmission service providers within ERCOT under its current or proposed Nodal market design. Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. Applicable definitions: According to NERC Reliability Standards Glossary of Terms, Available Transfer Capability (ATC) is defined as: “A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | above already committed uses. It is defined as Total Transfer Capability (TTC) less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin (CBM), less a Transmission Reliability Margin (TRM), plus Postbacks, plus counterflows”. TTC is defined as: the amount of electric power that can be transferred over the interconnected transmission network in a reliable manner while meeting all of a specific set of defined pre- and post-contingency system conditions. CBM is defined as the amount of transmission transfer capability reserved by load serving entities to ensure access to generation from interconnected systems to meet generation reliability requirements. TRM also is a component of ATC defined as: that amount of transmission transfer capability necessary to ensure that the interconnected |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | Electric Service Delivery | Reza Ebrahimian | Austin Energy | | | | | | transmission network is secure under a reasonable range of uncertainties in system conditions. Comments: ERCOT is an interconnection and a region with no synchronous AC ties with any other interconnections. In July 2001, based on a deregulated Retail and restructured Wholesale Markets, the ERCOT interconnection began acting as a Single Balancing Authority. The ERCOT market is designed such that there are no explicit transmission services being sold, hence, Available Transfer Capability (ATC) is not a measure used in a commercial activity within the ERCOT market. The current ERCOT market rules allow open transmission access to all eligible loads and resources without considering any specific Transmission Service Provider (TSP). Transmission facilities ratings are based upon individual branch |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | element designs and in cases of dynamic ratings, ambient conditions are also considered. ERCOT has several DC ties and an asynchronous tie using a Variable Frequency Transformer (VFT); however, the associated interchange capabilities are planned and coordinated by the TSPs involved. The current ERCOT Zonal Market uses a flow based congestion management methodology to predict potential congestions in the Day Ahead and Adjustment Periods. During the operating period, generation shift factors are used to determine the dispatch needed to remain within the constrained limits. The local congestions are managed using full AC load flow analysis and unit specific redispatch. MOD-001-1 is entirely about methodology and calculation of ATC, therefore, this standard is not applicable to ERCOT. MOD-008-1 covers Transmission |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | Reliability Margin (TRM) methodology calculation. Mathematically, ATC is defined as Total Transfer Capability (TTC) less the TRM and Capacity Benefit Margin (CBM). Therefore, TRM also is not applicable to ERCOT. MOD-028-1 covers Area Interchange calculation Methodology. Since ERCOT is a single control area, Area Interchange calculation is not applicable. MOD-029-1 covers Rated System Path Methodology, which is used to calculate TTC and ATC calculations. Therefore MOD-029-1 is not applicable to ERCOT. MOD-030-1 covers Flowgate methodology calculation of ATC, and therefore, is not applicable to ERCOT. ERCOT is currently transitioning to a Nodal Market, with a scheduled start date of December 1, 2008. The Nodal Market uses a Security Constrained Economic Dispatch (SCED) approach to |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | dispatch individual generating units and manage congestion. In the Nodal Market, ERCOT will still operate as a Single Balancing Authority. This again will not use ATC methodology, and aforementioned standards are not applicable to ERCOT in its ensuing Nodal Market. Therefore, Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. |
| | | | | | | | The Rated System Path Methodology definition, like Area Interchange and Flowgate, includes the text: "Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | Available Transfer Capability." This text describes the derivation of ATC or AFC, and should not be part of a definition to differentiate between the AIM, RSP and Flowgate methods. R1.1.1 - I support allowing "Equivalent representation of radial lines and facilities 161 kV or below" but equivalences for elements that are included in the regionally definition of the BES should be explained in the ATCID. Additional detail is appropriate if eliminating an equivalence has a material impact on transfer capability. R1.1.3. Requires the Transmission Operator to “[Model] all generation Facilities larger than 20 MVA in the studied area.” The NERC Glossary defines Facility as: A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.). Thus this requirement refers to a single generator connected to the BES, rather than a station or project. R1.1.3 does not literally require modeling of wind and other renewable generation projects because each unit may only be 1.5 MW. Yet such projects are likely to be the modeled | | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Allen Mosher | American Public Power Association | | | | source for Interchange Transactions. Conversely, generation that is connected to non-BES subtransmission or distribution network facilities that is used to serve local load may not have a material impact on Rated System Path TTC and ATC. I suggest a hybrid definition that is consistent with the Compliance Registry Criteria but allows for additional detail as required: “Models all generation units larger than 20 MVA and generation projects larger than 75 MVA in the studied area that are directly connected to the Bulk Electric System. Modeling of additional generation Facilities shall be addressed in the ATCID.” R5 and R6 – Definition of “GF” Grandfathered Firm/Non-Firm Transmission Service – please delete “accepted by FERC” after “Safe Harbor Tariff.” FERC regulatory approval of a tariff for rate purposes is not relevant to what form of transmission service tariff a NERC TSP provides. Many U.S. utilities are not FERC jurisdictional for electric rate purposes. All Canadian TSPs are non-jurisdictional. R7 and R8 - Postbacks and counterflows: “Counterflows” should be a defined term. It is used in MOD-1, | Yes | | Yes | | Excellent work |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | MOD-28, MOD-29 and MOD-30 and is an integral element in the calculation of ATC and AFC. The definition used in MOD-29-1 R7, for example, reads: “CounterflowsF are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.” This definition does not in any way describe what a counterflow is. “Postbacks” should incorporate a working definition developed by NAESB, to be revised once due process is completed on this business practice. Alternatively, consider use of the following text to at minimum describe the nature of postbacks: “Postbacks[Firm][Non-Firm] are changes to firm [non-firm] ATC [AFC] due to a change in the amount of Firm [non-firm] Transmission Service reserved or scheduled for a period, as defined in Business Practices. Postbacks are generally a positive quantity.” Also, include Postbacks in the "e.g." list of factors in M9 and M10. | | | | | |
| | | | | | | | The NYISO has previously commented that it is critically important to it that the algorithm for calculating “Existing Transmission Commitments” (“ETC”) in MOD-029 (and -028) be interpreted | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | flexibly. The NYISO’s existing ATC calculation procedure, which reflects the nature of its financial reservation system, and which has been accepted by the Commission, is to calculate firm and non-firm ATC as follows: ATC(Firm) = TTC – Transmission Flow Utilization(Firm) – TRM ATC(Non-Firm) = ATC(Firm) – Transmission Flow Utilization(Non-Firm) Where “Transmission Flow Utilization” represents the security constrained network powerflow solutions of the NYISO’s Security Constrained Unit Commitment software, with respect to the NYISO Day-Ahead Market, or its Real-Time Commitment and Real-Time Dispatch software with respect to the NYISO’s Real-Time Market. As the NYISO has explained in prior comments, it believes that the central role that Transmission Flow Utilization plays in its ATC/TTC calculations can be accommodated under proposed MOD-029 by accounting for it in the ETC calculation algorithms established under R5 and R6. Specifically, the SDT's proposed definition of the OS(F) variable appears to be broad enough to encompass Transmission Flow Utilization. The NYISO has previously requested that the | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Rick Gonzales | New York Independent System Operator | | | | SDT clarify or revise the OS(F) definition so that it would clearly allow the NYISO to account for Transmisison Flow Utilization in this way. The SDT has not yet responded. Accordingly, the NYISO requests that the the OS(F) definition under R5 be revised to read: OS(F) is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID, including security constrained network powerflow solutions produced by market software used by Transmisison Service Providers that administer FERC-approved organized markets. Similarly, the OS(F) definition under R6 should be revised to read: OS(F) is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID, including security constrained network powerflow solutions produced by market software used | | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | by Transmisison Service Providers that administer FERC-approved organized markets. Making these revisions should have no impact on the vast majority of Transmission Service Providers, because they will neither administer FERC-approved organized markets nor use security constrained network powerflow solutions produced by market software in their ATC/TTC calculations. On the other hand, the revisions would permit the NYISO to come into compliance with NERC's proposed MOD standards without having to make fundamental changes to its FERC-approved market design or financial reservation transmission model. Order No. 890 was clear that it would not require fundamental changes to ISO/RTO market designs. This principle was recently upheld when FERC accepted the NYISO's Order No. 890 tariff compliance filing without requiring any changes to its financial reservation transmission model. The NYISO asks that the SDT make the requested revisions in order to elimiante any possibility of a conflict between the NYISO's FERC approved system and the NERC MOD standards. The NYISO recognizes that the definition of OS(F) | | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | may already be broad enough to accommodate Transmission Flow Utilization. If the SDT does not make the requested revision the NYISO will take the position that it may describe its use of Transmission Flow Utilization in the ETC calculation within its ATCID. Nevertheless, because this issue is so important to the NYISO's future compliance with NERC's MOD standards the NYISO would strongly prefer that the issue be expressly addressed within the text of MOD-029 and (MOD-028). The NYISO may raise the issue at FERC if it is not addressed by NERC. | | | | | |
| | Individual | Tony Kroskey | Brazos Electric Power Cooperative, Inc. | | | | | | | | | Brazos Electric believes that the concept of the Rated System Path Methodology is not applicable to a single-control area operation like ERCOT. To address this issue, the Applicability section could have a clarifying statement that only TOPs or TSPs that conduct area to area operations and hence have have responsibility for ATC Path(s) must have a Rated System Path Methodology to support analysis and system |

RELIABILITY CORPORATION

**Consideration of Comments on Draft Standard — MOD-029 — Project 2006-07**

The ATC Standards Drafting Team thanks all commenters who submitted comments on the draft standard MOD-029-1 – Rated System Path methodology. This standard was posted for a 30-day public comment period from April 16, 2008 through May 15, 2008. The stakeholders were asked to provide feedback on the standard through a special electronic Standard Comment Form. There were 23 sets of comments, including comments from than 51 different people from approximately 30 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

There were some comments that led the drafting team to modify language to improve clarity, but none of the changes made by the drafting team changed the scope or intent of the requirements in the standard.

**Applicability**

- Several entities have continued to express concern regarding the applicability of the ATC, TRM, and CBM standards. While the drafting team has attempted to write the standards in ways that are flexible and allow for organizational diversity, we note that FERC Order 890 makes reference to the use of Variances. Entities with non-traditional physical transmission markets or that have alternative ATC methodologies that meet or exceed the NERC ATC standards may wish to consider requesting one or more Variances related to these standards.

- Several entities expressed concern regarding the responsibilities of the Transmission Operator. The SDT interprets the Functional Model as requiring the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining the methodology used to determine TTC. For those entities who believe the TSP to be the appropriate entity, we reiterate that options for delegation of this task exist.

- Some entities requested that some requirements be applicable to either the Transmission Operator or the Transmission Service Provider. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity “or” another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate.

- Several entities expressed concern with ERCOT’s applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

**Requirements**

- R1.1.1.1 - Some entities questioned the use of the 161kV threshold, requesting either a lower threshold or a requirement to document reasons for using equivalences. The SDT suggested that if such requirements are desired, the commenter should submit a request for a regional standard.

- R1.1.3 - Some entities expressed concern that the current definition of what had to be modeled did not address collections of small generators that should be treated as a bulk power resource, such as wind farms. The SDT modified the standard to read "Models all generation (may be either a single generator or multiple generators) that is greater than 20 MVA at the point of interconnection in the studied area. "

**Definitions**

- Some entities expressed concern that the definition of Rated System Path implied that counterflows must be used in the firm ATC calculation. The SDT added the words "as applicable" to the definition to clarify.

- Some entities expressed concerns with the definitions of Counterflows and Postbacks. The SDT does not believe that further definitions are necessary.

**Measures**

- M7 and M8 - Some entities expressed concern with the measures associated with the ETC calculation. The drafting team developed this measure so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measure and associated VSL from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to their documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not allow for subjective interpretation of the whether an entity is compliant. In response to concerns with data retention, the SDT has modified the data retention and the measure. The data retention now states that data to demonstrate compliance with hourly ETC calculations must be retained for 14 days, for daily calculations must be retained for 30 days, and for monthly calculations must be retained for 60 days. The measure has been rephrased to clarify that the intent is to verify that the algorithm was used.

**Compliance**

- Most commenters supported the setting of the Violation Risk Factors in the standard to "Lower." Two entities commented that requirement R2 and R3 should be higher. The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R2 and R3 do not directly affect the electrical state or the capability of the bulk power system.

- Some suggestions were made to change specific VSLs or measures and make them more graded. The SDT modified VSLs for R2, but did not modify the other measures or VSLs.

- Some commenter's expressed concern with potential for multiple violations of the standard due to a single event. The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.

- The drafting team provided a summary of the use of time horizons to address some comments.

**Concepts**

- One entity expressed concern that in some instances it may not be possible to stress both the existing and the new path to their limit simultaneously due to lack of resources. The SDT responded that when that occurs one method of dealing with the situation is to create a nomogram.

- The NERC RTOSDT expressed concern that the standard does not refer to Planning an operating limits. The SDT directed the RTOSDT to the specific areas in the methodology standard where such reference rare made.

**Variances**

The SDT believes it may be helpful to the industry to review the process for Variances. The Variance process can work either concurrent with or independent of the development of a standard. Because the drafting team working on a particular standard is likely to already have the necessary expertise to participate in the development of the Variance, concurrent development is generally more efficient. However, this may not always be practical; in this case, standards drafting may proceed, and even complete, prior to the development and approval of Variances. In this case, entities should seek to develop those Variances and seek their approval prior to the effective date of the standard. An entity is not exempt from meeting the requirements of the standard if the effective date has passed and that entity is in the process of developing a Variance.

The NERC process allows for three different types of variances:

- An Entity Variance
- A Regional Variance less than an Interconnection
- A Regional Variance on Interconnection-Wide basis

The NERC Rules of Procedure describe an Entity Variance as follows:

> Entity Variance — Any variance from a NERC reliability standard that is proposed to apply to one entity or a subset of entities within a limited portion of a regional entity, such as a variance that would apply to a regional transmission organization or particular market or to a subset of bulk power system owners, operators, or users, shall be approved through the regular standards development process defined in the NERC Reliability Standards Development Procedure and shall be made part of the applicable NERC reliability standard.

Entities seeking an Entity Variance should draft a SAR to request that Variance. In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately). In both cases, the Variance will be compared to the standard to ensure the requester is addressing the reliability goals of the standard. The ballot body is comprised of any member of the Registered Ballot Body that is interested and registers to join the ballot pool. Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe a Regional Variance Less Than an Interconnection as follows:

> Any regional variance from a NERC reliability standard that is proposed to apply for a regional entity, but not for an interconnection, shall be approved through the NERC Reliability Standards Development Procedure, except that only members of the registered ballot body located in the affected interconnection shall be permitted to vote; and the variance shall be made part of the applicable NERC reliability standard.

Entities seeking a Regional Variance Less Than an Interconnection should draft a SAR to request that Variance. In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately). In both cases, the Variance will be compared to the standard to ensure the requestor is addressing the reliability goals of the standard. The ballot body is comprised of any interested entities that that have registered with NERC and is a user, owner, or operator of facilities located within the interconnection in which the region requesting the Variance is located. Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe an Regional Variance on an Interconnection-wide Basis as follows:

> An interconnection-wide regional variance from a NERC reliability standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with other applicable standards of governmental authorities shall be made part of the NERC reliability standard. NERC shall rebuttably presume that a regional variance from a NERC reliability standard that is developed, in accordance with a procedure approved by NERC, by a regional entity organized on an interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest.

Entities seeking a Regional Variance on an Interconnection-wide Basis should draft that Variance using the regional standards development process described in the region's delegation agreement. In that Variance, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Once approved through the regional standards development process, the Variance should be brought to NERC for filing with the appropriate regulatory authorities.

Based on the comments received, the drafting team is recommending that the Standards Committee authorize moving these standards forward to posting for pre-ballot review.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standard can be viewed in their original format at:

[http://www.nerc.com/~filez/standards/MOD-V0-Revision.html](http://www.nerc.com/~filez/standards/MOD-V0-Revision.html)

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. The drafting team modified some requirements and associated measures in MOD-029 to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct. Incorrect Requirement(s) or Measure(s):?

**Summary Consideration:**
Some entities requested that either the Transmission operator or the Transmission Service Provider be applicable. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity "or" another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate.

Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

Some entities expressed concern with the measures associated with the ETC calculation. The drafting team developed this measure so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measure and associated VSL from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to their documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not allow for subjective interpretation of the whether an entity is compliant. In response to concerns with data retention, the SDT has modified the data retention and the measure. The data retention now states that data to demonstrate compliance with hourly ETC calculations must be retained for 14 days, for daily calculations must be retained for 30 days, and for monthly calculations must be retained for 60 days. The measure has been rephrased to clarify that the intent is to verify that the algorithm was used.

Some entities questioned the use of the 161kV threshold, requesting either a lower threshold or a requirement to document reasons for using equivalences. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent. Requirements for Data Exchange in MOD-001 already address sharing of models to support reliability objectives; to the extent a reliability entity has concerns regarding the use of equivalences within the model, the SDT encourages those entities to work directly with each other. Disclosure of this information to Transmission Customers should be addressed through the use of the NAESB process.

One entity expressed concern that in some instances it may not be possible to stress both the existing and the new path to their limit simultaneously due to lack of resources. The SDT responded that when that occurs one method of dealing with the situation is to create a nomogram.

Some entities expressed concern that the definition of Rated System Path implied that counterflows must be used in the firm ATC calculation. The SDT added the words "as applicable" to the definition to clarify.

Some entities expressed concern that the current definition of what had to be modeled did not address collections of small generators that should be treated as a bulk power resource, such as wind farms. The SDT modified the standard to read "Models all generation (may be either a single generator or multiple generators) that is greater than 20 MVA at the point of interconnection in the studied area. "

Some entities expressed concerns with the definitions of Counterflows and Postbacks. The SDT does not believe that further definitions are necessary.

| **Organization** | **Question 1 - Incorrect Requirement(s) or Measure(s):** |
|---|---|
| SMUD | Errata: MOD-29, R.1.1.1.2 and R.1.1.1.3, the word equivalent should be capitalized.<br>MOD-29, M7 and M8 as drafted require the TSP to be "capable" of demonstration but do not require actual demonstration. The WECC Team suggests a minor rewrite to state, "The TSP shall demonstrate that..." This shifts the measurement from the TSP's mere capability to an actual performance. |
| **Response:** Thank you for your comments. The SDT has accepted your suggestions. The word equivalent has been capitalized in MOD-29 R.1.1.1.2 and R.1.1.1.3.<br>The phrase "The TSP shall demonstrate that..." replaces "The TSP must be capable of demonstrating" in both M7 and M8 of MOD-29. | |
| EPSA | Through this revision process, some of the MOD standards have included an explicit requirement for consistency between planning assumptions and modeling assumptions used in calculation of ATC. We believe this is appropriate and should be included in MOD 029. |
| **Response:** While not stated explicitly, the SDT believes that the concerns of EPSA are addressed in R6 and R7 of MOD-001 and R1.1 of MOD 29. The SDT attempted to consider the intent of the Order in its review of this requirement. It seems clear, from both a reading of the Order and from comments submitted to the SDT, that FERC's intent is to ensure that service is not sold on a more conservative basis than the system has been planned for. Accordingly, the SDT modified this requirement to more closely align with this goal. | |
| Kansas City Power & Light | The Transmission Service Provider should be added along with the TOP for these functions in all requirements |
| Response: Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity "or" another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. | |

| Organization | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| ERCOT ISO | Requirement 1:I suggest modifying the requirement to state: "When calculating TTCs for ATC Paths, the Transmission Operator with ATC Path(s) shall use a Transmission model which satisfies the following requirements<br><br>"Requirement 2:I suggest modifying the requirement to state: "The Transmission Operator with ATC Path(s) shall use the following process to determine TTC:<br><br>"Requirement 3:I suggest modifying the requirement to state: "Each Transmission Operator with ATC Path(s) shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path.<br><br>"Requirement 4:I suggest modifying the requirement to state: "Within seven calendar days of the finalization of the study report, the Transmission Operator with ATC Path(s) shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path<br><br>"Requirement 5:I suggest modifying the requirement to state: "When calculating ETC for firm Existing Transmission Commitments (ETCF) for a specified period for an ATC Path, the Transmission Service Provider with ATC Path(s) shall use the algorithm below:<br><br>"Requirement 6:I suggest modifying the requirement to state: "When calculating ETC for non-firm Existing Transmission Commitments (ETCNF) for all time horizons for an ATC Path the Transmission Service Provider with ATC Path(s) shall use the following algorithm:<br><br>"Requirement 7:I suggest modifying the requirement to state: "When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider with ATC Path(s) shall use the following algorithm:<br><br>"Requirement 8:I suggest modifying the requirement to state: "When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider with ATC Path(s) shall use the following algorithm:" |

**Response:** The drafting team has reviewed your comments and has not modified the standard for the following reason. This standard is intended to apply to all entities that have chosen to implement the Rated System Path methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.

Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that

| Organization | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| Northeast Power Coordinating Council | NPCC Participating Members have the following comments on the Requirements and Measures: a. M1.1: The term "in its ATC calculations" is inappropriate and "its" should be removed.<br>**Response:** The SDT agrees and has deleted "used in its ATC calculation" from M1.1.<br><br>b. M7: This measure corresponds to R5, which stipulates the use of a specific algorithm. However, M7 provides the requirement for certain accuracy, which leads to the following questions<br>i. Is R5 about the use of an algorithm only or is it also about the proper or consistent setting of the variables within that algorithm?<br><br>ii. If it is also the proper or consistent setting of the variables, the requirement should stipulate the conditions rather than leaving the assessment to a recalculation process (stipulated in M7) to determine if the algorithm and its settings have been properly used .<br><br>iii. If accuracy is to be a criterion for having proper and consistent setting of the variables, it becomes a requirement and hence should be stipulated in the requirement section, not in the measure.<br>**Response:** The drafting team developed this measure so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measure and associated VSL from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to its documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather |

| Organization | Question 1 - Incorrect Requirement(s) or Measure(s): |
| --- | --- |
| | that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous. The measure has been rephrased to clarify that the intent is to verify that the algorithm was used.<br><br>c. M8: Same comment on M7 also applies here for R6.<br>**Response:** Please see previous response.<br><br>d. The current wording on R2.4 and R2.5 can be viewed as conflicting and the language should be modified. R2.4 implies that ATC Paths can impact each other, hence the purpose for a nomogram. However, then R2.5 says that the TTC on an ATC Path cannot adversely impact the TTC of an existing path — that would imply that nomograms would never be required. In addition, R2.5 requires one specific approach to handling the condition where a “new” study impacts an existing path. When, in reality, there are often contractual arrangements that would govern how that issue would be resolved where that resolution could be different than the approach defined in R2.5 and just as reliable. An example of that is when a “new” path has an impact on an “old” path, where “old path” has no requests for service and the “new path” will be in high demand. The following is our suggested language. The additional detail that we are suggesting be removed, the default resolution process, can be added to local procedures. 2.5 Transmission Operator shall identify when the TTC for the ATC Path being studied adversely impacts the TTC value of any existing path. The Transmission Operator shall include their resolution of this adverse impact in the study report for the ATC Path.<br>**Response:** The SDT agrees and has modified R2.5 to address this. |
| AEP | R1.1.1 possible English issue, Does the requirement allow that all radial lines be equivalents and that ALL facilities 161 kV and lower voltage may also be equivalents?<br>**Response:** R1.1.1 does *allow* for *ALL* radial lines and facilities 161 kV and lower voltage to be equivalenced, however it does not *require* the equivalence of these.<br><br>R.2.1.1 Was the intent that the “base case” contain no loading above the respective normal rating, rather than the literal remove any overloaded line from the model?<br>**Response:** To address your concerns the SDT has reworded R2.1.1 to read:<br>“ When modeling normal conditions, all Transmission Elements will be modeled at or below 100% of their continuous rating. “ |
| Duke Energy Corporation | R1.1 – Bulk electric system facilities 161kV and below may have significant network response. Since these facilities |

| **Organization** | **Question 1 - Incorrect Requirement(s) or Measure(s):** |
| --- | --- |
| | may have significant impact on TTC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders.<br>**Response:** The Drafting Team notes that the language of R1.1 allows detailed modeling of 161 kV and below; the language does not require it. Requirements for Data Exchange in MOD-001 already address sharing of models to support reliability objectives; to the extent a reliability entity has concerns regarding the use of equivalences within the model, the SDT encourages those entities to work directly with each other. Disclosure of this information to Transmission Customers should be addressed through the use of the NAESB process.<br><br>R2.8 – Need to ensure that comparable information should be required in either the study report or the ATCID in MOD-028, MOD-029 and MOD-030.<br>**Response:** The MOD-028 and MOD-030 standards have requirements for information to be located in the ATCID. MOD-029 has requirements for the comparable information to be included in the resulting study report. The SDT has reviewed and confirmed that the requirements are equivalent across the methodologies. |
| Oncor Electric Delivery | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Rated System Path methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| Xcel Energy | R2.5 reads: Verify that the TTC for the ATC Path being studied does not adversely impact the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in |

| Organization | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | R2.1.We feel this requirement may be, in some cases, impractical to meet due to lack of resources (generation) to simultaneously load two paths (existing and new) to their TTC limits. We suggest that the 2nd sentence of this requirement be reworded something like this: "Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its highest achieveable TTC level, up to the existing path's TTC limit, with a realistic generation dispatch while at the same time honoring the reliability criteria outlined in R2.1".<br>**Response:** The SDT agrees that in some instances it may not be possible to stress both the existing and the new path to their limit simultaneously due to lack of resources. When that occurs one method of dealing with the situation is to create a nomogram which quantifies the simultaneous interaction between the two paths as suggested in R2.4. This is no different from the case where the new path cannot be modeled at its proposed limit simultaneously with the existing path at its limit due to violation of a reliability criteria (e.g. thermal limit, voltage limit or stability limit). In the case where a lack of resources is the reason for the simultaneous interaction the new path would be considered “flow limited” (i.e. not able to simulate the desired flow) rather than “reliability criteria limited.” The SDT does not believe there is a need to change the wording of requirement R2.5. |
| Ontario IESO | 1. We have the following comments on the Requirements and Measures:<br><br>a. R3: Should the “or” before “any system operating limits” be an “and” to go along with the requirement that stipulates picking the lesser value of two? Same change applies to M5, and VSLs for R3.<br>**Response:** The SDT believe that replacing the “or” with “and” does not add clarity to the requirement, and has left R3 as written.<br><br>b. M1.1: We do not understand the basis for this measure, in particular the form and format. They are not specified in the requirement.<br>**Response:** R1 calls for and specifies the parameters of the model used by the TOP to calculate TTC. M1. calls for production of the model used. M1.1. further limits the mandate to produce the model. M1.1 prohibits the auditing entity from requiring the TOP translate or convert its model from one “form and format” to any another specified by the auditing entity. Restated: If the model used is created in “Software Package 1” whereas the auditing entity’s hardware /software can only read “Software Package 2”, the auditing entity cannot mandate an upgrade to “Software Package 2” nor can it require alteration of the model to any other “form and format” from that in which the model was originally created.<br><br>Further, the TOP does not calculate ATC; the term ?in its ATC calculations? is inappropriate.<br>**Response:** The SDT agrees and has reworded as follows: |

Cit.)* |
| PacifiCorp | PacifiCorp provided comments on March 12, 2008 related to the reference to counterflows in MOD-029, Rated System Path Methodology. In its comments, PacifiCorp relayed its concern that most transmission providers in the West, including PacifiCorp, using the Rated System Path Methodology do not use counterflows as defined in the formula for calculating increment firm ATC. The April 16, 2008 modified version of MOD-029 appears to address this concern by including language in M9 and M10 stating that: –Such documentation must show that only the variables allowed in R7 [R8 in M10] were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc.).<br><br>–In order to ensure consistency with the above, PacifiCorp recommends the below modifications to the associated violation severity levels for R7 and R8 and the definition of Rated System Path Methodology. The recommended recognizes that future utility personnel and audit staff that do not have the benefit of participation in this process and record can clearly understand that counterflows and postbacks may be used as determined by the Transmission Provider, and the necessary documentation only applies to components used in the ATC calculation. |

| Organization | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | Specifically, 1. The violation severity level for R7 and R8 should be revised to read: "The Transmission Service Provider did not use all the elements defined and applicable in R7 when determining firm ATC, or used additional elements" or our earlier suggested revision "The Transmission Service Provider did not use all the elements defined in R7 and as specified in the Transmission Service Provider's Available Transfer Capability Implementation Document required in MOD-001, when determining firm ATC, or used additional elements."<br>**Response:** The SDT believes the concerns with counter flows are addressed in M9 and M10 as they are currently written.<br><br>In order to ensure consistency with the way counterflows are addressed, the definition of Rated System Path Methodology should include the words "as applicable" after the new inserted language ?and postbacks and counterflows are added.? The revised language would read as follows: Rated System Path Methodology: The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC, and Postbacks and counterflows are added as applicable to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities. These changes ensure consistency and clarity of the standard that a utility is not required to apply counterflows to its firm ATC calculation.<br><br>Response: The SDT agrees and has added "as applicable" to the definition. |
| American Public Power Association | The Rated System Path Methodology definition, like Area Interchange and Flowgate, includes the text: "Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability." This text describes the derivation of ATC or AFC, and should not be part of a definition to differentiate between the AIM, RSP and Flowgate methods.<br>**Response:** The derivation of ATC is part of the Rated System Path Methodology, it is not identical in all three methods and it is appropriate to be included.<br><br>R1.1.1 - I support allowing "Equivalent representation of radial lines and facilities 161 kV or below" but equivalences for elements that are included in the regionally definition of the BES should be explained in the ATCID. Additional detail is appropriate if eliminating an equivalence has a material impact on transfer capability. |

| Organization | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | **Response:** The Drafting Team notes that the language of R2.1 allows detailed modeling of 161 kV and below; the language does not require it. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent. Requirements for Data Exchange in MOD-001 already address sharing of models to support reliability objectives; to the extent a reliability entity has concerns regarding the use of equivalences within the model, the SDT encourages those entities to work directly with each other. Disclosure of this information to Transmission Customers should be addressed through the use of the NAESB process.<br><br>R1.1.3. Requires the Transmission Operator to ? [Model] all generation Facilities larger than 20 MVA in the studied area.? The NERC Glossary defines Facility as: A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.). Thus this requirement refers to a single generator connected to the BES, rather than a station or project.R1.1.3 does not literally require modeling of wind and other renewable generation projects because each unit may only be 1.5 MW. Yet such projects are likely to be the modeled source for Interchange Transactions. Conversely, generation that is connected to non-BES subtransmission or distribution network facilities that is used to serve local load may not have a material impact on Rated System Path TTC and ATC. I suggest a hybrid definition that is consistent with the Compliance Registry Criteria but allows for additional detail as required: –Models all generation units larger than 20 MVA and generation projects larger than 75 MVA in the studied area that are directly connected to the Bulk Electric System. Modeling of additional generation Facilities shall be addressed in the ATCID.<br>**Response**: We agree with your comment and acknowledge the concerns. 75 MVA may be good for compliance registration; however for TTC the 20 MVA threshold is more accurate without being over prescriptive. We have modified the requirement to read: “Models all generation (may be either a single generator or multiple generators) that is greater than 20 MVA at the point of interconnection in the studied area. “<br><br>”R5 and R6 “Definition of “GF” Grandfathered Firm/Non-Firm Transmission Service — please delete “accepted by FERC” after “Safe Harbor Tariff.” FERC regulatory approval of a tariff for rate purposes is not relevant to what form of transmission service tariff a NERC TSP provides. Many U.S. utilities are not FERC jurisdictional for electric rate purposes. All Canadian TSPs are non-jurisdictional.<br>**Response**: The SDT agrees and has modified R5 and R6 per APPA’s suggestion.<br><br>R7 and R8 — Postbacks and counterflows: “Counterflows” should be a defined term. It is used in MOD-1, MOD-28, MOD-29 and MOD-30 and is an integral element in the calculation of ATC and AFC. The definition used in MOD-29-1 R7, for example, reads: “Counterflows” are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID. This definition does not in any way describe what a |

| Organization | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | counterflow is. “Postbacks” should incorporate a working definition developed by NAESB, to be revised once due process is completed on this business practice. Alternatively, consider use of the following text to at minimum describe the nature of postbacks: – Postbacks [Firm][Non-Firm] are changes to firm [non-firm] ATC [AFC] due to a change in the amount of Firm [non-firm] Transmission Service reserved or scheduled for a period, as defined in Business Practices. Postbacks are generally a positive quantity. Also, include Postbacks in the "e.g." list of factors in M9 and M10.<br>**Response:** The SDT has reviewed the standards, and finds that the Postbacks and counterflows definitions, the requirements for the ATCID, and the requirements and measures for calculating ATC in the methodologies address this sufficiently. MOD-001 indicates in the definition that Postbacks are defined by business practices, while the individual methodology standards indicate that Postbacks are “changes to firm (non-firm) ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.” Counterflows is an industry term, and the manner in which it applies to these standards is described in the methodologies (“adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID”), as well as in MOD-001 R3.2. |
| New York Independent System Operator | The NYISO has previously commented that it is critically important to it that the algorithm for calculating “Existing Transmission Commitments” (“ETC”) in MOD-029 (and -028) be interpreted flexibly. The NYISO’s existing ATC calculation procedure, which reflects the nature of its financial reservation system, and which has been accepted by the Commission, is to calculate firm and non-firm ATC as follows :ATC(Firm) = TTC ? Transmission Flow Utilization (Firm) — TRMATC (Non-Firm) = ATC(Firm) — Transmission Flow Utilization (Non-Firm) Where “Transmission Flow Utilization” represents the security constrained network powerflow solutions of the NYISO’s Security Constrained Unit Commitment software, with respect to the NYISO Day-Ahead Market, or its Real-Time Commitment and Real-Time Dispatch software with respect to the NYISO’s Real-Time Market. As the NYISO has explained in prior comments, it believes that the central role that Transmission Flow Utilization plays in its ATC/TTC calculations can be accommodated under proposed MOD-029 by accounting for it in the ETC calculation algorithms established under R5 and R6.<br>Specifically, the SDT's proposed definition of the OS (F) variable appears to be broad enough to encompass Transmission Flow Utilization. The NYISO has previously requested that the SDT clarify or revise the OS (F) definition so that it would clearly allow the NYISO to account for Transmission Flow Utilization in this way. The SDT has not yet responded. Accordingly, the NYISO requests that the OS(F) definition under R5 be revised to read: OS (F) is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID, including security constrained network powerflow solutions produced by market software used by Transmission Service Providers that administer FERC-approved organized markets. Similarly, the OS(F) definition under R6 should be revised to read: OS(F) is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as |

| Organization | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | specified in the ATCID, including security constrained network powerflow solutions produced by market software used by Transmission Service Providers that administer FERC-approved organized markets Making these revisions should have no impact on the vast majority of Transmission Service Providers, because they will neither administer FERC-approved organized markets nor use security constrained network powerflow solutions produced by market software in their ATC/TTC calculations. On the other hand, the revisions would permit the NYISO to come into compliance with NERC's proposed MOD standards without having to make fundamental changes to its FERC-approved market design or financial reservation transmission model. Order No. 890 was clear that it would not require fundamental changes to ISO/RTO market designs. This principle was recently upheld when FERC accepted the NYISO's Order No. 890 tariff compliance filing without requiring any changes to its financial reservation transmission model. The NYISO asks that the SDT make the requested revisions in order to eliminate any possibility of a conflict between the NYISO's FERC approved system and the NERC MOD standards. The NYISO recognizes that the definition of OS (F) may already be broad enough to accommodate Transmission Flow Utilization. If the SDT does not make the requested revision the NYISO will take the position that it may describe its use of Transmission Flow Utilization in the ETC calculation within its ATCID. Nevertheless, because this issue is so important to the NYISO's future compliance with NERC's MOD standards the NYISO would strongly prefer that the issue be expressly addressed within the text of MOD-029 and (MOD-028). The NYISO may raise the issue at FERC if it is not addressed by NERC.<br>**Response:** As NYISO has noted in their comment on MOD-029, the current wording of the OS term is broad enough to cover the NYISO market condition described. In addition, there is a NERC process by which NYISO can request a formal interpretation |
| PJM | PJM does not have any specific comments. |
| Pepco Holdings, Inc | PHI supports the comments of PJM and will not submit duplicate comments |
| **Response:** PJM did not provide comments. | |
| Transmission Reliability Program | BPA does not believe any are incorrect. |
| **Response:** Thank you for your supportive comment. | |

2. The drafting team has modified the Violation Risk Factors for MOD-029 to reflect industry concerns that they were too high. NERC's VRF definitions are listed below. Are the current VRFs established correctly? If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification?

High Risk Requirement:

(a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement:

(a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement: is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

**Summary Consideration:**

Most commenters supported the change to Lower VRFs.

Two entities commented that requirement R2 and R3 should be higher. The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R2 and R3 do not directly affect the electrical state or the capability of the bulk power system.

| Organization | Question 2: | Question 2 Comments: |
|---|---|---|
| Ontario IESO | No | Those requirements (at least R2 and R3) that hold the TOP responsible for establishing TTCs should be |

| Organization | Question 2: | Question 2 Comments: |
|---|---|---|
| | | assigned a Medium since TTCs set the reliability boundary, like an SOL or IROL, within which the TSP may provide transmission services. Failure to establish TTCs may result in the TSP over-selling transmission services beyond the reliability bounds, risking the BES to unreliable operation. |
| **Response:** The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R2 and R3 do not directly affect the electrical state or the capability of the bulk power system. | | |
| Southwest Power Pool | No | No, those requirements (at least R2 and R3) that hold the TOP responsible for establishing TTCs should be assigned a Medium since TTCs set the reliability boundary, like an SOL or IROL, within which the TSP may provide transmission services. Failure to establish TTCs may result in risking the BES to unreliable operation. |
| **Response:** The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R2 and R3 do not directly affect the electrical state or the capability of the bulk power system. | | |
| PJM | Yes | PJM supports NERC's position to revise all Violation Risk Factors to have an assigned risk factor of ?Lower.? A Lower Risk Factor requirement is administrative in nature and is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system. |

3. The drafting team has modified the Violation Severity Levels for MOD-029 to reflect industry concerns that they were too “pass/fail” oriented. Are the current VSLs established correctly? If “No,” please identify specific VSLs and suggest changes to the language.

**Summary Consideration:**

Some commenter’s expressed concern with potential for multiple violations of the standard due to a single event. The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.

Some suggestions were made to change specific VSLs or measures and make them more graded. The SDT modified VSLs for R2, but did not modify the other measures or VSLs.

| Organization | Question 3: | Question 3 Comments: |
|---|---|---|
| PJM | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but PJM has a concern regarding the possibility of multiple violations resulting from a single event. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations ?this language to be added to the standard. |
| **Response:** The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events. | | |
| Ontario IESO | No | We do not agree with the following VSLs:<br>a. R1 has two subrequirements: R1.1 for modeling details and R1.2 for use of facility ratings provided by the owners. A total failure of R1 would be failing both subrequirements. On this basis, we agree with the Low and Moderate but do not agree with the Severe which if changed, can impact the High VSL as well. For Severe, we suggest to change the condition to “AND” instead of “OR”. And with this change, the High would thus be for “3 or more” in the first condition and “21 or more” in the second condition, and the same language apply to the conditions for Severe, or something along that line in terms of the threshold numbers.<br>**Response:** After extensive discussion by the SDT, the SDT has determined that the VSL is appropriate as drafted.<br><br>b. There are 2 measures developed for R2 — an M3 for R2.7 and an M4 for the rest of R2 including R2.8 (a report that shows the process detailed in R2.1 to R2.6 was followed). Yet the VSL only has one entry, which appears to treat R2 as a binary requirement. There are at least two issues with this lone VSL: 1. M3 and M4 become irrelevant2. There is no provision for progressive (graded) VSLs for failing any of the subrequirements<br>**Response:** The SDT agrees and has changed the VSL to have a progressive grading.<br><br>c. We suggest the SDT review the measures in conjunction with the VSLs for this requirement. At a minimum, |

| Organization | Question 3: | Question 3 Comments: |
|---|---|---|
| | | the VSLs should be dependent on the number of subrequirements not met. If the SDT wishes to have a simple set of VSLs, it may consider eliminating M3 hence making all subrequirements binary to support a progressive (graded) VSL for the main requirement.<br>**Response:** The SDT agrees and has changed the VSL to have a progressive grading, and as a result will not eliminate M3.<br><br>d. R5: For these VSLs to be appropriate, please see our comments and suggestion for changes on M7 under Q1.<br>**Response:** Please see response to Q1.<br><br>e. R6: For these VSLs to be appropriate, please see our comments and suggestion for changes on M8 under Q1.<br>**Response:** Please see response to Q1. |

4. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-029.

**Summary Consideration:**

Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

Several entities expressed concern regarding the responsibilities of the Transmission Operator. The SDT interprets the Functional Model as requiring the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining the methodology used to determine TTC. For those entities who believe the TSP to be the appropriate entity, we reiterate that options for delegation of this task exist.

The NERC RTOSDT expressed concern that the standard does not refer to Planning an operating limits. The SDT directed the RTOSDT to the specific areas in the methodology standard where such reference rare made.

The drafting team provided a summary of the use of time horizons to address some comments,

| Organization | Question 4 Comments: |
|---|---|
| CenterPoint Energy | The group of standards is for ATC and TRM methodologies that are not used in ERCOT. CenterPoint Energy is concerned that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these standards, which we believe would not add value to the ERCOT region and could increase congestion in the region. Accordingly, CenterPoint Energy previously submitted comments to these standards asking for an exemption for the ERCOT region. We find the proposed standards unacceptable unless the following provision is added to each standard: This standard does not apply to ERCOT or any other region that operates as a single control area.<br>**Response:** This standard is intended to apply to all entities that have chosen to implement the Rated System Path methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub- |

| Organization | Question 4 Comments: |
|---|---|
| | regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* |
| ERCOT ISO | I suggest modifying the Applicability section to state""4.1. Each Transmission Operator with ATC Path(s) that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.""4.2. Each Transmission Service Provider with ATC Path(s) that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths."<br>**Response:** The SDT does not find that this adds further clarity, and has not made the suggested modification. |
| Austin Energy | These comments are filed on behalf of City of Austin d/b/a Austin Energy to address proposed NERC 5 MOD Standards. Austin Energy is a municipally owned electric utility and a transmission service provider with the Electric Reliability Council of Texas (ERCOT). ERCOT now operates as a Single Balancing Authority with no explicit transmission services being sold. Current ERCOT market rules allow open transmission access to all loads and resources. ERCOT will continue to operate as a Single Balancing Authority under Nodal market design. Accordingly, as explained in more detail below, the NERC 5 MOD Standards should not be applied to ERCOT and transmission service providers within ERCOT under its current or proposed Nodal market design. Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. Applicable definitions: According to NERC Reliability Standards Glossary of Terms, Available Transfer Capability (ATC) is defined as: – A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability (TTC) less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin (CBM), less a Transmission Reliability Margin (TRM), plus Postbacks, plus counterflows? TTC is defined as: the amount of electric power that can be transferred over the interconnected transmission network in a reliable manner while meeting all of a specific set of defined pre- and post-contingency system conditions. CBM is defined as the amount of transmission transfer capability reserved by load serving entities to ensure access to generation from interconnected systems to meet generation reliability requirements. TRM also is a component of ATC defined as: that amount of transmission transfer capability necessary to ensure that the interconnected transmission network is secure under a reasonable range of uncertainties in system conditions. Comments: ERCOT is an interconnection and a region with no synchronous AC ties with any other interconnections. In July 2001, based on a deregulated Retail and restructured Wholesale Markets, the ERCOT interconnection began acting as a Single Balancing Authority. The ERCOT market is designed such that there are no explicit transmission services being sold, hence, Available Transfer Capability (ATC) is not a measure used in a commercial activity within the ERCOT market. The current ERCOT market rules allow open transmission access to all eligible loads and resources without considering any specific Transmission Service Provider (TSP). Transmission facilities ratings are based upon individual branch element designs and in cases of dynamic ratings, ambient conditions are also considered. ERCOT has several DC ties and an asynchronous tie using a Variable Frequency Transformer (VFT); however, the associated interchange capabilities are planned and coordinated |

| Organization | Question 4 Comments: |
|---|---|
| | by the TSPs involved. The current ERCOT Zonal Market uses a flow based congestion management methodology to predict potential congestions in the Day Ahead and Adjustment Periods. During the operating period, generation shift factors are used to determine the dispatch needed to remain within the constrained limits. The local congestions are managed using full AC load flow analysis and unit specific redispatch.MOD-001-1 is entirely about methodology and calculation of ATC, therefore, this standard is not applicable to ERCOT.MOD-008-1 covers Transmission Reliability Margin (TRM) methodology calculation. Mathematically, ATC is defined as Total Transfer Capability (TTC) less the TRM and Capacity Benefit Margin (CBM). Therefore, TRM also is not applicable to ERCOT.MOD-028-1 covers Area Interchange calculation Methodology. Since ERCOT is a single control area, Area Interchange calculation is not applicable.MOD-029-1 covers Rated System Path Methodology, which is used to calculate TTC and ATC calculations. Therefore MOD-029-1 is not applicable to ERCOT.MOD-030-1 covers Flowgate methodology calculation of ATC, and therefore, is not applicable to ERCOT.ERCOT is currently transitioning to a Nodal Market, with a scheduled start date of December 1, 2008. The Nodal Market uses a Security Constrained Economic Dispatch (SCED) approach to dispatch individual generating units and manage congestion. In the Nodal Market, ERCOT will still operate as a Single Balancing Authority. This again will not use ATC methodology, and aforementioned standards are not applicable to ERCOT in its ensuing Nodal Market. Therefore, Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations.<br>**Response:** This standard is intended to apply to all entities that have chosen to implement the Rated System Path methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) “it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) “it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, “An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable.” *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance “Based on a justifiable difference between regions or between sub-regions within the Regional geographic area” could be pursued by ERCOT. *(Loc. Cit.)* |
| Brazos Electric Power Cooperative, Inc. | Brazos Electric believes that the concept of the Rated System Path Methodology is not applicable to a single-control area operation like ERCOT. To address this issue, the Applicability section could have a clarifying statement that only TOPs or TSPs that conduct area to area operations and hence have responsibility for ATC Path(s) must have a Rated |

| Organization | Question 4 Comments: |
|---|---|
| | System Path Methodology to support analysis and system operations.<br>**Response:** This standard is intended to apply to all entities that have chosen to implement the Rated System Path methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* |
| Oncor Electric Delivery | This standard should not apply to ERCOT for the reason expressed in question 1.<br>**Response:** This standard is intended to apply to all entities that have chosen to implement the Rated System Path methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. Cit.)* |
| AEP | The Applicability of this Standard should be solely upon the TSP, the Transmission Operator should not be subject to this Standard.<br>**Response:** The Drafting Team does not find any clear rationale for selecting the Transmission Service Provider as the entity responsible for selecting the methodology. As discussed previously, the Functional Model requires the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining the methodology used to determine TTC. The Transmission Service Provider is responsible for providing service within the constraints established by the Transmission Operator, not actually establishing those constraints.<br>For those entities who believe the TSP to be the appropriate entity, we reiterate that options for delegation of this task exist. Transmission operators can simply defer to the decisions made by their Transmission Service Provider; if a more formal agreement and transfer of responsibility is needed, the Transmission Service Provider and their Transmission Operators can register as a Joint Registration Organization, with the Transmission Service provider agreeing to take on responsibility for this requirement through written contract.<br><br>From the previous set of responses, it is the apparent belief of the SDT that the calculation of ATC is needed for reliability (response to AECI for example). We disagree. Considering that ATC is a mathematical amalgamation of forecasted system conditions (load, outages, generation dispatch, others? transactions, etc) compounded and adjusted by margins (TRM and CBM of own entity and other systems), using the calculated ATC to assess real or near real time transmission reliability would be — at best — unwise. Transmission Reliability can be assessed by monitoring specific and individual Facility loadings and/or other parameters, for example. The calculation of ATC and the value of resultant ATC is exactly for the purpose stated in the definition of ATC: "A measure of" "capability" for further commercial activity? |

| Organization | Question 4 Comments: |
|---|---|
| | — and note the definition does not infer ATC is a measure of reliability. Granted, ATC is calculated FROM reliability derived values and concepts (such as ratings, contingency analysis aspects, SOLs etc), BUT the resultant ATC values are not an assessment of transmission reliability — and therefore not a function for the Transmission Operators, but rather the Transmission Service Provider.<br>**Response:** FERC has already opined that ATC is a reliability issue. In Order 693, FERC held that:<br>"1022. We disagree with MISO's contention that the Reliability Standards are an inappropriate venue for addressing ATC comparability issues. *ATC raises both comparability and reliability issues*, and it would be irresponsible to take action under FPA section 206 to require consistency in ATC calculations without considering the reliability impact of those decisions." (See also P. 1014.) (Emphasis added.)<br>Docket No. RM06-16-000; 18 CFR Part 40; Mandatory Reliability Standards for the Bulk-Power System. Issued March 16, 2007)<br><br>In addition, the Purpose statement is unclear and perhaps nonsensical. Is the purpose "to increase consistency and reliability in the development of documentation".? or "to support analysis and system operation"? What entities? "short term use" Suggestion: Purpose: To ensure consistency of calculation of those entities employing Rated System Path Methodology pursuant to MOD-001 R1.<br>**Response:** The SDT believes that AEP has inaccurately quoted the language of the "Purpose" statement as being for "the development *of documentation*" (emphasis added); whereas the actual Purpose statement is to promote "the development and documentation *of transfer capability calculations*." (emphasis added). This statement clearly aligns with FERC's Order 693, P. 1015 wherein FERC states the purpose of the ATC suite is to promote "consistency and transparency for ATC calculations." As for the ambiguity of applicable entities in the Purpose statement, AEP is reminded that the Applicable entities are clearly stated in the Applicability section – not the Purpose section. As for short-term, FERC suggests that short-term is operational whereas long-term is planning in nature. Order 693, P. 1040. See also Order 890, P. 292 – 295 |
| Transmission Reliability Program | BPA respectfully submits the following observations and suggestions: a. Including counterflows in the calculation of firm ATC is not appropriate because it could result in exceeding a TTC limit due to forced outage scenarios. An accurate estimation of counterflows cannot be assured and may result in over selling transmission. R7 should be modified to state that for firm ATC calculations counterflows shall always be zero.<br>**Response:** Use of counter flows to calculate firm ATC is an option not an obligation and is an accepted practice within the industry. Within the WECC Rated System Path method counter schedules are used instead of counter flows.<br><br>b. The Time Horizons listed for all requirements should include the "Long-term Planning" Horizon, as ATC is to be calculated beyond the seasonal window. |

| Organization | Question 4 Comments: |
|---|---|
| | **Response:** The use of "Time Horizons" in this standard is in the form of a compliance element, and refers to the manner in which compliance evaluates the implications of a violation of the standard. In this context, time horizon has to do with the urgency of addressing a violation, e.g., how quickly a violation needs to be rectified. Together, the Violation Risk Factor and Time Horizon aid a compliance auditor in determining sanctions. Accordingly, the SDT believes that the appropriate horizon for compliances does not include "Long-term Planning."<br><br>c. Balancing Authorities may be appropriately identified as Applicable Entities in this MOD and request that the Standards Drafting Team provide an explanation as to why they are not listed.<br>**Response:** The SDT is uncertain what tasks BPA would assign to the Balancing Authority. To the extent that BPA has suggested requirements or tasks for the BAs to perform, the SDT suggests that BPA draft a SAR to incorporate those requirements in a future revision to the standard. |
| Southwest Power Pool | The extent to which standard MOD-029 is able to attain consistency in calculating ATC in-part depends on the definitions of terms used in the formulas. Unfortunately, the definition of the word "commitment" is not specific enough to be useful. In fact, the same phrase ("existing transmission commitment") is calculated differently in R5 than R6. For this reason, the term "ETC" should be dropped from standard MOD-029 and defined terms used.<br>**Response:** ETC is calculated the same in R5 and R6, it is the subscript that differentiates R5 from R6. The subscript defines the component as either firm or non-firm.<br><br>R6 defines PTP Non-Firm as including reserved capacity and should only include tagged or scheduled capacity. Capacity that is reserved but not scheduled should not affect NF ATC.<br>**Response**: Only including tagged or scheduled capacity would result in unchecked sale of non-firm service, resulting in potential adverse affect to the reliability of the system.<br><br>It is also important that the same time periods be used to define the three time periods (scheduling horizon, operating horizon, and planning horizon) within an interconnect (i.e. the WECC) so that the same ATC algorithm is applied in all BAs across an interconnect for the same hour.<br>**Response:** The SDT has identified the periods for which different methodologies are allowed in mod 001 R2. We do not agree that all entities within an interconnection must use the same methodology. |
| PJM | PJM reiterates that while we will not choose the calculation methodologies used in MODs 28 and 29, these MODs will require modification to assure consistency with any revisions made to MOD 30. PJM is including specific comments for MOD 30 in Section VI of this document. PJM is not providing specific comments for MODs 28 and 29.<br>**Response:** The SDT will work to maintain consistency between the three MOD standards. |

| Organization | Question 4 Comments: |
|---|---|
| SMUD | The WECC Team notes that changing the modeling equivalence threshold within MOD-29 to match that of the other methodologies creates a seamless and equal application across all methodologies for all of NERC.<br>**Response:** Thank you for your supportive comments. |
| American Public Power Association | Excellent work<br>**Response:** Thank you for your supportive comment. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Area Interchange Methodology:** The Area Interchange methodology is characterized by determination of incremental transfer capability via simulation, from which Total Transfer Capability (TTC) can be mathematically derived. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Area Interchange Methodology, TTC results are generally reported on an area to area basis.

## A. Introduction

1. **Title: Area Interchange Methodology**

2. **Number: MOD-028-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of Transfer Capability calculations for short-term use performed by entities using the Area Interchange Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Area Interchange Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

   **4.2.** Each Transmission Service Provider that uses the Area Interchange Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Service Provider shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining TTC: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R1.1.** Information describing how the selected methodology has been implemented, in such detail that, given the same information used by the Transmission Operator, the results of the TTC calculations can be validated.

**R1.2.** A description of the manner in which the Transmission Operator will account for Interchange Schedules in the calculation of TTC.

**R1.3.** Any contractual obligations for allocation of TTC.

**R1.4.** A description of the manner in which Contingencies are identified for use in the TTC process.

**R1.5.** The following information on how source and sink for transmission service is accounted for in ATC calculations including:

**R1.5.1.** Define if the source used for ATC calculations is obtained from the source field or the POR field of the transmission reservation

**R1.5.2.** Define if the sink used for ATC calculations is obtained from the sink field or the POD field of the transmission reservation

**R1.5.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.5.4.** If the Transmission Service Provider's ATC calculation process involves a grouping of generation, the ATCID must identify how these generators participate in the group.

**R2.** When calculating TTC for ATC Paths, the Transmission Operator shall use a Transmission model that contains all of the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R2.1.** Modeling data and topology of its Reliability Coordinator's area of responsibility. Equivalent representation of radial lines and facilities161kV or below is allowed.

**R2.2.** Modeling data and topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination areas.

**R2.3.** Facility Ratings specified by the Generator Owners and Transmission Owners.

**R3.** When calculating TTCs for ATC Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's area. The Transmission Operator shall also include the following data associated with Facilities that are explicitly represented in the Transmission model, as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** For on-peak and off-peak intra-day and next-dayTTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):

**R3.1.1.** Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.

**R3.1.2.** Load forecast for the applicable period being calculated.

**R3.1.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R3.2.** For days two through 31 TTCs and for months two through 13 TTCs, use the following (as well as any other values and internal parameters as specified in the ATCID):

**R3.2.1.** Expected generation and Transmission outages, additions, and Retirements, included as specified in the ATCID.

**R3.2.2.** Daily load forecast for the days two through 31 TTCs being calculated and monthly forecast for months two through 13 months TTCs being calculated.

**R3.2.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R4.** When calculating TTCs for ATC Paths, the Transmission Operator shall meet all of the following conditions: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** Use all Contingencies meeting the criteria described in its ATCID.

**R4.2.** Respect any contractual allocations of TTC.

**R4.3.** Include, for each time period, the Firm Transmission Service expected to be scheduled as specified in the ATCID (filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers) for the Transmission Service Provider, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed modeling the source and sink as follows:

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point shall as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can not be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider to which the power is to be delivered as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated

with the Transmission Service Provider to which the power is being delivered as the sink.

**R5.** Each Transmission Operator shall establish TTC for each ATC Path as defined below: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.1.** At least once in the calendar week prior to the specified period for TTCs used in hourly and daily ATC calculations.

**R5.2.** At least once per calendar month for TTCs used in monthly ATC calculations.

**R5.3.** Within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a transformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage, provided such outage is expected to last 24 hours or longer.

**R6.** Each Transmission Operator shall establish TTC for each ATC Path using the following process: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.1.** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either:

- A System Operating Limit is reached on the Transmission Service Provider's system, or
- A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater[1].

**R6.2.** If the limit in step R6.1 can not be reached by adjusting any combination of load or generation, then set the incremental Transfer Capability by the results of the case where the maximum adjustments were applied.

**R6.3.** Use (as the TTC) the lesser of:

– The sum of the incremental Transfer Capability and the impacts of Firm Transmission Services, as specified in the Transmission Service Provider's ATCID, that were included in the study model, or

– The sum of Facility Ratings of all ties comprising the ATC Path.

**R6.4.** For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Operator so the TTC does not exceed that Transmission Operator's contractual rights.

**R7.** The Transmission Operator shall provide the Transmission Service Provider of that ATC Path with the most current value for TTC for that ATC Path no more than: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.1.** One calendar day after its determination for TTCs used in hourly and daily ATC calculations.

[1] The Transmission operator may honor distribution factors less than 5% if desired.

