# Exhibit C

The complete development record of the proposed Reliability Standards

**ATC/TTC/AFC and CBM/TRM Revisions (Project 2006-07)**
Registered Ballot Body | Related Files | Drafting Team Rosters

**Status**
The drafting team is posting a new SAR and a new proposed version of MOD-030-2, and implementation plan, for a 45-day comment period beginning August 12, 2008. At the same time, the drafting team posted its consideration of the comments it received on the initial ballots for MOD-001-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1 and is proceeding to a recirculation ballot beginning August 12, 2008.

**Purpose/Industry Need**
Requirements 2 and 11 of MOD-030-01 will be modified.

**Status**
The drafting team has posted its consideration of the comments received from the posting of MOD-004 and is posting the standards and associated implementation plan for a 30-day pre-ballot review beginning August 12, 2008

The drafting team has posted the initial ballot results for MOD-001, MOD-008, MOD-028, MOD-029, and MOD-030 and will be considering the comments received with ballots.

The drafting team has posted its consideration of comments from the posting of the MOD standards and the next draft for a 30-day pre-ballot review beginning June 20, 2008.

**Purpose/Industry Need**
The ATC/TTC/AFC Revision SAR proposes changing MOD-001-0 by adding a requirement for transmission providers to coordinate the calculation of ATC and requires that specific reliability practices be incorporated into the ATC calculation and coordination methodologies. Such changes will enhance the reliable use of the transmission system without needlessly limiting commercial activity. This request adds a requirement for documentation of the methodologies used to coordinate ATC. In addition, a requirement is added for the enhanced documentation of the calculation methodology.

The CBM/TRM Revisions SAR proposes changing existing standards on TRM to require crisp and clear documentation of the calculation of TRM and make various components of the methodology mandatory so there is more consistency across methodologies.

## Standard Authorization Request Form

| | |
|---|---|
| Title of Proposed Standard | CBM/TRM Revisions |
| Request Date: | revised June 16, 2005 |

| **SAR Requestor Information** | | **SAR Type** (Put an 'x' in front of one of these selections) |
|---|---|---|
| Name Long Term AFC/ATC Task Force (LTATF) | ☐ | New Standard |
| Primary Contact ltatf@nerc.com | ☒ | Revision to existing Standard |
| Telephone<br>Fax | ☐ | Withdrawal of existing Standard |
| E-mail | ☐ | Urgent Action |

**Purpose/Industry Need** (Provide one or two sentences)

The existing standards on TRM should be revised to require crisp and clear documentation of the calculation of TRM and make various components of the methodology mandatory so there is more consistency across methodologies.

NOTE: the LTATF passed the following strawman by a vote of 15 to 2:

*Because the LTATF debated at length the merits of CBM calculation and utilization, the LTATF asks the SAR Drafting Team (SAR DT) to consider whether the calculation and/or withholding of CBM as an explicit quantity is necessary for reliability and should be part of a reliability standard.* (**please also see appendix F to the Final LTATF report**)

If however, the industry still considers CBM to be necessary, the SAR DT is asked to consider the following recommendations:

The existing standards on CBM should be revised to require crisp and clear documentation of the calculation of CBM and make various components of the methodology mandatory so there is more consistency across methodologies.

### *Reliability Functions*

| **The Standard will Apply to the Following Functions** *(Check box for each one that applies by double clicking the grey boxes.)* | | |
|---|---|---|
| ☐ | Reliability Authority | Ensures the reliability of the bulk transmission system within its Reliability Authority area. This is the highest reliability authority. |
| ☐ | Balancing Authority | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time |
| ☐ | Interchange Authority | Authorizes valid and balanced Interchange Schedules |
| ☐ | Planning Authority | Plans the bulk electric system |
| ☐ | Resource Planner | Develops a long-term (>1year) plan for the resource adequacy of specific loads within a Planning Authority area. |
| ☐ | Transmission Planner | Develops a long-term (>1 year) plan for the reliability of transmission systems within its portion of the Planning Authority area. |
| ☒ | Transmission Service Provider | Provides transmission services to qualified market participants under applicable transmission service agreements |
| ☐ | Transmission Owner | Owns transmission facilities |
| ☐ | Transmission Operator | Operates and maintains the transmission facilities, and executes switching orders |
| ☐ | Distribution Provider | Provides and operates the “wires” between the transmission system and the customer |
| ☐ | Generator Owner | Owns and maintains generation unit(s) |
| ☐ | Generator Operator | Operates generation unit(s) and performs the functions of supplying energy and Interconnected Operations Services |
| ☐ | Purchasing-Selling Entity | The function of purchasing or selling energy, capacity and all necessary Interconnected Operations Services as required |
| ☐ | Market Operator | Integrates energy, capacity, balancing, and transmission resources to achieve an economic, reliability-constrained dispatch. |
| ☐ | Load-Serving Entity | Secures energy and transmission (and related generation services) to serve the end user |

**<u>Applicability to be determined by SAR DT</u>.**

### *Reliability and Market Interface Principles*

| **Applicable Reliability Principles** *(Check boxes for all that apply by double clicking the grey boxes.)* | |
|---|---|
| ☒ | 1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards. |
| ☐ | 2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand. |
| ☒ | 3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| ☐ | 4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented. |
| ☒ | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems. |
| ☒ | 6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified and have the responsibility and authority to implement actions. |
| ☐ | 7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis. |

| **Does the proposed Standard comply with all of the following Market Interface Principles?** *(Select 'yes' or 'no' from the drop-down box by double clicking the grey area.)* |
|---|
| 1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes |
| 2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes |
| 3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes |
| 4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes |
| 5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes |

**Detailed Description** (Provide enough detail so that an independent entity familiar with the industry could draft, modify, or withdraw a Standard based on this description.)

**LTATF proposed changes are highlighted in green**

**SUGGESTED REVISIONS to MOD-004-0**

R1. Each group of transmission service providers/and or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region shall jointly develop and document a CBM methodology. This methodology shall be available to NERC, the Regions, and the stakeholders in the electricity market.

If a RRO's members CBM values are determined by a RTO or ISO, then a jointly developed regional methodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a jointly developed regional methodology.

Each transmission provider not associated with an RTO or ISO shall comply with the methodology jointly developed within its respective reliability region.

Each CBM methodology shall (S1):

R1.1 Specify that the method used to determine generation reliability requirements as the basis for CBM shall be consistent with the respective generation planning criteria.

R1.2 Specify the frequency of calculation of the generation reliability requirement and associated CBM values.

- Require that the calculations must be verified at least annually.
- Require that the dates seasonal CBM values apply must be specified.

R1.3 Require that generation unit outages considered in a transmission provider's CBM calculation be restricted to those units within the transmission provider's system.

**SAR DT should discuss whether CBM should be an explicit reservation and how/if it would be made a requirement. Also, whether the reservations would be a business practice?**

R1.4 Require that CBM be preserved only on the transmission provider's system where the load serving entity's load is located (i.e., CBM is an import quantity only).

**SAR DT should discuss whether there could be a reciprocal agreement for the use of CBM.**

R1.5 Describe the inclusion or exclusion rationale in the CBM calculation for generation resources of each LSE including those generation resources not directly connected to the transmission provider's system but serving LSE loads connected to the transmission provider's system. The following rationale must be included in all methodologies:

R1.5.1 All generation directly connected to the transmission provider's system being used to serve load directly connected to that system will be considered in the CBM requirement determination.

R1.5.2 The availability of generation not directly connected to the transmission provider's system being used to serve load directly connected to that system would be considered available per the terms under which it was arranged.

R1.6 Describe the inclusion or exclusion rationale for generation connected to the transmission provider's system ~~but not obligated to serve Native/Network Load connected to the TSP's system~~. The following rationale must be included in all methodologies:

R1.6.1 The following units shall be included in the CBM requirement determination because they are considered to be the installed generation capacity, committed to serve load, directly connected to the transmission system for which the CBM requirement is being determined:

i. Generation directly connected to the transmission provider's system but not obligated to serve load directly connected to that system, will be incorporated into the CBM requirement determination as follows:

1. Generation directly connected to the transmission provider's system, but committed to serve load on another system, will not be included in the CBM requirement determination for the transmission system to which the generator is directly connected. (**Note to SAR DT – Ensure that this would be consistent with any pending resource adequacy SAR.) These units are not included because they are committed to serve load on another system and therefore not available to serve load on the system for which the CBM requirement is being determined**.)

2. Generation directly connected to the TSP's system, but not committed to serve load on any system, will be included in the CBM requirement determination for the transmission system to which the generator is directly connected as follows:

The TSP will use the best information available to them (i.e. confirmed or requested transmission service/no service) to determine how these units should be considered in the CBM requirement determination. All assumptions made must be documented and approved by the entity responsible for the methodology.

R1.4 Describe the formal process and rationale for the RRO to grant any variances to individual transmission providers from the Regional CBM methodology.

R1.6.1 Require any variances must also be approved by NERC or its designate.

R1.5 Specify the relationship of CBM to the generation reliability requirement and the allocation of the CBM values to the appropriate transmission facilities. The sum of the CBM values allocated to all interfaces shall not exceed that portion of the generation reliability requirement that is to be provided by outside resources.

R1.6 Describe the inclusion or exclusion rationale for the loads of each LSE, including interruptible demands and buy-through contracts (type of service contract that offers the customer the option to be interrupted or to accept a higher rate for service under certain conditions).

R1.7 Describe any adjustments to CBM values to account for generation reserve sharing arrangements (i.e. Use of CBM and a reserve sharing event simultaneously occurring that is not planned for). Explain how the simultaneous application of CBM and TRM amounts being implemented in the ATC calculations are being taken into consideration during the planning process.

**SAR DT should consider paragraph below:**

R1.8 Require that CBM be based on the required or recommended planning reserve. In other words, a load serving entity that does not arrange for resources at least equal to the recommended or required planning reserve levels does not benefit by causing a higher CBM.

**The SAR DT should consider the option below:**

R1.9 Require that the appropriate entities will plan and reinforce the transmission system for the amount of CBM being preserved.

R2. The ~~RRO's~~ most recent version of the documentation of each entity's CBM methodology shall be available on a web site accessible by NERC, the RROs, and the stakeholders in the electricity market.

M3. Each RRO, in conjunction with its members, shall develop and implement a procedure to review the CBM calculations and values of member transmission providers to ensure that they comply with the Regional CBM methodology and are periodically updated (at least annually) and available to stakeholders. Documentation of the results of the most current Regional reviews shall be provided to NERC or its designate within 30 days of completion.

- The RRO must review and approve the TSP methodology to ensure it is consistent with the RRO's Planning Criteria. The TSP is responsible for ensuring that CBM calculations are consistent with the individual TOs planning criteria.

**Question for SAR DT - Would the above be applicable to the Planning Authority?**

-----------------------------------------------

**REVISIONS to MOD-005-0**

R1. Each Regional Reliability Organization, in conjunction with its members, shall develop and implement a procedure to review (at least annually) the CBM calculations and the resulting values of member Transmission Service Providers ~~to ensure that they comply with the Regional Reliability Organization's CBM methodology~~. The CBM review procedure shall ~~include the following four requirements~~:

R1.1 Indicate the frequency is at least annual, under which the verification review shall be implemented.

R1.2 Require review of the process by which CBM values are updated, and their frequency of update, to ensure that the most current CBM values are available to stakeholders.

R1.3 Require review of the consistency of the transmission provider's CBM components with its published planning criteria. A CBM value is considered consistent with published planning criteria if the same components that comprise CBM are also addressed in the planning criteria. The methodology used to determine and apply CBM does not have to involve the same mechanics as the planning process, but the same uncertainties must be considered and any simplifying assumptions explained. It is recognized that ATC determinations are often time constrained and thus will not permit the use of the same mechanics employed in the more rigorous planning process. The procedure must specify how the consistency would be verified.

**The SAR DT should consider the options below:**

R1.3.1 Require verification that the appropriate entities are planning and reinforcing the transmission system for the amount of CBM being preserved. The procedure must specify how the verification would be determined. Transmission service providers must also perform this verification and report on the findings as specified below.

R1.4 Require CBM values to be updated at least annually and available to the Regions, NERC, and stakeholders in the electricity markets.

R2. The documentation of the Regional CBM procedure shall be available to NERC on request (within 30 days).

R3. Documentation of the results of the most current implementation of the procedure shall be sent to NERC within 30 days of completion.

**REVISIONS to MOD-006-0**

**Note to SAR DT: Use of CBM should be addressed under business practices and not be part of this standard - consider the withdrawal of MOD-006-0 and transfer to NAESB.**

**REVISIONS to MOD-008-0**

R1. Each group of transmission service providers/and or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region in conjunction with its members, shall jointly develop and document a TRM methodology. This methodology shall be available to NERC, the Regions, and the transmission users in the electricity market. If a RRO's members TRM values are determined by a RTO or ISO, than a jointly developed regional methodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a regional methodology.

Each TRM methodology shall:

R1.1 Specify the update frequency of TRM calculations.

- Require that calculations be verified at least annually if determined to be required
- Require that dates that seasonal TRM values apply must be specified

R1.2 Specify how TRM values are incorporated into ATC calculations.

R1.3 Specify the uncertainties accounted for in TRM and the methods used to determine their impacts on the TRM values. The following components of uncertainty, if applied, shall be accounted for solely in TRM and not CBM:

R1.3.1 aggregate load forecast error (not included in determining generation reliability requirements).
R1.3.2 load distribution error.
R1.3.3 variations in facility loadings due to balancing of generation within a Balancing Authority Area.
R1.3.4 forecast uncertainty in transmission system topology.
R1.3.5 allowances for parallel path (loop flow) impacts.
R1.3.6 allowances for simultaneous path interactions.
R1.3.7 variations in generation dispatch
R1.3.8 short-term operator response (operating reserve actions not exceeding a 59-minute window).
R1.3.9 Any additional components of uncertainty shall benefit the interconnected transmission systems, as a whole, before they shall be permitted to be included in TRM calculations.
R1.3.10 Additional detail on how variations in generation dispatch are handled from intermittent generation sources such as wind and hydro, need to be provided.

R1.4 Describe the conditions, if any, under which TRM may be available to the market as Non-Firm Transmission Service.

R1.5 Describe the formal process for the granting of any variances to individual transmission service providers from the regional TRM methodology.

R1.5.1 Any variances must also be approved by NERC or its designate

R1.6 Describe the methodology and conditions thereof that are used to reflect if TRM is reduced for the operating horizon.

R1.7 Explain how the simultaneous application of CBM and TRM amounts being implemented in the ATC calculations are being taken into consideration during the planning process.

**SAR DT should consider paragraph below:**

R1.8 Specify TRM methodologies and values must be consistent with the approved planning criteria.

R1.8.1 Require that the appropriate entities will plan and reinforce the transmission system for the amount of TRM being preserved. The methodology must specify how the verification of the consistency would be determined.

R1.8.2 Each TRM methodology shall address each of the items above and shall explain its use, if any, in determining TRM values. Other items that are entity specific or that are considered in each respective methodology shall also be explained along with their use in determining TRM values.

**REVISIONS to MOD-009-0**

R1. Each group of transmission service providers/and or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region , in conjunction with its members, shall develop and implement a procedure to review the TRM calculations and resulting values of member transmission providers to ensure that they comply with the regional TRM methodology and are updated at least annually and available to transmission users.

**The SAR DT should consider ways to ensure adherence with the paragraph below:**

- The RRO must review and approve the transmission service provider(s)' methodology to ensure it is consistent with the RRO's Planning Criteria. The RRO is responsible for ensuring that TRM calculations are consistent with the individual TOs planning criteria.

The TRM review procedure shall:

R1.1 Indicate the frequency is at least annual, under which the verification review shall be implemented.

R1.2 Require review of the process by which TRM values are updated, and their frequency of update, to ensure that the most current TRM values are available to stakeholders.

R1.3 Require review of the consistency of the transmission service provider's or Transmission Owner's TRM components with its published planning criteria. A TRM value is considered consistent with published planning criteria if the same components that comprise TRM are also addressed in the planning criteria. The methodology used to determine and apply TRM does not have to involve the same mechanics as the planning process, but the same uncertainties must be considered and any simplifying assumption explained. It is recognized that ATC determinations are often time constrained and thus will not permit the use of the same mechanics employed in the more rigorous planning process. The review process used by a transmission service provider or transmission owner also needs to be documented.

R1.3.1 Explain how the simultaneous application of CBM and TRM amounts being implemented in the ATC calculations are being taken into consideration during the planning process.

SAR DT to review paragraph below:

R1.4 TRM methodologies and values must be consistent with the applicable planning criteria

- The methodology must specify how the verification of the consistency would be determined

R2. The documentation of the regional TRM procedure shall be available to NERC on request (within 30 days). Documentation of the results of the most current implementation of the procedure shall be available to NERC within 30 days of completion.

R3. Documentation of the results of the most current regional reviews shall be provided to NERC within 30 days of completion.

R4. Require TRM values to be verified at least annually and made available to the RROs, NERC, and stakeholders.

## Standard Authorization Request Form

| | |
|---|---|
| Title of Proposed Standard | ATC/TTC/AFC Revisions |
| Request Date | Revised June 16, 2005 |

| **SAR Requestor Information** | **SAR Type** (Put an 'x' in front of one of these selections) | |
|---|---|---|
| Name Long Term AFC/ATC Task Force (LTATF) | ☐ | New Standard |
| Primary Contact LTATF@nerc.com | ☒ | Revision to existing Standard |
| Telephone<br>Fax | ☐ | Withdrawal of existing Standard |
| E-mail | ☐ | Urgent Action |

**Purpose/Industry Need** (Provide one or two sentences)

This request changes existing modeling standard(s) by adding a requirement for transmission providers to coordinate the calculation of ATC and requires that specific reliability practices be incorporated into the ATC calculation and coordination methodologies. Such changes will enhance the reliable use of the transmission system without needlessly limiting commercial activity. This request adds a requirement for documentation of the methodologies used to coordinate ATC. In addition, a requirement is added for the enhanced documentation of the calculation methodology.

### *Reliability Functions*

| **The Standard will Apply to the Following Functions** *(Check box for each one that applies by double clicking the grey boxes.)* | | |
|---|---|---|
| ☐ | Reliability Authority | Ensures the reliability of the bulk transmission system within its Reliability Authority area. This is the highest reliability authority. |
| ☐ | Balancing Authority | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time |
| ☐ | Interchange Authority | Authorizes valid and balanced Interchange Schedules |
| ☐ | Planning Authority | Plans the bulk electric system |
| ☐ | Resource Planner | Develops a long-term (>1year) plan for the resource adequacy of specific loads within a Planning Authority area. |
| ☐ | Transmission Planner | Develops a long-term (>1 year) plan for the reliability of transmission systems within its portion of the Planning Authority area. |
| ☒ | Transmission Service Provider | Provides transmission services to qualified market participants under applicable transmission service agreements |
| ☐ | Transmission Owner | Owns transmission facilities |
| ☐ | Transmission Operator | Operates and maintains the transmission facilities, and executes switching orders |
| ☐ | Distribution Provider | Provides and operates the “wires” between the transmission system and the customer |
| ☐ | Generator Owner | Owns and maintains generation unit(s) |
| ☐ | Generator Operator | Operates generation unit(s) and performs the functions of supplying energy and Interconnected Operations Services |
| ☐ | Purchasing-Selling Entity | The function of purchasing or selling energy, capacity and all necessary Interconnected Operations Services as required |
| ☐ | Market Operator | Integrates energy, capacity, balancing, and transmission resources to achieve an economic, reliability-constrained dispatch. |
| ☐ | Load-Serving Entity | Secures energy and transmission (and related generation services) to serve the end user |

Pending resolution of the FMSCTF, might also apply to Transmission Planner and Planning Authority and Reliability Regions.

### *Reliability and Market Interface Principles*

| **Applicable Reliability Principles** *(Check boxes for all that apply by double clicking the grey boxes.)* | |
|---|---|
| ☒ | 1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards. |
| ☐ | 2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand. |
| ☒ | 3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| ☐ | 4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented. |
| ☐ | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems. |
| ☒ | 6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified and have the responsibility and authority to implement actions. |
| ☐ | 7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis. |

| **Does the proposed Standard comply with all of the following Market Interface Principles?** *(Select 'yes' or 'no' from the drop-down box by double clicking the grey area.)* |
|---|
| 1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes |
| 2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes |
| 3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes |
| 4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes |
| 5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes |

**Detailed Description** (Provide enough detail so that an independent entity familiar with the industry could draft, modify, or withdraw a Standard based on this description.)

Definitions of Terms used in standard:

The Drafting Team should finalize the definitions for TTC, ATC, AFC.

The Drafting Team should finalize the criteria for determining flowgates

The Drafting Team should add a requirement for transmission providers to coordinate the calculation of ATC and require that specific reliability practices be incorporated into the ATC calculation and coordination methodologies.

The Drafting Team should add a requirement for the enhanced documentation of the ATC calculation methodology.

Strawman Definitions from LTATF are contained in the Appendix:

----------------------------------------------------------------------

**Additions/changes from existing standard in green, recommended by LTATF**

**B. Requirements**

MOD-001-0 Requirement 1 (R1). Each group of transmission service providers/and or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region, shall jointly develop and document a TTC and ATC (which may include the calculation of AFC) methodology.

> If the transmission service providers/and or AFC/ATC/TTC calculators' AFC, TTC and ATC values are determined by a RTO or ISO, then a jointly developed regional methodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a jointly developed regional methodology.
>
> Each transmission provider not associated with an RTO or ISO shall comply with the methodology jointly developed by the group of transmission service providers/and or AFC/ATC/TTC calculators within its respective reliability region.
>
> This methodology shall be available to NERC, the Regions, and the stakeholders in the electricity market.

Each TTC and ATC methodology shall:

R1.1 Include a narrative explaining how TTC and ATC values are determined and in evaluating a transmission service request and made available to customers. In addition, an explanation for all items listed here must also be included of any process that produces values that can override the TTC, AFC and ATC values.

R1.2 Account for how the reservations and schedules for firm (non-recallable) and non-firm (recallable) transfers, both within and outside the transmission provider's system, are included. An explanation must be provided on how reservations that exceed the capability of the specified source point are accounted for. (e.g. 500 MW of transmission service exists in each of three directions sourced from a generator with a capacity of 500 MW).

R1.3 Account for the ultimate points of power injection (sources) and power extraction (sinks) in TTC and ATC calculations. Source and sink points are further defined in the Source and Sink Points white paper contained in Appendix B of the Final LTATF Report.

R1.4 Describe how incomplete or so-called partial path transmission reservations are addressed. (Incomplete or partial path transmission reservations are those for which all transmission reservations necessary to complete the transmission path from ultimate source to ultimate sink are not identifiable due to differing reservation priorities, durations, or that the reservations have not all been made.)

R1.5 Require that ATC values and postings be updated at a minimum frequency to assure proper representation of the transmission system. These values will be made available to stakeholders at a similar frequency.

R1.6 Indicate the treatment and level of customer demands, including interruptible demands.

R1.7 Require that the data listed below, and other data needed by transmission providers for the calculation of TTC and ATC values are shared and used. Entities requiring data should request the data as needed. (SAR DT to determine to whom this applies, who supplies – who uses). In addition, specify how this information is coordinated and used to determine TTC and ATC values. If some data is not used or coordinated, provide an explanation. The required minimum update frequency[1] for each item is listed below:

R1.7.1 **Generation Outage Schedules**: Minimum 13 month time frame includes all generators (SAR DT to determine MW threshold) used in the ATC/AFC calculation). The update frequency is daily.

R1.7.2 **Generation dispatch order**: generic dispatch participation factors on a control area/market basis. The update frequency is as required.

R1.7.3 **Transmission Outage Schedules**: Minimum 13 month time frame, updated daily for all bulk electric system facilities that impact ATC/AFC calculations; updated once an hour for unscheduled outages. (SAR DT should consider both pending and approved outages)

R1.7.4 **Interchange Schedules** : The update frequency is hourly.

[1] The update frequency specified should allow for improvements in technology, communication, etc, that might better represent actual system conditions.

R1.7.5 **Transmission Reservations**: The update frequency is daily.

R1.7.6 **Load Forecast**: supplied via the SDX(or similar method), includes hourly data or peak with profile for the next 7-day time frame. The update frequency is daily. **In addition, daily peak for day 8 to 30 updated at least daily, and monthly for next 12 months updated monthly.**

R1.7.7 **Flowgate AFC:** Firm and non-firm AFC values will be exchanged between entities that have coordination agreements. Unless otherwise specified in the coordination agreement, the minimum update frequency is as follows: Hourly AFC once-per-hour, Daily AFC once-per-day and Monthly AFC once-per-week.

R1.7.8 **Flowgate rating**: Seasonal flowgate ratings will also be provided. Updated as required.

R1.7.9 **Calculation model**: Updated model will be made available to neighboring/affected calculators.

R1.7.10 Flowgates and flowgate definitions/criteria should be exchanged with neighboring/affected calculators on a seasonal basis, or more often as required to represent actual system conditions.

**(SAR DT should discuss establishing defined criteria for establishing flowgates consistent with regional operating and planning practices)**

R1.8 Describe how the assumptions for and the calculations of TTC and ATC values change over different time (such as hourly, daily, and monthly) horizons.

R1.9 Describe assumptions used for positive impacts and counterflow of transmission reservations, including the basis for the assumptions.

R1.10 Describe assumptions used for generation dispatch for both external and internal systems for base case dispatch and transaction modeling, including the basis for the assumptions.

R1.11 Ensure that the TTC/ATC calculations are consistent with the Transmission Owner's/Transmission Planner's (leave FM designation to SAR DT) planning and operating criteria. **(SAR DT: see Appendix E of final LTATF report dealing with consistency with planning criteria)**

R1.12 Describe the formal process for the granting of any variances to individual transmission providers from the jointly developed regional TTC/ATC methodology.

- Any variances must be approved by NERC or its designate

R2. The most recent version of the documentation of each TTC and ATC methodology shall be available on a web site accessible by NERC, the Regions, and the stakeholders in the electricity market.

R3. Each TTC and ATC methodology shall address each of the items listed above and shall explain its use in determining TTC and ATC values.

C. Measures.

~~M1. The Regional Reliability Organization shall provide evidence that its most recent TTC and ATC methodology documentation meets Reliability Standard MOD-001-0_R1.~~

~~M2. The Regional Reliability Organization shall provide evidence that its TTC and ATC methodology is available on a web site accessible by NERC, the Regional Reliability Organizations, and transmission users.~~

(**SDT to develop procedures for audit to ensure adherence to stated methodology**)

**Moved to appendix per suggestion from SAC**

# Appendix

**<u>Strawman Definitions from LTATF:</u>**

Total Transfer Capability (TTC):

TTC and ATC are defined in standard 1E1
Existing Transmission Commitments (ETC)
ATC is expressed as:
ATC = TTC – Existing Transmission Commitments ) – CBM – TRM

Flowgate is the name given to the transmission element(s) and associated contingency(ies) if any, that may limit transfer capability.

Flowgate Criteria – to be determined by SDT

Available Flowgate Capability (AFC)
AFC is expressed as:
AFC = [to be finalized by SARDT]

The relationship between ATC and AFC is as follows:

$ATC_{(\text{Path A-B})}=AFC_{(\text{Most Limiting Flowgate for Path A-B})}/\text{Distribution Factor}_{(\text{Path A-B on Limiting Flowgate})}$

Daily, Monthly, Yearly TTC
Daily, Monthly, Yearly ATC
Daily, Monthly, Yearly TRM
Daily, Monthly, Yearly CBM

**LTATF Suggested Audit Methodology**

M1. Each group of transmission service providers within a region, in conjunction with the members of that region, shall jointly develop and implement a procedure to review periodically (at least annually) and ensure that the TTC and ATC calculations and resulting values of member transmission providers comply with the Regional TTC and ATC methodology, the NERC Planning Standards, and applicable Regional criteria.

M2. A review to verify that the ATC/TTC calculations are consistent with the TO’s/TP’s planning criteria is also required. The procedure used to verify the consistency must also be documented in the report. Documentation of the results of the most current reviews shall be provided to NERC within 30 Days of completion.

M3. Each entity responsible for the TTC and ATC methodology, in conjunction with its members and stakeholders, shall have and document a procedure on how stakeholders can input their concerns or questions regarding the TTC and ATC methodology and values of the transmission provider(s), and how these concerns or questions will be addressed. Documentation of the procedure shall be available on a web site accessible by the Regions, NERC, and the stakeholders in the electricity market.

M4. The RRO must review and approve the ATC/TTC methodology to ensure it is consistent with the RRO's Planning and Operating Criteria.

The RRO is responsible for ensuring that TTC and ATC calculations are consistent with the individual TOs/TPs planning criteria.

Each procedure shall specify:

b) The name, telephone number, and email address of a contact person to whom concerns are to be addressed.

c) The amount of time it will take for a response.

d) The manner in which the response will be communicated (e.g., email, letter, telephone, etc.)

e) What recourse a customer has if the response is deemed unsatisfactory.

**SAR Comment Form**
**Proposed Revisions to Existing Standard Number MOD-001-0**
**and**
**Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0**

This form is to be used to submit comments on Draft 1 of two individual SARs: 1) Proposed Revisions to Existing Standard Number MOD-001-0 dealing with AFC/ATC/TTC; and 2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 dealing with CBM/TRM. Comments must be submitted by **August 08, 2005**. You may submit the completed form by emailing it to: sarcomm@nerc.com with the words "ATC/TTC/CBM/TRM Comments" in the subject line. If you have questions please contact Mark Ladrow at mark.ladrow@nerc.net or by telephone at 609-452-8060.

## Background Information:

The Long-Term AFC/ATC Task Force (LTATF) was formed to develop specific recommendations for the calculation and coordination of AFC/ATC with the goal of increasing market liquidity and enhancing grid reliability. The task force's work was coordinated with NAESB to separate business practices from reliability concerns. The LTATF evaluated the results of the short-term recommendations in the Alliant West area for summer 2004, and used this evaluation when considering whether to recommend the Alliant West short-term recommendations continue.

In developing their recommendations the LTATF considered the calculation for AFC/ATC, communication and coordination of AFC/ATC, and consistency between transmission planning and AFC/ATC calculations. A final LTATF report was presented to the Standing Committees in March 2005. The task force used the report and recommendations to develop proposed standards for ATC/TTC and CBM/TRM. The proposed "Modification to MOD-001-0 Documentation of ATC and TTC Calculation" SAR and "Modification to standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 SAR are the culmination[1] of the LTATF's work and is the subject matter for this Comment Form.

The SAC and the LTATF would like to receive industry comments on the scope and need for these two individual SARs. Accordingly, we request your comments included on this form, emailed to sarcomm@nerc.com with the subject "ATC/TTC/CBM/TRM Comments" by **August 7, 2005**.