**R7.2.** Seven calendar days after its determination for TTCs used in monthly ATC calculations.

**R8.** When calculating Existing Transmission Commitments (ETCs) for firm commitments ($ETC_F$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

**$NITS_F$** is the firm capacity set aside for Network Integration Transmission Service (including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources) on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_F$** is the firm capacity set aside for Grandfathered Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_F$** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$ROR_F$** is the capacity reserved for roll-over rights for Firm Transmission Service contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**$OS_F$** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R9.** When calculating ETC for non-firm commitments ($ETC_{NF}$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**$NITS_{NF}$** is the non-firm capacity set aside for Network Integration Transmission Service (i.e., secondary service , including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources) reserved on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_{NF}$** is the non-firm capacity reserved for Grandfathered Non-Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access

Transmission Tariff or “Safe Harbor Tariff” accepted by FERC on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R10.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall utilize the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_F = TTC – ETC_F – CBM – TRM + Postbacks_F + counterflows_F$$

**Where:**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_F$** are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

**R11.** When calculating non-firm ATC for a ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_{NF} = TTC – ETC_F - ETC_{NF} – CBM_S – TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm Transmission commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled without a separate reservation during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its current ATCID that has the information described in R1 to show compliance with R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including the model used to calculate TTC as well as other evidence (such as Facility Ratings provided by facility owners, written documentation, logs, and data) to show that the modeling requirements in R2 were met. (R2)

**M3.** Each Transmission Operator shall provide evidence, including scheduled outages, facility additions and retirements, (such as written documentation, logs, and data) that the data described in R3 and R4 were included in the determination of TTC as specified in the ATCID. (R3)

**M4.** Each Transmission Operator shall provide the contingencies used in determining TTC and its ATCID as evidence to show that the contingencies described in the ATCID were included in the determination of TTC. (R4)

**M5.** Each Transmission Operator shall provide copies of contracts that contain requirements to allocate TTCs and TTC values to show that any contractual allocations of TTC were respected as required in R4.2. (R4)

**M6.** Each Transmission Operator shall provide evidence (such as copies of coordination agreements, reservations, interchange transactions, or other documentation) to show that firm reservations were used to estimate scheduled interchange, the modeling of scheduled interchange was based on the rules described in R4.3, and that estimated scheduled interchange was included in the determination of TTC. (R4)

**M7.** Each Transmission Operator shall provide evidence (such as logs and data and dated copies of requests from the Transmission Service Provider to establish TTCs at specific intervals) that TTCs have been established at least once in the calendar week prior to the specified period for TTCs used in hourly and daily ATC calculations, at least once per calendar month for TTCs used in monthly ATC calculations, and within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a autotransformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage; provided such outage is expected to last 24 hours or longer in duration per the specifications in R5.(R5)

**M8.** Each Transmission Operator shall provide evidence (such as written documentation) that TTCs have been calculated using the process described in R6. (R6)

**M9.** Each Transmission Operator shall have evidence including a copy of the latest calculated TTC values along with a dated copy of email notices or other equivalent evidence to show that it provided its Transmission Service Provider with the most current values for TTC in accordance with R7. (R7)

**M10.** The TSP must be capable of demonstrating that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the firm ETC for a specific time period as described in (MOD-001 R2), using the algorithm defined in R8 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R8)

**M11.** The TSP must be capable of demonstrating that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the non-firm ETC for a specific time period as described in (MOD-001 R2), using the algorithm defined in R9 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R9)

**M12.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R10. Such documentation must show that only the variables allowed in R10 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R10)

**M13.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R11. Such documentation must show that only the variables allowed in R11 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc.). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset

Not applicable.

#### 1.3. Data Retention

The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.

The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2.

The Transmission Operator shall retain evidence to show compliance with R3 for the most recent 12 months or until the model used to calculate TTC is updated, whichever is longer.

The Transmission Operator shall retain evidence to show compliance with R4, R5, R6 and R7 for the most recent 12 months.

The Transmission Service Provider shall retain evidence to show compliance with R8 and R9 for the most recent sixty days.

The Transmission Service Provider shall retain evidence to show compliance with R10 and R11 for the most recent 12 months.

If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Area Interchange Methodology:** The Area Interchange methodology is characterized by determination of incremental transfer capability via simulation, from which Total Transfer Capability (TTC) can be mathematically derived. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Area Interchange Methodology, TTC results are generally reported on an area to area basis.

## A. Introduction

1. **Title: Area Interchange Methodology**

2. **Number: MOD-028-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of Transfer Capability calculations for short-term use performed by entities using the Area Interchange Methodology to support analysis and system operations.

4. **Applicability:**

    **4.1.** Each Transmission Operator that uses the Area Interchange Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

    **4.2.** Each Transmission Service Provider that uses the Area Interchange Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities~~, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees~~.

## B. Requirements

**R1.** Each Transmission Service Provider shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining TTC: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R1.1.** Information describing how the selected methodology has been implemented, in such detail that, given the same information used by the Transmission Operator, the results of the TTC calculations can be validated.

**R1.2.** A description of the manner in which the Transmission Operator will account for Interchange Schedules in the calculation of TTC.

**R1.3.** Any contractual obligations for allocation of TTC.

**R1.4.** A description of the manner in which Contingencies are identified for use in the TTC process.

**R1.5.** The following information on how source and sink for transmission service is accounted for in ATC calculations including:

**R1.5.1.** Define if the source used for ATC calculations is obtained from the source field or the POR field of the transmission reservation

**R1.5.2.** Define if the sink used for ATC calculations is obtained from the sink field or the POD field of the transmission reservation

**R1.5.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.5.4.** If the Transmission Service Provider's ATC calculation process involves a grouping of generation, the ATCID must identify how these generators participate in the group.

**R2.** When calculating TTC for ATC Paths, the Transmission Operator shall use a Transmission model that contains all of the following: *[Violation Risk Factor: Lower~~Medium~~] [Time Horizon: Operations Planning]*

**R2.1.** Modeling data and topology of its Reliability Coordinator's area of responsibility. Equivalent representation of radial lines and facilities161kV or below is allowed.

**R2.2.** Modeling data and topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination areas.

**R2.3.** Facility Ratings specified by the Generator Owners and Transmission Owners.

**R3.** When calculating TTCs ~~(for intra-day and next-day)~~ for ATC Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's area. The Transmission Operator shall also include the following data associated with Facilities that are explicitly represented in the Transmission model, as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed: [*Violation Risk Factor: Lower~~Medium~~*] [*Time Horizon: Operations Planning*]

**R3.1.** For on-peak and off-peak intra-day and next-dayTTCs, ~~and on-peak next-day TTCs,~~ use the following (as well as any other values and additional parameters as specified in the ATCID):

**R3.1.1.** Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.

**R3.1.2.** Load forecast for the ~~on-peak~~applicable period being calculated.

**R3.1.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R3.2.** For ~~off-peak intra-day and off-peak next-day~~days two through 31 TTCs and for months two through 13 TTCs, use the following (as well as any other values and internal parameters as specified in the ATCID):

**R3.2.1.** Expected generation and Transmission outages, additions, and Retirements, included as specified in the ATCID.

**R3.2.2.** Daily load forecast for the days two through 31 TTCs being calculated and monthly forecast for months two through 13 months TTCs being calculated.

~~**R3.2.2.** Load forecast for the off-peak period being calculated.~~

**R3.2.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

~~**R4.** When calculating TTCs (for time periods beyond next day) for ATC Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's area. The Transmission Operator shall also include the following data associated with Facilities that are explicitly represented in the Transmission model as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*~~

~~**R4.1.** For days two through 31 TTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):~~

~~**R4.1.1.** Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.~~

~~**R4.1.2.** Load forecast for the day being calculated.~~

~~**R4.1.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.~~

~~**R4.2.** For months two through 13 TTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):~~

~~**R4.2.1.** Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.~~

~~**R4.2.2.** Load forecast for the month calculated.~~

~~**R4.2.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.~~

**R4.** When calculating TTCs for ATC Paths, the Transmission Operator shall meet all of the following conditions: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** Use all Contingencies meeting the criteria described in its ATCID.

**R4.2.** Respect any contractual allocations of TTC.

**R4.3.** Include, for each time period, the Firm Transmission Service expected to be scheduled as specified in the ATCID (filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers) for the Transmission Service Provider, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed modeling the source and sink as follows:

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point shall as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can not be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider to which the power is to be delivered as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider to which the power is being delivered as the sink.

**R5.** Each Transmission Operator shall ~~calculate~~ establish TTC for each ATC Path as defined below~~, unless otherwise requested by the Transmission Service Provider~~: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.1.** At least once in the calendar week prior to the specified period for TTCs used in hourly and daily ATC calculations.

**R5.2.** At least once per calendar month for TTCs used in monthly ATC calculations.

**R5.3.** Within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a transformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage, provided such outage is expected to last 24 hours or longer~~ in duration~~.

**R6.** Each Transmission Operator shall ~~calculate~~ establish TTC for each ATC Path using the following process: *[Violation Risk Factor: Lower~~Medium~~] [Time Horizon: Operations Planning]*

**R6.1.** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either:

- A System Operating Limit is reached on the Transmission Service Provider's system, or
- A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater[1].

**R6.2.** If the limit in step ~~R7~~R6.1 can not be reached by adjusting any combination of load or generation, then set the incremental Transfer Capability by the results of the case where the maximum adjustments were applied.

**R6.3.** Use (as the TTC) the lesser of:

– The sum of the incremental Transfer Capability and the impacts of Firm Transmission Services, as specified in the Transmission Service Provider's ATCID, that were included in the study model, or

– The sum of Facility Ratings of all ties comprising the ATC Path.

**R6.4.** For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Operator so the TTC does not exceed that Transmission Operator's contractual rights.

**R7.** The Transmission Operator shall provide the Transmission Service Provider of that ATC Path with the most current value for TTC for that ATC Path no more than: *[Violation Risk Factor: Lower~~Medium~~] [Time Horizon: Operations Planning]*

**R7.1.** One calendar day after its determination for TTCs used in hourly and daily ATC calculations.

**R7.2.** Seven calendar days after its determination for TTCs used in monthly ATC calculations.

**R8.** When calculating Existing Transmission Commitments (ETCs) for firm commitments ($ETC_F$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower~~Medium~~] [Time Horizon: Operations Planning]*

$$ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

[1] The Transmission operator may honor distribution factors less than 5% if desired.

**Where:**

**$NITS_F$** is the firm capacity set aside for Network Integration Transmission Service (including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources) on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_F$** is the firm capacity set aside for Grandfathered Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_F$** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$ROR_F$** is the capacity reserved for roll-over rights for Firm Transmission Service contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**$OS_F$** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R9.** When calculating ETC for non-firm commitments ($ETC_{NF}$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**$NITS_{NF}$** is the non-firm capacity set aside for Network Integration Transmission Service (i.e., secondary service , including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources) reserved on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_{NF}$** is the non-firm capacity reserved for Grandfathered Non-Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "Safe Harbor Tariff" accepted by FERC on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R10.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall utilize the following algorithm: *[Violation Risk Factor: Lower~~Medium~~] [Time Horizon: Operations Planning]*

$ATC_F = TTC – ETC_F – CBM – TRM + Postbacks_F + \cancel{Counterflow}counterflows_F$

**Where:**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm ATC due to a change in the use of ~~Firm~~ Transmission Service for that period, as defined in Business Practices.

**~~Counterflow~~counterflows$_F$** are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

**R11.** When calculating non-firm ATC for a ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$ATC_{NF} = TTC – ETC_F - ETC_{NF} – CBM_S – TRM_U + Postbacks_{NF} + \cancel{Counterflow}counterflows_{NF}$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm Transmission commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled without a separate reservation during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm ATC due to a change in the use of ~~Non-Firm~~ Transmission Service for that period, as defined in Business Practices.

**~~Counterflow~~counterflows$_{NF}$** are adjustments to non-firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its current ATCID that has the information described in R1 to show compliance with R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including the model used to calculate TTC as well as other evidence (such as Facility Ratings provided by facility owners, written documentation, logs, and data) to show that the modeling requirements in R2 were met. (R2)

**M3.** Each Transmission Operator shall provide evidence, including scheduled outages, facility additions and retirements, (such as written documentation, logs, and data) that the data described in R3 and R4 were included in the determination of TTC as specified in the ATCID. (R3) ~~(R4)~~

**M4.** Each Transmission Operator shall provide the contingencies used in determining TTC and its ATCID as evidence to show that the contingencies described in the ATCID were included in the determination of TTC. (R4~~5~~)

**M5.** Each Transmission Operator shall provide copies of contracts that contain requirements to allocate TTCs and TTC values to show that any contractual allocations of TTC were respected as required in R4~~5~~.2. (R4~~5~~)

**M6.** Each Transmission Operator shall provide evidence (such as copies of coordination agreements, reservations, interchange transactions, or other documentation) to show that firm reservations were used to estimate scheduled interchange, the modeling of scheduled interchange was based on the rules described in R4~~5~~.3, and that estimated scheduled interchange was included in the determination of TTC. (R4~~5~~)

**M7.** Each Transmission Operator shall provide evidence (such as logs and data and dated copies of requests from the Transmission Service Provider to ~~calculate~~ establish TTCs at specific intervals) that TTCs have been ~~calculated~~ established at least once in the calendar week prior to the specified period for TTCs used in hourly and daily ATC calculations, at least once per calendar month for TTCs used in monthly ATC calculations, and within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a autotransformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage; provided such outage is expected to last 24 hours or longer in duration per the specifications in R5~~6~~.(R5~~6~~)

**M8.** Each Transmission Operator shall provide evidence (such as written documentation) that TTCs have been calculated using the process described in R6~~7~~. (R6~~7~~)

**M9.** Each Transmission Operator shall have evidence including a copy of the latest calculated TTC values along with a dated copy of email notices or other equivalent evidence to show that it provided its Transmission Service Provider with the most current values for TTC in accordance with R7~~8~~. (R7~~8~~)

**M10.** The TSP must be capable of demonstrating that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the firm ETC for a specific time period as described in (MOD-001 R2), using the algorithm defined in R8 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R8)

~~**M10.** Each Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of firm ETC used the algorithm and elements described in R9 and did not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R9)~~

**M11.** The TSP must be capable of demonstrating that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the non-firm ETC for a specific time period as described in (MOD-001 R2), using the algorithm defined in R9 and with data used to calculate this specified value for the designated hour. The data used must meet the requirements specified in the standard and the ATCID, and the audited value must be within +/- 15% or 15 MW, whichever is greater, of the demonstrated result. (R9)

~~**M11.** Each Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of non-firm ETC used the algorithm and the elements described in R10 and did not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R10)~~

**M12.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R10. Such documentation must show that only the variables allowed in R10 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R10) ~~Each Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of firm ATC used the algorithm and the elements described in R11 and does not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R11)~~

**M13.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R11. Such documentation must show that only the variables allowed in R11 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc.). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R11)

~~**M13.** Each Transmission Service Provider shall provide evidence (such as documentation and data) that the determination of non-firm ATC used the algorithm and the elements described in R12 and does not include any additional elements. Note that variables may legitimately be zero if the value is not applicable or calculated to be zero. (R12)~~

## D. Compliance

### 1. Compliance Monitoring Process

### 1.1. Compliance Enforcement Authority

Regional Entity.

### 1.2. Compliance Monitoring Period and Reset

Not applicable.

### 1.3. Data Retention

The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.

The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2.

The Transmission Operator shall retain evidence to show compliance with R3 ~~and R4~~ for the most recent 12 months or until the model used to calculate TTC is updated, whichever is longer.

The Transmission Operator shall retain evidence to show compliance with R4~~5~~, R5~~6~~, R~~7~~6 and R7~~8~~ for the most recent 12 months.

The Transmission Service Provider shall retain evidence to show compliance with R8~~9,~~ and R9~~10, R11 and R12~~ for the most ~~recent12~~ recent sixty days~~months~~.

The Transmission Service Provider shall retain evidence to show compliance with R10 and R11 for the most recent 12 months.

If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |

# Implementation Plan for Standard MOD-028-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-028-1 — Area Interchange Methodology, which describes the Area Interchange methodology (previously referred to as the Network Response ATC methodology) for determining ATC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Retired Standards

FAC-012-1 — Transfer Capability Methodology includes four requirements. MOD-028-1 incorporates the following requirements from FAC-012-1:

– R1 (Documentation of the Transfer Capability Methodology).

– R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).

– R4 (Responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

FAC-013-1 — Establish and Communicate Transfer Capabilities, includes two requirements. MOD-028-1 incorporates the following requirements from FAC-013-1:

– R1 (Calculation of the Transfer Capabilities).

– R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-~~012~~013-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-028-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

## Implementation Plan for Standard MOD-028-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-028-1 — Area Interchange Methodology, which describes the Area Interchange methodology (previously referred to as the Network Response ATC methodology) for determining ATC.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### ~~Modified~~ Retired Standards

FAC-012-1 — Transfer Capability Methodology includes four requirements. MOD-028-1 ~~This standard~~ incorporates the following requirements from FAC-012-1:

– R1 (Documentation of the Transfer Capability Methodology).

– R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).

– R4 (Responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

FAC-013-1 — Establish and Communicate Transfer Capabilities, includes two requirements. ~~This standard~~MOD-028-1 incorporates the following requirements from FAC-013-1:

– R1 (Calculation of the Transfer Capabilities).

– R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-~~012~~013-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-028-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities~~, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date MOD-001, MOD-028, MOD-029, and MOD-030 are approved by the NERC Board of Trustees~~. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

Please **DO NOT** use this form to submit comments on the current draft of MOD-028. Comments must be submitted by **May 15, 2008.**

If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-452-8060.

**Background Information — MOD-028 — Area Interchange Methodology** (A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection.)

An initial ballot of MOD-028-1 — Area Interchange Methodology was conducted March 3-12, 2008 and there were several suggestions for modifying the standard that were submitted with ballots. The drafting team withdrew the standard from the ballot process, and made several changes to the standard based on stakeholder comments, including the following:

1. Several VRFs were changed from "Medium" to "Lower" in response to industry comments.. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.
2. A more graded approach was applied to the VSLs where appropriate.
3. During the review of the VSLs and Measures, it was determined that the measures for R8, R9, R10, and R11 did not adequately measure compliance with the requirements. The drafting team updated the measures and VSLs to ensure that they captured the need to have accurate and valid numbers used in the requirements.

**Please review the revised version of MOD-028 and then answer the following questions. You do not have to answer all questions. Enter All Comments in Simple Text Format.**

1. **The drafting team modified some requirements and associated measures in MOD-028 to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct.**

   Incorrect Requirement(s) or Measure(s):

2. **The drafting team has modified the Violation Risk Factors for MOD-028 to reflect industry concerns that they did not match NERC's VRF definitions. NERC's VRF definitions are listed below:**

   **High Risk Requirement**:
   (a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or
   (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

   **Medium Risk Requirement**:
   (a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or
   (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

   **Lower Risk Requirement**: is administrative in nature and
   (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or
   (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

   **Are the current VRFs established correctly?**

   ☐ Yes

☐ No

**If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification.**
Comments:

3. **The drafting team has modified the Violation Severity Levels for MOD-028 to reflect industry concerns that they were too "pass/fail" oriented. Are the current VSLs established correctly?**

   ☐ Yes
   ☐ No

   **If "No," please identify specific VSLs and suggest changes to the language.**
   Comments:

4. **Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-028.**

   Comments:

|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Jack Cashin/Barry Green | EPSA | | | Through this revision process, some of the MOD standards have included an explicit requirement for consistency between planning assumptions and modeling assumptions used in calculation of ATC. We believe this is appropriate and should be included in MOD 028. | | no comment | | no comment | no comment |
| | Individual | Jim Useldinger | Kansas City Power & Light | | | The Transmission Service Provider should be added along with TOP to perform these functions in all requirements | Yes | | Yes | | |
| | Individual | Paul Rocha | CenterPoint Energy | | | | | | | | The group of standards is for ATC and TRM methodologies that are not used in ERCOT. CenterPoint Energy is concerned that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these standards, which we believe would not add value to the ERCOT region and could increase congestion in the region. Accordingly, CenterPoint Energy previously submitted comments to these standards asking for an exemption for the ERCOT region. We find the proposed standards unacceptable unless the following provision is added to each standard: This standard does not apply to ERCOT or any other region that operates as a single control area. |
| | Group | | | SERC ATCWG | Doug Bailey | | Yes | | Yes | | |
| | | | | | | Requirement 1: I suggest modifying the requirement to state: "Each Transmission Service Provider with ATC Path(s) shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining TTC:" Requirement 2: I suggest modifying the requirement to state: "When calculating TTC for ATC Paths, the Transmission Operator with ATC Path(s) shall use a Transmission model that contains all of the following:" Requirement 3: I suggest modifying the requirement to state: "When calculating TTCs for ATC Paths, the Transmission Operator with ATC Path(s) shall | | | | | |

| | | | | | | | | | | | |

| | | | | | | an ATC Path the Transmission Service Provider with ATC Path (s) shall use the following algorithm:" Requirement 10: I suggest modifying the requirement to state: "When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider with ATC Path (s) shall utilize the following algorithm:" Requirement 11: I suggest modifying the requirement to state: "When calculating non-firm ATC for a ATC Path for a specified period, the Transmission Service Provider with ATC Path(s) shall use the following algorithm:" | | | | | |
| | Group | | | NERC RTOSDT | Jim Case, Chair | | | | | | The Real Time Operation Standards Drafting Team is concerned that the proposed MOD standards do not include any reference to the Planning and Operating Limits mandated by the current FAC, IRO and TOP standards. These standards already include transmission flow limits both in the longer term planning time frame as well as the shorter term operating time frame. The proposed MOD standards seem to be establishing procedures to calculate the commercial boundaries without a direct link to the required reliability boundaries. ============================================================ MOD-001 R6 states that the TTC "use assumptions" no more limiting than those used in planning. The RTO SDT would ask shouldn't TTC's be required to be "no less limiting" than the SOLs / IROLs computed for the system? Current NERC standards are not just asset limits, they are also system limits. The current standards require that limits be calculated that recognize both local and wide-area impacts. The RTO SDT believes that by at least linking (if not entirely eliminating) the MOD standards to the current SOLs / IROLs requirements, the Industry would be more correctly linking how the system MUST BE operated to any NAESB business practice. Indeed it would seem that current tariffs are based on the computations used in current planning and operating environments. By using the current SOL / IROL limits the procedural / prescriptive requirement in MOD-001 R9 et al would be unnecessary (i.e. they would revert back to the FAC and IRO requirements) The questions for the ATC SDT: • How do these MOD standards relate to the SOLs / IROLs • Why should these ATC/TTC limits be decoupled from the SOLs / IROLs • Shouldn't the long-term SOL / IROL limits computed in Planning be the TTC for the system (or at least the basis for the TTC) • Shouldn't the short-term SOL / IROL be the basis for the ATC for the system? MOD-008 computes margins. By coordinating the MOD standards with the SOL / IROL standards, the only Business (not NERC) requirement may be to define the options on how the TSP could couple the various SOL / IROL values that it obtains from its RCs and TOPs. MOD-028 By using SOLs / IROLs there would be no need to get into ATC / AFC "methodologies". Indeed standards that include "alternatives" are not defining a single "standard approach". But by using specific planning and operating limits the methodologies become irrelevant. The "limit" becomes explicit and well-defined. Any margins or variations about those limits would then be obvious and transparent. What is most important is respecting the reliability-based limits and not how the commercial value is computed. If this idea of using SOLs / IROLs as the limit(s) or at least the basis for those commercial limits, then the TSP becomes a coordinator of which values to use for the commercial periods. The TSP would not be the computer of those limits. Thus MOD-028 could become a business practice for posting – rather then a standard for computations. |
| | Group | | | NPCC Regional Standards | Guy V. Zito | a. R4.1: The "its" before ATCID should be replaced with "the" or "the Transmission Service Provider's" since the ATCID is the TSP's document. Same change to M4. b. R6.4: In general, a TOP doesn't have contractual rights of a jointly-owned or allocated facility, whereas the TSP does. We suggest this requirement be revised | No | No, those requirements (at least R5 and R6) that hold the TOP responsible for establishing TTCs should be assigned a Medium since TTCs set the reliability boundary, like an SOL or IROL, within which the TSP may provide transmission | | | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | Committee | | to “For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Operator so the TTC does not exceed the contractual rights of the Transmission Service Provider of that ATC path.” c. M11: Same comment on M10 also applies here for R9 | | services. Failure to establish TTCs may result in the TSP over-selling transmission services beyond the reliability bounds, risking the BES to unreliable operation. | | | |
| | Individual | Thad Ness | AEP | | | | | | | | The Applicability of this Standard should be solely upon the TSP, the Transmission Operator should not be subject to this Standard. From the previous set of responses, it is the apparent belief of the SDT that the calculation of ATC is needed for reliability (response to AECI for example). We disagree. Considering that ATC is a mathematical amalgamation of forecasted system conditions (load, outages, generation dispatch, others' transactions, etc) compounded and adjusted by margins (TRM and CBM of own entity and other systems), using the calculated ATC to assess real or near real time transmission reliability would be – at best – unwise. Transmission Reliability can be assessed by monitoring specific and individual Facility loadings and/or other parameters, for example. The calculation of ATC and the value of resultant ATC is exactly for the purpose stated in the definition of ATC: “A measure of … capability….for further commercial activity” – and note the definition does not infer ATC is a measure of reliability. Granted, ATC is calculated FROM reliability derived values and concepts (such as ratings, contingency analysis aspects, SOLs etc), BUT the resultant ATC values are not an assessment of transmission reliability – and therefore not a function for the Transmission Operators, but rather the Transmission Service Provider. In addition, the Purpose statement is unclear and perhaps nonsensical. Is the purpose “to increase consistency and reliability in the development of documentation….” or “to support analysis and system operation”? What entities' “short term use”? Suggestion: Purpose: To ensure consistency of calculation of those entities employing Area Interchange Methodology pursuant to MOD-001 R1. |
| | Group | | | Public Service Commission of South Carolina | Phil Riley | | Yes | | Yes | | |
| | Individual | Greg Rowland | Duke Energy Corporation | | | R1 – Need to ensure that comparable information should be required in either the study report or the ATCID in MOD-028, MOD-029 and MOD-030. R2.1 - Bulk electric system facilities 161kV and below may have significant network response. Since these facilities may have significant impact on TTC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders. | Yes | | Yes | | |
| | | | | | | | | PJM supports NERC's position to revise all Violation Risk Factors to have an assigned risk factor of “Lower.” A Lower Risk Factor requirement is administrative | | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but PJM has a | |

| | | | | | | | | | | | |

| | | | | | | | | in nature and is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system. | | concern regarding the possibility of multiple violations resulting from a single event. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations –this language to be added to the standard. | |
| | Individual | Patrick Brown | PJM | | | PJM does not have any specific comments. | Yes | | No | | PJM reiterates that while we will not choose the calculation methodologies used in MODs 28 and 29, these MODs will require modification to assure consistency with any revisions made to MOD 30. PJM is including specific comments for MOD 30 in Section VI of this document. PJM is not providing specific comments for MODs 28 and 29. |
| | Individual | Greg Ward / Darryl Curtis | Oncor Electric Delivery | | | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). | Yes | | Yes | | This standard should not apply to ERCOT for the reason expressed in question 1. |
| | Group | | | Bonneville Power | Denise Koehn | BPA does not believe any are incorrect. | Yes | | Yes | | none |
| | Individual | Richard Kafka | Pepco Holdings, Inc | | | PHI supports the comments of PJM and will not submit duplicate comments | | | | | |
| | Individual | Earl Fair | Gainesville Regional Utilities | | | In R8&9, must you determine ETC by only using the inputs specified, or can you determine each one separately then sum them to get ETC? Some methods for determining ETC may not take into account each individual item and its effect on a given path. | Yes | | Yes | Good improvement. | None at this time. |
| | | | | | | | | | | No. We suggest the following changes: a. R1: R1.5 contains | |

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | several subrequirements. It is not clear what constitutes a failure of R1.5 when considering the VSLs for R1 (i.e. number of elements missing in the ATCID. For similar situations in MOD-008, it is stipulated that failing any one of the subrequirements would constitute a requirement failure. We therefore suggest adding a sentence under each of Moderate, High and Severe: “Any violation or violations of the sub-requirements of R1.5 shall be considered a single violation of R1.5.” b. R2: We do not agree with the VSL assignments. Note that R2 has 3 subrequirements, hence a Moderate should be assigned for failing 1 of the 3, a High for failing 2 and a Severe for failing all 3. A progressive VSL for R2.3 doesn't work in this case since even having >30 incorrect ratings, the TOP would have only failed one of the 3 subrequirements and should not be assigned a Severe if it met the other 2. We suggest the SDT to revise these VSLs. c. R3: We do not agree with the VSL assignment. R3 has two subrequirements: R3.1 for on-peak and off-peak intra-day and next-day TTCs, and R3.2 for days two through 31 TTCs and for months two through 13 TTCs. A total failure of R3 would be | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | IRC Standards Review Committee | Charles Yeung | a. R4.1: The "its" before ATCID should be replaced with "the" or “the Transmission Service Provider’s” since the ATCID is the TSP’s document. Same change to M4. b. R6.4: In general, a TOP doesn’t have contractual rights of a jointly-owned or allocated facility, whereas the TSP does. We suggest this requirement be revised to “For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Operator so the TTC does not exceed the contractual rights of the Transmission Service Provider of that ATC path.” c. M10: This measure corresponds to R8, which stipulates the use of a specific algorithm. However, M10 provides the requirement for certain accuracy, which leads to the following questions: i. Is R8 about the use of an algorithm only or is it also about the proper or consistent setting of the variables within that algorithm? ii. If it is also the proper or consistent setting of the variables, the requirement should stipulate the conditions rather than leaving the assessment to a recalculation process (stipulated in M10) to determine if the algorithm and its settings have been properly used. iii. If accuracy is to be a | No | No, those requirements (at least R5 and R6) that hold the TOP responsible for establishing TTCs should be assigned a Medium since TTCs set the reliability boundary, like an SOL or IROL, within which the TSP may provide transmission services. Failure to establish TTCs may result in the TSP over-selling transmission services beyond the reliability bounds, risking the BES to unreliable operation. | No | failing both subrequirements. Within each of the subrequirements, there are 3 subrequirements. While the VSLs for each of R3.1 and R3.2 can be made progressive (graded) according to the extent of missing outages, additions, retirements, and load forecast and unit commitments, etc. they need to eventually be factored in the VSLs for R3. Suggest to revise the VSLs so that a Low would be missing some of the subrequirements in either R3.1 and R3.2, a Moderate for missing more of them, and so on with a Severe be assigned if the majority of the subrequirements in both R3.1 and R3.2 are missing. Better still, the SDT may consider rearranging R3 so that they can better facilitate VSL development. d. R4: Similar comments in R3 also apply here. In this case, modeling reservations’ sources or sinks is used as the parameter to assign progressive VSLs, leaving the violation of either R4.1 or R4.2 or failure to include firm transmission service (a part of R4.3) as the condition for a Severe. It appears that the impact of violation has been applied in arriving at the assigned VSLs, which is not proper. We | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | criterion for having proper and consistent setting of the variables, it becomes a requirement and hence should be stipulated in the requirement section, not in the measure. d. M11: Same comment on M10 also applies here for R9. | | | | suggest a rework of this set of VSL so that they are dependent on the extent to which the 3 subrequirments are violated. If necessary, the SDT may want to consider splitting R4.3 to separate out the inclusion of firm reservations requirement to make it a condition for assessing VSLs. e. R5: We do not agree that the VSL should be a single “Severe”. R5 contains 3 subrequirements. Presumably, a TSP may fail one or more of these subrequirements. A progressive (graded) VSL should be developed. f. R6: We assess that R6.1 and R6.2 are parts of a single process requirement. However R6.3 and R6.4 are distinct requirements that need to be met as well. Presumably, a TSP may fail anyone or more of the 3 subrequirements (R6.1 and R6.2 as a unit). Again, a progressive (graded) approach would be more appropriate. We suggest the SDT to revise the VSL for this requirement. g. R7: the second “OR” under the Severe column should be “AND” since the first two conditions both mean that the TOP fails R7.1 completely, but it’s only a part of R7. It needs to also fail R7.2 completely to have a Severe failure. To cover for case where the TOP fails either R7.1 or | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | R7.2 completely but not both, the conditions under High may be revised to remove the "but not been more than" parts and include the "did not provide…" as an OR condition. h. R8: We would assume the "M9" referenced in this set of VSL really meant "M10", or else these VSLs would be difficult to understand since R8 is on using the algorithm, not on the values whereas M9 is for R7 that stipulates the requirement for establishing TTC values. Please also see our comments on M10 under Q1. i. R9: Same comment as in VSLs for R8, except in this case the "M10" should be "M11". Please also see our comments on M11 under Q1. | |
| | | | | | | | | | | We suggest the following changes: a. R1: R1.5 contains several subrequirements. It is not clear what constitutes a failure of R1.5 when considering the VSLs for R1 (i.e. number of elements missing in the ATCID. For similar situations in MOD-008, it is stipulated that failing any one of the subrequirements would constitute a requirement failure. We therefore suggest adding a sentence under each of Moderate, High and Severe: "Any violation or violations of the sub-requirements of R1.5 shall be considered a single violation of R1.5." b. | | | | | | | | | | | R6.1 and R6.2 are parts of a single process requirement. However R6.3 and R6.4 are distinct requirements that need to be met as well. Presumably, a TSP may fail anyone or more of the 3 subrequirements (R6.1 and R6.2 as a unit). Again, a progressive (graded) approach would be more appropriate. We suggest the SDT to revise the VSL for this requirement. g. R7: the second "OR" under the Severe column should be "AND" since the first two conditions both mean that the TOP fails R7.1 completely, but it's only a part of R7. It needs to also fail R7.2 completely to have a Severe failure. To cover for case where the TOP fails either R7.1 or R7.2 completely but not both, the conditions under High may be revised to remove the "but not been more than" parts and include the "did not provide…" as an OR condition. h. R8: We would assume the "M9" referenced in this set of VSL really meant "M10", or else these VSLs would be difficult to understand since R8 is on using the algorithm, not on the values whereas M9 is for R7 that stipulates the requirement for establishing TTC values. Please also see our comments on M10 under Q1. i. R9: Same comment as in VSLs for R8, | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | except in this case the “M10” should be “M11”. Please also see our comments on M11 under Q1. | |
| | Individual | Alessia Dawes | Hydro One Networks | | | Measures M10 and M11 introduce requirements. Requirement 4.1, the "its" before ATCID should be replaced with "the Transmission Service Provider's". Same change to measure M4. Requirement 6.4, we suggest a following revision due to the fact that we cannot be sure "who owns the contractual rights, "For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit the TTC to respect the contractual rights on that ATC Path." | No | R3, R5 and R6 should be assigned Medium since TTCs set the reliability boundary. There is a risk of unreliable operation of the BES when failing to establish TTCs result in the TSP over-selling transmission services beyond the reliability bonds. | No | Note R1 has 5 sub-requirements, not four. In the VSL's for R1 include the statement, "Any violation or violations of the sub-requirements of R1.5 shall be considered a single violation of R1.5. The Lower VSL contains older wording and should be updated to similar wording as the rest of the levels: "The TSP has an ATCID but it is missing x of the five required elements in R1. The VSLs for R2 should be graded based on % to cater to different size systems. Also what is the logic behind using voltage 161 kV in the severe level? The VSLs for R3 should also be graded based on %. Correct VSLs for R8 and R9 with the correct reference to their Measures. | We question the retirement of standards FAC-012 and FAC-013 as indicated in the implementation plan as those FAC standards pertain to different responsible entities than these MOD standards. |
| | Group | | | MRO NERC Standards Review Subcommittee | Tom Mielnik | 1. The MRO believes that R1.3 should be revised to delete the word "Any" from the phrase "Any contractual obligations…". This use of "Any" seems to be unnecessary and may result in over-the-top auditing. 2. The MRO believes the words "all of" should be deleted from R2, "any" from R3.1, "all" from R3.1.3, "any" from R3.2, "all" from R3.2.3, "all of" from R4, "all" from R4.1, "any" from R4.2, "all" and "any" from R4.3, "all" from R6.3, the two uses of "any" in the OSf, and the two uses of "any" in OSnf. The MRO believes the use of these words are unnecessary and may lead to over-the-top auditing. We believe | Yes | The MRO commends the SDT on revising the VRFs to Lower. We believe the revised VRFs are in-line with the NERC | Yes | | 1. The MRO continues to have issues with the overall approach on this standard in combination with the MOD-030. As previously indicated in prior comment periods, the MRO has Transmission Service Providers that manage the levels of transmission service to a reliable level with flowgates and then establishes border control area-to-control area flows to contract path levels so that contractual rights are not exceeded. The MRO reads the MOD-028 standard to require the application of the MOD-028 methodology for its control area-to-control area path postings while MOD-030 standard is used for the flowgates postings. The MRO understands from a discusion with a member of the SDT that in actuality the intent is that the MOD-030 would be used for flowgate calculations and that these quantities could be converted into the ATC path quantities for the control area to control area paths from border companies to outside the Transmission Service Providers area. This application of the flow gate methodology to possibly generate all postings for a Transmission Service Provider including drive out is not clear from the standards and should be clarified in MOD-030 and possibly MOD-028. 2. The MRO commends the SDT in making significant changes to this standard and reissuing it for comment. The MRO believes the eventual standard that is approved will serve the industry and customers better as a result. 3. The MRO believes that |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | that the Measures, Compliance, and the VSLs should be changed to match these changes to the requirements. 3. The MRO urges the SDT to delete the new measures M10, M11, M12, and M13. We believe that these new measures are micromanagement of the Transmission Service Provider and encourage over-the-top auditing. The MRO considers these measures as written as being "deal-killers". | | definitions of the VRF levels. | | | the first time you use an abbreviation or acronym, you must spell out the full term followed by the abbreviation or acronym in brackets. Subsequent use of the term is then made by its abbreviation or acronym. ex: "Each Transmission Operator shall select one Available Transfer Capability (ATC) methodology2 for calculating ATC (Area Interchange methodology, Rated System Path methodology) or Available Flowgate Capacity (AFC) (Flowgate methodology) for each ATC Path per time period identified in R2 for those Facilities within its Transmission Operator Area." |
| | | | | | | The Area Interchange Methodology Definition, like Rated System Path and Flowgate, includes the text: "Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability." This text descrives the derivation of ATC or AFC, and should not be part of a definition to differentiate between the AIM, RSP and Flowgate methods. R2.1 - I support allowing "Equivalent representation of radial lines and facilities 161 kV or below, but equivalences for elements of the regionally defined definition of the BES should be explained in the ATCID. R6.1 - This requirement and the associated footnote 1 provide that "The Transmission operator may honor distribution factors les than 5% if desired." MOD-29 and MOD-30 have similar language allowing use of alternative distribution factors, generally related to the use of TLR curtailment thresholds. These practices should be posted in the TSP's ATCID and coordinated with the applicable RC (s) and each adjacent TOP and TSP. R8 and R9 – Definition of "GF" Grandfathered Firm/Non-Firm Transmission Service – | | | | | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Allen Mosher | American Public Power Association | | | please delete “accepted by FERC” after “Safe Harbor Tariff.” FERC regulatory approval of a tariff for rate purposes is not relevant to what form of transmission service tariff a NERC TSP provides. Many utilities U.S. utilities that are not FERC jurisdictional for electric rate purposes. All Canadian TSPs are non-jurisdictional. R10 and R11 - Postbacks and counterflows: “Counterflows” should be a defined term. It is used in MOD-1, MOD-28, MOD-29 and MOD-30 and is an integral element in the calculation of ATC and AFC. The definition used in MOD-28-1 R10, for example, reads: “counterflowsF are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.” This definition does not in any way describe what a counterflow is. “Postbacks” should incorporate a working definition developed by NAESB, to be revised once due process is completed on this business practice. Alternatively, consider use of the following text to at minimum describe the nature of postbacks: “Postbacks [Firm][Non-Firm] are changes to firm [non-firm] ATC [AFC] due to a change in the amount of Firm [non-firm] Transmission Service reserved or scheduled for a period, as defined in Business Practices. Postbacks are generally a positive quantity.” Also, include Postbacks in the "e.g." list of factors in M12 and M13. | Yes | | Yes | Major improvement. We will want to refine in the future but good work here. | These comments apply equally to MOD-1, MOD-28. MOD-29 and MOD-30 Excellent work by the SDT. |
| | | | | | | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Texas-New Mexico Power Company is concerned about the risk of ERCOT being found in non-compliance with | | | | | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Rex McDaniel | Texas-New Mexico Power Company | | | the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, TNMP believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. TNMP strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). | Yes | | Yes | | This standard should not apply to ERCOT for the reason stated in Question 1. |
| | Individual | Aaron Staley | Orlando Utilities Commission | | | | Yes | | Yes | | All the requirements and measures look great. One question on R8 and R9. In R8 and R9, it is obviously required that ETC is determined using only the inputs specified, however is it necessary to determine each of the individual inputs and then sum them to get ETC? For example the method for determining ETC might take into account only those items and their effect on the path, but may not break them out into their individual values (NITS, GF, PTP, OS) due to the nature of the method. |
| | Individual | Tony Kroskey | Brazos Electric Power Cooperative, Inc. | | | | | | | | Brazos Electric believes that the concept of a Area Interchange Methodology is not applicable to a single-control area operation like ERCOT. To address this issue, the Applicability section could be modified to state that only TOPs or TSPs that conduct area to area operations and hence have responsibility for ATC Path(s) must have an Area Interchange Methodology. |
| | | | | | | MOD-028 incorporates the new MOD-001 definition of "ATC Path." Please see the NYISO's comments on MOD-001 for an explanation of why this defined term appears to be overly broad when applied to the NYISO and could subject it to obligations, and potential penalties, that would be inconsistent with both the character of the NYISO's FERC-approved financial transmission service model and with waivers from the OASIS posting requirements that FERC has granted the NYISO. In particular, under R5 (and M7) of MOD-028, the current definition of ATC Path could be interpreted to require the NYISO to post TTCs for periods of time further in the future than one day-ahead for interfaces or scheduled lines for which FERC does not require the NYISO to post TTC beyond one-day ahead. As the NYISO discussed in its response to MOD-001, subjecting the NYISO to such requirements would serve no reliabilty purpose. The NYISO has proposed a revision to MOD-001 to address | | | | | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | this concern. In the same vein, the SDT should revise R 3.2, R5, and R.7 to clarify that they do not require Transmission Operators to calculate (or establish) monthly ATCs (or TTCs) to the extent that they are not required under FERC's regulations, or as a result of FERC orders, to calculate and post ATC for periods further out than one day-ahead The NYISO has previously commented that MOD-028 should be revised so that TTC would not have to be re-established (or re-calculated) at set intervals when the underlying inputs to TTC have not changed. The SDT previously made a similar change to the ATC re-calculation frequency requirement of what is now R8 under MOD-001 but has not yet made the corresponding change to MOD-028. The NYISO therefore respectfully renews its request that the STD make the requested changes to MOD-028. Under the NYISO system, TTC values do not change often. Accordingly, the proposed MOD-028 requirements would force the NYISO to adopt costly compliance measures that would offer no benefit to its customers and serve no reliability purpose. The NYISO has previously commented that it is critically important to it that the algorithm for calculating "Existing Transmission Commitments" ("ETC") in MOD-028 (and -029) be interpreted flexibly. The NYISO's existing ATC calculation procedure, which reflects the nature of its financial reservation system, and which has been accepted by the Commission, is to calculate firm and non-firm ATC as follows. ATC(Firm) = TTC – Transmission Flow Utilization(Firm) – TRM ATC(Non-Firm) = ATC | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Rick Gonzales | New York Independent System Operator | | | (Firm) – Transmission Flow Utilization(Non-Firm) Where "Transmission Flow Utilization" represents the security constrained network powerflow solutions of the NYISO's Security Constrained Unit Commitment software, with respect to the NYISO Day-Ahead Market, or its Real-Time Commitment and Real-Time Dispatch software with respect to the NYISO's Real-Time Market. As the NYISO has explained in prior comments, it believes that the central role that Transmission Flow Utilization plays in its ATC/TTC calculations can be accommodated under proposed MOD-028 and MOD-029 by accounting for it in the ETC calculation algorithms established under R8 and R9. Specifically, the SDT's proposed definition of the OS(F) variable appears to be broad enough to encompass Transmission Flow Utilization. The NYISO has previously requested that the SDT clarify or revise the OS (F) definition so that it would clearly allow the NYISO to account for Transmisison Flow Utilization in this way. The SDT has not yet responded. Accordingly, the NYISO requests that the the OS(F) definition under R8 be revised to read: OS(F) is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID, including security constrained network powerflow solutions produced by market software used by Transmisison Service Providers that administer FERC-approved organized markets. Similarly, the OS(F) definition under | | | | | | | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | R9 should be revised to read: OS(F) is the non-firm capacity reserved for any other service (s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID, including security constrained network powerflow solutions produced by market software used by Transmisison Service Providers that administer FERC-approved organized markets. Making these revisions should have no impact on the vast majority of Transmission Service Providers, because they will neither administer FERC-approved organized markets nor use Transmission Flow Utilization in their ATC/TTC calculations. On the other hand, it would permit the NYISO to come into compliance with NERC's proposed MOD standards without having to make fundamental changes to its FERC-approved market design or financial reservation transmission model. Order No. 890 was clear that it would not require fundamental changes to ISO/RTO market designs. This principle was recently upheld when FERC accepted the NYISO's Order No. 890 tariff compliance filing without requiring any changes to financial reservation transmission model. The NYISO asks that the SDT make the required revision in order to elimiante any possibility of a conflict between the NYISO's FERC approved system and the NERC MOD standards. The NYISO recognizes that the definition of OS(F) may already be broad enough to accommodate Transmission Flow Utilization. If the SDT does not make the | | | | | |

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | requested revision the NYISO will take the position that it may describe its use of Transmission Flow Utilization in the ETC calculation within its ATCID. Nevertheless, because this issue is so important to the NYISO's future compliance with NERC's MOD standards the NYISO would strongly prefer that the issue be expressly addressed within the text of MOD-028 and (MOD-029). The NYISO may raise the issue at FERC if it is not addressed by NERC. | | | | | |

**Consideration of Comments on Draft Standard — MOD-028 — Project 2006-07**

The ATC Standards Drafting Team thanks all commenters who submitted comments on the draft standard MOD-028-1 – Area Interchange Methodology. This standard was posted for a 30-day public comment period from April 16, 2008 through May 15, 2008. The stakeholders were asked to provide feedback on the standard through a special electronic Standard Comment Form. There were more than 24 sets of comments, including comments from more than 75 different people from approximately 50 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

There were some comments that led the drafting team to modify language to improve clarity, but none of the changes made by the drafting team changed the scope or intent of the requirements in the standard.

**Applicability**

- Transmission Operator or Transmission Service Provider - Some entities requested that either the Transmission Operator or the Transmission Service Provider be applicable. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity "or" another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate.

- Several entities expressed concern regarding the responsibilities of the Transmission Operator. The SDT interprets the Functional Model as requiring the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining the methodology used to determine TTC. For those entities who believe the TSP to be the appropriate entity, we reiterate that options for delegation of this task exist.

- Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

**Definitions**

- Some entities expressed concerns with the definitions of Counterflows and Postbacks. The SDT does not believe that further definitions are necessary.

**Requirements**

- R2.1 - Some entities questioned the use of the 161kV threshold, requesting either a lower threshold or a requirement to document reasons for using equivalences. The SDT suggested that if such requirements are desired, the commenter should submit a request for a regional standard.

- R6.4 - Some entities expressed concern regarding the assertion that a Transmission operator will have a contractual allocation of rights on a jointly owned or allocated facility. The drafting team modified the standard to refer to the Transmission Service Provider's contractual rights.

**Measures**

- M10 and M11 - Some entities expressed concern with the measures associated with the ETC calculation. The drafting team developed these measures so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measures and associated VSLs from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to its documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not allow for subjective interpretation of the whether an entity is compliant. In response to concerns with data retention, the SDT has modified the data retention and the measure. The data retention now states that data to demonstrate compliance with hourly ETC calculations must be retained for 14 days, for daily calculations must be retained for 30 days, and for monthly calculations must be retained for 60 days. The measure has been rephrased to clarify that the intent is to verify that the algorithm was used.

**Compliance Elements**

- Some commenters suggested that some of the VRF's should be raised. The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R5 and R6 do not directly affect the electrical state or the capability of the bulk power system.

- Some commenter's expressed concern with potential for multiple violations of the standard due to a single event. The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.

- Some suggestions were made to change specific VSLs and make them more graded. The SDT modified VSLs for R2, R3, R4, R5, and R7. Two measures were modified as well to correct invalid references.

- Some suggestions were made to modify the VSLs for R2 and R3 so they are based on a % rather than fixed counts. Variations in determining what constitutes the facilities that enter into the denominator would make this a difficult item to calculate, with significant discretion in determining the percentage. Because of this difficulty in measuring the value, the SDT believe it is appropriate to leave the numbers in the VSLs as fixed counts.

**Concepts**

- Several entities identified a concern with requiring "all" or "any" data. The SDT clarified that providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC.

- The NERC RTOSDT expressed concern that the standard does not refer to Planning an operating limits. The SDT directed the RTOSDT to the specific areas in the methodology standard where such reference rare made.

**Variances**

Several entities have continued to express concern regarding the applicability of the ATC, TRM, and CBM standards. While the drafting team has attempted to write the standards in ways that are flexible and allow for organizational diversity, we note that FERC Order 890 makes reference to the use of Variances. Entities with non-traditional physical transmission markets or that have alternative ATC methodologies that meet or exceed the NERC ATC standards may wish to consider requesting one or more Variances related to these standards.

The SDT believes it may be helpful to the industry to review the process for Variances. The Variance process can work either concurrent with or independent of the development of a standard. Because the drafting team working on a particular standard is likely to already have the necessary expertise to participate in the development of the Variance, concurrent development is generally more efficient. However, this may not always be practical; in this case, standards drafting may proceed, and even complete, prior to the development and approval of Variances. In this case, entities should seek to develop those Variances and seek their approval prior to the effective date of the standard. An entity is not exempt from meeting the requirements of the standard if the effective date has passed and that entity is in the process of developing a Variance.

The NERC process allows for three different types of variances:

- An Entity Variance
- A Regional Variance less than an Interconnection
- A Regional Variance on Interconnection-Wide basis

The NERC Rules of Procedure describe an Entity Variance as follows:

> Entity Variance — Any variance from a NERC reliability standard that is proposed to apply to one entity or a subset of entities within a limited portion of a regional entity, such as a variance that would apply to a regional transmission organization or particular market or to a subset of bulk power system owners, operators, or users, shall be approved through the regular standards development process defined in the NERC Reliability Standards Development Procedure and shall be made part of the applicable NERC reliability standard.

Entities seeking an Entity Variance should draft a SAR to request that Variance. In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately). In both cases, the Variance will be compared to the standard to ensure the requester is addressing the reliability goals of the standard. The ballot body is comprised of any member of the Registered Ballot Body that is interested and registers to join the ballot pool. Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe a Regional Variance Less Than an Interconnection as follows:

> Any regional variance from a NERC reliability standard that is proposed to apply for a regional entity, but not for an interconnection, shall be approved through the NERC Reliability Standards Development Procedure, except that only members of the registered ballot body located in the affected interconnection shall be permitted to vote; and the variance shall be made part of the applicable NERC reliability standard.

Entities seeking a Regional Variance Less Than an Interconnection should draft a SAR to request that Variance. In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately). In both cases, the Variance will be compared to the standard to ensure the requestor is addressing the reliability goals of the standard. The ballot body is comprised of any interested entities that that have registered with NERC and is a user, owner, or operator of facilities located within the interconnection in which the region requesting the Variance is located. Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe an Regional Variance on an Interconnection-wide Basis as follows:

> An interconnection-wide regional variance from a NERC reliability standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with other applicable standards of governmental authorities shall be made part of the NERC reliability standard. NERC shall rebuttably presume that a regional variance from a NERC reliability standard that is developed, in accordance with a procedure approved by NERC, by a regional entity organized on an interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest.

Entities seeking a Regional Variance on an Interconnection-wide Basis should draft that Variance using the regional standards development process described in the region's delegation agreement. In that Variance, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Once approved through the regional standards development process, the Variance should be brought to NERC for filing with the appropriate regulatory authorities.

Based on the comments received, the drafting team is recommending that the Standards Committee authorize moving these standards forward to posting for pre-ballot review.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standard can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

1. **The drafting team modified some requirements and associated measures in MOD-028 to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct. Incorrect Requirement(s) or Measure(s):**

**Summary Consideration:**

Some entities requested that either the Transmission operator or the Transmission Service Provider be applicable. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity "or" another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate.

Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

Some entities questioned the use of the 161kV threshold, requesting either a lower threshold or a requirement to document reasons for using equivalences. The SDT suggested that if such requirements are desired, the commenter should submit a request for a regional standard.

Some entities expressed concern with the measures associated with the ETC calculation. The drafting team developed this measure so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measure and associated VSL from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to their documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not allow for subjective interpretation. In response to concerns with data retention, the SDT has revised the data retention so that for hourly ETC calculations, 14 days of evidence must be retained – for daily ETC calculations 30 days of evidence must be retained – and for monthly ETC calculations, 60 days of data must be retained. The drafting team also modified the language in Measures M10 and M11 to clarify that the measure is verifying that the TSP used the algorithm in the requirement to calculate ETC.

R6.4 - Some entities expressed concern regarding the assertion that a Transmission operator will have a contractual allocation of rights on a jointly owned or allocated facility. The drafting team modified the standard to refer to the Transmission Service Provider's contractual rights.

Several entities identified a concern with requiring "all" or "any" data. The SDT clarified that providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC.

Some entities expressed concerns with the definitions of Counterflows and Postbacks. The SDT does not believe that further definitions are necessary.

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| EPSA | Through this revision process, some of the MOD standards have included an explicit requirement for consistency between planning assumptions and modeling assumptions used in calculation of ATC. We believe this is appropriate and should be included in MOD 028. |
| **Response:** This requirement is located in MOD-001 which applies to MOD-028, MOD-029 and MOD-030. | |
| Kansas City Power & Light | The Transmission Service Provider should be added along with TOP to perform these functions in all requirements |
| Response: Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity "or" another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. | |
| ERCOT ISO | Requirement 1:I suggest modifying the requirement to state: "Each Transmission Service Provider with ATC Path(s) shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining TTC:<br><br>Requirement 2:I suggest modifying the requirement to state: "When calculating TTC for ATC Paths, the Transmission Operator with ATC Path(s) shall use a Transmission model that contains all of the following:<br><br>Requirement 3:I suggest modifying the requirement to state: "When calculating TTCs for ATC Paths, the Transmission Operator with ATC Path(s) shall include the following data for the Transmission Service Provider's area. The Transmission Operator with ATC Path(s) shall also include the following data associated with Facilities that are explicitly represented in the Transmission model, as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed<br><br>Requirement 4:I suggest modifying the requirement to state: "When calculating TTCs for ATC Paths, the Transmission Operator with ATC Path(s) shall meet all of the following conditions :"Requirement 5:I suggest modifying the requirement to state: "Each Transmission Operator with ATC Path(s) shall establish TTC for each ATC Path as defined below:<br><br>Requirement 6:I suggest modifying the requirement to state: "Each Transmission Operator with ATC Path(s) shall establish TTC for each ATC Path using the following process:<br><br>Requirement 7:I suggest modifying the requirement to state: "The Transmission Operator with ATC Path(s) shall provide the Transmission Service Provider of that ATC Path with the most current value for TTC for that ATC Path no more than: "Requirement 8:I suggest modifying the requirement to state: "When calculating Existing Transmission Commitments (ETCs) for firm commitments (ETCF) for all time periods for an ATC Path the Transmission Service Provider with ATC Path(s) shall use the following algorithm: |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | Requirement 9:I suggest modifying the requirement to state: "When calculating ETC for non-firm commitments (ETCNF) for all time periods for an ATC Path the Transmission Service Provider with ATC Path(s) shall use the following algorithm:<br><br>Requirement 10:I suggest modifying the requirement to state: "When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider with ATC Path(s) shall utilize the following algorithm: "Requirement 11:I suggest modifying the requirement to state: "When calculating non-firm ATC for a ATC Path for a specified period, the Transmission Service Provider with ATC Path(s) shall use the following algorithm:" |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Area Interchange methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| NPCC Regional Standards Committee | a. R4.1: The "its" before ATCID should be replaced with "the" or "the Transmission Service Provider's" since the ATCID is the TSP's document. Same change to M4.<br>**Response:** The Drafting Team has modified the language as suggested.<br><br>b. R6.4: In general, a TOP doesn't have contractual rights of a jointly-owned or allocated facility, whereas the TSP does. We suggest this requirement be revised to "For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Operator so the TTC does not exceed the contractual rights of the Transmission Service Provider of that ATC path."<br>**Response:** The Drafting Team has modified R6.4 as follows: "R6.4. For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Service Provider so the TTC does not exceed each Transmission Service Provider's contractual rights."<br><br>c. M11: Same comment on M10 also applies here for R9<br>**Response:** No comment was listed for M10 to reply or to apply to M11. |
| **Response:** Please see in-line responses. | |
| Duke Energy Corporation | R1 — Need to ensure that comparable information should be required in either the study report or the ATCID in MOD-028, MOD-029 and MOD-030. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | **Response:** The MOD-028 and MOD-030 standards have requirements for information to be located in the ATCID. MOD-029 has requirements for the comparable information to be included in the resulting study report. The SDT has reviewed and confirmed that the requirements are equivalent across the methodologies.<br><br>R2.1 — Bulk electric system facilities 161kV and below may have significant network response. Since these facilities may have significant impact on TTC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders.<br>**Response:** The Drafting Team notes that the language of R2.1 allows detailed modeling of 161 kV and below; the language does not require it. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent. Requirements for Data Exchange in MOD-001 already address sharing of models to support reliability objectives; to the extent a reliability entity has concerns regarding the use of equivalences within the model, the SDT encourages those entities to work directly with each other. Disclosure of this information to Transmission Customers should be addressed through the use of the NAESB process. |
| **Response:** Please see in-line responses. | |
| Oncor Electric Delivery | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Area Interchange methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| Gainesville Regional Utilities | In R8&9, must you determine ETC by only using the inputs specified, or can you determine each one separately then sum them to get ETC? Some methods for determining ETC may not take into account each individual item and its effect on a given path. |
| **Response:** The equations in R8 and R9 describe the components that must be considered in ETC, but do not dictate the process by which the | |

| value is calculated. | |
| IRC Standards Review Committee | a. R4.1: The "its" before ATCID should be replaced with "the" or "the Transmission Service Provider's" since the ATCID is the TSP's document. Same change to M4.<br>**Response:** The Drafting Team has modified the language as suggested.<br><br>b. R6.4: In general, a TOP doesn't have contractual rights of a jointly-owned or allocated facility, whereas the TSP does. We suggest this requirement be revised to ?For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Operator so the TTC does not exceed the contractual rights of the Transmission Service Provider of that ATC path.?<br>**Response:** The Drafting Team has modified R6.4 as follows: "R6.4. For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Service Provider so the TTC does not exceed each Transmission Service Provider's contractual rights."<br><br>c. M10: This measure corresponds to R8, which stipulates the use of a specific algorithm. However, M10 provides the requirement for certain accuracy, which leads to the following questions:<br>i. Is R8 about the use of an algorithm only or is it also about the proper or consistent setting of the variables within that algorithm?<br>ii. If it is also the proper or consistent setting of the variables, the requirement should stipulate the conditions rather than leaving the assessment to a recalculation process (stipulated in M10) to determine if the algorithm and its settings have been properly used.<br>iii. If accuracy is to be a criterion for having proper and consistent setting of the variables, it becomes a requirement and hence should be stipulated in the requirement section, not in the measure.<br><br>d. M11: Same comment on M10 also applies here for R9.<br>**Response:** The drafting team developed this measure so that a benchmark could be developed to verify that an entity's processes for calculating ETC are functioning correctly. The measure and associated VSL from the previous draft focused on an entity proving this fact, but the standard did not provide any guidance on how to do so. Additionally, many commenters noted that the VSL was structured as a "pass/fail" VSL, and requested a graded VSL be developed. In response, the SDT developed this approach for identifying how closely an entity's process conforms to its documented process for determining ETC. The SDT focused the measure and VSL on how "repeatable" the process and associated result was after the fact. In effect, the measure is not intended to validate whether the calculated ETC is correct or incorrect, but rather that the process that occurred in the past matches the process documented in the ATCID. Recognizing that it may be difficult to exactly reproduce the conditions, the SDT drafted the measure to allow for a certain amount of difference between the original value and the subsequently calculated value. This is not intended to say that this requirement allows for a certain level of inaccuracy, but rather that the process of reproducing a calculation for auditor review may be difficult to do with absolute precision, given the complexities of the process. The intent of using this measure is to reduce vagueness, and to provide a clear and measurable goal for performance that is unambiguous and does not |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | allow for subjective interpretation. The drafting team modified the language in Measures M10 and M11 to clarify that the measure is verifying that the TSP used the algorithm in the requirement to calculate ETC. |
| **Response:** Please see in-line responses. | |

The drafting team modified the language in Measures M10 and M11 to clarify that the measure is verifying that the TSP used the algorithm in the requirement to calculate ETC.<br><br>The reason for the objection to M12 and M13 is not clear. |
| **Response:** Please see in-line responses. | |
| American Public Power Association | The Area Interchange Methodology Definition, like Rated System Path and Flowgate, includes the text: "Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability." |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | This text describes the derivation of ATC or AFC, and should not be part of a definition to differentiate between the AIM, RSP and Flowgate methods.<br>**Response:** The derivation of ATC is part of the Area Interchange Methodology, it is not identical in all three methods and it is appropriate to be included.<br><br>R2.1 - I support allowing "Equivalent representation of radial lines and facilities 161 kV or below, but equivalences for elements of the regionally defined definition of the BES should be explained in the ATCID.<br>**Response:** The Drafting Team notes that the language of R2.1 allows detailed modeling of 161 kV and below; the language does not require it. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent. Requirements for Data Exchange in MOD-001 already address sharing of models to support reliability objectives; to the extent a reliability entity has concerns regarding the use of equivalences within the model, the SDT encourages those entities to work directly with each other. Disclosure of this information to Transmission Customers should be addressed through the use of the NAESB process.<br><br>R6.1 - This requirement and the associated footnote 1 provide that "The Transmission operator may honor distribution factors les than 5% if desired." MOD-29 and MOD-30 have similar language allowing use of alternative distribution factors, generally related to the use of TLR curtailment thresholds. These practices should be posted in the TSP's ATCID and coordinated with the applicable RC(s) and each adjacent TOP and TSP.<br>**Response:** Requiring this information to be included in the ATCID will not add to the reliability of the system. Therefore, the Drafting Team does not see the benefit in adding a new requirement for such at this time.<br><br>R8 and R9 — Definition of “GF” Grandfathered Firm/Non-Firm Transmission Service — please delete “accepted by FERC” after “Safe Harbor Tariff.” FERC regulatory approval of a tariff for rate purposes is not relevant to what form of transmission service tariff a NERC TSP provides. Many utilities U.S. utilities that are not FERC jurisdictional for electric rate purposes. All Canadian TSPs are non-jurisdictional.<br>**Response:** The SDT agrees, and has modified R8 and R9 per APPA’s suggestion.<br><br>R10 and R11 — Postbacks and counterflows: “Counterflows” should be a defined term. It is used in MOD-1, MOD-28, MOD-29 and MOD-30 and is an integral element in the calculation of ATC and AFC. The definition used in MOD-28-1 R10, for example, reads: “counterflows” are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.? This definition does not in any way describe what a counterflow is. — “Postbacks” should incorporate a working definition developed by NAESB, to be revised once due process is completed on this business practice. Alternatively, consider use of the following text to at minimum describe the nature of postbacks: — Postbacks [Firm] [Non-Firm] are changes to firm [non-firm] ATC [AFC] due to a change in the amount of Firm [non-firm] Transmission Service reserved or scheduled for a period, as defined in Business Practices. Postbacks are generally a positive quantity. Also, include Postbacks in |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | the "e.g." list of factors in M12 and M13.<br>**Response:** The SDT has reviewed the standards, and finds that the Postbacks and counterflows definitions, the requirements for the ATCID, and the requirements and measures for calculating ATC in the methodologies address this sufficiently. MOD-001 indicates in the definition that Postbacks are defined by business practices, while the individual methodology standards indicate that Postbacks are "changes to firm (non-firm) ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices." Counterflows is an industry term, and the manner in which it applies to these standards is described in the methodologies ("adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID"), as well as in MOD-001 R3.2.<br>Regarding the use of postbacks in M12 and M13, the examples provided were not intended to be an exhaustive list. |
| **Response:** Please see in-line responses. | |
| Texas-New Mexico Power Company | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Texas-New Mexico Power Company is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, TNMP believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. TNMP strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Area Interchange methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| New York Independent System Operator | MOD-028 incorporates the new MOD-001 definition of "ATC Path." Please see the NYISO's comments on MOD-001 for an explanation of why this defined term appears to be overly broad when applied to the NYISO and could subject it to obligations, and potential penalties, that would be inconsistent with both the character of the NYISO's FERC-approved financial transmission service model and with waivers from the OASIS posting requirements that FERC has granted the NYISO. In particular, under R5 (and M7) of MOD-028, the current definition of ATC Path could be interpreted to require the NYISO to post TTCs for periods of time further in the future than one day-ahead for interfaces or scheduled lines for which FERC does not require the NYISO to post TTC beyond one-day ahead. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | **Response:** The Drafting Team believes that the definition of ATC Path is correct. R1 in MOD-001 requires Transmission Operators to select a methodology based on ATC Paths, which is defined to be any POR/POD combination for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. The SDT understands that while NYISO calculate ATC values on its internal interfaces, those internal interfaces do not meet the definition of an ATC Path, i.e., they are not described by a POR/POD combination and they are not a FERC Posted path.<br><br>Note that NYISO may wish to pursue a Variance to this standard.<br><br>As the NYISO discussed in its response to MOD-001, subjecting the NYISO to such requirements would serve no reliability purpose. The NYISO has proposed a revision to MOD-001 to address this concern. In the same vein, the SDT should revise R 3.2, R5, and R.7 to clarify that they do not require Transmission Operators to calculate (or establish) monthly ATCs (or TTCs) to the extent that they are not required under FERC's regulations, or as a result of FERC orders, to calculate and post ATC for periods further out than one day-ahead The NYISO has previously commented that MOD-028 should be revised so that TTC would not have to be re-established (or re-calculated) at set intervals when the underlying inputs to TTC have not changed.<br><br>The SDT previously made a similar change to the ATC re-calculation frequency requirement of what is now R8 under MOD-001 but has not yet made the corresponding change to MOD-028. The NYISO therefore respectfully renews its request that the STD make the requested changes to MOD-028. Under the NYISO system, TTC values do not change often. Accordingly, the proposed MOD-028 requirements would force the NYISO to adopt costly compliance measures that would offer no benefit to its customers and serve no reliability purpose.<br>**Response:** The requirement in MOD-028 requires entities to 'establish' the TTC on a minimum frequency. 'Establish' was intentionally chosen so that re-calculation would not be required if no inputs have changed, Even for entities that do not sell physical transmission service, the TTC is required data for reliability and the Drafting Team does not see how the defined timeframe for reviewing the TTC would result in an overly burdensome process for NYISO.<br><br>The NYISO has previously commented that it is critically important to it that the algorithm for calculating Existing Transmission Commitments? ("ETC") in MOD-028 (and -029) be interpreted flexibly. The NYISO's existing ATC calculation procedure, which reflects the nature of its financial reservation system, and which has been accepted by the Commission, is to calculate firm and non-firm ATC as follows. ATC (Firm) = TTC ? Transmission Flow Utilization (Firm) — TRMATC (Non-Firm) = ATC (Firm) — Transmission Flow Utilization (Non-Firm) Where "Transmission Flow Utilization" represents the security constrained network powerflow solutions of the NYISO's Security Constrained Unit Commitment software, with respect to the NYISO Day-Ahead Market, or its Real-Time Commitment and Real-Time Dispatch software with respect to the NYISO's Real-Time Market. |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | As the NYISO has explained in prior comments, it believes that the central role that Transmission Flow Utilization plays in its ATC/TTC calculations can be accommodated under proposed MOD-028 and MOD-029 by accounting for it in the ETC calculation algorithms established under R8 and R9. Specifically, the SDT's proposed definition of the OS (F) variable appears to be broad enough to encompass Transmission Flow Utilization. The NYISO has previously requested that the SDT clarify or revise the OS (F) definition so that it would clearly allow the NYISO to account for Transmission Flow Utilization in this way. The SDT has not yet responded. Accordingly, the NYISO requests that the OS (F) definition under R8 be revised to read: OS (F) is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID, including security constrained network powerflow solutions produced by market software used by Transmission Service Providers that administer FERC-approved organized markets. Similarly, the OS(F) definition under R9 should be revised to read: OS (F) is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID, including security constrained network powerflow solutions produced by market software used by Transmission Service Providers that administer FERC-approved organized markets. Making these revisions should have no impact on the vast majority of Transmission Service Providers, because they will neither administer FERC-approved organized markets nor use Transmission Flow Utilization in their ATC/TTC calculations. On the other hand, it would permit the NYISO to come into compliance with NERC's proposed MOD standards without having to make fundamental changes to its FERC-approved market design or financial reservation transmission model. Order No. 890 was clear that it would not require fundamental changes to ISO/RTO market designs. This principle was recently upheld when FERC accepted the NYISO's Order No. 890 tariff compliance filing without requiring any changes to financial reservation transmission model. The NYISO asks that the SDT make the required revision in order to eliminate any possibility of a conflict between the NYISO's FERC approved system and the NERC MOD standards. The NYISO recognizes that the definition of OS (F) may already be broad enough to accommodate Transmission Flow Utilization. If the SDT does not make the requested revision the NYISO will take the position that it may describe its use of Transmission Flow Utilization in the ETC calculation within its ATCID. Nevertheless, because this issue is so important to the NYISO's future compliance with NERC's MOD standards the NYISO would strongly prefer that the issue be expressly addressed within the text of MOD-028 and (MOD-029). The NYISO may raise the issue at FERC if it is not addressed by NERC.<br>**Response:** As NYISO has noted in its comments on MOD-028, the current wording of the Other Service (OS) term is broad enough to cover the NYISO market condition described. In addition, there is a NERC process by which NYISO can request a formal interpretation. |
| **Response:** Please see in-line responses. | |
| PJM | PJM does not have any specific comments. |
| Pepco Holdings, Inc | PHI supports the comments of PJM and will not submit duplicate comments |
| **Response:** PJM did not comment on this question. | |

| Organization/Group | Question 1 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| Bonneville Power | BPA does not believe any are incorrect. |

**2. The drafting team has modified the Violation Risk Factors for MOD-028 to reflect industry concerns that they did not match NERC's VRF definitions. NERC's VRF definitions are listed below. Are the current VRFs established correctly? If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification.**

High Risk Requirement:

(a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement:

(a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement: is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

**Summary Consideration:**

Some commenters suggested that some of the VRF's should be raised. The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R5 and R6 do not directly affect the electrical state or the capability of the bulk power system.

| Organization/Group | Question 2: | Question 2 Comments: |
|---|---|---|
| NPCC Regional Standards Committee | No | No, those requirements (at least R5 and R6) that hold the TOP responsible for establishing TTCs should be assigned a Medium since TTCs set the reliability boundary, like an SOL or IROL, within which the TSP may provide transmission services. Failure to establish TTCs may result in the TSP over-selling transmission services beyond the reliability bounds, risking the BES to unreliable operation. |
| **Response:** The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R5 and R6 do not directly affect the electrical state or the capability of the bulk power system. | | |

| Organization/Group | Question 2: | Question 2 Comments: |
|---|---|---|
| IRC Standards Review Committee | No | No, those requirements (at least R5 and R6) that hold the TOP responsible for establishing TTCs should be assigned a Medium since TTCs set the reliability boundary, like an SOL or IROL, within which the TSP may provide transmission services. Failure to establish TTCs may result in the TSP over-selling transmission services beyond the reliability bounds, risking the BES to unreliable operation. |
| **Response:** The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R5 and R6 do not directly affect the electrical state or the capability of the bulk power system. | | |
| Ontario IESO | No | Those requirements (at least R5 and R6) that hold the TOP responsible for establishing TTCs should be assigned a Medium since TTCs set the reliability boundary, like an SOL or IROL, within which the TSP may provide transmission services. Failure to establish TTCs may result in the TSP over-selling transmission services beyond the reliability bounds, risking the BES to unreliable operation. |
| **Response:** The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R5 and R6 do not directly affect the electrical state or the capability of the bulk power system. | | |
| Hydro One Networks | No | R3, R5 and R6 should be assigned Medium since TTCs set the reliability boundary. There is a risk of unreliable operation of the BES when failing to establish TTCs result in the TSP over-selling transmission services beyond the reliability bonds. |
| **Response:** The Drafting Team disagrees. The majority of the team and the industry believes that a violation of R3, R5 and R6 do not directly affect the electrical state or the capability of the bulk power system. | | |
| PJM | Yes | PJM supports NERC?s position to revise all Violation Risk Factors to have an assigned risk factor of ?Lower.? A Lower Risk Factor requirement is administrative in nature and is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system. |
| **Response:** Thank you for your supportive comment. | | |
| MRO? | Yes | The MRO commends the SDT on revising the VRFs to Lower. We believe the revised VRFs are in-line with the NERC definitions of the VRF levels. |
| **Response:** Thank you for your supportive comment. | | |

3. The drafting team has modified the Violation Severity Levels for MOD-028 to reflect industry concerns that they were too “pass/fail” oriented. Are the current VSLs established correctly?

**Summary Consideration:**

Some commenters expressed concern with potential for multiple violations of the standard due to a single event. The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.

Some suggestions were made to change specific VSLs and make them more graded. The SDT modified VSLs for R2, R3, R4, R5, and R7. Two measures were modified as well to correct invalid references.

Some suggestions were made to modify the VSLs for R2 and R3 so they are based on a % rather than fixed counts. Variations in determining what constitutes the facilities that enter into the denominator would make this a difficult item to calculate, with significant discretion in determining the percentage. Because of this difficulty in measuring the value, the SDT believe it is appropriate to leave the numbers in the VSLs as fixed counts.

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| PJM | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but PJM has a concern regarding the possibility of multiple violations resulting from a single event. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations — this language to be added to the standard. |
| **Response:** The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events. | | |
| Ontario IESO | No | We suggest the following changes:<br>a. R1: R1.5 contains several subrequirements. It is not clear what constitutes a failure of R1.5 when considering the VSLs for R1 (i.e. number of elements missing in the ATCID. For similar situations in MOD-008, it is stipulated that failing any one of the subrequirements would constitute a requirement failure. We therefore suggest adding a sentence under each of Moderate, High and Severe: ?Any violation or violations of the sub-requirements of R1.5 shall be considered a single violation of R1.5.?<br>**Response:** The SDT agrees and has modified the VSLs for R1.<br>b. R2: We do not agree with the VSL assignments. Note that R2 has 3 subrequirements, hence a Moderate should be assigned for failing 1 of the 3, a High for failing 2 and a Severe for failing all 3. A progressive VSL for R2.3 doesn’t work in this case since even having >30 incorrect ratings, the TOP would have only failed one of the 3 subrequirements and should not be assigned a Severe if it met the other 2. We suggest the SDT to revise these VSLs.<br>**Response:** The SDT agrees and has modified the VSLs for R2.<br><br>c. R3: We do not agree with the VSL assignment. R3 has two subrequirements: R3.1 for on-peak and off-peak intra-day and next-day TTCs, and R3.2 for days two through 31 TTCs and for months two through |

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| | | 13 TTCs. A total failure of R3 would be failing both subrequirements. Within each of the subrequirements, there are 3 subrequirements. While the VSLs for each of R3.1 and R3.2 can be made progressive (graded) according to the extent of missing outages, additions, retirements, and load forecast and unit commitments, etc. they need to eventually be factored in the VSLs for R3. Suggest to revise the VSLs so that a Low would be missing some of the subrequirements in either R3.1 and R3.2, a Moderate for missing more of them, and so on with a Severe be assigned if the majority of the subrequirements in both R3.1 and R3.2 are missing. Better still, the SDT may consider rearranging R3 so that they can better facilitate VSL development.<br>**Response:** The SDT believes the VSLs for R3 are written appropriately, but has modified them slightly to reduce the potential for multiple violations due to a single event.<br><br>d. R4: Similar comments in R3 also apply here. In this case, modeling reservations? sources or sinks is used as the parameter to assign progressive VSLs, leaving the violation of either R4.1 or R4.2 or failure to include firm transmission service (a part of R4.3) as the condition for a Severe. It appears that the impact of violation has been applied in arriving at the assigned VSLs, which is not proper. We suggest a rework of this set of VSL so that they are dependent on the extent to which the 3 subrequirements are violated. If necessary, the SDT may want to consider splitting R4.3 to separate out the inclusion of firm reservations requirement to make it a condition for assessing VSLs.<br>**Response:** The SDT believes the VSLs for R4 are written appropriately, but has modified them slightly to reduce the potential for multiple violations due to a single event.<br><br>e. R5: We do not agree that the VSL should be a single “Severe”. R5 contains 3 subrequirements. Presumably, a TSP may fail one or more of these subrequirements. A progressive (graded) VSL should be developed.<br>**Response:** The SDT has modified the VSLs for R5 to have a more progressive approach, but does not believe simply counting the sub-requirements is an effective way to measure compliance with this standard.<br><br>f. R6: We assess that R6.1 and R6.2 are parts of a single process requirement. However R6.3 and R6.4 are distinct requirements that need to be met as well. Presumably, a TSP may fail anyone or more of the 3 subrequirements (R6.1 and R6.2 as a unit). Again, a progressive (graded) approach would be more appropriate. We suggest the SDT to revise the VSL for this requirement.<br>**Response:** The sub-requirements under R6 describe the overall process by which TTC should be calculated, and is where the TTC process meets SOL/IROL requirements. If any or all of these sub-requirements are violated, the entity is not following the standard and the VSL should be Severe.<br><br>g. R7: the second “OR” under the Severe column should be “AND” since the first two conditions both mean that the TOP fails R7.1 completely, but it’s only a part of R7. It needs to also fail R7.2 completely |

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| | | to have a Severe failure. To cover for case where the TOP fails either R7.1 or R7.2 completely but not both, the conditions under High may be revised to remove the "but not been more than" parts and include the ?did not provide?? as an OR condition.<br>**Response:** The SDT disagrees. R7, as written, requires the Transmission Operator to deliver all its TTCs within a certain time frame. The SDT believes that not delivering a significant number of the values, or delivering those values grossly late, is a severe violation.<br><br>h. R8: We would assume the "M9" referenced in this set of VSL really meant "M10", or else these VSLs would be difficult to understand since R8 is on using the algorithm, not on the values whereas M9 is for R7 that stipulates the requirement for establishing TTC values. Please also see our comments on M10 under Q1.<br>**Response:** The reference to the measure has been corrected.<br><br>i. R9: Same comment as in VSLs for R8, except in this case the "M10" should be "M11". Please also see our comments on M11 under Q1.<br>**Response:** The reference to the measure has been corrected |
| **Response:** Please see in-line responses. | | |
| IRC Standards Review Committee | No | No. We suggest the following see IESO |
| **Response:** Please see IESO responses. | | |
| Hydro One Networks | No | Note R1 has 5 sub-requirements, not four. In the VSL's for R1 include the statement, "Any violation or violations of the sub-requirements of R1.5 shall be considered a single violation of R1.5. The Lower VSL contains older wording and should be updated to similar wording as the rest of the levels: "The TSP has an ATCID but it is missing x of the five required elements in R1.<br>**Response:** The SDT agrees and has modified the VSLs for R1.<br><br>The VSLs for R2 should be graded based on % to cater to different size systems.<br>**Response:** The SDT does not believe determining a percentage is as easy as is suggested by the commenter. Variations in determining what constitutes the facilities that enter into the denominator would make this a difficult item to measure, with significant discretion in determining the percentage. Because of this difficulty in measuring the value, the SDT believe it is appropriate to leave the numbers in the VSLs as fixed counts.<br><br>Also what is the logic behind using voltage 161 kV in the severe level?<br>**Response:** If an entity equivalences any non-radial lines with nominal voltage greater than 161kv, they |

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| | | failed to meet requirement R2.1. R2.1 is a pass/fail requirement (not given a gradient on the violation severity levels) therefore it must be given a severe violation.<br><br>The VSLs for R3 should also be graded based on %.<br>**Response:** The SDT does not believe determining a percentage is as easy as is suggested by the commenter. Variations in determining what constitutes the facilities that enter into the denominator would make this a difficult item to measure, with significant discretion in determining the percentage. Because of this difficulty in measuring the value, the SDT believe it is appropriate to leave the numbers in the VSLs as fixed counts.<br><br>Correct VSLs for R8 and R9 with the correct reference to their Measures.<br>**Response:** The reference to the measure has been corrected. |
| Gainesville Regional Utilities | Yes | Good improvement. |
| **Response:** Thank you for your supportive comment. | | |

| EPSA | | no comment |

4. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-028.

**Summary Consideration:**

Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

The NERC RTOSDT expressed concern that the standard does not refer to Planning and operating limits. The SDT directed the RTOSDT to the specific areas in the methodology standard where such references are made.

Several entities expressed concern regarding the responsibilities of the Transmission Operator. The SDT interprets the Functional Model as requiring the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining the methodology used to determine TTC. For those entities who believe the TSP to be the appropriate entity, we reiterate that options for delegation of this task exist.

| Organization/Group | Question 4 Comments: |
|---|---|
| CenterPoint Energy | The group of standards is for ATC and TRM methodologies that are not used in ERCOT. CenterPoint Energy is concerned that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these standards, which we believe would not add value to the ERCOT region and could increase congestion in the region. Accordingly, CenterPoint Energy previously submitted comments to these standards asking for an exemption for the ERCOT region. We find the proposed standards unacceptable unless the following provision is added to each standard: This standard does not apply to ERCOT or any other region that operates as a single control area. |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Area Interchange methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| ERCOT ISO | I suggest modifying the Applicability section as follows:"4.1. Each Transmission Operator with ATC Path(s) that uses the Area Interchange Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.""4.2. Each Transmission Service Provider with ATC Path(s) that uses the Area Interchange Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths." |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Area Interchange methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard. | |

| Organization/Group | Question 4 Comments: |
|---|---|
| Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) “it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) “it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, “An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable.” *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance “Based on a justifiable difference between regions or between sub-regions within the Regional geographic area” could be pursued by ERCOT. *(Loc. Cit.)* | |
| NERC RTOSDT | The Real Time Operation Standards Drafting Team is concerned that the proposed MOD standards do not include any reference to the Planning and Operating Limits mandated by the current FAC, IRO and TOP standards. These standards already include transmission flow limits both in the longer term planning time frame as well as the shorter term operating time frame. The proposed MOD standards seem to be establishing procedures to calculate the commercial boundaries without a direct link to the required reliability boundaries.<br><br>MOD-001 R6 states that the TTC “use assumptions” no more limiting than those used in planning. The RTO SDT would ask shouldn’t TTC’s be required to be “no less limiting” than the SOLs / IROLs computed for the system?<br><br>Current NERC standards are not just asset limits, they are also system limits. The current standards require that limits be calculated that recognize both local and wide-area impacts. The RTO SDT believes that by at least linking (if not entirely eliminating) the MOD standards to the current SOLs / IROLs requirements, the Industry would be more correctly linking how the system MUST BE operated to any NAESB business practice. Indeed it would seem that current tariffs are based on the computations used in current planning and operating environments. By using the current SOL / IROL limits the procedural / prescriptive requirement in MOD-001 R9 et al would be unnecessary (i.e. they would revert back to the FAC and IRO requirements)<br><br>The questions for the ATC SDT:<br>• How do these MOD standards relate to the SOLs / IROLs?<br>• Why should these ATC/TTC limits be decoupled from the SOLs / IROLs?<br>• Shouldn’t the long-term SOL / IROL limits computed in Planning be the TTC for the system (or at least the basis for the TTC)?<br>• Shouldn’t the short-term SOL / IROL be the basis for the ATC for the system — MOD-008 computes margins.<br><br>By coordinating the MOD standards with the SOL / IROL standards, the only Business (not NERC) requirement may be to define the options on how the TSP could couple the various SOL / IROL values that it obtains from its RCs and TOPs. MOD-028By using SOLs / IROLs there would be no need to get into ATC / AFC “methodologies”. Indeed standards that include “alternatives” are not defining a single “standard approach”. But by using specific planning and operating limits the methodologies become irrelevant. The “limit” becomes explicit and well-defined. Any margins or variations about |

| Organization/Group | Question 4 Comments: |
|---|---|
| | those limits would then be obvious and transparent. What is most important is respecting the reliability-based limits and not how the commercial value is computed. If this idea of using SOLs / IROLs as the limit(s) or at least the basis for those commercial limits, then the TSP becomes a coordinator of which values to use for the commercial periods. The TSP would not be the computer of those limits. Thus MOD-028 could become a business practice for posting — rather then a standard for computations. |
| **Response:** With regard to the comments on setting Planning and Operating Limits, the MOD-028, MOD-029 and MOD-030 posted methodology standards include references to SOLs to address the concerns expressed by the RTO SDT. These references are as follows: MOD-028 R6.1; MOD-029 R3; MOD-030 R2.4. Regarding the need for these standards, the approval of the SAR related to these standards and the NOPR process for Order 890 has already identified that the industry believes these methodologies are appropriate areas for standards development. With regard to the comment "The RTO SDT would ask shouldn't TTC's be required to be "no less limiting" than the SOLs / IROLs computed for the system?" the SDT notes that MOD-028 does not contain "no more limiting" language. Instead, MOD-028 requires that SOLs be respected in R6.1. | |
| AEP | The Applicability of this Standard should be solely upon the TSP, the Transmission Operator should not be subject to this Standard. From the previous set of responses, it is the apparent belief of the SDT that the calculation of ATC is needed for reliability (response to AECI for example). We disagree. Considering that ATC is a mathematical amalgamation of forecasted system conditions (load, outages, generation dispatch, others? transactions, etc) compounded and adjusted by margins (TRM and CBM of own entity and other systems), using the calculated ATC to assess real or near real time transmission reliability would be ? at best ? unwise. Transmission Reliability can be assessed by monitoring specific and individual Facility loadings and/or other parameters, for example. The calculation of ATC and the value of resultant ATC is exactly for the purpose stated in the definition of ATC: "A measure of ? capability?. for further commercial activity? ? and note the definition does not infer ATC is a measure of reliability. Granted, ATC is calculated FROM reliability derived values and concepts (such as ratings, contingency analysis aspects, SOLs etc), BUT the resultant ATC values are not an assessment of transmission reliability ? and therefore not a function for the Transmission Operators, but rather the Transmission Service Provider.<br>**Response:** The Drafting Team does not find any clear rationale for selecting the Transmission Service Provider as the entity responsible for selecting the methodology. As discussed previously, the Functional Model requires the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining the methodology used to determine TTC. The Transmission Service Provider is responsible for providing service within the constraints established by the Transmission Operator, not actually establishing those constraints.<br>For those entities who believe the TSP to be the appropriate entity, we reiterate that options for delegation of this task exist. Transmission operators can simply defer to the decisions made by their Transmission Service Provider; if a more formal agreement and transfer of responsibility is needed, the Transmission Service Provider and their Transmission Operators can register as a Joint Registration Organization, with the Transmission Service provider agreeing to take on responsibility for this requirement through written contract.<br><br>In addition, the Purpose statement is unclear and perhaps nonsensical. Is the purpose ? to increase consistency and reliability in the development of documentation?.? or ? to support analysis and system operation?? What entities? ?short term use?? Suggestion: Purpose: To ensure consistency of calculation of those entities employing Area Interchange |

| Organization/Group | Question 4 Comments: |
|---|---|
| | Methodology pursuant to MOD-001 R1.<br>**Response:** As for the Purpose statement being nonsensical, AEP inaccurately quotes the language of the "Purpose" statement as being for "the development of documentation" (emphasis added); whereas the actual Purpose statement is to promote "the development and documentation of transfer capability calculations." (emphasis added). This statement clearly aligns with FERC's Order 693, P. 1015 wherein FERC states the purpose of the ATC suite is to promote "consistency and transparency for ATC calculations." As for the ambiguity of applicable entities in the Purpose statement, AEP is reminded that the Applicable entities are clearly stated in the Applicability section – not the Purpose section. As for short-term, FERC suggests that short-term is operational whereas long-term is planning in nature. Order 693, P. 1040. See also Order 890, P. 292 – 295. |
| **Response:** Please see in-line responses. | |
| PJM | PJM reiterates that while we will not choose the calculation methodologies used in MODs 28 and 29, these MODs will require modification to assure consistency with any revisions made to MOD 30. PJM is including specific comments for MOD 30 in Section VI of this document. PJM is not providing specific comments for MODs 28 and 29. |
| Oncor Electric Delivery | This standard should not apply to ERCOT for the reason expressed in question 1. |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Area Interchange methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| Hydro One Networks | We question the retirement of standards FAC-012 and FAC-013 as indicated in the implementation plan as those FAC standards pertain to different responsible entities than these MOD standards. |
| **Response:** The SDT believes that while these did apply to different functional entities, the tasks have been appropriately addressed within the new standards. Additionally, the SDT believes that since the various methodologies are all dependent on the calculation of TTC consistent with the methodology chosen, the requirements from the FAC-012 and FAC-013 standard must be included within the methodologies themselves. Otherwise, entities could calculate TTC using one methodology and ATC with another (but using the inconsistently determined TTC). | |
| MRO | 1. The MRO continues to have issues with the overall approach on this standard in combination with the MOD-030. As previously indicated in prior comment periods, the MRO has Transmission Service Providers that manage the levels of transmission service to a reliable level with flowgates and then establishes border control area-to-control area flows to contract path levels so that contractual rights are not exceeded. The MRO reads the MOD-028 standard to require the application of the MOD-028 methodology for its control area-to-control area path postings while MOD-030 standard is used for the flowgates postings. The MRO understands from a discussion with a member of the SDT that in actuality the |

| Organization/Group | Question 4 Comments: |
|---|---|
| | intent is that the MOD-030 would be used for flowgate calculations and that these quantities could be converted into the ATC path quantities for the control area to control area paths from border companies to outside the Transmission Service Providers area. This application of the flow gate methodology to possibly generate all postings for a Transmission Service Provider including drive out is not clear from the standards and should be clarified in MOD-030 and possibly MOD-028.<br>**Response:** The SDT does not see a need to modify MOD-028 in response to this comment; any clarification would be done in MOD-030.<br><br>2. The MRO commends the SDT in making significant changes to this standard and reissuing it for comment. The MRO believes the eventual standard that is approved will serve the industry and customers better as a result.<br>**Response:** Thank you for your support<br><br>3. The MRO believes that the first time you use an abbreviation or acronym, you must spell out the full term followed by the abbreviation or acronym in brackets. Subsequent use of the term is then made by its abbreviation or acronym. ex: "Each Transmission Operator shall select one Available Transfer Capability (ATC) methodology2 for calculating ATC (Area Interchange methodology, Rated System Path methodology) or Available Flowgate Capacity (AFC) (Flowgate methodology) for each ATC Path per time period identified in R2 for those Facilities within its Transmission Operator Area."<br>**Response:** The SDT has modified MOD-028 where required. |
| **Response:** Please see in-line responses. | |
| American Public Power Association | These comments apply equally to MOD-1, MOD-28. MOD-29 and MOD-30Excellent work by the SDT. |
| **Response:** Thank you for your supportive comment. | |
| Texas-New Mexico Power Company | This standard should not apply to ERCOT for the reason stated in Question 1. |
| **Response:** This standard is intended to apply to all entities that have chosen to implement the Area Interchange methodology. To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |

<table>
<tr><th>Organization/Group</th><th>Question 4 Comments:</th></tr>
<tr><td>Brazos Electric Power Cooperative, Inc.</td><td>Brazos Electric believes that the concept of an Area Interchange Methodology is not applicable to a single-control area operation like ERCOT.  To address this issue, the Applicability section could be modified to state that only TOPs or TSPs that conduct area to area operations and hence have responsibility for ATC Path(s) must have an Area Interchange Methodology.</td></tr>
<tr><td colspan="2">Response: This standard is intended to apply to all entities that have chosen to implement the Area Interchange methodology.  To the extent ERCOT does not choose to implement this methodology, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. ## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Transmission Reliability Margin Implementation Document (TRMID):** A document that describes the implementation of a Transmission Reliability Margin methodology, and provides information related to a Transmission Operator's calculation of TRM.

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**

2. **Number:** **MOD-008-1**

3. **Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to support analysis and system operations.

4. **Applicability:**

   **4.1.** Transmission Operators that maintain TRM.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R1.1.** Identification of (on each of its respective ATC Paths or Flowgates) each of the following components of uncertainty if used in establishing TRM, and a description of how that component is used to establish a TRM value:

- Aggregate Load forecast.
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window).
- Reserve sharing requirements.
- Inertial response and frequency bias.

**R1.2.** The description of the method used to allocate TRM across ATC Paths or Flowgates.

**R1.3.** The identification of the TRM calculation used for the following time periods:

**R1.3.1.** Same day and real-time.

**R1.3.2.** Day-ahead and pre-schedule.

**R1.3.3.** Beyond day-ahead and pre-schedule, up to thirteen months ahead.

**R2.** Each Transmission Operator shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R3.** Each Transmission Operator shall make available its TRMID, and if requested, underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request no more than 30 calendar days after receiving the request. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Transmission Service Providers
- Reliability Coordinators
- Planning Coordinators
- Transmission Planner
- Transmission Operators

**R4.** Each Transmission Operator using TRM shall establish TRM values in accordance with the TRMID at least once every 13 months. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.** The Transmission Operator using TRM shall provide the TRM values to its Transmission Service Provider(s) and Transmission Planner(s) no more than seven calendar days after a TRM value is initially established or subsequently changed. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

## C. Measures

**M1.** Each Transmission Operator shall produce its TRMID evidencing inclusion of all specified information in R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, and CBMID , or other evidence, (such as written documentation, study reports, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

**M3.** Each Transmission Operator shall provide a dated copy of any request from an entity described in R3. The Transmission Operator shall also provide evidence (such as copies of emails or postal receipts that show the recipient, date and contents) that the requested documentation (such as work papers and load flow cases) was made available within the specified timeframe to the requestor. (R3)

**M4.** Each Transmission Operator shall provide evidence (such as logs, study report, review notes, or data) that it established TRM values at least once every thirteen months for each of the TRM time periods. (R4)

**M5.** Each Transmission Operator shall provide evidence (such as logs, email, website postings) that it provided their Transmission Service Provider(s) and Transmission Planner(s) with the updated TRM value as described in R5. (R5)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.

The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.

The Transmission Operator shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.

If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes

Any of the following may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

#### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator has a TRMID that does not incorporate changes made up to three months ago. | The Transmission Operator has a TRMID that does not incorporate changes that have been made three or more months ago but less than six months ago.<br>**OR**<br>The Transmission Operator's TRMID does not address one of the subrequirements (R1.1, R1.2, R1.3). Any violation or violations of the sub-requirements of R1.3 shall be considered a single violation of R1.3. | The Transmission Operator has a TRMID that does not incorporate changes that have been made six or more months ago but less than one year ago.<br>**OR**<br>The Transmission Operator's TRMID does not address two of the subrequirements (R1.1, R1.2, R1.3). Any violation or violations of the sub-requirements of R1.3 shall be considered a single violation of R1.3. | The Transmission Operator has a TRMID that does not incorporate changes that have been made one year ago or more.<br>**OR**<br>The Transmission Operator does not have a TRMID;<br>**OR**<br>The Transmission Operator's TRMID does not address three of the subrequirements (R1.1, R1.2, R1.3). Any violation or violations of the sub-requirements of R1.3 shall be considered a single violation of R1.3. |
| R2. | N/A | N/A | N/A | The Transmission Operator included elements of uncertainty not defined in R1 in their establishment of TRM.<br>**OR**<br>The Transmission Operator included components of CBM in TRM. |
| R3. | The Transmission Operator made the TRMID available to a requesting entity specified in R3 but provided TRMID in more than 30 days but less than 45 days. | The Transmission Operator made the TRMID available to a requesting entity specified in R3 but provided TRMID in 45 days or more but less than 60 days. | The Transmission Operator made the TRMID available to a requesting entity specified in R3 but provided TRMID in 60 days or more but less than 90 days. | The Transmission Operator did not make the TRMID available for 90 days or more. |

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R4 | The Transmission Operator established TRM values on schedule BUT the values were incomplete or incorrect. Not more than 5% or 1 value (which ever is greater) were incorrect or missing. | The Transmission Operator did not establish TRM within thirteen months of the previous determination, and the last determination was not more than 15 months ago<br>**OR**<br>The Transmission Operator established TRM values on schedule BUT the values were incomplete. More than 5%, or 1 value (which ever is greater) were incorrect or missing, but not more than 10% or 2 values (whichever is greater). | The Transmission Operator did not establish TRM within 15 months of the previous determination, and the last determination was not more than 18 months ago.<br>**OR**<br>The Transmission Operator established TRM values on schedule BUT the values were incomplete or incorrect. ## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Transmission Reliability Margin Implementation Document (TRMID):** A document that describes the implementation of a Transmission Reliability Margin methodology, and provides information related to a Transmission Operator's calculation of TRM.

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**

2. **Number:** **MOD-008-1**

3. **Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to support analysis and system operations.

4. **Applicability:**

   **4.1.** Transmission Operators that maintain TRM.

   ~~4.2.Transmission Service Provider.~~

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R1.1.** Identification of (on each of its respective ATC Paths or Flowgates) each of the following components of uncertainty if used in ~~calculating~~ establishing TRM, and a description of how that component is used to ~~calculate~~ establish a TRM value:

- Aggregate Load forecast ~~uncertainty (not included in determining generation reliability requirements for CBM)~~.
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window).
- Reserve sharing requirements.
- Inertial response and frequency bias.

~~R1.2.A statement to confirm that it shall use assumptions in calculating TRM that are consistent with those assumptions that are used in the Transmission planning process for the time period studied .~~

**~~R1.3.~~R1.2.** The description of the method used to allocate TRM across ATC Paths or Flowgates.

**~~R1.4.~~R1.3.** The identification of the TRM calculation used for the following time periods:

**~~R1.4.1.~~R1.3.1.** Same day and real-time.

**~~R1.4.2.~~R1.3.2.** Day-ahead and pre-schedule.

**~~R1.4.3.~~R1.3.3.** Beyond day-ahead and pre-schedule, up to thirteen months ahead.

~~**R1.5.**If TRM is not used, a statement of that practice.~~

**R2.** Each Transmission Operator shall only use the components of uncertainty from R1.1 to ~~calculate~~ establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. ***[****Violation Risk Factor: Lower**]*** ***[****Time Horizon: Operations Planning**]***

**R3.** Each Transmission Operator shall make available its TRMID, and if requested, ~~any~~ underlying documentation~~, work papers and load flow base cases~~ (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request no more than 30 calendar days after receiving the request. ***[****Violation Risk Factor: Lower**]*** ***[****Time Horizon: Operations Planning**]***

- Transmission Service Providers
- Reliability Coordinators
- Planning Coordinators
- Transmission Planner
- Transmission Operators

**R4.** Each Transmission Operator using TRM shall ~~recalculate~~ establish TRM values in accordance with the TRMID at least once every 13 months. ~~–~~*[Violation Risk Factor: Lower~~Medium~~] [Time Horizon: Operations Planning]*

**R5.** The Transmission Operator using TRM shall provide the TRM values to its Transmission Service Provider(s) and Transmission Planner(s) no more than seven calendar days after ~~they~~ a TRM value is initially ~~change~~established or subsequently changed. ***[****Violation Risk Factor: Lower~~Medium~~**]*** ***[****Time Horizon: Operations Planning**]***

## C. Measures

**M1.** Each Transmission Operator shall produce its TRMID evidencing inclusion of all specified information in R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, and CBMID , or other evidence, (such as written documentation, study reports, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

**M3.** Each Transmission Operator shall provide a dated copy of any request from an entity described in R3. The Transmission Operator shall also provide ~~request for its TRMID or associated documentation, and~~ evidence (such as copies of emails or postal receipts that show the recipient, date and contents)~~ as evidence~~ that the requested documentation (such as work papers and load flow cases) was ~~provided~~ made available within the specified timeframe to the ~~entities described in R3~~requestor. (R3)

**M4.** Each Transmission Operator shall provide evidence (such as logs, study report, review notes, or data) that it ~~recalculated~~ established TRM values at least once every thirteen months for each of the TRM time periods. (R4)

**M5.** Each Transmission Operator shall provide evidence (such as logs, email, website postings) that it provided their Transmission Service Provider(s) and Transmission Planner(s) with the updated TRM value as described in R5. (R5)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.

The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.

The Transmission ~~Service Provider~~Operator shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.

If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes

Any of the following may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations

- Self-Reporting
- Complaints

### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| **R1.** | **The Transmission Operator has a TRMID that does not incorporate changes made up to three months ago.** | **The Transmission Operator has a TRMID that does not incorporate changes that have been made three or more months ago but less than six months ago.**<br>**OR**<br>**The Transmission Operator's TRMID does not address one of the ~~sub requirement~~**subrequirements **(R1.1, R1.2, R1.3). # Implementation Plan for Standard MOD-008-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-008-1 — Transmission Reliability Margin which describes the reliability aspects of determining and maintaining a Transmission Reliability Margin and what components of uncertainty may be considered when making that determination.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard supersedes MOD-008-0. MOD-009-0 — Procedure for Verifying Transmission Reliability Margin Values, has been incorporated into this standard, made irrelevant by this standard, or is being addressed by the North American Energy Standards Board, and should be retired when MOD-008-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-008-1 | ■ | | | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the reliability standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Implementation Plan for Standard MOD-008-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-008-1 — Transmission Reliability Margin~~,~~ which describes the reliability aspects of determining and maintaining a Transmission Reliability Margin and what components of uncertainty may be considered when making that determination.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## ~~Modified~~ Retired Standards

This standard supersedes MOD-008-0. MOD-009-0 – Procedure for Verifying Transmission Reliability Margin Values, has been incorporated into this standard, made irrelevant by this standard, or is being addressed by the North American Energy Standards Board, and should be retired when MOD-008-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-008-1 | ■ | | ~~■~~ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the reliability standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

Please **DO NOT** use this form to submit comments on the current draft of MOD-008. Comments must be submitted by **May 15, 2008.**

If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-452-8060.

**Background Information MOD-008 — Transmission Reliability Margin** (A standard that describes the calculation and use of TRM.)

An initial ballot of MOD-008-1 — Transmission Reliability Margin was conducted March 3-12, 2008 and there were several suggestions for modifying the standard that were submitted with ballots. The drafting team withdrew the standard from the ballot process, and made several changes to the standard based on stakeholder comments, including the following:

1. The Drafting Team changed language throughout the standard to specify that TRM be "established" instead of "calculated".
2. The drafting team removed the requirement that the assumptions used in Transmission Reliability Margin studies be consistent with those used in "associated" operations or planning studies. Studies used for TRM are based on non-standard scenarios, and would be inappropriate to make consistent with "normal" studies.
3. Several VRFs were changed from "Medium" to "Lower" in response to industry comments. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.
4. A more graded approach was applied to the VSLs where appropriate.

**Please review the revised version of MOD-008 and then answer the following questions. You do not have to answer all questions. Enter All Comments in Simple Text Format.**

1. **Some entities have indicated they believe the Transmission Operator should not be an applicable entity in the TRM standard (MOD-008). The Drafting Team believes that the Transmission Operator is the appropriate entity since the Transmission Operator is ultimately responsible for operating a reliable system while using all Transmission Service Providers' calculated available capability. The drafting team also believes that the Transmission Operator can, via mutual agreement, delegate these tasks to other entities (such as Transmission Service Providers, ISOs, or RTOs). Do you believe the Transmission Operator is the correct responsible entity for the tasks it has been assigned in MOD-008?**

   ☐ Yes

   ☐ No

   ☐ No preference

   **If "No," please identify requirements where the Transmission Operator is incorrect and specify who the correct entity should be.** Comments:

2. **The drafting team modified some requirements and associated measures to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct.**

   Incorrect Requirement(s) or Measure(s):

3. **The drafting team has modified the Violation Risk Factors for MOD-008 to reflect industry concerns that they did not reflect NERC's VRF definitions. NERC's VRF definitions are listed below:**

   **High Risk Requirement**:
   (a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or
   (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

   **Medium Risk Requirement**:
   (a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**Lower Risk Requirement**: is administrative in nature and
(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or
(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

**Are the current VRFs established correctly?**

☐ Yes
☐ No

**If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification.**
Comments:

4. **The drafting team has modified the Violation Severity Levels for MOD-008 to reflect industry concerns that they were too "pass/fail" oriented. Are the current VSLs established correctly?**

   ☐ Yes
   ☐ No

   **If "No," please identify specific VSLs and suggest changes to the language.**
   Comments:

5. **Please provide any other comments (that you have not already provided in response to the questions above) that you have on MOD-008.**

   Comments:

| | Individual or group. | Name | Organization | Group Name | Lead Contact | Question 1 | Question 1 Comments | Question 2 | Question 3 | Question 3 Comments | Question 4 | Question 4 Comments | Question 5 Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Paul Rocha | CenterPoint Energy | | | | | | | | | | The group of standards is for ATC and TRM methodologies that are not used in ERCOT. CenterPoint Energy is concerned that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these standards, which we believe would not add value to the ERCOT region and could increase congestion in the region. Accordingly, CenterPoint Energy previously submitted comments to these standards asking for an exemption for the ERCOT region. We find the proposed standards unacceptable unless the following provision is added to each standard: This standard does not apply to ERCOT or any other region that operates as a single control area. |
| | Group | | | SERC ATCWG | Doug Bailey | No preference | | | Yes | | Yes | | |
| | Individual | Jack Cashin/Barry Green | EPSA | | | No preference | | We believe that the former requirement R1.2 which established the consistency between planning assumptions and those used in calculation TRM was appropriate and do not agree with its deletion. In R3, the previous draft of the standard required sharing of "underlying documentation, work papers and load flow base cases". In the current draft, the latter two of the listed items have been deleted. It is acceptable to us if this is done merely because they are deemed to be redundant as they are included within the meaning of "underlying documentation". If this was not the intent of the drafters, we would disagree with this change as those are items that would be required in order to reproduce the studies that have led to the posted ATC values. | | no comment | | no comment | This comment relates also to the NAESB recommendation that no additional business practices related to TRM will be developed. Our comments are based also on Order 890 Paragraph 207 which states in part: "The purpose of increasing the consistency and transparency of ATC calculations is to reduce the potential for undue discrimination in the provision of transmission service, specifically by reducing the opportunity for transmission providers to exercise excessive discretion. We find that the amount of discretion in the existing ATC calculation methodologies gives transmission providers the ability and opportunity to unduly discriminate against third parties. In order to minimize this discretion, the Final Rule requires that all ATC components (i.e., TTC, ETC, CBM, and TRM) and certain data inputs, data exchange, and assumptions be consistent and that the number of industry-wide ATC calculation formulas be few in number, transparent and produce equivalent results." EPSA does not believe that the mandate given by FERC to NERC and to NAESB has been carried out. EPSA accepts that in calculating ATC, Transmission operators need a margin, which is deducted from the TTC or AFC as appropriate, to allow for uncertainties in forecast conditions and thus to insure that Transmission Service is not oversold. As it represents an allowance for uncertainties, it is recognized that TRM is based on assumptions about future conditions and is in general, determined probabilistically. However, based on the proposed actions of the two standards development organizations, in order to meet FERC's Order to "increas[e] the consistency and transparency of ATC calculations" and to "reduc[e] the opportunity for transmission providers to exercise excessive discretion" the industry has provided standards that: • Require Transmission Operators to only identify various elements if they are used in establishing TRM. At no point in the standard however, is any direction provided on how the Transmission Operators determine whether or not to use the various components or, if used, how values are to be established. • Make no provision for monitoring or reporting on utilization of TRM • Make no provision for verifying from season to season or year to year whether the values utilized in establishing TRM were or remain appropriate. These standards therefore impose only a minimal requirement for transparency and no requirement for consistency in establishing TRM and no requirement to monitor its usage to verify that assumed values are appropriate. The current NERC and NAESB standards on TRM are reminiscent of the previous NERC standard on ATC which was developed in response to Order 888. It required only that Transmission Operators document their methodology for calculating ATC, much like other fill-in-the-blank standards. Clearly in approving Order 890 and more particularly in Order 693 where they declined to approve other industry fill-in-the-blank standards, FERC has determined that such a standard is insufficient. Yet, with respect to TRM, the industry, through NERC and NAESB, seems prepared to submit standards to FERC that demonstrate that very little progress has been made. |
| | | | | | | | | The Team suggests moving the final phrase of the proposed R3 Requirement to the beginning of the sentence to add clarity. (This is a non-substantive change.) The new R would read: No | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | WECC Market Interface Committee / Sub Committ / ATC Task Force | W. Shannon Black | Yes | | more than 30 calendar days after receiving a request, each Transmission Operator shall make available its TRMID, and if requested, its underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request for that data: | Yes | | Yes | | | |
| | Individual | Jim Usedinger | Kansas City Power & Light | | | No | The Transmission Service Provider should also be listed as an appropriate entity along with the TOP in all requirements, so that either entity could perform this function. | Add "or Transmission Service Provider" after Transmission Operator in all requirements. | Yes | | Yes | | | |
| | Group | | | WECC Market Interface Committee ATC Task Force | W. Shannon Black | Yes | | The Team suggests moving the final phrase of the proposed R3 Requirement to the beginning of the sentence to add clarity. (This is a non-substantive change.) The new R would read: No more than 30 calendar days after receiving a request, each Transmission Operator shall make available its TRMID, and if requested, its underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request for that data: | Yes | | Yes | | | |
| | | | | | | | | Requirement 1: I suggest modifying the requirement to state: "Each Transmission Operator with ATC Path(s) and with TRM shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following | | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | H. Steven Myers | ERCOT ISO | | | No preference | | information:" Requirement 2: I suggest modifying the requirement to state: "Each Transmission Operator with ATC Path(s) and with TRM shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM." Requirement 3: I suggest modifying the requirement to state: "Each Transmission Operator with ATC Path(s) and with TRM shall make available its TRMID, and if requested, underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request no more than 30 calendar days after receiving the request." | | | | | |
| | | | | | | | | In MOD-008-1 the following requirement was removed: R1.2.A A statement to confirm that it shall use assumptions in calculating TRM that are consistent with those assumptions that are used in the Transmission planning process for the time period studied". The NERC ATCWG reached conclusion on the following rule as they were developing the “Transmission Capability Margins and Their Use in ATC Determination” white paper which discusses the reliability margins of TRM and CBM: A Transmission | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | Provider's ATC/AFC calculations, and associated margins, must be consistent with the Transmission Owners' and Public Power Entities documented Planning Criteria This rule was incorporated into the "Transmission Capability Margins and Their Use in ATC Determination" white paper dated June 17, 1999 as demonstrated in the following exert: Ø "The methodology used to derive TRM and its components must be documented and consistent with published planning criteria, and must not account for uncertainties already accounted for elsewhere in the ATC determination. A TRM is considered consistent with published planning criteria if the same components that comprise it are also addressed in the planning criteria. The methodology used to determine and apply TRM does not have to involve the same mechanics as the planning process, but the same uncertainties must be considered and any simplifying assumptions explained. It is recognized that ATC determinations are often time constrained and thus will not permit the use of the same mechanics employed in the more rigorous planning process" AFC/ATC calculations must be consistent with each Transmission Owner's planning criteria in order to maintain reliability. AFC/ATC calculations must | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Eric Mortenson | Exelon | | | Yes | | not be subject to evaluation scenarios that exceed or are 'beyond' the applicable planning criteria. For example, if the most extreme event a Transmission Owner plans for were single contingencies, it would be inconsistent with the applicable planning criteria to evaluate a transmission service request to meet a double contingency test. In this instance, evaluating a transmission service request using double contingency analysis would be in conflict with the planning criteria and would not be compatible with the reliability requirements used to serve native connected load. In an ATC calculation the following components determine the loading on a flowgate for the period of time under evaluation: 1. Base Case Flows (which recognizes the forecasted load connected to the transmission network and planned system topology) 2. Impacts of existing transmission service reservations -- both positive and negative (i.e. counterflow) 3. TRM (consistent with applicable Planning Criteria) 4. CBM (consistent with applicable Planning Criteria) When these four components are applied to a flowgate the result is a calculated AFC. If the resultant AFC is negative, the result indicates that the flowgate is projected to be overloaded because of the preexisting commitments (i.e. | | | | | |