1) Proposed Revisions to Existing Standard Number MOD-001-0 (AFC/ATC/TTC)

2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 (CBM/TRM)

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

**1. Is there a reliability need for the proposed standard?**

☐ Yes

☐ No

Comments:

**2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

☐ Yes

☒ No

Comments: The standard must state that aspects of the calculation ciritcal to the reliability be required in the methodologies. Some examples of the aspects critical to reliability are exchange and use of data, monitoring all critical flowgates and meeting a minimum frequency of calculation. These items and any others must be required in the methodologies. What method the ATC calculator uses to accomplish these critical aspects is up to them and therefore a standard method should not be required.

**3. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments:

**4. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**5. Do you agree with the list of entities to which the standard would apply?**

☒ Yes
☐ No

Comments:

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes
☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes
☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments: ATC/TTC SAR does not require a RTO or ISO to have a methodology that meets the requirements in this proposed standard. The followin wording changes (noted in CAPITALS) to section B-R1 are recommended.

MOD-001-0 Requirement 1 (R1). Each group of transmission service providers and/or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region shall pointly develop and document a REGIONAL TTC and ATC (which may include the calculation of ATC) methodology.

If the transmission service providors and/or AFC/ATC/TTC calculators' AFC, TTC, and ATC values are determined by RTO or ISO, then a jointly developed regional metodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a jointly developed regional methodology. A RTO OR ISO THAT CALCULATES AFC/ATC/TTC IS REQUIRED TO HAVE A WRITTEN METHODOLOGY DOCUMENT THAT MEETS THE REQUREMENTS SPECIFIED IN THIS STANDARD.

M2 needs to specify that RTOS AND ISOS WILL ALSO BE REQUIRED TO PERFORM THIS REVIEW OF CONSISTENCY WITH PLANNING CRITERIA AND DOCUMENT THE RESULTS. If this requrement is not added, ther is no check on the consistancy with planning criteria for members who are not under the regional methodology but under a RTO or ISO methodology.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes
☐ No
Comments:

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: Earlier in the development of this industry, there were predominately 'local' vertically integrated electric utilities. Each utiltiy built sufficient generation to serve its own load responsibility. Transmission interconnections with neighboring utilities were typically established for one of the following reasons:

First, to minimize duplication of trasmission (ie. tie to neighbor for trasmission reliability.)

Second, was an economic descision to build transmission instead of generation based on the generation reqliablity criteria the utility planned for (ie. tie to neighbor to meet generation reliability criteria.)

This second reason is the origin of the CBM concept. Transmission interconnections provide easch interconnected system with access to their neighbors so that in the event of an extreme generation outage within a utility, that temporarily generation deficient utility could have access to 'emergency' generation resources from their interconnected neighbors. CBM is the quantification of this use of the transmission system. Therefor CBM is an 'emergency' use transmission quantity and only 'exists' on the importing system for use only during periods of an emergency generation deficiency when firm transmission service is not available. Just as transmission capacity is preserved for the generation contingencies a utility planned for, transmission capacity is also preserved for the generation contingencies that are planned for. In either case, the utility constomers paid for the transmission capacity that was installed to maintain the reliability level that is planned for, via their rates for service.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments:

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**13. Do you agree with the list of entities to which the standard would apply?**

☒ Yes
☐ No

Comments:

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes
☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments: CBM/TRM SAR does not require a RTO or ISO to have a methodology that meets the requirements in this proposed standard. The following word changes (noted in CAPITALS) to section R1 of the CBM portion are recommended -

R1. Each group of transmission service providers/and or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region shall jointly develop and document a REGIONAL CBM methodology. This methodology shall be available to NERC, the Regions, and the stakeholders in the electricity market.

If a RRO's members CBM values are determined by a RTO or ISO, then a jointly developed regional methodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a jointly developed regional methodology.   A RTO OR ISO THAT CALCULATES CBM AND OR TRM IS REQUIRED TO HAVE A WRITTEN METHODOLOGY DOCUMENT THAT MEETS THE REQUIREMENTS SPECIFIED IN THIS STANDARD.

M4 needs to specify that THE RRO MUST REVIEW AND APPROVE THE  RTO OR ISO CBM METHODOLOGY TO ENSURE IT IS CONSISTENT WITH THE RRO'S PLANNING ABD OPERATING CRITERIA.  If this requirement is not added there appears to be no check of a RTO or ISO' ATC/TTC methodology.

CBM/TRM SAR does not require a RTO or ISO to have a methodology that meets the requirements in this proposed standard.  The following wording changes (noted in CAPITALS) to section  R1 of the TRM portion are recommended :

R1. Each group of transmission service providers/and or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region in conjunction with its members, shall jointly develop and document a REGIONAL TRM methodology. This methodology shall be available to NERC, the Regions, and the transmission users in the electricity market. If a RRO's members TRM values are determined by a RTO or ISO, than a jointly developed regional methodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a regional methodology.  A RTO OR ISO CALCULATES CBM AND OR TRM IS REQUIRED TO HAVE A  METHODOLOGY DOCUMENT THAT MEETS THE REQUIREMENTS SPECIFIED IN THIS STANDARD.

In addition, the  text in section R1 of the SAR needs to be revised to clarify that the following reviews are done by the RRO. First, the RRO needs to review the calculations of transmission providers under the regional methodology to ensure they are adhereing to the regional methodology.     Second, the RRO must review the transmission service provider(s)' not under the regional methodology to ensure that their methodology is consistent with the RRO's Planning Criteria. Finally, the RRO is responsible for ensuring that TRM calculations done by transmission service providers', regardless of what methodology they are under, are consistent with the individual TOs planning criteria.          The following wording changes noted in CAPITALS are recommended:

The RRO must review and approve the METHODOLOGY OF transmission service provider(s)' NOT UNDER THE REGIONAL  methodology to ensure it is consistent with the RRO's Planning Criteria. The RRO is responsible for ensuring that TRM calculations are consistent with the individual TOs planning criteria.

## Background Information:

The Long-Term AFC/ATC Task Force (LTATF) was formed to develop specific recommendations for the calculation and coordination of AFC/ATC with the goal of increasing market liquidity and enhancing grid reliability. The task force's work was coordinated with NAESB to separate business practices from reliability concerns. The LTATF evaluated the results of the short-term recommendations in the Alliant West area for summer 2004, and used this evaluation when considering whether to recommend the Alliant West short-term recommendations continue.

In developing their recommendations the LTATF considered the calculation for AFC/ATC, communication and coordination of AFC/ATC, and consistency between transmission planning and AFC/ATC calculations. A final LTATF report was presented to the Standing Committees in March 2005. The task force used the report and recommendations to develop proposed standards for ATC/TTC and CBM/TRM. The proposed "Modification to MOD-001-0 Documentation of ATC and TTC Calculation" SAR and "Modification to standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 SAR are the culmination[1] of the LTATF's work and is the subject matter for this Comment Form.

The SAC and the LTATF would like to receive industry comments on the scope and need for these two individual SARs. Accordingly, we request your comments included on this form, emailed to sarcomm@nerc.com with the subject "ATC/TTC/CBM/TRM Comments" by **August 7, 2005**.

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

1. **Is there a reliability need for the proposed standard?**

   ☒ Yes

   ☐ No

   Comments: Reliability must be maintained at all times including accounting for planned outages and unexpected dynamic system conditions, while at the same time providing for ATC/AFC to users of the the system. Therefore there is a reliability need for this standard. A transmission system has finite capability and the provision for a transmission reliability margin (TRM) is an important component in determining ATC/AFC and is necessary to take into account such varied system conditions in order to maintain reliability while not overstating the ATC/AFC. However, the ATC values are not reliability indicators, but rather the ATC values are derived from reliability based values, assumptions and criteria.

2. **Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

   ☐ Yes

   ☒ No

   Comments: The proposed standard should require that ATC/AFC values be coordinated across interfaces. The standard should not require one specific uniform methodology for each ATC/AFC calculator for calculating ATC, AFC and TTC, but should require that the Regional Reliability Organizations (including RTO/ISOs) develop a region wide methodology that meets the needs of each respective Planning Authority within the region, such that when applied by individual ATC/AFC calculators would produce consistent results at all interfaces.

3. **Do you agree with the scope of the proposed standard?**

   ☒ Yes

   ☐ No

   Comments:

4. **Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

   **Note: NAESB has a proposal for companion business practice - R05004)**

   ☐ Yes

   ☒ No

Comments: No, it is not necessary, but to the extent some sort of business issues need to be addressed, such as response times for OASIS requests, it should be limited strictly to business practices, and not address reliability issues.

**5. Do you agree with the list of entities to which the standard would apply?**

☐ Yes
☒ No

Comments: This standard should also apply to the Planning Authority and the Reliability Regions.

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes
☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes
☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments: Requirement R1.11 states "Ensure that the TTC/ATC calculations are consistent with the TO/TP planning and operating criteria." The standard must be more descriptive about the relationship between these calculations and their consistency with the appropriate planning criteria. The basic criteria utilized for determining acceptable reliability levels should be consistent, but the assumptions and conditions evaluated may be somewhat different to take into account short-term or real-time system conditions as compared to long term planning assumptions. The time horizons for each process will create differences that must be recognized. In many cases, there will be situations that exist in the short term that were not anticipated or modeled in the longer term (> than 1 year) planning cases, such as, planned or unplanned generator outages or line outages. However, the system security must be evaluated with these outages if they extend over the study period when calculating ATC.

Requirement R1.5 states "Require that ATC values and posting be updated at a minimum frequency to assure proper representation of the transmission system. These values will be made available to stakeholders at a similar frequency". This requirement should not establish a minimum frequency for updating or posting, rather, it should require a minimum frequency of review, with update and posting, only if necessary. It is imperative that the standard establish frequency minimums and timings that are practical and meaningful. Requirement R1.7 specifies minimum update frequencies for 10 items. The standard should be very clear that if values have not changed from the previous posting, such as in the case where there are not any unscheduled transmission outages (R1.7.3), there is not a requirement to post an update.

Requirement R1.7 states "Require that the data listed below, and other data needed by transmission providers for the calculation of TTC and ATC values are shared and used." Add the words "by transmission providers" to the end of the sentence above. This addition will ensure that there is not a requirement to share this sensitive data with the public.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments: Reliability must be maintained at all times including accounting for planned outages and unexpected dynamic system conditions, while at the same time providing for ATC/AFC to users of the the system. Therefore there is a reliability need for this standard. A transmission system has finite capability and the provision for a transmission reliability margin (TRM) is an important component in determining ATC/AFC and is necessary to take into account such varied system conditions in order to maintain reliability while not overstating the ATC/AFC.

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: Since CBM is an "implied" reservation of a portion of the transmission capability it is important to include it an ATC calculations to ensure reliability.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments:

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments: No, it is not necessary, but to the extent some sort of business issues need to be addressed, such as response times for OASIS requests, it should be limited strictly to business practices, and not address reliability issues. Additionally, TRM is a reliability quantity and therefore would be inappropriate for NAESB to have a parallel standard.

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes
☒ No

Comments: This standard should also apply to the Planning Authority and the Reliability Regions.

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes
☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes
☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments: "MOD-008-1 R1.5.1 Any variances must also be approved by NERC or its designate. Delete this requirement. Variances should be approved by the Regional Reliability Organizations, not NERC, since the RROs have an approved methodology."

## Background Information:

The Long-Term AFC/ATC Task Force (LTATF) was formed to develop specific recommendations for the calculation and coordination of AFC/ATC with the goal of increasing market liquidity and enhancing grid reliability. The task force's work was coordinated with NAESB to separate business practices from reliability concerns. The LTATF evaluated the results of the short-term recommendations in the Alliant West area for summer 2004, and used this evaluation when considering whether to recommend the Alliant West short-term recommendations continue.

In developing their recommendations the LTATF considered the calculation for AFC/ATC, communication and coordination of AFC/ATC, and consistency between transmission planning and AFC/ATC calculations. A final LTATF report was presented to the Standing Committees in March 2005. The task force used the report and recommendations to develop proposed standards for ATC/TTC and CBM/TRM. The proposed "Modification to MOD-001-0 Documentation of ATC and TTC Calculation" SAR and "Modification to standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 SAR are the culmination[1] of the LTATF's work and is the subject matter for this Comment Form.

The SAC and the LTATF would like to receive industry comments on the scope and need for these two individual SARs. Accordingly, we request your comments included on this form, emailed to sarcomm@nerc.com with the subject "ATC/TTC/CBM/TRM Comments" by **August 7, 2005**.

1) Proposed Revisions to Existing Standard Number MOD-001-0 (AFC/ATC/TTC)

2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 (CBM/TRM)

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

**1. Is there a reliability need for the proposed standard?**

☒ Yes

☒ No

Comments: Yes for TTC: TTCs reflect the operating/planning system conditions thus have to be accurate to achieve system reliability

No for ATC/AFC : ATCs/AFCs are quantities that are based on different market rules to access the transmission systems and to manage system congestion. Thus ATC and AFC should be market driven

**2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

☒ Yes

☐ No

Comments: The proposed standard is already going too much into methodology details

**3. Do you agree with the scope of the proposed standard?**

☒ Yes

☒ No

Comments: the standard should be limited to TTC/TFC for reliability purposes and ATC/AFC should addressed by NAESB

**4. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☒ Yes

☐ No

Comments: System quantities that are required by the market (such as ATC/AFC ) should be defined by NAESB

**5. Do you agree with the list of entities to which the standard would apply?**

☐ Yes

☒ No

Comments: LSE, PSE, MO, PA, TP

**6. Do you have any other terms that should be included in the definitions?**

☒ Yes

☒ No

Comments:

- NATC and RATC .firm or non firm should be defined by NAESB

- ultimate source and sink have a role in TTC determination and should be included in the NERC standard

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes

☒ No

Comments: The proposed standard is already too much directive and may unduly impose some coordination requirements to some transmission service providers

**8. Do you have any other comments on these proposed standards?**

Comments: The proposed standard is asking for exhaustive coordination in TTC/ATC/AFC calculation. Outside system boundary coordination requirements are needed in some parts of an Interconnection but could be minimal in other parts. For example, such exhaustive coordination is not required for DC transmission facilities between two asynchronous system.

Hydro-Québec TransÉnergie believes that although standardization and coordination of the calculation of ATC, AFC, TTC and the related definitions of TRM and CBM is a valuable goal, it must take into account the specifics of each System. In its own particular case, Hydro-Québec TransÉnergie's system is in fact a distinct Interconenction as it is not synchronized with the Eastern Interconnection. Its ties with the Eastern Interconnection are either controllable (DC ties) or radial (generation/load pockets isolated from one system and synchronized with the other). This situation must be taken into account when calculating TTC and ATC.

Not being subject to loop flows originating from neighboring Systems and its internal dispatch causing no such loop flows on those Systems, Hydro-Québec TransÉnergie does not have to participate in coordination to calculate flowgate capacities (AFC). Hydro-Québec TransÉnergie already posts its calculation methodology for ATC on its OASIS. The drafting team should include such considerations in the preparation of the releveant standards.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes

☒ No

Comments: Yes for the TRM use to take into account inaccuracy/uncertainty in TTCs forcasted values. No for the CBM and the TRM use to retain transmission capacity for unplanned utilisation. System reliability impacted by transmission congestion could be managed by the market through adequate and well coordonated market rules. LSEs should gain firm access to the system to be protected for contingencies by acquiring adequate transmissiion service from the source to the load, not by CBM and/or TRM.

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☐ Yes

☒ No

Comments: LSEs should gain firm access to the system to be protected for contingencies by acquiring adequate transmissiion service from the source to the load, not by CBM and/or TRM.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes

☒ No

Comments: see 9. in addition over utilisation of TRM and CBM may lead to limit open access to the system

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☒ Yes

☐ No

Comments: System reliability impacted by transmission congestion could be manage by the market through adequate and well coordonate market rules

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes
☒ No

Comments: LSE, PSE, MO, PA, TP

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes
☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes
☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments: The proposed standard is asking for exhaustive coordination in TRM calculation. Outside system boundary coordination requirements are needed in some parts of an Interconnection but could be minimal in other parts. For example, such exhaustive coordination is not required for DC transmission facilities between two asynchronous system.

## Background Information:

The Long-Term AFC/ATC Task Force (LTATF) was formed to develop specific recommendations for the calculation and coordination of AFC/ATC with the goal of increasing market liquidity and enhancing grid reliability. The task force's work was coordinated with NAESB to separate business practices from reliability concerns. The LTATF evaluated the results of the short-term recommendations in the Alliant West area for summer 2004, and used this evaluation when considering whether to recommend the Alliant West short-term recommendations continue.

In developing their recommendations the LTATF considered the calculation for AFC/ATC, communication and coordination of AFC/ATC, and consistency between transmission planning and AFC/ATC calculations. A final LTATF report was presented to the Standing Committees in March 2005. The task force used the report and recommendations to develop proposed standards for ATC/TTC and CBM/TRM. The proposed "Modification to MOD-001-0 Documentation of ATC and TTC Calculation" SAR and "Modification to standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 SAR are the culmination[1] of the LTATF's work and is the subject matter for this Comment Form.

The SAC and the LTATF would like to receive industry comments on the scope and need for these two individual SARs. Accordingly, we request your comments included on this form, emailed to sarcomm@nerc.com with the subject "ATC/TTC/CBM/TRM Comments" by **August 7, 2005**.

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

**1. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

☒ Yes

☒ No

Comments: IESO agrees that the proposed scope of the standard is sufficient to address reliability concerns. IESO disagrees that there needs to be a standard method for calculation of ATC, AFC and TTC for all ISOs/RTOs. Some differences in methodologies (market, non-market, etc.) may exist, but the processes must be coordinated and work together.

**3. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments: See comments above.

**4. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**5. Do you agree with the list of entities to which the standard would apply?**

☐ Yes

☒ No

Comments: Aspects of this standard would also apply to Transmission Planner, Transmission Owner, Planning Authority, RC and Regional Reliability Organization.

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes

☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments:
IESO would suggest the following replace all of R1, not just the first paragraph:
"The development of TTC/ATC/AFC methodology is primarily the responsibility of the Transmission Provider, but may be delegated to a Balancing Authority, a Reliability Coordinator. All responsible entities shall develop and document a TTC and ATC/AFC methodology. In the case where the methodology is developed by a designated entity, that methodology document must clearly indicate to which Transmission Providers it applies. That methodology shall be reviewed by the RRO to ensure coordination between the entities within that region and to ensure compliance with this standard. This methodology document shall be available to NERC, the Regions, and the stakeholders in the electricity market."
With this change, the language in R1.12 is no longer required.

R1.7 - Several items in the set may be considered confidential information that should not be shared with market participants (such as generator outages and generator dispatch orders). These items can be shared with Transmission Service Providers to be used in TTC and ATC calculations but not be released to market participants.

R1.7.2 - Because of variations on how generation is dispatched in different markets, the drafting team will need to be clear on the generator dispatch information being requested and how it will be used.

R1.7.2 - For generators that will be used to determine firm AFC, these should be limited to generators that have already secured firm usage of the transmission system. A transmission service provider should not include generators in the firm AFC calculation that do not have firm transmission service backing them up.

R1.7.6 - The IESO does not believe a NERC standard should reference a specific tool (such as the SDX). It should be more general and apply to the current tool(s)?

R1.7.7 - IESO doesn't understand why AFC will be exchanged only between entities that have coordination agreements. In the Monitoring/Coordination Section of the LTATF Final Report, it states "The Task Force recommends the revision of the existing NERC standards to require the recognition and respect of impacts on external flowgates/paths in AFC/ATC calculations, and the establishment of NERC standards on AFC/ATC coordination." Monitoring other party flowgates was recommendation V. in the AWTTF Short-Term Recommendations.

R1.9 - The assumption should also include treatment of transmission requests with a status of Study (for both the transmission provider requests and neighboring transmission provider requests) and long-term firm reservations with roll-over rights (for both the transmission provider requests and neighboring transmission provider requests).

General - The concepts in Appendix will need to be considered in development of the standard. It contains ATC and AFC formula that are not stated in the body of the SAR.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: Some areas use zero for CBM. If CBM is used, the standardized definitions should be used and amount disclosed.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments:

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes

☒ No

Comments: Aspects of this standard should also apply to Transmission Planner, Transmission Owner, Planning Authority, RC and Regional Reliability Organization

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes

☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments:

COMMENTS TO MOD-004-0 and MOD-008-0

R1 - References to having a single regional CBM methodology and TRM methodology should be removed along with references to exceptions for entities that are members of an RTO or an ISO.

R.1.6 - To the extent generators that are not committed to serve load inside the transmission provider's system are considered in the CBM requirement determination, there should be CBM preserved on impacted flowgates for the use of this generation.

Please note the numbering error. There are two R1.4, R1.5 and R1.6.

R1.8 - CBM should not be used in place of maintaining either minimum planning reserves or to compensate for poor generator maintenance practices.

General - When establishing CBM import area boundaries, there is an explicit assumption that all generators can serve all load within the boundary (with no constraints). As part of the description of the CBM calculation process, it should describe the basis for establishing the CBM import area boundaries.

## Background Information:

The Long-Term AFC/ATC Task Force (LTATF) was formed to develop specific recommendations for the calculation and coordination of AFC/ATC with the goal of increasing market liquidity and enhancing grid reliability. The task force's work was coordinated with NAESB to separate business practices from reliability concerns. The LTATF evaluated the results of the short-term recommendations in the Alliant West area for summer 2004, and used this evaluation when considering whether to recommend the Alliant West short-term recommendations continue.

In developing their recommendations the LTATF considered the calculation for AFC/ATC, communication and coordination of AFC/ATC, and consistency between transmission planning and AFC/ATC calculations. A final LTATF report was presented to the Standing Committees in March 2005. The task force used the report and recommendations to develop proposed standards for ATC/TTC and CBM/TRM. The proposed "Modification to MOD-001-0 Documentation of ATC and TTC Calculation" SAR and "Modification to standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 SAR are the culmination[1] of the LTATF's work and is the subject matter for this Comment Form.

The SAC and the LTATF would like to receive industry comments on the scope and need for these two individual SARs. Accordingly, we request your comments included on this form, emailed to sarcomm@nerc.com with the subject "ATC/TTC/CBM/TRM Comments" by **August 7, 2005**.

## Tabular Summary of Requirement Changes

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

1. **Is there a reliability need for the proposed standard?**

   ☒ Yes

   ☐ No

   Comments:

2. **Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

   ☒ Yes

   ☐ No

   Comments:

3. **Do you agree with the scope of the proposed standard?**

   ☒ Yes

   ☐ No

   Comments:

4. **Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

   **Note: NAESB has a proposal for companion business practice - R05004)**

   ☐ Yes

   ☒ No

   Comments:

5. **Do you agree with the list of entities to which the standard would apply?**

   ☐ Yes

   ☒ No

   Comments: Aspects of this standard will also apply to Transmission Planner and Regional Reliability Organization

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes

☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments:

Comments on the proposed wording:

- The current wording of R1 is very confusing, and does not require that RTO/ISOs have a documented methodology. It seems to be trying to acknowledge that some TPs within an RRO may be using an RTO/ISO methdology. We would recommend that while there may be more than one methodology applicable in a region, it should be required that the methdology for every TP in the RRO be available on the RRO website.
- R3 is duplicative and should be deleted
- We do not understand why Generation Dispatch orders are required for TTC/ATC coordination, Generation Outage coordination should be adequate
- It is unclear in the SAR what the intent is of the Appendix. We do not support the definitions shown being included in the standard.

Recommendation for a Regional Difference:

We suggest that a Regional Difference be added to acknowledge that for TPs within a purely financial market, the ATC requirements of this standard are not applicable. However, the requirements associated with TTC continue to be applicable to these TPs. In addition, if these TPs do post ATC, they should be required to post the methodology used to calculate those posted values.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes
☐ No

Comments:

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes
☐ No

Comments: While not all TPs use CBM, those that do use it for reliability reasons.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes
☐ No

Comments:

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes
☒ No

Comments:

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes
☒ No

Comments: Aspects of this standard will also apply to Transmission Planner and Regional Reliability Organization

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes

☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments: Comments on the proposed wording:

- R1 of MOD-004 and MOD-008 are confusing and do not require an ISO/RTO to post their methodology. While there may be more than one methodology applicable in a region, it should be required that the methdology for every TP in the RRO be available on the RRO website
- R1.8.1 MOD-008 implies that TRM is set as a fixed amount which must be maintained through time, since entities would be required to "plan and reinforce the transmission system for the amount of TRM being preserved". We feel that this is an inappropriate requirement, since TRM represents a variable quantity based on known system conditions plus uncertainty.
- R1.8.2 of MOD-008 is not related to item 1.8 and should be moved in the text to be before and applicable to all R1.x requirements.

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

**1. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

☒ Yes

☒ No

Comments: We agree that the proposed scope of the standard is sufficient to address relaibility concerns. We disagree that there needs to be a standard method for calulation of ATC, AFC and TTC for all ISOs/RTOs. Some differences in methodologies (market, non-market, etc.) may exist, but the processes must be coordinated and work together.

**3. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments: See comments above.

**4. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**5. Do you agree with the list of entities to which the standard would apply?**

☐ Yes

☒ No

Comments: Aspects of this standard would also apply to Transmission Planner, Transmission Owner, Planning Authority, RC and Regional Reliability Organization.

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes

☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments:
We would suggest the following replace all of R1, not just the first paragraph:
"The development of TTC/ATC/AFC methodology is primarily the responsibility of the Transmission Provider, but may be delegated to a Balancing Authority, a Reliability Coordinator. All responsible entities shall develop and document a TTC and ATC/AFC methodology. In the case where the methodology is developed by a designated entity, that methodology document must clearly indicate to which Transmission Providers it applies. That methodology shall be reviewed by the RRO to ensure coordination between the entities within that region and to ensure compliance with this standard. This methodology document shall be available to NERC, the Regions, and the stakeholders in the electricity market."
With this change, the language in R1.12 is no longer needed.

R1.7 - Several items in the set may be considered confidential information that should not be shared with market participants (such as generator outages and generator dispatch orders). These items can be shared with Transmission Service Providers to be used in TTC and ATC calculations but not be released to market participants.

R1.7.2 - Because of variations on how generation is dispatched in different markets, the drafting team will need to be clear on the generator dispatch information being requested and how it will be used.

R1.7.2 - For generators that will be used to determine firm AFC, these should be limited to generators that have already secured firm usage of the transmission system. A transmission service provider should not include generators in the firm AFC calculation that do not have firm transmission service backing them up.

R1.7.6 - Should a NERC standard reference a tool (such as the SDX) or be more general and apply to the current tool?

R1.7.7 - We don't understand why AFC will be exchanged only between entities that have coordination agreements. In the Monitoring/Coordination Section of the LTATF Final Report, it states "The Task Force recommends the revision of the existing NERC standards to require the recognition and respect of impacts on external flowgates/paths in AFC/ATC calculations, and the establishment of NERC standards on AFC/ATC coordination." Monitoring other party flowgates was recommendation V. in the AWTTF Short-Term Recommendations.

R1.9 - The assumption should also include treatment of transmission requests with a status of Study (for both the transmission provider requests and neighboring transmission provider requests) and long-term firm reservations with roll-over rights (for both the transmission provider requests and neighboring transmission provider requests).

General - The concepts in Apendix will need to be considered in development of the standard. It contains ATC and AFC formula that are not stated in the body of the SAR.

## CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: Some areas use zero for CBM. If CBM is used, the standardized definitions should be used and amount disclosed.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments:

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes

☒ No

Comments: Aspects of this standard should also apply to Transmission Planner, Transmission Owner, Planning Authority, RC and Regional Reliability Organization

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes

☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments:

COMMENTS TO MOD-004-0 and MOD-008-0

R1 - References to having a single regional CBM methodology and TRM methodology should be removed along with references to exceptions for entities that are members of an RTO or an ISO.

R.1.6 - To the extent generators that are not committed to serve load inside the transmission provider's system are considered in the CBM requirement determination, there should be CBM preserved on impacted flowgates for the use of this generation.

There are two R1.4, R1.5 and R1.6.

R1.8 - CBM should not be used in place of maintaining either minimum planning reserves or to compensate for poor generator maintenance practices.

General - When establishing CBM import area boundaries, there is an explicit assumption that all generators can serve all load within the boundary (with no constraints). As part of the description of the CBM calculation process, it should describe the basis for establishing the CBM import area boundaries.

## Background Information:

The Long-Term AFC/ATC Task Force (LTATF) was formed to develop specific recommendations for the calculation and coordination of AFC/ATC with the goal of increasing market liquidity and enhancing grid reliability. The task force's work was coordinated with NAESB to separate business practices from reliability concerns. The LTATF evaluated the results of the short-term recommendations in the Alliant West area for summer 2004, and used this evaluation when considering whether to recommend the Alliant West short-term recommendations continue.

In developing their recommendations the LTATF considered the calculation for AFC/ATC, communication and coordination of AFC/ATC, and consistency between transmission planning and AFC/ATC calculations. A final LTATF report was presented to the Standing Committees in March 2005. The task force used the report and recommendations to develop proposed standards for ATC/TTC and CBM/TRM. The proposed "Modification to MOD-001-0 Documentation of ATC and TTC Calculation" SAR and "Modification to standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 SAR are the culmination[1] of the LTATF's work and is the subject matter for this Comment Form.

The SAC and the LTATF would like to receive industry comments on the scope and need for these two individual SARs. Accordingly, we request your comments included on this form, emailed to sarcomm@nerc.com with the subject "ATC/TTC/CBM/TRM Comments" by **August 7, 2005**.

## Tabular Summary of Requirement Changes

1) Proposed Revisions to Existing Standard Number MOD-001-0 (AFC/ATC/TTC)

2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 (CBM/TRM)

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

1. **Is there a reliability need for the proposed standard?**

   ☒ Yes

   ☐ No

   Comments:

2. **Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

   ☒ Yes

   ☐ No

   Comments:

3. **Do you agree with the scope of the proposed standard?**

   ☒ Yes

   ☐ No

   Comments:

4. **Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

   **Note: NAESB has a proposal for companion business practice - R05004)**

   ☐ Yes

   ☒ No

   Comments: There may be certain practices that could be considered for a NAESB Business Practice, however compliance with it should be voluntary

5. **Do you agree with the list of entities to which the standard would apply?**

   ☐ Yes

   ☒ No

Comments: Aspects of this standard should also apply to Transmission Planner, Transmission Owner, Planning Authority and Regional Reliability Organization.