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | the four components listed above). In some cases negative AFC values exist for future years preventing transmission customers from obtaining transmission reservations for these future time periods. The inconsistency between Transmission Provider's AFC/ATC calculations and the Transmission Owner's Planning criteria becomes evident when the Transmission Owner internal planning processes does not result in identification of system deficiencies requiring system expansion – even on Flowgate determined by the Transmission Provider to have negative AFC values far into the future. The likely cause of this discrepancy is that the TO is not applying the same scenario, including the same transmission uses (i.e. confirmed reservations), or consistent margins (TRM/CBM) in its internal planning process. | | | | | |
| Individual | Maria Neufeld | Manitoba Hydro | | | No preference | | | Yes | | Yes | | |
| Group | | | NERC RTOSDT | Jim Case, Chair | | | | | | | | The Real Time Operation Standards Drafting Team is concerned that the proposed MOD standards do not include any reference to the Planning and Operating Limits mandated by the current FAC, IRO and TOP standards. These standards already include transmission flow limits both in the longer term planning time frame as well as the shorter term operating time frame. The proposed MOD standards seem to be establishing procedures to calculate the commercial boundaries without a direct link to the required reliability boundaries. ============================================================ MOD-001 R6 states that the TTC "use assumptions" no more limiting than those used in planning. The RTO SDT would ask shouldn't TTC's be required to be "no less limiting" than the SOLs / IROLs computed for the system? Current NERC standards are not just asset limits, they are also system limits. The current standards require that limits be calculated that recognize both local and wide-area impacts. The RTO SDT believes that by at least linking (if not entirely eliminating) the MOD standards to the current SOLs / IROLs requirements, the Industry would be more correctly linking how the system MUST BE operated to any NAESB business practice. Indeed it would seem that current tariffs are based on the computations used in current planning and operating environments. By using the current SOL / IROL limits the procedural / prescriptive requirement in MOD-001 R9 et al would be unnecessary (i.e. they would revert back to the FAC and IRO requirements) The questions for the ATC SDT: • How do these MOD standards relate to the SOLs / IROLs • Why should these ATC/TTC limits be decoupled from the SOLs / IROLs • Shouldn't the long-term SOL / IROL limits computed in Planning be the TTC for the system (or at least the basis for the TTC) • Shouldn't the short-term SOL / IROL be the basis for the ATC for the system? MOD-008 computes margins. By coordinating the MOD standards with the SOL / IROL standards, the only Business (not NERC) requirement may be to define the options on how the TSP could couple the various SOL / IROL values that it obtains from its RCs and TOPs. MOD-028 By using SOLs / IROLs there would be no need to get into ATC / AFC "methodologies". Indeed standards that include "alternatives" are not defining a single "standard approach". But by using specific planning and operating limits the methodologies become irrelevant. The "limit" becomes explicit and well-defined. Any margins or variations about those limits would then be obvious and transparent. |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | What is most important is respecting the reliability-based limits and not how the commercial value is computed. If this idea of using SOLs / IROLs as the limit(s) or at least the basis for those commercial limits, then the TSP becomes a coordinator of which values to use for the commercial periods. The TSP would not be the computer of those limits. Thus MOD-028 could become a business practice for posting – rather then a standard for computations. |
| | Group | | | NPCC Regional Standards Committee | Guy V. Zito | Yes | | None | | | Yes | | The language in the Proposed Effective Date should be modified to be consistent with the other standards |
| | Group | | | FirstEnergy | Doug Hohlbaugh | No | Within many RTO areas it is the TSP who maintains the TRM Methodology and assures its appropriate implementation while calculating ATC or AFC. This is the case in a large portion of the continent and a standard should not be written in a way that would knowingly require an assignment delegation for a large number of potential responsible entities. Assigning the applicability in this standard to the TSP would work for non-market areas of the continent since in those areas the TOP most likely serves as its own TSP. | R2 – This requirement states "Each Transmission Operator shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM." We recommend replacing "only use" with "include" since "only use" presumes that the list of uncertainties stated in the standard are all inclusive of all factors that a TOP/TSP may want to address in TRM. The requirement explicitly states that CBM should not be included in TRM, so making this change should not create an opportunity for double dipping on CBM. | Yes | FE supports the SDT's adjustment of VRFs such that no VRF within the ATC standards exceeds a "Lower" rating. We concur with the team's reasoning and rationale provided in response to ballot comments in making this change. | No | The Severe VSL stated for requirement R2 does not seem appropriate if a TOP/TSP included elements of uncertainty that were outside of those items explicitly stated in R1 so long as all of the items in R1 are covered AND that CBM is not included in its TRM. See proposed change above for R2. | FirstEnergy appreciates the Standard Drafting Team's decision to move to a formal comment period based on the prior initial ballot feedback. We commend the team for moving quickly to respond to the ballot comments and providing the industry a revised set of standards to review and comment. Regarding the revision to the Effective Date, while FirstEnergy agrees that there is a need to ensure that the standard is implemented consistently across the entire continent we are concerned with the Effective Date being subject to approval of ALL regulatory authorities. We believe an appropriate Implementation Plan should reflect a period of time beyond the NERC Board of Trustee approval date that would reflect when the requirements are considered mandatory and enforceable. The timeline should allow sufficient time for regulatory authority reviews, with the intent of sanctions also being enforced in conjunction with the conclusion of the implementation period. However, a delay from a given regulatory agency should not impact when the requirements are considered mandatory and enforceable for the bulk electric system. |
| | Individual | Thad Ness | AEP | | | No | The Transmission Service Provider is the applicable entity. | | | | | | |
| | Group | | | Public Service Commission of South Carolina | Phil Riley | No preference | | | Yes | | Yes | | |
| | Individual | Patrick | PJM | | | Yes | | Although the SDT had the appropriate Team to establish a default percentage for TRM, the FERC deadline did not allow enough time to complete this portion of the requirement. Since TRM is a reliability margin, PJM encourages the Team to provide what ever input it currently has in a 'parking lot' for a possible future Team to | Yes | PJM supports NERC's position to revise all Violation Risk Factors to have an assigned risk factor of "Lower." A Lower Risk Factor requirement is administrative in nature and is a requirement | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but PJM has a concern regarding the | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Brown | | | | | | undertake the development activity. There should be a default percentage to be used without requiring specific documentation, work papers and load flow cases if a straight percentage such as 5% is used. Additional information would be required only if a greater percentage is used. | | that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system. | | possibility of multiple violations resulting from a single event. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations –this language to be added to the standard. | |
| | Individual | Greg Rowland | Duke Energy Corporation | | | Yes | | | Yes | | Yes | | Implementation Plan – Since R2 and M2 link the TRM calculation methodology with the CBM methodology in MOD-004, implementation dates for these standards should be aligned. Since R2 and M2 link the TRM calculation methodology with the CBM methodology in MOD-004, the Standards Drafting Team must avoid creating a duplicate requirement the CBM standard, which could subject entities to multiple penalties for the same violation. |
| | Group | | | Bonneville Power | Denise Koehn | Yes | | BPA does not believe any are incorrect. | Yes | | Yes | | BPA respectfully submits the following observations and suggestions: a. The sixth component of uncertainty listed in R1.1 should be expanded as follows: - Variations in generation dispatch (including forced or unplanned outages, maintenance outages, and location of future generation). b. To comply with FERC Order 890 transparency requirements, R1.5 should not be removed (e.g. "If TRM is not used, a statement of that practice.") – BPA believes a Transmission Operator should be required to provide a robust justification as to why it is not using TRM in it's ATC or AFC calculations. c. A new R6 should be added that clearly states the timeframe in which TRM is to be used (i.e. within the hour). d. The Time Horizons listed for all requirements should include the "Long-term Planning" Horizon, as TRM is to be calculated beyond the seasonal window. e. Balancing Authorities may be appropriately identified as Applicable Entities in this MOD and request that the Standards Drafting Team provide an explanation as to why they are not listed. |
| | Individual | Greg Ward / Darryl Curtis | Oncor Electric Delivery | | | No preference | | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path (s). | Yes | | Yes | | This standard should not apply to ERCOT for the reason expressed in question 2. |
| | | | | | | | | PHI supports the | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Richard Kafka | Pepco Holdings, Inc | | | Yes | | comments of PJM and will not submit duplicate comments | | | | | |
| | Individual | Earl Fair | Gainesville Regional Utilities | | | No | I would suggest the TSP and let that entity negotiate, via mutual agreement, to delegate these task. | R2: Why limit what items can be considered in developing TRM? What reliability purpose could it possibly serve? R1,3,4 & 5 are OK as presented. | Yes | | Yes | | None at this time. |
| | Group | | | ISO RTO Council/Standards Review Committee (SRC) | Charles Yeung | Yes | | | Yes | The MOD standards assess the correct amount of reliability risk in areas that do not affect reliability. The IRC supports the position that no requirement from this set of ATC standards should have an assigned Risk Factor exceeding "Lower". A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but the IRC has a concern regarding the possibility of multiple violations resulting from a single event. The IRC requests that the potential for double counting of violations for a single event be eliminated. | Although the SDT had the appropriate Team to establish a default percentage for TRM, the FERC deadline did not allow enough time to complete this portion of the requirement. Since TRM is a reliability margin, the IRC encourages the Team to provide what ever input it currently has in a 'parking lot' for a possible future Team to undertake the development activity. There should be a default percentage to be used without requiring specific documentation, work papers and load flow cases if a straight percentage such as 5% is used. Additional information would be required only if a greater percentage is used. |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | restore the bulk power system. | | | |
| | Group | | | MRO NERC Standards Review Subcommittee | Tom Mielnik | Yes | | 1. The MRO believes that M1 should be revised to delete the words "all" from the phrase "all specified information…". This use of "all" seem to be unnecessary and may result in over-the-top auditing. 2. The MRO commends the SDT on deleting R1.2.A and R1.5. The MRO believes that these former requirements were unnecessary and not reliability related and that the changes are significant improvements to the standard. 3. The MRO is asking for clarification in R1.1 on "Reserve sharing requirements". The MRO is assuming that this is not non-operating reserves such as planning reserves. 4. R1.1, bullet 7 reads: Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window). The "59-minute window" conflicts with BAL-002. Under BAL-002, operating reserves can be supplied for up to 105 minutes (R4.2 15 minutes for the disturbance plus R6.2 90 minutes). We suggest the following wording instead: "(Operating Reserve actions not exceeding the operating reserve sharing deployment period)". | Yes | The MRO commends the SDT on revising the VRFs to Lower. We believe the revised VRFs are in-line with the NERC definitions of the VRF levels. | Yes | | 1. The MRO commends the SDT in making significant changes to this standard and reissuing it for comment. The MRO believes the eventual standard that is approved will serve the industry and customers better as a result. 2. The MRO believes that the first time you use an abbreviation or acronym, you must spell out the full term followed by the abbreviation or acronym in brackets. Subsequent use of the term is then made by its abbreviation or acronym. |
| | | | | | | | | | | The VRF for R4 should be a Medium. R4 stipulates that the TOP establish a TRM. Given that TRM is that portion of the ATC reserved to cover for | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Ron Falsetti | Ontario IESO | | | Yes | | None | No | uncertainties that can affect transmission reliability, failure to establish this value could result in the TOP facing unreliable operations due to the TSP offering and committing this value as a transmission service to transmission users. The end result could have a direct impact on the control and reliability of the BES. | Yes | | The language in the Proposed Effective Date should be modified to be consistent with the other standards |
| | Individual | Alessia Dawes | Hydro One Networks | | | Yes | | none | Yes | | Yes | | Language in the Proposed Effective Date should be modified to be consistent with the other standards, e.g. MOD-001-1 |
| | Group | | | Entergy Services Inc. | Narinder K. Saini | Yes | | R2- Entergy recommends deleting the phrase "and shall not include any of the components of Capacity Benefit Margin (CBM). | Yes | | Yes | | |
| | Individual | John Harmon | The Midwest ISO | | | Yes | | R1.1 – Please clarify the uncertainty components below: o Allowances for simultaneous path interactions (how is it different from loop flow above?) o Short-term System Operator response (Does this exclude reserve sharing requirements?). R2 – This requirement as it is written doesn't allow the Transmission Operators to include any other uncertainties other than from R1.1. If R1.1 is not trying to list the complete set of uncertainties, we recommend to revise R2 to "Each Transmission Operator shall not include any of the components of Capacity Benefit Margin (CBM). ..." | Yes | | Yes | | |
| | Group | | | Southwest Power Pool | Kevin Bates | Yes | | | Yes | | | | |
| | | | | | | | | Modification Requirement 1: Each TOP shall prepare and keep current a Transmission Reliability Margin | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Jason Shaver | American Transmission Company | | | Yes | We agree that the Transmission Operator is the correct entity but are concerned with the inserted exlcusion. Why did the SDT insert the exclusion in this draft of the Standard? (No previous drafts contained this exclusion.) How would a TOP go about notifing NERC that MOD-008 is not applicabile to them? How would NERC or the Regions know if something changed and the TOP is now performing TRM? When would this standard apply to a TOP that does not currenlty perform a TRM? An alternate approach is to have TOPs that do not perform TRMs, cerify yearly that they do not peform TRMs and therefore satisfy MOD-008-1. | Implementation Document (TRMID) that includes the following information: The phrase "as a minimum" is not needed because the TOP has to include all sub-requirement in order to meet requirement 1. Any information above that which is listed is outside of NERC's audit. Modifications to Requirement 4: Each TOP shall establish TRM values in accordance with the TRMID at least once every 13 months. Modification to Requirement 5: The TOP shall provide the TRM values to its TSP (s) and TP(s) no more than seven calendar days after a TRM value is initially established or subsequently changed. The phrase "using TRM" conflicts with Requirements 1 - 3. In addition we believe the deletion aligns with our comment on the applicability section. M1 should be revised to delete the words "all" from the phrase "all specified information..." to avoid being overly inclusive. | Yes | | Yes | | The first time that each abbreviation or acronym is introduced, the full terminology should be stated followed by the abbreviation or acronym in brackets (i.e. ATC). The Proposed Effective Date for MOD-008-1 is different then that written for MOD-001-1. Why the difference in the Effective Date? We do not believe that the SDT has to provide a definition of TRMID. Requirement 1 outlines the specifics of TRMID and we find the definition unnecessary. The SDT should explain why this definition is necessary and what if anything is it including that the requirement does not already contain. |
| | | | | | | | We feel that the applicability should apply to the TSP, recognizing that the TSP will require input from the TOP. To further explain, the ATC/AFC methodology is primarily a mechanism for the TSP to sell/provide transmission service in a manner that ensures the transmission system is secure. A TOP however will utilize SOLs and IROLs in | R1.1, bullet 7 reads: Short-term System Operator response (Operating Reserve actions not exceeding a | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Alice Druffel | Xcel Energy | | | No | the operations of the transmission system, and do not necessarily have to be the same as the ATC/AFC components. As an example, in the selling of service, TRM will not be sold so the limit =TTC-TRM. However the TOP may operate into the TRM during real-time operations and not hold this margin, but honor the true system limit. As another example, there are interdependent flowgates where the ATC components will be based on the most conservative combination, but the system will be operated to minimize restrictions. This may result in a sliding operating limit for the TOP based on actual conditions, while a TSP has to use the most conservative limits for ATC/AFC. | 59-minute window). The "59-minute window" seems arbitrary and potentially conflicting. We suggest the following wording instead: "(Operating Reserve actions not exceeding the reserve sharing deployment period)". If the drafting team does not like the suggestion, then please clarify what is the basis for an odd # of minutes, instead of using more common 1/4 or full hour incriments? Under BAL-002, operating reserves can be supplied for up to 105 minutes (15 minutes for the disturbance plus 90 minutes). | Yes | | Yes | | |
| | Individual | Rex McDaniel | Texas-New Mexico Power company | | | No preference | | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Texas-New Mexico Power Company is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, TNMP believes that | Yes | | Yes | | This standard should not apply to ERCOT for the reason expressed in question 2. |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. TNMP strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path (s). | | | | | |
| | Group | | | PPL Supply Group | Annette Bannon | | | R3. PPL suggests that the Purchasing/Selling Entities should be included in the listing of entities under Requirement R3. | | | | | |
| | Individual | Tony Kroskey | Brazos Electric Power Cooperative, Inc. | | | Yes | The TOP is the responsible entity however, if the TOP operates in a single-control area region the establishment and applicability of TRM may have no reliabilty benefits. | | | | | | Brazos Electric believes that for a TOP operating in a single-control area region like ERCOT that the establishment of TRM may have no reliability benefits. The Applicability Section 4.1 for MOD-008 as written in this draft states "Transmission Operators that maintain TRM" could possibly be interpreted that this applies only to those TOPs who have a need to establish TRM because of the region it operates in. Otherwise in R1 it is reconmmended that an "if applicable" clause be inserted to address this issue. |
| | Group | | | Electric Service Delivery | Reza Ebrahimian | | | | | | | | These comments are filed on behalf of City of Austin d/b/a Austin Energy to address proposed NERC 5 MOD Standards. Austin Energy is a municipally owned electric utility and a transmission service provider with the Electric Reliability Council of Texas (ERCOT). ERCOT now operates as a Single Balancing Authority with no explicit transmission services being sold. Current ERCOT market rules allow open transmission access to all loads and resources. ERCOT will continue to operate as a Single Balancing Authority under Nodal market design. Accordingly, as explained in more detail below, the NERC 5 MOD Standards should not be applied to ERCOT and transmission service providers within ERCOT under its current or proposed Nodal market design. Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. Applicable definitions: According to NERC Reliability Standards Glossary of Terms, Available Transfer Capability (ATC) is defined as: "A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability (TTC) less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin (CBM), less a Transmission Reliability Margin (TRM), plus Postbacks, plus counterflows". TTC is defined as: the amount of electric power that can be transferred over the interconnected transmission network in a reliable manner while meeting all of a specific set of defined pre- and post-contingency system conditions. CBM is defined as the amount of transmission transfer capability reserved by load serving entities to ensure access to generation from interconnected systems to meet generation reliability requirements. TRM also is a component of ATC defined as: that amount of transmission transfer capability necessary to ensure that the interconnected transmission network is secure under a reasonable range of uncertainties in system conditions. Comments: ERCOT is an interconnection and a region with no synchronous AC ties with any other interconnections. In July 2001, based on a deregulated Retail and restructured Wholesale Markets, the ERCOT interconnection began acting as a Single Balancing Authority. The ERCOT market is designed such that there are no explicit transmission services being sold, hence, Available Transfer Capability (ATC) is not a measure used in a commercial activity within the ERCOT market. The current ERCOT market rules allow open transmission access to all eligible loads and resources without considering any specific Transmission Service Provider (TSP). Transmission facilities ratings are based upon individual branch element designs and in cases of dynamic ratings, ambient conditions are also considered. ERCOT has several DC ties and an asynchronous tie using a Variable Frequency Transformer (VFT); however, the associated interchange capabilities are planned and coordinated by the TSPs involved. The current ERCOT Zonal Market uses a flow based congestion management methodology to predict potential congestions in the Day Ahead and Adjustment Periods. During the operating period, generation shift factors are used to determine the dispatch needed to remain within the constrained limits. The local congestions are managed using full AC load flow analysis and unit specific redispatch. MOD-001-1 is entirely about methodology and calculation of ATC, therefore, this standard is not applicable to ERCOT. MOD-008-1 covers Transmission Reliability Margin (TRM) methodology calculation. Mathematically, ATC is defined as Total Transfer Capability (TTC) less the TRM and Capacity Benefit Margin (CBM). Therefore, TRM also is not applicable to ERCOT. MOD-028-1 covers Area Interchange calculation Methodology. Since ERCOT is a single control area, Area Interchange calculation is not applicable. MOD-029-1 covers Rated System Path Methodology, which is used to |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | calculate TTC and ATC calculations. Therefore MOD-029-1 is not applicable to ERCOT. MOD-030-1 covers Flowgate methodology calculation of ATC, and therefore, is not applicable to ERCOT. ERCOT is currently transitioning to a Nodal Market, with a scheduled start date of December 1, 2008. The Nodal Market uses a Security Constrained Economic Dispatch (SCED) approach to dispatch individual generating units and manage congestion. In the Nodal Market, ERCOT will still operate as a Single Balancing Authority. This again will not use ATC methodology, and aforementioned standards are not applicable to ERCOT in its ensuing Nodal Market. Therefore, Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. |
| | Individual | Aaron Staley | Orlando Utilities Commission | | | No preference | | | Yes | | Yes | | Requirements 1, 3, 4 and 5 are great exactly as they are. They are a good balance of standardization, disclosure and recognition that different parts of the transmission system function differently and are most sensitive to different factors. For Requirement #2, what is the reliability purpose for limiting the items that an entity can consider when establishing TRM? |
| | Individual | Rick Gonzales | New York Independent System Operator | | | Yes | | The NYISO has previously commented that R4 would require TRM to be recalculated more frequently than necessary for Transmission Operators whose TRM assumptions do not change frequently. Under the NYISO system, TRM values are stable over time and often do not change for periods longer than 13 months. The NYISO therefore renews its request that the SDT modify R4 to specify that TRM need not be re-established (or re-calculated) every 13 months to the extent that none of the underlying TRM inputs have changed. The SDT has previously revised R8 under MOD-001 in the same manner and there is every reason to make the same change to R4 under MOD-008. | Yes | | | | |

**Consideration of Comments on Draft Standard — MOD-008-1 — Project 2006-07**

The ATC Standards Drafting Team thanks all commenters who submitted comments on the draft standard MOD-008-1 – Transmission Reliability Margin Calculation Methodology. This standard was posted for a 30-day public comment period from April 16, 2008 through May 15, 2008. The stakeholders were asked to provide feedback on the standard through a special electronic Standard Comment Form. There were 33 sets of comments, including comments from 103 different people from approximately 60 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

There were some comments that led the drafting team to modify language to improve clarity, but none of the changes made by the drafting team changed the scope or intent of the requirements in the standard.

**Applicability**

- Transmission Operator or Transmission Service Provider - The April 2008 request for comments asked the industry to express their opinion on whether or not the Transmission Operator was the correct entity to be responsible for TRM. The results where 18 in favor of the TOP as the responsible entity, 5 against and 8 who had no preference. Some of the commenter's on this and other comment forms have asked for a "or" entry where the TOP or the TSP could be responsible. Current NERC standards have been written so that only one entity is (or multiple entities are) the responsible entity; so there is no question on who is accountable for a requirement. There has not yet been a standard written that established an "or" where it could be one or the other. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry. While the response to this questionnaire may not be a definitive survey of the industry preference, the team is going to go with the majority of the respondents and keep the standard as written, with the TOP responsible. For those for whom this does not result in a perfect fit with their current method of doing business, delegation of task, contract, adoption of another's work, an entity/regional/interconnection variance, or the use of a Joint Registration Entity may be appropriate means for meeting this requirement in addition to changing their current method.

- Several entities had questions and comments regarding the applicability statement in the standard and the language in some of the requirements. The team made no changes to the standard in regard to this but did paraphrase the applicability statement in some of the responses. The requirements in the standard only apply to those Transmission Operators that maintain a TRM value, and do not establish a requirement for an entity to maintain a TRM.

- Several entities have continued to express concern regarding the applicability of the ATC, TRM, and CBM standards. While the drafting team has attempted to write the standards in ways that are flexible and allow for organizational diversity, we note that FERC Order 890 makes reference to the use of Variances. Entities with non-traditional physical transmission markets or that have alternative ATC methodologies that meet or exceed the NERC ATC standards may wish to consider requesting one or more Variances related to these standards.

**Requirements**

- R1.1 - There were several respondents who asked questions about, made suggestions to or sought clarification on the list of uncertainties. The team modified the list slightly to further expand the list of transmission system topology differences, generation dispatch differences and to remove the timing requirement from the reserve sharing item.

- R2 - Several respondents questioned the reliability benefit of requirement 2, which limited the items that can be considered and forbids the use of elements of CBM. Requirement 2 is included in the standard as a direct response to the request of FERC in Order 890 that specified the standard should include a list of uncertainties and should restrict the utilities from straying from that list, or using any element of CBM in TRM.

**Compliance**

- The industry opinion regarding Violation Risk Factors for this standard as expressed in this request for comments indicates a preference 23 to 1 in favor of the current Violation Risk Factors, which are lower. The team once again iterates that it believes that per the current NERC definitions of violation risk factors, no part of this standard (TRM) if not correctly applied would have a direct affect on the state or capability of the bulk power system.

- The industry opinion regarding Violation Severity Levels for this standard as expressed in this request for comments indicates a preference 20 to 3 in favor of the current Violation Severity Levels. One commenter expressed concern on R2 having only a single VSL of severe. The drafting team believes that if a requirement is a pass/fail, and therefore has only one "VSL" that VSL has to be severe. VSL srefer to how badly a requirement was missed, not to the criticality of that particular requirement. Violation Risk Factors address the criticality of a particular element.

- Two other commenters expressed concerns on double jeopardy in the standard, or having a single event result in multiple violations. While this is an issue that has to be addressed by the compliance side of NERC and its policies, the team did review the standards with this concept in mind. As a result of this review the team revised the wording on the VSL's for Requirement 5 to reinforce that an incorrect value developed under R4, that was properly made available per R5, is not a violation of R5.

**Concepts**

- Several entities had questions and comments regarding the team developing a universal (mandatory) or default (recommended) TRM value. The team does not believe the have sufficient information or time in the process to gather the information, to establish a universal TRM. The transmission system varies between regions and even within regions and to arbitrarily select a TRM value or method would result in some areas suffering either an inappropriate decrease in reliability, an unnecessary decrease in market access, and more likely a mix of these problems across the entities that follow NERC standards. By the same measure the team has declined to establish a default or recommended TRM methodology or percentage, again because the team felt that lacked sufficient technical information to provide a value that was not arbitrary. The team has encouraged several respondents to pursue a white paper request or follow up SAR request to develop a dedicated team for looking at this issue.

- Several commenters questioned the removal of the tie between TRM and long term planning. The other MOD standards tie parts of the ATC development process to appropriate parts of the planning process to insure consistency and fair treatment. TRM since it applies to all users of a path will insures equal treatment to all users. All FERC Jurisdictional entities are required to have an Attachment K (planning process), this process allows market participants access to the utilities planning process, and thereby the opportunity to questions the entity on their TRM and how it is accounted for in their long term plans.

**Implementation**

- A popular comment related to the implementation plan. Because MOD-008 can be implemented independent of the other standards and because MOD-008 being implemented in one area and not another would not cause a coordination problem, the standard team is keeping the current implementation language.

**Variance**

The SDT believes it may be helpful to the industry to review the process for Variances. The Variance process can work either concurrent with or independent of the development of a standard. Because the drafting team working on a particular standard is likely to already have the necessary expertise to participate in the development of the Variance, concurrent development is generally more efficient. However, this may not always be practical; in this case, standards drafting may proceed, and even complete, prior to the development and approval of Variances. In this case, entities should seek to develop those Variances and seek their approval prior to the effective date of the standard. An entity is not exempt from meeting the requirements of the standard if the effective date has passed and that entity is in the process of developing a Variance.

The NERC process allows for three different types of variances:

- An Entity Variance
- A Regional Variance less than an Interconnection
- A Regional Variance on Interconnection-Wide basis

The NERC Rules of Procedure describe an Entity Variance as follows:

> Entity Variance — Any variance from a NERC reliability standard that is proposed to apply to one entity or a subset of entities within a limited portion of a regional entity, such as a variance that would apply to a regional transmission organization or particular market or to a subset of bulk power system owners, operators, or users, shall be approved through the regular standards development process defined in the NERC Reliability Standards Development Procedure and shall be made part of the applicable NERC reliability standard.

Entities seeking an Entity Variance should draft a SAR to request that Variance. In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately). In both cases, the Variance will be compared to the standard to ensure the requester is addressing the reliability goals of the standard. The ballot body is comprised of any member of the Registered Ballot Body that is interested and registers to join the ballot pool. Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe a Regional Variance Less Than an Interconnection as follows:

> Any regional variance from a NERC reliability standard that is proposed to apply for a regional entity, but not for an interconnection, shall be approved through the NERC Reliability Standards Development Procedure, except that only members of the registered ballot body located in the affected interconnection shall be permitted to vote; and the variance shall be made part of the applicable NERC reliability standard.

Entities seeking a Regional Variance Less Than an Interconnection should draft a SAR to request that Variance. In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately). In both cases, the Variance will be compared to the standard to ensure the requestor is addressing the reliability goals of the standard. The ballot body is comprised of any interested entities that that have registered with NERC and is a user, owner, or operator of facilities located within the interconnection in which the region requesting the Variance is located. Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe a Regional Variance on an Interconnection-wide Basis as follows:

> An interconnection-wide regional variance from a NERC reliability standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with other applicable standards of governmental authorities shall be made part of the NERC reliability standard. NERC shall rebuttably presume that a regional variance from a NERC reliability standard that is developed, in accordance with a procedure approved by NERC, by a regional entity organized on an interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest.

Entities seeking a Regional Variance on an Interconnection-wide Basis should draft that Variance using the regional standards development process described in the region's delegation agreement. In that Variance, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Once approved through the regional standards development process, the Variance should be brought to NERC for filing with the appropriate regulatory authorities.

Based on the comments received, the drafting team is recommending that the Standards Committee authorize moving these standards forward to posting for pre-ballot review.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standard can be viewed in their original format at:

[http://www.nerc.com/~filez/standards/MOD-V0-Revision.html](http://www.nerc.com/~filez/standards/MOD-V0-Revision.html)

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. Some entities have indicated they believe the Transmission Operator should not be an applicable entity in the TRM standard (MOD-008). The Drafting Team believes that the Transmission Operator is the appropriate entity since the Transmission Operator is ultimately responsible for operating a reliable system while using all Transmission Service Providers' calculated available capability. The drafting team also believes that the Transmission Operator can, via mutual agreement, delegate these tasks to other entities (such as Transmission Service Providers, ISOs, or RTOs). Do you believe the Transmission Operator is the correct responsible entity for the tasks it has been assigned in MOD-008? If "No," please identify requirements where the Transmission Operator is incorrect and specify who the correct entity should be.

**Summary Consideration:**

The April 2008 request for comments asked the industry to express its opinion on this issue. The SDT received 18 comments in favor of the TOP as the responsible entity, 5 comments against and 8 comments that specified no preference. Some of the commenters on this and other comment forms have asked for an "or" entry where the TOP or the TSP could be responsible. Current NERC standards have been written so that only one entity is (or multiple entities are) the responsible entity; so there is no question on who is accountable for a requirement. There has not yet been a standard written that established an "or" where it could be one or the other. Given that restriction, the requirement has to be written for only one entity.

It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry. While the response to this questionnaire may not be a definitive survey of the industry preference, the team is going to go with the majority of the respondents and keep the standard as written, with the TOP responsible. For those for whom this does not result in a perfect fit with their current method of doing business, delegation of task, contract, adoption of another's work, an entity/regional/interconnection variance, or the use of a Joint Registration Entity may be appropriate means for meeting this requirement in addition to changing their current method.

| Organization/Group | Question 1: | Question 1 Comments: |
|---|---|---|
| Xcel Energy | No | We feel that the applicability should apply to the TSP, recognizing that the TSP will require input from the TOP. To further explain, the ATC/AFC methodology is primarily a mechanism for the TSP to sell/provide transmission service in a manner that ensures the transmission system is secure .A TOP however will utilize SOLs and IROLs in the operations of the transmission system, and do not necessarily have to be the same as the ATC/AFC components. As an example, in the selling of service, TRM will not be sold so the limit =TTC-TRM. However the TOP may operate into the TRM during real-time operations and not hold this margin, but honor the true system limit. As another example, there are interdependent flowgates where the ATC components will be based on the most conservative combination, but the system will be operated to minimize restrictions. This may result in a sliding operating limit for the TOP based on actual conditions, while a TSP has to use the most conservative limits for ATC/AFC. |
| **Response:** The April 2008 request for comments asked the industry to express their opinion on this issue The SDT received 18 comments in favor of the TOP as the responsible entity, 5 comments against and 8 comments that specified no preference Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is | | |

| Organization/Group | Question 1: | Question 1 Comments: |
|---|---|---|
| no allowance for one entity “or” another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. TRM applies only to the calculation of ATC, and is not an operational requirement on the TOP that would restrict its actions. | | |
| Kansas City Power & Light | No | The Transmission Service Provider should also be listed as an appropriate entity along with the TOP in all requirements, so that either entity could perform this function. |
| **Response:** The April 2008 request for comments asked the industry to express their opinion on this issue The SDT received 18 comments in favor of the TOP as the responsible entity, 5 comments against and 8 comments that specified no preference. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity “or” another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. | | |
| FirstEnergy | No | Within many RTO areas it is the TSP who maintains the TRM Methodology and assures its appropriate implementation while calculating ATC or AFC. This is the case in a large portion of the continent and a standard should not be written in a way that would knowingly require an assignment delegation for a large number of potential responsible entities. Assigning the applicability in this standard to the TSP would work for non-market areas of the continent since in those areas the TOP most likely serves as its own TSP. |
| **Response:** The April 2008 request for comments asked the industry to express their opinion on this issue The SDT received 18 comments in favor of the TOP as the responsible entity, 5 comments against and 8 comments that specified no preference. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity “or” another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. | | |
| AEP | No | The Transmission Service Provider is the applicable entity. |
| **Response:** The April 2008 request for comments asked the industry to express their opinion on this issue. The SDT received 18 comments in favor of the TOP as the responsible entity, 5 comments against and 8 comments that specified no preference. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity “or” another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. | | |
| Gainesville Regional Utilities | No | I would suggest the TSP and let that entity negotiate, via mutual agreement, to delegate these task. |

| Organization/Group | Question 1: | Question 1 Comments: |
|---|---|---|
| **Response:** The April 2008 request for comments asked the industry to express their opinion on this issue. The results where 18 in favor of the TOP as the responsible entity, 5 against and 8 who had no preference. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity "or" another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. | | |
| American Transmission Company | Yes | We agree that the Transmission Operator is the correct entity but are concerned with the inserted exclusion. Why did the SDT insert the exclusion in this draft of the Standard? (No previous drafts contained this exclusion.)How would a TOP go about notifying NERC that MOD-008 is not applicable to them? How would NERC or the Regions know if something changed and the TOP is now performing TRM? When would this standard apply to a TOP that does not currently perform a TRM? An alternate approach is to have TOPs that do not perform TRMs, Certify yearly that they do not perform TRMs and therefore satisfy MOD-008-1. |
| **Response:** The April 2008 request for comments asked the industry to express their opinion on this issue. The SDT received 18 comments in favor of the TOP as the responsible entity, 5 comments against and 8 comments that specified no preference. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity "or" another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. | | |
| Brazos Electric Power Cooperative, Inc. | Yes | The TOP is the responsible entity however, if the TOP operates in a single-control area region the establishment and applicability of TRM may have no reliability benefits. |
| **Response:** Thank you for your supportive comment. | | |

2. The drafting team modified some requirements and associated measures to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct. Incorrect Requirement(s) or Measure(s):

**Summary Consideration:**

Several entities had questions on requirements applying to TOP's or TSP's. A summary of the team's resolution is presented in the "summary consideration" for question #1.

Several entities had questions and comments regarding the applicability statement in the standard and the language in some of the requirements. The team made no changes to the standard in regard to this, but did paraphrase the applicability statement in some of the responses. The requirements in the standard only apply to those TOP's who maintain a TRM value, and do not establish a requirement for an entity to maintain a TRM.

Several entities had questions and comments regarding the team developing a universal (mandatory) or default (recommended) TRM value. The team does not believe it has sufficient information or time in the process to gather the information, to establish a universal TRM. The transmission system varies between regions and even within regions; to arbitrarily select a TRM value or method would result in some areas suffering either an inappropriate decrease in reliability, an unnecessary decrease in market access, and more likely a mix of these problems across the entities that follow NERC standards. By the same measure, the team has declined to establish a default or recommended TRM methodology or percentage, again because the team felt that it lacked sufficient technical information to provide a value that was not arbitrary. The team has encouraged several respondents to pursue a white paper request or follow up SAR request to develop a dedicated team to look at this issue.

Several commenters questioned the removal of the tie between TRM and long term planning. The other MOD standards tie parts of the ATC development process to appropriate parts of the planning process to insure consistency and fair treatment. TRM, since it applies to all users of a path, will insure equal treatment to all users. All FERC Jurisdictional entities are required to have an Attachment K (planning process). This process allows market participants access to the utilities' planning processes, and thereby the opportunity to question an entity on its TRM and how it is accounted for TRM in its long term plans.

Several respondents questioned the reliability benefit of requirement 2, which limits the items that can be considered and forbids the use of elements of CBM. Requirement 2 is included in the standard as a response to the directive in FERC Order 890 that specified the standard should include a list of uncertainties and should restrict the utilities from straying from that list, or using any element of CBM in TRM.

There were several respondents who asked questions about, made suggestions to, or sought clarification on the list of uncertainties. The team modified the list slightly to further expand the list of transmission system topology differences, generation dispatch differences and to remove the timing requirement from the reserve sharing item.

| Organization/Group | Question 2 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| EPSA | We believe that the former requirement R1.2 which established the consistency between planning assumptions and those used in calculation TRM was appropriate and do not agree with its deletion.<br>**Response:** The TRM standards should apply only to the calculation of TRM and its application for the determination of ATC. The team removed the consistency clause in response to comments and supports this with three reasons. The first being that any requirement linking TRM methodology with planning assumptions would need to be in the planning standard, to do otherwise is to create the potential for conflicting standards where meeting both is not possible. Second, the entity's open planning process (as documented in its OATT Attachment K) provides opportunity to address any unfairness between the TRM and its planning process. Finally, TRM is intended to be based on conditions other than those expected, so requiring assumptions to be consistent with those used in planning of operations would be contrary to the goal of TRM.<br><br>In R3, the previous draft of the standard required sharing of "underlying documentation, work papers and load flow base cases". In the current draft, the latter two of the listed items have been deleted. It is acceptable to us if this is done merely because they are deemed to be redundant as they are included within the meaning of "underlying documentation". If this was not the intent of the drafters, we would disagree with this change as those are items that would be required in order to reproduce the studies that have led to the posted ATC values.<br>**Response:** The intent of the requirement is that "underlying documentation" would include work papers, load flow cases and any other reference material used to create the TRM. |
| **Response:** Please see in-line responses. | |
| WECC Market Interface Committee / Sub Commtt / ATC Task Force | The Team suggests moving the final phrase of the proposed R3 Requirement to the beginning of the sentence to add clarity. (This is a non-substantive change.) The new R would read: No more than 30 calendar days after receiving a request, each Transmission Operator shall make available its TRMID, and if requested, its underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request for that data: |
| **Response:** The SDT has tried to use a consistent structure for the requirements, and believes the suggested change would not add sufficient clarity to warrant the change at this time. | |
| Kansas City Power & Light | Add "or Transmission Service Provider" after Transmission Operator in all requirements. |

| Organization/Group | Question 2 - Incorrect Requirement(s) or Measure(s): |
| --- | --- |
| **Response:** The April 2008 request for comments asked the industry to express their opinion on this issue. The SDT received 18 comments in favor of the TOP as the responsible entity, 5 comments against and 8 comments that specified no preference. Current NERC standards are written so that only one entity is (or multiple entities are) the responsible entity; so that there is no question on who is accountable for a requirement, there is no allowance for one entity "or" another. Given that restriction, the requirement has to be written for only one entity. It is obvious that neither selection (TSP or TOP) provides a perfect fit for the entire industry, and for those for whom this does not work a delegation of task, an entity variance, or the use of a Joint Registration Entity may be appropriate. | |
| WECC Market Interface Committee ATC Task Force | The Team suggests moving the final phrase of the proposed R3 Requirement to the beginning of the sentence to add clarity. (This is a non-substantive change.)The new R would read :No more than 30 calendar days after receiving a request, each Transmission Operator shall make available its TRMID, and if requested, its underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request for that data: |
| **Response:** The SDT has tried to use a consistent structure for the requirements, and believes the suggested change would not add sufficient clarity to warrant the change at this time. | |
| ERCOT ISO | Requirement 1:I suggest modifying the requirement to state: "Each Transmission Operator with ATC Path(s) and with TRM shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: "<br><br>Requirement 2:I suggest modifying the requirement to state: "Each Transmission Operator with ATC Path(s) and with TRM shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. "<br><br>Requirement 3: I suggest modifying the requirement to state: "Each Transmission Operator with ATC Path(s) and with TRM shall make available its TRMID, and if requested, underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request no more than 30 calendar days after receiving the request." |
| **Response:** Because the applicability already exempts any entities that do not maintain TRM from the standard, these changes will not be adopted. | |
| Exelon | In MOD-008-1 the following requirement was removed: R1.2.A A statement to confirm that it shall use assumptions in calculating TRM that are consistent with those assumptions that are used in the Transmission planning process for the time period studied". The NERC ATCWG reached conclusion on the following rule as they were developing the "Transmission Capability Margins and Their Use in ATC Determination" white paper which discusses the reliability margins of TRM and CBM: A Transmission Provider's ATC/AFC calculations, and associated margins, must be consistent with the Transmission Owners and Public Power Entities documented |

| Organization/Group | Question 2 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | Planning Criteria. This rule was incorporated into the "Transmission Capability Margins and Their Use in ATC Determination? white paper dated June 17, 1999 as demonstrated in the following exert:? ?The methodology used to derive TRM and its components must be documented and consistent with published planning criteria, and must not account for uncertainties already accounted for elsewhere in the ATC determination. A TRM is considered consistent with published planning criteria if the same components that comprise it are also addressed in the planning criteria. The methodology used to determine and apply TRM does not have to involve the same mechanics as the planning process, but the same uncertainties must be considered and any simplifying assumptions explained. It is recognized that ATC determinations are often time constrained and thus will not permit the use of the same mechanics employed in the more rigorous planning process? AFC/ATC calculations must be consistent with each Transmission Owner's planning criteria in order to maintain reliability. AFC/ATC calculations must not be subject to evaluation scenarios that exceed or are "beyond" the applicable planning criteria. For example, if the most extreme event a Transmission Owner plans for were single contingencies, it would be inconsistent with the applicable planning criteria to evaluate a transmission service request to meet a double contingency test. In this instance, evaluating a transmission service request using double contingency analysis would be in conflict with the planning criteria and would not be compatible with the reliability requirements used to serve native connected load. In an ATC calculation the following components determine the loading on a flowgate for the period of time under evaluation:<br>1. Base Case Flows (which recognizes the forecasted load connected to the transmission network and planned system topology)<br>2. Impacts of existing transmission service reservations -- both positive and negative (i.e. counterflow)<br>3. TRM (consistent with applicable Planning Criteria)<br>4. CBM (consistent with applicable Planning Criteria) When these four components are applied to a flowgate the result is a calculated AFC. If the resultant AFC is negative, the result indicates that the flowgate is projected to be overloaded because of the preexisting commitments (i.e. the four components listed above). In some cases negative AFC values exist for future years preventing transmission customers from obtaining transmission reservations for these future time periods.<br>The inconsistency between Transmission Provider's AFC/ATC calculations and the Transmission Owner's Planning criteria becomes evident when the Transmission Owner internal planning processes does not result in identification of system deficiencies requiring system expansion — even on Flowgate determined by the Transmission Provider to have negative AFC values far into the future. The likely cause of this discrepancy is that the TO is not applying the same scenario, including the same transmission uses (i.e. confirmed reservations), or consistent margins (TRM/CBM) in its internal planning process. |
| **Response:** The relationship between an entity's TTC/TFC/AFC/ATC/CBM and other calculations and the operations and transmission planning process are discussed in the responses to the comments submitted on those other applicable MOD standards. The TRM standard was written to | |

| Organization/Group | Question 2 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| only apply to the calculation of TRM and its application for the determination of ATC. The team removed the consistency clause in response to comments and supports this with three reasons. The first being that any requirement linking TRM methodology with planning assumptions would need to be in the planning standard, to do otherwise is to create the potential for conflicting standards where meeting both is not possible. Second, the entity's open planning process (as documented in its OATT Attachment K) provides opportunity to address any unfairness between the TRM and its planning process. Finally, TRM is intended to be based on conditions other than those expected, so requiring assumptions to be consistent with those used in planning of operations would be contrary to the goal of TRM. | |
| FirstEnergy | R2 – This requirement states "Each Transmission Operator shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM." We recommend replacing "only use" with "include" since "only use" presumes that the list of uncertainties stated in the standard are all inclusive of all factors that a TOP/TSP may want to address in TRM. The requirement explicitly states that CBM should not be included in TRM, so making this change should not create an opportunity for double dipping on CBM. |
| **Response:** Requirement 2 is based on FERC Order 890 instructions to NERC to develop a list of uncertainties for TRM and establish requirements that do not allow the use of uncertainty other then those in the list. The Order also requested that the standard specify that TRM not include elements of CBM. | |
| PJM | Although the SDT had the appropriate Team to establish a default percentage for TRM, the FERC deadline did not allow enough time to complete this portion of the requirement. Since TRM is a reliability margin, PJM encourages the Team to provide what ever input it currently has in a ?parking lot? for a possible future Team to undertake the development activity. There should be a default percentage to be used without requiring specific documentation, work papers and load flow cases if a straight percentage such as 5% is used. Additional information would be required only if a greater percentage is used. |
| **Response:** The drafting team, in numerous discussions, examined the use of a fixed percentage rather then specifying the areas of uncertainty. The standard as it is currently written does not require or forbid the use of a fixed percentage as a margin, but does require that the entity explain the rationale for the percentage. Additionally the standard requires that the margin represent only the areas of uncertainty specified in R1 and not include any items included in CBM. We encourage PJM to draft a SAR if further development in TRM is desired and/or file for a variance that more clearly permits a flat percentage. | |
| Pepco Holdings, Inc | PHI supports the comments of PJM and will not submit duplicate comments |
| **Response:** Please see PJM response. | |
| Oncor Electric Delivery | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would |

<table>
<tr><th>Organization/Group</th><th>Question 2 - Incorrect Requirement(s) or Measure(s):</th></tr>
<tr><td></td><td>add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s).</td></tr>
<tr><td colspan="2">Response: This standard is intended to apply to all entities that have chosen to maintain a TRM. To the extent ERCOT does not choose to maintain TRM, ERCOT is effectively exempt form this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) “it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) “it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, “An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable.” <u>Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.</u> The SDT believes that a regional variance “Based on a justifiable difference between regions or between sub-regions within the Regional geographic area” could be pursued by ERCOT. (Loc. Cit.)</td></tr>
<tr><td>Gainesville Regional Utilities</td><td>R2: Why limit what items can be considered in developing TRM? What reliability purpose could it possibly serve? R1,3,4 & 5 are OK as presented.</td></tr>
<tr><td colspan="2">Response: Requirement 2 is based on FERC Order 890 instructions to NERC to develop a list of uncertainties for TRM and establish requirements that do not allow the use of uncertainty other then those in the list. The Order also directed that the standard specify that TRM not include elements of CBM.</td></tr>
<tr><td>MRO NERC Standards Review Subcommittee</td><td>1. The MRO believes that M1 should be revised to delete the words "all" from the phrase "all specified information?" This use of "all" seem to be unnecessary and may result in over-the-top auditing.<br>Response: The SDT intends for the measure to determine if all sub-requirements were addressed, not if all bullets in R1.1 were included. Each bullet in R1.1 is only required if used, as described in the sub-requirement.<br><br>2. The MRO commends the SDT on deleting R1.2.A and R1.5. The MRO believes that these former requirements were unnecessary and not reliability related and that the changes are significant improvements to the standard.<br>Response: Thank you for your supportive comment.<br><br>3. The MRO is asking for clarification in R1.1 on "Reserve sharing requirements". The MRO is assuming that this is not non-operating reserves such as planning reserves.<br>Response: MRO is correct; this is not intended to cover planning reserves. This was not meant to be specific to a particular arrangement, but to cover any generation reserve sharing agreement that might require a margin on the</td></tr>
</table>

| Organization/Group | Question 2 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | transmission system for delivery.<br><br>4. R1.1, bullet 7 reads: Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window). The "59-minute window" conflicts with BAL-002. Under BAL-002, operating reserves can be supplied for up to 105 minutes (R4.2 15 minutes for the disturbance plus R6.2 90 minutes). We suggest the following wording instead: "(Operating Reserve actions not exceeding the operating reserve sharing deployment period)".<br>**Response:** The SDT will not comment on whether or not the statement regarding provision of reserves for up to 105 minutes is correct or incorrect. The team eliminated the 59-minute limitation since this was not meant to identify a specific arrangement but a category of arrangements. |
| 3. **Response:** Please see in-line responses. | |
| Entergy Services Inc. | R2 – Entergy recommends deleting the phrase "and shall not include any of the components of Capacity Benefit Margin (CBM). |
| **Response:** Requirement 2 is based on FERC Order 890 instructions to NERC to develop a list of uncertainties for TRM and establish requirements that do not allow the use of uncertainty other then those in the list. The order also directed that the standard specify that TRM not include elements of CBM. | |
| The Midwest ISO | R1.1 – Please clarify the uncertainty components below: o Allowances for simultaneous path interactions (how is it different from loop flow above?)<br>**Response:** Different parts of the country refer to these concepts using a variety of terms with a variety of definitions ranging from overlapping definitions to distinct and exclusive definitions. Listing of both allows for greater flexibility since neither is a defined term.<br><br>Short-term System Operator response (Does this exclude reserve sharing requirements?).<br>**Response:** "Reserve sharing requirements" is listed as the next sub bullet under "System Operator Response", so it doesn't matter if short term system operator response includes reserve sharing requirement – provided the values are not duplicated.<br><br>R2 — This requirement as it is written doesn't allow the Transmission Operators to include any other uncertainties other than from R1.1. If R1.1 is not trying to list the complete set of uncertainties, we recommend to revise R2 to "Each Transmission Operator shall not include any of the components of Capacity Benefit Margin (CBM)"<br>**Response:** Requirement 2 is based on FERC Order 890 instructions to NERC to develop a list of uncertainties for TRM and establish requirements that do not allow the use of uncertainty other then those in the list. The order |

| Organization/Group | Question 2 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | also directed that the standard specify that TRM not include elements of CBM. |
| **Response:** Please see in-line responses. | |
| American Transmission Company | Modification Requirement 1: Each TOP shall prepare and keep current a Transmission Reliability Margin Implementation Document (TRMID) that includes the following information: The phrase "as a minimum" is not needed because the TOP has to include all sub-requirement in order to meet requirement 1. Any information above that which is listed is outside of NERC's audit<br>**Response:** While the requirement specifies that you can only use the listed items to determine TRM, entities may provide additional information beyond that which is required in the TRMID (e.g., examples of calculations). Using the phrase "as a minimum" insures an entity can include the additional information without a compliance issue.<br><br>Modifications to Requirement 4: Each TOP shall establish TRM values in accordance with the TRMID at least once every 13 months.<br><br>Modification to Requirement 5: The TOP shall provide the TRM values to its TSP(s) and TP(s) no more than seven calendar days after a TRM value is initially established or subsequently changed. The phrase "using TRM" conflicts with Requirements 1 - 3. In addition we believe the deletion aligns with our comment on the applicability section.<br>**Response:** We have included this in R4 and R5 to further emphasize that TOPs without TRM don't need to do this, even though it is redundant with the applicability section.<br><br>M1 should be revised to delete the words "all" from the phrase "all specified information?" to avoid being overly inclusive.<br>**Response:** The SDT intends for the measure to determine if all sub-requirements were addressed, not if all bullets in R1.1 were included. Each bullet in R1.1 is only required if used, as described in the sub-requirement. |
| **Response:** Please see in-line responses. | |
| Xcel Energy | R1.1, bullet 7 reads: Short-term System Operator response (Operating Reserve actions not exceeding a 59-minute window). The "59-minute window" seems arbitrary and potentially conflicting. We suggest the following wording instead: "(Operating Reserve actions not exceeding the reserve sharing deployment period)". If the drafting team does not like the suggestion, then please clarify what is the basis for an odd # of minutes, instead of using more common 1/4 or full hour increments? Under BAL-002, operating reserves can be supplied for up to 105 minutes (15 minutes for the disturbance plus 90 minutes). |
| **Response:** The SDT will not comment on whether or not the statement regarding provision of reserves for up to 105 minutes is correct or incorrect. | |

| Organization/Group | Question 2 - Incorrect Requirement(s) or Measure(s): |
| --- | --- |
| The team eliminated the 59-minute limitation since this was not meant to identify a specific arrangement but a category of arrangements. | |
| Texas-New Mexico Power company | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Texas-New Mexico Power Company is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, TNMP believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. TNMP strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). |
| **Response:** This standard is intended to apply to all entities that have chosen to maintain a TRM. To the extent ERCOT does not choose maintain TRM, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| PPL Supply Group | R3. PPL suggests that the Purchasing/Selling Entities should be included in the listing of entities under Requirement R3. |
| **Response:** Purchasing and Selling entities in the opinion of the team do not have a transmission reliability need to access those items. This is an openness and transparency issue that would best be addressed in an entity's OATT or in business practices. | |
| New York Independent System Operator | The NYISO has previously commented that R4 would require TRM to be recalculated more frequently than necessary for Transmission Operators whose TRM assumptions do not change frequently. Under the NYISO system, TRM values are stable over time and often do not change for periods longer than 13 months. The NYISO therefore renews its request that the SDT modify R4 to specify that TRM need not be re-established (or re-calculated) every 13 months to the extent that none of the underlying TRM inputs have changed. The SDT has previously revised R8 under MOD-001 in the same manner and there is every reason to make the same change to R4 under MOD-008. |
| **Response:** The current wording of R4 was in part in response to NYISO's earlier comment and the SDT believed they had addressed it. The phrase "establish" was chosen to allow entities to simply republish prior values each year if their inputs have not changed. Changing to your suggested language would require an entity to "prove" their inputs haven't changed. | |

| Organization/Group | Question 2 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| Bonneville Power | BPA does not believe any are incorrect. |
| **Response:** Thank you for your supportive comment. | |
| Ontario IESO | None |
| Hydro One Networks | None |
| NPCC Regional Standards Committee | None |

4. The drafting team has modified the Violation Risk Factors for MOD-008 to reflect industry concerns that they did not reflect NERC's VRF definitions. NERC's VRF definitions are listed below. Are the current VRFs established correctly? If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification.

High Risk Requirement:

(a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement:

(a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement: is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

**Summary Consideration:**

The industry opinion as expressed in this request for comments indicates a preference in favor of the current Violation Risk Factors, which are lower. The team once again iterates that it believes that per the current NERC definitions of violation risk factors, no part of this standard (TRM) if not correctly applied would have a direct affect on the state or capability of the bulk power system.

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| Ontario IESO | No | The VRF for R4 should be a Medium. R4 stipulates that the TOP establish a TRM. Given that TRM is |

| Organization/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| | | that portion of the ATC reserved to cover for uncertainties that can affect transmission reliability, failure to establish this value could result in the TOP facing unreliable operations due to the TSP offering and committing this value as a transmission service to transmission users. The end result could have a direct impact on the control and reliability of the BES. |
| **Response:** The drafting team disagrees. The majority of the team and industry believes that a violation of R4 does not directly affect the electrical state or the capability of the bulk power system. | | |
| FirstEnergy | Yes | FE supports the SDT's adjustment of VRFs such that no VRF within the ATC standards exceeds a "Lower" rating. We concur with the team's reasoning and rationale provided in response to ballot comments in making this change. |
| **Response:** Thank you for your supportive comment. | | |
| PJM | Yes | PJM supports NERC's position to revise all Violation Risk Factors to have an assigned risk factor of "Lower." A Lower Risk Factor requirement is administrative in nature and is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system. |
| **Response:** Thank you for your supportive comment. | | |
| ISO RTO Council/Standards Review Committee (SRC) | Yes | The MOD standards assess the correct amount of reliability risk in areas that do not affect reliability. The IRC supports the position that no requirement from this set of ATC standards should have an assigned Risk Factor exceeding "Lower". A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system. |
| **Response:** Thank you for your supportive comment. | | |
| MRO NERC Standards Review Subcommittee | Yes | The MRO commends the SDT on revising the VRFs to Lower. We believe the revised VRFs are in-line with the NERC definitions of the VRF levels. |
| **Response:** Thank you for your supportive comment. | | |

5. The drafting team has modified the Violation Severity Levels for MOD-008 to reflect industry concerns that they were too “pass/fail” oriented. Are the current VSLs established correctly? If “No,” please identify specific VSLs and suggest changes to the language.

**Summary Consideration:**

The industry opinion as expressed in this request for comments indicates a preference in favor of the current Violation Severity Levels. One commenter expressed concern on R2 having only a single VSL of severe. The drafting team believes that if a requirement is a pass/fail, and therefore has only one “VSL” that VSL has to be severe. VSLs refer to how badly a requirement was missed, not to the criticality of that particular requirement. Violation Risk Factors address the criticality of a particular element.

Two other commenters expressed concerns on double jeopardy in the standard, or having a single event result in multiple violations. While this is an issue that has to be addressed by the compliance side of NERC and its policies, the team did review the standards with this concept in mind. As a result of this review the team revised the wording on the VSL’s for Requirement 5 to reinforce that an incorrect value developed under R4, that was properly made available per R5, is not a violation of R5.

| Organization/Group | Question 4: | Question 4 Comments: |
|---|---|---|
| PJM | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but PJM has a concern regarding the possibility of multiple violations resulting from a single event. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations — this language to be added to the standard. |
| **Response:** The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.<br><br>VSLs for R2: SDT modified the phrasing to be clear so that if you use CBM (in violation of R2) you aren’t double penalized for also violating the “only the components of…”<br><br>VSLs for R5: The SDT modified all four VSLs to be clear that the accuracy portion refers to the values matching those developed in R4, not the absolute accuracy of the values. This was to make the VSL clearly match the requirement in R5 for transmission of values. This is for a situation where the values are incorrect, but were transmitted. The violation would be of R4, not of R5. | | |
| FirstEnergy | No | The Severe VSL stated for requirement R2 does not seem appropriate if a TOP/TSP included elements of uncertainty that were outside of those items explicitly stated in R1 so long as all of the items in R1 are covered AND that CBM is not included in its TRM. See proposed change above for R2. |
| **Response:** Requirement 2 is based on FERC Order 890 instructions to NERC to develop a list of uncertainties for TRM and establish requirements | | |

| Organization/Group | Question 4: | Question 4 Comments: |
| --- | --- | --- |
| that do not allow the use of uncertainty other then those in the list. The order also directed that the standard specify that TRM not include elements of CBM. The Violation Risk Factor determines the impact a violation could have on the bulk electric system, the Violation Severity Level is a measure of how badly a requirement was violated. In the case of a pass/fail requirement, the violation severity level is severe. | | |
| ISO RTO Council/Standards Review Committee (SRC) | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but the IRC has a concern regarding the possibility of multiple violations resulting from a single event. The IRC requests that the potential for double counting of violations for a single event be eliminated. |
| **Response:** The SDT has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.<br><br>VSLs for R2: SDT modified the phrasing to be clear so that if you use CBM (in violation of R2) you aren't double penalized for also violating the "only the components of…"<br><br>VSLs for R5: The SDT modified all four of the VSLs to be clear that the accuracy portion refers to the values matching those developed in R4, not the absolute accuracy of the values. This was to make the VSLs clearly match the requirement in R5 for transmission of values. This is for a situation where the values are incorrect, but were transmitted. 6. **Please provide any other comments (that you have not already provided in response to the questions above) that you have on MOD-008.**

**Summary Consideration:**

A popular comment under question 5 related to the implementation plan. Because Mod 008 can be implemented independent of the other standards and because Mod 008 being implemented in one area and not another would not cause a coordination problem, the standard team is keeping the current implementation language.

EPSA made some very detailed comments, and the team attempted to respond to all of them. Those responses to EPSA's comments are below in the individual comments.

Many of the other comments and questions posted under question #5 are similar or verbatim repetitions of questions asked under questions 1-4, so their summary will not be repeated here.

Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

| Organization/Group | Question 5 Comments: |
|---|---|
| CenterPoint Energy | The group of standards is for ATC and TRM methodologies that are not used in ERCOT. CenterPoint Energy is concerned that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these standards, which we believe would not add value to the ERCOT region and could increase congestion in the region. Accordingly, CenterPoint Energy previously submitted comments to these standards asking for an exemption for the ERCOT region. We find the proposed standards unacceptable unless the following provision is added to each standard: This standard does not apply to ERCOT or any other region that operates as a single control area. |
| **Response:** This standard is intended to apply to all entities that have chosen to maintain a TRM. To the extent ERCOT does not choose to maintain TRM, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| EPSA | This comment relates also to the NAESB recommendation that no additional business practices related to TRM will be |

| Organization/Group | Question 5 Comments: |
| --- | --- |
| | developed. Our comments are based also on Order 890 Paragraph 207 which states in part: "The purpose of increasing the consistency and transparency of ATC calculations is to reduce the potential for undue discrimination in the provision of transmission service, specifically by reducing the opportunity for transmission providers to exercise excessive discretion. We find that the amount of discretion in the existing ATC calculation methodologies gives transmission providers the ability and opportunity to unduly discriminate against third parties. In order to minimize this discretion, the Final Rule requires that all ATC components (i.e., TTC, ETC, CBM, and TRM) and certain data inputs, data exchange, and assumptions be consistent and that the number of industry-wide ATC calculation formulas be few in number, transparent and produce equivalent results ."EPSA does not believe that the mandate given by FERC to NERC and to NAESB has been carried out. EPSA accepts that in calculating ATC, Transmission operators need a margin, which is deducted from the TTC or AFC as appropriate, to allow for uncertainties in forecast conditions and thus to insure that Transmission Service is not oversold. As it represents an allowance for uncertainties, it is recognized that TRM is based on assumptions about future conditions and is in general, determined probabilistically. However, based on the proposed actions of the two standards development organizations, in order to meet FERC's Order to "increas[e] the consistency and transparency of ATC calculations" and to "reduc[e] the opportunity for transmission providers to exercise excessive discretion" the industry has provided standards that: ? Require Transmission Operators to only identify various elements if they are used in establishing TRM. At no point in the standard however, is any direction provided on how the Transmission Operators determine whether or not to use the various components or, if used, how values are to be established.<br><br>? Make no provision for monitoring or reporting on utilization of TRM? Make no provision for verifying from season to season or year to year whether the values utilized in establishing TRM were or remain appropriate. These standards therefore impose only a minimal requirement for transparency and no requirement for consistency in establishing TRM and no requirement to monitor its usage to verify that assumed values are appropriate. The current NERC and NAESB standards on TRM are reminiscent of the previous NERC standard on ATC which was developed in response to Order 888. It required only that Transmission Operators document their methodology for calculating ATC, much like other fill-in-the-blank standards. Clearly in approving Order 890 and more particularly in Order 693 where they declined to approve other industry fill-in-the-blank standards, FERC has determined that such a standard is insufficient. Yet, with respect to TRM, the industry, through NERC and NAESB, seems prepared to submit standards to FERC that demonstrate that very little progress has been made. |

**Response:** There was a lot of ground covered in this comment, and it is not really possible to break it into sections like some of the other commenter's submittals. The team will attempt to answer the various topics by addressing them individually.