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes

☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments: On page SAR - 4 Clarification is needed providing the direction for the Standard Drafting Team concerning definitions. This portion of the SAR is not written in complete sentences so that it can be completely understood by those who are not on the LTATF For example, the SAR lists "Daily, Monthly, Yearly TTC". Does the LTATF wish the Standard Drafting Team to prepare definitions for Daily, Monthly, Yearly TTC? The SAR says that the TTC and ATC are defined in standard 1E1. These definitions should be repeated here so that it is clear what the SDT should use as a starting point. ATC is defined in the SAR by an equation. Is this to be added to the definition in 1E1 for ATC or is this already included in the previous definition? Then ATC is listed with no directions. Does the LTATF wish ATC to be defined, ATC definition to change, or something else? The SAR needs to be specific as to which definitions the SAR drafting team thinks needs to be added, deleted, or changed. If changes are needed, the SAR needs to explain what sort of changes are required.

COMMENTS TO MOD-001-0

R1 - Revise the first paragraph to read " Each Transmission Provider shall develop and document a TTC and ATC (may include the calculation of AFC) methodology, and require coordination between the

Transmission Providers, with oversight by the respective RRO's." We do not see the need for a RRO region wide methodology, but do see the need for the RRO to review the methodology the Transmission Providers use to insure it meets the requirements of this standard. The regional methodology would need to be at a high level even with the exclusion of RTO/ISO members. MRO members include ISO and non-ISO members throughout the MRO region. It would be better for reliability to have the MRO review the Transmission Provider methodology for the items included in the standard then to have a high level regional methodology for non-ISO/RTO members.

R1.1 - Revise the first sentence to read "Include a narrative explaining how TTC and ATC values are determined and how those values are used in evaluating a transmission service request (TSR), and how the results of the TSR evaluation are made available to customers."

R1.2 - Please clarify what the explanation in the second sentence is meant to accomplish.

R1.71 - We would recommend revising the 13 month time frame to 12 months, to reflect seams agreements presently in place.

R1.7.2 - The update frequency should at least be seasonal.

R1.7.3 - We would recommend revising the 13 month time frame to 12 months, to reflect seams agreements presently in place.

R1.9 - Add "(Netting)" after "Transmission Reservations".

R1.12 - Revise the article to have the RRO provide authorization for a variance to the regionally approved Transmission Provider's ATC/TTC methodology. Variances to the MRO approval do not require NERC approval.

R3 should be combined with R1.1

Section C. Measures should be as follows:
M1. Each group of transmission service providers within a region, in counjunction with the members of that region, shall jointly develop and implement a procedure to review changes periodically (at least annually) and ensure that that TTC and ATC/AFC calculations and resulting values of member transmission providers

comply with the Regionally approved Transmission Provider TTC and ATC methodology, the NERC Planning Standards, and applicable RRO criteria.

M2. A review to verify that theAFC/TTC calculations are consistent with the TO's/TP's planning criteria is also required. The procedure used to verify the consistency must also be documented in the report. Documentation of the results of the most current reviews shall be provided to NERC within 30 days of compliance.

M3. Each entity responsible for the TTC and ATC methodology, in conjunction with its member(s) and stakeholders, shall have and document a procedure on how stakeholders can input their concerns or questions regarding the TTC and ATC methodology and values of the transmission provider(s), and how these concerns or questions will be addressed. Documentation of the procedure shall be available on a web site accessible by the Regions, NERC, and the stakeholders in the electricity market.

M4. The RRO must review and approve the ATC/TTC methodology so as to ensure it is consistent with the RRO's Planning and Operating Criteria.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: Some Reserve Sharing Pools utilize CBM to insure transfer capability is available for movement of energency energy. Without CBM, this may not be possible resulting in significant reliability issues.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments:

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments: There may be certain practices that could be considered for a NAESB Business Practice, however compliance with it should be voluntary.

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes

☒ No

Comments: Aspects of this standard should also apply to Transmission Planner, Transmission Owner, Planning Authority and Regional Reliability Organization

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes

☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments: COMMENTS TO MOD-004-0

R1 - Revise the first paragraph to read " Each Transmission Provider shall develop and document a CBM methodology, and require coordination between the transmission providers, with oversight by the respective RRO's."  We do not see the need for a RRO region wide methodology, but do see the need for the RRO to review the methodology the Transmission Providers use to insure it meets the requirements of this standard.  The regional methodology would need to be at a high level even with the exclusion of RTO/ISO members.  For example the MRO members include ISO and non-ISO members throughout the MRO region. It would be better for reliability to have the MRO review the Transmission Provider methodology for the items included in the standard than to have high-level regional methodology for non-ISO/RTO members.

R1.2 - In bullets 1 and 2 the word "must" should be deleted.  It is not necessary.

The article numbering after R1.6 is in error.  It drops back to R1.4, when it should be R1.7.

Under present article number R1.4, Revise the first sentence to "Describe the formal process and rationale for the RRO to grant any variances to an individual transmission provider's regionally approved CBM Methodology." R1.6.1 should be deleted. The RRO approves variances.

Under the present article number R1.7 - Clarify what the objective is for the "simultaneous application of CBM and TRM." Is this intended to make sure that reserves are not double counted?

It is not stated if Measures M1 and M2 are kept or not. Please confirm that they are still in force.

COMMENTS TO MOD-005-0

R1 - Revise the first sentence to read "Each RRO in conjunction with its members, shall develop and implement a procedure to review changes (at least annually) to the CBM calculations and the resulting values of member Transmission Service Providers."

R1.3 - We believe R1.3.1 should be incorporated into the standard.

COMMENTS TO MOD-006-0

We are not opposed to making this standard a Busniess Practice, as long as the Business Practice is voluntary.

COMMENTS TO MOD-008-0

R1 - Revise the first sentence of the paragraph to read " Each Transmission Provider in a region shall develop and document, in conjunction with the members of the region, a TRM methodology, and require coordination between the transmission providers, with oversight by the respective RRO's." We do not see the need for a RRO region wide methodology, but do see the need for the RRO to review the methodology the Transmission Providers use to insure it meets the requirements of this standard. The regional methodology would need to be at a high level even with the exclusion of RTO/ISO members. For example the MRO members include ISO and non-ISO members throughout the MRO region. It would be better for reliability to have the MRO review the Transmission Provider methodology for the items included in the standard than to have high-level regional methodology for non-ISO/RTO members.

R1.3.10 should be renumbered to R1.3.9. The article that was numbered R1.3.9 should be placed at the end of the list and not have a number.

R1.5 - Revise the first sentence to "Describe the formal process and rationale for the RRO to grant any variances to an individual transmission provider's regionally approved TRM Methodology." R1.5.1 should be deleted. The RRO approves variances.

R1.7 - Clarify what the objective is for the "simultaneous application of CBM and TRM." Is this intended to make sure that reserves are not double counted?

COMMENTS TO MOD-009-0

R1 - Revise the first sentence of the paragraph to read " The RRO in a region shall develop and document, in conjunction with the members of the region, a procedure to, at least annually, review the TRM calculations and the resulting values of member transmission providers, to ensure that they comply with the regionally approved transmission provider methodologies." We do not see the need for a RRO region wide methodology, but do see the need for a region-wide process to review the methodology the Transmission Providers use to insure it meets the requirements of this standard. The regional methodology would need to be a high level even with the exclusion of RTO/ISO members. For example the MRO members include ISO and non-ISO members throughout the MRO region. It would be better for reliability to have the MRO review the Transmission Provide methodology for the items included in the standard than to have high-level regional methodology for non-ISO/RTO members.

R1.1 - Change the article to ". . . implemented, and made available to the RRO's, NERC, and stakeholders."

R1.4 - Combine this article into R1.3.

R4 - Delete as it is included in the revised R1.1.

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

**1. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

☐ Yes

☒ No

Comments: ATC/TTC/AFC calculations should be standardized across all regions. The way the SAR is written now, TSPs within a region will be required to coordinate methodology and calculations, but the regions will not be required to coordinate with each other. Without standardized calcuations and coordination between regions, we will continue to have differences in regional ATC/TTC/AFC values and limit commercial activity. Rather than having calculation differences between neighboring TSPs as it is today, it will just be pushed up to the regional level and the problem of uncoordinated ATC/TTC/AFC values will remain.

**3. Do you agree with the scope of the proposed standard?**

☐ Yes

☒ No

Comments: The scope should include standardized ATC/TTC/AFC calculations and required coordination between regions.

**4. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**5. Do you agree with the list of entities to which the standard would apply?**

☒ Yes
☐ No

Comments:

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes
☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

# Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

This form is to be used to submit comments on Draft 1 of two individual SARs: 1) Proposed Revisions to Existing Standard Number MOD-001-0 dealing with AFC/ATC/TTC; and 2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 dealing with CBM/TRM. Comments must be submitted by **August 08, 2005**. You may submit the completed form by emailing it to: sarcomm@nerc.com with the words "ATC/TTC/CBM/TRM Comments" in the subject line. If you have questions please contact Mark Ladrow at mark.ladrow@nerc.net or by telephone at 609-452-8060.

**ALL DATA ON THIS FORM WILL BE TRANSFERRED AUTOMATICALLY TO A DATABASE AND IT IS THEREFORE IMPORTANT TO ADHERE TO THE FOLLOWING REQUIREMENTS:**

**DO:**
- **Do** enter text only, with no formatting or styles added.
- **Do** use punctuation and capitalization as needed (except quotations).
- **Do** use more than one form if responses do not fit in the spaces provided.
- **Do** submit any formatted text or markups in a separate WORD file.

**DO NOT:**
- **Do not** insert tabs or paragraph returns in any data field.
- **Do not** use numbering or bullets in any data field.
- **Do not** use quotation marks in any data field.
- **Do not** submit a response in an unprotected copy of this form.

## Background Information:

The Long-Term AFC/ATC Task Force (LTATF) was formed to develop specific recommendations for the calculation and coordination of AFC/ATC with the goal of increasing market liquidity and enhancing grid reliability. The task force's work was coordinated with NAESB to separate business practices from reliability concerns. The LTATF evaluated the results of the short-term recommendations in the Alliant West area for summer 2004, and used this evaluation when considering whether to recommend the Alliant West short-term recommendations continue.

In developing their recommendations the LTATF considered the calculation for AFC/ATC, communication and coordination of AFC/ATC, and consistency between transmission planning and AFC/ATC calculations. A final LTATF report was presented to the Standing Committees in March 2005. The task force used the report and recommendations to develop proposed standards for ATC/TTC and CBM/TRM. The proposed "Modification to MOD-001-0 Documentation of ATC and TTC Calculation" SAR and "Modification to standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 SAR are the culmination[1] of the LTATF's work and is the subject matter for this Comment Form.

The SAC and the LTATF would like to receive industry comments on the scope and need for these two individual SARs. Accordingly, we request your comments included on this form, emailed to sarcomm@nerc.com with the subject "ATC/TTC/CBM/TRM Comments" by **August 7, 2005**.

1) Proposed Revisions to Existing Standard Number MOD-001-0 (AFC/ATC/TTC)

2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 (CBM/TRM)

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

**1. Is there a reliability need for the proposed standard?**

X Yes

☐ No

Comments: Yes – It is important to recognize that while AFC/ATC/TTC are not indicators of reliability, AFC/ATC/TTC values are limited by NERC standards and definitions, Regional criteria, and the physical characteristics of the interconnected electric systems. The proper calculation and use of AFC/ATC/TTC are critical to maintaining system reliability.

**2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

☐ Yes

X No

Comments: No – The NERC Planning Committee encourages further standardization of certain key elements and parameters in the calculation of ATC, AFC, and TTC. The proposed standards on ATC, AFC, and TTC calculations must require that key elements of the calculation critical to reliability be incorporated into any proposed NERC ATC and TTC standard methodology and strengthened for increased consistency.

The existing NERC ATC and TTC methodology prescribes a set of requirements that must be addressed in calculating ATC and TTC values. While the current methodology provides a degree of commonality in the calculations, that commonality needs to be strengthened. This strengthening of the calculation requirements refers to additions and refinements to the elements or parameters to be addressed in the calculation methodology and not to the tools or equipment used for the calculations.

Some examples of the elements critical to reliability and for which further standardization in the ATC and TTC calculations should be required include: 1) coordination in the exchange and use of system data within the Regions and among adjacent Regions, 2) the monitoring of critical limiting transmission facilities under appropriate contingencies consistent with planning and operating criteria, 3) consistency in the manner in which transmission services are reserved, scheduled, and accounted in the calculations, 4) using appropriate generation dispatches, 5) meeting a minimum frequency of ATC and TTC calculations, 6) base case model building (i.e., what data needs to be incorporated and updated), 7) ATC and TTC calculators (those who are responsible for calculating ATC and TTC values) who impact each other's transmission system must have appropriate and adequate model representation (load level, generation dispatch, transmission and generation outages) of each other's system, and 8) monitoring of transmission facilities based on the use of an appropriate distribution cutoff factor.

Further, AFC (available flowgate capability) must be clearly defined. The NERC ATC and TTC methodology must be expanded to include and describe the key elements that must be addressed in the calculation of AFC values. In addition, the relationship of AFC to ATC and TTC must be clearly defined along with the manner in which they will be used and coordinated in accounting for transmission reservations and schedules.

3. **Do you agree with the scope of the proposed standard?**

☐ Yes

X No

Comments: No – Please see comments provided in response to Question 2.

4. **Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

X Yes

☐ No

Comments: Yes – The business process flow of requesting transmission service, the evaluation of a transmission service request against the calculated ATC, TTC, or AFC values, and the communication of the resulting service to the transmission user are possible elements to be considered in business practice standards. In developing the business practices, care must be taken to ensure that the tools or equipment to implement this process flow not be specified, only the process flow. All aspects dealing with reliability must be handled by NERC.

5. **Do you agree with the list of entities to which the standard would apply?**

☐ Yes

X No

Comments: No – Aspects of this standard also should apply to the Transmission Planner, Transmission Owner, Planning Authority, and Regional Reliability Organization.

In those areas where Regional Transmission Organizations (RTOs), Independent System Operators (ISOs), or other agents, such as Transmission Service Coordinators (TSCs), are involved with ATC, TTC, and AFC calculations for multiple Regions or portions thereof, the role of these entities must be clearly defined.

6. **Do you have any other terms that should be included in the definitions?**

X Yes

☐ No

Comments: Yes – In the SAR or standard drafting of the proposed ATC/TTC standard, definitions must be established, as necessary, for industry acceptance so that a common language is used in reference to ATC and TTC. In particular, definitions for “flowgate,” “flowgate rating,” and “Available Flowgate Capability (AFC)” need to be established (See also the fourth paragraph in response to Question 2.) since these terms have never been formally defined by NERC.

On pages SAR - 4 and SAR – 9, further clarification and direction are needed for the Standard Drafting Team (SDT) concerning definitions. This portion of the SAR is not written in complete sentences and therefore may not be completely understood by those who were not on the LTATF. For example, the SAR lists “Daily, Monthly, Yearly TTC.” Does the LTATF wish the Standard Drafting Team to prepare definitions for Daily, Monthly, Yearly TTC and ATC? The SAR says that the TTC and ATC are defined in standard 1E1. These definitions should be repeated here so that it is clear what the SDT should use as a starting point. ATC is defined in the SAR by an equation. Is this to be added to the definition in 1E1 for ATC or is this already included in the previous definition? Then, Existing Transmission Commitments (ETC) is listed with no directions. Does the LTATF wish ETC to be defined, ETC definition to change, or something else? The SAR needs to be specific as to which definitions the SAR drafting team recommends to be added, deleted, or changed. If changes are needed, the SAR needs to explain what sorts of changes are required.

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes

X No

Comments: No additional data elements.

**8. Do you have any other comments on these proposed standards?**

Comments: Yes - The ATC/TTC SAR needs to be reworded to clearly establish the following:

1) A Regional ATC/TTC methodology must be developed in conjunction with Regional members.
2) All ATC/TTC calculators must abide by the Regional methodology for the Region in which they are members.
3) RTOs and ISOs that encompass multiple Regional Reliability Organizations are exempt from abiding by the Regional ATC/TTC methodology provided they have established a single ATC/TTC calculation methodology, in conjunction with their membership, for the entire RTO or ISO. These RTO or ISO methodologies must be consistent with the requirements of the NERC ATC/TTC standard and applicable Regional criteria.
4) RTOs and ISOs that are exempt from the Regional methodologies must perform reviews to ensure consistency between the RTO or ISO ATC /TCC calculation methodology and their members' transmission planning and operating criteria. If this requirement is not added, there is no check on the consistency with planning and operating criteria for members who are not under the Regional methodology but under an RTO or ISO ATC/TCC methodology. This requirement will help to ensure that ATC/TTC calculations only incorporate contingencies, TRM components, and CBM for which the systems are reinforced and planned.
5) Each RRO must review and approve the RTO or ISO ATC/TTC methodology to ensure that it is consistent with the NERC ATC/TTC standard and the RRO's planning and operating criteria. If this requirement is not added, there appears to be no check of an RTO or ISO's ATT/TCC methodology.

R1.1 – Revise the first sentence to read "Include a narrative explaining how TTC and ATC values are determined and how those values are used in evaluating a transmission service request (TSR), and how the results of the TSR evaluation are made available to customers."

R1.7.2 – The update frequency should at least be seasonal.

R3 – This requirement should be combined with R1.1.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

X Yes

☐ No

Comments: Yes - There is a reliability need for the CBM/TRM standard. Please see the comments provided in response to Question 10 below.

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

X Yes

☐ No

Comments: Yes – Earlier in the development of this industry, there were predominantly local, vertically integrated electric utilities. Each utility built sufficient generation to serve its own load responsibility. Transmission interconnections with neighboring utilities were typically established for one of the following reasons: 1) to minimize duplication of transmission (i.e., tie to neighbor for transmission reliability), and 2) an economic decision, to build transmission instead of generation based on the generation reliability criteria for which the utility planned (i.e., tie to neighbor to meet generation reliability criteria). This second reason is the origin of the CBM concept. Transmission interconnections provide each interconnected system with access to its neighbors so that in the event of an extreme generation outage within a utility, the temporarily generation deficient utility could have access to "emergency" generation resources from its interconnected neighbors. CBM is the quantification of this use of the transmission system. Therefore, CBM is an "emergency" use transmission quantity and only exists on the importing system for use only during periods of an emergency generation deficiency when firm transmission service is not available. Just as transmission capacity is preserved for the transmission contingencies for which a utility plans, transmission capacity is also preserved for the generation contingencies for which a utility plans. In either case, the utility customers paid for the transmission capacity that was installed to maintain the reliability level that is planned, via their rates for service.

Some reserve sharing pools utilize CBM to ensure transfer capability is available for movement of emergency energy. Without CBM, this may not be possible, resulting in significant reliability issues.

**11. Do you agree with the scope of the proposed standard?**

X Yes

☐ No

Comments: Yes – The scope of the standard is sufficient for the industry at this time.

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

X Yes

☐ No

Comments: Yes – The process under which CBM is used may be considered a business practice that could be handled by NAESB. However, the calculation of CBM amounts and how they are implemented in an ATC/TCC calculation are reliability issues that belong in the CBM/TRM standard.

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes

X No

Comments: No – Aspects of this standard also should apply to the Transmission Planner, Transmission Owner, Planning Authority, and Regional Reliability Organization.

In those areas where Regional Transmission Organizations (RTOs), Independent System Operators (ISOs), or other agents, such as Transmission Service Coordinators (TSCs), are involved with ATC, TTC, and AFC calculations for multiple Regions or portions thereof, the role of these entities must be clearly defined.

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes

X No

Comments: No – In the SAR or standard drafting of the proposed CBM/TRM standard, definitions must be established, as necessary, for industry acceptance so that a common language is used in reference to CBM and TRM.

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes

X No

Comments: No additional data elements.

**16. Do you have any other comments on these proposed standards?**

Comments: Yes – The CBM/TRM SAR needs to be reworded to clearly establish the following:

1) A Regional CBM/TRM methodology must be developed in conjunction with Regional members.
2) All entities calculating CBM and/or TRM must abide by the Regional methodology for the Region in which they are members.
3) RTOs and ISOs that encompass multiple Regional Reliability Organizations are exempt from abiding by the Regional CBM/TRM methodologies provided they have established a single CBM and/or TRM calculation methodology, in conjunction with their membership, for the entire RTO or ISO. These RTO or ISO methodologies must be consistent with the requirements of the NERC CBM/TRM standard and applicable Regional criteria.
4) RTOs and ISOs that are exempt from the Regional methodologies must perform reviews to ensure consistency between the RTO or ISO CBM and/or TRM calculation methodologies and their members' transmission planning, generation planning, and operating criteria. If this requirement is not added, there is no check on the consistency with planning and operating criteria for members who are not under the Regional methodology but under an RTO or ISO CBM and/or TRM methodology.
5) In addition, the text in section R1 of the SAR needs to be revised to clarify that the following reviews are to be performed by the RRO. First, each RRO needs to review the CBM and/or TRM calculations of transmission providers under the Regional methodology to ensure they are adhering to the Regional methodology. Second, each RRO must review and approve the RTO and ISO CBM and/or TRM methodologies to ensure they are consistent with the NERC CBM/TRM standard and the RRO's planning and operating criteria. Finally, the RRO is responsible for ensuring that TRM calculations performed by transmission service providers, regardless of what methodology they are under, are consistent with the individual transmission owner's planning criteria.

COMMENTS TO MOD-004-0

R1.2 – In bullets 1 and 2, the word “must” should be deleted. It is not necessary.

Under the present article number R1.7 – Clarify what the objective is for the “simultaneous application of CBM and TRM.” Is this intended to make sure that reserves are not double counted?

COMMENTS TO MOD –008-0

R1.7 – Clarify what the objective is for the “simultaneous application of CBM and TRM.” Is this intended to make sure that reserves are not double counted?

COMMENTS TO MOD- 009-0

R1.4 – Combine this article into R1.3.

R4 – Delete, as it is included in the revised R1.1.

1) Proposed Revisions to Existing Standard Number MOD-001-0 (AFC/ATC/TTC)

2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 (CBM/TRM)

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

**1. Is there a reliability need for the proposed standard?**

☒ Yes

☒ No

Comments: TTC and TRM are reliability driven quanities however ATC/AFCs are quantities that are based on market rules and used in the managing of system congestion. ATC/AFC calculations are not required to achieve Reliability

**2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

☒ Yes

☐ No

Comments: Although it is agreed that the proposed scope is sufficient to address reliability objectives, we disagree that there needs to be a standard outlining the method for calculation of ATC/AFC. There are different market stuctures in the Northeast and the processes need to be coordinated to ensure they work together to achieve a transparent, documented methodology to calculate those quantities that are critical to maintaining reliability objectives.

**3. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments: See above comments

**4. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☒ Yes

☐ No

Comments: ATC/AFC system quantities that are market specific should be addressed by NAESB

**5. Do you agree with the list of entities to which the standard would apply?**

☐ Yes
☒ No

Comments: Aspects of this standard will also apply to Transmission Planner, Planning Authority and Regional Reliability Organization

**6. Do you have any other terms that should be included in the definitions?**

☒ Yes
☐ No

Comments: NATC and RATC should be defined by NAESB

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes
☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments:
General Comment: It must be noted that the application of ATC, and therefore its derivation, can be significantly different in market-based jurisdictions that do not take physical transmission reservations, and those that do. The principles that "An Organization Standard shall neither mandate nor prohibit any specific market structure" and "An Organization Standard shall not preclude market solutions to achieving compliance with that standard" must be maintained. The Standards Drafting Team must be familiar with the market structures in use in North America, to accommodate these variances

Items for the Standard Drafting team to consider with respect to the proposed wording:

- R1 is very confusing with it's reference to how the methodology must be documented. It seems to leave a hole that does not require RTO/ISOs to post their methodology. While there may be more than one methodology applicable in a region, it should be required that the methdology for every TP in the RRO be available on the RRO website.
- R3 is duplicative and should be deleted
- We do not understand why Generation Dispatch orders are required for TTC/ATC coordination, Generation Outage coordination should be adequate

- It is unclear in the SAR what the intent is of the Appendix. We do not support the definitions shown being included in the standard.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: While not all TPs use CBM, those that do use it for reliability reasons.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments:

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes

☒ No

Comments: Aspects of this standard will also apply to Transmission Planner, Planning Authority and Regional Reliability Organization

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes

☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments: Items for the Standard Drafting team to consider with respect to the proposed wording:

- R1 of MOD-004 and MOD-008 seem confusing and not to require an ISO/RTO to post their methodology. While there may be more than one methodology applicable in a region, it should be required that the methdology for every TP in the RRO be available on the RRO website
- R1.8.1 MOD-008 implies that TRM is set as a fixed amount which must be maintained through time, since entities would be required to "plan and reinforce the transmission system for the amount of TRM being preserved". We feel that this is an inappropriate requirement, since TRM represents a variable quantity based on known system conditions plus uncertainty.
- R1.8.2 of MOD-008 is not related to item 1.8 and should be moved in the text to be before and applicable to all R1.x requirements.

In Summary, NPCC concerns are as follows-

a) Québec Area is not synchronously interconnected with the rest of the Eastern Interconnexion thus i) coordination requirements are limited within its synchronous system, ii) ultimate source and sink are limited within its synchronous system
b) NY's, NE's, IESO 's transmission commitments are not based point to point transmission reservations in both operating and planning horizon thus posting requirement will not include ATC based on physical reservation and we believe that ATC is a market based quantity.
c) CBM is more or less a physical reservation made, at no cost, by LSEs within the boundaries of the TP's system. Therefore for some members of NPCC, because they have market based systems and are not using physical reservations, feel a standard NERC Standards for CBM is not necessary.
d) Some of NPCC's Areas have confidentiality issues especially with Generator outage schedules and we are asking the drafting team to be cognizant of these and respect this confidentiality.

## Background Information:

The Long-Term AFC/ATC Task Force (LTATF) was formed to develop specific recommendations for the calculation and coordination of AFC/ATC with the goal of increasing market liquidity and enhancing grid reliability. The task force's work was coordinated with NAESB to separate business practices from reliability concerns. The LTATF evaluated the results of the short-term recommendations in the Alliant West area for summer 2004, and used this evaluation when considering whether to recommend the Alliant West short-term recommendations continue.

In developing their recommendations the LTATF considered the calculation for AFC/ATC, communication and coordination of AFC/ATC, and consistency between transmission planning and AFC/ATC calculations. A final LTATF report was presented to the Standing Committees in March 2005. The task force used the report and recommendations to develop proposed standards for ATC/TTC and CBM/TRM. The proposed "Modification to MOD-001-0 Documentation of ATC and TTC Calculation" SAR and "Modification to standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 SAR are the culmination[1] of the LTATF's work and is the subject matter for this Comment Form.

The SAC and the LTATF would like to receive industry comments on the scope and need for these two individual SARs. Accordingly, we request your comments included on this form, emailed to sarcomm@nerc.com with the subject "ATC/TTC/CBM/TRM Comments" by **August 7, 2005**.

2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 (CBM/TRM)

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

1. **Is there a reliability need for the proposed standard?**

   ☒ Yes

   ☐ No

   Comments:

2. **Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

   ☒ Yes

   ☐ No

   Comments: Coordination and documentation of the calculation method would improve transparancy. Standardization, however, must recognize the inherent differences between systems which employ physical transmission reservations and energy markets which use financial congestion management and not be prescriptive.

3. **Do you agree with the scope of the proposed standard?**

   ☒ Yes

   ☐ No

   Comments:

4. **Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

   **Note: NAESB has a proposal for companion business practice - R05004)**

   ☐ Yes

   ☒ No

   Comments:

5. **Do you agree with the list of entities to which the standard would apply?**

   ☒ Yes

☐ No

Comments:

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes

☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments:

Secion R.1.7 - all data listed should be considered confidential and used for the purposes of  RC reliability studies.

Secion R.1.7.2 - please clarify what is meant by Generation Dispatch Order and why it is needed?

Section R.1.7.6 - please explain why this document specifies the use of tool, namely SDX, while other NERC standards such as coordinated operations are not requiring the use of a specific software tool.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes
☐ No

Comments:

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: In the operation horizion the NYISO does not use CBM, however, we agree that areas that employ a non-zero CBM should coordinate and document the process.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments:

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**13. Do you agree with the list of entities to which the standard would apply?**

☒ Yes
☐ No

Comments:

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes

1) Proposed Revisions to Existing Standard Number MOD-001-0 (AFC/ATC/TTC)

2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 (CBM/TRM)

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

**1. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

☐ Yes

☒ No

Comments: The standard should focus on increasing the transparency of study assumptions and methods utilized by each Transmission Service Provider (TSP), rather than attempt to prescribe or mandate the exact procedures and assumptions used in the calculation of TTC/ATC/AFC by all TSPs. Additionally, this standard should increase communication around and the coordination of transfer capability calculations. Determination of ATC is already defined within each FERC-jurisdictional TSP's Open Access Transmission Tariff (Attachment C of the pro-forma OATT). There is no reliability need to mandate a prescribed detailed procedure and assumptions for calculating TTC/ATC/AFC.

**3. Do you agree with the scope of the proposed standard?**

☐ Yes

☒ No

Comments: See comments in response to Question 2 above. In addition, clarification should be provided with respect to the applicability of any portions of a standard to either short-term and long-term service (as defined in FERC Order 888, 889, 638, etc.) TTC/ATC study methods. The scope is too broad in terms of requiring data that is commercially sensitive (e.g., generation dispatch order); any data to be shared should be adequately protected; and data only needs to be made available if it is truly relevant to the study process.

**4. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments: We would like to emphasize that CBM should remain in this standard due to it being a critical component of Grid reliability and should not become a business practice in a NAESB standard.

5. **Do you agree with the list of entities to which the standard would apply?**

☐ Yes

☒ No

Comments: RTO/ISOs should be required to provide the same documentation for their assumptions and methods.

6. **Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments: It should be pointed out that this standard should contain consistent definitions, including but not limited to, ATC, AFC, TTC, CBM, and TRM. The definitions should be developed as part of the industry effort of this standard.

7. **Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes

☒ No

Comments:

8. **Do you have any other comments on these proposed standards?**

Comments: While this SAR suggests that individual transmission owners and operators within an RTO or ISO may be exempt from developing and documenting a regional methodology for TTC/ATC/AFC determination, we expect that the RTO/ISO would not be exempt from clearly documenting their assumptions and methods. Maintaining this requirement will help to ensure the same transparency exists for the RTO/ISO footprint as in other regions.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☐ Yes

☒ No

Comments: There is a reliability need for communication and coordination of TTC, CBM, and TRM determination, but no reliability need exists for every Transmission Service Provider to utilize the exact same methods to determine these values.

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: Availibility of CBM is an integral part of overall system reliability for each entity that relies on it as part of its generation adequacy calculations.

**11. Do you agree with the scope of the proposed standard?**

☐ Yes

☒ No

Comments: As with the SAR for MOD-001-0, the scope of this SAR goes beyond what is required for system relaibility. There is no reliability need to prescribe in detail how each entity should calculate either TRM or CBM. There is a need to ensure transparancy in the methodology used by each entity but not in the specific components of the calculation.