Tracking TRM: Unlike CBM, TRM is not called upon, tracked or reserved nor is it possible to do so. TRM is simply a margin that would, in theory, be sufficient such that reasonable deviations from the system conditions modeled when ATC was calculated would not result in unscheduled operator actions and/or curtailment of transactions. If EPSA has specific recommendation on how to monitor and report the utilization of TRM please file a SAR to modify the standard to include those.

| Organization/Group | Question 5 Comments: |
|---|---|
| Transparency: The standard requires full transparency among reliability entities. However, NAESB is the appropriate entity to developing any standards related to transparency for market participants.<br><br>Consistency: The standard creates consistency in the way an entity must report, update and describe its TRM. The MOD standards as a group also insure that TRM is applied consistently to all customers. The standard does not establish a consistent (universal) TRM across all regions. Transmission systems vary between regions and even within a region. Applying a universal TRM would, due to the nature of the transmission systems, be detrimental to either reliability, market access, or and more likely both.<br><br>Undue Discrimination: The consistency required by the standard will prevent a utility from undue discrimination since the TRM applies to all users of a path, not just one particular user.<br><br>Overall if the commenter has recommended text for the standard please submit a SAR to further modify the standard. | |
| NERC RTOSDT | The Real Time Operation Standards Drafting Team is concerned that the proposed MOD standards do not include any reference to the Planning and Operating Limits mandated by the current FAC, IRO and TOP standards. These standards already include transmission flow limits both in the longer term planning time frame as well as the shorter term operating time frame. The proposed MOD standards seem to be establishing procedures to calculate the commercial boundaries without a direct link to the required reliability boundaries.<br>MOD-001 R6 states that the TTC "use assumptions" no more limiting than those used in planning. The RTO SDT would ask shouldn't TTCs be required to be "no less limiting" than the SOLs / IROLs computed for the system? Current NERC standards are not just asset limits, they are also system limits. The current standards require that limits be calculated that recognize both local and wide-area impacts. The RTO SDT believes that by at least linking (if not entirely eliminating) the MOD standards to the current SOLs / IROLs requirements, the Industry would be more correctly linking how the system MUST BE operated to any NAESB business practice. Indeed it would seem that current tariffs are based on the computations used in current planning and operating environments. By using the current SOL / IROL limits the procedural / prescriptive requirement in<br>MOD-001 R9 et al would be unnecessary (i.e. they would revert back to the FAC and IRO requirements)The questions for the ATC SDT:? How do these MOD standards relate to the SOLs / IROLs? Why should these ATC/TTC limits be decoupled from the SOLs / IROLs? Shouldn't the long-term SOL / IROL limits computed in Planning be the TTC for the system (or at least the basis for the TTC)? Shouldn't the short-term SOL / IROL be the basis for the ATC for the system?<br>MOD-008 computes margins. By coordinating the MOD standards with the SOL / IROL standards, the only Business (not NERC) requirement may be to define the options on how the TSP could couple the various SOL / IROL values that it obtains from its RCs and TOPs.<br>MOD-028 By using SOLs / IROLs there would be no need to get into ATC / AFC "methodologies". Indeed standards that include "alternatives" are not defining a single "standard approach". But by using specific planning and operating limits the |

| Organization/Group | Question 5 Comments: |
|---|---|
| | methodologies become irrelevant. The "limit" becomes explicit and well-defined. Any margins or variations about those limits would then be obvious and transparent. What is most important is respecting the reliability-based limits and not how the commercial value is computed. If this idea of using SOLs / IROLs as the limit(s) or at least the basis for those commercial limits, then the TSP becomes a coordinator of which values to use for the commercial periods. The TSP would not be the computer of those limits. Thus MOD-028 could become a business practice for posting ? rather than a standard for computations. |
| **Response:** This comment does not raise any questions related to MOD-008. The SDT agrees that MOD-008 computes margins. Please see the response to this question in the responses to comments for the other MOD standards. | |
| NPCC Regional Standards Committee | The language in the Proposed Effective Date should be modified to be consistent with the other standards |
| **Response:** TRM can be calculated independent of other entities, and therefore, has implementation language that does not require simultaneous implementation across all jurisdictions. | |
| FirstEnergy | FirstEnergy appreciates the Standard Drafting Team's decision to move to a formal comment period based on the prior initial ballot feedback. We commend the team for moving quickly to respond to the ballot comments and providing the industry a revised set of standards to review and comment.<br>**Response:** Thank you for your supportive comment.<br><br>Regarding the revision to the Effective Date, while FirstEnergy agrees that there is a need to ensure that the standard is implemented consistently across the entire continent we are concerned with the Effective Date being subject to approval of ALL regulatory authorities. We believe an appropriate Implementation Plan should reflect a period of time beyond the NERC Board of Trustee approval date that would reflect when the requirements are considered mandatory and enforceable. The timeline should allow sufficient time for regulatory authority reviews, with the intent of sanctions also being enforced in conjunction with the conclusion of the implementation period. However, a delay from a given regulatory agency should not impact when the requirements are considered mandatory and enforceable for the bulk electric system.<br>**Response:** TRM can be calculated independent of other entities, and therefore, has implementation language that does not require simultaneous implementation across all jurisdictions. |
| **Response:** Please see in-line responses. | |
| Duke Energy Corporation | Implementation Plan – Since R2 and M2 link the TRM calculation methodology with the CBM methodology in MOD-004, implementation dates for these standards should be aligned.<br>**Response:** The SDT has modified the measure to address this concern. |

| Organization/Group | Question 5 Comments: |
| --- | --- |
| | Since R2 and M2 link the TRM calculation methodology with the CBM methodology in MOD-004, the Standards Drafting Team must avoid creating a duplicate requirement the CBM standard, which could subject entities to multiple penalties for the same violation.<br><br>**Response:** The CBM standard does not have a similar requirement, so there is no potential for multiple penalties for the same violation. |
| **Response:** Please see in-line responses. | |
| Bonneville Power | BPA respectfully submits the following observations and suggestions: a. The sixth component of uncertainty listed in R1.1 should be expanded as follows: - Variations in generation dispatch (including forced or unplanned outages, maintenance outages, and location of future generation)<br>**Response:** Bullet #3 and #6 were modified based on this comment to read<br><br>"Forecast uncertainty in Transmission system topology (including, but not limited to, forced or unplanned outages and maintenance outages).<br>"Variations in generation dispatch (including, but not limited to, forced or unplanned outages, maintenance outages and location of future generation)."<br><br>.b. To comply with FERC Order 890 transparency requirements, R1.5 should not be removed (e.g. " If TRM is not used, a statement of that practice.") – BPA believes a Transmission Operator should be required to provide a robust justification as to why it is not using TRM in it's ATC or AFC calculations.<br>**Response:** The applicability makes this standard apply only to those entities that maintain TRM. At this time the SDT is not requiring an entity to document that they don't use or need TRM.<br><br>c. A new R6 should be added that clearly states the timeframe in which TRM is to be used (i.e. within the hour).<br>**Response:** Unlike CBM, TRM is not called upon, tracked or reserved. TRM is simply a margin that would, in theory, be sufficient that reasonable deviations from the system conditions modeled when ATC was calculated would not result in unscheduled operator actions and/or curtailment of transactions.<br><br>d. The Time Horizons listed for all requirements should include the "Long-term Planning" Horizon, as TRM is to be calculated beyond the seasonal window.<br>**Response:** The use of "Time Horizons" in this standard is in the form of a compliance element, and refers to the manner in which compliance evaluates the implications of a violation of the standard. In this context, time horizon has to do with the |

| Organization/Group | Question 5 Comments: |
|---|---|
| | urgency of addressing a violation, e.g., how quickly a violation needs to be rectified. Together, the Violation Risk Factor and Time Horizon aid a compliance auditor in determining sanctions. Accordingly, the SDT believes that the appropriate horizon for compliances does not include "Long-term Planning."<br><br>e. Balancing Authorities may be appropriately identified as Applicable Entities in this MOD and request that the Standards Drafting Team provide an explanation as to why they are not listed.<br>**Response:** Only Transmission Operator's are assigned requirements in this standard and therefore they are the only applicable entity. |
| **Response:** See imbedded Responses. | |
| Oncor Electric Delivery | This standard should not apply to ERCOT for the reason expressed in question 2. |
| **Response:** This standard is intended to apply to all entities that have chosen to maintain a TRM. To the extent ERCOT does not choose to maintain TRM, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| ISO RTO Council/Standards Review Committee (SRC) | Although the SDT had the appropriate Team to establish a default percentage for TRM, the FERC deadline did not allow enough time to complete this portion of the requirement. Since TRM is a reliability margin, the IRC encourages the Team to provide what ever input it currently has in a 'parking lot' for a possible future Team to undertake the development activity. There should be a default percentage to be used without requiring specific documentation, work papers and load flow cases if a straight percentage such as 5% is used. Additional information would be required only if a greater percentage is used. |
| **Response:** The drafting team in numerous discussions examined the use of a fixed percentage rather then specifying the areas on uncertainty. The standard as it is currently written does not require or forbid the use of a fixed percentage as a margin, but does require that the entity explain the rationale for the percentage. Additionally the standard requires that the margin represent only the areas of uncertainty specified in R1 and not include any items included in CBM. We encourage the ISO RTO Council to draft a SAR if further development in TRM is desired. | |
| MRO NERC | 1. The MRO commends the SDT in making significant changes to this standard and reissuing it for comment. The MRO |

| Organization/Group | Question 5 Comments: |
| --- | --- |
| Standards Review Subcommittee | believes the eventual standard that is approved will serve the industry and customers better as a result<br>**Response:** Thank you for your supportive comment.<br><br>2. The MRO believes that the first time you use an abbreviation or acronym, you must spell out the full term followed by the abbreviation or acronym in brackets. Subsequent use of the term is then made by its abbreviation or acronym.<br>**Response:** The team agrees that abbreviations or acronyms should generally not be used until defined, but was unable to find an instance of this in the standard. If you are referencing "ATC Path," that is a defined term and therefore not an acronym or abbreviation. |
| **Response:** Please see in-line responses. | |
| Ontario IESO | The language in the Proposed Effective Date should be modified to be consistent with the other standards |
| **Response:** TRM can be calculated independent of other entities, and therefore, has implementation language that does not require simultaneous implementation across all jurisdictions. | |
| Hydro One Networks | Language in the Proposed Effective Date should be modified to be consistent with the other standards, e.g. MOD-001-1 |
| **Response:** TRM can be calculated independent of other entities, and therefore, has implementation language that does not require simultaneous implementation across all jurisdictions. | |
| American Transmission Company | The first time that each abbreviation or acronym is introduced, the full terminology should be stated followed by the abbreviation or acronym in brackets (i.e. ATC).<br>**Response:** The team agrees that abbreviations or acronyms should generally not be used until defined, but was unable to find an instance of this in the standard. If you are referencing "ATC Path," that is a defined term and therefore not an acronym or abbreviation.<br><br>The Proposed Effective Date for MOD-008-1 is different then that written for MOD-001-1. Why the difference in the Effective Date?<br>**Response:** TRM can be calculated independent of other entities, and therefore, has implementation language that does not require simultaneous implementation across all jurisdictions.<br><br>We do not believe that the SDT has to provide a definition of TRMID. Requirement 1 outlines the specifics of TRMID and we find the definition unnecessary. The SDT should explain why this definition is necessary and what if anything is it including that the requirement does not already contain.<br>**Response:** The team believes the definition is helpful, and was asked by a previous commenter to provide a definition. Additionally, the term may be used in NAESB Business Practices. |

(Loc. Cit.)</td></tr>
<tr><td>Electric Service Delivery</td><td>These comments are filed on behalf of City of Austin d/b/a Austin Energy to address proposed NERC 5 MOD Standards. Austin Energy is a municipally owned electric utility and a transmission service provider with the Electric Reliability Council of Texas (ERCOT). ERCOT now operates as a Single Balancing Authority with no explicit transmission services being sold. Current ERCOT market rules allow open transmission access to all loads and resources. ERCOT will continue to operate as a</td></tr>
</table>

| Organization/Group | Question 5 Comments: |
|---|---|
| | Single Balancing Authority under Nodal market design. Accordingly, as explained in more detail below, the NERC 5 MOD Standards should not be applied to ERCOT and transmission service providers within ERCOT under its current or proposed Nodal market design. Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. Applicable definitions: According to NERC Reliability Standards Glossary of Terms, Available Transfer Capability (ATC) is defined as: ?A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability (TTC) less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin (CBM), less a Transmission Reliability Margin (TRM), plus Postbacks, plus counterflows? TTC is defined as: the amount of electric power that can be transferred over the interconnected transmission network in a reliable manner while meeting all of a specific set of defined pre- and post-contingency system conditions. CBM is defined as the amount of transmission transfer capability reserved by load serving entities to ensure access to generation from interconnected systems to meet generation reliability requirements. TRM also is a component of ATC defined as: that amount of transmission transfer capability necessary to ensure that the interconnected transmission network is secure under a reasonable range of uncertainties in system conditions. Comments: ERCOT is an interconnection and a region with no synchronous AC ties with any other interconnections. In July 2001, based on a deregulated Retail and restructured Wholesale Markets, the ERCOT interconnection began acting as a Single Balancing Authority. The ERCOT market is designed such that there are no explicit transmission services being sold, hence, Available Transfer Capability (ATC) is not a measure used in a commercial activity within the ERCOT market. The current ERCOT market rules allow open transmission access to all eligible loads and resources without considering any specific Transmission Service Provider (TSP). Transmission facilities ratings are based upon individual branch element designs and in cases of dynamic ratings, ambient conditions are also considered. ERCOT has several DC ties and an asynchronous tie using a Variable Frequency Transformer (VFT); however, the associated interchange capabilities are planned and coordinated by the TSPs involved. The current ERCOT Zonal Market uses a flow based congestion management methodology to predict potential congestions in the Day Ahead and Adjustment Periods. During the operating period, generation shift factors are used to determine the dispatch needed to remain within the constrained limits. The local congestions are managed using full AC load flow analysis and unit specific redispatch.MOD-001-1 is entirely about methodology and calculation of ATC, therefore, this standard is not applicable to ERCOT.MOD-008-1 covers Transmission Reliability Margin (TRM) methodology calculation. Mathematically, ATC is defined as Total Transfer Capability (TTC) less the TRM and Capacity Benefit Margin (CBM). Therefore, TRM also is not applicable to ERCOT.MOD-028-1 covers Area Interchange calculation Methodology. Since ERCOT is a single control area, Area Interchange calculation is not applicable.MOD-029-1 covers Rated System Path Methodology, which is used to calculate TTC and ATC calculations. Therefore MOD-029-1 is not applicable to ERCOT.MOD-030-1 covers Flowgate methodology calculation of ATC, and therefore, is not applicable to ERCOT.ERCOT is currently transitioning to a Nodal Market, with a scheduled start date of December 1, 2008. The Nodal Market uses a Security Constrained Economic Dispatch (SCED) approach to dispatch individual generating units and manage congestion. In the Nodal Market, ERCOT will still operate as a |

| Organization/Group | Question 5 Comments: |
|---|---|
| | Single Balancing Authority. This again will not use ATC methodology, and aforementioned standards are not applicable to ERCOT in its ensuing Nodal Market. Therefore, Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. |
| **Response:** **Response:** This standard is intended to apply to all entities that have chosen to maintain a TRM. To the extent ERCOT does not choose to maintain TRM, ERCOT is effectively exempt from this standard.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| Orlando Utilities Commission | Requirements 1, 3, 4 and 5 are great exactly as they are. They are a good balance of standardization, disclosure and recognition that different parts of the transmission system function differently and are most sensitive to different factors.<br>**Response:** Thank you for your supportive comment.<br><br>For Requirement #2, what is the reliability purpose for limiting the items that an entity can consider when establishing TRM?<br>**Response:** Requirement 2 is based on FERC Order 890 instructions to NERC to develop a list of uncertainties for TRM and establish requirements that do not allow the use of uncertainty other then those in the list. The order also directed that the standard specify that TRM not include elements of CBM. |
| **Response:** Please see in-line responses. | |
| Gainesville Regional Utilities | None at this time. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR Development June 20, 2005.
2. SAC Authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from February 15–March 16, 2007.
5. SDT posted second draft for comment from May 25–June 25, 2007.
6. SDT posted third draft for comment from October 31–December 15, 2007.
7. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fifth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**ATC Path:** Any Posted Path[1] or any other combination of Point of Receipt and Point of Delivery for which Available Transfer Capability is calculated.

**Available Transfer Capability (ATC):** A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows.

**Available Transfer Capability Implementation Document (ATCID):** A document that describes the implementation of a methodology for calculating Available Transfer Capability (ATC) or Available Flowgate Capability (AFC), and provides information related to a Transmission Service Provider's calculation of ATC or AFC.

**Transmission Operator Area:** The collection of Transmission assets over which the Transmission Operator is responsible for operating.

**Existing Transmission Commitments (ETC):** Committed uses of a Transmission Service Provider's Transmission system considered when determining Available Transfer Capability or Available Flowgate Capability.

**Planning Coordinator:** See Planning Authority.

**Postback:** Positive adjustments to Available Transfer Capability or Available Flowgate Capability as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.

**Business Practices:** Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization or regional entity business practices; or NAESB Business Practices**.**

**Block Dispatch:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).

**Dispatch Order:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.

**Participation Factors:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.

[1] See 18 CFR 37.6(b)(1)

## A. Introduction

1. **Title:** **Available Transmission System Capability**

2. **Number:** **MOD-001-1**

3. **Purpose:** To ensure that calculations are performed by Transmission Service Providers to maintain awareness of available transmission system capability and future flows on their own systems as well as those of their neighbors.

4. **Applicability:**

   **4.1.** Transmission Service Provider.

   **4.2.** Transmission Operator.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Operator shall select one ATC methodology[2] for calculating ATC (Area Interchange methodology, Rated System Path methodology) or AFC (Flowgate methodology) for each ATC Path per time period identified in R2 for those Facilities within its Transmission Operator Area. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R2.** Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s): *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R2.1.** Hourly values for at least the next 48 hours.

**R2.2.** Daily values for at least the next 31 calendar days.

**R2.3.** Monthly values for at least the next 12 months (months 2-13).

**R3.** Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R3.1.** Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC or AFC calculations can be validated.

**R3.2.** A description of the manner in which the Transmission Service Provider will account for counterflows including:

**R3.2.1.** How confirmed Transmission reservations, expected Interchange and internal counterflow are addressed in firm and non-firm ATC or AFC calculations.

**R3.2.2.** A rationale for the defined accounting.

---

[2] All ATC Paths do not have to use the same methodology and no particular ATC Path must use the same methodology for all time periods.

**R3.3.** The identity of the Transmission Operators and Transmission Service Providers from which the Transmission Service Provider receives data for use in calculating transfer of Flowgate capability.

**R3.4.** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer or Flowgate capability.

**R3.5.** A description of the allocation processes listed below that are applicable to the Transmission Service Provider:

- Processes used to allocate transfer or Flowgate capability among multiple lines or sub-paths within a larger ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities among multiple owners or users of an ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities between Transmission Service Providers to address issues such as forward looking congestion management and seams coordination.

**R3.6.** A description of how outages are considered in ATC calculations, including:

**R3.6.1.** The criteria used to determine when an outage impacts a daily ATC or AFC calculation.

**R3.6.2.** The criteria used to determine when an outage impacts a monthly ATC or AFC calculation.

**R3.6.3.** How outages (including those outages from other Transmission Service Providers that are unrecognized) are processed.

**R4.** The Transmission Service Provider shall notify the following entities (via electronic mail) before implementing a new or revised ATCID: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** Each Planning Coordinator associated with the Transmission Service Provider's area.

**R4.2.** Each Reliability Coordinator associated with the Transmission Service Provider's area.

**R4.3.** Each Transmission Operator associated with the Transmission Service Provider's area.

**R4.4.** Each Planning Coordinator adjacent to the Transmission Service Provider's area.

**R4.5.** Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

**R4.6.** Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

**R5.** The Transmission Service Provider shall make available the current ATCID to all of the entities specified in R4. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.** When calculating TTC or TFC the Transmission Operator shall use assumptions no more limiting than those used in planning of operations for the corresponding time period studied. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.** When calculating ATC or AFC the Transmission Service Provider shall use assumptions no more limiting than those used in planning of operations for the corresponding time period studied. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R8.** Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R8.1.** Hourly values, once per hour. Transmission Service Providers are allowed up to 80 hours per calendar year during which calculations are not required to be performed.

**R8.2.** Daily values, once per day.

**R8.3.** Monthly values, once per week.

**R9.** Within thirty calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below for use in ATC or AFC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R9.1 and R9.2: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Expected generation and Transmission outages, additions, and retirements.
- Load forecasts.
- Unit commitments and order of dispatch, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:
  - Dispatch Order
  - Participation Factors
  - Block Dispatch
- Aggregated firm capacity set-aside for Network Integration Transmission Service and aggregated non-firm capacity set aside for Network Integration Transmission Service (i.e. Secondary Service).
- Firm and non-firm Transmission reservations.
- Aggregated capacity set-aside for Grandfathered obligations.
- Firm roll-over rights.
- Any firm and non-firm adjustments applied by the Transmission Service Provider to reflect parallel path impacts.
- Power flow models and underlying assumptions.
- Contingencies, provided in one or more of the following formats:
  - A list of Elements
  - A list of Flowgates
  - A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider
- Facility Ratings.

- Any other services that impact Existing Transmission Commitments (ETCs).
- Values of Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM), and TTC for all ATC Paths or Flowgates.
- Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider receiving the request when selling Transmission service.
- Values of TTC and ATC for all ATC Paths for those Transmission Service Providers receiving the request that do not consider Flowgates when selling Transmission Service.
- Source and sink identification and mapping to the model.

**R9.1.** The Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months into the future (subject to confidentiality and security requirements).

**R9.2.** This data shall be made available by the Transmission Service Provider on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider).

## C. Measures

**M1.** The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one of the specified methodologies per time period in R2 for use in determining Transfer Capabilities of those Facilities for each ATC Path within its Transmission Operator Area. (R1).

**M2.** The Transmission Service Provider shall provide ATC or AFC values and identification of the selected methodologies along with other evidence (such as written documentation, processes, or data) to show it calculated ATC or AFC for the following using the selected methodology or methodologies chosen as part of R1 (R2):

- There has been at least 48 hours of hourly values calculated at all times. (R2.1)
- There has been at least 31 consecutive calendar days of daily values calculated at all times. (R2.2)
- There has been at least the next 12 months of monthly values calculated at all times (Months 2-13). (R2.3)

**M3.** The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

**M4.** The Transmission Service Provider shall provide evidence (such as dated electronic mail messages) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)

**M5.** The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in R4, as required by R5. (R5)

**M6.** The Transmission Operator shall provide a copy of the assumptions (such as loop flow, generation re-dispatch, switching operating guides, load shedding or data sources for load forecast and facility outages) used to calculate TTC or TFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining TTC or TFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Operator may demonstrate that the same load flow cases are used for both TTC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R6)

**M7.** The Transmission Service Provider shall provide a copy of the assumptions (such as loop flow, generation re-dispatch, switching operating guides, load shedding or data sources for load forecast and facility outages) used to calculate ATC or AFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining ATC or AFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Service Provider may demonstrate that the same load flow cases are used for both AFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R7)

**M8.** The Transmission Service Provider calculating ATC shall provide evidence (such as logs or data) that it has calculated the hourly, daily, and monthly values on at least the minimum frequencies specified in R8 or provide evidence (such as data, procedures, or software documentation) that the calculated values identified in the ATC equation have not changed. (R8)

**M9.** The Transmission Service Provider shall provide a copy of the dated request, if any, for ATC or AFC data as well as evidence to show it responded to that request (such as logs or data) within thirty calendar days of receiving the request, and the requested data items were made available in accordance with R9. (R9)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator shall maintain its current selected method(s) for calculating ATC or AFC and any methods in force since last compliance audit period to show compliance with R1.

The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7, and R8 for the most recent calendar year plus the current year.

The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.

The Transmission Service Provider shall maintain evidence to show compliance with R5 for the most recent three calendar years plus the current year.

The Transmission Operator shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.

If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | N/A | N/A | N/A | The Transmission Operator did not select one of the specified methodologies for each ATC Path per time period identified in R2 for those Facilities within its Transmission Operator Area. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR Development June 20, 2005.
2. SAC Authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from February 15–March 16, 2007.
5. SDT posted second draft for comment from May 25–June 25, 2007.
6. SDT posted third draft for comment from October 31–December 15, 2007.
7. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fifth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**ATC Path:** Any Posted Path[1] or any other combination of Point of Receipt and Point of Delivery for which Available Transfer Capability~~ATC~~ is calculated.~~Any combination of Point of Receipt and Point of Delivery for which ATC is calculated.~~

**Available Transfer Capability (ATC):** A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows.

**Available Transfer Capability Implementation Document (ATCID):** A document that describes the implementation of a~~n~~ ~~Available Transfer Capability~~ methodology for calculating Available Transfer Capability (ATC) or Available Flowgate Capability (AFC), and provides information related to a Transmission Service Provider's calculation of ATC or AFC.

**Transmission Operator Area:** The collection of Transmission assets over which the Transmission Operator is responsible for operating.

**Existing Transmission Commitments (ETC):** Committed uses of a Transmission Service Provider's Transmission system considered when determining Available Transfer Capability ~~.~~or Available Flowgate Capability~~AFC~~.

**Planning Coordinator:** See Planning Authority.

**Postback:** Positive adjustments to Available Transfer Capability or Available Flowgate Capability ~~ATC or AFC~~ as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.

**Business Practices:** Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization or regional entity business practices; or NAESB Business Practices**.**

**Block Dispatch:** A ~~simplification~~ set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).

**Dispatch Order:** A ~~simplification~~ set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.

**Participation Factors:** A ~~simplification~~ set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.

[1] See 18 CFR 37.6(b)(1)

## A. Introduction

1. **Title:** **Available ~~Transfer~~ Transmission System Capability**

2. **Number:** **MOD-001-1**

3. **Purpose:** To ensure that calculations are performed by Transmission Service Providers to maintain awareness of available transmission system capability and future flows on their own systems as well as those of their neighbors.~~To promote the consistent and reliable application and documentation of Available Transfer Capability (ATC) calculations for analysis and system operations.~~

4. **Applicability:**

   **4.1.** Transmission Service Provider.

   **4.2.** Transmission Operator.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities~~, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the set of standards is approved by the NERC Board of Trustees~~.

## B. Requirements

**R1.** Each Transmission Operator shall select one ATC methodology[2] for calculating ATC (Area Interchange methodology, Rated System Path methodology)~~,~~ or AFC (Flowgate methodology) for each ATC Path per time period identified in R2 for ~~use in determining Transfer Capabilities of~~ those Facilities within its Transmission ~~operating~~ Operator ~~area~~Area. ***[****Violation Risk Factor: ~~Medium~~Lower**]** **[***Time Horizon: Operations Planning***]***

**R2.** Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the ~~ATC~~ methodology or methodologies selected by its Transmission Operator(s): ***[****Violation Risk Factor: Lower]~~Medium~~**~~]~~** ***[****Time Horizon: Operations Planning***]***

**R2.1.** Hourly ~~ATC~~ values for at least the next ~~168~~ 48 hours.

**R2.2.** Daily ~~ATC~~ values for at least the next 31 calendar days.

**R2.3.** Monthly ~~ATC~~ values for at least the next 12 months (months 2-13).

**R3.** Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: ***[****Violation Risk Factor: Lower***]*** ***[****Time Horizon: Operations Planning***]***

**R3.1.** Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC or AFC calculations can be validated.

**R3.2.** A description of the manner in which the Transmission Service Provider will account for counterflows including:

---

[2] All ATC Paths do not have to use the same ~~ATC~~ m~~M~~ethodology and no particular ATC Path must use the same ~~ATC~~ m~~M~~ethodology for all time periods.

**R3.2.1.** How confirmed Transmission reservations, expected Interchange and internal counterflow are addressed in firm and non-firm ATC or AFC calculations.

**R3.2.2.** A rationale for the defined accounting.

**R3.3.** The identity of the Transmission Operators and Transmission Service Providers from which the Transmission Service Provider receives data for use in calculating ~~ATC~~transfer of Flowgate capability.

**R3.4.** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer or Flowgate capability.

~~**R3.5.**The identity of the Transmission Service Providers from which it receives data for use in calculating transfer capability.~~

~~**R3.6.**~~**R3.5.** A description of the allocation processes listed below that are applicable to the Transmission Service Provider:

- Processes used to allocate ~~Transfer~~ transfer ~~Capability~~ or Flowgate capability among multiple lines or sub-paths within a larger ATC Path or Flowgate.
- Processes used to allocate ~~Transfer~~ transfer ~~Capabilities~~ or Flowgate capabilities among multiple owners or users of a~~ single~~n ~~path~~ ATC Path or Flowgate.
- Processes used to allocate ~~AFC~~ transfer or Flowgate capabilities between Transmission Service Providers to address issues such as forward looking congestion management and seams coordination.

~~**R3.7.**~~**R3.6.** A description of how outages ~~durations~~ are considered in ATC calculations, including:

~~**R3.7.1.**~~**R3.6.1.** The criteria used to determine when an outage impacts a daily ATC or AFC calculation.

~~**R3.7.2.**~~**R3.6.2.** The criteria used to determine when an outage impacts a monthly ATC or AFC calculation.

**R3.6.3.** How outages (including those outages from other Transmission Service Providers that are unrecognized) are processed.

**R4.** The Transmission Service Provider shall notify the following entities (via electronic mail) before implementing a new or revised ATCID: ***[****Violation Risk Factor: Lower****]*** ***[****Time Horizon: Operations Planning****]***

**R4.1.** Each Planning Coordinator associated with the Transmission Service Provider's area.

**R4.2.** Each Reliability Coordinator associated with the Transmission Service Provider's area.

**R4.3.** Each Transmission Operator associated with the Transmission Service Provider's area.

**R4.4.** Each Planning Coordinator adjacent to the Transmission Service Provider's area.

**R4.5.** Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

**R4.6.** Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

**R5.** The Transmission Service Provider shall make available the current ATCID to all of the entities specified in R4. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.** When calculating TTC~~, AFC and ATC,~~ or TFC the Transmission Operator ~~and Transmission Service Provider~~ shall ~~each~~ use assumptions ~~consistent with~~no more limiting than those used in planning of operations for the corresponding ~~in any associated operations studies or planning studies for the~~ time period studied. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.** When calculating ATC or AFC the Transmission Service Provider shall use assumptions no more limiting than those used in planning of operations for the corresponding time period studied. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**~~R7.~~R8.** Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed: ***[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]***

**~~R7.1.~~R8.1.** ~~For h~~Hourly ~~ATC~~values, once per hour. Transmission Service Providers are allowed up to 80 hours per calendar year during which calculations are not required to be performed.

**~~R7.2.~~R8.2.** ~~For d~~Daily ~~ATC~~values, once per day.

**~~R7.3.~~R8.3.** ~~For m~~Monthly ~~ATC~~values, once ~~a~~ per week.

**~~R8.~~R9.** Within thirty calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below for use in ATC or AFC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in ~~R8~~R9.1 and ~~R8~~R9.2: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Expected generation and Transmission outages, additions, and retirements.
- Load forecasts.
- Unit commitments and order of dispatch, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:
  - Dispatch Order
  - Participation Factors
  - Block Dispatch
- Aggregated firm capacity set-aside for Network Integration Transmission Service and aggregated non-firm capacity set aside for Network Integration Transmission Service (i.e. Secondary Service).
- ~~Confirmed f~~Firm and non-firm Transmission reservations.
- Aggregated capacity set-aside for Grandfathered obligations.
- Firm roll-over rights.
- Any firm and non-firm adjustments applied by the Transmission Service Provider to reflect parallel path impacts.

- Power flow models and underlying assumptions.
- Contingencies, provided in one or more of the following formats:
  - A list of Elements
  - A list of Flowgates
  - A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider
- Facility Ratings.
- Any other services that impact Existing Transmission Commitments (ETCs).
- Values of Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM), and TTC for all ATC Paths or Flowgates.
- Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider receiving the request when selling Transmission service.
- Values of TTC and ATC for all ATC Paths for those Transmission Service Providers receiving the request that do not consider Flowgates when selling Transmission Service.
- Source and sink identification and mapping to the model.

**~~R8.1.~~R9.1.** The Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months into the future (subject to confidentiality and security requirements).

**~~R8.2.~~R9.2.** This data shall be made available by the Transmission Service Provider on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider).

## C. Measures

**M1.** The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one ~~or more~~ of the specified ~~ATC~~ methodologies per time period in R2 for use in determining Transfer Capabilities of those Facilities for each ATC Path within ~~the~~ its Transmission Operator~~'s operating area~~Area. (R1).

**M2.** The Transmission Service Provider shall provide ATC or AFC values and identification of the selected ~~ATC~~ methodologies along with other evidence (such as written documentation, processes, or data) to show it calculated ATC or AFC for the following using the selected methodology or methodologies chosen as part of R1 (R2):

- There has been at least ~~168~~ 48 hours of hourly ~~ATC~~ values calculated at all times. (R2.1)
- There has been at least 31 consecutive calendar days of daily ~~ATC~~ values calculated at all times. (R2.2)
- There has been at least the next 12 months of monthly ~~ATC~~ values calculated at all times (Months 2-13). (R2.3)

**M3.** The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

**M4.** The Transmission Service Provider shall provide evidence (such as dated electronic mail messages) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)

**M5.** The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in R4, as required by R5. (R5)

**M6.** The ~~Transmission Service Provider and~~ Transmission Operator shall ~~each~~ provide a copy of the assumptions (such as loop flow, generation re-dispatch, switching operating guides, load shedding or data sources for load forecast and facility outages) used to calculate TTC~~, ATC and AFC~~ or TFC as well as other evidence (such as copies of operations ~~and~~ planning studies, models, supporting information, or data) to show that the assumptions used in determining TTC~~, ATC, and AFC~~ or TFC are no more limiting than those ~~were consistent with those~~ used in planning of operations ~~or planning studies~~ for the corresponding time period studied. Alternatively the Transmission Operator may demonstrate that the same load flow cases are used for both TTC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R6)

**M7.** The Transmission Service Provider shall provide a copy of the assumptions (such as loop flow, generation re-dispatch, switching operating guides, load shedding or data sources for load forecast and facility outages) used to calculate ATC or AFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining ATC or AFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Service Provider may demonstrate that the same load flow cases are used for both AFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R7)

**~~M7~~M8.** The Transmission Service Provider calculating ATC shall provide evidence (such as logs or data) that it has calculated the hourly, daily, and monthly ~~ATC~~ values on at least the minimum frequencies specified in ~~R7~~ R8 or provide evidence (such as data, procedures, or software documentation) that the calculated values identified in the ATC equation have not changed. (~~R7~~R8)

**~~M8~~M9.** The Transmission Service Provider shall provide a copy of the dated request, if any, for ATC or AFC data as well as evidence to show it responded to that request (such as logs or data) within thirty calendar days of receiving the request, and the requested data items were made available in accordance with ~~R8~~R9. (~~R8~~R9)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

-The Transmission Operator shall maintain its current selected method(s) for calculating ATC or AFC and any methods in force since last compliance audit period to show compliance with R1.

-The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7, and R8 for the most recent calendar year plus the current year.

-The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.

-The Transmission Service Provider shall maintain evidence to show compliance with R5 for the most recent three calendar years plus the current year.

-The Transmission Operator shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.

-If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

-The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## Implementation Plan for Standard MOD-001-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-001-1 — Available Transfer Capability which requires the selection of an ATC methodology and describes the parts of the ATC process that apply to all entities, regardless of methodology chosen.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Retired Standards

This standard supersedes the current MOD-001-0.

FAC-012-1 — Transfer Capability Methodology includes four requirements. MOD-001-1 incorporates the requirements from FAC-012-1 as follows:

- R1 (Documentation of the Transfer Capability Methodology).
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (Responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

FAC-013-1 — Establish and Communicate Transfer Capabilities, includes two requirements. MOD-001-1 incorporates the two requirements from FAC-013-1 as follows:

- R1 (Calculation of the Transfer Capabilities).
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-001-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

### Implementation Plan for Standard MOD-001-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-001-1 — Available Transfer Capability which requires the selection of an ATC methodology and describes the parts of the ATC process that apply to all entities, regardless of methodology chosen.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## ~~Modified~~ Retired Standards

This standard supersedes the current MOD-001-0.

FAC-012-1 — Transfer Capability Methodology includes four requirements. ~~This standard~~ MOD-001-1 incorporates the ~~four~~ requirements from FAC-012-1 as follows:

- R1 (Documentation of the Transfer Capability Methodology).
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (Responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

FAC-013-1 — Establish and Communicate Transfer Capabilities, includes two requirements. MOD-001-1~~This standard~~ incorporates the two requirements from FAC-013-1 as follows:

- R1 (Calculation of the Transfer Capabilities).
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-~~012~~013-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-001-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities~~, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date MOD-001, MOD-028, MOD-029, and MOD-030 are approved by the NERC Board of Trustees.~~ . This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

Please **DO NOT** use this form to submit comments on the current draft of MOD-001. Comments must be submitted by **May 15, 2008.**

If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-452-8060.

**Background Information MOD-001 — Available Transmission System Capability.** (An "umbrella" standard requires the selection of a methodology, the updating of values, and the sharing of procedures and data – formerly called, "Available Transfer Capability.")

An initial ballot of MOD-001-1 — Available Transmission System Capability, was conducted March 3-12, 2008 and there were several suggestions for modifying the standard that were submitted with ballots. The drafting team withdrew the standard from the ballot process, and made several changes to the standard based on stakeholder comments, including the following:

1. The title and purpose were modified to more clearly reflect the reliability aspects of 'why' ATC and AFC are calculated.
2. The standard was modified to be clear that MOD-001 does not require conversion of AFC to ATC. While the OASIS Requirements require that ATC be posted, the Drafting Team could not find any reason that AFC must be converted to ATC for reliability. MOD-030 continues to provide the equation to convert AFC to ATC, that shall be used 'when' the conversion occurs, but the NERC standards do not define 'when' that conversion must occur. The standard now uses the phrase "ATC or AFC", where applicable. While the use of 'or' is not typically used in standards, since any Transmission Service Provider is only required to calculated either AFC or ATC, based on method that was selected, the use of 'or' is appropriate.
3. Several definitions were modified to provide greater clarity.
4. Several VRFs were changed from "Medium" to "Lower" in response to industry comments. A medium risk factor is appropriate for "a requirement that, if violated, could ***directly*** affect the electrical state or the capability of the bulk power system, or the ability to effectively monitor and control the bulk power system, but is unlikely to lead to bulk power system instability, separation, or cascading failures." A violation of these standards can produce values that indirectly affect the system (i.e., the value may be used in other processes that result in the sale of transmission service), which results in a Lower VRF. The Drafting Team believes that subsequent recalculations of ATC or AFC will help address any incorrect values. Additionally, such a value would be identified and prevented in advance of actual reliability problems by other standards (e.g., SOL or IROL in the FAC standards) as well as the Transmission Operator's existing guidelines and procedures that prevent the Transmission Operator from over-scheduling.
5. R2 was changed such that only 48 Hourly values are required instead of 168 Hourly values. It is necessary for reliability to know the hourly information for the next 1-2 days. However, while OASIS posting is required for 168 hours, the Drafting Team does not see any reliability benefit to calculating more than 48 hours of Hourly data. Daily and monthly values provide the necessary reliability information for time periods more than 48 hours in the future.
6. R6 (and R7) were modified to clarify that assumptions need to be "no more limiting" rather than "consistent" with those used in planning or operations for the

corresponding time period. In addition, the existing R6 was split to clarify which aspects the Transmission Operator and Transmission Service Provider are responsible for. Measures were expanded to be more clear.

7. A more graded approach was applied to the VSLs where appropriate.

8. The Transmission Service Provider was given an 80-hour-per-year grace period in R8 for scheduled or unscheduled outages of any ATC calculation software that impact the hourly calculation.

**Please review the revised version of MOD-001 and then answer the following questions. You do not have to answer all questions. Enter All Comments in Simple Text Format.**

1. **The drafting team modified several definitions in MOD-001 based on stakeholder comments. Do you agree with the revised definitions? If not, please specify any definition that you disagree with and, if possible, provide a suggested revision.**

   ☐ Yes – definitions are acceptable as revised

   ☐ No – one or more definitions needs revision – see comments

   Comments:

2. **MOD-001-1, R1 says, "Each Transmission Operator shall select one methodology for calculating the available capability on the bulk electric system…" The Drafting Team believes that the Transmission Operator is the appropriate entity since the Transmission Operator is ultimately responsible for operating a reliable system while using all Transmission Service Providers' calculated available capability. However, some parties have commented that the Transmission Service Provider should select the methodology for calculating the available capability since (a) a Transmission Service Provider may use the transmission of multiple Transmission Operators, (b) there are 'registered' Transmission Operators that do not calculate ATC, and (c) the Transmission Operator has only 2 responsibilities -- R1 to pick a calculation method, and R6 where the Transmission Operator must calculate consistent with planning studies.**

   **Should the Transmission Operator or the Transmission Service Provider select the methodology for calculating the available capability on the bulk electric system?**

   ☐ Transmission Operator

   ☐ Transmission Service Provider

   ☐ No preference

3. **The drafting team modified some requirements and associated measures in MOD-001 to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct.**

   Incorrect Requirement(s) or Measure(s):

4. **The drafting team has modified the Violation Risk Factors for MOD-001 to reflect industry concerns that they did not reflect NERC's VRF definitions. NERC's VRF definitions are listed below:**

   **High Risk Requirement**:
   (a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could

place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or
(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

**Medium Risk Requirement**:
(a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or
(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**Lower Risk Requirement**: is administrative in nature and
(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or
(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

**Are the current VRFs established correctly?**

☐ Yes
☐ No

**If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification.**

Comments:

5. **The drafting team has modified the Violation Severity Levels for MOD-001 to reflect industry concerns that they were too "pass/fail" oriented and to reflect the modifications to the requirements and measures. Are the current VSLs established correctly?**

☐ Yes
☐ No

**If "No," please identify specific VSLs and suggest changes to the language.**
Comments:

6. **Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-001.**

   Comments:

| | Individual or group. | Name | Organization | Group Name | Lead Contact | Question 1 | Question 1 Comments | Question 2 | Question 3 | Question 4 | Question 4 Comments | Question 5 | Question 5 Comments | Question 6 Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | | | American Public Power Association | Allen Mosher | No - one or more definitions needs revision - see comments | “Counterflows” should be a defined term. It is used in MOD-1, MOD-28, MOD-29 and MOD-30 and is an integral element in the calculation of ATC and AFC. The definition used in MOD-28-1 R10, for example, reads: “counterflowsF are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.” This definition does not in any way describe what a counterflow is. “Postbacks” should incorporate a working definition developed by NAESB, to be revised once due process is completed on this business practice. Alternatively, consider use of the following text to at minimum describe the nature of postbacks: “PostbacksF are changes to firm [non-firm] ATC [AFC] due to a change in the amount of Firm [non-firm] Transmission Service reserved or scheduled for a period, as defined in Business Practices. Postbacks are generally a positive | Transmission Service Provider | R3.3 - seems awkward for tranfer capability to not be a defined term when TTC and ATC are defined; at minimum, edit to read transfer or Flowgate capability. R3.6 - clarify that "outages" are transmission outages, generator outages or both. R8.1 - why hardwire 80 hours per calendar year during which calculations are not required to be performed? Should this be a compliance Measure? | Yes | | Yes | | Excellent work - my thanks to the SDT members. |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | quantity." Also, capitalize existing transmission commitments in the definition of ATC. | | | | | | | |
| Individual | Paul Rocha | CenterPoint Energy | | | | | | | | | | | The group of standards is for ATC and TRM methodologies that are not used in ERCO that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these not add value to the ERCOT region and could increase congestion in the region. Acc previously submitted comments to these standards asking for an exemption for the standards unacceptable unless the following provision is added to each standard: Th or any other region that operates as a single control area. |
| Group | | | SERC Available Transfer Capability Working Group (ATCWG) | Dough Bailey | Yes - definitions are acceptable as revised | | No Preference | | Yes | | | | |
| Individual | John Harmon | The Midwest ISO | | | Yes - definitions are acceptable as revised | | Transmission Service Provider | R3.3 – last line should read: … calculating ATC or AFC. R3.4 – last line should read: … calculating ATC or AFC. R3.5 – Each bullet should read: … allocate ATC or AFC… R6 and R7 – The term 'assumptions' is not specific enough for entities to prepare for compliance. The Midwest ISO requests the standard to list specific assumptions within the scope and what defines 'more limiting' for each of them. For example, is load assumption within the scope? If yes, what load assumption is more limiting? If it is not possible, the Midwest ISO believes that this topic from Order 890 should be left out from any standard and left to FERC to address issues on a case by case basis. R9 – Please expand/clarify the intentions of the 4th bullet. What specific aggregated firm capacity is being referenced? Capacity in ETC for each flowgate as specified by reservations? An example would be very beneficial. R9 – The 13th bullet should read: .. (TRM), and TTC or TFC for all….. M6 – Include reference for TFC, should read: … used for TTC, or TFC, and Operations Planning…. | Yes | | No | The VSLs for R8 of MOD-001 are inconsistent to the VSLs stated for R10 of MOD-030 although each is related to comparable requirements regarding the frequency of recalculations. If the suggestion of deletion of R10 in MOD-030 is accepted the inconsistency will be addressed. Otherwise, the team should align these VSLs consistently. | |
| Individual | John Dalessi | Transmission Agency of Northern California | | | Yes - definitions are acceptable as revised | | No Preference | | Yes | | Yes | | R.9 lists many data elements that another entity can request and a TSP is obligated this data themselves, and R.9 should be clarified to state that the TSP is not obigate Perhaps this is implied in R9.1, but if so it should be stated more clearly. Also the fir assume the requested data is for use in the requestor's ATC or AFC calculations, but used in the ATC/AFC calcualation of the TSP receiving the request. |
| | | | | | | | | MOD-01, R9. Could the NERC Team please clarify "which" Load | | | | | |

| | Group | | | WECC Market Interface Committee / Sub Commtt / ATC Task Force | W. Shannon Black | Yes - definitions are acceptable as revised | | Transmission Service Provider | Forecast it is requesting? Hourly? Daily? For what affected area? MOD-01, R9. Could the NERC Team please clarify that Block/Dispatch Order and Participation Factors do not call for the submission of specific schedules; rather, these defintions only call for dispatch rules from which approximations can be made. | Yes | | Yes | | |
| | Group | | | Southwest Power Pool | Kevin Bates | Yes - definitions are acceptable as revised | | | | Yes | | | | R3.6.3. How outages (including those outages from other Transmission Service Prov<br>processed. Define "unrecognized." Does this also refer to outages that are not used<br>outside the TSP's model and therefore do not impact calculations?<br>______________________________________________________________<br>R9. Within thirty calendar days of receiving a request by any Transmission Service P<br>Reliability Coordinator, or Transmission Operator for data from the list below for use<br>Transmission Service Provider receiving said request shall begin to make the reques<br>subject to the conditions specified in R9.1 and R9.2: The concern of R9 is numerous<br>unnecessary burden for TSPs fulfilling said requests. SPP feels a justification should l<br>comunication between requestor and TSP so desired result is obtained. |
| | Individual | Maria Neufeld | Manitoba Hydro | | | Yes - definitions are acceptable as revised | | No Preference | | Yes | | Yes | | |
| | Individual | Jack Cashin/Barry Green | EPSA | | | Yes - definitions are acceptable as revised | | No Preference | R6/7. I believe the wording of this requirement in the previous draft was superior. In the revised language, deletion of the word "consistent" allows for discontinuities in the ATC calculations. For example, if the assumptions used in "planning of operations" in the period beyond one month are different than for those in the current month, this could create discontinuities where the calculations adopt different assumptions. In addition, the current language has broken the explicit link between planning studies and operations studies. | | no comment | | NO COMMENT | We offer two additional comments. First, with respect to the purpose of this standar<br>previous draft was more appropriate. The previous draft stated that consistency in tl<br>documentation were part of the purpose of this standard. We believe those are impo<br>included. Secondly, requirement 3.2 dealing with counterflows is insufficient in the c<br>consistency in the use of counterflows on all interfaces would not be appropriate. Inc<br>single system, it is likely appropriate that the counterflows on some interfaces be tre<br>historical usage of the interface. However, to create a standard that requires only an<br>and a statement of the rationale, with no guidance on appropriate methodologies or<br>sufficiently enforceable and amounts to a fill-in-the-blank standard. |
| | Group | | | Public Service Commission of South Carolina | Phil Riley | Yes - definitions are acceptable as revised | | No Preference | | Yes | | Yes | | |
| | | | | | | | | | Requirement 2 •While the IRC understands that the SDT believes that the requirements need to address the amount of ATC or AFC data calculated and the frequency of calculation associated with them, these requirements should be business practices and should be considered NAESB scope and | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | ISO RTO Council/Standards Review Committee (SRC) | Charles Young | Yes - definitions are acceptable as revised | | | eliminated from the MOD Standards. The MODs can still address FERC orders and be reliability based without the MOD-001 R2 (amount of ATC or AFC) and R8 (frequency ATC recalculation) and MOD-030 R10 (frequency AFC recalculation) requirements. The violation severity levels for these draft standards now have a graded implementation. The possibility of multiple violations resulting from a single event still remains. The IRC requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations. This language should be added to the standard as a new item 6 to section A of MOD-001. Requirement 3 •R3.2.1 - The IRC understands the SDT's reasons for using "Confirmed" reservations in accordance with the FERC regulations. However, reservations that are in "Accepted", as well as, "Confirmed" status should be included. Once service is "Accepted" by a TSP it cannot be retracted. Using reservations that are in "Accepted" and "Confirmed" status should also be included in MOD-030 R6.3, R6.4, R7.1, and R7.2. This does not prevent the TSP from decrementing for accepted and confirmed TSRs. We understand that some TSPs maintain two sets of ATCs. One set is maintained internally and accounts for accepted and confirmed TSRs. The other set of ATC values is maintained externally and only accounts for confirmed TSRs. It is important for TSPs who maintain two sets of ATC values to post the "internal" ATC values to provide greater transparency and | Yes | The MOD standards assess the correct amount of reliability risk in areas that do not affect reliability. The IRC supports the position that no requirement from this set of ATC standards should have an assigned Risk Factor exceeding "Lower". A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of | No | ERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but the IRC has a concern regarding the possibility of multiple violations resulting from a single event. The IRC requests that double counting of violations for a single event be eliminated. The IRC recommends that the SDT add a new item 6 to section A of MOD-001 that states "A single event shall not result in multiple violations". A review of MOD-001 R2 and R8 should be performed for determination of multiple violations resulting from one event. | The IRC applauds the efforts of the NERC Standards Drafting Team (SDT) in providir comment that include many of the Industry's comments from the Ballot. However, tl require modification. The MOD standards extend into areas that should be covered a Practices (as defined in MOD-001 Definitions). The frequency of postings and freque be NAESB Business Practices, and not included in the NERC Standards as reliability t details for MOD-001 R2 and R7). Non-firm should be removed from this reliability st |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | give customers a more accurate picture of capability available to new requests. •R3.6 - For R3.6 in MOD 001 requires outages to be included in the daily and monthly calculations. R5.2 in MOD 30 requires outages to be included in the hourly calculations. A single requirement should be placed in MOD 1 and applied consistently across MODS 28, 29 and 30. Requirement 8 •If R8 is not moved to NAESB Business Practices then revise R8.1 and the VSL to align the requirement and NAESB practice which allows OASIS to be down 2% of the time over a year. Modify the 80 hour per year allowable outage requirement to 175 hours per year (8760 hrs/year x 0.02= 175 hours). This VSL does not become a possible sanction until the accumulated amount of hours missed exceeds 175 hours. The 175 hours is for planned, system IT outages. Unplanned, system IT outages should not be included in this total. | | the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system. | | | |
| | | | | | | | | | Requirement 1: I suggest modifying the requirement to state: "Each Transmission Service Provider with ATC Path(s) shall select one ATC methodology for calculating ATC (Area Interchange methodology, Rated System Path methodology)or AFC (Flow gate methodology) for each ATC Path per time period identified in R2 for those facilities within its Transmission Service Provider area." Comment: The TOP is to operate its transmission operating area in a reliable manner and ensure SOLs are determined. ATC is a transmission service market concept, not a reliability function. In areas where there is a transmission service market in operation, there is some reliability | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | H. Steven Myers | ERCOT ISO | | | Yes - definitions are acceptable as revised | | Transmission Service Provider | value to having a representative ATC in play to ensure proper planning is conducted, but reliability is ensured by adherance to the SOLs of the system, not by adherance to ATC. Requirement 3: I suggest modifying the requirement to state: "Each Transmission Service Provider with ATC Path(s) shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information:" Requirement 4: I suggest modifying the requirement to state: "The Transmission Service Provider with ATC Path(s) shall notify the following entities (via electronic mail) before implementing a new or revised ATCID." Requirement 5: I suggest modifying the requirement to state: "The Transmission Service Provider with ATC Path(s) shall make available the current ATCID to all of the entities specified in R4." Requirement 6: I suggest modifying the requirement to state: "When calculating TTC or TFC, the Transmission Service Provider with ATC Path(s) shall use assumptions no more limiting than the estimated SOLs used in planning of operations for the corresponding time period studied." Requirement 7: I suggest modifying the requirement to read: "When calculating ATC or AFC, the Transmission Service Provider with ATC Path(s) shall use assumptions no more limiting than the estimated SOLs used in planning of operations for the corresponding time period studied." Requirement 8: I suggest modifying the requirement to state: "Within 30 calendar days of receiving a request by any Transmission | | | | | I suggest modifying the Applicability section to state: 4.1 Transmission Service Provi Transmission Oerator with ATC Path(s) Comment: It is unclear how failing to meet tl grid reliability. This should be a commercial standard or a business practice rather th Severity Levels: Violation of timeing requirements should not constitute a severe vio failure to attempt to perform the task at all. A high violation could be a long failure t NO attempted corrective action. All other failures in timing should be lower violation |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | Service Provider, Planning Coordinator, or Reliability Coordinator for data from the list below for use in ATC or AFC calculations, each Transmission Service Provider with ATC Path(s) receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R9.1 and R9.2." Requirement 9.1: I suggest modifying the sub-requirement to state: "The Transmission Service Provider with ATC Path(s) shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months in the future (subject to confidentiality and security requirements)." Requirement 9.2: I suggest modifying the sub-requirement to state: "This data shall be made available by the Transmission Service Provider with ATC Path(s) on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requestor and the provider)." | | | | | |
| | Individual | Aaron Staley | Orlando Utilities Commission | | | Yes - definitions are acceptable as revised | | Transmission Service Provider | | Yes | | Yes | | Overall Question: As written currently, the standard appears to set requirements for<br>but does not require an entity to perform the calculation. For example, R1 and R6 ap<br>TOP doesn't calculate ATC/AFC/TTC/TFC then nothing in the requirements seems to<br>seems to be true of the requirements that apply to a TSP. Is this a correct reading o<br>If the drafting team changes the responsible entity in Requirement 1, will they also<br>What if there is not "planning of operations" activity for the corresponding time peri<br>have an ATC study done, it may not have a corresponding "planning of operations"<br>you provide some examples of what you mean by "assumptions". Requirement 6 &<br>these requirements, specifically what is the reliability purpose of setting a maximum<br>assumption can be? |
| | Group | | | WECC Market Interface Committee ATC Task Force | W. Shannon Black | Yes - definitions are acceptable as revised | | Transmission Service Provider | Mod-001, R9. Could the NERC Team please clarify "which" Load Forecast it is requesting? Hourly? Daily? For what affected area? MOD-001, R9. Could the NERC Team please clarify that Block/Dispatch Order and Participation Factors do not call for the submission of specific schedules; rather, these definitions only call for dispatch rules from which approximations can | Yes | | Yes | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | be made. | | | | | |
| | Individual | Patrick Brown | PJM | | | Yes - definitions are acceptable as revised | | Transmission Operator | Requirement 2 • While PJM understands that the SDT believes that the requirements need to address the amount of ATC or AFC data calculated and the frequency of calculation associated with them, these requirements should be business practices and should be considered NAESB scope and eliminated from the MOD Standards. The MODs can still address FERC orders and be reliability based without the MOD-001 R2 (amount of ATC or AFC) and R8 (frequency ATC recalculation) and MOD-030 R10 (frequency AFC recalculation) requirements. The violation severity levels for these draft standards now have a graded implementation. The possibility of multiple violations resulting from a single event still remains. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations. This language should be added to the standard as a new item 6 to section A of MOD-001. Requirement 3 • R3.2.1 - PJM understands the SDT's reasons for using "Confirmed" reservations in accordance with the FERC regulations. However, reservations that are in "Accepted", as well as, "Confirmed" status should be included. Once service is "Accepted" by a TSP it cannot be retracted. Using reservations that are in "Accepted" and "Confirmed" status should also be included in MOD-030 R6.3, R6.4, R7.1, and R7.2. This does not prevent the TP from decrementing for accepted and confirmed TSRs. We understand that some TPs maintain | Yes | PJM supports NERC's position to revise all Violation Risk Factors to have an assigned risk factor of "Lower." A Lower Risk Factor requirement is administrative in nature and is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but PJM has a concern regarding the possibility of multiple violations resulting from a single event. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations –this language to be | Depth of the ATC MOD standards extends beyond the scope of the reliability standar areas that should be covered and addressed by NAESB Business Practices (as define frequency of postings and frequency of AFC/ATC calculations should be NAESB Busin NERC Standards as reliability based requirements (see specific details for MOD-001 I Specific Comments sections below). Non-firm should be removed from this reliability |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | two sets of ATCs. One set is maintained internally and accounts for accepted and confirmed TSRs. The other set of ATC values is maintained externally and only accounts for confirmed TSRs. It is important for TPs who maintain two sets of ATC values to post the “internal” ATC values to provide greater transparency and give customers a more accurate picture of capability available to new requests. • R3.6 - For R3.6 in MOD 001 requires outages to be included in the daily and monthly calculations. R5.2 in MOD 30 requires outages to be included in the hourly calculations. A single requirement should be placed in MOD 1 and applied consistently across MODS 28, 29 and 30. Requirement 8 • If R8 is not moved to NAESB Business Practices then revise R8.1 and the VSL to align the requirement and NAESB practice which allows OASIS to be down 2% of the time over a year. Modify the 80 hour per year allowable outage requirement to 175 hours per year (8760 hrs/year x 0.02= 175 hours). This VSL does not become a possible sanction until the accumulated amount of hours missed exceeds 175 hours. The 175 hours is for planned, system IT outages. Unplanned, system IT outages should not be included in this total. | | power system, or the ability to effectively monitor and control the bulk power system. | | added to the standard. Add a new item 6 to section A of MOD-001. For example a review of MOD-001 R2 and R8 and MOD-30 R10 should be performed for determination of multiple violations resulting from one event. | |
| | | | | | | | | | | | | | | These comments are filed on behalf of City of Austin d/b/a Austin Energy to address Austin Energy is a municipally owned electric utility and a transmission service provi Council of Texas (ERCOT). ERCOT now operates as a Single Balancing Authority with being sold. Current ERCOT market rules allow open transmission access to all loads operate as a Single Balancing Authority under Nodal market design. Accordingly, as NERC 5 MOD Standards should not be applied to ERCOT and transmission service pr current or proposed Nodal market design. Austin Energy requests that the NERC Sta to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1 applicable to regions with a Single Balancing Authority that do not use ATC methodo their market operations. Applicable definitions: According to NERC Reliability Standa Transfer Capability (ATC) is defined as: “A measure of the transfer capability remain network for further commercial activity over and above already committed uses. It i (TTC) less existing transmission commitments (including retail customer service), le less a Transmission Reliability Margin (TRM), plus Postbacks, plus counterflows”. TT power that can be transferred over the interconnected transmission network in a reli specific set of defined pre- and post-contingency system conditions. CBM is defined transfer capability reserved by load serving entities to ensure access to generation f generation reliability requirements. TRM also is a component of ATC defined as: that capability necessary to ensure that the interconnected transmission network is secu uncertainties in system conditions. Comments: ERCOT is an interconnection and a r |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | NPCC Regional Standards Committee | Guy V. Zito | Yes - definitions are acceptable as revised | | Transmission Service Provider | NPCC Participating Members have the following comments on specific requirements 1. R3.6.3: This subrequirement is too vague and its addition is not necessary. Subrequirements R3.6.1 and R3.6.2 suffice to hold the TSP responsible for considering the impact of outages in ATC calculation. How the outages are processed has no bearing on the ultimate scenarios (topologies) that the TSP must consider. 2. Also we do not agree with the changes made to R6 and R7. By “no more limiting than” the assumptions used in planning of operations for the same time period, it would imply that the TOP and TSP may use less restrictive (or more liberal) assumptions. The results could be that the TTCs and ATCs are higher than the planned operational parameters, giving rise to potential unreliability. We do not see a problem with the previous wording of “consistent with”, and this should be reinstated | Yes | | No | NPCC Participating Members have the following comments on the VSL: 1. R3: There is a potential overlap between High and Severe. For an ATCID does not include “two or more” of the information items in R3, it could mean does not include all of the information items. This is the same condition as a Severe. We suggest to reword the High VSL to “does not include up to 2 of the information items in R3”; and the Severe VSL to “or its ATCID does not include 3 or more of the information described in R3”, or numbers along that line. 2. We do not agree with the VSLs for R6 and R7 for reasons noted under Q3, above. | NPCC Participating Members do not see the role of TOP in this standard. The TOP’s p<br>transmission operating area in a reliable manner, and determine SOLs and where ne<br>capabilities and flowgate capabilities (where applicable). Given the established SOLs<br>the TOP for operational planning, and the TTCs and TFCs determined by other entitie<br>wider area and for different time frames, the TSP needs only to calculate ATCs (or A<br>constraints. In doing so, it should be able to select an ATC calculation method to sui<br>due consideration to the basis of the TTCs and TFCs that affect its service area. With<br>response to Q2, above, that the TSP be the one who selects the ATC method and R1<br>also that it should not be assumed that the TOP area and the TSP area are the same<br>TFCs that affect the TSP’s area may differ from one part to another. Also we believe<br>the method to be used in calculating available transmission transfer capability since<br>processing transmission services, not the TOP. In determining ATCs, the TSP needs<br>determined by the TOPs, RCs, TPs and PCs. Keeping the determination of TTCs (TFC<br>ATC, including the latter’s methodology, would be the appropriate approach in movir<br>standards. |
| | | | | | | | | | R1- The selection of a calculation methodology should reside with the party responsible for calculating ATC. As stated in question 2, FE believes that R1, the selection of an ATC methodology, should be applicable to the Transmission Service Provider (TSP) and not the Transmission Operator since within many RTO areas it is the TSP who maintains the ATC methodology documentation and performs the ATC calculations. This is the case in a large portion of the continent and a standard should not be written in a way that would knowingly require an assignment delegation for a large number of potential responsible entities. Assigning the requirement | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | FirstEnergy | Doug Hohlbaugh | Yes - definitions are acceptable as revised | | Transmission Service Provider | responsibility to the TSP would also work for non-market areas of the continent where a TO/TOP also serves as its own its own TSP. The TOP should provide a support role in providing data and information that is needed by the TSP to fulfill its responsibilities in calculating ATC. The TSP is overseeing transmission service requests and making determination of the viability of such requests. The TOP has ultimate reliability responsibility in the real-time environment and will manage its system to its system operating limits regardless of the ATC methodology used by its TSP to approve transactions that make use of the transmission operator's system. R3.3 – There appears to be a typo. Replace "of" in the words "transfer of Flowgate capability" with "or" R3.3, R3.4, R3.5 – Suggest the SDT consider replacing the words "transfer or Flowgate capability" with "ATC or AFC" to improve readability. R3.6 – Replace "ATC" with "ATC or AFC". R3.6 (sub-requirements) - The sub-requirements of R3.6 require that outages be included in the daily and monthly calculations, but excludes hourly calculation periods. In MOD-030 (AFC Methodology) requirement R5.2 requires expected transmission and generation outages are included for all applicable time period calculated. It is suggested that a single requirement reside in MOD-001 to cover the hourly, daily and monthly aspects for this intent that would assure consistent application across the MOD-028, MOD-029 and MOD-030 standards. R8 – It is not clear why the frequency for recalculation is only | Yes | FE supports the SDT's adjustment of VRFs such that no VRF within the ATC standards exceeds a "Lower" rating. We concur with the team's reasoning and rationale provided in response to ballot comments in making this change. | No | The VSLs for R8 of MOD-001 are inconsistent to the VSLs stated for R10 of MOD-030 although each are related to comparable requirements regarding the frequency of recalculations. If the above suggestion revising MOD-001 R8 and deletion of R10 in MOD-030 is accepted the inconsistency will be addressed. Otherwise, the team should align these VSLs consistently. | FirstEnergy appreciates the Standard Drafting Team's decision to move to a formal c initial ballot feedback. We commend the team for moving quickly to respond to the b industry a revised set of standards to review and comment. Regarding the revision t FirstEnergy agrees that there is a need to ensure that the standard is implemented c continent we are concerned with the Effective Date being subject to approval of ALL appropriate Implementation Plan should reflect a period of time beyond the NERC Bo would reflect when the requirements are considered mandatory and enforceable. The for regulatory authority reviews, with the intent of sanctions also being enforced in c implementation period. However, a delay from a given regulatory agency should not considered mandatory and enforceable for the bulk electric system. |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | focused on ATC, and does not read "ATC or AFC", similar to the wording used for calculating in R2. In MOD-030 R10 addresses recalculation for the AFC but it seems that with the suggested change in R8 of MOD-001, that R10 of MOD-030 could be eliminated. Additionally they are inconsistent in that R10 does not provide for the 80 hour annual allowance that is stated in R8. | | | | | |
| | Individual | Thad Ness | AEP | | | Yes - definitions are acceptable as revised | | Transmission Service Provider | | | | | | The Applicability of this Standard should be solely upon the TSP, the Transmission O Standard. From the previous set of responses, it is the apparent belief of the SDT th for reliability (response to AECI for example). We disagree. Considering that ATC is a forecasted system conditions (load, outages, generation dispatch, others' transactio margins (TRM and CBM of own entity and other systems), using the calculated ATC t transmission reliability would be – at best – unwise. Transmission Reliability can be a individual Facility loadings and/or other parameters, for example. The calculation of exactly for the purpose stated in the definition of ATC: "A measure of ... capability.... note the definition does not infer ATC is a measure of reliability. Granted, ATC is cal values and concepts (such as ratings, contingency analysis aspects, SOLs etc), BUT assessment of transmission reliability – and therefore not a function for the Transmi Transmission Service Provider. |
| | Group | | | PPL Supply Group | Annette Bannon | | | | R4. PPL suggests that Purchasing/Selling Entities should be included in the listing of entities under Requirement R4 who have access to the ATCID. R8. PPL suggests that the following changes be made to the calculation time periods: R8.1 should require hourly ATC to be calculated "as close to continuously as possible". Once per hour is too slow. R8.2 should require daily ATC to be calculated at 15 minute or less intervals. Once per day is too slow. R8.3 should require that Monthly ATC be calculated hourly or at most daily. Once per week is too slow. | | | | | PPL suggests that the standard should require that the TSP make available the new |
| | Individual | Greg Rowland | Duke Energy Corporation | | | No - one or more definitions needs revision - see comments | ATC path : Insert the phrase "or Available Flowgate Capability" after the phrase "Available Transfer | Transmission Operator | R8.1 – The following sentence, "Transmission Service Providers are allowed up to 80 hours per calendar year during which calculations are not required to be performed." appears somewhat capricious and should be clarified to show the drafting team's intentions. As presented, it would permit a TP to decide not to calculate hourly ATC for a 3 1/3 day period. Also, R8 does not require | Yes | | Yes | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | Capability". | | recalculation if none of the calculated values identified in the ATC equation have changed. Does R8.1 limit the exemption provided in R8 to 80 hours per year? M7 - insert the phrase “list of contingencies,” before the phrase “loop flow”. | | | | | |
| | Individual | Greg Ward / Darryl Curtis | Oncor Electric Delivery | | | No - one or more definitions needs revision - see comments | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). | No Preference | | Yes | | Yes | | This standard should not apply to ERCOT for the reason expressed in question 1. |
| | Group | | | Bonneville Power Administration | Denise Koehn | Yes - definitions are acceptable as revised | | Transmission Operator | BPA does not believe any are incorrect. | Yes | | Yes | | BPA thanks the drafting team for the modifying MOD-001 to not require the conversi your assessment that there is no reliability need for such conversion. Additionally, BI observations and suggestions: a. The purpose statement of MOD-001 be modified as 890-A: Purpose: To ensure the consistent and transparent application and document used in the calculation of Available Transfer Capability (ATC) or Available Flowgate C listed for all requirements should include the “Long-term Planning” Horizon, as ATC c seasonal window. c. Balancing Authorities may be appropriately identified as Applica request that the Standards Drafting Team provide an explanation as to why they are |
| | Individual | Alice Druffel | Xcel Energy | | | Yes - definitions are acceptable as revised | | | 1) R3.6.3 Need to strike "that are unrecognized". The term "unrecognized" is problematic and vague. 2) R3.2.2 Please clarify what you mean by "defined accounting". 3) R3.3 | Yes | | Yes | | We feel that the applicability of this standard as proposed is problematic. We also dc is resolved by choosing either the TOP or TSP. While it is not a perfect solution, we f applicability to remain at the regional level. We suggest the following wording: "Regi its members". |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | There is a typo. Please change "of" to "or". | | | | | |
| | Individual | Earl Fair | Gainesville Regional Utilities | | | Yes - definitions are acceptable as revised | | Transmission Service Provider | R1: In reading the standard and the definitions, it seems that the std. doesn"t require an entity to calculate TTC/TFC/AFC, but only tells them how it must be done if it is to be done at all. Am I understanding this requirement correctly? R6: If the responsible entity is changed in R1, with it also be changed in this requirement as well? R6&7: If for example a study for month 10 may not have a corresponding "planning of operations" activity, what action is required to fulfill this requriement? R6&7: What is meant by " assumptions"? Can the team provide some GOOD examples? R6&7: I do not see a reliability purpose of these 2 requirements. I do not see how setting a maximum threshold on limiting assumptions can support a reliability interest. | Yes | | Yes | | None at this time. |

| | | | | | | | | | 1. The MRO agrees with the changes made to replace "ATC" with "ATC or AFC" in the standards. However, the MRO believes this change should be made to R3.6 should be revised this way as well to say "A description of how outages are considered in ATC or AFC calculations, including:". 2. The MRO continues to believe that R4 should be revised to match M4 "The Transmission Service Provider shall provide evidence (such as dated electronic mail messages) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)" The MRO does not see the reliability need to specify the | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | MRO NERC Standards Review Subcommittee | Tom Mielnik | No - one or more definitions needs revision - see comments | The MRO supports the changes to the definitions. However, the MRO believes there is a need to define "counterflows". The MRO suggests that the SDT consider the following definition for Counterflows: "Counterflows are net impacts on a path or flowgate as determined by the Transmission Service Provider and specified in the appropriate implementation document." Capitalize "Existing Transmission Commitments" in the Available Transfer capability definition, since it is a defined term. | Transmission Service Provider | media via how the Transmission Service Provider notifies the following entities. However, if the issue is that the SDT believes that there must be a record of the notification, the MRO suggests that the words "in writing" be used allowing the Transmission Service Provider to determine the media of notification. 3. The MRO believes that R8 should also be revised to refer to "ATC or AFC" rather than just "ATC". 4. The MRO believes that R5 should be revised to delete the words "all of". The phrase "all of" seems to be unnecessary and may result in over-the-top auditing. 5. The MRO believes that the changes made to R6 are a significant improvement to the standard and commends the SDT on taking this more reasonable approach to consistency, that is "no more limiting than those used in planning of operations." 6. The MRO believes that R9 should be revised to delete the words "any" from "Within thirty calendar days of receiving a request by any Transmission Service Provider...". R9 should be revised to delete the words "all" from "Unit commitments and order of dispatch, to include all designated network resources...". R9 should be revised to delete the words "Any" from the phrase "Any firm and non-firm adjustments...". R9 should be revised to delete the words "Any" from the phrase "Any other services that that impact .....". R9 should be revised to delete the word "all" from "Values of CBM and TRM and TTC for all ATC [paths or Flowgates." R9 should be revised to delete "any" from the phrase "any Flowgates considered by the Transmission Service | Yes | The MRO commends the SDT in the changes made to VRFs to Lower. The MRO agrees that these changes puts the VRFs more in line with the NERC's definitions of the VRF levels. | Yes | | 1. The MRO commends the SDT in making significant changes to this standard and r believes the eventual standard that is approved will serve the industry and customer believes that the first time you use an abbreviation or acronym, you must spell out t abbreviation or acronym in brackets. Subsequent use of the term is then made by its Transmission Operator shall select one Available Transfer Capability (ATC) methodol Interchange methodology, Rated System Path methodology) or Available Flowgate C methodology) for each ATC Path per time period identified in R2 for those Facilities w Area." R3.3 – last line should read: ...calculating ATC or AFC. R3.4 – last line should – Each bullet should read: ...allocate ATC or AFC... R6 and R7 – Overall, both require MRO asks that the standards drafting team specify what assumptions are referenced Also the MRO objects the requirement to use assumptions that are no more limiting result in potentionally onorous calcualations to determine assumtions that meet this requirements are covered by FERC order #890 anyway. R9 – Please expand/clarify t specific aggregated firm capacity is being referenced? Capacity in ETC for each flowg example would be very beneficial. R9 – The 13th bullet should read: "Values of Capa Transmission Reliability Margin (TRM),and TTC for all ATC Paths or (TFC) for Flowgat should read: "Alternatively the Transmission Operator may demonstrate that the sar TTC or TFC..." |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | Provider receiving the request..." R9 should be revised to delete the word "all" from the phrase "Values of TTC and ATC for all ATC Paths for those...". These uses of "any" and "all" seem to be unnecessary and may result in over-the-top auditing. 7. The MRO believes comparable changes should be made to deleting "all" and "any" in the Measures, the Compliance section, and the Violations Severity Levels to match the changes to R9. 8. R3.6.3 Need to strike "that are unrecognized". The term "unrecognized" is problematic and vague. 9. R3.2.2 Alternate language for the statement "a rationale for the defined accounting" A suggestion to use counterflow process instead. 10. R3.3 There is a typo. Please change "of" to "or". | | | | | |
| | | | | | | | | | R3.3 - Replace "--- transfer of Flowgate capability." by "--- transfer or Flowgate capability." R3.6.3 - Entergy is not sure what the parenthetical is implying, specifically the phrase, "that are unrecognized." In addition, Entergy proposes that rather than processing of outages, it should refer to modeling of outages in ATC calculations, therfore, replace "processed" by "modeled". R6 and R7 - The phrase "planning of operations" may be better understood if the term "reliability" was inserted at the beginning. We assume that the SDT is trying to tie the reliability planning studies/activities to the ATC calculations. Similar terms are used in MOD-030. (This also raises the question of why it is in MOD-030 and not MOD-028 and MOD-029.) If all instances can use the same phrase, we think the standards would benefit from the standardization. R8.1 needs to be | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | Entergy Services Inc | Narinder K. Saini | Yes - definitions are acceptable as revised | Revised definitions are acceptable | Transmission Operator | worded as requirement rather than giving allowance/exemption from the requirement for 80 hours (approx 1% of 8760 hours) in a calendar year. Entergy recommends the language "Hourly values, once per hour at least 99% of hours every calendar year." R9 - This requirement is for sharing the data by TSP with others who need it for calculation of their ATCs. This requirement is not to replace the requirement of Order 889 37.6(b)(2)(ii) "On request, the Responsible Party must make all data used to calculate ATC and TTC for any constrained posted paths publicly available (including the limiting element(s) and the cause of the limit (e.g., thermal, voltage, stability)) in electronic form within one week of the posting. The information is required to be provided only in the electronic format in which it was created, along with any necessary decoding instructions, at a cost limited to the cost of reproducing the material." If it can be emphasized this fact, it will greatly clarify some confusion that some stakeholders are having regarding data sharing. | Yes | | Yes | | The effective date info provided in the standards posted indicate that all 5 standards seems that MOD-004 should also be a part of the set becoming effective. CBM is refe R3.2.2.2 The term "accounting" implies bookkeeping and dollars - obviously not som reliability standard. We suggest adding some clarification to this requirement to ensu audiences: "A rationale stating how counterflows are accounted for." R3.3 Change "c do not feel that it is prudent to use switching operating guides and load shedding, et even suggest these in M7 seems misguided and in conflict with the current draft of t a grace period similar to R8.1 to account for unforeseen system emergencies where technology issues. |
| | Individual | Ron Falsetti | Ontario IESO | | | Yes - definitions are | | Transmission Service | We have the following comments on specific requirements: 1. R3.6.3: This subrequirement is too vague and its addition is not necessary. Subrequirements R3.6.1 and R3.6.2 suffice to hold the TSP responsible for considering the impact of outages in ATC calculation. How the outages are processed has no bearing on the ultimate scenarios (topologies) that the TSP must consider. 2. We do not agree with the changes made to R6 and R7. | Yes | | No | We have the following comments on the VSL: 1. R3: There is a potential overlap between High and Severe. For an ATCID does not include “two or more” of the information items in R3, it could mean does not include all of the information items. This is the same condition as a Severe. We | We do not see the role of TOP in this standard. The TOP’s primary responsibility is to area in a reliable manner, and determine SOLs and where necessary, transmission tr capabilities (where applicable). Given the established SOLs, TTCs, TFCs that are dete planning, and the TTCs and TFCs determined by other entities such as the RCs, TPs a different time frames, the TSP needs only to calculate ATCs (or AFCs) respecting the |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | acceptable as revised | | Provider | By “no more limiting than” the assumptions used in planning of operations for the same time period, it would imply that the TOP and TSP may use less restrictive (or more liberal) assumptions. The results could be that the TTCs and ATCs are higher than the planned operational parameters, giving rise to potential unreliability. We do not see a problem with the previous wording of “consistent with”, and this should be reinstated. | | | | suggest to reword the High VSL to “does not include up to 2 of the information items in R3”; and the Severe VSL to “or its ATCID does not include 3 or more of the information described in R3”, or numbers along that line. 2. We do not agree with the VSLs for R6 and R7 for reasons noted above. | so, it should be able to select an ATC calculation method to suit its business model a the basis of the TTCs and TFCs that affect its service area. With this in mind, we sug that the TSP be the one who selects the ATC method and R1 should be revised accor be assumed that the TOP area and the TSP area are the same and hence the basis o TSP's area may differ from one part to another. |
| | Individual | Alessia Dawes | Hydro One Networks | | | Yes - definitions are acceptable as revised | | Transmission Service Provider | There are 2 methodologies listed in R1. Are these the only two from which we have to choose? We suggest rewording the requirement to avoid this confusion by inserting the words "for example". In R6 and R7, we prefer the previous wording "consistent with" instead of "no more limiting" as the new wording may result in the use of less restrictive assumptions and hence give rise to potential unreliability. | Yes | | No | For the severe VSL for R2 keep consistent the wording as per the other levels. The Lower, Moderate, and High VSLs for R4 are missing the words "did not". | In requirement 8, if the 80 days grace period is to account for software outages ther else entities may interpret the requirement as applicable to outages other then softw |
| | | | | | | | | | Modification to Requirement 1: Each Transmission Operator shall select a methodology for calculating ATC or AFC for each ATC Path or Flowgate for each time period identified in Requirements 2.1 - 2.3 for those Facilities within its Transmission Operators Area. Modifications to 2.2 Daily values for at least the next 31 calendar days (Following the 48 Hours specified in R2.1) Modification to 2.3 Monthly values for at least the next 12 months (Following the 31 Calendar days specified in R2.2) Modification to R3: Each TSP shall prepare and keep current an ATCID that includes the following information. (The Phrase "at a minimum" is unnecessary because the TSP | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Jason Shaver | American Transmission Company | | | No - one or more definitions needs revision - see comments | Capitalize "Existing Transmission Commitments" in the Available Transfer capability definition, since it is a defined term. We do not believe that the SDT has to provide a definition of ATCID. Requirement 3 outlines the specifics of ATCID and we find the definition unnecessary. The SDT should explain why this definition is necessary. | Transmission Operator | must comply with the sub-requirements. Any additional information is beyond the requirements and therefore not subject to NERC's audit.) Starting in Requirement 3.3 the phrase "transfer or Flowgate capability" is used. Does this phase equate to ATC and AFC where ATC is equal to transfer capability and AFC is equal to Flowgate capability? We would prefer that the SDT remain consistent and use the phrase "ATC or AFC if the phrases are equal. In Requirement 3.3 did the SDT mean "transfer or Flowgate capability" or "transfer of Flowgate capability"? The requirement currently uses the "of" word. In order to maintain a consistent use of the phrase "ATC or AFC" we suggest the following change to Requirement 3.6. "A description of how outages are considered in ATC or AFC calculations including:" The SDT should explain any disagreement with our suggested modification. R5 should be revised to delete the words "all of" to avoid being overly inclusive. R6 should be revised to "no more limiting than those used in the planning of operations." Modifications to R8: The TSP shall recalculate ATC or AFC on the following frequency, unless none of the calculated values identified in the ATC or AFC equations have changed. Question to R8.1: How will the 80 hours per calendar year be calculated? (Does a non-calculation period that is exempt in Requirement 8 count to the 80 hours?) R9 should be revised to eliminate "any" and "all" to avoid being overly inclusive: (1) delete the words "any" from "Within thirty calendar days of receiving a request by any | Yes | | Yes | | The first time that each abbreviation or acronym is introduced, the full terminology s abbreviation or acronym in brackets (i.e. ATC, AFC, TTC, and TFC). The SDT should what would be the proposed effective data of this standard. FERC has justification ov operators of the BPS and following their approval the standard would become "enfor even in the US these standards will not become "enforceable" until all regulatory aut have approved this set of standards? If this is the case how would NERC insure such |

Delete "all" and "any" in the Measures, the Compliance section, and the Violations Severity Levels to avoid being overly inclusive. | | | | | |
| | Individual | Rex McDaniel | Texas-New Mexico Power Company | | | No - one or more definitions needs revision - see comments | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Texas-New Mexico Power Company (TNMP) is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, TNMP believes that implementation of the prescribed methodologies would add no value to the ERCOT market | No Preference | | Yes | | Yes | | This standard should not apply to ERCOT for the reason expressed in question 1. |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | and could result in more system congestion. TNMP strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). | | | | | | | |
| | Individual | Tony Kroskey | Brazos Electric Power Cooperative, Inc. | | | No - one or more definitions needs revision - see comments | For the ERCOT region/market the concept of ATC, AFC are not applicable. It is suggested that the definition of ATC have some consideration for whether there is a required "commercial activity" for it in a region. | Transmission Operator | | | | | | As commented in Question #1, Brazos Electric does not believe that the application would serve any reliability need or commercial market purpose. Therefore an exclusi requirements based on whether a TO/TOP operates soley in a single control area reg |
| | | | | | | | The NYISO has continuing concerns with two of the revised definitions: (i) "ATC Path;" and (ii) "ATC." ATC Path: The NYISO previously expressed concern with the SDT's use of a new defined term "ATC Path" instead of the term "Posted Path" that was used in earlier versions of MOD-001 and is more consistent with the terminology used in FERC's OASIS posting regulations. The NYISO continues to be concerned that the proposed definition of "ATC Path" set forth in the latest version of proposed MOD-001 could, absent revision or clarification, subject the NYISO to potential penalties that would be inappropriate given the nature of its financial reservation system and the inapplicability | | | | | | | |

| | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | of certain OASIS posting requirements to it. Specifically, as the NYISO has explained in previous comments, ATC serves a fundamentally different purpose and is calculated differently in New York, because there are no express physical transmission reservations and all desired uses of the grid are accommodated to the extent that customers are willing to pay congestion. FERC has expressly recognized that the NYISO's ATC postings are merely advisory projections that may be of some commercial benefit to customers but that they do not determine whether customers can obtain transmission service. The NYISO has also explained that there are no "Posted Paths" as that term is defined under FERC's OASIS regulations internal to the NYISO and that the NYISO is not required, both because of that fact, and because of FERC orders exempting the NYISO from certain OASIS regulations, to post ATC on its internal interfaces for periods further out than one day-ahead. The current draft of MOD-001 would define "ATC Path" as including both "Posted Paths" and "any other combination of Point of Receipt and Point of | | | | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | Delivery for which Available Transfer Capability is calculated." The NYISO remains concerned that without clarification this definition could be interpreted in a way that would require the NYISO to post ATC for time periods further out than one day ahead when it is not required by FERC's regulations to make such postings and where such postings would serve no reliability purpose (because they have nothing to do with scheduling or "over-scheduling" long-term transactions.) Given the nature of the NYISO's financial reservation system, and the central role that the output of its day-ahead and real-time market software plays in its ATC calculations (see below), the NYISO would not have any meaningful information to post for periods further out than one day-ahead in any case. The NYISO therefore respectfully requests that the SDT either: (i) remove the defined term "ATC Path" and return to the use of "Posted Path" as that term is defined in FERC's OASIS regulations; or (ii) revise the term "ATC Path" as follows: "ATC Path: Any Posted Path or any other combination of | | The NYISO continues to agree with the ISO/RTO Council that the MOD standards extend into areas that should be covered and addressed by NAESB Business Practices (as defined in MOD-001 Definitions). The frequency of postings and frequency of AFC/ATC calculations should be NAESB Business Practices, and not included in the NERC standards as reliability based requirements Nevertheless, to the extent that the SDT decides to keep such requirements in proposed MOD-001, the NYISO offers the following additional comments or R2, R8, and M2. R2 This requirement continues to reflect an assumption that all Transmission Service Providers are required under FERC's regulations to calculate and post ATC values for periods 48 hours, one month, and one year into the future. This is not true of the NYISO. Because of the nature of its financial reservation system, FERC has only required the NYISO to calculate and post ATCs for its internal interfaces for a period one day-ahead. The NYISO does not post and calculate, and given the nature of its system, cannot post and calculate, ATCs further out than one day ahead for those internal interfaces or for certain controllable lines that link the NYISO to neighboring Transmission Service Providers. Thus, as drafted, R2 would conflict with FERC orders and FERC approved tariff provisions excusing the NYISO from posting longer range ATCs. It would also require the NYISO to calculate and post ATCs that it cannot practically calculate given the nature of its system (under which ATC is determined primarily | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Rick Gonzales | New York Independent System Operator | | | No - one or more definitions needs revision - see comments | Point of Receipt and Point of Delivery for which Available Transfer Capability is calculated, provided, however, that interfaces or paths for which a Transmission Service Provider is not required under FERC's regulations, or as a result of FERC orders, to calculate and post ATC for periods further out than one day-ahead shall not be considered to be ATC Paths" The NYISO's proposed revision would apply to few Transmission Service Providers, and thus would not undermine the proposed requirements or harm reliability. It would, however, be a very important accommodation to the NYISO that would prevent it from being subjected to inappropriate penalties under R1, R2, or R8. Available Transfer Capability ("ATC"): The proposed new definition of "ATC" does not appear to be flexible enough to accommodate the fundamentally different nature of ATC under the NYISO's FERC-approved financial reservation transmission model. As the NYISO has previously explained, a customer's ability to schedule transactions in the NYISO system is not limited by a pre-defined amount of ATC. In New York | Transmission Service Provider | by the output of the NYISO's day-ahead and real-time market software). If R2 is not modified, the NYISO would have to seek a modification (or waiver) from FERC to avoid being subject to penalties for non-compliance with a requirement that should not apply to it. The NYISO respectfully requests that the SDT address the problem by revising proposed R2 as follows: "Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the ATC methodology or methodologies selected by its Transmission Operator(s), except to the extent that the Transmission Service Provider is not required, under FERC's regulations, or as a result of FERC orders, to calculate and post ATC for periods further out than one day-ahead: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] R2.1. Hourly ATC values for at least the next 48 hours. R2.2. Daily ATC values for at least the next 31 calendar days. R2.3. Monthly ATC values for at least the next 12 months (months 2-13). In addition, the violation severity levels for these draft standards now have a graded implementation. Nevertheless, it may still be possible for multiple violations to result from a single unintended event. The NYISO requests that double counting of violations for a single event be eliminated by adding a new Item 6 to Section A of the proposed standard to establish this point. R8 The NYISO has previously asked the SDT to clarify or revise R8 so that Transmission Service Providers such as the NYISO that are not required to post monthly ATC values for internal interfaces (See the | Yes | | No | The NYISO agrees with the ISO/RTO Council comments on this issue. NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now for the most part have a graded implementation, but the NYISO remains concerned regarding the possibility of multiple violations resulting from a single event. Therefore, the NYISO requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations. |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | ATC is not, in the SDT's words, "a measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses." Instead, ATC postings are really "advisory projections" calculated after the NYISO markets close, and transactions are scheduled, based on calculations performed by the NYISO's day-ahead and real-time market software. The fact that a posted ATC is zero does not mean that further commercial activity is precluded because the NYISO may redispatch its system to support additional transactions. A posted ATC value of zero simply indicates that there is congestion at a particular NYISO interface. FERC has granted the NYISO a number of waivers from its OASIS regulations that reflect these differences and has recognized that ATC is merely an "advisory projection" in New York. The NYISO therefore respectfully requests that the SDT accommodate the different nature of ATC under the NYISO's FERC-approved financial | NYISO's response to Question One, above) would not be subject to a requirement to recalculate such values on a weekly basis. Otherwise, R8 would effectively require the NYISO to conduct calculations that FERC has excused it from conducting and that would serve no reliability purpose under the NYISO's financial reservation transmission model. The NYISO therefore respectfully requests that the SDT revise R8 to to clearly establish that Transmission Service Providers need not recalculate ATC values that they are not required to calculate or post under FERC's regulations, or as a result of FERC orders M2 Consistent with the NYISO's comments on R2 and R8, and with past NYISO comments, NERC should revise M2 to clearly state that Transmission Service Providers need not provide evidence that they calculated ATCs that they are not required to calculate or post under FERC's regulations, or as a result of FERC orders | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | transmission model by either: (i) deleting the proposed definition of ATC; or (ii) specifying that each Transmission Service Provider must include its definition of ATC in its ATCID (and expressly allowing entities such as the NYISO to have definitions that vary from the standard definition); or (iii) revising the definition as follows: "Available Transfer Capability (ATC): A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows, except with respect to Transmission Service Providers that employ FERC-approved financial reservation transmission models in which ATC serves as an advisory projection of potential transmission congestion." Again, the NYISO's proposed revision would not apply to | | | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | many Transmission Service Providers, and thus would not undermine the proposed standard or harm reliability. It would, however, be a very important accommodation to the NYISO that would prevent it from being subjected to inappropriate penalties under R1, R2, R3.6, and R8. | | | | | | | |

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

## Consideration of Comments on Draft Standard — MOD-001-1 — Project 2006-07

The ATC Standards Drafting Team thanks all commenters who submitted comments on the draft standard MOD-001-1. These standards were posted for a 30-day public comment period from April 16, 2008 through May 15, 2008. The stakeholders were asked to provide feedback on the standard through a special electronic Standard Comment Form. There were 37 sets of comments, including comments from 74 different people from approximately 50 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

There were many comments that led the drafting team to correct typographical errors, and to modify language to improve clarity, but none of the changes made by the drafting team changed the scope or intent of the requirements in the standard.

### Applicability

- Several entities have continued to express concern regarding the applicability of the ATC, TRM, and CBM standards. While the drafting team has attempted to write the standards in ways that are flexible and allow for organizational diversity, we note that FERC Order 890 makes reference to the use of Variances. Entities with non-traditional physical transmission markets or that have alternative ATC methodologies that meet or exceed the NERC ATC standards may wish to consider requesting one or more Variances related to these standards.

- Transmission Service Provider or Transmission Operator - The Drafting Team did not elect to change the entity that selects the methodology to the Transmission Service Provider; instead leaving it as the Transmission Operator. Based on the responses received, it appears that the industry remains divided on this question; only 13 of 35 comments received suggested that the entity should be the Transmission Service Provider. Reviewing comments made later related to this question, the Drafting Team does not find any clear rationale for selecting the Transmission Service Provider as the entity responsible for selecting the methodology. As discussed previously, the Functional Model requires the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining the methodology used to determine TTC. The Transmission Service Provider is responsible for providing service within the constraints established by the Transmission Operator, not actually establishing those constraints. The SDT has reviewed this with the Functional Model Working Group in the past, and the FMWG was supportive of the SDT's interpretation. For those entities who believe the TSP to be the appropriate entity, we reiterate that options for delegation of this task exist. Transmission operators can simply defer to the decisions made by their Transmission Service Provider; if a more formal agreement and transfer of responsibility is needed, the Transmission Service Provider and their Transmission Operators can register as a Joint Registration Organization, with the Transmission Service provider agreeing to take on responsibility for this requirement through written contract.

### Definitions

- Some entities expressed concerns with the definitions of Counterflows and Postbacks. The SDT does not believe that further definitions are necessary.

- The SDT modified the definition of ATC Path slightly to be clearer.

**Requirements**

- R1 - The SDT modified R1 to clearly identify the three methodologies for calculating ATC or AFC.

- R3.6 - Some entities did not completely understand the requirements related to explaining the processing of outages. The SDT modified R3.6 to be clearer.

- R3.6.3 - Several entities expressed uncertainty what the drafting team meant when referring to outages "that are unrecognized." The SDT clarified the requirement to require "how outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed."

- R6 and R7 - Several entities expressed concern with the drafting team's removal of the language requiring ATC/AFC assumptions to be "consistent" with those used in the planning of operations. The SDT attempted to consider the intent of the Order in its review of this requirement. It seems clear, from both a reading of the order and from comments submitted to the SDT, that FERC's intent is to ensure that service is not sold on a more conservative basis than the system has been planned for. Accordingly, the SDT modified this requirement to more closely align with this goal. Additionally, it was pointed out that requiring the two to be "consistent" could lead to conflicts and double jeopardy between these standards and the planning standards.

- R8.1 - Some entities requested a larger calculation grace period than 80 hours. The SDT extended the grace period to 175 hours, to be consistent with OASIS requirements.

  Some entities suggested that the "80-hour" allowance (now 175 hours) in R8.1 should not be in the requirement. The SDT disagrees, and believes that elimination of this form the standard would effectively require 100% availability of the calculation, which is not the intent of the drafting team.

  Some entities suggested that the allowance for a certain number of hourly calculations to be skipped did not specify that the allowance was only for software outages. The SDT felt that qualifying the limit as suggested would be difficult to verify objectively, as software outages vary in degree and impact.

- The SDT clarified R9.1 to indicate what information should be provided pursuant to requirement R9.

- Several entities suggested eliminating R2 and R8. The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives, and did not delete the requirements.

**Compliance**

- Some entities suggested adding language to the standard that the potential to count a single event as multiple violations was not allowed. The SDT does not believe it is within the drafting team's scope to modify the standards template or create obligations upon compliance. In response, the drafting team has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.

- Some entities identified an overlap in the VSL for R3. The SDT corrected the overlap.

- Some commenters misunderstood the concept of time horizons, and the drafting team provided a summary of the use of time horizons to address these comments.

- All entities that responded indicated support for the new VRFs.

**Implementation Plan**

- Some entities expressed concern with the effective date and the "concurrent" implementation being dependent on "all" regulatory authorities. The SDT notes that the language indicates that it is dependent on all applicable regulatory authorities. The intent is that the standards all become effective on the same date across North America; that date will be established one year following all the needed regulatory approvals.

**Concepts**

- Some entities questioned whether "internal ATC" should be required or posted. The SDT responded that the standard does not prohibit the use of Internal ATC, but that any suggestions to post it should be addressed through the NAESB process.

- Several entities did not understand why MOD-001 and MOD-030 both had requirements related to recalculation frequency. The SDT explained that these two requirements are different, and address fundamental differences between the methodologies.

- Several entities identified a concern with requiring "all" or "any" data. The SDT clarified that providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC.

- Some entities suggested R8 in MOD-001 and R10 in MOD-030 needed to be aligned. The SDT modified MOD-030 to address this.

- It was suggested that more detail needs to be developed for the treatment of counterflows. The SDT suggested the commenter develop a SAR in pursuit of this detail.

- The NERC RTOSDT expressed concern that the standard does not refer to Planning and operating limits. The SDT directed the RTOSDT to the specific areas in the methodology standard where such reference are made.

**Variances**

The SDT believes it may be helpful to the industry to review the process for Variances. The Variance process can work either concurrent with or independent of the development of a standard. Because the drafting team working on a particular standard is likely to already have the necessary expertise to participate in the development of the Variance, concurrent development is generally more efficient. However, this may not always be practical; in this case, standards drafting may proceed, and even complete, prior to the development and approval of Variances. In this case, entities should seek to develop those Variances and seek their approval prior to the effective date of the standard. An entity is not exempt from meeting the requirements of the standard if the effective date has passed and that entity is in the process of developing a Variance.

The NERC process allows for three different types of variances:

- An Entity Variance
- A Regional Variance less than an Interconnection
- A Regional Variance on Interconnection-Wide basis

The NERC Rules of Procedure  describe an Entity Variance as follows:

> Entity Variance — Any variance from a NERC reliability standard that is proposed to apply to one entity or a subset of entities within a limited portion of a regional entity, such as a variance that would apply to a regional transmission organization or particular market or to a subset of bulk power system owners, operators, or users, shall be approved through the regular standards development process defined in the NERC Reliability Standards Development Procedure and shall be made part of the applicable NERC reliability standard.

Entities seeking an Entity Variance should draft a SAR to request that Variance.  In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested.  Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately).  In both cases, the Variance will be compared to the standard to ensure the requester is addressing the reliability goals of the standard.  The ballot body is comprised of any member of the Registered Ballot Body that is interested and registers to join the ballot pool. Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe a Regional Variance Less Than an Interconnection as follows:

> Any regional variance from a NERC reliability standard that is proposed to apply for a regional entity, but not for an interconnection, shall be approved through the NERC Reliability Standards Development Procedure, except that only members of the registered ballot body located in the affected interconnection shall be permitted to vote; and the variance shall be made part of the applicable NERC reliability standard.

Entities seeking a Regional Variance Less Than an Interconnection should draft a SAR to request that Variance.  In that SAR, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested.  Such a variance can be addressed concurrently with a standard (e.g., balloted with the standard for which it applies) or subsequent to that standard's approval (balloted separately).  In both cases, the Variance will be compared to the standard to ensure the requestor is addressing the reliability goals of the standard.  The ballot body is comprised of any interested entities that that have registered with NERC and is a user, owner, or operator of facilities located within the interconnection in which the region requesting the Variance is located.   Once approved through the NERC standards development process, the Variance is filed with the appropriate regulatory authorities.

The NERC Rules of Procedure Describe a Regional Variance on an Interconnection-wide Basis as follows:

> An interconnection-wide regional variance from a NERC reliability standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with other applicable standards of governmental authorities shall be made part of the NERC reliability standard. NERC shall rebuttably presume that a regional variance from a NERC reliability standard that is developed, in accordance with a procedure approved by NERC, by a regional entity organized on an interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest.

Entities seeking a Regional Variance on an Interconnection-wide Basis should draft that Variance using the regional standards development process described in the region's delegation agreement. In that Variance, the entity should clearly identify the need for the Variance, as well as how it meets the reliability objectives of the standard (or the specific requirements) for which the Variance is being requested. Once approved through the regional standards development process, the Variance should be brought to NERC for filing with the appropriate regulatory authorities.

Based on the comments received, the drafting team is recommending that the Standards Committee authorize moving these standards forward to posting for pre-ballot consideration.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standard can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

---

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. The drafting team modified several definitions in MOD-001 based on stakeholder comments. Do you agree with the revised definitions? If not, please specify any definition that you disagree with and, if possible, provide a suggested revision.

**Summary Consideration:**

Some entities expressed concerns with the definitions of Counterflows and Postbacks. The SDT does not believe that further definitions are necessary.

The SDT modified the definition of ATC Path as shown below to be clearer:

**ATC Path:** ~~Any Posted Path or a~~Any ~~other~~ combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path.

Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

| Organization/Group | Question 1: | Question 1 Comments: |
|---|---|---|
| American Public Power Association | No - one or more definitions needs revision - see comments | "Counterflows" should be a defined term. It is used in MOD-1, MOD-28, MOD-29 and MOD-30 and is an integral element in the calculation of ATC and AFC. The definition used in MOD-28-1 R10, for example, reads: "counterflows" are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID? This definition does not in any way describe what a counterflow is. "Postbacks" should incorporate a working definition developed by NAESB, to be revised once due process is completed on this business practice. Alternatively, consider use of the following text to at minimum describe the nature of postbacks: "Postbacks" are changes to firm [non-firm] ATC [AFC] due to a change in the amount of Firm [non-firm] Transmission Service reserved or scheduled for a period, as defined in Business Practices. Postbacks are generally a positive quantity? Also, capitalize existing transmission commitments in the definition of ATC. |
| **Response:** The SDT has reviewed the standards, and finds that the definitions in MOD-001, the requirements for the ATCID in MOD-001, and the requirements and measures for calculating ATC in the methodologies all address this sufficiently. MOD-001 indicates in the definition that Postbacks are defined by business practices, while the individual methodology standards indicate that Postbacks are "changes to firm (non-firm) ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices." Counterflows is an industry term, and the manner in which it applies to these standards is described in the methodologies ("adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID"), as well as in MOD-001 R3.2. | | |
| Oncor Electric Delivery | No - one or more definitions needs revision - see comments | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). |
| **Response:** MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to be any POR/POD combination for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. Assuming ERCOT | | |

| Organization/Group | Question 1: | Question 1 Comments: |
|---|---|---|
| does not calculate ATC and has no directive to do so, MOD-001 R1 (and therefore also R2, R6, R7, R8) would not be applicable to ERCOT. R3, R4, and R5 will apply to ERCOT, but the requirements are documentation related and do not seem to be onerous. R9 is intended to support neighboring entities, and ERCOT is expected to comply with this requirement. However, if none of ERCOT's neighbors request data from ERCOT, then compliance with R9 would be achieved with no action on ERCOT's part.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | | |
| Texas-New Mexico Power Company | No - one or more definitions needs revision - see comments | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Texas-New Mexico Power Company (TNMP) is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, TNMP believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. TNMP strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). |
| **Response:** MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to be any POR/POD combination for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. Assuming ERCOT does not calculate ATC and has no directive to do so, MOD-001 R1 (and therefore also R2, R6, R7, R8) would not be applicable to ERCOT. R3, R4, and R5 will apply to ERCOT, but the requirements are documentation related and do not seem to be onerous. R9 is intended to support neighboring entities, and ERCOT is expected to comply with this requirement. | | comments | for the ATCID in MOD-001, and the requirements and measures for calculating ATC in the methodologies all address this sufficiently. Counterflows is an industry term, and the manner in which it applies to these standards is described in the methodologies ("adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID"), as well as in MOD-001 R3.2.<br><br>Capitalize "Existing Transmission Commitments" in the Available Transfer capability definition, since it is a defined term.<br>**Response:** The SDT has modified the definition of ATC as suggested (i.e., capitalizing ETC). |
| **Response:** Please see in-line response. | | |
| New York Independent System Operator | No - one or more definitions needs revision - see comments | The NYISO has continuing concerns with two of the revised definitions:<br><br>(i)"ATC Path;" and (ii) "ATC."<br>ATC Path:<br>The NYISO previously expressed concern with the SDT's use of a new defined term "ATC Path" instead of the term "Posted Path" that was used in earlier versions of MOD-001 and is more consistent with the terminology used in FERC's OASIS posting regulations. The NYISO continues to be concerned that the proposed definition of "ATC Path" set forth in the latest version of proposed MOD-001 could, absent revision or clarification, subject the NYISO to potential penalties that would be inappropriate given the nature of its financial reservation system and the inapplicability of certain OASIS posting requirements to it. Specifically, as the NYISO has explained in previous comments, ATC serves a fundamentally different purpose and is calculated differently in New York, because there are no express physical transmission reservations and all desired uses of the grid are accommodated to the extent that customers are willing to pay congestion. FERC has expressly recognized that the NYISO's ATC postings are merely advisory projections that may be of some commercial benefit to customers but that they do not determine whether customers can obtain transmission service. The NYISO has also explained that there are no "Posted Paths" as that term is defined under FERC's OASIS regulations internal to the NYISO and that the NYISO is not required, both because of that fact, and because of FERC orders exempting the NYISO from certain OASIS regulations, to post ATC on its internal interfaces for periods further out than one day-ahead. The current draft of MOD-001 would define "ATC Path" as including both "Posted Paths" and "any other combination of Point of Receipt and Point of Delivery for which Available Transfer Capability is calculated." The NYISO remains concerned that without clarification this definition could be interpreted in a way that would require the NYISO to post ATC for time periods further out than one day ahead when it is not required by FERC's regulations to make such postings and where such postings would serve no reliability purpose (because they have nothing to do with scheduling or "over-scheduling" long-term transactions.) Given the nature of the NYISO's financial reservation system, and the central role that the output of its day-ahead and real-time market software plays in its ATC calculations (see below), the NYISO would not have any meaningful information to post for periods further out than one day-ahead in any case. The NYISO therefore respectfully requests that the SDT either: (i) remove the defined |

| Organization/Group | Question 1: | Question 1 Comments: |
|---|---|---|
| | | term “ATC Path” and return to the use of “Posted Path” as that term is defined in FERC’s OASIS regulations; or (ii) revise the term ?ATC Path? as follows: ATC Path: Any Posted Path or any other combination of Point of Receipt and Point of Delivery for which Available Transfer Capability is calculated, provided, however, that interfaces or paths for which a Transmission Service Provider is not required under FERC’s regulations, or as a result of FERC orders, to calculate and post ATC for periods further out than one day-ahead shall not be considered to be ATC Paths? The NYISO’s proposed revision would apply to few Transmission Service Providers, and thus would not undermine the proposed requirements or harm reliability. It would, however, be a very important accommodation to the NYISO that would prevent it from being subjected to inappropriate penalties under R1, R2, or R8.<br><br>Available Transfer Capability (“ATC”): The proposed new definition of “ATC” does not appear to be flexible enough to accommodate the fundamentally different nature of ATC under the NYISO’s FERC-approved financial reservation transmission model. As the NYISO has previously explained, a customer’s ability to schedule transactions in the NYISO system is not limited by a pre-defined amount of ATC. In New York ATC is not, in the SDT’s words, ?a measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses.? Instead, ATC postings are really “advisory projections” calculated after the NYISO markets close, and transactions are scheduled, based on calculations performed by the NYISO’s day-ahead and real-time market software. The fact that a posted ATC is zero does not mean that further commercial activity is precluded because the NYISO may redispatch its system to support additional transactions. A posted ATC value of zero simply indicates that there is congestion at a particular NYISO interface. FERC has granted the NYISO a number of waivers from its OASIS regulations that reflect these differences and has recognized that ATC is merely an ?advisory projection? in New York. The NYISO therefore respectfully requests that the SDT accommodate the different nature of ATC under the NYISO’s FERC-approved financial transmission model by either: (i) deleting the proposed definition of ATC; or (ii) specifying that each Transmission Service Provider must include its definition of ATC in its ATCID (and expressly allowing entities such as the NYISO to have definitions that vary from the standard definition); or (iii) revising the definition as follows: Available Transfer Capability (ATC): A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows, except with respect to Transmission Service Providers that employ FERC-approved financial reservation transmission models in which ATC serves as an advisory projection of potential transmission congestion.? Again, the NYISO’s proposed revision would not apply to many Transmission Service Providers, and thus would not undermine the proposed standard or harm reliability. It would, however, be a very important accommodation to the NYISO that would prevent it from being subjected to inappropriate penalties under R1, R2, R3.6, and R8. |
| **Response:** The Drafting Team has changed the definition of ATC Path slightly to be clearer, but believes that the definition of ATC Path is correct. MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to | | |

| Organization/Group | Question 1: | Question 1 Comments: |
|---|---|---|
| be any POR/POD combination for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. The SDT understands that while NYISO calculates ATC values on its internal interfaces, those internal interfaces do not meet the definition of an ATC Path, i.e., they are not described by a POR/POD combination and they are not a FERC Posted Path.<br><br>Regarding the definition of ATC, the SDT believe the definition proposed is correct. Based on NYISO's description, it sounds as if the NYISO is not actually posting ATC, but "advisory projections." The SDT believes that if this is correct, the NYISO may not actually have any paths that qualify as Posted Paths.<br><br>Note that NYISO may wish to pursue a Variance to this standard. | | |
| American Transmission Company | No - one or more definitions needs revision - see comments | Capitalize "Existing Transmission Commitments" in the Available Transfer capability definition, since it is a defined term.<br><br>**Response:** The SDT has modified the definition of ATC as suggested (i.e., capitalizing ETC).<br><br>We do not believe that the SDT has to provide a definition of ATCID. Requirement 3 outlines the specifics of ATCID and we find the definition unnecessary. The SDT should explain why this definition is necessary.<br><br>**Response:** The definition of ATCID has been provided based on previous comments provided by the industry. Additionally, use of this definition allows NAESB to easily refer to these documents within their standards. |
| **Response:** Please see in-line responses. | | |
| California ISO | Yes - definitions are acceptable as revised | Please see comments given ion last question. |
| **Response:** Please see response to last question. | | |
| Entergy Services Inc | Yes - definitions are acceptable as revised | Revised definitions are acceptable |
| SERC Available Transfer Capability Working Group (ATCWG) | Yes - definitions are acceptable as revised | |
| The Midwest ISO | Yes - definitions are acceptable as revised | |
| Transmission Agency of Northern California | Yes - definitions are acceptable as revised | |
| WECC Market | Yes - definitions are acceptable as revised | |

| Organization/Group | Question 1: | Question 1 Comments: |

2. MOD-001-1, R1 says, “Each Transmission Operator shall select one methodology for calculating the available capability on the bulk electric system…” The Drafting Team believes that the Transmission Operator is the appropriate entity since the Transmission Operator is ultimately responsible for operating a reliable system while using all Transmission Service Providers’ calculated available capability. However, some parties have commented that the Transmission Service Provider should select the methodology for calculating the available capability since (a) a Transmission Service Provider may use the transmission of multiple Transmission Operators, (b) there are 'registered' Transmission Operators that do not calculate ATC, and (c) the Transmission Operator has only 2 responsibilities — R1 to pick a calculation method, and R6 where the Transmission Operator must calculate consistent with planning studies.

   Should the Transmission Operator or the Transmission Service Provider select the methodology for calculating the available capability on the bulk electric system?

**Summary Consideration:** The Drafting Team appreciates the input provided by the industry regarding this question. Based on the responses received, it appears that the industry remains divided on this question; only 13 of 35 comments received suggested that the entity should be the Transmission Service Provider. Reviewing comments made later related to this question, the Drafting Team does not find any clear rationale for selecting the Transmission Service Provider as the entity responsible for selecting the methodology. As discussed previously, the Functional Model requires the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining the methodology used to determine TTC. The Transmission Service Provider is responsible for providing service within the constraints established by the Transmission Operator, not actually establishing those constraints. The SDT has reviewed this with the Functional Model Working Group in the past, and the FMWG was supportive of the SDT’s interpretation.

For those entities who believe the Transmission Service Provider to be the appropriate entity, we reiterate that options for delegation of this task exist. Transmission Operators can simply defer to the decisions made by their Transmission Service Provider; if a more formal agreement and transfer of responsibility is needed, the Transmission Service Provider and their Transmission Operators can register as a Joint Registration Organization, with the Transmission Service Provider agreeing to take on responsibility for this requirement through written contract.

| Organization/Group | Question 2: |
|---|---|
| PJM | Transmission Operator |
| Duke Energy Corporation | Transmission Operator |
| Bonneville Power Administration | Transmission Operator |
| Pepco Holdings, Inc. | Transmission Operator |
| Entergy Services Inc | Transmission Operator |
| American Transmission Company | Transmission Operator |
| Brazos Electric Power Cooperative, Inc. | Transmission Operator |
| Manitoba Hydro | No Preference |

| Organization/Group | Question 2: |
|---|---|
| Transmission Agency of Northern California | No Preference |
| SERC Available Transfer Capability Working Group (ATCWG) | No Preference |
| EPSA | No Preference |
| Public Service Commission of South Carolina | No Preference |
| Oncor Electric Delivery | No Preference |
| The Midwest ISO | Transmission Service Provider |
| WECC Market Interface Committee / Sub Commtt / ATC Task Force | Transmission Service Provider |
| American Public Power Association | Transmission Service Provider |
| ERCOT ISO | Transmission Service Provider |
| Orlando Utilities Commission | Transmission Service Provider |
| NPCC Regional Standards Committee | Transmission Service Provider |
| FirstEnergy | Transmission Service Provider |
| AEP | Transmission Service Provider |
| Gainesville Regional Utilities | Transmission Service Provider |
| MRO NERC Standards Review Subcommittee | Transmission Service Provider |
| Ontario IESO | Transmission Service Provider |
| Hydro One Networks | Transmission Service Provider |
| New York Independent System Operator | Transmission Service Provider |

3. The drafting team modified some requirements and associated measures in MOD-001 to reflect industry concerns. If there are any requirements or measures that you believe are incorrect, please identify them for us, being as specific as possible with a suggestion for revising the language so you believe it is correct.

**Summary Consideration:**

R1 - The SDT modified R1 to clearly enumerate the three methodologies.

R3.3 - The SDT made some changes to address appropriate inclusion of "AFC".

R3.6 - Some entities did not completely understand the requirements related to explaining the processing of outages. The SDT modified R3.6 to be clearer.

R6, R7 - Several entities expressed concern with the drafting team's removal of the language requiring ATC/AFC assumptions to be "consistent" with those used in the planning of operations. The SDT attempted to consider the intent of the Order in its review of this requirement. It seems clear, from both a reading of the Order and from comments submitted to the SDT, that FERC's intent is to ensure that service is not sold on a more conservative basis than the system has been planned for. Accordingly, the SDT modified these requirements to more closely align with this goal. Additionally, it was pointed out that requiring the two to be "consistent" could lead to conflicts and double jeopardy between these standards and the planning standards.

R8 - Some entities suggested that the "80-hour" allowance should not be in the requirement. The SDT disagrees, and believes that elimination of this form the standard would effectively require 100% availability of the calculation, which is not the intent of the drafting team. Some entities requested a larger calculation grace period than 80 hours. The SDT extended the grace period to 175 hours, to be consistent with OASIS requirements.

R9.1 - The SDT clarified R9.1 to indicate what information should be provided pursuant to requirement R9.

VSLs - Several entities suggested eliminating R2 and R8. The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives.

Some entities questioned whether "internal ATC" should be required or posted. The SDT responded that the standard does not prohibit the use of Internal AT, but that any suggestions to post it should be addressed through the NAESB process.

Several entities did not understand why MOD-001 and MOD-030 both had requirements related to recalculation frequency. The SDT explained that these two requirements are different, and address fundamental differences between the methodologies.

Several entities identified a concern with requiring "all" or "any" data. The SDT clarified that providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC.

Several entities expressed uncertainty what the drafting team meant when referring to outages "that are unrecognized." The SDT clarified the requirement to require "how outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed."

The SDT also modified the standard to address several minor language changes and corrections.