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes
☒ No

Comments: RTO/ISOs should be required to provide the same documentation for their assumptions and methods.

**14. Do you have any other terms that should be included in the definitions?**

☒ Yes
☐ No

Comments: Please define "Calculation Model" as described in requirement R1.7.9.

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes
☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments: If this standard is developed  beyond the transparancy issue, the methodology should only mandate that certain guiding priciples be considered in the determination of TRM and CBM and not that a industry-wide prescriptive set of calculations be made.  Also it should be up to each entity with responsibility for their own system reliability and generation adequacy on how internal generation should be considered in the determination of CBM and thus generation adequacy within their system.

**SAR Comment Form**
**Proposed Revisions to Existing Standard Number MOD-001-0**
**and**
**Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0**

This form is to be used to submit comments on Draft 1 of two individual SARs: 1) Proposed Revisions to Existing Standard Number MOD-001-0 dealing with AFC/ATC/TTC; and 2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 dealing with CBM/TRM. Comments must be submitted by **August 08, 2005**. You may submit the completed form by emailing it to: sarcomm@nerc.com with the words "ATC/TTC/CBM/TRM Comments" in the subject line. If you have questions please contact Mark Ladrow at mark.ladrow@nerc.net or by telephone at 609-452-8060.

**ALL DATA ON THIS FORM WILL BE TRANSFERRED AUTOMATICALLY TO A DATABASE AND IT IS THEREFORE IMPORTANT TO ADHERE TO THE FOLLOWING REQUIREMENTS:**

**DO:** **Do** enter text only, with no formatting or styles added.
**Do** use punctuation and capitalization as needed (except quotations).
**Do** use more than one form if responses do not fit in the spaces provided.
**Do** submit any formatted text or markups in a separate WORD file.

**DO NOT:** **Do not** insert tabs or paragraph returns in any data field.
**Do not** use numbering or bullets in any data field.
**Do not** use quotation marks in any data field.
**Do not** submit a response in an unprotected copy of this form.

## Background Information:

The Long-Term AFC/ATC Task Force (LTATF) was formed to develop specific recommendations for the calculation and coordination of AFC/ATC with the goal of increasing market liquidity and enhancing grid reliability. The task force's work was coordinated with NAESB to separate business practices from reliability concerns. The LTATF evaluated the results of the short-term recommendations in the Alliant West area for summer 2004, and used this evaluation when considering whether to recommend the Alliant West short-term recommendations continue.

In developing their recommendations the LTATF considered the calculation for AFC/ATC, communication and coordination of AFC/ATC, and consistency between transmission planning and AFC/ATC calculations. A final LTATF report was presented to the Standing Committees in March 2005. The task force used the report and recommendations to develop proposed standards for ATC/TTC and CBM/TRM. The proposed "Modification to MOD-001-0 Documentation of ATC and TTC Calculation" SAR and "Modification to standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 SAR are the culmination[1] of the LTATF's work and is the subject matter for this Comment Form.

The SAC and the LTATF would like to receive industry comments on the scope and need for these two individual SARs. Accordingly, we request your comments included on this form, emailed to sarcomm@nerc.com with the subject "ATC/TTC/CBM/TRM Comments" by **August 7, 2005**.

1) Proposed Revisions to Existing Standard Number MOD-001-0 (AFC/ATC/TTC)

2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 (CBM/TRM)

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

**1. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

☐ Yes

☒ No

Comments: The standard should focus on increasing the transparency of study assumptions and methods utilized by each Transmission Service Provider (TSP), rather than attempt to prescribe or mandate the exact procedures and assumptions used in the calculation of TTC/ATC/AFC by all TSPs. Determination of ATC is already defined within each FERC-jurisdictional TSP's Open Access Transmission Tariff (Attachment C of the pro-forma OATT). There is no reliability need to mandate a prescribed, detailed procedure and assumptions for calculating TTC/ATC/AFC.

**3. Do you agree with the scope of the proposed standard?**

☐ Yes

☒ No

Comments: See comments in response to Question 2 above. Additionally, clarification should be provided with respect to the applicability of any portions of a standard to either short-term and long-term (service as defined in FERC Order 888, 889, 638, etc.) TTC/ATC study methods. The scope is too broad in terms of requiring data that is commercially sensitive (e.g., generation dispatch order); any data to be shared should be adequately protected; and data only needs to be made available if it is truly relevant to the study process.

**4. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments: We believe CBM should remain in this standard due to it being a critical component of Grid reliability and should not become a business practice in a NAESB standard.

**5. Do you agree with the list of entities to which the standard would apply?**

☐ Yes
☒ No

Comments: No. See comment in Question #8.

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes
☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments: While this SAR suggests that individual transmission owners and operators within an RTO or ISO may be exempt from developing and documenting a regional methodology for TTC/ATC/AFC determination, we expect that the RTO/ISO would not be exempt from clearly documenting their assumptions and methods.  Maintaining this requirement will help to ensure the same transparency exists for the RTO/ISO footprint as in other regions.

# CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☐ Yes

☒ No

Comments: There is a reliability need for communication and coordination of TTC, CBM, and TRM determination, but no reliability need exists for every Transmission Service Provider to utilize the exact same methods to determine these values.

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: Availability of CBM is an integral part of overall system reliability for each entity that relies on it as part of its generation adequacy calculations.

**11. Do you agree with the scope of the proposed standard?**

☐ Yes

☒ No

Comments: As with the SAR for MOD-001-0, the scope of this SAR goes beyond what is required for system reliability. There is no reliability need to prescribe in detail how each entity should calculate either TRM or CBM. There is a need to ensure transparency in the methodology used by each entity, but not in the specific components of the calculation.

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☐ Yes

☒ No

Comments:

**13. Do you agree with the list of entities to which the standard would apply?**

☐ Yes
☒ No

Comments: Similar to the comments supplied in response to Question 8, we expect that all regions will be expected to clearly document their assumptions and methods, regardless of operational or organizational structure, in order to ensure transparency.

**14. Do you have any other terms that should be included in the definitions?**

☒ Yes

☐ No

Comments: Please define "Calculation Model" as described in requirement R1.7.9.

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes
☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments: If a standard is developed that extends beyond the basic assurance of transparency, any resulting method should only mandate that certain guiding principles be considered in the determination of TRM and CBM - rather than mandate that a prescriptive set of calculations be made. Furthermore, each entity responsible for the generation adequacy of their system should be the one to determine how best to consider their own internal generation for use in the determination of an appropriate CBM value for that specific system.

2) Proposed Revisions to Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0 (CBM/TRM)

# AFC/ATC/TTC SAR Regarding Existing Standard MOD-001-0

1. **Is there a reliability need for the proposed standard?**

   ☒ Yes

   ☐ No

   Comments:

2. **Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?**

   ☒ Yes

   ☐ No

   Comments:

3. **Do you agree with the scope of the proposed standard?**

   ☒ Yes

   ☐ No

   Comments:

4. **Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

   **Note: NAESB has a proposal for companion business practice - R05004)**

   ☒ Yes

   ☐ No

   Comments: NAESB business practice R05004.

5. **Do you agree with the list of entities to which the standard would apply?**

   ☒ Yes

   ☐ No

   Comments:

**6. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**7. Do you have any other data elements that should be included in the coordination and communication of the calculation of AFC/ATC/TTC?**

☐ Yes

☒ No

Comments:

**8. Do you have any other comments on these proposed standards?**

Comments: As written, the proposed standards do not require an RTO/ISO to develop and document an AFC/TTC/ATC methodology consistent with the standards. Section B (R1) must inlcude language to ensure that the standard also applies to an RTO/ISO performing AFC/TTC/ATC calculations.

Throughout the proposed standard, there is not a consistent reference to AFC and TTC/ATC. For example, some areas of the SAR refer only to AFC and other areas refer to TTC/ATC. All requirements of the proposed standard should apply to all three quantities, AFC/TTC/ATC.

## CBM/TRM SAR Regarding Existing Standards MOD-004-0, MOD-005-0, MOD-006-0, MOD-008-0, and MOD-009-0

**9. Is there a reliability need for the proposed standard?**

☒ Yes

☐ No

Comments:

**10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard? Y/N Comment?**

☒ Yes

☐ No

Comments: But, only to the extent that the resource adequacy requirement of the CBM region assumes support from external resources AND the transmission system of the CBM region is planned and built to accommodate the CBM amount.

**11. Do you agree with the scope of the proposed standard?**

☒ Yes

☐ No

Comments:

**12. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?**

**Note: NAESB has a proposal for companion business practice - R05004)**

☒ Yes

☐ No

Comments: NAESB business practice R05004.

**13. Do you agree with the list of entities to which the standard would apply?**

☒ Yes

☐ No

Comments:

**14. Do you have any other terms that should be included in the definitions?**

☐ Yes

☒ No

Comments:

**15. Do you have any other data elements that should be included in the coordination and communication of the calculation of CBM/TRM?**

☐ Yes

☒ No

Comments:

**16. Do you have any other comments on these proposed standards?**

Comments: As written, the proposed standards do not require an RTO/ISO to develop and document a CBM/TRM methodology consistent with the standards. Section R1 of MOD-004-00 must inlcude language to ensure that the standard also applies to an RTO/ISO performing CBM/TRM calculations.

Within section R1.5 (note numbering error in this section of the SAR) of the CBM methodology (allocation of CBM to interfaces), the methodology should require the specification and rational for the selection of source and sink points to simulate the import of the CBM amount, if a simulation is performed. The source and sink points must be consistent with those used by the transmission owner/service provider in their CBM planning studies.

The CBM/TRM SAR should include a requirement that the methodology specify how CBM/TRM is incoporated in the AFC/ATC/TTC calculations (firm, nonfirm, or both). If CBM/TRM is applied within a market structure that utilizes a security constrained centrally dispatch system (locational marginal pricing), the SAR should require the that CBM/TRM methodology specify how it is applied in financial transmission rights models, day-ahead models, and real-time models.

# Questions 1 – 8 apply to ATC/TTC/AFC SAR
# Questions 9 – 16 apply to CBM/TRM SAR

1. Is there a reliability need for the proposed standard?

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Summary | | | In general, most people felt that there is a reliability need for the proposed standard.<br><br>Most of the parties that responded had no comments, however two that did comment felt that TTC and TRM were reliability quantities and that ATC and AFC were market quantities.<br><br>Nearly all commented that yes there is a reliability need – Of the 14 that responded only four commented with any level of negative response, but just for ATC. These four stressed TTC is a reliability quantity and should be addressed. | The ATCT SAR drafting team agrees that there is a reliability need for the proposed standard, and believes that TTC/ATC are not reliability indicators, but are derived from reliability-based values, assumptions and criteria. However, there is a need to acknowledge the relationship between TTC and ATC values. The drafting team believes that both these quantities should be addressed by this reliability standard. |

2. Is the proposed scope of the standard sufficient to address reliability concerns; i.e. should the proposed standard include standardizing methods for the calculation of ATC, AFC and TTC?

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Total: | | | | |
| | | | Of 14 responses, 6 were “yes”, 6 were “no”, and 2 were “yes and no”. The majority of comments are in agreement, however.<br><br>In general, most people disagree with the idea of a standard methodology for ATC/TTC/AFC calculation. NCMPA1 is the only exception.<br><br>Nearly all commented about the need for increased data exchange, coordination, and documentation to promote transparency. | The DT believes that each entity, in complying with the standard, should clearly document the fundamental components of its transfer capability calculations and make such documentation transparent to the marketplace.<br><br>While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves.<br><br>When a commenter refers to “standard methodology”, it is unclear if they are referring to a standard method for only Total Transfer Capability (TTC), Available Transfer Capability (ATC), or Available Flowgate Capability (AFC) or for all three.<br><br>The SAR drafting recognizes the need for clarification and regional standardization of these issues, and will refer them to the Standard Drafting Team. |
| WPS Resources<br>Christopher Plante | X | | | |
| Southern company – Transmission | | X | The standard should focus on increasing the transparency of study assumptions and methods utilized by each Transmission Service Provider (TSP), rather than attempt to prescribe or mandate the exact procedures and assumptions used in the calculation of TTC/ATC/AFC by all TSPs. Determination of ATC is already defined within each FERC-jurisdictional TSP's Open Access Transmission Tariff (Attachment C of the pro-forma OATT). There is no reliability need to mandate a prescribed, detailed procedure and assumptions for calculating TTC/ATC/AFC. | While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves. |
| Southern Company Generation | | X | The standard should focus on increasing the transparency of study assumptions and methods utilized by each Transmission Service Provider (TSP), rather than attempt to prescribe or mandate the exact procedures and assumptions used in the calculation of TTC/ATC/AFC by all TSPs. Additionally, this standard should increase | While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves. |

| | | | | |
|---|---|---|---|---|
| | | | communication around and the coordination of transfer capability calculations. Determination of ATC is already defined within each FERC-jurisdictional TSP's Open Access Transmission Tariff (Attachment C of the pro-forma OATT). There is no reliability need to mandate a prescribed detailed procedure and assumptions for calculating TTC/ATC/AFC. | |
| NYISO | X | | Coordination and documentation of the calculation method would improve transparency. Standardization, however, must recognize the inherent differences between systems which employ physical transmission reservations and energy markets which use financial congestion management and not be prescriptive | Standardization must recognize inherent differences between markets. ATCT DT will work with this concern as regional difference.<br>Coordination and documentation of calculation method would improve transparency. |
| ATC Task Force of NERC Planning Committee | | X | No – The NERC Planning Committee encourages further standardization of certain key elements and parameters in the calculation of ATC, AFC, and TTC. The proposed standards on ATC, AFC, and TTC calculations must require that key elements of the calculation critical to reliability be incorporated into any proposed NERC ATC and TTC standard methodology and strengthened for increased consistency.<br><br>The existing NERC ATC and TTC methodology prescribes a set of requirements that must be addressed in calculating ATC and TTC values. While the current methodology provides a degree of commonality in the calculations, that commonality needs to be strengthened. This strengthening of the calculation requirements refers to additions and refinements to the elements or parameters to be addressed in the calculation methodology and not to the tools or equipment used for the calculations.<br><br>Some examples of the elements critical to reliability and for which further standardization in the ATC and TTC calculations should be required include: 1) coordination in the exchange and use of system data within the Regions and among adjacent Regions, 2) the monitoring of critical limiting transmission facilities under appropriate contingencies consistent with planning and operating criteria, 3) consistency in the manner in which transmission services are reserved, scheduled, and accounted in the calculations, 4) using appropriate | The DT believes that each entity, in complying with the standard, should clearly document the fundamental components of its transfer capability calculations and make such documentation transparent to the marketplace.<br><br>While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves.<br><br>When a commenter refers to "standard methodology", it is unclear if they are referring to a standard method for only Total Transfer Capability (TTC), Available Transfer Capability (ATC), or Available Flowgate Capability (AFC) or for all three.<br><br>The SAR drafting recognizes the need for clarification and regional standardization of these issues, and will refer them to the Standard Drafting Team. |

| | | | | |
|---|---|---|---|---|
| | | | generation dispatches, 5) meeting a minimum frequency of ATC and TTC calculations, 6) base case model building (i.e., what data needs to be incorporated and updated), 7) ATC and TTC calculators (those who are responsible for calculating ATC and TTC values) who impact each other's transmission system must have appropriate and adequate model representation (load level, generation dispatch, transmission and generation outages) of each other's system, and 8) monitoring of transmission facilities based on the use of an appropriate distribution cutoff factor.<br><br>Further, AFC (available flowgate capability) must be clearly defined. The NERC ATC and TTC methodology must be expanded to include and describe the key elements that must be addressed in the calculation of AFC values. In addition, the relationship of AFC to ATC and TTC must be clearly defined along with the manner in which they will be used and coordinated in accounting for transmission reservations and schedules. | |
| North Carolina Municipal Power Agency Number 1. | | X | ATC/TTC/AFC calculations should be standardized across all regions. The way the SAR is written now, TSPs within a region will be required to coordinate methodology and calculations, but the regions will not be required to coordinate with each other. Without standardized calculations and coordination between regions, we will continue to have differences in regional ATC/TTC/AFC values and limit commercial activity. Rather than having calculation differences between neighboring TSPs as it is today, it will just be pushed up to the regional level and the problem of uncoordinated ATC/TTC/AFC values will remain. | While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves. |
| RTO/ISO Standards Review Committee | X | X | We agree that the proposed scope of the standard is sufficient to address reliability concerns. We disagree that there needs to be a standard method for calculation of ATC, AFC and TTC for all ISOs/RTOs. Some differences in methodologies (market, non-market, etc.) may exist, but the processes must be coordinated and work together. | The drafting team realizes that differences in implementing methodologies may exist, but the processes must be coordinated and work together. |
| ISO-NE | X | | | |
| Ontario – Independent Electricity System Operator | X | X | IESO agrees that the proposed scope of the standard is sufficient to address reliability concerns. IESO disagrees | The DT believes that each entity, in complying with the standard, should clearly document the fundamental components of its transfer |

| | | | | |
|---|---|---|---|---|
| | | | that there needs to be a standard method for calculation of ATC, AFC and TTC for all ISOs/RTOs. Some differences in methodologies (market, non-market, etc.) may exist, but the processes must be coordinated and work together. | capability calculations and make such documentation transparent to the marketplace.<br><br>While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves.<br><br>When a commenter refers to “standard methodology”, it is unclear if they are referring to a standard method for only Total Transfer Capability (TTC), Available Transfer Capability (ATC), or Available Flowgate Capability (AFC) or for all three.<br><br>The SAR drafting recognizes the need for clarification and regional standardization of these issues, and will refer them to the Standard Drafting Team. |
| Hydro-Quebec Trans Energie | X | | The proposed standard is already going too much into methodology details | The drafting team disagrees, we believe it has an appropriate amount of detail. |
| FRCC | | X | The proposed standard should require that ATC/AFC values be coordinated across interfaces. The standard should not require one specific uniform methodology for each ATC/AFC calculator for calculating ATC, AFC and TTC, but should require that the Regional Reliability Organizations (including RTO/ISOs) develop a region wide methodology that meets the needs of each respective Planning Authority within the region, such that when applied by individual ATC/AFC calculators would produce consistent results at all interfaces. | The DT believes that each entity, in complying with the standard, should clearly document the fundamental components of its transfer capability calculations and make such documentation transparent to the marketplace.<br><br>While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves.<br><br>When a commenter refers to “standard methodology”, it is unclear if they are referring to a standard method for only Total Transfer Capability (TTC), Available Transfer Capability (ATC), or Available Flowgate Capability (AFC) or for all three.<br><br>The SAR drafting recognizes the need for clarification and regional standardization of these issues, and will refer them to the Standard Drafting Team. |
| Northeast Power Coordinating Council<br>Guy V. Zito | X | | Although it is agreed that the proposed scope is sufficient to address reliability objectives, we disagree that there needs to be a standard outlining the method for calculation of ATC/AFC. There are different market structures in the Northeast and the processes need to be | The DT believes that each entity, in complying with the standard, should clearly document the fundamental components of its transfer capability calculations and make such documentation transparent to the marketplace. |

| | | | | |
|---|---|---|---|---|
| | | | coordinated to ensure they work together to achieve a transparent, documented methodology to calculate those quantities that are critical to maintaining reliability objectives. | While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves.<br><br>When a commenter refers to “standard methodology”, it is unclear if they are referring to a standard method for only Total Transfer Capability (TTC), Available Transfer Capability (ATC), or Available Flowgate Capability (AFC) or for all three.<br><br>The SAR drafting recognizes the need for clarification and regional standardization of these issues, and will refer them to the Standard Drafting Team. |
| Exelon | | X | The standard must state that aspects of the calculation critical to the reliability be required in the methodologies. Some examples of the aspects critical to reliability are exchange and use of data, monitoring all critical flow gates and meeting a minimum frequency of calculation. These items and any others must be required in the methodologies. What method the ATC calculator uses to accomplish these critical aspects is up to them and therefore a standard method should not be required. | The DT believes that each entity, in complying with the standard, should clearly document the fundamental components of its transfer capability calculations and make such documentation transparent to the marketplace.<br><br>While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves.<br><br>The SAR drafting recognizes the need for clarification and regional standardization of these issues, and will refer them to the Standard Drafting Team. |
| MRO<br><br>*Alliant Energy does not agree with these comments | X | | | The DT believes that each entity, in complying with the standard, should clearly document the fundamental components of its transfer capability calculations and make such documentation transparent to the marketplace.<br><br>While the specifics of each calculation may differ to accommodate regional variances, the goal of the standard is to ensure that entities are generating results that are in agreement and foster better coordination and communications between themselves.<br><br>When a commenter refers to “standard methodology”, it is unclear if they are referring to a standard method for only Total Transfer Capability (TTC), Available Transfer Capability (ATC), or Available Flowgate Capability (AFC) or for all three. |

| | | | | |
|---|---|---|---|---|
| | | | | The SAR drafting recognizes the need for clarification and regional standardization of these issues, and will refer them to the Standard Drafting Team. |

3. Do you agree with the scope of the proposed standard?

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Total: | | | | |
| | | | In general, most people felt that the scope of the proposed standard was appropriate. A simple tally of the 14 Yes or No responses comes to 9 Yes, 4 No with one Yes and No. This question (#3) is related to the responses to question #2, and several responders to question #3 simply referred to comments in their response to #2.<br><br>Most felt that standardization *of the particular method of ATC/TTC calculation (i.e. a prescriptive requirement)* was not necessary, although several felt that further standardization of certain coordination elements would improve and strengthen the ATC/TTC calculation process (from responses to question #2).<br><br>some asked for clarification on the applicability of any portion of a standard to either short-term or long-term (service as defined in FERC Order 888,889,638, etc.) TTC/ATC study methods. | The drafting team agrees with the scope of the standard. |
| WPS Resources | X | | | |
| Southern Company Transmission | | X | See comments in response to Question 2 above. Additionally, clarification should be provided with respect to the applicability of any portions of a standard to either short-term and long-term (service as defined in FERC Order 888, 889, 638, etc.) TTC/ATC study methods. The scope is too broad in terms of requiring data that is commercially sensitive (e.g., generation dispatch order); any data to be shared should be adequately protected; and data only needs to be made available if it is truly relevant to the study process. | The drafting team agrees with the scope of the standard.<br><br>The SAR drafting team acknowledges the importance of protecting commercially sensitive information. |
| Southern Company Generation | | X | See comments in response to Question 2 above. In addition, clarification should be provided with respect to the applicability of any portions of a standard to either short-term and long-term service (as defined in FERC Order 888, 889, 638, etc.) TTC/ATC study methods. The scope is too broad in terms of requiring data that is commercially sensitive (e.g., generation dispatch order); any data to be shared should be adequately protected; and data only needs to be made available if it is truly relevant to the study process. | The drafting team agrees with the scope of the standard.<br><br>The SAR drafting team acknowledges the importance of protecting commercially sensitive information. |

| | | | | |
|---|---|---|---|---|
| NYISO | X | | | |
| ATC Task Force of NERC Planning Committee | | X | No – Please see comments provided in response to Question 2. | See response to question 2 |
| North Carolina Municipal Power Agency Number 1. | | X | The scope should include standardized ATC/TTC/AFC calculations and required coordination between regions. | More standardization and greater coordination between regions is a global theme of the LTATF report and their recommendations and the primary goal of the drafting team. The LTATF also recognized, however that a single prescriptive methodology would not be appropriate because regional and market model differences must be accommodated for a standard that will apply to all calculators. |
| RTO/ISO Standards Review Committee | X | | | |
| ISO-NE | X | | | |
| Ontario – Independent Electricity System Operator | X | | | |
| Hydro-Quebec Trans Energie | X | | The standard should be limited to TTC/TFC for reliability purposes and ATC/AFC should addressed by NAESB. | The responder apparently feels that only TTC and TFC are quantities that have reliability significance, while ATCs and AFCs are manipulated by differing market rules (from response to #1).<br><br>The drafting team disagrees; the calculation of TTC/TFC and ATC/AFC (because ATC/AFC are not independent of TTC/TFC, rather they are a subset of TTC/TFC) requires adherence to reliability standards (the purpose of this team), sound engineering principles and good utility practices which are not market rules that could be delegated to NAESB. (See proposed NAESB business practice R05004) |
| FRCC | X | | | |
| Northeast Power Coordinating Council | X | | | |
| Exelon | X | | | |
| MRO<br>*Alliant Energy does not agree with these comments | X | | | |

4. Are there aspects of the proposed standard you believe should be developed as a business practice through NAESB?
Note: NAESB has a proposal for companion business practice - R05004)

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Total: | | | | |
| Total | | | Of 14 responses, 4 were “yes”, 10 were “no”.<br><br>Some commenters indicated that some aspects of the calculation should be developed as business practices by NAESB. There was one comment focused on the separation between business practices and reliability issues. A couple of entities indicated the need for CBM to be included in this standard and not in a business practice standard | NAESB has a proposal for companion business practice - R05004<br><br>R05004 has been revised to deal more specifically with related business practice issues. |
| WPS Resources | X | | | |
| Southern company – Transmission | | X | We believe CBM should remain in this standard due to it being a critical component of Grid reliability and should not become a business practice in a NAESB standard. | CBM is addressed in a companion SAR on CBM/TRM. |
| Southern Company Generation | | X | We would like to emphasize that CBM should remain in this standard due to it being a critical component of Grid reliability and should not become a business practice in a NAESB standard. | CBM is addressed in a companion SAR on CBM/TRM. |
| NYISO | | X | | |
| ATC Task Force of NERC Planning Committee | X | | Yes – The business process flow of requesting transmission service, the evaluation of a transmission service request against the calculated ATC, TTC, or AFC values, and the communication of the resulting service to the transmission user are possible elements to be considered in business practice standards. In developing the business practices, care must be taken to ensure that the tools or equipment to implement this process flow not be specified, only the process flow. All aspects dealing with reliability must be handled by NERC | To the extent the issues are related to market needs and do not impact reliability, it would be appropriate for NAESB to define appropriate standards. It is prudent to have standards define the process, not the implementation details. |
| North Carolina Municipal Power Agency Number 1. | | X | | |
| RTO/ISO Standards Review Committee | | X | | |
| ISO-NE | | X | | |
| Ontario – Independent Electricity System Operator | | X | | |
| Hydro-Quebec Trans Energie | X | | System quantities that are required by the market (such as ATC/AFC ) should be defined by NAESB | To the extent the issues are related to market needs and do not impact reliability, it would be appropriate for NAESB to define |

| | | | | |
|---|---|---|---|---|
| | | | | appropriate standards. |
| FRCC | | X | No, it is not necessary, but to the extent some sort of business issues need to be addressed, such as response times for OASIS requests, it should be limited strictly to business practices, and not address reliability issues. | Certain aspects of every transfer capability calculation deal with market needs and may be better addressed via a business practice standard. The DT agrees that such efforts should not address reliability issues. |
| Northeast Power Coordinating Council | X | | ATC/AFC system quantities that are market specific should be addressed by NAESB | To the extent the items are related to market needs and do not impact reliability, it would be appropriate for NAESB to define appropriate standards. |
| Exelon | | X | | |
| MRO<br>*Alliant Energy does not agree with these comments | | X | There may be certain practices that could be considered for a NAESB Business Practice, however compliance with it should be voluntary. | To the extent the issues are related to market needs and do not impact reliability, it would be appropriate for NAESB to define appropriate standards. If a standard is defined, it must be adhered to; voluntary compliance is not an effective way of achieving industry-wide standardization. |

5. Do you agree with the list of entities to which the standard would apply?

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Total: | | | | |
| Total | | | In general, most people felt that MOD-001-0 should apply to one or more additional entities.<br><br>Nearly all commented that the standard should apply to the Transmission Planner, Planning Authority, and Regional Reliability Organization.<br><br>And some that asked for the standard to apply to the Transmission Owner and Reliability Coordinator. | Transmission Service Providers (TSPs) should be required to document their assumptions and methodologies. Drafting Team should discuss whether the standard applies to Transmission Planner, Transmission Owner, Planning Authority, Reliability Coordinator, Load Serving Entity, Purchase Selling Entity, or Market Operator.<br><br>ISO/RTOs would be covered to the extend they are TSPs. |
| WPS Resources | X | | | |
| Southern Company Transmission | | X | No. See comment in Question #8. | TSPs should be required to document their assumptions and methodologies. Drafting Team should discuss whether the standard applies to Transmission Planner, Transmission Owner, Planning Authority, Reliability Coordinator, Load Serving Entity, Purchase Selling Entity, or Market Operator. |
| Southern Company Generation | | X | RTO/ISOs should be required to provide the same documentation for their assumptions and methods. | TSPs should be required to document their assumptions and methodologies. Drafting Team should discuss whether the standard applies to Transmission Planner, Transmission Owner, Planning Authority, Reliability Coordinator, Load Serving Entity, Purchase Selling Entity, or Market Operator. |
| NYISO | X | | | |
| ATC Task Force of NERC | | X | No – Aspects of this standard also should apply to the Transmission Planner, Transmission Owner, Planning Authority, and Regional Reliability Organization.<br><br>In those areas where Regional Transmission Organizations (RTOs), Independent System Operators (ISOs), or other agents, such as Transmission Service Coordinators (TSCs), are involved with ATC, TTC, and AFC calculations for multiple Regions or portions thereof, the role of these entities must be clearly defined. | TSPs should be required to document their assumptions and methodologies. Drafting Team should discuss whether the standard applies to Transmission Planner, Transmission Owner, Planning Authority, Reliability Coordinator, Load Serving Entity, Purchase Selling Entity, or Market Operator. |

6. Do you have any other terms that should be included in the definitions?

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Total: | | | Of 14 responses, 3 were "yes", 11 were "no".<br><br>Most entities did not see the need for additional terms to be included in the standard. The ones that did see the need for new terms were mostly focused on better definitions for NATC and RATC. | ATCT agrees that Ultimate Source and Ultimate Sink should be defined.<br><br>ATCT DT feels that Non Recallable ATC and Recallable ATC should remain with NERC |
| WPS Resources | | X | | |
| Southern company – Transmission | | X | | |
| Southern Company Generation | | X | It should be pointed out that this standard should contain consistent definitions, including but not limited to, ATC, AFC, TTC, CBM, and TRM. The definitions should be developed as part of the industry effort of this standard. | ATCT agrees that Ultimate Source and Ultimate Sink should be defined.<br><br>ATCT DT feels that Non Recallable ATC and Recallable ATC should remain with NERC |
| NYISO | | X | | |
| ATC Task Force of NERC Planning Committee | X | | Yes – In the SAR or standard drafting of the proposed ATC/TTC standard, definitions must be established, as necessary, for industry acceptance so that a common language is used in reference to ATC and TTC. In particular, definitions for "flowgate," "flowgate rating," and "Available Flowgate Capability (AFC)" need to be established (See also the fourth paragraph in response to Question 2.) since these terms have never been formally defined by NERC.<br><br>On pages SAR - 4 and SAR – 9, further clarification and direction are needed for the Standard Drafting Team (SDT) concerning definitions. This portion of the SAR is not written in complete sentences and therefore may not be completely understood by those who were not on the LTATF. For example, the SAR lists "Daily, Monthly, Yearly TTC." Does the LTATF wish the Standard Drafting Team to prepare definitions for Daily, Monthly, Yearly TTC and ATC? The SAR says that the TTC and ATC are defined in standard 1E1. These definitions should be repeated here so that it is clear what the SDT should use as a starting point. ATC is defined in the SAR by an equation. Is this to be added to the definition in 1E1 for ATC or is this already included in the previous | ATCT DT agrees with ATC Task Force of Planning Committee regarding flowgate, flowgate rating, and available flowgate capability.<br><br>ATCT agrees that Ultimate Source and Ultimate Sink should be defined<br><br>ATCT DT feels that Non Recallable ATC and Recallable ATC should remain with NERC |

| | | | | |
|---|---|---|---|---|
| | | | definition? Then, Existing Transmission Commitments (ETC) is listed with no directions. Does the LTATF wish ETC to be defined, ETC definition to change, or something else? The SAR needs to be specific as to which definitions the SAR drafting team recommends to be added, deleted, or changed. If changes are needed, the SAR needs to explain what sorts of changes are required. | |

8. Do you have any other comments on these proposed standards?

| Commenter | Comment | Response |
|---|---|---|
| | In general, most people felt that RTOs/ISOs should not be exempt from the documentation process, and the methodology should gain RRO approval of the methodology.<br><br>Most felt that standardization was not necessary but consistency and transparency was. There were comments that there was not support for a single tool across the industry.<br><br>Nearly all commented that there should be consistency with the RRO Planning Criteria.<br><br>And some that asked for Interconnection variances to the standard for isolated entities | ACTC SAR DT agrees with the general comments, and that the standard would apply to RTOs and ISOs if they are certified as a Transmission Service Provider.<br><br>ATCT SAR DT suggests that for an entity that crosses multiple RRO boundaries could either get approval from each RRO in aggregate or from NERC. |
| WPS Resources | As written, the proposed standards do not require an RTO/ISO to develop and document an AFC/TTC/ATC methodology consistent with the standards. Section B (R1) must include language to ensure that the standard also applies to an RTO/ISO performing AFC/TTC/ATC calculations.<br><br>Throughout the proposed standard, there is not a consistent reference to AFC and TTC/ATC. For example, some areas of the SAR refer only to AFC and other areas refer to TTC/ATC.<br><br>All requirements of the proposed standard should apply to all three quantities, AFC/TTC/ATC. | See general response to comments above.<br><br>The drafting team will word check the proposal to ensure that all three terms, ATC AFC TTC, are used throughout as appropriate. |
| Southern Company Transmission | While this SAR suggests that individual transmission owners and operators within an RTO or ISO may be exempt from developing and documenting a regional methodology for TTC/ATC/AFC determination, we expect that the RTO/ISO would not be exempt from clearly documenting their assumptions and methods. Maintaining this requirement will help to ensure the same transparency exists for the RTO/ISO footprint as in other regions. | See general response to comments above. |
| Southern Company Generation | While this SAR suggests that individual transmission owners and operators within an RTO or ISO may be exempt from developing and documenting a regional methodology for TTC/ATC/AFC determination, we expect that the RTO/ISO would not be exempt from clearly documenting their assumptions and methods. Maintaining this requirement will help to ensure the same transparency exists for the RTO/ISO | See general response to comments above. |

| | | |
|---|---|---|
| | footprint as in other regions. | |
| NYISO | Section R.1.7 - all data listed should be considered confidential and used for the purposes of RC reliability studies.<br><br>Section R.1.7.2 - please clarify what is meant by Generation Dispatch Order and why it is needed?<br><br>Section R.1.7.6 - please explain why this document specifies the use of tool, namely SDX, while other NERC standards such as coordinated operations are not requiring the use of a specific software tool. | The drafting team does not believe that 1.7.6 specifically requires the use of SDX.<br><br>The drafting team agrees that a coordination agreement is not necessary, but would be advantageous, for an exchange of data in 1.7.7, and will review the wording. |
| ATC Task Force of NERC Planning Committee | Yes - The ATC/TTC SAR needs to be reworded to clearly establish the following:<br>1) A Regional ATC/TTC methodology must be developed in conjunction with Regional members.<br>2) All ATC/TTC calculators must abide by the Regional methodology for the Region in which they are members.<br>3) RTOs and ISOs that encompass multiple Regional Reliability Organizations are exempt from abiding by the Regional ATC/TTC methodology provided they have established a single ATC/TTC calculation methodology, in conjunction with their membership, for the entire RTO or ISO. These RTO or ISO methodologies must be consistent with the requirements of the NERC ATC/TTC standard and applicable Regional criteria.<br>4) 4) RTOs and ISOs that are exempt from the Regional methodologies must perform reviews to ensure consistency between the RTO or ISO ATC /TCC calculation methodology and their members' transmission planning and operating criteria. If this requirement is not added, there is no check on the consistency with planning and operating criteria for members who are not under the Regional methodology but under an RTO or ISO ATC/TCC methodology. This requirement will help to ensure that ATC/TTC calculations only incorporate contingencies, TRM components, and CBM for which the systems are reinforced and planned.<br>5) Each RRO must review and approve the RTO or ISO ATC/TTC methodology to ensure that it is consistent | The drafting team agrees that a coordination agreement is not necessary, but would be advantageous, for an exchange of data in 1.7.7, and will review the wording.<br><br>We will look at moving the wording in R3 to the beginning of the section R1.<br><br>The drafting team will consider market aspects.<br><br>The DT will consider the proposed language change in R.1.1 as proposed by the NERC ATC TF |

| | | |
|---|---|---|
| | with the NERC ATC/TTC standard and the RRO's planning and operating criteria. If this requirement is not added, there appears to be no check of an RTO or ISO's ATT/TCC methodology.<br><br>R1.1 – Revise the first sentence to read "Include a narrative explaining how TTC and ATC values are determined and how those values are used in evaluating a transmission service request (TSR), and how the results of the TSR evaluation are made available to customers."<br><br>R1.7.2 – The update frequency should at least be seasonal.<br><br>R3 – This requirement should be combined with R1.1. | |
| North Carolina Municipal Power Agency Number 1. | | |
| RTO/ISO Standards Review Committee | We would suggest the following replace all of R1, not just the first paragraph:<br>"The development of TTC/ATC/AFC methodology is primarily the responsibility of the Transmission Provider, but may be delegated to a Balancing Authority, a Reliability Coordinator. All responsible entities shall develop and document a TTC and ATC/AFC methodology. In the case where the methodology is developed by a designated entity, that methodology document must clearly indicate to which Transmission Providers it applies. That methodology shall be reviewed by the RRO to ensure coordination between the entities within that region and to ensure compliance with this standard. This methodology document shall be available to NERC, the Regions, and the stakeholders in the electricity market."With this change, the language in R1.12 is no longer needed.<br><br>R1.7 - Several items in the set may be considered confidential information that should not be shared with market participants (such as generator outages and generator dispatch orders). These items can be shared with Transmission Service Providers to be used in TTC and ATC calculations but not be released to market participants.<br><br>R1.7.2 - Because of variations on how generation is dispatched in different markets, the drafting team will need to be clear on the generator dispatch information being requested and how it | The drafting team will evaluate rewording the requirement for 1.9, but that we disagree that the SAR is dictating methodologies, but agree that how Long Term rollover rights should be documented.<br><br>We will look at moving the wording in R3 to the beginning of the section R1.<br><br>The drafting team agrees that a coordination agreement is not necessary, but would be advantageous, for an exchange of data in 1.7.7, and will review the wording.<br><br>Generation dispatch orders are required in areas where ATC and TTC are coordinated<br><br>The appendix is used so as to not bind the standard drafting team to any particular formula. |

| | | |
|---|---|---|
| | will be used.<br><br>R1.7.2 - For generators that will be used to determine firm AFC, these should be limited to generators that have already secured firm usage of the transmission system. A transmission service provider should not include generators in the firm AFC calculation that do not have firm transmission service backing them up.<br><br>R1.7.6 - Should a NERC standard reference a tool (such as the SDX) or be more general and apply to the current tool?<br><br>R1.7.7 - We don't understand why AFC will be exchanged only between entities that have coordination agreements. In the Monitoring/Coordination Section of the LTATF Final Report, it states "The Task Force recommends the revision of the existing NERC standards to require the recognition and respect of impacts on external flowgates/paths in AFC/ATC calculations, and the establishment of NERC standards on AFC/ATC coordination." Monitoring other party flowgates was recommendation V. in the AWTTF Short-Term Recommendations.<br><br>R1.9 - The assumption should also include treatment of transmission requests with a status of Study (for both the transmission provider requests and neighboring transmission provider requests) and long-term firm reservations with roll-over rights (for both the transmission provider requests and neighboring transmission provider requests).<br><br>General - The concepts in Appendix will need to be considered in development of the standard. It contains ATC and AFC formula that are not stated in the body of the SAR. | |
| ISO-NE | Comments on the proposed wording:<br>- The current wording of R1 is very confusing, and does not require that RTO/ISOs have a documented methodology. It seems to be trying to acknowledge that some TPs within an RRO may be using an RTO/ISO methodology. We would recommend that while there may be more than one methodology applicable in a region, it should be required that the methodology for every TP in the RRO be available on the RRO website.<br>- R3 is duplicative and should be deleted | Editorial comments will be addressed during the formal standard development phase.<br><br>If a market is not selling service in advance, a regional difference should be identified in the development of the standard.<br><br>We will look to reconcile R3 with R1 |

| | | |
|---|---|---|
| | - We do not understand why Generation Dispatch orders are required for TTC/ATC coordination, Generation Outage coordination should be adequate<br>- It is unclear in the SAR what the intent is of the Appendix. We do not support the definitions shown being included in the standard.<br><br>Recommendation for a Regional Difference:<br>We suggest that a Regional Difference be added to acknowledge that for TPs within a purely financial market, the ATC requirements of this standard are not applicable. However, the requirements associated with TTC continue to be applicable to these TPs. In addition, if these TPs do post ATC, they should be required to post the methodology used to calculate those posted values. | |
| Ontario – Independent Electricity System Operator | IESO would suggest the following replace all of R1, not just the first paragraph:<br>"The development of TTC/ATC/AFC methodology is primarily the responsibility of the Transmission Provider, but may be delegated to a Balancing Authority, a Reliability Coordinator. All responsible entities shall develop and document a TTC and ATC/AFC methodology. In the case where the methodology is developed by a designated entity, that methodology document must clearly indicate to which Transmission Providers it applies. That methodology shall be reviewed by the RRO to ensure coordination between the entities within that region and to ensure compliance with this standard. This methodology document shall be available to NERC, the Regions, and the stakeholders in the electricity market."<br>With this change, the language in R1.12 is no longer required.<br>R1.7 - Several items in the set may be considered confidential information that should not be shared with market participants (such as generator outages and generator dispatch orders). These items can be shared with Transmission Service Providers to be used in TTC and ATC calculations but not be released to market participants.<br>R1.7.2 - Because of variations on how generation is dispatched in different markets, the drafting team will need to be clear on the generator dispatch information being requested and how it will be used.<br>R1.7.2 - For generators that will be used to determine firm | We will look at moving the wording in R3 to the beginning of the section R1.<br><br>The drafting team does not believe that 1.7.6 specifically requires the use of SDX.<br><br>The drafting team agrees that a coordination agreement is not necessary, but would be advantageous, for an exchange of data in 1.7.7, and will review the wording. |

| | | |
|---|---|---|
| | AFC, these should be limited to generators that have already secured firm usage of the transmission system. A transmission service provider should not include generators in the firm AFC calculation that do not have firm transmission service backing them up.<br>R1.7.6 - The IESO does not believe a NERC standard should reference a specific tool (such as the SDX). It should be more general and apply to the current tool(s)?<br>R1.7.7 - IESO doesn't understand why AFC will be exchanged only between entities that have coordination agreements. In the Monitoring/Coordination Section of the LTATF Final Report, it states "The Task Force recommends the revision of the existing NERC standards to require the recognition and respect of impacts on external flowgates/paths in AFC/ATC calculations, and the establishment of NERC standards on AFC/ATC coordination." Monitoring other party flowgates was recommendation V. in the AWTTF Short-Term Recommendations.<br>R1.9 - The assumption should also include treatment of transmission requests with a status of Study (for both the transmission provider requests and neighboring transmission provider requests) and long-term firm reservations with roll-over rights (for both the transmission provider requests and neighboring transmission provider requests).<br><br>General - The concepts in Appendix will need to be considered in development of the standard. It contains ATC and AFC formula that are not stated in the body of the SAR. | |
| Hydro-Quebec Trans Energie | The proposed standard is asking for exhaustive coordination in TTC/ATC/AFC calculation. Outside system boundary coordination requirements are needed in some parts of an Interconnection but could be minimal in other parts. For example, such exhaustive coordination is not required for DC transmission facilities between two asynchronous systems.<br><br>Hydro-Québec TransÉnergie believes that although standardization and coordination of the calculation of ATC, AFC, TTC and the related definitions of TRM and CBM is a valuable goal, it must take into account the specifics of each System. In its own particular case, Hydro-Québec TransÉnergie's system is in fact a distinct Interconnection as it is not synchronized with the Eastern Interconnection. Its ties with the Eastern Interconnection are either controllable (DC | The drafting team will consider different market aspects. |

| | | |
|---|---|---|
| | ties) or radial (generation/load pockets isolated from one system and synchronized with the other). This situation must be taken into account when calculating TTC and ATC. Not being subject to loop flows originating from neighboring Systems and its internal dispatch causing no such loop flows on those Systems, Hydro-Québec TransÉnergie does not have to participate in coordination to calculate flowgate capacities (AFC). Hydro-Québec TransÉnergie already posts its calculation methodology for ATC on its OASIS. The drafting team should include such considerations in the preparation of the relevant standards. | |
| FRCC | Requirement R1.11 states "Ensure that the TTC/ATC calculations are consistent with the TO/TP planning and operating criteria." The standard must be more descriptive about the relationship between these calculations and their consistency with the appropriate planning criteria. The basic criteria utilized for determining acceptable reliability levels should be consistent, but the assumptions and conditions evaluated may be somewhat different to take into account short-term or real-time system conditions as compared to long term planning assumptions. The time horizons for each process will create differences that must be recognized. In many cases, there will be situations that exist in the short term that were not anticipated or modeled in the longer term (> than 1 year) planning cases, such as, planned or unplanned generator outages or line outages. However, the system security must be evaluated with these outages if they extend over the study period when calculating ATC.<br><br>Requirement R1.5 states "Require that ATC values and posting be updated at a minimum frequency to assure proper representation of the transmission system. These values will be made available to stakeholders at a similar frequency". This requirement should not establish a minimum frequency for updating or posting, rather, it should require a minimum frequency of review, with update and posting, only if necessary. It is imperative that the standard establish frequency minimums and timings that are practical and meaningful. Requirement R1.7 specifies minimum update frequencies for 10 items. The standard should be very clear that if values have not changed from the previous posting, such as in the case where there are not any unscheduled transmission outages (R1.7.3), there is not a requirement to post an update. | We agree that differences could occur between operations planning and long-term planning horizons. |

| | | |
|---|---|---|
| | Requirement R1.7 states "Require that the data listed below, and other data needed by transmission providers for the calculation of TTC and ATC values are shared and used." Add the words "by transmission providers" to the end of the sentence above. This addition will ensure that there is not a requirement to share this sensitive data with the public. | |
| Northeast Power Coordinating Council | General Comment: It must be noted that the application of ATC, and therefore its derivation, can be significantly different in market-based jurisdictions that do not take physical transmission reservations and those that do. The principles that "An Organization Standard shall neither mandate nor prohibit any specific market structure" and "An Organization Standard shall not preclude market solutions to achieving compliance with that standard" must be maintained. The Standards Drafting Team must be familiar with the market structures in use in North America, to accommodate these variances<br>Items for the Standard Drafting team to consider with respect to the proposed wording:<br>- R1 is very confusing with it's reference to how the methodology must be documented. It seems to leave a hole that does not require RTO/ISOs to post their methodology. While there may be more than one methodology applicable in a region, it should be required that the methodology for every TP in the RRO be available on the RRO website.<br>- R3 is duplicative and should be deleted<br>- We do not understand why Generation Dispatch orders are required for TTC/ATC coordination, Generation Outage coordination should be adequate<br>- It is unclear in the SAR what the intent is of the Appendix. We do not support the definitions shown being included in the standard. | We will look at moving the wording in R3 to the beginning of the section R1.<br><br>The use of the appendix to provide the standard drafting team with the initial thoughts and work of the SAR drafting team, but to not bind them in scope. |
| Exelon | ATC/TTC SAR does not require a RTO or ISO to have a methodology that meets the requirements in this proposed standard. The following wording changes (noted in CAPITALS) to section B-R1 are recommended.<br><br>MOD-001-0 Requirement 1 (R1). Each group of transmission service providers and/or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region shall jointly develop and document a REGIONAL TTC and ATC (which may include the calculation of ATC) methodology. | The standard would apply to RTOs and ISOs if they are certified as a Transmission Service Provider. |

| | | |
|---|---|---|
| | If the transmission service providers and/or AFC/ATC/TTC calculators' AFC, TTC, and ATC values are determined by RTO or ISO, then a jointly developed regional methodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a jointly developed regional methodology. A RTO OR ISO THAT CALCULATES AFC/ATC/TTC IS REQUIRED TO HAVE A WRITTEN METHODOLOGY DOCUMENT THAT MEETS THE REQUREMENTS SPECIFIED IN THIS STANDARD.<br><br>M2 needs to specify that RTOS AND ISOS WILL ALSO BE REQUIRED TO PERFORM THIS REVIEW OF CONSISTENCY WITH PLANNING CRITERIA AND DOCUMENT THE RESULTS. If this requirement is not added, there is no check on the consistency with planning criteria for members who are not under the regional methodology but under a RTO or ISO methodology. | |
| MRO<br>*Alliant Energy does not agree with these comments | On page SAR - 4 Clarification is needed providing the direction for the Standard Drafting Team concerning definitions. This portion of the SAR is not written in complete sentences so that it can be completely understood by those who are not on the LTATF For example, the SAR lists "Daily, Monthly, Yearly TTC". Does the LTATF wish the Standard Drafting Team to prepare definitions for Daily, Monthly, Yearly TTC? The SAR says that the TTC and ATC are defined in standard 1E1. These definitions should be repeated here so that it is clear what the SDT should use as a starting point. ATC is defined in the SAR by an equation. Is this to be added to the definition in 1E1 for ATC or is this already included in the previous definition? Then ATC is listed with no directions. Does the LTATF wish ATC to be defined, ATC definition to change, or something else? The SAR needs to be specific as to which definitions the SAR drafting team thinks needs to be added, deleted, or changed. If changes are needed, the SAR needs to explain what sort of changes are required.<br><br>COMMENTS TO MOD-001-0<br>R1 - Revise the first paragraph to read " Each Transmission Provider shall develop and document a TTC and ATC (may include the calculation of AFC) methodology, and require coordination between the Transmission Providers, with oversight by the respective RRO's." We do not see the need for a RRO region wide methodology, but do see the need for the | The drafting team agrees with MRO and will set forth a minimum set of definitions that must be included in the calculators methodology<br><br>The drafting team believes that MOD-001 clearly addresses the need for an RRO wide methodology.<br><br>The drafting team will consider the proposed language modification by MRO in R.1.1<br><br>The timeframes referenced reflect current requirements for calculation and posting of ATC/TTC by the appropriate regulatory bodies. |

| | | |
|---|---|---|
| | RRO to review the methodology the Transmission Providers use to insure it meets the requirements of this standard. The regional methodology would need to be at a high level even with the exclusion of RTO/ISO members. MRO members include ISO and non-ISO members throughout the MRO region. It would be better for reliability to have the MRO review the Transmission Provider methodology for the items included in the standard then to have a high level regional methodology for non-ISO/RTO members.<br>R1.1 - Revise the first sentence to read "Include a narrative explaining how TTC and ATC values are determined and how those values are used in evaluating a transmission service request (TSR), and how the results of the TSR evaluation are made available to customers."<br>R1.2 - Please clarify what the explanation in the second sentence is meant to accomplish.<br>R1.71 - We would recommend revising the 13 month time frame to 12 months, to reflect seams agreements presently in place.<br>R1.7.2 - The update frequency should at least be seasonal.<br>R1.7.3 - We would recommend revising the 13 month time frame to 12 months, to reflect seams agreements presently in place.<br>R1.9 - Add "(Netting)" after "Transmission Reservations".<br>R1.12 - Revise the article to have the RRO provide authorization for a variance to the regionally approved Transmission Provider's ATC/TTC methodology. Variances to the MRO approval do not require NERC approval.<br>R3 should be combined with R1.1<br>Section C. Measures should be as follows:<br>M1. Each group of transmission service providers within a region, in counjunction with the members of that region, shall jointly develop and implement a procedure to review changes periodically (at least annually) and ensure that that TTC and ATC/AFC calculations and resulting values of member transmission providers comply with the Regionally approved Transmission Provider TTC and ATC methodology, the NERC Planning Standards, and applicable RRO criteria.<br>M2. A review to verify that theAFC/TTC calculations are consistent with the TO's/TP's planning criteria is also required. The procedure used to verify the consistency must also be documented in the report. Documentation of the results of the most current reviews shall be provided to NERC within 30 | |

| | | |
|---|---|---|
| | days of compliance.<br>M3. Each entity responsible for the TTC and ATC methodology, in conjunction with its member(s) and stakeholders, shall have and document a procedure on how stakeholders can input their concerns or questions regarding the TTC and ATC methodology and values of the transmission provider(s), and how these concerns or questions will be addressed. Documentation of the procedure shall be available on a web site accessible by the Regions, NERC, and the stakeholders in the electricity market.<br>M4. The RRO must review and approve the ATC/TTC methodology so as to ensure it is consistent with the RRO's Planning and Operating Criteria. | |

## Questions 1 – 8 apply to ATC/TTC/AFC SAR
## Questions 9 – 16 apply to CBM/TRM SAR

9. Is there a reliability need for the proposed standards?

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Total: | | | | The SAR drafting team agrees that there is a reliability need for the standards. |
| WPS Resources | X | | | |
| Southern Company Transmission<br>Marc M. Butts<br>Raymond Vice<br>Keith Calhoun<br>Jim Viikinsalo<br>Doug McLaughlin<br>Jim Griffith<br>Steve Corbin<br>Dean Ulch<br>Mike Robinson<br>Matt Guillebaud | | X | There is a reliability need for communication and coordination of TTC, CBM, and TRM determination, but no reliability need exists for every Transmission Service Provider to utilize the exact same methods to determine these values. | ATCT DT – despite checkbox, answer appears to be yes, but that SCT would like not be bound by the exact same methods. |
| Southern Company Generation<br>Roman Carter<br>Matt Ansley<br>Roger Green<br>Terry Crawley<br>Tom Higgins | | X | There is a reliability need for communication and coordination of TTC, CBM, and TRM determination, but no reliability need exists for every Transmission Service Provider to utilize the exact same methods to determine these values. | ATCT DT – despite checkbox, answer appears to be yes, but that SCG would like not be bound by the exact same methods. |

10. Is the calculation and/or withholding of CBM (as opposed to TRM) as an explicit quantity necessary for reliability and should it be part of a reliability standard?

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Total: | | | In general, most people felt that withholding of CBM is necessary for reliability, though some areas use zero CBM.<br><br>Some replied that standardization is necessary if CBM is withheld.<br><br>Only one "No" response, which came from Hydro Quebec | The ATCT DT believes that the original intent of CBM was to protect the LSEs within an area and should be a benefit to reliability, but some of the ATCT DT feels that the current processes employed by transmission service providers could actually be a detriment rather than a benefit to reliability.<br><br>A minority opinion white paper has been written on this topic and provided with the ATCT DT information. However, the others on the ATCT DT feel that the calculation of CBM amounts and how they are implemented in an ATC/TTC calculation are reliability issues that belong in the CBM/TRM standard.<br><br>ATCT DT believes that only MOD –006 Section R.1.3 should be sent to NAESB (Procedure for the use of CBM Values). The process under which CBM is released for use by the market may be considered a business practice that could be handled by NAESB.<br><br>CBM will not be required to be withheld. If it is used, a consistent regional (RRO) methodology will be required. |
| WPS Resources | X | | But, only to the extent that the resource adequacy requirement of the CBM region assumes support from external resources AND the transmission system of the CBM region is planned and built to accommodate the CBM amount. | In areas that utilize CBM, consistency between CBM calculation criteria and planning criteria will be required |
| Southern Company Transmission | X | | Availability of CBM is an integral part of overall system reliability for each entity that relies on it as part of its generation adequacy calculations. | CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology will be required. |
| Southern Company Generation | X | | Availability of CBM is an integral part of overall system reliability for each entity that relies on it as part of its generation adequacy calculations. | CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology will be required. |
| NYISO | X | | In the operation horizon the NYISO does not use CBM, however, we agree that areas that employ a non-zero CBM should coordinate and document the process. | In areas that utilize CBM, transparency in the calculation methodology of CBM will be required. |
| ATC Task Force of NERC Planning Committee | X | | Yes – Earlier in the development of this industry, there were predominantly local, vertically integrated electric utilities. Each utility built sufficient generation to serve its own load responsibility. Transmission interconnections with neighboring utilities were typically established for one of the following reasons: 1) to minimize duplication of transmission (i.e., tie to neighbor | Agreed. CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology will be required.<br>Agreed. CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology will be required to recognize the Reserve Sharing Pools. |

| | | | | |
|---|---|---|---|---|
| | | | for transmission reliability), and 2) an economic decision, to build transmission instead of generation based on the generation reliability criteria for which the utility planned (i.e., tie to neighbor to meet generation reliability criteria). This second reason is the origin of the CBM concept. Transmission interconnections provide each interconnected system with access to its neighbors so that in the event of an extreme generation outage within a utility, the temporarily generation deficient utility could have access to "emergency" generation resources from its interconnected neighbors. CBM is the quantification of this use of the transmission system. Therefore, CBM is an "emergency" use transmission quantity and only exists on the importing system for use only during periods of an emergency generation deficiency when firm transmission service is not available. Just as transmission capacity is preserved for the transmission contingencies for which a utility plans, transmission capacity is also preserved for the generation contingencies for which a utility plans. In either case, the utility customers paid for the transmission capacity that was installed to maintain the reliability level that is planned, via their rates for service.<br><br>Some reserve sharing pools utilize CBM to ensure transfer capability is available for movement of emergency energy. Without CBM, this may not be possible, resulting in significant reliability issues. | |
| North Carolina Municipal Power Agency Number 1. | | | | |
| RTO/ISO Standards Review Committee | X | | Some areas use zero for CBM. If CBM is used, the standardized definitions should be used and amount disclosed. | Agreed. CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology will be required. |
| ISO-NE | X | | | |
| Ontario – Independent Electricity System Operator | X | | Some areas use zero for CBM. If CBM is used, the standardized definitions should be used and amount disclosed. | In areas that utilize CBM, transparency in the calculation methodology of CBM will be required. |
| Hydro-Quebec Trans Energie | | X | LSEs should gain firm access to the system to be protected for contingencies by acquiring adequate transmission service from the source to the load, not by CBM and/or TRM. | ATCT DT thinks that CBM is needed for reliability, and while that there is a clear need to reserve access from generation to load, whether it is done through an explicit reservation or CBM, is up to the transmission provider and/or appropriate regulatory agency. |
| FRCC | X | | Since CBM is an "implied" reservation of a portion of the transmission capability it is important to include it an | In areas that utilize CBM, inclusion in ATC calculations will be required. |

| | | | | |
|---|---|---|---|---|
| | | | ATC calculations to ensure reliability. | |
| Northeast Power Coordinating Council | X | | While not all TPs use CBM, those that do use it for reliability reasons. | Agreed. CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology will be required. |
| Exelon | X | | Earlier in the development of this industry, there were predominately 'local' vertically integrated electric utilities. Each utility built sufficient generation to serve its own load responsibility. Transmission interconnections with neighboring utilities were typically established for one of the following reasons:<br>First, to minimize duplication of transmission (i.e. tie to neighbor for transmission reliability.)<br>Second, was an economic decision to build transmission instead of generation based on the generation reliability criteria the utility planned for (i.e. tie to neighbor to meet generation reliability criteria.)<br>This second reason is the origin of the CBM concept. Transmission interconnections provide each interconnected system with access to their neighbors so that in the event of an extreme generation outage within a utility, that temporarily generation deficient utility could have access to 'emergency' generation resources from their interconnected neighbors. CBM is the quantification of this use of the transmission system. Therefore CBM is an 'emergency' use transmission quantity and only 'exists' on the importing system for use only during periods of an emergency generation deficiency when firm transmission service is not available. Just as transmission capacity is preserved for the generation contingencies a utility planned for, transmission capacity is also preserved for the generation contingencies that are planned for. In either case, the utility customers paid for the transmission capacity that was installed to maintain the reliability level that is planned for, via their rates for service. | Agreed. CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology will be required. |
| MRO<br>Alliant Energy does not agree with these comments | X | | Some reserve sharing pools utilize CBM to insure transfer capability is available for movement of emergency energy. Without CBM, this may not be possible resulting in significant reliability issues. | Agreed. CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology will be required.<br>Agreed. CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology will be required to recognize the Reserve Sharing Pools. |