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
| --- | --- |
| American Public Power Association | R3.3 - seems awkward for transfer capability to not be a defined term when TTC and ATC are defined; at minimum, edit to read transfer or Flowgate capability. |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | **Response:** The SDT has modified R3.3 to include flowgate capability, but has also clarified that since this applies to the Transmission Service provider, it only refers to "Available" capacity (since the Transmission operator is the entity that calculates Total Transfer/Flowgate Capability).<br><br>R3.6 - clarify that "outages" are transmission outages, generator outages or both.<br>**Response:** The SDT has clarified R3.6 as suggested.<br><br>R8.1 - why hardwire 80 hours per calendar year during which calculations are not required to be performed? Should this be a compliance Measure?<br>**Response:** The SDT has incorporated the allowance into the requirement to ensure that compliance is actually judged based on the requirement. The measure is intended to demonstrate how compliance can be verified, not modify the requirement to be less stringent. |
| **Response:** Please see in-line responses. | |
| The Midwest ISO | R3.3 - last line should read: calculating ATC or AFC.<br>**Response:** The SDT has modified R3.3 to include flowgate capability, but has also clarified that since this applies to the Transmission Service provider, it only refers to "Available" capacity (since the Transmission operator is the entity that calculates Total Transfer/Flowgate Capability).<br><br>R3.4 - last line should read: "calculating ATC or AFC.<br>**Response:** The posted version of the standard refers to ATC, AFC, TTC, and TFC, and the SDT believes the language used is appropriate.<br><br>R3.5 – Each bullet should read: "allocate ATC or AFC?<br>**Response:** to the posted version of the standard refers to ATC, AFC, TTC, and TFC, and the SDT believes the language used is appropriate.<br><br>R6 and R7" The term "assumptions" is not specific enough for entities to prepare for compliance. The Midwest ISO requests the standard to list specific assumptions within the scope and what defines "more limiting' for each of them. For example, is load assumption within the scope? If yes, what load assumption is more limiting? If it is not possible, the Midwest ISO believes that this topic from Order 890 should be left out from any standard and left to FERC to address issues on a case by case basis.<br>**Response:** The assumptions are generally those defined in the ATC methodologies (MOD-028, MOD-029, and MOD-030). To the extent other assumptions used in the ATC processes are described in the ATCID, they should be considered as well. |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | R9 - Please expand/clarify the intentions of the 4th bullet. What specific aggregated firm capacity is being referenced? Capacity in ETC for each flowgate as specified by reservations? An example would be very beneficial.<br>**Response:** The SDT uses the term "aggregated" to mean that the requirement refers to the sum of the uses, not individual schedules.<br><br>R9? The 13th bullet should read: "(TRM), and TTC or TFC for all".<br>**Response:** The SDT has deleted "TTC" from the requirement, as it appears to be an editing error.<br><br>M6 - Include reference for TFC, should read: "used for TTC, or TFC, and Operations Planning."<br>**Response:** The SDT has modified the measure as suggested. |
| **Response:** Please see in-line responses. | |
| WECC Market Interface Committee / Sub Commtt / ATC Task Force | MOD-01, R9. Could the NERC Team please clarify "which" Load Forecast it is requesting? Hourly? Daily? For what affected area - ?<br>**Response:** The SDT has modified R9.1 to be clear that the intention is for the provision of the load forecast that is used in the ATC/AFC process. To the extent that no forecast is used in the ATC/AFC process, but one exists, that one must be provided.<br><br>MOD-01, R9. Could the NERC Team please clarify that Block/Dispatch Order and Participation Factors do not call for the submission of specific schedules; rather, these definitions only call for dispatch rules from which approximations can be made.<br>**Response:** The SDT notes that these have been proposed to be defined terms, and that the proposed definitions align with the suggested improvements made by WECC. |
| **Response:** Please see in-line responses. | |
| EPSA | R6/7. I believe the wording of this requirement in the previous draft was superior. In the revised language, deletion of the word "consistent" allows for discontinuities in the ATC calculations. For example, if the assumptions used in "planning of operations" in the period beyond one month are different than for those in the current month, this could create discontinuities where the calculations adopt different assumptions. In addition, the current language has broken the explicit link between planning studies and operations studies. |
| **Response:** The SDT attempted to consider the intent of the Order in its review of this requirement. It seems clear, from both a reading of the order and from comments submitted to the SDT, that FERC's intent is to ensure that service is not sold on a more conservative basis than the system has been planned for. Accordingly, the SDT modified these requirements to more closely align with this goal. | |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| Additionally, it was pointed out that requiring the two to be "consistent" could lead to conflicts and double jeopardy between these standards and the planning standards.<br><br>Regarding "planning studies and operations studies," the drafting team carefully reviewed Order 890, and modified the language to be consistent with that used in the Order. The Order specifically refers to the "planning of operations," not "planning and operations." The SDT believes this to be a specific reference to the Operations Planning timeframe. | |
| ISO RTO Council/Standards Review Committee (SRC) | Requirement 2?While the IRC understands that the SDT believes that the requirements need to address the amount of ATC or AFC data calculated and the frequency of calculation associated with them, these requirements should be business practices and should be considered NAESB scope and eliminated from the MOD Standards. The MODs can still address FERC orders and be reliability based without the MOD-001 R2 (amount of ATC or AFC) and R8 (frequency ATC recalculation) and MOD-030 R10 (frequency AFC recalculation) requirements.<br>**Response:** The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives.<br><br>The violation severity levels for these draft standards now have a graded implementation. The possibility of multiple violations resulting from a single event still remains. The IRC requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations. This language should be added to the standard as a new item 6 to section A of MOD-001.<br>**Response:** The SDT does not believe it is within the drafting team's scope to modify the standards template or create obligations upon compliance. In response, the drafting team has clarified many of the Violation Severity Levels in an attempt to eliminate the potential for multiple violations due to single events.<br><br>Requirement 3 -R3.2.1 - The IRC understands the SDT's reasons for using "Confirmed" reservations in accordance with the FERC regulations. However, reservations that are in "Accepted", as well as, "Confirmed" status should be included. Once service is "Accepted" by a TSP it cannot be retracted. Using reservations that are in "Accepted" and "Confirmed" status should also be included in MOD-030 R6.3, R6.4, R7.1, and R7.2. This does not prevent the TSP from decrementing for accepted and confirmed TSRs. We understand that some TSPs maintain two sets of ATCs. One set is maintained internally and accounts for accepted and confirmed TSRs. The other set of ATC values is maintained externally and only accounts for confirmed TSRs. It is important for TSPs who maintain two sets of ATC values to post the "internal" ATC values to provide greater transparency and give customers a more accurate picture of capability available to new requests?<br>**Response:** The standard does not prohibit the TSP from maintaining an "internal" ATC value for use in approving reservation requests that includes these Accepted reservations. To the extent the IRC |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | believes these numbers should be posted, the SDT believes the IRC should develop a NAESB request for the posting of this information.<br><br>R3.6 - For R3.6 in MOD 001 requires outages to be included in the daily and monthly calculations. R5.2 in MOD 30 requires outages to be included in the hourly calculations. A single requirement should be placed in MOD 1 and applied consistently across MODS 28, 29 and 30.<br>**Response:** MOD-001 R3.6 does not specify which calculations the outages have to be used in - it requests clarification of outage processing rules for outages that are in effect for partial days or months. We have clarified MOD-001 to make this more easily understood.<br><br>MOD-030 R5.2 requires those outages to be used in the AFC process, and requires that the outage processing rules from the ATCID be used. This is the same requirement for MOD-028 R3. Due to differences in the nature of the Rated System Path methodology, MOD-029 uses outages in a different fashion, but includes their consideration in R2.<br><br>Requirement 8 ?If R8 is not moved to NAESB Business Practices then revise R8.1 and the VSL to align the requirement and NAESB practice which allows OASIS to be down 2% of the time over a year. Modify the 80 hour per year allowable outage requirement to 175 hours per year (8760 hrs/year x 0.02= 175 hours). This VSL does not become a possible sanction until the accumulated amount of hours missed exceeds 175 hours. The 175 hours is for planned, system IT outages. Unplanned, system IT outages should not be included in this total.<br>**Response:** The drafting team has modified the requirement to allow for 175 hours of outage as suggested. However, the SDT believes that this time is sufficient to include both planned and unplanned outages. |
| **Response:** Please see in-line responses. | |
| ERCOT ISO | Requirement 1:I suggest modifying the requirement to state: "Each Transmission Service Provider with ATC Path(s) shall select one ATC methodology for calculating ATC (Area Interchange methodology, Rated System Path methodology)or AFC (Flow gate methodology) for each ATC Path per time period identified in R2 for those facilities within its Transmission Service Provider area. "Comment: The TOP is to operate its transmission operating area in a reliable manner and ensure SOLs are determined. ATC is a transmission service market concept, not a reliability function. In areas where there is a transmission service market in operation, there is some reliability value to having a representative ATC in play to ensure proper planning is conducted, but reliability is ensured by adherence to the SOLs of the system, not by adherence to ATC.<br>**Response:** The requirement currently applies only to ATC Paths. The SDT believes adding this statement again would be redundant and add no value to the standard. |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | Requirement 3:I suggest modifying the requirement to state: "Each Transmission Service Provider with ATC Path(s) shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: "<br>**Response:** The SDT does not believe it is appropriate to exempt an entity from documenting the information described. To the extent an entity has not ATC paths, they may so document where appropriate. However, the other information should be included in support of coordination with other entities.<br><br>Requirement 4:I suggest modifying the requirement to state: "The Transmission Service Provider with ATC Path(s) shall notify the following entities (via electronic mail) before implementing a new or revised ATCID ."<br>**Response:** The SDT does not believe it is appropriate to exempt an entity from notifying the listed entities of changes to the documentation described.<br><br>Requirement 5:I suggest modifying the requirement to state: "The Transmission Service Provider with ATC Path(s) shall make available the current ATCID to all of the entities specified in R4."<br>**Response:** The SDT does not believe it is appropriate to exempt an entity from providing the listed entities with the documentation described.<br><br>Requirement 6:I suggest modifying the requirement to state: "When calculating TTC or TFC, the Transmission Service Provider with ATC Path(s) shall use assumptions no more limiting than the estimated SOLs used in planning of operations for the corresponding time period studied. "<br>**Response:** If an entity is not calculating TTC or TFC, the requirement does not apply. To the extent an entity does calculate these values, they are expected to comply.<br><br>Requirement 7:I suggest modifying the requirement to read: "When calculating ATC or AFC, the Transmission Service Provider with ATC Path(s) shall use assumptions no more limiting than the estimated SOLs used in planning of operations for the corresponding time period studied."<br>**Response:** The SDT has already included references to SOLs in other areas of the standard, and does not believe they need to be added to this requirement.. While not included in MOD-001, the other posted methodology standards include references to SOLs. These references are as follows: MOD-028 R6.1; MOD-029 R3; MOD-030 R2.4.<br><br>Requirement 8:I suggest modifying the requirement to state: "Within 30 calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, or Reliability Coordinator for data |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | from the list below for use in ATC or AFC calculations, each Transmission Service Provider with ATC Path(s) receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R9.1 and R9.2."<br>**Response:** Assuming this comment applies to R9, the SDT believes that all Transmission Service Providers should be willing to share this information with it neighbors in the interest of ensuring reliable and accurate calculation of ATC.<br><br>Requirement 9.1:I suggest modifying the sub-requirement to state: "The Transmission Service Provider with ATC Path(s) shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months in the future (subject to confidentiality and security requirements)."<br>**Response:** The SDT believes that all Transmission Service Providers should be willing to share this information with it neighbors in the interest of ensuring reliable and accurate calculation of ATC.<br><br>Requirement 9.2:I suggest modifying the sub-requirement to state: "This data shall be made available by the Transmission Service Provider with ATC Path(s) on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requestor and the provider)."<br>**Response:** The SDT believes that all Transmission Service Providers should be willing to share this information with it neighbors in the interest of ensuring reliable and accurate calculation of ATC |
| **Response:** Please see in-line responses. | |
| PJM | Requirement 2? While PJM understands that the SDT believes that the requirements need to address the amount of ATC or AFC data calculated and the frequency of calculation associated with them, these requirements should be business practices and should be considered NAESB scope and eliminated from the MOD Standards. The MODs can still address FERC orders and be reliability based without the MOD-001 R2 (amount of ATC or AFC) and R8 (frequency ATC recalculation) and MOD-030 R10 (frequency AFC recalculation) requirements.<br>**Response:** The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives.<br><br>The violation severity levels for these draft standards now have a graded implementation. The possibility of multiple violations resulting from a single event still remains. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations. This language should be added to the standard as a new item 6 to section A of MOD-001.<br>**Response:** The SDT does not believe it is within the drafting team's scope to modify the standards template or create obligations upon compliance. In response, the drafting team has clarified many of |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
| --- | --- |
| | the Violation Severity levels in an attempt to eliminate the potential for multiple violations due to single events.<br><br>Requirement 3 - R3.2.1 - PJM understands the SDT's reasons for using "Confirmed" reservations in accordance with the FERC regulations. However, reservations that are in "Accepted", as well as, "Confirmed" status should be included. Once service is "Accepted" by a TSP it cannot be retracted. Using reservations that are in "Accepted" and "Confirmed" status should also be included in MOD-030 R6.3, R6.4, R7.1, and R7.2. This does not prevent the TP from decrementing for accepted and confirmed TSRs. We understand that some TPs maintain two sets of ATCs. One set is maintained internally and accounts for accepted and confirmed TSRs. The other set of ATC values is maintained externally and only accounts for confirmed TSRs. It is important for TPs who maintain two sets of ATC values to post the "internal" ATC values to provide greater transparency and give customers a more accurate picture of capability available to new requests.?<br>**Response:** The standard does not prohibit the TSP from maintaining an "internal" ATC value for use in approving reservation requests that includes these Accepted reservation. To the extent the IRC believes these numbers should be posted, the SDT believes the IRC should develop a NAESB request for the posting of this information.<br><br>R3.6 - For R3.6 in MOD 001 requires outages to be included in the daily and monthly calculations. R5.2 in MOD 30 requires outages to be included in the hourly calculations. A single requirement should be placed in MOD 1 and applied consistently across MODS 28, 29 and 30.<br>**Response:** MOD-001 R3.6 does not specify which calculations the outages have to be used in - it requests clarification of outage processing rules for outages that are in effect for partial days or months. We have clarified MOD-001 to make this more easily understood.<br><br>MOD-030 R5.2 requires those outages to be used in the AFC process, and requires that the outage processing rules from the ATCID be used. This is the same requirement for MOD-028 R3. Due to differences in the nature of the Rated System Path methodology, MOD-029 uses outages in a different fashion, but includes their consideration in R2.<br><br>Requirement 8? If R8 is not moved to NAESB Business Practices then revise R8.1 and the VSL to align the requirement and NAESB practice which allows OASIS to be down 2% of the time over a year. Modify the 80 hour per year allowable outage requirement to 175 hours per year (8760 hrs/year x 0.02= 175 hours). This VSL does not become a possible sanction until the accumulated amount of hours missed exceeds 175 hours. The 175 hours is for planned, system IT outages. Unplanned, system IT outages should not be included in this total.<br>**Response:** The drafting team has modified the requirement to allow for 175 hours of outage as |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | suggested. However, the SDT believes that this time is sufficient to include both planned and unplanned outages. |
| **Response:** Please see in-line responses. | |
| NPCC Regional Standards Committee | NPCC Participating Members have the following comments on specific requirements1. R3.6.3: This subrequirement is too vague and its addition is not necessary. Subrequirements R3.6.1 and R3.6.2 suffice to hold the TSP responsible for considering the impact of outages in ATC calculation. How the outages are processed has no bearing on the ultimate scenarios (topologies) that the TSP must consider.<br>**Response:** The SDT has modified the standard to more clearly indicate that the ATCID should document how to utilize partial outages within the ATC/AFC process.<br><br>2. Also we do not agree with the changes made to R6 and R7. By "no more limiting than" the assumptions used in planning of operations for the same time period, it would imply that the TOP and TSP may use less restrictive (or more liberal) assumptions. The results could be that the TTCs and ATCs are higher than the planned operational parameters, giving rise to potential unreliability. We do not see a problem with the previous wording of ?consistent with?, and this should be reinstated<br>**Response:** The SDT attempted to consider the intent of the Order in its review of this requirement. It seems clear, from both a reading of the order and from comments submitted to the SDT, that FERC's intent is to ensure that service is not sold on a more conservative basis than the system has been planned for. Accordingly, the SDT modified this requirement to more closely align with this goal.<br><br>Additionally, it was pointed out that requiring the two to be "consistent" could lead to conflicts and double jeopardy between these standards and the planning standards. |
| **Response:** Please see in-line responses. | |
| FirstEnergy | R1- The selection of a calculation methodology should reside with the party responsible for calculating ATC. As stated in question 2, FE believes that R1, the selection of an ATC methodology, should be applicable to the Transmission Service Provider (TSP) and not the Transmission Operator since within many RTO areas it is the TSP who maintains the ATC methodology documentation and performs the ATC calculations. This is the case in a large portion of the continent and a standard should not be written in a way that would knowingly require an assignment delegation for a large number of potential responsible entities. Assigning the requirement responsibility to the TSP would also work for non-market areas of the continent where a TO/TOP also serves as its own its own TSP. The TOP should provide a support role in providing data and information that is needed by the TSP to fulfill its responsibilities in calculating ATC. The TSP is overseeing transmission service requests and making determination of the viability of such requests. The TOP has ultimate reliability responsibility in the real-time environment and will manage its system to its system operating limits regardless of the ATC |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | methodology used by its TSP to approve transactions that make use of the transmission operator's system.<br>**Response:** Please see summary response to Question 2.<br><br>R3.3 - There appears to be a typo. Replace "of" in the words "transfer of Flowgate capability" with "or"<br>**Response:** The SDT has modified the document to rectify this error.<br><br>R3.3, R3.4, R3.5 - Suggest the SDT consider replacing the words "transfer or Flowgate capability" with "ATC or AFC" to improve<br>**Response:** The SDT has modified R3.3 in response to this comment. In R3.4 and R3.5, the language has been left as written, as it is intended to cover ATC, AFC, TTC, and TFC.<br><br>R3.6 - Replace "ATC" with "ATC or AFC".<br>**Response:** The SDT has modified R3.6 to incorporate flowgate values.<br><br>R3.6 (sub-requirements) - The sub-requirements of R3.6 require that outages be included in the daily and monthly calculations, but excludes hourly calculation periods. In MOD-030 (AFC Methodology) requirement R5.2 requires expected transmission and generation outages are included for all applicable time period calculated. It is suggested that a single requirement reside in MOD-001 to cover the hourly, daily and monthly aspects for this intent that would assure consistent application across the MOD-028, MOD-029 and MOD-030 standards.<br>**Response:** MOD-001 R3.6 does not specify which calculations the outages have to be used in - it requests clarification of outage processing rules for outages that are in effect for partial days or months. We have clarified MOD-001 to make this more easily understood.<br><br>MOD-030 R5.2 requires those outages to be used in the AFC process, and requires that the outage processing rules from the ATCID be used. This is the same requirement for MOD-028 R3. Due to differences in the nature of the Rated System Path methodology, MOD-029 uses outages in a different fashion, but includes their consideration in R2.<br><br>R8 - It is not clear why the frequency for recalculation is only focused on ATC, and does not read "ATC or AFC", similar to the wording used for calculating in R2. In MOD-030 R10 addresses recalculation for the AFC but it seems that with the suggested change in R8 of MOD-001, that R10 of MOD-030 could be eliminated. Additionally they are inconsistent in that R10 does not provide for the 80 hour annual |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | allowance that is stated in R8.<br>**Response:** These two requirements are different, and address fundamental differences between the methodologies. MOD-001 discusses the recalculation of ATC on a fixed schedule unless the components in the ATC equation change. MOD-030 R10 addresses calculation of AFC on a schedule consistent with the MOD-001 requirement. However, there is additional information in the MOD-030 requirement that is specific to that methodology. MOD-030 R10 does not require full recalculation of the distribution factors through an update of the transmission model; updates of the transmission model occur on a separate schedule as defined in MOD-030 R3. MOD-028 addresses this similarly through the recalculation of TTC on a separate schedule as defined in MOD-028 R5. MOD-029 addresses changes to topology through adjustments to TTC. Because of these technical differences between the methodologies, the SDT believes having the two requirements is appropriate.<br><br>The SDT has modified MOD-030 R10 to allow for the annual allowance specified in R8. |
| **Response:** Please see in-line response. | |
| PPL Supply Group | R4. PPL suggests that Purchasing/Selling Entities should be included in the listing of entities under Requirement R4 who have access to the ATCID.<br>**Response:** The SDT is not addressing access of Transmission Customers to this information. NAESB will be drafting standards that address this requirement.<br><br>R8. PPL suggests that the following changes be made to the calculation time periods : R8.1 should require hourly ATC to be calculated ?as close to continuously as possible?. Once per hour is too slow.R8.2 should require daily ATC to be calculated at 15 minute or less intervals. Once per day is too slow.R8.3 should require that Monthly ATC be calculated hourly or at most daily. Once per week is too slow.<br>**Response:** The standard is establishing a minimum set of requirements. Note that Transmission Service Providers may calculate more often if desired. |
| **Response:** Please see in-line responses. | |
| Duke Energy Corporation | R8.1 - The following sentence, ?Transmission Service Providers are allowed up to 80 hours per calendar year during which calculations are not required to be performed.? Appears somewhat capricious and should be clarified to show the drafting team's intentions. As presented, it would permit a TP to decide not to calculate hourly ATC for a 3 1/3 day period. Also, R8 does not require recalculation if none of the calculated values identified in the ATC equation have changed. Does R8.1 limit the exemption provided in R8 to 80 hours per year?<br>**Response:** No. The SDT has modified R8.1 to make this clearer. |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | M7 - insert the phrase "list of contingencies," before the phrase "loop flow".<br>**Response:** The SDT has modified the standard as suggested. |
| **Response:** Please see in-line responses. | |
| Xcel Energy | 1) R3.6.3 Need to strike "that are unrecognized". The term "unrecognized" is problematic and vague.<br>**Response:** The SDT has modified the requirement to be more explicit by requiring "how outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed."<br><br>2) R3.2.2 Please clarify what you mean by "defined accounting".<br>**Response:** The SDT has modified the standard to reference R3.2, rather than simply using the words above.<br><br>3) R3.3 There is a typo. Please change "of" to "or".<br>**Response:** The SDT has modified the standard as suggested. |
| **Response:** Please see in-line responses. | |
| Gainesville Regional Utilities | R1: In reading the standard and the definitions, it seems that the std. doesn't require an entity to calculate TTC/TFC/AFC, but only tells them how it must be done if it is to be done at all. Am I understanding this requirement correctly?<br>**Response:** R1 requires that if a Transmission Operator has "ATC paths," it must choose a methodology. R2 requires the Transmission Service Provider to use that methodology. To the extent a Transmission Operator has no ATC paths, the associated Transmission Service Provider would not be obligated to calculate ATC/TTC/TFC/AFC.<br><br>R6: If the responsible entity is changed in R1, with it also be changed in this requirement as well?<br>**Response:** No. The Transmission Operator remains responsible for determining TTC and/or TFC.<br><br>R6&7: If for example a study for month 10 may not have a corresponding "planning of operations" activity, what action is required to fulfill this requirement?<br>**Response:** The SDT has modified the requirement to clarify that if a study has not been undertaken for a specific period, there is no requirement for the assumptions to be no more limiting than those used in the study.<br><br>R6&7: What is meant by " assumptions"? Can the team provide some GOOD examples?<br>**Response:** The SDT has provided several examples within the measures for the requirement. |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | R6&7: I do not see a reliability purpose of these 2 requirements. I do not see how setting a maximum threshold on limiting assumptions can support a reliability interest.<br>**Response:** FERC identified in Order 890 that this “Predictable, sufficiently accurate, consistent, equivalent, and replicable results promote reliability.” The drafting team concurs. |
| **Response:** Please see in-line responses. | |
| Pepco Holdings, Inc. | PHI supports the comments of PJM and will not duplicate the submission of comments |
| **Response:** Please see response to PJM comments. | |
| MRO NERC Standards Review Subcommittee | 1. The MRO agrees with the changes made to replace "ATC" with "ATC or AFC" in the standards. However, the MRO believes this change should be made to R3.6 should be revised this way as well to say "A description of how outages are considered in ATC or AFC calculations, including:".<br>**Response:** The SDT has modified the requirement to include flowgates.<br><br>2. The MRO continues to believe that R4 should be revised to match M4 "The Transmission Service Provider shall provide evidence (such as dated electronic mail messages) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)" The MRO does not see the reliability need to specify the media via how the Transmission Service Provider notifies the following entities. However, if the issue is that the SDT believes that there must be a record of the notification, the MRO suggests that the words "in writing" be used allowing the Transmission Service Provider to determine the media of notification.<br>**Response:** The SDT has modified the R4 to not require a specific medium.<br><br>3. The MRO believes that R8 should also be revised to refer to "ATC or AFC" rather than just "ATC".<br>**Response:** These two requirements are different, and address fundamental differences between the methodologies. MOD-001 discusses the recalculation of ATC on a fixed schedule unless the components in the ATC equation change. MOD-030 R10 addresses calculation of AFC on a schedule consistent with the MOD-001 requirement. However, there is additional information in the MOD-030 requirement that is specific to that methodology. MOD-030 R10 does not require full recalculation of the distribution factors through an update of the transmission model; updates of the transmission model occur on a separate schedule as defined in MOD-030 R3. MOD-028 addresses this similarly through the recalculation of TTC on a separate schedule as defined in MOD-028 R5. MOD-029 addresses changes to topology through adjustments to TTC. Because of these technical differences between the methodologies, the SDT believes having the two requirements is appropriate. |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | 4. The MRO believes that R5 should be revised to delete the words "all of". The phrase "all of" seems to be unnecessary and may result in over-the-top auditing.<br>**Response:** The SDT does not believe this to be an onerous requirement. Posting on a public website would accomplish this easily.<br><br>5. The MRO believes that the changes made to R6 are a significant improvement to the standard and commends the SDT on taking this more reasonable approach to consistency that is "no more limiting than those used in planning of operations."<br>**Response:** The Drafting Team appreciates this supportive comment. Note that the SDT has made other clarifying modifications to R6.<br><br>6. The MRO believes that R9 should be revised to delete the words "any" from "Within thirty calendar days of receiving a request by any Transmission Service Provider?".<br>R9 should be revised to delete the words "all" from "Unit commitments and order of dispatch, to include all designated network resources?".<br>R9 should be revised to delete the words "Any" from the phrase "Any firm and non-firm adjustments?". R9 should be revised to delete the words "Any" from the phrase "Any other services that that impact ?..".<br>R9 should be revised to delete the word "all" from "Values of CBM and TRM and TTC for all ATC [paths or Flowgates."<br>R9 should be revised to delete "any" from the phrase "any Flowgates considered by the Transmission Service Provider receiving the request?"<br>R9 should be revised to delete the word "all" from the phrase "Values of TTC and ATC for all ATC Paths for those?". These uses of "any" and "all" seem to be unnecessary and may result in over-the-top auditing.<br>**Response:** Providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC. Use of the words of "any" and "all" prevents discretionary sets of data being provided and argued as being compliant.<br><br>7. The MRO believes comparable changes should be made to deleting "all" and "any" in the Measures, the Compliance section, and the Violations Severity Levels to match the changes to R9.<br>**Response:** Providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC. Use of the words of "any" and "all" prevents discretionary sets of data being provided and argued as being compliant. |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | 8. R3.6.3 Need to strike "that are unrecognized". The term "unrecognized" is problematic and vague.<br>**Response:** The SDT has modified the requirement to be more explicit by requiring "how outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed."<br>.<br>9. R3.2.2 Alternate language for the statement "a rationale for the defined accounting "A suggestion to use counterflow process instead.<br>**Response:** The SDT has modified this language to be more clear by referencing R3.2.<br><br>10. R3.3 There is a typo. Please change "of" to "or".<br>**Response:** The SDT has made the suggested correction. |
| **Response:** Please see in-line responses. | |
| Entergy Services Inc | R3.3 - Replace "---transfer of Flowgate capability." by "---transfer or Flowgate capability."<br>**Response:** The SDT has made the suggested correction.<br><br>R3.6.3 - Entergy is not sure what the parenthetical is implying, specifically the phrase, "that are unrecognized." In addition, Entergy proposes that rather than processing of outages, it should refer to modeling of outages in ATC calculations, therefore, replace "processed" by "modeled".<br>**Response:** The SDT has modified the requirement to be more explicit by requiring "how outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed."<br><br>R6 and R7 - The phrase "planning of operations" may be better understood if the term "reliability" was inserted at the beginning. We assume that the SDT is trying to tie the reliability planning studies/activities to the ATC calculations. Similar terms are used in MOD-030. (This also raises the question of why it is in MOD-030 and not MOD-028 and MOD-029.) If all instances can use the same phrase, we think the standards would benefit from the standardization.<br>**Response:** The drafting team carefully reviewed Order 890, and modified the language to be consistent with that used in the Order. The Order specifically refers to the "planning of operations." The SDT believes this to be a specific reference to the Operations Planning timeframe.<br><br>In MOD-030, the standard describes the specific rules for identifying flowgates. In MOD-001, the reference relates to the generic calculation of ATC/AFC and TTC/TFC, which correctly applies to all three methodologies. |

<table>
<tr><th>Organization/Group</th><th>Question 3 - Incorrect Requirement(s) or Measure(s):</th></tr>
<tr><td></td><td>R8.1 needs to be worded as requirement rather than giving allowance/exemption from the requirement for 80 hours (approx 1% of 8760 hours) in a calendar year.  Entergy recommends the language "Hourly values, once per hour at least 99% of hours every calendar year."<br>Response: The SDT believes the current language is consistent with the intent.<br><br>R9 - This requirement is for sharing the data by TSP with others who need it for calculation of their ATCs.  This requirement is not to replace the requirement of Order 889  37.6(b) (2)(ii) "On request, the Responsible Party must make all data used to calculate ATC and TTC for any constrained posted paths publicly available (including the limiting element(s) and the cause of the limit (e.g., thermal, voltage, stability)) in electronic form within one week of the posting.  The information is required to be provided only in the electronic format in which it was created, along with any necessary decoding instructions, at a cost limited to the cost of reproducing the material."  If it can be emphasized this fact, it will greatly clarify some confusion that some stakeholders are having regarding data sharing.<br>Response: The SDT has added a yellow text box to the standard to highlight this fact.</td></tr>
<tr><td colspan="2">Response:  Please see in-line responses.</td></tr>
<tr><td>Ontario IESO</td><td>We have the following comments on specific requirements:<br>1. R3.6.3: This subrequirement is too vague and its addition is not necessary. Subrequirements R3.6.1 and R3.6.2 suffice to hold the TSP responsible for considering the impact of outages in ATC calculation. How the outages are processed has no bearing on the ultimate scenarios (topologies) that the TSP must consider.<br>Response: The SDT has modified the requirement to be more explicit by requiring “how outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed.”<br><br>2. We do not agree with the changes made to R6 and R7. By “no more limiting than” the assumptions used in planning of operations for the same time period, it would imply that the TOP and TSP may use less restrictive (or more liberal) assumptions. The results could be that the TTCs and ATCs are higher than the planned operational parameters, giving rise to potential unreliability. We do not see a problem with the previous wording of “consistent with”, and this should be reinstated.<br>Response: The SDT attempted to consider the intent of the Order in its review of this requirement.  It seems clear, from both a reading of the order and from comments submitted to the SDT, that FERC’s intent is to ensure that service is not sold on a more conservative basis than the system has been planned for.  Accordingly, the SDT modified this requirement to more closely align with this goal.  Additionally, it was pointed out that requiring the two to be “consistent” could lead to conflicts and double jeopardy between these standards and the planning standards.</td></tr>
</table>

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | If entities are concerned that this "may result in the use of less restrictive assumptions and hence give rise to potential unreliability," the SDT suggests that those entities ensure their Planning efforts utilize sufficiently conservative assumptions and use the same assumptions in their calculation of ATC. Meeting the requirements of this standard does not eliminate the responsibility to reliably operate the Transmission system in real-time. |
| **Response:** Please see in-line responses. | |
| Hydro One Networks | There are 2 methodologies listed in R1. Are these the only two from which we have to choose? We suggest rewording the requirement to avoid this confusion by inserting the words "for example". In R6 and R7, we prefer the previous wording "consistent with" instead of "no more limiting" as the new wording may result in the use of less restrictive assumptions and hence give rise to potential unreliability. |
| **Response:** The SDT has listed three choices: Area Interchange, Rated System Path, and Flowgate. These relate to three detailed standards. It is expected that Transmission Operators choose one or more of the detailed methodologies to implement. The SDT has modified R1 to be clearer.<br><br>Regarding R6 and R7, the SDT attempted to consider the intent of the Order in its review of this requirement. It seems clear, from both a reading of the order and from comments submitted to the SDT, that FERC's intent is to ensure that service is not sold on a more conservative basis than the system has been planned for. Accordingly, the SDT modified this requirement to more closely align with this goal. Additionally, it was pointed out that requiring the two to be "consistent" could lead to conflicts and double jeopardy between these standards and the planning standards.<br><br>If entities are concerned that this "may result in the use of less restrictive assumptions and hence give rise to potential unreliability," the SDT suggests that those entities ensure their Planning efforts utilize sufficiently conservative assumptions and use the same assumptions in their calculation of ATC. Meeting the requirements of this standard does not eliminate the responsibility to reliably operate the Transmission system in real-time. | |
| American Transmission Company | Modification to Requirement 1: Each Transmission Operator shall select a methodology for calculating ATC or AFC for each ATC Path or Flowgate for each time period identified in Requirements 2.1 - 2.3 for those Facilities within its Transmission Operators Area.<br>**Response:** The Reference to R2 within R1 is intended to include all components of R2, including the sub-requirements.<br><br>Modifications to 2.2Daily values for at least the next 31 calendar days (Following the 48 Hours specified in R2.1) Modification to 2.3Monthly values for at least the next 12 months (Following the 31 Calendar days specified in R2.2)<br>**Response:** The SDT disagrees with this interpretation. Entities are expected to calculate overlapping |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | values so entities know the "daily" ATC for the next two days, as well as the hourly ATC for the next two days. The same is true for monthly and daily values.<br><br>Modification to R3:Each TSP shall prepare and keep current an ATCID that includes the following information. (The Phrase "at a minimum" is unnecessary because the TSP must comply with the sub-requirements. Any additional information is beyond the requirements and therefore not subject to NERC's audit.)<br>**Response:** The SDT drafted this language so that entities may include more information in their ATCID if they so desire and still be in compliance with the standard. The standard is not intended to require the ATCID to have only the information listed.<br><br>Starting in Requirement 3.3 the phrase "transfer or Flowgate capability" is used. Does this phase equate to ATC and AFC where ATC is equal to transfer capability and AFC is equal to Flowgate capability? We would prefer that the SDT remain consistent and use the phrase "ATC or AFC if the phrases are equal .<br>**Response:** The phases are not equal, and are intended to cover the following four values: ATC, AFC, TTC, and TFC.<br><br>In Requirement 3.3 did the SDT mean "transfer or Flowgate capability" or "transfer of Flowgate capability"? The requirement currently uses the "of" word. In order to maintain a consistent use of the phrase "ATC or AFC" we suggest the following change to Requirement 3.6. "A description of how outages are considered in ATC or AFC calculations including:" The SDT should explain any disagreement with our suggested modification.<br>**Response:** The SDT has corrected the typographical error from "of" to "or."<br><br>The phases are not equal, and are intended to cover the following four values: ATC, AFC, TTC, and TFC.<br><br>.<br>R5 should be revised to delete the words "all of" to avoid being overly inclusive.<br>**Response:** Providing only "some" of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC. Use of the words of "any" and "all" prevents discretionary sets of data being provided and argued as being compliant.<br><br>R6 should be revised to "no more limiting than those used in the planning of operations. "<br>The SDT has modified the language as suggested. |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
| --- | --- |
| | Modifications to R8: The TSP shall recalculate ATC or AFC on the following frequency, unless none of the calculated values identified in the ATC or AFC equations have changed.<br>**Response:** These two requirements are different, and address fundamental differences between the methodologies. MOD-001 discusses the recalculation of ATC on a fixed schedule unless the components in the ATC equation change. MOD-030 R10 addresses calculation of AFC on a schedule consistent with the MOD-001 requirement. However, there is additional information in the MOD-030 requirement that is specific to that methodology. MOD-030 R10 does not require full recalculation of the distribution factors through an update of the transmission model; updates of the transmission model occur on a separate schedule as defined in MOD-030 R3. MOD-028 addresses this similarly through the recalculation of TTC on a separate schedule as defined in MOD-028 R5. MOD-029 addresses changes to topology through adjustments to TTC. Because of these technical differences between the methodologies, the SDT believes having the two requirements is appropriate.<br><br>Question to R8.1: How will the 80 hours per calendar year be calculated? (Does a non-calculation period that is exempt in Requirement 8 count to the 80 hours?)<br>**Response:** No. The SDT has modified R8.1 to make this clearer.<br><br>R9 should be revised to eliminate "any" and "all" to avoid being overly inclusive:<br>(1) delete the words "any" from "Within thirty calendar days of receiving a request by any Transmission Service Provider?";<br>(2) delete the words "all" from "Unit commitments and order of dispatch, to include all designated network resources?";<br>(3) delete the words "Any" from the phrase "Any firm and non-firm adjustments?";<br>(4) delete the words "Any" from the phrase "Any other services that that impact ?..";<br>(5) delete the word "all" from "Values of CBM and TRM and TTC for all ATC [paths or Flowgates.";<br>(6) delete "any" from the phrase "any Flowgates considered by the Transmission Service Provider receiving the request?";<br>(7) delete the word "all" from the phrase "Values of TTC and ATC for all ATC Paths for those?".<br>5. Delete "all" and "any" in the Measures, the Compliance section, and the Violations Severity Levels to avoid being overly inclusive.<br>**Response:** Providing only “some” of the data would not accomplish the reliability goal of sharing information transparently for the purposes of improving ATC. Use of the words of “any” and “all” prevents discretionary sets of data being provided and argued as being compliant. |
| **Response:** Please see in-line responses. | |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| New York Independent System Operator | The NYISO continues to agree with the ISO/RTO Council that the MOD standards extend into areas that should be covered and addressed by NAESB Business Practices (as defined in MOD-001 Definitions). The frequency of postings and frequency of AFC/ATC calculations should be NAESB Business Practices, and not included in the NERC standards as reliability based requirements<br>**Response:** The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives.<br><br>Nevertheless, to the extent that the SDT decides to keep such requirements in proposed MOD-001, the NYISO offers the following additional comments or R2, R8, and M2.<br><br>R2 This requirement continues to reflect an assumption that all Transmission Service Providers are required under FERC's regulations to calculate and post ATC values for periods 48 hours, one month, and one year into the future. This is not true of the NYISO. Because of the nature of its financial reservation system, FERC has only required the NYISO to calculate and post ATCs for its internal interfaces for a period one day-ahead. The NYISO does not post and calculate, and given the nature of its system, cannot post and calculate, ATCs further out than one day ahead for those internal interfaces or for certain controllable lines that link the NYISO to neighboring Transmission Service Providers. Thus, as drafted, R2 would conflict with FERC orders and FERC approved tariff provisions excusing the NYISO from posting longer range ATCs. It would also require the NYISO to calculate and post ATCs that it cannot practically calculate given the nature of its system (under which ATC is determined primarily by the output of the NYISO's day-ahead and real-time market software). If R2 is not modified, the NYISO would have to seek a modification (or waiver) from FERC to avoid being subject to penalties for non-compliance with a requirement that should not apply to it. The NYISO respectfully requests that the SDT address the problem by revising proposed R2 as follows:"<br>Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the ATC methodology or methodologies selected by its Transmission Operator(s), except to the extent that the Transmission Service Provider is not required, under FERC?s regulations, or as a result of FERC orders, to calculate and post ATC for periods further out than one day-ahead: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]<br>R2.1. Hourly ATC values for at least the next 48 hours.<br>R2.2. Daily ATC values for at least the next 31 calendar days.<br>R2.3. Monthly ATC values for at least the next 12 months (months 2-13).<br>**Response:** It is recognized that under the financial market operated by NYISO, where the advance purchase of transmission service is not required, some of the variables in these standards may be zero at all times, and some variables may be zero for certain periods of time. However, the SDT is developing the standard to apply across all market designs, and for other areas this is more useful |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | information. The Drafting Team notes that NYISO can describe their process, and which components of the ATC equation are zero in their ATCID to satisfy these standards. Based on the Drafting Team's understanding of the NYISO market, the standard can be applied to the NYISO market as-written and does not believe it is necessary to incorporate the suggested exceptions. However, NYISO may pursue an Entity or Regional variance if you feel it is necessary.<br><br>With respect to your comments on 'posting' ATCs; the NERC standards are for reliability and do not address 'posting' of any data, all posting requirements are handled by NAESB.<br><br>With respect to the suggested language to be added to the requirement; these standards are applicable to all of North America, and every effort is made to avoid references to FERC regulations, orders and Tariffs because not all entities that must comply with NERC standards are FERC jurisdictional.<br><br>In addition, the violation severity levels for these draft standards now have a graded implementation. Nevertheless, it may still be possible for multiple violations to result from a single unintended event. The NYISO requests that double counting of violations for a single event be eliminated by adding a new Item 6 to Section A of the proposed standard to establish this point.<br>**Response:** The SDT does not believe it is within the drafting team's scope to modify the standards template or create obligations upon compliance. In response, the drafting team has clarified many of the Violation Severity levels in an attempt to eliminate the potential for multiple violations due to single events.<br><br>R8 The NYISO has previously asked the SDT to clarify or revise R8 so that Transmission Service Providers such as the NYISO that are not required to post monthly ATC values for internal interfaces (See the NYISO's response to Question One, above) would not be subject to a requirement to recalculate such values on a weekly basis. Otherwise, R8 would effectively require the NYISO to conduct calculations that FERC has excused it from conducting and that would serve no reliability purpose under the NYISO's financial reservation transmission model. The NYISO therefore respectfully requests that the SDT revise R8 to clearly establish that Transmission Service Providers need not recalculate ATC values that they are not required to calculate or post under FERC's regulations, or as a result of FERC orders M2 Consistent with the NYISO's comments on R2 and R8, and with past NYISO comments, NERC should revise M2 to clearly state that Transmission Service Providers need not provide evidence that they calculated ATCs that they are not required to calculate or post under FERC's regulations, or as a result of FERC orders<br>**Response:** There are several different issues to respond to in this comment:<br>• With respect to the NYISO comment on posting, R8 does not require any posting of |

| Organization/Group | Question 3 - Incorrect Requirement(s) or Measure(s): |
|---|---|
| | information, the NERC standard deals solely with the calculation of information.<br>• As describe in Q1, the internal interfaces for which NYISO calculates ATC do not seem to fall under the definition of an ATC Path; therefore these NERC standards would not apply to what NYISO is currently calculating on those internal interfaces.<br>• With respect to the suggested language to be added to the requirement; these standards are applicable to all of North America, and every effort is made to avoid references to FERC regulations, orders and Tariffs because not all entities that must comply with NERC standards are FERC jurisdictional. |
| **Response:** Please see in-line responses. | |
| Bonneville Power Administration | BPA does not believe any are incorrect. |

4. The drafting team has modified the Violation Risk Factors for MOD-001 to reflect industry concerns that they did not reflect NERC's VRF definitions. NERC's VRF definitions are listed below. If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification. Are the current VRFs established correctly?

High Risk Requirement:

(a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement:

(a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or

(b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement: is administrative in nature and

(a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or

(b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

**Summary Consideration:**

All entities that responded indicated support for the new VRFs.

| **Organization/Group** | Question 4: | Question 4 Comments: |
|---|---|---|
| EPSA | | no comment |
| ISO RTO Council/Standards Review Committee (SRC) | Yes | The MOD standards assess the correct amount of reliability risk in areas that do not affect reliability. The IRC supports the position that no requirement from this set of ATC standards should have an assigned Risk Factor exceeding "Lower". A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the |

| | | preparations, be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor, control, or restore the bulk power system. |
| **Response**: The SDT disagrees that these areas do not affect reliability, but are appreciative of the supportive comment. | | |
| PJM | Yes | PJM supports NERC's position to revise all Violation Risk Factors to have an assigned risk factor of "Lower." A Lower Risk Factor requirement is administrative in nature and is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system. |
| **Response:** Thank you for this supportive comment. | | |
| FirstEnergy | Yes | FE supports the SDT's adjustment of VRFs such that no VRF within the ATC standards exceeds a "Lower" rating. We concur with the team's reasoning and rationale provided in response to ballot comments in making this change. |
| **Response:** Thank you for this supportive comment. | | |
| MRO NERC Standards Review Subcommittee | Yes | The MRO commends the SDT in the changes made to VRFs to Lower. The MRO agrees that these changes put the VRFs more in line with the NERC's definitions of the VRF levels. |
| **Response:** Thank you for this supportive comment. | | |
| American Public Power Association | Yes | |
| SERC Available Transfer Capability Working Group (ATCWG) | Yes | |
| The Midwest ISO | Yes | |
| Transmission Agency of Northern California | Yes | |

5. The drafting team has modified the Violation Severity Levels for MOD-001 to reflect industry concerns that they were too "pass/fail" oriented and to reflect the modifications to the requirements and measures. Are the current VSLs established correctly?

**Summary Consideration:**

Some entities suggested R8 in MOD-001 and R10 in MOD-030 needed to be aligned. The SDT modified MOD-030 to address this.

Some entities identified an overlap in the VSL for R3. The SDT corrected the overlap.

Some entities requested that the standard include a statement that a single event could not create multiple violations. The SDT does not believe it is within the drafting team's scope to modify the standards template or create obligations upon compliance. In response, the drafting team has clarified many of the Violation Severity levels in an attempt to eliminate the potential for multiple violations due to single events.

| Organization/Group | Question 5: | Question 5 Comments: |
|---|---|---|
| EPSA | | NO COMMENT |
| The Midwest ISO | No | The VSLs for R8 of MOD-001 are inconsistent to the VSLs stated for R10 of MOD-030 although each is related to comparable requirements regarding the frequency of recalculations. If the suggestion of deletion of R10 in MOD-030 is accepted the inconsistency will be addressed. Otherwise, the team should align these VSLs consistently. |
| **Response:** The SDT has modified MOD-030 R10 to incorporate an allowance for missed calculations consistent with MOD-001 R8. | | |
| ISO RTO Council/Standards Review Committee (SRC) | No | ERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but the IRC has a concern regarding the possibility of multiple violations resulting from a single event. The IRC requests that double counting of violations for a single event be eliminated. The IRC recommends that the SDT add a new item 6 to section A of MOD-001 that states "A single event shall not result in multiple violations". A review of MOD-001 R2 and R8 should be performed for determination of multiple violations resulting from one event. |
| **Response:** The SDT does not believe it is within the drafting team's scope to modify the standards template or create obligations upon compliance. In response, the drafting team has clarified many of the Violation Severity levels in an attempt to eliminate the potential for multiple violations due to single events. | | |
| PJM | No | NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but PJM has a concern regarding the possibility of multiple violations resulting from a single event. PJM requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations - this language to be added to the standard. Add a new item 6 to section A of MOD-001. For example a review of MOD-001 R2 and R8 and MOD-30 R10 should be performed for determination of multiple violations resulting from one event. |
| **Response:** The SDT does not believe it is within the drafting team's scope to modify the standards template or create obligations upon | | |

| Organization/Group | Question 5: | Question 5 Comments: |
|---|---|---|
| compliance. In response, the drafting team has clarified many of the Violation Severity levels in an attempt to eliminate the potential for multiple violations due to single events. | | |
| NPCC Regional Standards Committee | No | NPCC Participating Members have the following comments on the VSL:<br>1. R3: There is a potential overlap between High and Severe. For an ATCID does not include - two or more? of the information items in R3, it could mean does not include all of the information items. This is the same condition as a Severe. We suggest to reword the High VSL to - does not include up to 2 of the information items in R3; and the Severe VSL to ?or its ATCID does not include 3 or more of the information described in R3?, or numbers along that line.<br>**Response:** The SDT has modified the standard as suggested.<br><br>2. We do not agree with the VSLs for R6 and R7 for reasons noted under Q3, above.<br>**Response:** Please see response to Q3. |
| **Response:** Please see in-line responses. | | |
| FirstEnergy | No | The VSLs for R8 of MOD-001 are inconsistent to the VSLs stated for R10 of MOD-030 although each are related to comparable requirements regarding the frequency of recalculations. If the above suggestion revising MOD-001 R8 and deletion of R10 in MOD-030 is accepted the inconsistency will be addressed. Otherwise, the team should align these VSLs consistently. |
| **Response:** The SDT has modified MOD-030 R10 to incorporate an allowance for missed calculations consistent with MOD-001 R8. | | |
| Ontario IESO | No | We have the following comments on the VSL: 1. R3: There is a potential overlap between High and Severe. For an ATCID does not include “two or more” of the information items in R3, it could mean does not include all of the information items. This is the same condition as a Severe. We suggest to reword the High VSL to ?does not include up to 2 of the information items in R3?; and the Severe VSL to ?or its ATCID does not include 3 or more of the information described in R3?, or numbers along that line.<br>**Response:** The SDT has modified the standard as suggested.<br><br>2. We do not agree with the VSLs for R6 and R7 for reasons noted above.<br>**Response:** Please see response to Q3. |
| **Response:** Please see in-line responses. | | |
| Hydro One Networks | No | For the severe VSL for R2 keep consistent the wording as per the other levels.<br>**Response:** The SDT has modified the language to be consistent.<br><br>The Lower, Moderate, and High VSLs for R4 are missing the words "did not".<br>**Response:** The SDT has modified the language as to clarify the intent. |

| Organization/Group | Question 5: | Question 5 Comments: |
|---|---|---|
| **Response:** Please see in-line responses. | | |
| New York Independent System Operator | No | The NYISO agrees with the ISO/RTO Council comments on this issue. NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now for the most part have a graded implementation, but the NYISO remains concerned regarding the possibility of multiple violations resulting from a single event. Therefore, the NYISO requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations. |
| **Response:** The SDT does not believe it is within the drafting team's scope to modify the standards template or create obligations upon compliance. In response, the drafting team has clarified many of the Violation Severity levels in an attempt to eliminate the potential for multiple violations due to single events. | | |
| American Public Power Association | Yes | |

| Texas-New Mexico Power Company | Yes | |

6. **Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-001**.

**Summary Consideration:**

Several entities expressed concern with ERCOT's applicability. The drafting team explained the applicability of the standard, and suggested that ERCOT may wish to pursue a regional standard or variance.

It was suggested that more detail needs to be developed for the treatment of counterflows. The SDT suggested the commenter develop a SAR in pursuit of this detail.

The NERC RTOSDT expressed concern that the standard does not refer to planning and operating limits. The SDT directed the RTOSDT to the specific areas in the methodology standard where such references are made.

Some entities expressed concern with the effective date and the "concurrent" implementation being dependent on "all" regulatory authorities. The SDT notes that the language indicates that it is dependent on all applicable regulatory authorities. The intent is that the standards all become effective on the same date across North America; that date will be established one year following all the needed regulatory approvals.

The drafting team provided a summary of the use of time horizons to address some comments.

Some entities suggested that the allowance for a certain number of hourly calculations to be skipped did not specify that the allowance was only for software outages. The SDT felt that qualifying the limit as suggested would be difficult to verify objectively, as software outages vary in degree and impact.

| Organization/Group | Question 6 Comments: |
|---|---|
| American Public Power Association | Excellent work - my thanks to the SDT members. |
| **Response:** Thank you for your supportive comment. | |
| CenterPoint Energy | The group of standards is for ATC and TRM methodologies that are not used in ERCOT. CenterPoint Energy is concerned that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these standards, which we believe would not add value to the ERCOT region and could increase congestion in the region. Accordingly, CenterPoint Energy previously submitted comments to these standards asking for an exemption for the ERCOT region. We find the proposed standards unacceptable unless the following provision is added to each standard: This standard does not apply to ERCOT or any other region that operates as a single control area. |
| **Response:** MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to be any POR/POD combination for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. Assuming ERCOT does not calculate ATC and has no directive to do so, MOD-001 R1 (and therefore also R2, R6, R7, R8) would not be applicable to ERCOT. R3, R4, and R5 will apply to ERCOT, but the requirements are documentation related and do not seem to be onerous. R9 is intended to support neighboring entities, and ERCOT is expected to comply with this requirement. However, if none of ERCOT's neighbors request data from ERCOT, then compliance with R9 would be achieved with no action on ERCOT's part.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that | |

| Organization/Group | Question 6 Comments: |
|---|---|
| states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| Transmission Agency of Northern California | R.9 lists many data elements that another entity can request and a TSP is obligated to provide. Not all TSPs have or use this data themselves, and R.9 should be clarified to state that the TSP is not obligated to provide data it does not have. Perhaps this is implied in R9.1, but if so it should be stated more clearly.<br><br>Also the first sentence of R.9 is ambiguous - I assume the requested data is for use in the requestor's ATC or AFC calculations, but it could also be read that the data is used in the ATC/AFC calculation of the TSP receiving the request. |
| **Response:** The SDT has clarified the language to explain the intent. | |
| Southwest Power Pool | R3.6.3. How outages (including those outages from other Transmission Service Providers that are unrecognized) are processed. Define "unrecognized." Does this also refer to outages that are not used because the elements are well outside the TSP's model and therefore do not impact calculations?<br>**Response:** The SDT has modified the requirement to be more explicit by requiring "how outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed."<br><br>R9. Within thirty calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below for use in ATC or AFC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R9.1 and R9.2:The concern of R9 is numerous requests that could create an unnecessary burden for TSPs fulfilling said requests. SPP feels a justification should be provided with requests to promote communication between requestor and TSP so desired result is obtained.<br>**Response:** The methodology standards themselves (MOD-029, -029, and -030) define the required uses of neighbors information in the ATC process. It is expected that the TSP will be required to respond to neighbors needs for information as those neighbors comply with the standards. Similarly, it is expected that the TSP will be requesting this data from its neighbors. |
| **Response:** Please see in-line responses. | |
| EPSA | We offer two additional comments. First, with respect to the purpose of this standard, we believe the purpose of the previous draft was more appropriate. The previous draft stated that consistency in the calculation of ATC and appropriate documentation were part of the purpose of this standard. We believe those are important purposes and should be included. |

| Organization/Group | Question 6 Comments: |
| --- | --- |
| | **Response:** The SDT drafted the purpose to align more closely with the reliability objectives of the standard. While consistency and documentation are also important components of the standard, they support the reliability objectives included in the purpose, and are not in themselves the purpose for the standard.<br><br>Secondly, requirement 3.2 dealing with counterflows is insufficient in the current draft. We accept that consistency in the use of counterflows on all interfaces would not be appropriate. Indeed it is likely that even within a single system, it is likely appropriate that the counterflows on some interfaces be treated differently than others based on historical usage of the interface. However, to create a standard that requires only an identification of the methodology and a statement of the rationale, with no guidance on appropriate methodologies or acceptable rationales is not sufficiently enforceable and amounts to a fill-in-the-blank standard.<br>**Response:** The SDT discussed counterflows extensively during previous drafting efforts. The current language is intended to ensure that the treatment of counterflows is understood for coordination purposes. With regard to specific methodologies or acceptable rationales, the SDT encourages EPSA to draft a SAR that identifies suggestions for improving the manner in which counterflows are addressed in the standard. |
| **Response:** Please see in-line responses. | |
| ISO RTO Council/Standards Review Committee (SRC) | The IRC applauds the efforts of the NERC Standards Drafting Team (SDT) in providing a set of MOD standards for formal comment that include many of the Industry's comments from the Ballot. However, there are several standards which still require modification. The MOD standards extend into areas that should be covered and addressed by NAESB Business Practices (as defined in MOD-001 Definitions). The frequency of postings and frequency of AFC/ATC calculations should be NAESB Business Practices, and not included in the NERC Standards as reliability based requirements (see specific details for MOD-001 R2 and R7). Non-firm should be removed from this reliability standard. |
| **Response:** The SDT appreciates the supportive comment.<br><br>The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives. Removal of non-firm from the standard could allow for unchecked selling of non-firm service, which could lead to concerns within real-time. | |
| ERCOT ISO | I suggest modifying the Applicability section to state:4.1 Transmission Service Provider with ATC Path(s)<br>4.2 Transmission Operator with ATC Path(s)<br>**Response:** The SDT does not agree. Entities without ATC paths, while not required to implement one of the three ATC methodologies, are still required to implement other portions of the standard, including the requirement to support the Data Exchange if requested.<br><br>Comment: It is unclear how failing to meet the requirements of MOD-001 affects grid reliability. This should be a commercial standard or a business practice rather than a reliability standard requirement.<br>**Response:** FERC identified in Order 890 that this “Predictable, sufficiently accurate, consistent, equivalent, and replicable |

| Organization/Group | Question 6 Comments: |
|---|---|
| | results promote reliability." The drafting team concurs.<br><br>Assuming that ERCOT has no ATC Paths, the remaining requirements support reliability in that they provide coordination information to entities impacted by ERCOT operations. This includes entities both internal and external to ERCOT.<br><br>Severity Levels: Violation of timing requirements should not constitute a severe violation. A severe violation is the failure to attempt to perform the task at all. A high violation could be a long failure to perform, such as >96 hours with NO attempted corrective action. All other failures in timing should be lower violation severity.<br>**Response:** A severe violation is not a failure to attempt to perform the task at all, it is a complete violation or a mostly complete violation of the requirement. While consideration of intent may be undertaken by an auditor when determining sanctions, the verification of whether the violation occurred or not is an objective determination regardless of intent. |
| **Response:** Please see in-line responses. | |
| Orlando Utilities Commission | Overall Question: As written currently, the standard appears to set requirements for calculating TTC/TFC/ATC/AFC etc, but does not require an entity to perform the calculation. For example, R1 and R6 apply to the TOP, but as written if the TOP doesn't calculate ATC/AFC/TTC/TFC then nothing in the requirements seems to obligate them to do so. This also seems to be true of the requirements that apply to a TSP. Is this a correct reading of the requirements?<br>**Response:** R1 requires that if an Transmission Operator has "ATC paths," they must choose a methodology. R2 requires the Transmission Service Provider to use that methodology. To the extent an Transmission Operator has no ATC paths, the associated Transmission Service Provider would not be obligated to calculate ATC/TTC/TFC/AFC.<br><br>Requirement 6: If the drafting team changes the responsible entity in Requirement 1, will they also change this one?<br>**Response:** No. The Transmission Operator remains responsible for determining TTC and/or TFC.<br><br>Requirement 6 & 7: What if there is not "planning of operations" activity for the corresponding time period? For example while month 11 may have an ATC study done, it may not have a corresponding "planning of operations" activity.<br>**Response:** The SDT has modified the requirement to clarify that if a study has not been undertaken for a specific period, there is no requirement for the assumptions to be no more limiting than those used in the study.<br><br>Requirement 6 & 7: Could you provide some examples of what you mean by "assumptions."<br>**Response:** The SDT has provided several examples within the measures for the requirement<br><br>Requirement 6 & 7: What is the reliability purpose of these requirements, specifically what is the reliability purpose of setting a maximum threshold on how limiting an assumption can be?<br>**Response:** FERC identified in Order 890 that this "Predictable, sufficiently accurate, consistent, equivalent, and replicable |

| Organization/Group | Question 6 Comments: |
|---|---|
| | results promote reliability." The drafting team concurs. |
| **Response:** Please see in-line responses. | |
| PJM | Depth of the ATC MOD standards extends beyond the scope of the reliability standards The MOD standards extend into areas that should be covered and addressed by NAESB Business Practices (as defined in MOD-001 Definitions). The frequency of postings and frequency of AFC/ATC calculations should be NAESB Business Practices, and not included in the NERC Standards as reliability based requirements (see specific details for MOD-001 R2 and R7 and MOD-030 R10 in the Specific Comments sections below). Non-firm should be removed from this reliability standard. |
| **Response:** The SDT believes that creating a requirement to perform an action in a certain way without associated requirements that an entity actually perform the action would not meet any reliability objectives. Removal of non-firm from the standard could allow for unchecked selling of non-firm service, which could lead to concerns within real-time. | |
| Electric Service Delivery | These comments are filed on behalf of City of Austin d/b/a Austin Energy to address proposed NERC 5 MOD Standards. Austin Energy is a municipally owned electric utility and a transmission service provider with the Electric Reliability Council of Texas (ERCOT). ERCOT now operates as a Single Balancing Authority with no explicit transmission services being sold. Current ERCOT market rules allow open transmission access to all loads and resources. ERCOT will continue to operate as a Single Balancing Authority under Nodal market design. Accordingly, as explained in more detail below, the NERC 5 MOD Standards should not be applied to ERCOT and transmission service providers within ERCOT under its current or proposed Nodal market design. Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations.<br>Applicable definitions:According to NERC Reliability Standards Glossary of Terms, Available Transfer Capability (ATC) is defined as: ?A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability (TTC) less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin (CBM), less a Transmission Reliability Margin (TRM), plus Postbacks, plus counterflows?.<br>TTC is defined as: the amount of electric power that can be transferred over the interconnected transmission network in a reliable manner while meeting all of a specific set of defined pre- and post-contingency system conditions.<br>CBM is defined as the amount of transmission transfer capability reserved by load serving entities to ensure access to generation from interconnected systems to meet generation reliability requirements.<br>TRM also is a component of ATC defined as: that amount of transmission transfer capability necessary to ensure that the interconnected transmission network is secure under a reasonable range of uncertainties in system conditions.<br>Comments:ERCOT is an interconnection and a region with no synchronous AC ties with any other interconnections. In July 2001, based on a deregulated Retail and restructured Wholesale Markets, the ERCOT interconnection began acting as a Single Balancing Authority. The ERCOT market is designed such that there are no explicit transmission services being sold, hence, Available Transfer Capability (ATC) is not a measure used in a commercial activity within the ERCOT market. The current ERCOT market rules allow open transmission access to all eligible loads and resources without considering any specific Transmission Service Provider (TSP). Transmission facilities ratings are based upon individual branch element |

| Organization/Group | Question 6 Comments: |
|---|---|
| | designs and in cases of dynamic ratings, ambient conditions are also considered. ERCOT has several DC ties and an asynchronous tie using a Variable Frequency Transformer (VFT); however, the associated interchange capabilities are planned and coordinated by the TSPs involved. The current ERCOT Zonal Market uses a flow based congestion management methodology to predict potential congestions in the Day Ahead and Adjustment Periods. During the operating period, generation shift factors are used to determine the dispatch needed to remain within the constrained limits. The local congestions are managed using full AC load flow analysis and unit specific redispatch.MOD-001-1 is entirely about methodology and calculation of ATC, therefore, this standard is not applicable to ERCOT.<br>MOD-008-1 covers Transmission Reliability Margin (TRM) methodology calculation. Mathematically, ATC is defined as Total Transfer Capability (TTC) less the TRM and Capacity Benefit Margin (CBM). Therefore, TRM also is not applicable to ERCOT.<br>MOD-028-1 covers Area Interchange calculation Methodology. Since ERCOT is a single control area, Area Interchange calculation is not applicable.<br>MOD-029-1 covers Rated System Path Methodology, which is used to calculate TTC and ATC calculations. Therefore MOD-029-1 is not applicable to ERCOT.<br>MOD-030-1 covers Flowgate methodology calculation of ATC, and therefore, is not applicable to ERCOT.<br>ERCOT is currently transitioning to a Nodal Market, with a scheduled start date of December 1, 2008. The Nodal Market uses a Security Constrained Economic Dispatch (SCED) approach to dispatch individual generating units and manage congestion. In the Nodal Market, ERCOT will still operate as a Single Balancing Authority. This again will not use ATC methodology, and aforementioned standards are not applicable to ERCOT in its ensuing Nodal Market.Therefore, Austin Energy requests that the NERC Standards Drafting team add language to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 Standards are not applicable to regions with a Single Balancing Authority that do not use ATC methodology and any of its components in their market operations. |

**Response:** MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to be any POR/POD combination for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. Assuming ERCOT does not calculate ATC and has no directive to do so, MOD-001 R1 (and therefore also R2, R6, R7, R8) would not be applicable to ERCOT. R3, R4, and R5 will apply to ERCOT, but the requirements are documentation related and do not seem to be onerous. R9 is intended to support neighboring entities, and ERCOT is expected to comply with this requirement. However, if none of ERCOT's neighbors request data from ERCOT, then compliance with R9 would be achieved with no action on ERCOT's part.

Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT beleives that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)*

| Organization/Group | Question 6 Comments: |
|---|---|
| California ISO | Purpose ? The MOD 1 Purpose as presently written does not clearly relate the intent of the associated MOD standards. Purpose statement should be more explicit, i.e. ?To require that ATC calculations are performed by TSPs for present (DA and HA) and forecasted system operating conditions on ATC Paths?, using one or more of the 3 ATC calculations options embodied in MOD 28 ? 30. Purpose should clearly state ?for ATC Paths?, and then clearly define ?ATC Paths?.<br>**Response:** The Purpose is intended to be a high-level summary of the goals of the standard, and not serve as a requirement or applicability statement. The qualification related to "ATC Paths" is included in R1.<br><br>The present MOD 1 CFR definition of ?ATC Path? is very open to interpretation, given that ?ATC Path? is defined first as a ?Posted Path? via a footnote reference to 18 CFR 37.6(b)(1) OR ?any OTHER combination of POR and POD for which ATC is calculated?. Posted Path implies a requirement to post the ATC to an OASIS site, and to Market the transmission on the referenced path. The MOD 1 ?ATC? definition does refer to the intention that ATC is calculated ?for further commercial activity?. Presumption is that the ATC is posted for sale. ATC Path Definition ? Clarify that ATC Path definition is applicable ONLY to interties and internal paths between systems where Transmission is sold (for further commercial activity).<br>**Response:** The SDT has modified the definition of ATC Path to be clearer by moving the "Other combination" phrase, and believes that as written, it specifies what qualifies as a path for which ATC or AFC must be calculated.<br><br>Clarify if ANY posting requirement is embodied in these standards. Explanation ?<br>**Response:** NERC is not specifically requiring any posting of information. However, the SDT notes that in some cases, it may be possible to meet a requirement through posting of information. For example, when the STD requires information to be "made available" to certain entities, this can be accomplished in many ways, only one of which would be posting of the data.<br><br>It is the California ISO?s interpretation is that under MOD 1 and 29, the ISO will be required to calculate and post ATCs for each of its 41 interties. The ISO will use the MOD 29 Rated System Path Methodology to calculate ATCs DA, HA and for future Market timeframes, consistent with practice in the WECC for interchange ratings. However, the ISO will be employing a Flow based Integrated forward Market under its new MRTU Market design to be implemented this Fall. This internal ISO Market will use an Integrated Forward Market in combination with an Full Network Model and LMP pricing to dispatch generation, imports and exports, procure AS and Balancing energy for RT, to optimize use of the grid. This model employs the use of flowgates in the 3000 node FNM. However, the ISO will only be posting ATCs for transmission capability at the 41 ties, consistent with our Market design and interpretation of the definition of ATC Path, provided by these proposed ATC standards.<br>Note; The CAISO operates the combined transmission assets of 11 TOs located within its BAA boundary, as one Transmission system for Market purposes. Is this interpretation consistent with the SDT?s intent? Does the SDT believe that MOD 30 contains any requirement to convert the IFM's use of flow gates to ATCs, given that these AFCs are not related to ATC Paths, as defined by MOD 1? This would appear to be very impractical and of virtually no Market benefit, as the power flow solution used to dispatch energy in the IFM is only known after the IFM has run, and a power flow solution is reached for each of the thousands of interconnected transmission elements within the BAA for the 3000 nodal bus network. |

| Organization/Group | Question 6 Comments: |
|---|---|
| | **Response:** The SDT does not believe any conversion from AFC to ATC is required by these standards.<br><br>R2 & R8 ? Should the actual ATC Calculation timing requirements to relegated to a NAESBY Standard??? Any requirement to calculate and post ATC with any accuracy, should be limited to the Hourly, daily and perhaps weekly values. The requirement to calculate Monthly and yearly ATC values beyond the outage reporting requirements and beyond any reasonable expectation of knowledge of operating conditions, is of minimal use, under and CAISO Market construct. Posting of ATC for timeframes beyond seven days would seem to be very inaccurate, not knowing what the operationally constraints would be to any degree of accuracy (I.e. hydro conditions, forced outages, planned generation and transmission outages, planned maintenance work).<br>**Response:** The SDT acknowledges for a market, this info may not be as useful, and in many cases, components used in the ATC equation may be zero for a market. However, the SDT is developing the standard to apply across all market designs, and for other areas, this is more useful information. In some cases, the pursuit of Entity or Regional Variances may be appropriate.<br><br>R9 - Does this Requirement require that the CAISO release our power flow model to our TO?s, absent a NDA??? See 9th bullet.<br>**Response:** The SDT notes that R9.1 subjects the obligation to provide the model to security and confidentiality requirements. To the extent such requirements mandate the execution of a non-disclosure agreement, the SDT does not believe that requiring an NDA is in conflict with the standard. |
| **Response:** Please see in-line responses. | |
| NERC RTOSDT | The Real Time Operation Standards Drafting Team is concerned that the proposed MOD standards do not include any reference to the Planning and Operating Limits mandated by the current FAC, IRO and TOP standards. These standards already include transmission flow limits both in the longer term planning time frame as well as the shorter term operating time frame. The proposed MOD standards seem to be establishing procedures to calculate the commercial boundaries without a direct link to the required reliability boundaries.<br>MOD-001 R6 states that the TTC ?use assumptions? no more limiting than those used in planning. The RTO SDT would ask shouldn?t TTC?s be required to be ?no less limiting? than the SOLs / IROLs computed for the system? Current NERC standards are not just asset limits, they are also system limits. The current standards require that limits be calculated that recognize both local and wide-area impacts. The RTO SDT believes that by at least linking (if not entirely eliminating) the MOD standards to the current SOLs / IROLs requirements, the Industry would be more correctly linking how the system MUST BE operated to any NAESB business practice. Indeed it would seem that current tariffs are based on the computations used in current planning and operating environments. By using the current SOL / IROL limits the procedural / prescriptive requirement in MOD-001 R9 et al would be unnecessary (i.e. they would revert back to the FAC and IRO requirements)The questions for the ATC SDT:? How do these MOD standards relate to the SOLs / IROLs? Why should these ATC/TTC limits be decoupled from the SOLs / IROLs? Shouldn't the long-term SOL / IROL limits computed in Planning be the TTC for the system (or at least the basis for the TTC)? Shouldn't the short-term SOL / IROL be the basis for the ATC for the system? MOD-008 computes margins. By coordinating the MOD standards with the SOL / IROL standards, the only |

| Organization/Group | Question 6 Comments: |
|---|---|
| | Business (not NERC) requirement may be to define the options on how the TSP could couple the various SOL / IROL values that it obtains from its RCs and TOPs. MOD-028By using SOLs / IROLs there would be no need to get into ATC / AFC “methodologies”. Indeed standards that include “alternatives” are not defining a single ?standard approach?. But by using specific planning and operating limits the methodologies become irrelevant. The “limit” becomes explicit and well-defined. Any margins or variations about those limits would then be obvious and transparent. What is most important is respecting the reliability-based limits and not how the commercial value is computed. If this idea of using SOLs / IROLs as the limit(s) or at least the basis for those commercial limits, then the TSP becomes a coordinator of which values to use for the commercial periods. The TSP would not be the computer of those limits. Thus MOD-028 could become a business practice for posting - rather then a standard for computations. |
| **Response:** While not included in MOD-001, the other posted methodology standards include references to SOLs to address the concerns expressed by the RTOSDT. These references are as follows: MOD-028 R6.1; MOD-029 R3; MOD-030 R2.4. Regarding the need for these standards, the approval of the SAR related to these standards and the NOPR process for Order 890 has already identified that the industry believes these methodologies are appropriate areas for standards development. | |
| NPCC Regional Standards Committee | NPCC Participating Members do not see the role of TOP in this standard. The TOP’s primary responsibility is to operate its transmission operating area in a reliable manner, and determine SOLs and where necessary, transmission transfer capabilities and flowgate capabilities (where applicable). Given the established SOLs, TTCs, TFCs that are determined by the TOP for operational planning, and the TTCs and TFCs determined by other entities such as the RCs, TPs and PCs for wider area and for different time frames, the TSP needs only to calculate ATCs (or AFCs) respecting these established constraints. In doing so, it should be able to select an ATC calculation method to suit its business model and needs, with due consideration to the basis of the TTCs and TFCs that affect its service area. With this in mind, we suggest in our response to Q2, above, that the TSP be the one who selects the ATC method and R1 should be revised accordingly.<br>Note also that it should not be assumed that the TOP area and the TSP area are the same and hence the basis of the TTCs and TFCs that affect the TSP/s area may differ from one part to another.Also we believe the TSP should be the entity to select the method to be used in calculating available transmission transfer capability since it is the entity responsible for processing transmission services, not the TOP. In determining ATCs, the TSP needs to observe SOLs, IROLs and TTCs determined by the TOPs, RCs, TPs and PCs. Keeping the determination of TTCs (TFCs) separate from the determination of ATC, including the latter’s methodology, would be the appropriate approach in moving forward with these MOD standards. |
| **Response:** Please see summary response to Question 2. | |
| FirstEnergy | FirstEnergy appreciates the Standard Drafting Team's decision to move to a formal comment period based on the prior initial ballot feedback. We commend the team for moving quickly to respond to the ballot comments and providing the industry a revised set of standards to review and comment.<br>Response: Thank you for your supportive comment.<br><br>Regarding the revision to the Effective Date, while FirstEnergy agrees that there is a need to ensure that the standard is implemented consistently across the entire continent we are concerned with the Effective Date being subject to approval of ALL regulatory authorities. We believe an appropriate Implementation Plan should reflect a period of time beyond the NERC |

| Organization/Group | Question 6 Comments: |
|---|---|
| | Board of Trustee approval date that would reflect when the requirements are considered mandatory and enforceable. The timeline should allow sufficient time for regulatory authority reviews, with the intent of sanctions also being enforced in conjunction with the conclusion of the implementation period. However, a delay from a given regulatory agency should not impact when the requirements are considered mandatory and enforceable for the bulk electric system. |
| **Response:** The SDT notes that the language indicates that it is dependent on all applicable regulatory authorities. The intent is that the standards all become effective on the same date across North America; that date will be established one year following all the needed regulatory approvals. | |
| AEP | The Applicability of this Standard should be solely upon the TSP, the Transmission Operator should not be subject to this Standard. From the previous set of responses, it is the apparent belief of the SDT that the calculation of ATC is needed for reliability (response to AECI for example). We disagree. Considering that ATC is a mathematical amalgamation of forecasted system conditions (load, outages, generation dispatch, others? transactions, etc) compounded and adjusted by margins (TRM and CBM of own entity and other systems), using the calculated ATC to assess real or near real time transmission reliability would be ? at best ? unwise. Transmission Reliability can be assessed by monitoring specific and individual Facility loadings and/or other parameters, for example. The calculation of ATC and the value of resultant ATC is exactly for the purpose stated in the definition of ATC: ?A measure of ? capability?.for further commercial activity? ? and note the definition does not infer ATC is a measure of reliability. Granted, ATC is calculated FROM reliability derived values and concepts (such as ratings, contingency analysis aspects, SOLs etc), BUT the resultant ATC values are not an assessment of transmission reliability ? and therefore not a function for the Transmission Operators, but rather the Transmission Service Provider. |
| **Response:** Please see summary response to Question 2. | |
| PPL Supply Group | PPL suggests that the standard should require that the TSP make available the new ATC as soon as possible. |
| **Response:** While the SDT understands and supports the intent of this request, such a requirement is ultimately one that is difficult, if not impossible, to measure objectively. | |
| Oncor Electric Delivery | This standard should not apply to ERCOT for the reason expressed in question 1. |
| **Response:** MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to be any POR/POD combination for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. Assuming ERCOT does not calculate ATC and has no directive to do so, MOD-001 R1 (and therefore also R2, R6, R7, R8) would not be applicable to ERCOT. R3, R4, and R5 will apply to ERCOT, but the requirements are documentation related and do not seem to be onerous. R9 is intended to support neighboring entities, and ERCOT is expected to comply with this requirement. However, if none of ERCOT's neighbors request data from ERCOT, then compliance with R9 would be achieved with no action on ERCOT's part.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, | |

| Organization/Group | Question 6 Comments: |
|---|---|
| and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| Bonneville Power Administration | BPA thanks the drafting team for the modifying MOD-001 to not require the conversion of AFC to ATC and agrees with your assessment that there is no reliability need for such conversion.<br>**Response:** Thank you for your supportive comment.<br><br>Additionally, BPA respectfully submits the following observations and suggestions: a. The purpose statement of MOD-001 be modified as follows to comply with FERC Order 890-A:Purpose: To ensure the consistent and transparent application and documentation for the variables defined and used in the calculation of Available Transfer Capability (ATC) or Available Flowgate Capability (AFC).<br>**Response:** The SDT removed the statement related to transparency, as this issue is not one that impacts Reliability but rather Open Access. As such, NAESB will be addressing it within their standards.<br><br>b. The Time Horizons listed for all requirements should include the "Long-term Planning" Horizon, as ATC or AFC is to be calculated beyond the seasonal window.<br>**Response:** The use of "Time Horizons" in this standard is in the form of a compliance element, and refers to the manner in which compliance evaluates the implications of a violation of the standard. In this context, time horizon has to do with the urgency of addressing a violation, e.g., how quickly a violation needs to be rectified. Together, the Violation Risk Factor and Time Horizon aid a compliance auditor in determining sanctions. Accordingly, the SDT believes that the appropriate horizon for compliances does not include "Long-term Planning."<br><br>c. Balancing Authorities may be appropriately identified as Applicable Entities in this standard and request that the Standards Drafting Team provide an explanation as to why they are not listed.<br>**Response:** The SDT is uncertain what tasks BPA would assign to the Balancing Authority. To the extent that BPA has suggested requirements or tasks for the BAs to perform, the SDT suggests that BPA draft a SAR to incorporate those requirements in a future revision to the standard. |
| **Response:** Please see in-line responses. | |
| Xcel Energy | We feel that the applicability of this standard as proposed is problematic. We also do not feel that this problematic nature is resolved by choosing either the TOP or TSP. While it is not a perfect solution, we feel the best option is for the applicability to remain at the regional level. We suggest the following wording: "Regional Reliability Organization, through its members". |
| **Response:** NERC standards have to be applicable to a functional entity, and cannot create a requirement that applies to an RRO. However, if desired, regions can create regional standards or pursue regional variances. | |
| Gainesville Regional Utilities | None at this time. |

| Organization/Group | Question 6 Comments: |
| --- | --- |
| MRO NERC Standards Review Subcommittee | 1. The MRO commends the SDT in making significant changes to this standard and reissuing it for comment. The MRO believes the eventual standard that is approved will serve the industry and customers better as a result.<br>**Response:** Thank you for your supportive comment.<br><br>2. The MRO believes that the first time you use an abbreviation or acronym, you must spell out the full term followed by the abbreviation or acronym in brackets. Subsequent use of the term is then made by its abbreviation or acronym. ex: "Each Transmission Operator shall select one Available Transfer Capability (ATC) methodology2 for calculating ATC (Area Interchange methodology, Rated System Path methodology) or Available Flowgate Capacity (AFC) (Flowgate methodology) for each ATC Path per time period identified in R2 for those Facilities within its Transmission Operator Area."<br>**Response:** The SDT has made the suggested modifications.<br><br>R3.3 - last line should read: “calculating ATC or AFC.<br>**Response:** The SDT has modified R3.3 to include flowgate capability, but has also clarified that since this applies to the Transmission Service provider, it only refers to “Available” capacity (since the Transmission operator is the entity that calculates Total Transfer/Flowgate Capability).<br><br>R3.4“ last line should read: ?calculating ATC or AFC.<br>**Response:** The SDT has drafted R3.4 to refer to ATC, AFC, TTC, and TFC, and believe the language used is appropriate.<br><br>R3.5 ? Each bullet should read: -allocate ATC or AFC?<br>**Response:** The SDT has drafted R3.5 to refer to ATC, AFC, TTC, and TFC, and believe the language used is appropriate.<br><br>R6 and R7 ? Overall, both requirements as written are unclear. The MRO asks that the standards drafting team specify what assumptions are referenced or else delete these requirements. Also the MRO objects the requirement to use assumptions that are no more limiting in that such a requirement would result in potentially onerous calculations to determine assumptions that meet this limitation. The MRO notes that these requirements are covered by FERC order #890 anyway.<br>**Response:** The assumptions are generally those defined in the ATC methodologies (MOD-028, MOD-029, and MOD-030). To the extent other assumptions used in the ATC processes are described in the ATCID, they should be considered as well.<br><br>R9 - Please expand/clarify the intentions of the 4th bullet. What specific aggregated firm capacity is being referenced? Capacity in ETC for each flowgate as specified by reservations? An example would be very beneficial .<br>**Response:** The SDT uses the term “aggregated” to mean that the requirement refers to the sum of the uses, not individual schedules.<br><br>R9 - The 13th bullet should read: "Values of Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM), and |

| Organization/Group | Question 6 Comments: |
|---|---|
| | TTC for all ATC Paths or (TFC) for Flowgates."<br>**Response:** The SDT has deleted "TTC" from the requirement, as it appears to be an editing error.<br><br>M6 - Include reference for TFC, should read: "Alternatively the Transmission Operator may demonstrate that the same load flow cases are used for both TTC or TFC?"<br>**Response:** The SDT has modified the measure as suggested. |
| **Response:** Please see in-line responses. | |
| Entergy Services Inc | The effective date info provided in the standards posted indicate that all 5 standards should become effective together. It seems that MOD-004 should also be a part of the set becoming effective. CBM is referenced in the posted standards.<br>**Response:** The SDT believes that the existing CBM standards will address the need for a CBM standard during the interim period between the approval of MOD-001,-028, -029, and -030 and the approval of the new MOD-004 is standard. Note that the effective date for concurrent implementation does not include MOD-008.<br><br>R3.2.2.2 The term "accounting" implies bookkeeping and dollars - obviously not something that should be included in a reliability standard. We suggest adding some clarification to this requirement to ensure the intent is clear to all audiences: "A rationale stating how counterflows are accounted for."<br>**Response:** The SDT has modified this language to be more clear.<br><br>R3.3 Change "of" to "or" in added phrase.<br>**Response:** The SDT has made a modification to address this issue.<br><br>M7 - We do not feel that it is prudent to use switching operating guides and load shedding, etc to sell transmission service. To even suggest these in M7 seems misguided and in conflict with the current draft of the TPL standards.<br>**Response:** The SDT believes that switching operating guides are appropriate, and has retained this item. However, load shedding has been removed. .<br><br>R8.2 and 8.3 need a grace period similar to R8.1 to account for unforeseen system emergencies where the selling of ATC is suspended or technology issues.<br>**Response:** Based on the timing requirements associated with R8.2 and 8.3, the SDT has already established inherent 24-hour "grace periods" for daily, and 7-day "grace periods" for weekly. |
| **Response:** Please see in-line responses. | |
| Ontario IESO | We do not see the role of TOP in this standard. The TOP's primary responsibility is to operate its transmission operating area in a reliable manner, and determine SOLs and where necessary, transmission transfer capabilities and flowgate capabilities (where applicable). Given the established SOLs, TTCs, TFCs that are determined by the TOP for operational planning, and |

| Organization/Group | Question 6 Comments: |
| --- | --- |
| | the TTCs and TFCs determined by other entities such as the RCs, TPs and PCs for wider area and for different time frames, the TSP needs only to calculate ATCs (or AFCs) respecting these established constraints. In doing so, it should be able to select an ATC calculation method to suit its business model and needs, with due consideration to the basis of the TTCs and TFCs that affect its service area. With this in mind, we suggest in our response to Q2, above, that the TSP be the one who selects the ATC method and R1 should be revised accordingly. Note also that it should not be assumed that the TOP area and the TSP area are the same and hence the basis of the TTCs and TFCs that affect the TSP's area may differ from one part to another. |
| **Response:** Please see summary response to Question 2. | |
| Hydro One Networks | In requirement 8, if the 80 days grace period is to account for software outages then say so explicitly in the requirement else entities may interpret the requirement as applicable to outages other then software. |
| **Response:** The SDT discussed whether it was appropriate to limit the requirement to outages only, and felt that to do so would require subjective analysis on the part of a compliance auditor to determine if the outage was legitimate. Rather than do this, the SDT felt it would be more appropriate to set a specific amount of time, independent of cause. Note that the standard as posted mandated 80 hours, not 80 days. | |
| American Transmission Company | The first time that each abbreviation or acronym is introduced, the full terminology should be stated followed by the abbreviation or acronym in brackets (i.e. ATC, AFC, TTC, and TFC).<br>**Response:** The SDT has modified the standards to incorporate this suggested practice.<br><br>The SDT should provide greater explanation as to what would be the proposed effective data of this standard. FERC has justification over all US users, owners and operators of the BPS and following their approval the standard would become "enforceable". Is the SDT proposing that even in the US these standards will not become "enforceable" until all regulatory authorities including Canada and Mexico have approved this set of standards? If this is the case how would NERC insure such a system of enforcement?<br>**Response:** The SDT notes that the language indicates that it is dependent on all applicable regulatory authorities. The intent is that the standards all become effective on the same date across North America; that date will be established one year following all the needed regulatory approvals. |
| **Response:** Please see in-line responses. | |
| Texas-New Mexico Power Company | This standard should not apply to ERCOT for the reason expressed in question 1. |
| **Response:** MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to be any POR/POD combination for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. Assuming ERCOT does not calculate ATC and has no directive to do so, MOD-001 R1 (and therefore also R2, R6, R7, R8) would not be applicable to ERCOT. R3, R4, and R5 will apply to ERCOT, but the requirements are documentation related and do not seem to be onerous. R9 is intended to support neighboring entities, and ERCOT is expected to comply with this requirement. However, if none of ERCOT's neighbors request data from ERCOT, then compliance with R9 would be achieved with no action on ERCOT's part. | |

| Organization/Group | Question 6 Comments: |
|---|---|
| Note that ERCOT may wish to pursue a Variance to this standard. The SDT notes that ERCOT has language in its delegation agreement that states where an ERCOT-specific standard is required, 1) "it shall provide for as much uniformity as possible with (NERC) reliability standards, 2) "it shall be more stringent than a continent-wide reliability standard, including a regional difference that addresses matters that the continent-wide reliability standard does not, or shall be a regional difference necessitated by a physical difference in the bulk power system. The SDT also notes that, "An ERCOT-Specific Standard that satisfies the statutory and regulatory criteria for approval of proposed North American reliability standards, and that is more stringent than a continent-wide reliability standard, would generally be acceptable." *Texas Regional Entity Standards Development Process, Exhibit C to the Delegation Agreement between NERC and ERCOT.* The SDT believes that a regional variance "Based on a justifiable difference between regions or between sub-regions within the Regional geographic area" could be pursued by ERCOT. *(Loc. Cit.)* | |
| Brazos Electric Power Cooperative, Inc. | As commented in Question #1, Brazos Electric does not believe that the application of ATC to a single control area region would serve any reliability need or commercial market purpose. Therefore an exclusion should be provided in the requirements based on whether a TO/TOP operates solely in a single control area region. |
| **Response:** MOD-001 has R1 that requires Transmission Operators to select a methodology based on ATC Paths, which have now been defined to be any POR/POD combination for which ATC is already calculated or any path that is a Posted Path, as defined by FERC. Assuming ERCOT does not calculate ATC and has no directive to do so, MOD-001 R1 (and therefore also R2, R6, R7, R8) would not be applicable to ERCOT. R3, R4, and R5 will apply to ERCOT, but the requirements are documentation related and do not seem to be onerous. R9 is intended to support neighboring entities, and ERCOT is expected to comply with this requirement. However, if none of ERCOT's neighbors request data from ERCOT, then compliance with R9 would be achieved with no action on ERCOT's part.<br><br>Note that ERCOT may wish to pursue a Variance to this standard. | | Individual or group. | Name | Organization | Group Name | Lead Contact | Question 1 | Question 1 Comments | Question 2 | Question 3 | Question 4 | Question 4 Comments | Question 5 | Question 5 Comments | Question 6 Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | | | American Public Power Association | Allen Mosher | No - one or more definitions needs revision - see comments | “Counterflows” should be a defined term. It is used in MOD-1, MOD-28, MOD-29 and MOD-30 and is an integral element in the calculation of ATC and AFC. The definition used in MOD-28-1 R10, for example, reads: “counterflowsF are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.” This definition does not in any way describe what a counterflow is. “Postbacks” should incorporate a working definition developed by NAESB, to be revised once due process is completed on this business practice. Alternatively, consider use of the following text to at minimum describe the nature of postbacks: “PostbacksF are changes to firm [non-firm] ATC [AFC] due to a change in the amount of Firm [non-firm] Transmission Service reserved or scheduled for a period, as defined in Business Practices. Postbacks are generally a positive | Transmission Service Provider | R3.3 - seems awkward for tranfer capability to not be a defined term when TTC and ATC are defined; at minimum, edit to read transfer or Flowgate capability. R3.6 - clarify that "outages" are transmission outages, generator outages or both. R8.1 - why hardwire 80 hours per calendar year during which calculations are not required to be performed? Should this be a compliance Measure? | Yes | | Yes | | Excellent work - my thanks to the SDT members. |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | quantity." Also, capitalize existing transmission commitments in the definition of ATC. | | | | | | | |
| | Individual | Paul Rocha | CenterPoint Energy | | | | | | | | | | | The group of standards is for ATC and TRM methodologies that are not used in ERCOT. that ERCOT might have to adopt the ATC and TRM methodologies prescribed in these s not add value to the ERCOT region and could increase congestion in the region. Accordi previously submitted comments to these standards asking for an exemption for the ER standards unacceptable unless the following provision is added to each standard: This s or any other region that operates as a single control area. |
| | Group | | | SERC Available Transfer Capability Working Group (ATCWG) | Dough Bailey | Yes - definitions are acceptable as revised | | No Preference | | Yes | | | | |
| | Individual | John Harmon | The Midwest ISO | | | Yes - definitions are acceptable as revised | | Transmission Service Provider | R3.3 – last line should read: ... calculating ATC or AFC. R3.4 – last line should read: ... calculating ATC or AFC. R3.5 – Each bullet should read: ... allocate ATC or AFC... R6 and R7 – The term 'assumptions' is not specific enough for entities to prepare for compliance. The Midwest ISO requests the standard to list specific assumptions within the scope and what defines 'more limiting' for each of them. For example, is load assumption within the scope? If yes, what load assumption is more limiting? If it is not possible, the Midwest ISO believes that this topic from Order 890 should be left out from any standard and left to FERC to address issues on a case by case basis. R9 – Please expand/clarify the intentions of the 4th bullet. What specific aggregated firm capacity is being referenced? Capacity in ETC for each flowgate as specified by reservations? An example would be very beneficial. R9 – The 13th bullet should read: .. (TRM), and TTC or TFC for all..... M6 – Include reference for TFC, should read: ... used for TTC, or TFC, and Operations Planning.... | Yes | | No | The VSLs for R8 of MOD-001 are inconsistent to the VSLs stated for R10 of MOD-030 although each is related to comparable requirements regarding the frequency of recalculations. If the suggestion of deletion of R10 in MOD-030 is accepted the inconsistency will be addressed. Otherwise, the team should align these VSLs consistently. | |
| | Individual | John Dalessi | Transmission Agency of Northern California | | | Yes - definitions are acceptable as revised | | No Preference | | Yes | | Yes | | R.9 lists many data elements that another entity can request and a TSP is obligated to this data themselves, and R.9 should be clarified to state that the TSP is not obigated t Perhaps this is implied in R9.1, but if so it should be stated more clearly. Also the first s assume the requested data is for use in the requestor's ATC or AFC calculations, but it used in the ATC/AFC calcualation of the TSP receiving the request. |
| | | | | | | | | | MOD-01, R9. Could the NERC Team please clarify "which" Load | | | | | |

| Group | | | WECC Market Interface Committee / Sub Commtt / ATC Task Force | W. Shannon Black | Yes - definitions are acceptable as revised | | Transmission Service Provider | Forecast it is requesting? Hourly? Daily? For what affected area? MOD-01, R9. Could the NERC Team please clarify that Block/Dispatch Order and Participation Factors do not call for the submission of specific schedules; rather, these defintions only call for dispatch rules from which approximations can be made. | Yes | | Yes | | |
| Group | | | Southwest Power Pool | Kevin Bates | Yes - definitions are acceptable as revised | | | | Yes | | | | R3.6.3. How outages (including those outages from other Transmission Service Provide processed. Define "unrecognized." Does this also refer to outages that are not used bec outside the TSP's model and therefore do not impact calculations? ________________ R9. Within thirty calendar days of receiving a request by any Transmission Service Prov Reliability Coordinator, or Transmission Operator for data from the list below for use in Transmission Service Provider receiving said request shall begin to make the requested subject to the conditions specified in R9.1 and R9.2: The concern of R9 is numerous re unnecessary burden for TSPs fulfilling said requests. SPP feels a justification should be comunication between requestor and TSP so desired result is obtained. |
| Individual | Maria Neufeld | Manitoba Hydro | | | Yes - definitions are acceptable as revised | | No Preference | | Yes | | Yes | | |
| Individual | Jack Cashin/Barry Green | EPSA | | | Yes - definitions are acceptable as revised | | No Preference | R6/7. I believe the wording of this requirement in the previous draft was superior. In the revised language, deletion of the word "consistent" allows for discontinuities in the ATC calculations. For example, if the assumptions used in "planning of operations" in the period beyond one month are different than for those in the current month, this could create discontinuities where the calculations adopt different assumptions. In addition, the current language has broken the explicit link between planning studies and operations studies. | | no comment | | NO COMMENT | We offer two additional comments. First, with respect to the purpose of this standard, previous draft was more appropriate. The previous draft stated that consistency in the documentation were part of the purpose of this standard. We believe those are importa included. Secondly, requirement 3.2 dealing with counterflows is insufficient in the curr consistency in the use of counterflows on all interfaces would not be appropriate. Indee single system, it is likely appropriate that the counterflows on some interfaces be treat historical usage of the interface. However, to create a standard that requires only an id and a statement of the rationale, with no guidance on appropriate methodologies or ac sufficiently enforceable and amounts to a fill-in-the-blank standard. |
| Group | | | Public Service Commission of South Carolina | Phil Riley | Yes - definitions are acceptable as revised | | No Preference | | Yes | | Yes | | |
| | | | | | | | | Requirement 2 •While the IRC understands that the SDT believes that the requirements need to address the amount of ATC or AFC data calculated and the frequency of calculation associated with them, these requirements should be business practices and should be considered NAESB scope and | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | ISO RTO Council/Standards Review Committee (SRC) | Charles Young | Yes - definitions are acceptable as revised | | | eliminated from the MOD Standards. The MODs can still address FERC orders and be reliability based without the MOD-001 R2 (amount of ATC or AFC) and R8 (frequency ATC recalculation) and MOD-030 R10 (frequency AFC recalculation) requirements. The violation severity levels for these draft standards now have a graded implementation. The possibility of multiple violations resulting from a single event still remains. The IRC requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations. This language should be added to the standard as a new item 6 to section A of MOD-001. Requirement 3 •R3.2.1 - The IRC understands the SDT's reasons for using “Confirmed” reservations in accordance with the FERC regulations. However, reservations that are in “Accepted”, as well as, “Confirmed” status should be included. Once service is “Accepted” by a TSP it cannot be retracted. Using reservations that are in “Accepted” and “Confirmed” status should also be included in MOD-030 R6.3, R6.4, R7.1, and R7.2. This does not prevent the TSP from decrementing for accepted and confirmed TSRs. We understand that some TSPs maintain two sets of ATCs. One set is maintained internally and accounts for accepted and confirmed TSRs. The other set of ATC values is maintained externally and only accounts for confirmed TSRs. It is important for TSPs who maintain two sets of ATC values to post the “internal” ATC values to provide greater transparency and | Yes | The MOD standards assess the correct amount of reliability risk in areas that do not affect reliability. The IRC supports the position that no requirement from this set of ATC standards should have an assigned Risk Factor exceeding “Lower”. A Lower Risk Factor requirement is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the bulk power system, or the ability to effectively monitor and control the bulk power system; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of | No | ERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now, for the most part, have a graded implementation, but the IRC has a concern regarding the possibility of multiple violations resulting from a single event. The IRC requests that double counting of violations for a single event be eliminated. The IRC recommends that the SDT add a new item 6 to section A of MOD-001 that states "A single event shall not result in multiple violations". A review of MOD-001 R2 and R8 should be performed for determination of multiple violations resulting from one event. | The IRC applauds the efforts of the NERC Standards Drafting Team (SDT) in providing a comment that include many of the Industry's comments from the Ballot. However, ther require modification. The MOD standards extend into areas that should be covered and Practices (as defined in MOD-001 Definitions). The frequency of postings and frequency be NAESB Business Practices, and not included in the NERC Standards as reliability bas details for MOD-001 R2 and R7). Non-firm should be removed from this reliability stand |

| | | | | | | | | | | | | | | |

| | | | | | | | | | | | | | | These comments are filed on behalf of City of Austin d/b/a Austin Energy to address pr Austin Energy is a municipally owned electric utility and a transmission service provider Council of Texas (ERCOT). ERCOT now operates as a Single Balancing Authority with no being sold. Current ERCOT market rules allow open transmission access to all loads and operate as a Single Balancing Authority under Nodal market design. Accordingly, as exp NERC 5 MOD Standards should not be applied to ERCOT and transmission service provi current or proposed Nodal market design. Austin Energy requests that the NERC Stand to these Standards to clarify that MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, a applicable to regions with a Single Balancing Authority that do not use ATC methodolog their market operations. Applicable definitions: According to NERC Reliability Standards Transfer Capability (ATC) is defined as: “A measure of the transfer capability remaining network for further commercial activity over and above already committed uses. It is d (TTC) less existing transmission commitments (including retail customer service), less a less a Transmission Reliability Margin (TRM), plus Postbacks, plus counterflows”. TTC is power that can be transferred over the interconnected transmission network in a reliab specific set of defined pre- and post-contingency system conditions. CBM is defined as transfer capability reserved by load serving entities to ensure access to generation from generation reliability requirements. TRM also is a component of ATC defined as: that ar capability necessary to ensure that the interconnected transmission network is secure u uncertainties in system conditions. Comments: ERCOT is an interconnection and a regi |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | NPCC Regional Standards Committee | Guy V. Zito | Yes - definitions are acceptable as revised | | Transmission Service Provider | NPCC Participating Members have the following comments on specific requirements 1. R3.6.3: This subrequirement is too vague and its addition is not necessary. Subrequirements R3.6.1 and R3.6.2 suffice to hold the TSP responsible for considering the impact of outages in ATC calculation. How the outages are processed has no bearing on the ultimate scenarios (topologies) that the TSP must consider. 2. Also we do not agree with the changes made to R6 and R7. By “no more limiting than” the assumptions used in planning of operations for the same time period, it would imply that the TOP and TSP may use less restrictive (or more liberal) assumptions. The results could be that the TTCs and ATCs are higher than the planned operational parameters, giving rise to potential unreliability. We do not see a problem with the previous wording of “consistent with”, and this should be reinstated | Yes | | No | NPCC Participating Members have the following comments on the VSL: 1. R3: There is a potential overlap between High and Severe. For an ATCID does not include “two or more” of the information items in R3, it could mean does not include all of the information items. This is the same condition as a Severe. We suggest to reword the High VSL to “does not include up to 2 of the information items in R3”; and the Severe VSL to “or its ATCID does not include 3 or more of the information described in R3”, or numbers along that line. 2. We do not agree with the VSLs for R6 and R7 for reasons noted under Q3, above. | NPCC Participating Members do not see the role of TOP in this standard. The TOP’s prin transmission operating area in a reliable manner, and determine SOLs and where neces capabilities and flowgate capabilities (where applicable). Given the established SOLs, T the TOP for operational planning, and the TTCs and TFCs determined by other entities s wider area and for different time frames, the TSP needs only to calculate ATCs (or AFCs constraints. In doing so, it should be able to select an ATC calculation method to suit it due consideration to the basis of the TTCs and TFCs that affect its service area. With th response to Q2, above, that the TSP be the one who selects the ATC method and R1 sh also that it should not be assumed that the TOP area and the TSP area are the same ar TFCs that affect the TSP’s area may differ from one part to another. Also we believe the the method to be used in calculating available transmission transfer capability since it i processing transmission services, not the TOP. In determining ATCs, the TSP needs to determined by the TOPs, RCs, TPs and PCs. Keeping the determination of TTCs (TFCs) ATC, including the latter’s methodology, would be the appropriate approach in moving standards. |
| | | | | | | | | | R1- The selection of a calculation methodology should reside with the party responsible for calculating ATC. As stated in question 2, FE believes that R1, the selection of an ATC methodology, should be applicable to the Transmission Service Provider (TSP) and not the Transmission Operator since within many RTO areas it is the TSP who maintains the ATC methodology documentation and performs the ATC calculations. This is the case in a large portion of the continent and a standard should not be written in a way that would knowingly require an assignment delegation for a large number of potential responsible entities. Assigning the requirement | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | FirstEnergy | Doug Hohlbaugh | Yes - definitions are acceptable as revised | | Transmission Service Provider | responsibility to the TSP would also work for non-market areas of the continent where a TO/TOP also serves as its own its own TSP. The TOP should provide a support role in providing data and information that is needed by the TSP to fulfill its responsibilities in calculating ATC. The TSP is overseeing transmission service requests and making determination of the viability of such requests. The TOP has ultimate reliability responsibility in the real-time environment and will manage its system to its system operating limits regardless of the ATC methodology used by its TSP to approve transactions that make use of the transmission operator's system. R3.3 – There appears to be a typo. Replace "of" in the words "transfer of Flowgate capability" with "or" R3.3, R3.4, R3.5 – Suggest the SDT consider replacing the words "transfer or Flowgate capability" with "ATC or AFC" to improve readability. R3.6 – Replace "ATC" with "ATC or AFC". R3.6 (sub-requirements) - The sub-requirements of R3.6 require that outages be included in the daily and monthly calculations, but excludes hourly calculation periods. In MOD-030 (AFC Methodology) requirement R5.2 requires expected transmission and generation outages are included for all applicable time period calculated. It is suggested that a single requirement reside in MOD-001 to cover the hourly, daily and monthly aspects for this intent that would assure consistent application across the MOD-028, MOD-029 and MOD-030 standards. R8 – It is not clear why the frequency for recalculation is only | Yes | FE supports the SDT's adjustment of VRFs such that no VRF within the ATC standards exceeds a "Lower" rating. We concur with the team's reasoning and rationale provided in response to ballot comments in making this change. | No | The VSLs for R8 of MOD-001 are inconsistent to the VSLs stated for R10 of MOD-030 although each are related to comparable requirements regarding the frequency of recalculations. If the above suggestion revising MOD-001 R8 and deletion of R10 in MOD-030 is accepted the inconsistency will be addressed. Otherwise, the team should align these VSLs consistently. | FirstEnergy appreciates the Standard Drafting Team's decision to move to a formal com initial ballot feedback. We commend the team for moving quickly to respond to the ball industry a revised set of standards to review and comment. Regarding the revision to t FirstEnergy agrees that there is a need to ensure that the standard is implemented con continent we are concerned with the Effective Date being subject to approval of ALL reg appropriate Implementation Plan should reflect a period of time beyond the NERC Boar would reflect when the requirements are considered mandatory and enforceable. The ti for regulatory authority reviews, with the intent of sanctions also being enforced in con implementation period. However, a delay from a given regulatory agency should not im considered mandatory and enforceable for the bulk electric system. |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | focused on ATC, and does not read "ATC or AFC", similar to the wording used for calculating in R2. In MOD-030 R10 addresses recalculation for the AFC but it seems that with the suggested change in R8 of MOD-001, that R10 of MOD-030 could be eliminated. Additionally they are inconsistent in that R10 does not provide for the 80 hour annual allowance that is stated in R8. | | | | | |
| | Individual | Thad Ness | AEP | | | Yes - definitions are acceptable as revised | | Transmission Service Provider | | | | | | The Applicability of this Standard should be solely upon the TSP, the Transmission Ope Standard. From the previous set of responses, it is the apparent belief of the SDT that for reliability (response to AECI for example). We disagree. Considering that ATC is a n forecasted system conditions (load, outages, generation dispatch, others' transactions, margins (TRM and CBM of own entity and other systems), using the calculated ATC to a transmission reliability would be – at best – unwise. Transmission Reliability can be ass individual Facility loadings and/or other parameters, for example. The calculation of AT exactly for the purpose stated in the definition of ATC: "A measure of … capability….for note the definition does not infer ATC is a measure of reliability. Granted, ATC is calcula values and concepts (such as ratings, contingency analysis aspects, SOLs etc), BUT the assessment of transmission reliability – and therefore not a function for the Transmissi Transmission Service Provider. |
| | Group | | | PPL Supply Group | Annette Bannon | | | | R4. PPL suggests that Purchasing/Selling Entities should be included in the listing of entities under Requirement R4 who have access to the ATCID. R8. PPL suggests that the following changes be made to the calculation time periods: R8.1 should require hourly ATC to be calculated "as close to continuously as possible". Once per hour is too slow. R8.2 should require daily ATC to be calculated at 15 minute or less intervals. Once per day is too slow. R8.3 should require that Monthly ATC be calculated hourly or at most daily. Once per week is too slow. | | | | | PPL suggests that the standard should require that the TSP make available the new AT |
| | Individual | Greg Rowland | Duke Energy Corporation | | | No - one or more definitions needs revision - see comments | ATC path : Insert the phrase "or Available Flowgate Capability" after the phrase "Available Transfer | Transmission Operator | R8.1 – The following sentence, "Transmission Service Providers are allowed up to 80 hours per calendar year during which calculations are not required to be performed." appears somewhat capricious and should be clarified to show the drafting team's intentions. As presented, it would permit a TP to decide not to calculate hourly ATC for a 3 1/3 day period. Also, R8 does not require | Yes | | Yes | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | Capability". | | recalculation if none of the calculated values identified in the ATC equation have changed. Does R8.1 limit the exemption provided in R8 to 80 hours per year? M7 - insert the phrase "list of contingencies," before the phrase "loop flow". | | | | | |
| | Individual | Greg Ward / Darryl Curtis | Oncor Electric Delivery | | | No - one or more definitions needs revision - see comments | All schedules in ERCOT flow with no pre-defined paths and any congestion is mitigated by market mechanisms and/or verbal dispatch instructions from ERCOT (in the case of an emergency). Oncor is concerned about the risk of ERCOT being found in non-compliance with the underlying standard due to the methodologies not being a part of the ERCOT market. Furthermore, Oncor believes that implementation of the prescribed methodologies would add no value to the ERCOT market and could result in more system congestion. Oncor strongly suggests that this standard specify that it is not applicable to regions with a single control area and no defined ATC path(s). | No Preference | | Yes | | Yes | | This standard should not apply to ERCOT for the reason expressed in question 1. |
| | Group | | | Bonneville Power Administration | Denise Koehn | Yes - definitions are acceptable as revised | | Transmission Operator | BPA does not believe any are incorrect. | Yes | | Yes | | BPA thanks the drafting team for the modifying MOD-001 to not require the conversion your assessment that there is no reliability need for such conversion. Additionally, BPA observations and suggestions: a. The purpose statement of MOD-001 be modified as fo 890-A: Purpose: To ensure the consistent and transparent application and documentati used in the calculation of Available Transfer Capability (ATC) or Available Flowgate Cap listed for all requirements should include the "Long-term Planning" Horizon, as ATC or seasonal window. c. Balancing Authorities may be appropriately identified as Applicable request that the Standards Drafting Team provide an explanation as to why they are n |
| | Individual | Alice Druffel | Xcel Energy | | | Yes - definitions are acceptable as revised | | | 1) R3.6.3 Need to strike "that are unrecognized". The term "unrecognized" is problematic and vague. 2) R3.2.2 Please clarify what you mean by "defined accounting". 3) R3.3 | Yes | | Yes | | We feel that the applicability of this standard as proposed is problematic. We also do n is resolved by choosing either the TOP or TSP. While it is not a perfect solution, we feel applicability to remain at the regional level. We suggest the following wording: "Region its members". |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | MRO NERC Standards Review Subcommittee | Tom Mielnik | No - one or more definitions needs revision - see comments | The MRO supports the changes to the definitions. However, the MRO believes there is a need to define "counterflows". The MRO suggests that the SDT consider the following definition for Counterflows: "Counterflows are net impacts on a path or flowgate as determined by the Transmission Service Provider and specified in the appropriate implementation document." Capitalize "Existing Transmission Commitments" in the Available Transfer capability definition, since it is a defined term. | Transmission Service Provider | media via how the Transmission Service Provider notifies the following entities. However, if the issue is that the SDT believes that there must be a record of the notification, the MRO suggests that the words "in writing" be used allowing the Transmission Service Provider to determine the media of notification. 3. The MRO believes that R8 should also be revised to refer to "ATC or AFC" rather than just "ATC". 4. The MRO believes that R5 should be revised to delete the words "all of". The phrase "all of" seems to be unnecessary and may result in over-the-top auditing. 5. The MRO believes that the changes made to R6 are a significant improvement to the standard and commends the SDT on taking this more reasonable approach to consistency, that is "no more limiting than those used in planning of operations." 6. The MRO believes that R9 should be revised to delete the words "any" from "Within thirty calendar days of receiving a request by any Transmission Service Provider…". R9 should be revised to delete the words "all" from "Unit commitments and order of dispatch, to include all designated network resources…". R9 should be revised to delete the words "Any" from the phrase "Any firm and non-firm adjustments…". R9 should be revised to delete the words "Any" from the phrase "Any other services that that impact …..". R9 should be revised to delete the word "all" from "Values of CBM and TRM and TTC for all ATC [paths or Flowgates." R9 should be revised to delete "any" from the phrase "any Flowgates considered by the Transmission Service | Yes | The MRO commends the SDT in the changes made to VRFs to Lower. The MRO agrees that these changes puts the VRFs more in line with the NERC's definitions of the VRF levels. | Yes | | 1. The MRO commends the SDT in making significant changes to this standard and reis believes the eventual standard that is approved will serve the industry and customers b believes that the first time you use an abbreviation or acronym, you must spell out the abbreviation or acronym in brackets. Subsequent use of the term is then made by its a Transmission Operator shall select one Available Transfer Capability (ATC) methodolog Interchange methodology, Rated System Path methodology) or Available Flowgate Cap methodology) for each ATC Path per time period identified in R2 for those Facilities wit Area." R3.3 – last line should read: …calculating ATC or AFC. R3.4 – last line should re – Each bullet should read: …allocate ATC or AFC… R6 and R7 – Overall, both requireme MRO asks that the standards drafting team specify what assumptions are referenced o Also the MRO objects the requirement to use assumptions that are no more limiting in result in potentionally onorous calcualations to determine assumtions that meet this lin requirements are covered by FERC order #890 anyway. R9 – Please expand/clarify the specific aggregated firm capacity is being referenced? Capacity in ETC for each flowgat example would be very beneficial. R9 – The 13th bullet should read: "Values of Capaci Transmission Reliability Margin (TRM),and TTC for all ATC Paths or (TFC) for Flowgates should read: "Alternatively the Transmission Operator may demonstrate that the same TTC or TFC…" |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | Provider receiving the request..." R9 should be revised to delete the word "all" from the phrase "Values of TTC and ATC for all ATC Paths for those...". These uses of "any" and "all" seem to be unnecessary and may result in over-the-top auditing. 7. The MRO believes comparable changes should be made to deleting "all" and "any" in the Measures, the Compliance section, and the Violations Severity Levels to match the changes to R9. 8. R3.6.3 Need to strike "that are unrecognized". The term "unrecognized" is problematic and vague. 9. R3.2.2 Alternate language for the statement "a rationale for the defined accounting" A suggestion to use counterflow process instead. 10. R3.3 There is a typo. Please change "of" to "or". | | | | | |
| | | | | | | | | | R3.3 - Replace "--- transfer of Flowgate capability." by "--- transfer or Flowgate capability." R3.6.3 - Entergy is not sure what the parenthetical is implying, specifically the phrase, "that are unrecognized." In addition, Entergy proposes that rather than processing of outages, it should refer to modeling of outages in ATC calculations, therfore, replace "processed" by "modeled". R6 and R7 - The phrase "planning of operations" may be better understood if the term "reliability" was inserted at the beginning. We assume that the SDT is trying to tie the reliability planning studies/activities to the ATC calculations. Similar terms are used in MOD-030. (This also raises the question of why it is in MOD-030 and not MOD-028 and MOD-029.) If all instances can use the same phrase, we think the standards would benefit from the standardization. R8.1 needs to be | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Group | | | Entergy Services Inc | Narinder K. Saini | Yes - definitions are acceptable as revised | Revised definitions are acceptable | Transmission Operator | worded as requirement rather than giving allowance/exemption from the requirement for 80 hours (approx 1% of 8760 hours) in a calendar year. Entergy recommends the language "Hourly values, once per hour at least 99% of hours every calendar year." R9 - This requirement is for sharing the data by TSP with others who need it for calculation of their ATCs. This requirement is not to replace the requirement of Order 889 37.6(b)(2)(ii) "On request, the Responsible Party must make all data used to calculate ATC and TTC for any constrained posted paths publicly available (including the limiting element(s) and the cause of the limit (e.g., thermal, voltage, stability)) in electronic form within one week of the posting. The information is required to be provided only in the electronic format in which it was created, along with any necessary decoding instructions, at a cost limited to the cost of reproducing the material." If it can be emphasized this fact, it will greatly clarify some confusion that some stakeholders are having regarding data sharing. | Yes | | Yes | | The effective date info provided in the standards posted indicate that all 5 standards sh<br>seems that MOD-004 should also be a part of the set becoming effective. CBM is refere<br>R3.2.2.2 The term "accounting" implies bookkeeping and dollars - obviously not sometl<br>reliability standard. We suggest adding some clarification to this requirement to ensure<br>audiences: "A rationale stating how counterflows are accounted for." R3.3 Change "of"<br>do not feel that it is prudent to use switching operating guides and load shedding, etc t<br>even suggest these in M7 seems misguided and in conflict with the current draft of the<br>a grace period similar to R8.1 to account for unforeseen system emergencies where the<br>technology issues. |
| Individual | Ron Falsetti | Ontario IESO | | | Yes - definitions are | | Transmission Service | We have the following comments on specific requirements: 1. R3.6.3: This subrequirement is too vague and its addition is not necessary. Subrequirements R3.6.1 and R3.6.2 suffice to hold the TSP responsible for considering the impact of outages in ATC calculation. How the outages are processed has no bearing on the ultimate scenarios (topologies) that the TSP must consider. 2. We do not agree with the changes made to R6 and R7. | Yes | | No | We have the following comments on the VSL: 1. R3: There is a potential overlap between High and Severe. For an ATCID does not include “two or more” of the information items in R3, it could mean does not include all of the information items. This is the same condition as a Severe. We | We do not see the role of TOP in this standard. The TOP’s primary responsibility is to o<br>area in a reliable manner, and determine SOLs and where necessary, transmission tran<br>capabilities (where applicable). Given the established SOLs, TTCs, TFCs that are determ<br>planning, and the TTCs and TFCs determined by other entities such as the RCs, TPs an<br>different time frames, the TSP needs only to calculate ATCs (or AFCs) respecting these |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | acceptable as revised | | Provider | By “no more limiting than” the assumptions used in planning of operations for the same time period, it would imply that the TOP and TSP may use less restrictive (or more liberal) assumptions. The results could be that the TTCs and ATCs are higher than the planned operational parameters, giving rise to potential unreliability. We do not see a problem with the previous wording of “consistent with”, and this should be reinstated. | | | | suggest to reword the High VSL to “does not include up to 2 of the information items in R3”; and the Severe VSL to “or its ATCID does not include 3 or more of the information described in R3”, or numbers along that line. 2. We do not agree with the VSLs for R6 and R7 for reasons noted above. | so, it should be able to select an ATC calculation method to suit its business model and the basis of the TTCs and TFCs that affect its service area. With this in mind, we sugge that the TSP be the one who selects the ATC method and R1 should be revised accordi be assumed that the TOP area and the TSP area are the same and hence the basis of t TSP's area may differ from one part to another. |
| | Individual | Alessia Dawes | Hydro One Networks | | | Yes - definitions are acceptable as revised | | Transmission Service Provider | There are 2 methodologies listed in R1. Are these the only two from which we have to choose? We suggest rewording the requirement to avoid this confusion by inserting the words "for example". In R6 and R7, we prefer the previous wording "consistent with" instead of "no more limiting" as the new wording may result in the use of less restrictive assumptions and hence give rise to potential unreliability. | Yes | | No | For the severe VSL for R2 keep consistent the wording as per the other levels. The Lower, Moderate, and High VSLs for R4 are missing the words "did not". | In requirement 8, if the 80 days grace period is to account for software outages then s else entities may interpret the requirement as applicable to outages other then softwa |
| | | | | | | | | | Modification to Requirement 1: Each Transmission Operator shall select a methodology for calculating ATC or AFC for each ATC Path or Flowgate for each time period identified in Requirements 2.1 - 2.3 for those Facilities within its Transmission Operators Area. Modifications to 2.2 Daily values for at least the next 31 calendar days (Following the 48 Hours specified in R2.1) Modification to 2.3 Monthly values for at least the next 12 months (Following the 31 Calendar days specified in R2.2) Modification to R3: Each TSP shall prepare and keep current an ATCID that includes the following information. (The Phrase "at a minimum" is unnecessary because the TSP | | | | | |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Jason Shaver | American Transmission Company | | | No - one or more definitions needs revision - see comments | Capitalize "Existing Transmission Commitments" in the Available Transfer capability definition, since it is a defined term. We do not believe that the SDT has to provide a definition of ATCID. Requirement 3 outlines the specifics of ATCID and we find the definition unnecessary. The SDT should explain why this definition is necessary. | Transmission Operator | must comply with the sub-requirements. Any additional information is beyond the requirements and therefore not subject to NERC's audit.) Starting in Requirement 3.3 the phrase "transfer or Flowgate capability" is used. Does this phase equate to ATC and AFC where ATC is equal to transfer capability and AFC is equal to Flowgate capability? We would prefer that the SDT remain consistent and use the phrase "ATC or AFC if the phrases are equal. In Requirement 3.3 did the SDT mean "transfer or Flowgate capability" or "transfer of Flowgate capability"? The requirement currently uses the "of" word. In order to maintain a consistent use of the phrase "ATC or AFC" we suggest the following change to Requirement 3.6. "A description of how outages are considered in ATC or AFC calculations including:" The SDT should explain any disagreement with our suggested modification. R5 should be revised to delete the words "all of" to avoid being overly inclusive. R6 should be revised to "no more limiting than those used in the planning of operations." Modifications to R8: The TSP shall recalculate ATC or AFC on the following frequency, unless none of the calculated values identified in the ATC or AFC equations have changed. Question to R8.1: How will the 80 hours per calendar year be calculated? (Does a non-calculation period that is exempt in Requirement 8 count to the 80 hours?) R9 should be revised to eliminate "any" and "all" to avoid being overly inclusive: (1) delete the words "any" from "Within thirty calendar days of receiving a request by any | Yes | | Yes | | The first time that each abbreviation or acronym is introduced, the full terminology sho abbreviation or acronym in brackets (i.e. ATC, AFC, TTC, and TFC). The SDT should prc what would be the proposed effective data of this standard. FERC has justification over operators of the BPS and following their approval the standard would become "enforcea even in the US these standards will not become "enforceable" until all regulatory autho have approved this set of standards? If this is the case how would NERC insure such a |