11. Do you agree with the scope of the proposed standard?

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Total: | | | In general, most companies/organizations that commented on the SAR agreed with the scope of the proposed standards. Only three commenters did not agree with the scope. These were Hydro Quebec Trans Energie (agreed and disagreed), Southern Company Generation, and Southern Company Transmission.<br><br>Most felt that the scope of the proposed standard was acceptable.<br><br>Nearly all elected not to comment except for a statement of agreement with the scope of the proposed standard. | The majority of the drafting team agrees with the scope. |
| WPS Resources | X | | | |
| Southern Company Transmission | | X | As with the SAR for MOD-001-0, the scope of this SAR goes beyond what is required for system reliability. There is no reliability need to prescribe in detail how each entity should calculate either TRM or CBM. There is a need to ensure transparency in the methodology used by each entity, but not in the specific components of the calculation. | ATCT DT feels that the level of detail and data elements remain to be specified, but that coordination and communication procedures should be the same.<br><br>ATCT DT recognizes that different regulatory regimes might impact what is determined to be needed for CBM and TRM. |
| Southern Company Generation | | X | As with the SAR for MOD-001-0, the scope of this SAR goes beyond what is required for system reliability. There is no reliability need to prescribe in detail how each entity should calculate either TRM or CBM. | RTO/ISO Standards Review Committee | | X | | |
| ISO-NE | | X | | |
| Ontario – Independent Electricity System Operator | | X | | |
| Hydro-Quebec Trans Energie | X | | System reliability impacted by transmission congestion could be managed by the market through adequate and well coordinate market rules | The Drafting Team agrees. However, this approach requires liquid and transparent markets, which do not exist in some regions. The Drafting Team will look for a solution that can be applied to all market types. |

| | | | | |
|---|---|---|---|---|
| | | | | ATCT DT believes that only MOD –006 Section R.1.3 should be sent to NAESB (Procedure for the use of CBM Values). The process under which CBM is released for use by the market may be considered a business practice that could be handled by NAESB. However, the calculation of CBM amounts and how they are implemented in an ATC/TTC calculation are reliability issues that belong in the CBM/TRM standard. |
| FRCC | | X | No, it is not necessary, but to the extent some sort of business issues need to be addressed, such as response times for OASIS requests, it should be limited strictly to business practices, and not address reliability issues. Additionally, TRM is a reliability quantity and therefore would be inappropriate for NAESB to have a parallel standard. | ATCT DT believes that only MOD –006 Section R.1.3 should be sent to NAESB (Procedure for the use of CBM Values). The process under which CBM is released for use by the market may be considered a business practice that could be handled by NAESB.<br><br>However, the calculation of CBM amounts and how they are implemented in an ATC/TTC calculation are reliability issues that belong in the CBM/TRM standard. |
| Northeast Power Coordinating Council | | X | | |
| Exelon | | X | | |
| MRO<br>*Alliant Energy does not agree with these comments | | X | There may be certain practices that could be considered for a NAESB Business Practice, however compliance with it should be voluntary. | ATCT DT believes that only MOD –006 Section R.1.3 should be sent to NAESB (Procedure for the use of CBM Values). The process under which CBM is released for use by the market may be considered a business practice that could be handled by NAESB. However, the calculation of CBM amounts and how they are implemented in an ATC/TTC calculation are reliability issues that belong in the CBM/TRM standard. |

13. Do you agree with the list of entities to which the standard would apply?

| Commenter | Yes | No | Comment | Response |
|---|---|---|---|---|
| Total: | | | In general, most people felt that additional entities to which the standard would apply needed to be added to the list.<br><br>Nearly all responders (7/9) who thought additional entities should be added commented that the following entities were appropriate to add – Planning Authority, Regional Reliability Organization and Transmission Planners<br><br>And some responders who thought additional entities should be added commented that the following additional entities be added – Transmission Owner (4/9), Reliability Coordinator (1/9), Load Serving Entity (1/9), Purchasing-Selling Entity (1/9), Market Operator (1/9), RTO/ISO (1/9). | This standard would apply to whatever entity that calculates CBM/TRM, and could apply to TSP, Planning Authority, Regional Reliability Organization and Transmission Planners |
| WPS Resources | X | | | |
| Southern Company Transmission | | X | Similar to the comments supplied in response to Question 8, we expect that all regions will be expected to clearly document their assumptions and methods, regardless of operational or organizational structure, in order to ensure transparency. | The drafting team agrees with the need for transparency. |
| Southern Company Generation | | X | RTO/ISOs should be required to provide the same documentation for their assumptions and methods. | DT agrees addition of suggested additional entities is appropriate.<br><br>RTO/ISOs would be covered if they are registered as Transmission Service Providers. |
| NYISO | X | | | |
| ATC Task Force of NERC Planning Committee | | X | No – Aspects of this standard also should apply to the Transmission Planner, Transmission Owner, Planning Authority, and Regional Reliability Organization.<br><br>In those areas where Regional Transmission Organizations (RTOs), Independent System Operators (ISOs), or other agents, such as Transmission Service Coordinators (TSCs), are involved with ATC, TTC, and AFC calculations for multiple Regions or portions thereof, the role of these entities must be clearly defined. | DT agrees addition of suggested additional entities is appropriate.<br><br>RTO/ISOs would be covered if they are registered as Transmission Service Providers. |

| Exelon | | X | | |
| MRO<br>*Alliant Energy does not agree with these comments | | X | | |

16. Do you have any other comments on these proposed standards?

| Commenter | Comment | Response |
|---|---|---|
| | Generally most agreed that the SAR needs to state that to the extent that RTOs/ISOs are transmission service providers, they also need to also document their methodology with RRO approval | ATCT DT – where a TSP crosses Regional boundaries, all RROs must approve the methodology. ATCT SAR DT suggests that for an entity that crosses multiple RRO boundaries could either get approval from each RRO in aggregate or from NERC.<br><br>ATCT DT – will remove references to RTOs/ISOs because they are not in the functional model, howeverthey could be acting as a TSP with respect to these standards<br><br>ATCT DT – each TSP's methodologies will have to meet their respective Regional criteria.<br><br>CBM will not be required to be withheld, if it is used a consistent regional (RRO) methodology should be required. |
| WPS Resources | As written, the proposed standards do not require an RTO/ISO to develop and document a CBM/TRM methodology consistent with the standards. Section R1 of MOD-004-00 must inlcude language to ensure that the standard also applies to an RTO/ISO performing CBM/TRM calculations.<br><br>Within section R1.5 (note numbering error in this section of the SAR) of the CBM methodology (allocation of CBM to interfaces), the methodology should require the specification and rational for the selection of source and sink points to simulate the import of the CBM amount, if a simulation is performed. The source and sink points must be consistent with those used by the transmission owner/service provider in their CBM planning studies.<br><br>The CBM/TRM SAR should include a requirement that the methodology specify how CBM/TRM is incorporated in the AFC/ATC/TTC calculations (firm, nonfirm, or both). If CBM/TRM is applied within a market structure that utilizes a security constrained centrally dispatch system (locational marginal pricing), the SAR should require the that CBM/TRM methodology specify how it is applied in financial transmission rights models, day-ahead models, and real-time models. | ATCT DT – where a TSP crosses Regional boundaries, all RROs must approve the methodology<br><br>ATCT DT – will remove references to RTOs/ISOs because they are not in the functional model, howeverthey could be acting as a TSP with respect to these standards<br><br>ATCT DT – each TSP's methodologies will have to meet their respective Regional criteria. |
| | | |

| | | |
|---|---|---|
| Southern Company Transmission | If a standard is developed that extends beyond the basic assurance of transparency, any resulting method should only mandate that certain guiding principles be considered in the determination of TRM and CBM - rather than mandate that a prescriptive set of calculations be made. Furthermore, each entity responsible for the generation adequacy of their system should be the one to determine how best to consider their own internal generation for use in the determination of an appropriate CBM value for that specific system. | ATCT DT - the current and proposed versions of MOD 4 state that a CBM methodology be developed within an RRO. If options are provided in the regional methodology, each TSP must document which option is being used. |
| Southern Company Generation | If this standard is developed beyond the transparency issue, the methodology should only mandate that certain guiding principles be considered in the determination of TRM and CBM and not that a industry-wide prescriptive set of calculations be made. Also it should be up to each entity with responsibility for their own system reliability and generation adequacy on how internal generation should be considered in the determination of CBM and thus generation adequacy within their system. | ATCT DT - the current and proposed versions of MOD 4 state that a CBM methodology be developed within an RRO. If options are provided in the regional methodology, each TSP must document which option is being used. |
| NYISO | | |
| ATC Task Force of NERC Planning Committee | Yes – The CBM/TRM SAR needs to be reworded to clearly establish the following:<br>1) A Regional CBM/TRM methodology must be developed in conjunction with Regional members.<br>2) All entities calculating CBM and/or TRM must abide by the Regional methodology for the Region in which they are members.<br>3) RTOs and ISOs that encompass multiple Regional Reliability Organizations are exempt from abiding by the Regional CBM/TRM methodologies provided they have established a single CBM and/or TRM calculation methodology, in conjunction with their membership, for the entire RTO or ISO. These RTO or ISO methodologies must be consistent with the requirements of the NERC CBM/TRM standard and applicable Regional criteria.<br>4) RTOs and ISOs that are exempt from the Regional methodologies must perform reviews to ensure consistency between the RTO or ISO CBM and/or TRM calculation methodologies and their members' transmission planning, generation planning, and operating criteria. If this requirement is not added, there is no check on the consistency with planning and operating criteria for members who are not under the Regional methodology but under an RTO or ISO CBM | ATCT DT – will remove references to RTOs/ISOs because they are not in the functional model however, and they could be acting as a TSP with respect to these standards<br><br>The drafting team will forward these comments to the standards drafting team for possible use during the detailed standards drafting process.<br><br>ATCT DT – for those methodologies include N-1 loss of a unit in TRM, CBM should not also include the loss of that unit, to avoid double counting. |

| | | |
|---|---|---|
| | and/or TRM methodology.<br>5) In addition, the text in section R1 of the SAR needs to be revised to clarify that the following reviews are to be performed by the RRO. First, each RRO needs to review the CBM and/or TRM calculations of transmission providers under the Regional methodology to ensure they are adhering to the Regional methodology. Second, each RRO must review and approve the RTO and ISO CBM and/or TRM methodologies to ensure they are consistent with the NERC CBM/TRM standard and the RRO's planning and operating criteria. Finally, the RRO is responsible for ensuring that TRM calculations performed by transmission service providers, regardless of what methodology they are under, are consistent with the individual transmission owner's planning criteria.<br><br>COMMENTS TO MOD-004-0<br>R1.2 – In bullets 1 and 2, the word "must" should be deleted. It is not necessary.<br>Under the present article number R1.7 – Clarify what the objective is for the "simultaneous application of CBM and TRM." Is this intended to make sure that reserves are not double counted?<br>COMMENTS TO MOD –008-0<br>R1.7 – Clarify what the objective is for the "simultaneous application of CBM and TRM." | North Carolina Municipal Power Agency Number 1. | | |
| RTO/ISO Standards Review Committee | COMMENTS TO MOD-004-0 and MOD-008-0<br>R1 - References to having a single regional CBM methodology and TRM methodology should be removed along with references to exceptions for entities that are members of an RTO or an ISO.<br>R.1.6 - To the extent generators that are not committed to serve load inside the transmission provider's system are considered in the CBM requirement determination, there should be CBM preserved on impacted flowgates for the use of this | These details will be forwarded to the Standard drafting team when it is formed.<br><br>The ATDT DT suggests that the TSP use the best information available to them (i.e. confirmed or requested transmission service/no service) to determine how these units should be considered in the CBM requirement determination. All assumptions made must be documented and approved by the entity responsible for the methodology. |

| | | |
|---|---|---|
| | generation.<br>There are two R1.4, R1.5 and R1.6.<br>R1.8 - CBM should not be used in place of maintaining either minimum planning reserves or to compensate for poor generator maintenance practices.<br>General - When establishing CBM import area boundaries, there is an explicit assumption that all generators can serve all load within the boundary (with no constraints). As part of the description of the CBM calculation process, it should describe the basis for establishing the CBM import area boundaries. | |
| ISO-NE | Comments on the proposed wording:<br>- R1 of MOD-004 and MOD-008 are confusing and do not require an ISO/RTO to post their methodology. While there may be more than one methodology applicable in a region, it should be required that the methodology for every TP in the RRO be available on the RRO website<br>- R1.8.1 MOD-008 implies that TRM is set as a fixed amount which must be maintained through time, since entities would be required to "plan and reinforce the transmission system for the amount of TRM being preserved". We feel that this is an inappropriate requirement, since TRM represents a variable quantity based on known system conditions plus uncertainty.<br>- R1.8.2 of MOD-008 is not related to item 1.8 and should be moved in the text to be before and applicable to all R1.x requirements. | ATCT DT - MOD 4 already states that a CBM methodology be developed within an RRO. If options are provided in the regional methodology, each TSP must document which option is being used.<br><br>The SAR drafting team agrees that TRM not necessarily be a fixed amount maintained through time.<br><br>The standard drafting team should consider language changes to clarify. |
| Ontario – Independent Electricity System Operator | COMMENTS TO MOD-004-0 and MOD-008-0<br>R1 - References to having a single regional CBM methodology and TRM methodology should be removed along with references to exceptions for entities that are members of an RTO or an ISO.<br>R.1.6 - To the extent generators that are not committed to serve load inside the transmission provider's system are considered in the CBM requirement determination, there should be CBM preserved on impacted flowgates for the use of this generation.<br>Please note the numbering error. There are two R1.4, R1.5 and R1.6.<br>R1.8 - CBM should not be used in place of maintaining either minimum planning reserves or to compensate for poor generator maintenance practices.<br>General - When establishing CBM import area boundaries, there is an explicit assumption that all generators can serve all load within the boundary (with no constraints). As part of the | ATCT DT - the current and proposed versions of MOD 4 state that a CBM methodology be developed within an RRO. If options are provided in the regional methodology, each TSP must document which option is being used.<br>ATCT DT – The ATDT DT suggests that the TSP use the best information available to them (i.e. confirmed or requested transmission service/no service) to determine how these units should be considered in the CBM requirement determination. All assumptions made must be documented and approved by the entity responsible for the methodology.<br><br>The ATCT agrees CBM should not replace “poor resource planning or maintenance”<br>ATCT DT methodology should define how CBM boundaries are defined, as long as those boundaries are consistent with the way the system is planned and used for other considerations, such as calculation of ATC, TTC |

| | | |
|---|---|---|
| | description of the CBM calculation process, it should describe the basis for establishing the CBM import area boundaries. | |
| Hydro-Quebec Trans Energie | The proposed standard is asking for exhaustive coordination in TRM calculation. Outside system boundary coordination requirements are needed in some parts of an Interconnection but could be minimal in other parts. For example, such exhaustive coordination is not required for DC transmission facilities between two asynchronous systems. | The SAR drafting team will recommend to the standard drafting team that it consider differences in market structures. |
| FRCC | "MOD-008-1 R1.5.1 Any variances must also be approved by NERC or its designate. Delete this requirement. Variances should be approved by the Regional Reliability Organizations, not NERC, since the RROs have an approved methodology." | The SAR drafting team will forward this comment to the standard drafting team.<br><br>However, the drafting team believes that while an RRO can allow for flexibility in implementing methodologies, NERC would have to approve variances.<br><br>In a Region wide interconnection a regional variance could be rebuttably presumed to be correct. |
| Northeast Power Coordinating Council | Items for the Standard Drafting team to consider with respect to the proposed wording:<br>- R1 of MOD-004 and MOD-008 seem confusing and not to require an ISO/RTO to post their methodology. While there may be more than one methodology applicable in a region, it should be required that the methodology for every TP in the RRO be available on the RRO website<br>- R1.8.1 MOD-008 implies that TRM is set as a fixed amount which must be maintained through time, since entities would be required to "plan and reinforce the transmission system for the amount of TRM being preserved". We feel that this is an inappropriate requirement, since TRM represents a variable quantity based on known system conditions plus uncertainty.<br>- R1.8.2 of MOD-008 is not related to item 1.8 and should be moved in the text to be before and applicable to all R1.x requirements.<br>In Summary, NPCC concerns are as follows-<br>a) Québec Area is not synchronously interconnected with the rest of the Eastern Intercommunion thus i) coordination requirements are limited within its synchronous system, ii) ultimate source and sink are limited within its synchronous system<br>b) NY's, NE's, IESO 's transmission commitments are not based point to point transmission reservations in both operating and planning horizon thus posting requirement will not include | ATCT DT - MOD 4 already states that a CBM methodology be developed within an RRO. If options are provided in the regional methodology, each TSP must document which option is being used.<br><br>The ATDT DT suggests that the TSP use the best information available to them (i.e. confirmed or requested transmission service/no service) to determine how these units should be considered in the CBM requirement determination. All assumptions made must be documented and approved by the entity responsible for the methodology.<br><br>The ATCT agrees CBM should not replace poor resource planning or maintenance<br><br>ATCT DT methodology should define how CBM boundaries are defined, as long as those boundaries are consistent with the way the system is planned and used for other considerations, such as calculation of ATC, TTC, |

| | | |
|---|---|---|
| | ATC based on physical reservation and we believe that ATC is a market based quantity.<br>c) CBM is more or less a physical reservation made, at no cost, by LSEs within the boundaries of the TP's system. Therefore for some members of NPCC, because they have market based systems and are not using physical reservations, feel a standard NERC Standards for CBM is not necessary.<br>d) Some of NPCC's Areas have confidentiality issues especially with Generator outage schedules and we are asking the drafting team to be cognizant of these and respect this confidentiality. | |
| Exelon | CBM/TRM SAR does not require a RTO or ISO to have a methodology that meets the requirements in this proposed standard. The following word changes (noted in CAPITALS) to section R1 of the CBM portion are recommended -<br>R1. Each group of transmission service providers/and or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region shall jointly develop and document a REGIONAL CBM methodology. This methodology shall be available to NERC, the Regions, and the stakeholders in the electricity market.<br>If a RRO's members CBM values are determined by a RTO or ISO, then a jointly developed regional methodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a jointly developed regional methodology. A RTO OR ISO THAT CALCULATES CBM AND OR TRM IS REQUIRED TO HAVE A WRITTEN METHODOLOGY DOCUMENT THAT MEETS THE REQUIREMENTS SPECIFIED IN THIS STANDARD.<br>M4 needs to specify that THE RRO MUST REVIEW AND APPROVE THE RTO OR ISO CBM METHODOLOGY TO ENSURE IT IS CONSISTENT WITH THE RRO'S PLANNING ABD OPERATING CRITERIA. If this requirement is not added there appears to be no check of a RTO or ISO' ATC/TTC methodology.<br>CBM/TRM SAR does not require a RTO or ISO to have a methodology that meets the requirements in this proposed standard. The following wording changes (noted in CAPITALS) to section R1 of the TRM portion are recommended :<br>R1. Each group of transmission service providers/and or AFC/ATC/TTC calculators within a region, in conjunction with | ATCT DT – will remove references to RTOs/ISOs because they are not in the functional model however, and they could be acting as a TSP with respect to these standards<br><br>The drafting team will forward these comments to the standards drafting team for possible use during the detailed standards drafting process. |

| | | |
|---|---|---|
| | the members of that region in conjunction with its members, shall jointly develop and document a REGIONAL TRM methodology. This methodology shall be available to NERC, the Regions, and the transmission users in the electricity market. If a RRO's members TRM values are determined by a RTO or ISO, than a jointly developed regional methodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a regional methodology. A RTO OR ISO CALCULATES CBM AND OR TRM IS REQUIRED TO HAVE A METHODOLOGY DOCUMENT THAT MEETS THE REQUIREMENTS SPECIFIED IN THIS STANDARD.<br>In addition, the text in section R1 of the SAR needs to be revised to clarify that the following reviews are done by the RRO. First, the RRO needs to review the calculations of transmission providers under the regional methodology to ensure they are adhering to the regional methodology.<br>Second, the RRO must review the transmission service provider(s)' not under the regional methodology to ensure that their methodology is consistent with the RRO's Planning Criteria. Finally, the RRO is responsible for ensuring that TRM calculations done by transmission service providers', regardless of what methodology they are under, are consistent with the individual TOs planning criteria. The following wording changes noted in CAPITALS are recommended:<br>The RRO must review and approve the METHODOLOGY OF transmission service provider(s)' NOT UNDER THE REGIONAL methodology to ensure it is consistent with the RRO's Planning Criteria. The RRO is responsible for ensuring that TRM calculations are consistent with the individual TOs planning criteria. | |
| MRO<br>*Alliant Energy does not agree with these comments | COMMENTS TO MOD-004-0<br>R1 - Revise the first paragraph to read " Each Transmission Provider shall develop and document a CBM methodology, and require coordination between the transmission providers, with oversight by the respective RRO's." We do not see the need for a RRO region wide methodology, but do see the need for the RRO to review the methodology the Transmission Providers use to insure it meets the requirements of this standard. The regional methodology would need to be at a high level even with the exclusion of RTO/ISO members. For example the MRO members | While an RRO can allow for flexibility in implementing methodologies, NERC would have to approve variances.<br>In a Region wide interconnection a regional variance could be rebuttably presumed to be correct.<br><br>ATCT DT – for those methodologies include N-1 loss of a unit in TRM, CBM should not also include the loss of that unit, to avoid double counting.<br><br>The SAR drafting team will forward the other comments to the standard drafting team for consideration during the formal standard drafting process. |

| | | |
|---|---|---|
| | include ISO and non-ISO members throughout the MRO region. It would be better for reliability to have the MRO review the Transmission Provider methodology for the items included in the standard than to have high-level regional methodology for non-ISO/RTO members.<br>R1.2 - In bullets 1 and 2 the word "must" should be deleted. It is not necessary.<br>The article numbering after R1.6 is in error. It drops back to R1.4, when it should be R1.7.<br>Under present article number R1.4, Revise the first sentence to "Describe the formal process and rationale for the RRO to grant any variances to an individual transmission provider's regionally approved CBM Methodology." R1.6.1 should be deleted. The RRO approves variances.<br>Under the present article number R1.7 - Clarify what the objective is for the "simultaneous application of CBM and TRM." Is this intended to make sure that reserves are not double counted?<br>It is not stated if Measures M1 and M2 are kept or not. Please confirm that they are still in force.<br>COMMENTS TO MOD-005-0<br>R1 - Revise the first sentence to read "Each RRO in conjunction with its members, shall develop and implement a procedure to review changes (at least annually) to the CBM calculations and the resulting values of member Transmission Service Providers."<br>R1.3 - We believe R1.3.1 should be incorporated into the standard.<br>COMMENTS TO MOD-006-0<br>We are not opposed to making this standard a Business Practice, as long as the Business Practice is voluntary.<br>COMMENTS TO MOD-008-0<br>R1 - Revise the first sentence of the paragraph to read " Each Transmission Provider in a region shall develop and document, in conjunction with the members of the region, a TRM methodology, and require coordination between the transmission providers, with oversight by the respective RRO's." We do not see the need for a RRO region wide methodology, but do see the need for the RRO to review the methodology the Transmission Providers use to insure it meets the requirements of this standard. The regional methodology would need to be at a high level even with the exclusion of RTO/ISO members. For example the MRO | |

| | | |
|---|---|---|
| | members include ISO and non-ISO members throughout the MRO region. It would be better for reliability to have the MRO review the Transmission Provider methodology for the items included in the standard than to have high-level regional methodology for non-ISO/RTO members.<br>R1.3.10 should be renumbered to R1.3.9. The article that was numbered R1.3.9 should be placed at the end of the list and not have a number.<br>R1.5 - Revise the first sentence to "Describe the formal process and rationale for the RRO to grant any variances to an individual transmission provider's regionally approved TRM Methodology." R1.5.1 should be deleted. The RRO approves variances.<br>R1.7 - Clarify what the objective is for the "simultaneous application of CBM and TRM." Is this intended to make sure that reserves are not double counted?<br>COMMENTS TO MOD-009-0<br>R1 - Revise the first sentence of the paragraph to read " The RRO in a region shall develop and document, in conjunction with the members of the region, a procedure to, at least annually, review the TRM calculations and the resulting values of member transmission providers, to ensure that they comply with the regionally approved transmission provider methodologies." We do not see the need for a RRO region wide methodology, but do see the need for a region-wide process to review the methodology the Transmission Providers use to insure it meets the requirements of this standard. The regional methodology would need to be a high level even with the exclusion of RTO/ISO members. For example the MRO members include ISO and non-ISO members throughout the MRO region. # Standard Authorization Request Form

| | |
|---|---|
| Title of Proposed Standard | Revision to Standards MOD 004, MOD005, MOD006, MOD 008, and MOD 009 |
| Request Date | revised February 15, 2006 |

| **SAR Requestor Information** | **SAR Type** (Put an 'x' in front of one of these selections) | |
|---|---|---|
| Name<br>ATCT SAR Drafting Team<br>atctdt_plus@nerc.com | ☐ | New Standard |
| Primary Contact Larry Middleton SAR Drafting Team Chair | X | Revision to existing Standard(s) |
| Telephone (317) 249-5447<br>Fax | ☐ | Withdrawal of existing Standard |
| E-mail lmiddleton@midwestiso.org | ☐ | Urgent Action |

**Purpose/Industry Need** (Provide one or two sentences)

The existing standards on TRM should be revised to require crisp and clear documentation of the calculation of TRM and make various components of the methodology mandatory so there is more consistency across methodologies.

The existing standards on CBM should be revised to require crisp and clear documentation of the calculation of CBM and make various components (zero values could be acceptable, if applicable) of the methodology mandatory so there is more consistency across methodologies. The Standard drafting team should identify and clarify the various definitions of CBM.

The SAR drafting team will not be addressing the measures, compliance, and regional differences. Those will be reserved for the Standard Drafting Team. The Standard Drafting Team should also consider whether the definitions of CBM and TRM should be revised.

The Standard Drafting Team should coordinate its work with the related proposal for the draft NAESB business practice R05004.

**Detailed Description** (Provide enough detail so that an independent entity familiar with the industry could draft, modify, or withdraw a Standard based on this description.)

Below is a list of issues/items that should be addressed in the revision to MOD-004, 5, 6, 8, and 9. The SAR drafting team does not believe any of the existing requirements should be eliminated during this revision; however, the SAR drafting team expects some existing requirements may be modified and/or re-organized during the revision.

In addition to the specific changes suggested in the SAR Appendix 1, the revisions to these standards should address these additional issues:

- Cataloging of various uses and interpretations of CBM
    - How should they be differentiated?
- Should CBM be an explicit reservation?
    - How and if it would be made a requirement
    - Would it be source to sink or partial path?
- How it might impact systems that use CBM for resource adequacy?
- Whether there should be a reciprocal agreement for the use of CBM.
- Should CBM be based on required or recommended planning reserve.
- Whether entities should plan and reinforce their systems for the amount of CBM being reserved.
- How would RRO (and NERC?) approve CBM/TRM methodologies
- How should TRM be made consistent with applicable planning criteria?

The SAR drafting team has included suggested changes related to these issues in Appendix 1 to this SAR. These are a result of discussions during the SAR drafting and are provided as information that may aide the standard drafting team during their work.

### *Reliability Functions*

| **The Standard will Apply to the Following Functions** *(Check box for each one that applies by double clicking the grey boxes.)* | | |
|---|---|---|
| ☐x | Reliability Authority | Ensures the reliability of the bulk transmission system within its Reliability Authority area. This is the highest reliability authority. |
| ☐x | Balancing Authority | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time |
| ☐x | Interchange Authority | Authorizes valid and balanced Interchange Schedules |
| ☐x | Planning Authority | Plans the bulk electric system |
| ☐x | Resource Planner | Develops a long-term (>1year) plan for the resource adequacy of specific loads within a Planning Authority area. |
| ☐x | Transmission Planner | Develops a long-term (>1 year) plan for the reliability of transmission systems within its portion of the Planning Authority area. |
| ☐**x** | Transmission Service Provider | Provides transmission services to qualified market participants under applicable transmission service agreements |
| ☐x | Transmission Owner | Owns transmission facilities |
| ☐x | Transmission Operator | Operates and maintains the transmission facilities, and executes switching orders |
| ☐ | Distribution Provider | Provides and operates the "wires" between the transmission system and the customer |
| ☐x | Generator Owner | Owns and maintains generation unit(s) |
| ☐x | Generator Operator | Operates generation unit(s) and performs the functions of supplying energy and Interconnected Operations Services |
| ☐x | Purchasing-Selling Entity | The function of purchasing or selling energy, capacity and all necessary Interconnected Operations Services as required |
| ☐x | Market Operator | Integrates energy, capacity, balancing, and transmission resources to achieve an economic, reliability-constrained dispatch. |
| ☐x | Load-Serving Entity | Secures energy and transmission (and related generation services) to serve the end user |

Applicability to be determined by standard drafting team.

### *Reliability and Market Interface Principles*

| | |
|---|---|
| **Applicable Reliability Principles** *(Check boxes for all that apply by double clicking the grey boxes.)* | |
| x☐ | Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards. |
| ☐ | The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand. |
| ☐x | Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| ☐ | Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented. |
| ☐x | Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems. |
| ☐x | Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified and have the responsibility and authority to implement actions. |
| ☐ | The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis. |

| |
|---|
| **Does the proposed Standard comply with all of the following Market Interface Principles?** *(Select 'yes' or 'no' from the drop-down box by double clicking the grey area.)* |
| The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes |
| An Organization Standard shall not give any market participant an unfair competitive advantage.Yes |
| An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes |
| An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes |
| An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes |

**Appendix 1**

**proposed changes are highlighted in green**

**SUGGESTED REVISIONS to MOD-004-0**

R1. Each Regional Reliability Organization, in conjunction with its members, shall develop and document a CBM methodology that is approved by the RRO. A Transmission Service Provider that crosses multiple RRO boundaries shall get approval for its CBM methodology either from each of the respective RROs, or from NERC.

Each CBM methodology shall :

R1.1 Specify that the method used to determine generation reliability requirements as the basis for CBM shall be consistent with the respective generation planning criteria.

R1.2 Specify the frequency of calculation of the generation reliability requirement and associated CBM values.

- Require that the calculations must be verified at least annually.
- Require that the dates seasonal CBM values apply must be specified.

R1.3 Require that generation unit outages considered in a transmission provider's CBM calculation be restricted to those units within the transmission provider's system.

[The standard drafting team should discuss whether CBM should be an explicit reservation and how it would be made a requirement.]

R1.4 Require that CBM be preserved only on the transmission provider's system where the load serving entity's load is located (i.e., CBM is an import quantity only).

[The standard drafting team should discuss whether there could be a reciprocal agreement for the use of CBM.]

R1.5 Describe the inclusion or exclusion rationale in the CBM calculation for generation resources of each LSE including those generation resources not directly connected to the transmission provider's system but serving LSE loads connected to the transmission provider's system. The following rationale must be included in all methodologies:

R1.7.1 All generation directly connected to the transmission provider's system being used to serve load directly connected to that system will be considered in the CBM requirement determination.

R1.7.2 The availability of generation not directly connected to the transmission provider's system being used to serve load directly connected to that system would be considered available per the terms under which it was arranged.

R1.6 Describe the inclusion or exclusion rationale for generation connected to the transmission provider's system. The following rationale must be included in all methodologies:

R1.7.1 The following units shall be included in the CBM requirement determination because they are considered to be the installed generation capacity, committed to serve load, directly connected to the transmission system for which the CBM requirement is being determined:

i. Generation directly connected to the transmission provider's system but not obligated to serve load directly connected to that system, will be incorporated into the CBM requirement determination as follows:

1. Generation directly connected to the transmission provider's system, but committed to serve load on another system, will not be included in the CBM requirement determination for the transmission system to which the generator is directly connected.)

2. Generation directly connected to the TSP's system, but not committed to serve load on any system, will be included in the CBM requirement determination for the transmission system to which the generator is directly connected as follows:

The TSP will use the best information available to them (i.e. confirmed or requested transmission service/no service) to determine how these units should be considered in the CBM requirement determination. All assumptions made must be documented and approved by the entity responsible for the methodology.

R1.7 Describe the formal process and rationale for the RRO to grant any variances to individual transmission providers from the Regional CBM methodology.

R1.7.1 Require any variances must also be approved by NERC or its designate.

R1.8 Specify the relationship of CBM to the generation reliability requirement and the allocation of the CBM values to the appropriate transmission facilities. The sum of the CBM values allocated to all interfaces shall not exceed that portion of the generation reliability requirement that is to be provided by outside resources.

R1.9 Describe the inclusion or exclusion rationale for the loads of each LSE, including interruptible demands and buy-through contracts (type of service contract that offers the customer the option to be interrupted or to accept a higher rate for service under certain conditions).

R1.10 Describe any adjustments to CBM values to account for generation reserve sharing arrangements (i.e. Use of CBM and a reserve sharing event simultaneously occurring that is not planned for). Explain how the simultaneous application of CBM and TRM amounts being implemented in the ATC calculations are being taken into consideration during the planning process.

[The standard drafting team should consider paragraph below:]

R1.11 Require that CBM be based on the required or recommended planning reserve. In other words, a load serving entity that does not arrange for resources at least equal to the recommended or required planning reserve levels does not benefit by causing a higher CBM.

[The standard drafting team should consider the option below:]

R1.12 Require that the appropriate entities will plan and reinforce the transmission system for the amount of CBM being preserved.

R2. The RRO's most recent version of the documentation of each entity's CBM methodology shall be available on a web site accessible by NERC, the RROs, and the stakeholders in the electricity market.

M3. Each RRO, in conjunction with its members, shall develop and implement a procedure to review the CBM calculations and values of member transmission providers to ensure that they comply with the Regional CBM methodology and are periodically updated (at least annually) and available to stakeholders. Documentation of the results of the most current Regional reviews shall be provided to NERC or its designate within 30 days of completion.

- The RRO must review and approve the TSP methodology to ensure it is consistent with the RRO's Planning Criteria. The TSP is responsible for ensuring that CBM calculations are consistent with the individual TOs planning criteria.

-----------------------------------------------

**SUGGESTED REVISIONS to MOD-005-0**

R1. Each Regional Reliability Organization, in conjunction with its members, shall develop and implement a procedure to review (at least annually) the CBM calculations and the resulting values of member Transmission Service Providers. The CBM review procedure shall:

R1.1 Indicate the frequency is at least annual, under which the verification review shall be implemented.

R1.2 Require review of the process by which CBM values are updated, and their frequency of update, to ensure that the most current CBM values are available to stakeholders.

R1.3 Require review of the consistency of the transmission provider's CBM components with its published planning criteria. A CBM value is considered consistent with published planning criteria if the same components that comprise CBM are also addressed in the planning criteria. The methodology used to determine and apply CBM does not have to involve the same mechanics as the planning process, but the same uncertainties must be considered and any simplifying assumptions explained. It is recognized that ATC determinations are often time constrained and thus will not permit the use of the same mechanics employed in the more rigorous planning process. The procedure must specify how the consistency would be verified.

R1.3.1 Require verification that the appropriate entities are planning and reinforcing the transmission system for the amount of CBM being preserved. The procedure must specify how the verification would be determined. Transmission service providers must also perform this verification and report on the findings as specified below.

R1.4 Require CBM values to be updated at least annually and available to the Regions, NERC, and stakeholders in the electricity markets.

R2. The documentation of the Regional CBM procedure shall be available to NERC on request (within 30 days).

R3. Documentation of the results of the most current implementation of the procedure shall be sent to NERC within 30 days of completion.

**SUGGESTED REVISIONS to MOD-008-0**

R1. Each RRO in conjunction with its members, shall jointly develop and document a TRM methodology. This methodology shall be available to NERC, the Regions, and the transmission users in the electricity market. If a RRO's members TRM values are determined by a RTO or ISO, than a jointly developed regional methodology is not required for those members. RRO members not covered by an RTO/ISO would be required to have a regional methodology.

Each TRM methodology shall:

R1.1 Specify the update frequency of TRM calculations.

- Require that calculations be verified at least annually if determined to be required
- Require that dates that seasonal TRM values apply must be specified

R1.2 Specify how TRM values are incorporated into ATC calculations.

R1.3 Specify the uncertainties accounted for in TRM and the methods used to determine their impacts on the TRM values. The following components of uncertainty, if applied, shall be accounted for solely in TRM and not CBM:

R1.3.1 aggregate load forecast error (not included in determining generation reliability requirements).
R1.3.2 load distribution error.
R1.3.3 variations in facility loadings due to balancing of generation within a Balancing Authority Area.
R1.3.4 forecast uncertainty in transmission system topology.
R1.3.5 allowances for parallel path (loop flow) impacts.
R1.3.6 allowances for simultaneous path interactions.
R1.3.7 variations in generation dispatch
R1.3.8 short-term operator response (operating reserve actions not exceeding a 59-minute window).
R1.3.9 Any additional components of uncertainty shall benefit the interconnected transmission systems, as a whole, before they shall be permitted to be included in TRM calculations.
R1.3.10 Additional detail on how variations in generation dispatch are handled from intermittent generation sources such as wind and hydro, need to be provided.

R1.4 Describe the conditions, if any, under which TRM may be available to the market as Non-Firm Transmission Service.

R1.5 Describe the formal process for the granting of any variances to individual transmission service providers from the regional TRM methodology.

R1.5.1 Any variances must also be approved by NERC or its designate

R1.6 Describe the methodology and conditions thereof that are used to reflect if TRM is reduced for the operating horizon.

R1.7 Explain how the simultaneous application of CBM and TRM amounts being implemented in the ATC calculations are being taken into consideration during the planning process.

R1.8 Specify TRM methodologies and values must be consistent with the approved planning criteria.

R1.8.1 Require that the appropriate entities will plan and reinforce the transmission system for the amount of TRM being preserved. The methodology must specify how the verification of the consistency would be determined.

R1.8.2 Each TRM methodology shall address each of the items above and shall explain its use, if any, in determining TRM values. Other items that are entity specific or that are considered in each respective methodology shall also be explained along with their use in determining TRM values.

**SUGGESTED REVISIONS to MOD-009-0**

R1. Each group of transmission service providers/and or AFC/ATC/TTC calculators within a region, in conjunction with the members of that region , in conjunction with its members, shall develop and implement a procedure to review the TRM calculations and resulting values of member transmission providers to ensure that they comply with the regional TRM methodology and are updated at least annually and available to transmission users.

- The RRO must review and approve the transmission service provider(s)' methodology to ensure it is consistent with the RRO's Planning Criteria. The RRO is responsible for ensuring that TRM calculations are consistent with the individual TOs planning criteria.

The TRM review procedure shall:

R1.1 Indicate the frequency is at least annual, under which the verification review shall be implemented.

R1.2 Require review of the process by which TRM values are updated, and their frequency of update, to ensure that the most current TRM values are available to stakeholders.

R1.3 Require review of the consistency of the transmission service provider's or Transmission Owner's TRM components with its published planning criteria. A TRM value is considered consistent with published planning criteria if the same components that comprise TRM are also addressed in the planning criteria. The methodology used to determine and apply TRM does not have to involve the same mechanics as the planning process, but the same uncertainties must be considered and any simplifying assumption explained. It is recognized that ATC determinations are often time constrained and thus will not permit the use of the same mechanics employed in the more rigorous planning process. The review process used by a transmission service provider or transmission owner also needs to be documented.

R1.3.1 Explain how the simultaneous application of CBM and TRM amounts being implemented in the ATC calculations are being taken into consideration during the planning process.

R1.4 TRM methodologies and values must be consistent with the applicable planning criteria

- The methodology must specify how the verification of the consistency would be determined

R2. The documentation of the regional TRM procedure shall be available to NERC on request (within 30 days). Documentation of the results of the most current implementation of the procedure shall be available to NERC within 30 days of completion.

R3. Documentation of the results of the most current regional reviews shall be provided to NERC within 30 days of completion.

R4. Require TRM values to be verified at least annually and made available to the RROs, NERC, and stakeholders.

*When completed, e-mail to: mark.ladrow@nerc.net*

## Standard Authorization Request Form

| | |
|---|---|
| Title of Proposed Standard | Revision to Existing Standard MOD-001-0 |
| Request Date | Revised February 15, 2006 |

| **SAR Requestor Information** | | **SAR Type** (Put an 'x' in front of one of these selections) | |
|---|---|---|---|
| Name | ATCT SAR Drafting Team<br>atct_plus@nerc.com | ☐ | New Standard |
| Primary Contact | Larry Middleton<br>SAR Drafting Team Chair | x | Revision to existing Standard |
| Telephone<br>Fax | (317) 249-5447 | ☐ | Withdrawal of existing Standard |
| E-mail | lmiddleton@midwestiso.org | ☐ | Urgent Action |

**Purpose/Industry Need** (Provide one or two sentences)

This request changes existing modeling standard(s) by adding a requirement for transmission providers to coordinate the calculation of TTC/ATC/AFC and requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies.

Such changes will enhance the reliable use of the transmission system without needlessly limiting commercial activity. This request adds a requirement for documentation of the methodologies used to coordinate TTC/ATC/AFC*. In addition, a requirement is added for the enhanced documentation of the calculation methodology.

The Standards Authorization Request (SAR) drafting team did not address the measures, compliance, and regional differences. Those will be reserved for the standard drafting team.

*TTC – Total Transfer Capability

*ATC – Available Transfer Capability

*AFC – Available Flowgate Capability

*the drafting team may also deem it appropriate to define TFC – Total Flowgate Capability

***Reliability Functions***

| **The Standard will Apply to the Following Functions** *(Check box for each one that applies by double clicking the grey boxes.)* | | |
|---|---|---|
| ☐x | Reliability Authority | Ensures the reliability of the bulk transmission system within its Reliability Authority area. This is the highest reliability authority. |
| ☐x | Balancing Authority | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within its metered boundary and supports system frequency in real time |
| ☐x | Interchange Authority | Authorizes valid and balanced Interchange Schedules |
| ☐x | Planning Authority | Plans the bulk electric system |
| ☐x | Resource Planner | Develops a long-term (>1year) plan for the resource adequacy of specific loads within a Planning Authority area. |
| ☐x | Transmission Planner | Develops a long-term (>1 year) plan for the reliability of transmission systems within its portion of the Planning Authority area. |
| ☐x | Transmission Service Provider | Provides transmission services to qualified market participants under applicable transmission service agreements |
| ☐x | Transmission Owner | Owns transmission facilities |
| ☐x | Transmission Operator | Operates and maintains the transmission facilities, and executes switching orders |
| ☐ | Distribution Provider | Provides and operates the "wires" between the transmission system and the customer |
| ☐x | Generator Owner | Owns and maintains generation unit(s) |
| ☐x | Generator Operator | Operates generation unit(s) and performs the functions of supplying energy and Interconnected Operations Services |
| ☐x | Purchasing-Selling Entity | The function of purchasing or selling energy, capacity and all necessary Interconnected Operations Services as required |
| ☐x | Market Operator | Integrates energy, capacity, balancing, and transmission resources to achieve an economic, reliability-constrained dispatch. |
| ☐x | Load-Serving Entity | Secures energy and transmission (and related generation services) to serve the end user |

***Reliability and Market Interface Principles***

| **Applicable Reliability Principles** *(Check boxes for all that apply by double clicking the grey boxes.)* | |
|---|---|
| ☐x | 1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards. |
| ☐ | 2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand. |
| ☐x | 3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| ☐ | 4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented. |
| ☐ | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems. |
| ☐x | 6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified and have the responsibility and authority to implement actions. |
| ☐ | 7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis. |

| **Does the proposed Standard comply with all of the following Market Interface Principles?** *(Select 'yes' or 'no' from the drop-down box by double clicking the grey area.)* |
|---|
| 1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes |
| 2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes |
| 3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes |
| 4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes |
| 5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes |

**Detailed Description** (Provide enough detail so that an independent entity familiar with the industry could draft, modify, or withdraw a Standard based on this description.)

Definitions of Terms used in standard:

The standard drafting team should develop a definition for AFC (and TFC, if needed), and if necessary, revise the definitions for ATC and TTC. (some straw man definitions are contained in Appendix 2)

In those definitions, the standard drafting team should provide clarification (and differentiation) between the uses and application of the defined terms, particularly as the terms would be applied to either specific facilities or paths between two areas.

The standard drafting team should specify how criteria for determining flowgates would be used in an AFC/ATC process.

The standard drafting team should add a requirement for transmission providers to coordinate the calculation of TTC/ATC/AFC and require that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies.

The standard drafting team should add a requirement for the enhanced documentation of the TTC/ATC/AFC calculation methodology.

**NOTE: Many of the specific recommendations for changes to the standard(s) from the SAR drafting team have be moved to Appendix 1 so as to not bind the hands of the standard drafting team.**

**--------------------------------------------------------------------**

Below is a list of issues/items that should be addressed in the revision to MOD-001.

The SAR drafting team does not believe any of the existing requirements should be eliminated during this revision; however, the SAR DT expects some existing requirements may be modified and/or re-organized during the revision.

The revisions to this standard should:

- Finalize definitions for TTC (possibly add a definition for TFC), ATC and AFC
- Address the issue of methodology documentation and review of the methodology where an ISO/RTO may span multiple NERC regions
- Include a requirement that will enhance the required documentation of TTC and ATC calculations, increasing transparency of those calculations to the marketplace; also ensure it clearly defines who is responsible for that documentation.
- Require that the methodology document(s) are available to the industry
- Include a list of required data that must be coordinated for TTC and/or ATC/AFC calculations; such as, but not limited to: generation dispatch, transmission and generation outage, load forecasts, flowgate definitions/criteria.
- Consider trying to develop common criteria for establishing flowgates.
- Include a requirement that addresses issues surrounding the need to assign responsibility for analysis of third-party flowgates in TTC/ATC/AFC calculations to avoid double and triple evaluating of the same reservation request.

- Consider adding requirements to address that parties need to ensure 'agreement' between the coordinated ATC/AFCs values and require documentation of a process to define how discrepancies will be handled. For example, TSP1 should be denying service for a path that impacts a flowgate in TSP2 if the data received from TSP2 shows no service is available.
- Ensure requirements exist to document consistency between operational and planning TTC/ATC/AFC calculations.
- Consider changing the current approach of referencing TTC/ATC/AFC requirements as one group and separating them into TTC requirement(s) and AFC/ATC requirement(s)
- Consider adding more description on what is considered a 'standard' methodology (at what level of detail does the 'standard methodology' document need to go and can there be variations/options allowed within the methodology document?);
- Ensure that any mention of a standard methodology clearly refers to TTC or ATC or AFC.
- Consider requiring that the regional document describe what data is being coordinated between what TSPs and why that 'set' of TSPs are coordinating such data. Set a guideline/criteria associated with who must coordinate.
- Ensure that all requirements are stated in such a way that they can be quantified and measured
- Provide clarification of how the standard(s) would apply to the Western and Eastern (also ERCOT) Interconnections. (For example, WECC uses "committed uses or existing transmission committments".
- Establish a consistent set of definitions across the Western, Eastern, and ERCOT Interconnections, considering aspects of each.
- Establish a baseline set of equations for ATC and AFC and any appropriate component, which would include margins such as those specified in MOD 2, MOD 3, MOD 4, MOD 5, MOD 6, MOD 8, and MOD 9, that will incorporate the set of definitions referred to above, allowing for a zero value for a variable that is not used in a specific interconnection. E.g. : ATC = TTC – committed uses – CBM – TRM. (committed uses may be referred to as base flow or existing transmission commitments.)

This SAR lists items that the Long Term AFC/ATC Task Force (LTATF) and the SAR drafting team believe are required to be addressed in the standard revision. However, this list does not prevent the standard drafting team from proposing additional requirements to ensure the objectives of this standard revision are met.

The SAR drafting team has included suggested changes related to these issues as Appendix 1 to this SAR. These are a result of discussions during the SAR drafting and are provided as information that may aide the Standard drafting team during their work.

If during the development of changes to MOD-001, corresponding changes are required to MOD-002 and MOD-003 for consistency the Standard DT should propose such changes to those standards.

**A. Introduction**

1. **Title:** **Development and Documentation of Total Transfer Capability and Available Transfer Capability Calculation Methodologies**
2. **Number:** MOD-001-0

3. **Purpose:** The purpose of the standard is to promote the consistent and uniform application of Transfer Capability calculations among Transmission Service Providers. The standard will require methodologies to be developed and documented for calculating Total Transfer Capability (TTC), Available Transfer Capability (ATC), and Available Flowgate Capability (AFC) that comply with NERC definitions for TTC, ATC, and AFC; NERC Reliability Standards; and applicable Regional Reliability Organization criteria.

4. **Applicability:**

   **4.1.** Transmission Service Providers and Regional Reliability Organizations

   **4.2.** Others as may be deemed appropriate by the standard drafting team

5. **Effective Date:** **t.b.d.**

# Appendix 1

## B. Requirements

R1. All Transmission Service Providers within a RRO, shall jointly develop and document a TTC, ATC, and/or AFC methodology that is approved by the RRO.

A Transmission Service Provider that crosses multiple RRO boundaries shall get approval for its TTC, ATC, and/or AFC methodology either from each of the respective RROs, or from NERC.

This methodology shall be available to NERC, the Regions, and the stakeholders in the electricity market.

Each TTC and ATC/AFC methodology shall address each of the items listed below:

R1.1 Include a narrative explaining how TTC and ATC/AFC values are determined and used in evaluating transmission service requests. In addition, an explanation for all items listed here must also include any process that produces values that can override the TTC and ATC/AFC values.

R1.2 Account for how the reservations and schedules for Firm (non-recallable) and Non- firm (recallable) Transmission Service, both within and outside the Transmission Service Provider's system, are included. An explanation must be provided on how reservations that exceed the capability of the specified source point are accounted for. (i.e. how does the Transmission Service Provider's calculation account for multiple concurrent requests for transmission service in excess of a generator's capacity or in excess of a Load Serving Entity's load).

R1.3 Account for the ultimate points of power injection (sources) and power extraction (sinks) in TTC and ATC calculations. Source and sink points are further defined in the Source and Sink Points white paper contained in Appendix B of the Final LTATF Report.

R1.4 Describe how incomplete or so-called partial path transmission reservations are addressed. (Incomplete or partial path transmission reservations are those for which all transmission reservations necessary to complete the transmission path from ultimate source to ultimate sink are not identifiable due to differing reservation priorities, durations, or that the reservations have not all been made.)

R1.5 Require that TTC/ATC/AFC values and postings be reviewed at a minimum frequency and updated if changed to assure proper representation of the transmission system. These values will be made available to stakeholders at a similar frequency.

R1.6 Indicate the treatment and level of customer demands, including interruptible demands.

R1.7 Require that the data listed below, and other data needed by transmission providers for the calculation of TTC and ATC/AFC values are shared and used between Transmission Service Providers. Transmission Service Providers requiring data should request the data as needed. In addition, specify how this information is coordinated and used to determine TTC and ATC/AFC values. If some data is not used or coordinated, provide an explanation. The required minimum update frequency[1] for each item is listed below:

R1.7.1 **Generation Outage Schedules**: Minimum 13 month time frame includes all generators (for 20 MW or more) used in the ATC/AFC calculation). The update frequency is daily. The information exchanged shall differentiate between pending and approved outages.

R1.7.2 **Generation dispatch order**: Generic dispatch participation factors on a control area/market basis. The update frequency is as required.

R1.7.3 **Transmission Outage Schedules**: Minimum 13 month time frame, updated daily for all bulk electric system facilities that impact ATC/AFC calculations; updated once an hour for unscheduled outages. The information exchanged shall differentiate between pending and approved outages.

R1.7.4 **Interchange Schedules** : The update frequency is hourly.

R1.7.5 **Transmission Service Requests**: The update frequency is daily. This will include all requests, regardless of status, for all future time points.

R1.7.6 **Load Forecast**: supplied via the SDX (or similar method), includes hourly data or peak with profile for the next 7-day time frame. The update frequency is daily. In addition, daily peak for day 8 to 30 updated at least daily, and monthly for next 12 months updated at least monthly.

R1.7.7 **Flowgate AFC data exchange:** For transmission service providers in the Eastern Interconnection, firm and non-firm AFC values will be exchanged. The minimum update frequency is as follows: Hourly AFC once-per-hour, Daily AFC once-per-day and Monthly AFC once-per-week. [Note to standard drafting team. See Appendix A from LTATF Final Report section 2.1].

R1.7.8 **Flowgate rating**: Seasonal flowgate ratings will also be provided and exchanged. Users of the flowgate should have the same rating in their calculation as the owner of the facility. Updated as required. [The standard drafting team will need to clarify what

[1] The update frequency specified should allow for improvements in technology, communication, etc, that might better represent actual system conditions.

definitions are used. Would this be TFC, thermal or stability?] [The Standard Drafting team will need to define seasonal.]

R1.7.9 **Calculation model**: Updated models will be made available to neighboring/affected calculators. Changes/upgrades to facilities that would change the rating of the facilities that are limiting facilities should be included the models [joint modeling results can be utilized where applicable]

R1.7.10 **Criteria and definitions:** Flowgates and flowgate definitions/criteria should be exchanged with neighboring/affected calculators on a seasonal basis, or more often as required to represent actual system conditions.

R1.8 Describe how the assumptions for and the calculations of TTC and ATC/AFC values change over different time (such as hourly, daily, and monthly) horizons.

R1.9 Describe assumptions used for positive impacts and counterflow of transmission reservations, and /or schedules, including the basis for the assumptions.

R1.10 Describe assumptions used for generation dispatch for both external and internal systems for base case dispatch and transaction modeling, including the basis for the assumptions.

R1.11 Ensure that the TTC/ATC/AFC calculations are consistent with the Transmission Owner's/Transmission Planner's (leave Functional Model designation to Standard DT) planning criteria and operating criteria [The standard drafting team will need to be more specific regarding time frames].
Note: this regards, for example 1) TSR studies not being subjected to more stringent criteria than what is in the planning studies, and 2) negative ATC/AFC are shown over long periods of time on an operating basis, but planning studies show no anticipated remedies.

R1.12 Describe the formal process for the granting of any variances to individual transmission service providers from the TTC/ATC/AFC methodology. (Standard Drafting team will describe who is responsible.)

- Any variances must be approved by NERC or its designate

R2. The most recent version of the documentation of each TTC, ATC, and AFC methodology shall be available on a web site accessible by NERC, the Regions, and the stakeholders in the electricity market. [standard drafting team: NEED to add a description how this would apply in WECC for TTC.]

C. Measures.
(<u>standard drafting team to develop procedures for audit to ensure adherence to stated methodology – see Appendix 3</u>)

# Appendix 2

**<u>Strawman Definitions from LTATF:</u>**

Total Transfer Capability (TTC):

TTC and ATC are defined in standard 1E1
Existing Transmission Commitments (ETC)
ATC is expressed as:
ATC = TTC – Existing Transmission Commitments ) – CBM – TRM

Flowgate is the name given to the transmission element(s) and associated contingency(ies) if any, that may limit transfer capability.

Flowgate Criteria – to be determined by SDT

Available Flowgate Capability (AFC)
AFC is expressed as:
AFC = [to be finalized by SDT]

The relationship between ATC and AFC is as follows:

$ATC_{(\text{Path A-B})} = AFC_{(\text{Most Limiting Flowgate for Path A-B})} / \text{Distribution Factor}_{(\text{Path A-B on Limiting Flowgate})}$

Daily, Monthly, Yearly TTC
Daily, Monthly, Yearly ATC
Daily, Monthly, Yearly TRM
Daily, Monthly, Yearly CBM

# Appendix 3 LTATF Suggested Audit Methodology

M1. Each group of transmission service providers within a region, in conjunction with the members of that region, shall jointly develop and implement a procedure to review periodically (at least annually) and ensure that the TTC and ATC/AFC calculations and resulting values of member transmission providers comply with the Regional TTC and ATC/AFC methodology, the NERC Planning Standards, and applicable Regional criteria.

M2. A review to verify that the ATC/TTC/AFC calculations are consistent with the TO's/TP's planning criteria is also required. The procedure used to verify the consistency must also be documented in the report. Documentation of the results of the most current reviews shall be provided to NERC within 30 Days of completion.

M3. Each entity responsible for the TTC and ATC/AFC methodology, in conjunction with its members and stakeholders, shall have and document a procedure on how stakeholders can input their concerns or questions regarding the TTC and ATC/AFC methodology and values of the transmission provider(s), and how these concerns or questions will be addressed. Documentation of the procedure shall be available on a web site accessible by the Regions, NERC, and the stakeholders in the electricity market.

M4. The RRO must review and approve the ATC/TTC/AFC methodology to ensure it is consistent with the RRO's Planning and Operating Criteria.

The RRO is responsible for ensuring that TTC and ATC/AFC calculations are consistent with the individual TOs/TPs planning criteria.

Each procedure shall specify:

a) The name, telephone number, and email address of a contact person to whom concerns are to be addressed.

b) The amount of time it will take for a response.

c) The manner in which the response will be communicated (e.g., email, letter, telephone, etc.)

d) What recourse a customer has if the response is deemed unsatisfactory.

# CBM: Does it help or hinder reliability?

*This is **the minority opinion** of the ATCT Drafting Team. Although this paper may not apply to all Transmission Service Providers (TSPs), it does apply to several in the eastern interconnection.*

The design of the Capacity Benefit Margin (CBM) product as it is today does little to enhance reliability. In fact, one could deduce that the preservation of CBM actually hinders reliability. CBM is intended to be an instrument to ensure the availability of transmission during a local generation resource shortage, but until the industry can agree to coordinate these efforts, the result may be making things worse instead of better. In fact, current interpretations of the calculation and use of CBM by several TSPs cause several concerns:

1. **CBM is a partial path reservation without a designated generation source.**

   CBM is an import quantity only. There are no arrangements between TSPs for the reservation and use of CBM on neighboring transmission systems. This means that when CBM is being utilized on a TSP's system during emergency conditions, there still needs to be arrangements made with all external TSPs for the use of *their* transmission systems. There is absolutely no assurance that the transmission service will be available on that other TSP's system. Furthermore, since emergencies occur in real-time, firm service is not available due to timing requirements. In fact, the only service that is available is non-firm hourly service or non-firm secondary service. With TLR occurrences being the rule, rather than the exception, the risk of curtailment of the emergency import is very probable due to the use of non-firm transmission. There are currently no provisions in either the TLR procedure or any TSPs tariff that allow for special treatment for external Load Serving Entities (LSEs) to use their system for emergency (CBM) purposes. In addition to the transmission availability risk, there is also no assurance that generation resources will be available on the interfaces (or impact flowgates) on which CBM is reserved.

2. **Use of CBM can restrict adequate resource planning.**

   Another problem with the current CBM methodology employed by some TSPs is that a LSE that expects to have a capacity deficit is now less likely to be able to make a long-term capacity purchase to ensure resource adequacy. The shortage can almost be seen as a self-fulfilling prediction. The LSE may be forecasting a shortage based on a Loss of Load Expectation (LOLE) calculation, so CBM is added to the interface (or flowgates) to ensure deliverability during emergencies. Since CBM is on the interface (or flowgates), the LSE can not get firm transmission service to purchase capacity and is forced into an emergency situation. This seems to be an illogical approach and does not appear to be in the best interest of the LSEs who are trying to hedge against generation shortages and price risk.

The opposite problem can also occur. The LSE (or TSP) may calculate a CBM of 100 MW to maintain the correct LOLE and later the LSE can make a firm transmission and generation purchase (import) of 25 MW. The CBM should actually be decremented by 25 MW down to 75 MW. However, the CBM may not be calculated every time an LSE makes a firm capacity purchase. In this case, the CBM requirement would be 75 MW, but the TSP is reserving 100 MW. This would limit others from making firm economic purchases to hedge against price risk. Again, this is not in the best interest of the LSEs.

3. **LSEs that can choose which interfaces to reserve CBM could restrict competition in that area.**

   Some TSPs have affiliated LSEs and allow LSEs to determine which interfaces utilize CBM. A TSP's decision to set aside transmission capacity for emergency imports pursuant to either long-term reserve sharing arrangements or probabilistic LOLE calculations reduces the firm import capacity available to its competitors. Whether to reduce ATC/AFC for a CBM reservation, at which interface and in what amount, is a competitively significant decision that is driven by commercial choices which may be made by the large incumbent LSE. It reflects tradeoffs made by the LSE (and its generation/merchant function) as to reliance on internal vs. external generation for sources of energy and reserves. This procedure invites abuse.

4. **CBM should not be used as a substitute for "real" reserves.**

   There could be cases where LSEs are physically "short" real reserves, but use CBM to justify resource adequacy.

   Clearly, the current use of CBM has questionable reliability value. The lack of transparency, standardization, and auditable definition, coupled with the absence of procedures for CBM to be reserved and paid for like other transmission reservations, invites abuse. It also may provide a false sense of security that CBM will provide the transmission needed to import emergency generation.

**Proposed Solution**

The current use of CBM by some TSPs should be discontinued. Today, Capacity Benefit Margin (CBM) is defined as:

*The amount of firm transmission transfer capability preserved by the transmission provider for load-serving entities (LSEs), whose loads are located on that transmission provider's system, to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability* *requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.*

For some LSEs, the current use of CBM may be better than no CBM (although it may be harming some LSEs). Instead of setting aside CBM on a TSP's system as a reliability quantity without the appropriate charges, it would be more reasonable and reliable to require the LSE(s) to obtain a firm transmission path from source to sink and obtain contracts from outside generation to ensure resource adequacy.

Those entities that currently allow for the use of CBM to reduce generation reliability requirements would be better served by this approach than the CBM approach which "assumes" that uncommitted external resources will be there when you need them. This ensures that not only is transmission available in the event of an emergency, but generation will also be available because it is contracted for. It also assigns the cost of the transmission reservations and the cost of capacity to the LSE(s) who directly benefit. A CBM "assumption" about external capacity may be an unrealistic expectation in this time of shrinking capacity margins.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developmed as a standard on February 14, 2006.
3. SC appointed a standard drafting team on March 17, 2006.

**Description of Current Draft:**

This is the first draft of the proposed standard posted for stakeholders comment.

**Future Development Plan:**

| | |
|---|---|
| 1. Post revised standard for stakeholder comments. | February 15–March 16, 2007 |
| 2. Respond to comments. | |
| 3. Post revised standard for stakeholder comment. | TBD |
| 4. Respond to comments. | TBD |
| 5. First ballot of standard. | TBD |
| 6. Respond to comments. | TBD |
| 7. Post for recirculation. | TBD |
| 8. 30 Day posting before board adoption. | TBD |
| 9. Board adopts MOD-001-1. | TBD |
| 10. Effective date. | TBD |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Glossary of Terms Used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Available Flowgate Capability (AFC):** A measure of the capability remaining in the Flowgate for further commercial activity over and above already committed uses. It is equal to the Total Flowgate Capability less the impacts of Existing Transmission Commitments (including retail customer service), less the impacts of Capacity Benefit Margin and less the impacts of Transmission Reliability Margin.

**Existing Transmission Commitments (ETC):** Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

**Flowgate:** A single transmission element, group of transmission elements and any associated contingency (ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

**Network Response Method**: A method of calculating Transfer Capability for transmission networks where customer Demand, generation sources, and the Transmission systems are closely interconnected.

**Rated System Path Method:** A method of calculating transfer capability for transmission networks where the critical transmission paths between areas of the network have been identified and rated as to their achievable transfer loading capabilities for a range of system conditions.

**Total Flowgate Capability (TFC):** The amount of electric power that can flow across the Flowgate under specified system conditions without exceeding the capability of the Facilities. Typically expressed in the form of thermal capability. Flowgates can be proxies for Stability and other limiting criteria.

**Transmission Reservation:** A reservation is a confirmed Transmission Service Request.

**Transmission Service Request:** A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

## A. Introduction

1. **Title:** **ATC and AFC Calculation Methodologies**

2. **Number:** MOD-001-1

3. **Purpose:** To promote the consistent and uniform application and documentation of Available Transfer Capability (ATC), and Available Flowgate Capability (AFC) calculation methodologies for reliable system operations.

4. **Applicability:**

   **4.1.** Transmission Service Provider

5. **Proposed Effective Date:** TBD

## B. Requirements

**R1.** The Transmission Service Provider that calculates ATC (using either the Rated System Path Methodology or the Network Response Methodology) shall use the following equation to calculate ATC:

ATC = TTC – TRM – CBM – ETC

Where:

TTC = Total Transfer Capability

TRM = Transmission Reliability Margin

CBM = Capacity Benefit Margin

ETC = Existing Transmission Commitments

The requirements for calculating TTC, TRM, CBM and ETC will be developed in separate sets of standards.

**R2.** The Transmission Service Provider that calculates ATC shall recalculate ATC when any one of the following components of ATC changes:

**R2.1.** TTC

**R2.2.** TRM

**R2.3.** CBM

**R2.4.** ETC

The timing requirements for reposting on OASIS will be in accordance with the complementary NAESB Business Practices.

**R3.** The Transmission Service Provider that calculates ATC, shall, when requested, provide or make available, the following values (within 7 calendar days) to each Transmission Service Provider, Planning Coordinator, Transmission Planner, Reliability Coordinator, and Transmission Operator that requested the values and has a reliability-related need for the values:

**R3.1.** ATC

**R3.2.** TTC

**R3.3.** TRM

**R3.4.** CBM

**R3.5.** ETC

The requirements for calculating TTC, TRM, CBM and ETC will be developed in separate sets of standards.

**R4.** The Transmission Service Provider that calculates AFC (using a Network Response Methodology) shall use the following equation to calculate AFC:

AFC = TFC – (TRM * Distribution Factor) – (CBM * Distribution Factor) – the sum of (ETC impacts * respective Distribution Factors)

Where:

TFC = Total Flowgate Capability

TRM = Transmission Reserve Margin

CBM = Capacity Benefit Margin

ETC = Existing Transmission Commitments

The requirements for calculating TFC, TRM, CBM and ETC will be developed in separate sets of standards.

**R5.** The Transmission Service Provider that calculates AFC (using a Network Response Methodology) shall have a methodology that includes the following:

Please note that it may appear that the AFC methodology contains more requirements than that ATC methodology. Due to the characteristics of the ATC methodology, the corresponding level of detail will be contained in the standard that determines TTC (e.g. FAC 12 or FAC 13) when it is revised

**R5.1.** Separate consideration of the Transmission Reservation(s) for Firm (non-recallable) and Non-firm (recallable) Transmission Service inside the Transmission Service Provider's system in the AFC calculation with respect to how each is treated in the Transmission Service Provider's counter flow rules.

**R5.2.** Separate consideration of the Schedules for Firm (non-recallable) and Non-firm (recallable) Transmission Service inside the Transmission Service Provider's system in the AFC calculation with respect to how each is treated in the Transmission Service Provider's counter flow rules.

**R5.3.** Assumptions used for base case and transfer generation dispatch for both external and internal systems on OASIS (or its successor).

**R6.** The Transmission Service Provider that calculates AFC (using a Network Response Methodology) shall exchange the following data as agreed upon, or within 7 calendar days, with the Transmission Service Providers with whom AFC is coordinated and with each Planning Coordinator, Transmission Planner, Reliability Coordinator, and Transmission Operator that requested that data and has a reliability-related need for that data:

**R6.1.** Data describing coordinated transmission system elements scheduled to be taken out of or returned to service, that is updated and provided as changes occur.

**R6.2.** Data describing coordinated generation resources scheduled to be taken out of or returned to service, that is updated and provided as changes occur.

**R6.3.** A typical generation dispatch order that is updated at least prior to each peak load season or the generation participation factors of all units on an affected

Balancing Authority basis that is updated as required by changes in the status of the unit.

**R6.4.** The baseline power flow model for calculating AFC updated to reflect facility changes.

**R6.5.** Load Forecast information provided daily and updated as changes occur.

**R6.6.** Flowgates and Flowgate definitions and criteria provided on a seasonal basis, and when revised.

**R6.7.** Total Flowgate Capability (TFC) provided when initially established or revised, and provided daily thereafter.

**R6.8.** Firm and non-firm AFC values at the minimum update intervals listed below:

**R6.8.1.** Hourly AFC once per hour for 168 hours.

**R6.8.2.** Daily AFC once per day for thirty days.

**R6.8.3.** Weekly AFC once per day for four weeks.

**R6.8.4.** Monthly AFC once per month for 13 months.

The timing requirements for reposting on OASIS will be in accordance with the complementary NAESB Business Practices.

**R6.9.** Existing Transmission Commitments (ETC) information as reflected in an initial Power Flow model and provided within seven calendar days of the date the Power Flow Model is updated.

The requirements for calculating ETC may be developed in a separate standard following input from industry.

**R6.10.** Transmission Service Reservation information provided when revised once per hour.

**R7.** Each Transmission Service Provider that calculates AFC (using a Network Response Methodology) shall update its AFC values using the updated information received (from Transmission Service Providers with whom AFC is coordinated) at the frequency noted below:

The timing requirements for reposting on OASIS will be in accordance with the complementary NAESB Business

**R7.1.** For hourly, once per hour.

**R7.2.** For daily, once per day.

**R7.3.** For weekly, once per day.

**R7.4.** For monthly, once a week.

The timing requirements for reposting on OASIS will be in accordance with the complementary NAESB Business

**R8.** The Transmission Service Provider's methodology for calculating ATC or AFC shall identify how it accounts for the Transmission Reservations and Interchange Schedules for Firm (non-recallable) and Non-firm (recallable) Transmission Service inside its Transmission Service Provider system.

**R9.** Each Transmission Service Provider shall consistently use its sole ATC or AFC calculation methodology for all instances of coordinating, calculating or posting ATC or AFC values.

**R10.** Each Transmission Service Provider shall post the most recent version of its ATC or AFC calculation methodology on its OASIS (or its successor).

NAESB will be asked to develop a template in their complementary business practice.

**R11.** Each Transmission Service Provider's ATC or AFC calculation methodology shall include or address the following:

**R11.1.** Identify the parties responsible for posting the ATC or AFC values on OASIS.

**R11.2.** Require that the calculation of ATC or AFC use the same criteria and assumptions used to conduct reliability assessments and internal expansion planning for different time frames (real-time; same day; day-ahead; and from day-ahead up to 13 months).

**R11.3.** Document the criteria used for calculating ATC or AFC values for the different time frames (real-time; same day; day-ahead; and from day-ahead up to 13 months) and the rationale for any differences between these.

**R11.4.** Identify the contingencies considered in the ATC and AFC calculations methodology.

**R11.5.** Require that the calculation of ATC or AFC for use in the 13 months and longer time frame use the same power flow models, and the same assumptions regarding load, generation dispatch, special protection systems, post contingency switching, and transmission and generation facility additions and retirements as those used in the expansion planning for the same time frame.

**R12.** Identify the Transmission Service Providers with which the data used in the calculation of ATC or AFC is exchanged.

**R13.** If the Transmission Service Provider approves a Transmission Service Request using a value other than and less than its value for ATC or AFC, then the Transmission Service Provider shall identify how it calculated the lesser value.

**R14.** The Transmission Service Provider shall require that the Transmission Customer provide both ultimate source and ultimate sink on the Transmission Service Request and shall require that the Transmission Customer use the same source and sink on Interchange Transaction Tags.

~~Introduction~~

~~Title: Documentation of Total Transfer Capability and Available Transfer Capability~~

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developmed as a standard on February 14, 2006.
3. SC appointed a standard drafting team on March 17, 2006.

**Description of Current Draft:**

This is the first draft of the proposed standard posted for stakeholders comment.

**Future Development Plan:**

| | |
|---|---|
| 1. Post revised standard for stakeholder comments. | February 15–March 16, 2007 |
| 2. Respond to comments. | |
| 3. Post revised standard for stakeholder comment. | TBD |
| 4. Respond to comments. | TBD |
| 5. First ballot of standard. | TBD |
| 6. Respond to comments. | TBD |
| 7. Post for recirculation. | TBD |
| 8. 30 Day posting before board adoption. | TBD |
| 9. Board adopts MOD-001-1. | TBD |
| 10. Effective date. | TBD |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Glossary of Terms Used in Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Available Flowgate Capability (AFC):** A measure of the capability remaining in the Flowgate for further commercial activity over and above already committed uses. It is equal to the Total Flowgate Capability less the impacts of Existing Transmission Commitments (including retail customer service), less the impacts of Capacity Benefit Margin and less the impacts of Transmission Reliability Margin.

**Existing Transmission Commitments (ETC):** Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

**Flowgate:** A single transmission element, group of transmission elements and any associated contingency (ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

**Network Response Method**: A method of calculating Transfer Capability for transmission networks where customer Demand, generation sources, and the Transmission systems are closely interconnected.

**Rated System Path Method:** A method of calculating transfer capability for transmission networks where the critical transmission paths between areas of the network have been identified and rated as to their achievable transfer loading capabilities for a range of system conditions.

**Total Flowgate Capability (TFC):** The amount of electric power that can flow across the Flowgate under specified system conditions without exceeding the capability of the Facilities. Typically expressed in the form of thermal capability. Flowgates can be proxies for Stability and other limiting criteria.

**Transmission Reservation:** A reservation is a confirmed Transmission Service Request.

**Transmission Service Request:** A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

## A. Introduction

1. **Title:** **ATC and AFC Calculation Methodologies**

2. **Number:** MOD-001-~~0~~1

3. **Purpose:** To promote the consistent and uniform application ~~**of Transfer Capability calculations among transmission system users, the Regional Reliability Organization shall develop methodologies for calculating Total Transfer Capability (TTC) and**~~ and documentation of Available Transfer Capability (ATC~~**) that comply with NERC definitions for TTC and ATC, NERC Reliability Standards, and applicable Regional criteria.**~~), and Available Flowgate Capability (AFC) calculation methodologies for reliable system operations.

4. **Applicability:**

   ~~**4.1.** Regional Reliability Organization~~

   **4.1.** Transmission Service Provider

5. **Proposed Effective Date:** ~~**April 1, 2005**~~TBD

## B. Requirements

~~**R1.** Each Regional Reliability Organization, in conjunction with its members, shall develop and document a Regional TTC and ATC methodology. (Certain systems that are not required to post ATC values are exempt from this standard.) The Regional Reliability Organization's TTC and ATC methodology shall include each of the following nine items, and shall explain its use in determining TTC and ATC values:~~

~~**R1.1.** A narrative explaining how TTC and ATC values are determined.~~

~~**R1.2.** An accounting for how the reservations and schedules for firm (non-recallable) and non-firm (recallable) transfers, both within and outside the Transmission Service Provider's system, are included.~~

~~**R1.3.** An accounting for the ultimate points of power injection (sources) and power extraction (sinks) in TTC and ATC calculations.~~

~~**R1.4.** A description of how incomplete or so-called partial path transmission reservations are addressed. (Incomplete or partial path transmission reservations are those for which all transmission reservations necessary to complete the transmission path from ultimate source to ultimate sink are not identifiable due to differing reservation priorities, durations, or because the reservations have not all been made.)~~

~~**R1.5.** A requirement that TTC and ATC values shall be determined and posted as follows:~~

~~**R1.5.1.** Daily values for current week at least once per day.~~

~~**R1.5.2.** Daily values for day 8 through the first month at least once per week.~~

~~**R1.5.3.** Monthly values for months 2 through 13 at least once per month.~~

~~**R1.6.** Indication of the treatment and level of customer demands, including interruptible demands.~~

~~**R1.7.** A specification of how system conditions, limiting facilities, contingencies, transmission reservations, energy schedules, and other data needed by Transmission Service Providers for the calculation of TTC and ATC values are shared and used within the Regional Reliability Organization and with neighboring interconnected electric systems, including adjacent systems, subregions, and Regional Reliability Organizations. In addition, specify how this information is to be used to determine TTC and ATC values. If some data is not used, provide an explanation.~~

~~**R1.8.** A description of how the assumptions for and the calculations of TTC and ATC values change over different time (such as hourly, daily, and monthly) horizons.~~

~~**R1.9.** A description of the Regional Reliability Organization's practice on the netting of transmission reservations for purposes of TTC and ATC determination.~~

~~**R2.** The Regional Reliability Organization shall make the most recent version of the documentation of its TTC and ATC methodology available on a Web site accessible by NERC, the Regional Reliability Organizations, and transmission users.~~

**R1.** The Transmission Service Provider that calculates ATC (using either the Rated System Path Methodology or the Network Response Methodology) shall use the following equation to calculate ATC:

ATC = TTC – TRM – CBM – ETC

Where:

TTC = Total Transfer Capability

TRM = Transmission Reliability Margin

CBM = Capacity Benefit Margin

ETC = Existing Transmission Commitments

The requirements for calculating TTC, TRM, CBM and ETC will be developed in separate sets of standards.

**R2.** The Transmission Service Provider that calculates ATC shall recalculate ATC when any one of the following components of ATC changes:

**R2.1.** TTC

**R2.2.** TRM

**R2.3.** CBM

**R2.4.** ETC

The timing requirements for reposting on OASIS will be in accordance with the complementary NAESB Business Practices.

**R3.** The Transmission Service Provider that calculates ATC, shall, when requested, provide or make available, the following values (within 7 calendar days) to each Transmission Service Provider, Planning Coordinator, Transmission Planner, Reliability Coordinator, and Transmission Operator that requested the values and has a reliability-related need for the values:

**R3.1.** ATC

**R3.2.** TTC

**R3.3.** TRM

**R3.4.** CBM

**R3.5.** ETC

The requirements for calculating TTC, TRM, CBM and ETC will be developed in separate sets of standards.

**R4.** The Transmission Service Provider that calculates AFC (using a Network Response Methodology) shall use the following equation to calculate AFC:

AFC = TFC – (TRM * Distribution Factor) – (CBM * Distribution Factor) – the sum of (ETC impacts * respective Distribution Factors)

Where:

TFC = Total Flowgate Capability

TRM = Transmission Reserve Margin

CBM = Capacity Benefit Margin

ETC = Existing Transmission Commitments

The requirements for calculating TFC, TRM, CBM and ETC will be developed in separate sets of standards.

**R5.** The Transmission Service Provider that calculates AFC (using a Network Response Methodology) shall have a methodology that includes the following:

**R5.1.** Separate consideration of the Transmission Reservation(s) for Firm (non-recallable) and Non-firm (recallable) Transmission Service inside the Transmission Service Provider's system in the AFC calculation with respect to how each is treated in the Transmission Service Provider's counter flow rules.

**R5.2.** Separate consideration of the Schedules for Firm (non-recallable) and Non-firm (recallable) Transmission Service inside the Transmission Service Provider's system in the AFC calculation with respect to how each is treated in the Transmission Service Provider's counter flow rules.

**R5.3.** Assumptions used for base case and transfer generation dispatch for both external and internal systems on OASIS (or its successor).

Please note that it may appear that the AFC methodology contains more requirements than that ATC methodology. Due to the characteristics of the ATC methodology, the corresponding level of detail will be contained in the standard that determines TTC (e.g. FAC 12 or FAC 13) when it is revised

**R6.** The Transmission Service Provider that calculates AFC (using a Network Response Methodology) shall exchange the following data as agreed upon, or within 7 calendar days, with the Transmission Service Providers with whom AFC is coordinated and with each Planning Coordinator, Transmission Planner, Reliability Coordinator, and Transmission Operator that requested that data and has a reliability-related need for that data:

**R6.1.** Data describing coordinated transmission system elements scheduled to be taken out of or returned to service, that is updated and provided as changes occur.

**R6.2.** Data describing coordinated generation resources scheduled to be taken out of or returned to service, that is updated and provided as changes occur.

**R6.3.** A typical generation dispatch order that is updated at least prior to each peak load season or the generation participation factors of all units on an affected Balancing Authority basis that is updated as required by changes in the status of the unit.

**R6.4.** The baseline power flow model for calculating AFC updated to reflect facility changes.

**R6.5.** Load Forecast information provided daily and updated as changes occur.

**R6.6.** Flowgates and Flowgate definitions and criteria provided on a seasonal basis, and when revised.

**R6.7.** Total Flowgate Capability (TFC) provided when initially established or revised, and provided daily thereafter.

**R6.8.** Firm and non-firm AFC values at the minimum update intervals listed below:

**R6.8.1.** Hourly AFC once per hour for 168 hours.

**R6.8.2.** Daily AFC once per day for thirty days.

**R6.8.3.** Weekly AFC once per day for four weeks.

**R6.8.4.** Monthly AFC once per month for 13 months.

The timing requirements for reposting on OASIS will be in accordance with the complementary NAESB Business Practices.

**R6.9.** Existing Transmission Commitments (ETC) information as reflected in an initial Power Flow model and provided within seven calendar days of the date the Power Flow Model is updated.

The requirements for calculating ETC may be developed in a separate standard following input from industry.

**R6.10.** Transmission Service Reservation information provided when revised once per hour.

The timing requirements for reposting on OASIS will be in accordance with the complementary NAESB Business

**R7.** Each Transmission Service Provider that calculates AFC (using a Network Response Methodology) shall update its AFC values using the updated information received (from Transmission Service Providers with whom AFC is coordinated) at the frequency noted below:

The timing requirements for reposting on OASIS will be in accordance with the complementary NAESB Business

**R7.1.** For hourly, once per hour.

**R7.2.** For daily, once per day.

**R7.3.** For weekly, once per day.

**R7.4.** For monthly, once a week.

**R8.** The Transmission Service Provider's methodology for calculating ATC or AFC shall identify how it accounts for the Transmission Reservations and Interchange Schedules for Firm (non-recallable) and Non-firm (recallable) Transmission Service inside its Transmission Service Provider system.

**R9.** Each Transmission Service Provider shall consistently use its sole ATC or AFC calculation methodology for all instances of coordinating, calculating or posting ATC or AFC values.

**R10.** Each Transmission Service Provider shall post the most recent version of its ATC or AFC calculation methodology on its OASIS (or its successor).

NAESB will be asked to develop a template in their complementary business practice.

**R11.** Each Transmission Service Provider's ATC or AFC calculation methodology shall include or address the following:

**R11.1.** Identify the parties responsible for posting the ATC or AFC values on OASIS.

**R11.2.** Require that the calculation of ATC or AFC use the same criteria and assumptions used to conduct reliability assessments and internal expansion planning for different time frames (real-time; same day; day-ahead; and from day-ahead up to 13 months).

**R11.3.** Document the criteria used for calculating ATC or AFC values for the different time frames (real-time; same day; day-ahead; and from day-ahead up to 13 months) and the rationale for any differences between these.

**R11.4.** Identify the contingencies considered in the ATC and AFC calculations methodology.

**R11.5.** Require that the calculation of ATC or AFC for use in the 13 months and longer time frame use the same power flow models, and the same assumptions regarding load, generation dispatch, special protection systems, post contingency switching, and transmission and generation facility additions and retirements as those used in the expansion planning for the same time frame.

**R12.** Identify the Transmission Service Providers with which the data used in the calculation of ATC or AFC is exchanged.

**R13.** If the Transmission Service Provider approves a Transmission Service Request using a value other than and less than its value for ATC or AFC, then the Transmission Service Provider shall identify how it calculated the lesser value.

**R14.** The Transmission Service Provider shall require that the Transmission Customer provide both ultimate source and ultimate sink on the Transmission Service Request and shall require that the Transmission Customer use the same source and sink on Interchange Transaction Tags.

## C. Measures

~~**M1.** The Regional Reliability Organization shall provide evidence that its most recent TTC and ATC methodology documentation meets Reliability Standard MOD-001-0_R1.~~

~~**M2.** The Regional Reliability Organization shall provide evidence that its TTC and ATC methodology is available on a Web site accessible by NERC, the Regional Reliability Organizations, and transmission users.~~

## D. Compliance

~~**1. Compliance Monitoring Process**~~

~~**1.1. Compliance Monitoring Responsibility**~~

~~Compliance Monitor: NERC.~~

~~**1.2. Compliance Monitoring Period and Reset Time Frame**~~

~~Available on a Web site accessible by NERC, the Regional Reliability Organizations, and transmission users.~~

~~**1.3. Data Retention**~~

~~None identified.~~

~~**1.4. Additional Compliance Information**~~

~~None.~~

~~**2. Levels of Non-Compliance**~~

~~**2.1. Level 1:** The Regional Reliability Organization's documented TTC and ATC methodology does not address one or two of the nine items required for documentation under Reliability Standard MOD-001-0_R1.~~

~~**2.2. Level 2:** Not applicable.~~

~~**2.3. Level 3:** Not applicable.~~

~~**2.4. Level 4:** The Regional Reliability Organization's documented TTC and ATC methodology does not address three or more of the nine items required for documentation under Reliability Standard MOD-001-0_R1 or the Regional Reliability Organization does not have a documented TTC and ATC methodology available on a Web site in accordance with Reliability Standard MOD-001-0_R2.~~

## E. Regional Differences

**None ~~identified.~~**

## F. Associated Documents

**Maureen E. Long**
Standards Process Manager

February 15, 2007

TO: REGISTERED BALLOT BODY

Ladies and Gentlemen:

## Announcement: Three 30-day Comment Periods Open

**The Standards Committee (SC) announces the following standards actions:**

### SAR to Amend the Assess Transmission Future Needs and Develop Transmission Plans SAR Posted for 30-day Comment Period February 15–March 16, 2007

The SAR to amend the already-approved SAR for Assess Transmission Future Needs and Develop Transmission Plans (Project 2006-02) proposes to add TPL-005-0 and TPL-006-0 to the list of transmission planning standards currently addressed (TPL-001 through TPL-004), to consider issues raised by FERC and stakeholders regarding this set of standards, and to bring the entire set of standards into conformance with the ERO Rules of Procedure and the latest version of the Reliability Standards Development Procedure. Please use the comment form to provide comments on this SAR amendment.

### First Standard (MOD-001-1) in the Series of ATC/TTC/AFC Revisions Posted for 30-day Comment Period February 15–March 16, 2007

The first standard modified under Project 2006-07, MOD-001-1 — ATC and AFC Calculation Methodologies, requires the Transmission Service Provider to document and use a single methodology for calculating ATC or AFC. The drafting team is soliciting comments on the proposed requirements before developing the measures and compliance elements. Please use the comment form to provide comments on this draft standard's proposed requirements.

### Second Draft of SAR for Backup Facilities Posted for 30-day Comment Period February 15–March 16, 2007

The SAR for Project 2006-04 proposes modifying EOP-008-0 — Plans for Loss of Control Center Functionality. The revisions to EOP-008 focus on ensuring the continuation of functionality needed for reliable system operation regardless of the manner in which it is achieved. The modifications will consider issues raised by FERC and stakeholders about this standard, and will bring the standard into conformance with the ERO Rules of Procedure and the latest version of the Reliability Standards Development Procedure. Please use the comment form to provide comments on this SAR.

### Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☐ No

   Comments:

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☐ No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☐ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☐ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☐ Yes

   ☐ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments:

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☐ No

    Comments:

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☐ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☐ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments:

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments:

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments:

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

Comments:

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

[2] ftp://www.nerc.com/pub/sys/all_updl/standards/rs/Glossary_02May06.pdf

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: The definition is too vague to be used as a major component of the ATC Calculations. Therefore a Standard needs to be developed to determine the rules for what is ETC, where to post ETC, and the requirements for archiving the ETC for future Compliance Records and Auditing.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: A Transmission Service Request is a request to reserve Transmission Capacity. If accepted and confirmed, it is not necessary for the Transmission Customer to move energy on this Transmission Capacity. In fact, it may be used for operating reserves and energy would only be scheduled on this capacity if there was an emergency. The definition should read in a manner that the Transmission Customer is requesting Transmission Capacity from a point of receipt and points of delivery.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

☐ Already approved definition

Comments: Flowgate are also used in the Western Interconnection where there is not an IDC.

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

    **Operating Horizon** — Time frames encompassing same-day and real-time periods.

    **Scheduling Horizon** — Time frames encompassing the day-ahead period.

    **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

    **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

    Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

    ☐ N/A — these terms do not need to be defined for use in this standard

    ☐ The terms do need to be defined and I do agree with the proposed definitions

    ☒ The terms do need to be defined but I don't agree with the proposed definitions

    Comments: This Standard does not need to redefine what the planners and operators of the BES has already defined. The Regions, Reliability Coordinator, Planners and Transmission Operators have established what is the Planning Horizons (T >= 1 Year) and Operating Horizon (T< 1 Year).

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

    ☐ Agree

    ☒ Disagree

    Comments: This Standard Drafting Team should not try to define terms that have been used by planners, operators, and Reliability Coordinators for many years. The terms Rated System Path (RSP) Method and Network Response (NR) Method have already been defined or described in many white papers for operators and planners. Why is the following an incorrect statement; "The method (RSP, NR, or Flowgate) will be determined by the method that the planners and operators use for that part of the Bulk Electric System."

**Comment [m1]:** While these terms may have been used by entities for many years, one of the purposes of the standard is to promote consistency. Defining these terms in a standard is a step in that direction. I would agree with the definitions of terms.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

    ☐ Yes

    ☒ No

Comments: As written the Standard is unclear and could not be audited for compliance. Numerous requirements have been omitted or written so incomplete that it is uncertain what a Transmission Service Provider is to do to provide a accurate ATC/AFC that is consistent with other TSPs. Requirements listed in MOD-001, particularly for flowgate, are the responsibility of the planners and operators for determining transfer capability. Many of the requirements, particularly for Flowgate are rules for determining ETC, not posting ATC values.

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments: A Transmission Service Provider (TSP) function will only sell excess transmission capacity and not determine what methodology that is used to plan and operate the BES. How would a TSP come up with a different method when it is the planners and operators that determine a method? Requirements 1 and 4 do not address the formula for determining non-firm ATC; does not address if TSP is Monthly, Daily, or Hourly in Requirement 1; and does not address how many values of Monthly Daily, and Hourly ATC should be posted. In addition, Requirement 4 does not address how the TSP will determine an ATC from the AFC calculations? How will these be handled?

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

Comments: This will depend on if you are talking about Monthly, Daily, or Hourly ATC. If you are talking about Hourly ATC the change will need to be made quickly, However, if the ETC for Monthly changes the need to repost is not so important since the need for the Transmission capacity is much further into the future.

**Comment [m2]:** I would hope that most of these calculations are automated, and a change in any component would prompt an immediate recalculation and posting of ATC regardless of time period.

9. Do you agree with the frequency of exchanging data as specified in Requirement 6?

☒ Yes

☐ No

Comments: The need to exchange data will depend upon which component is changing. If the TTC or TFC is changing in the operating time horizon the Reliability Coordinator will need to exchange this information quickly to several Reliability Functions including Transmission Service Providers. Again in the operating time horizons if the ETC, CBM, or TRM changes the Transmission Service Providers need to recalculate ATC and post this new information quickly to keep the Transmission Customers updated in the quick moving operating horizon.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

☐ Yes

☒ No

Comments: This Standard is written to make the industry believe that only one ATC will be calculated for each Transmission Service Provider. In reality, the TSP will post several ATCs; one ATC for each path or network the TSP is marketing transmission capacity. Each individual path or network will only use one method, but a TSP's planners may use different methods to plan and operate different paths in their system. MISO and PJM are entities that use two methods to market transmission capacity in its system. They only uses AFC at the borders or seams of their system to determine how much transmission capacity is available at their seams, while they use LMP to determine how much transmission capacity is available on their interior system. BPA will use flowgates to determine how much ATC is available to its Transmission Customer on the interior of their system, while BPA uses Transfer Path on its seams to determine how much transmission capacity is available to Transmission Customers exterior to their system.

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

☒ No

Comments: It is not necessary in this Standard. It will be necessary to explain difference in one of the Standards that spell out the rules for TTC, ETC, CBM or TRM. This is part of the posted assumptions that is necessary for the Transmission Service Provider to post when showing the values of the components that was used to calculate the number for ATC. MOD-001 is only for the rule of calculating ATC, i.e. maximum time between calculations and rules for recalculations; and posting ATC values and posting values and assumptions for the components. Rules for the components are in other standards.

**Comment [m3]:** R13 is addressing the case where a TSR is refused because the TSP is using an ATC or AFC value that is less than the calculated and/or posted value for some reason. I don't believe it is referring to the components of ATC or AFC. I think R13 is necessary.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: Many of the requirements listed in MOD-001 are requirements needed in the Standards that set the rules for TTC, TFC, CBM, TRM, and ETC. The characteristic of each component will be made available to the industry if the Standards for the components are written properly. If MOD-001 is written in a manner that requires those characteristic to be provided to the TSP and require the TSP the post characteristics the SDT will meet its obligations.

R14 should be eliminated. Requiring the same ultimate source and ultimate sink on the Transmission Service Request and the Interchange Transaction Tag will harm commercial use of transmission service. It will force transmission users to redirect transmission service on OASIS every time a source or sink changes, even within the same control areas, while providing little, if any, benefit for reliability. If the drafting team feels this requirement is still needed, it should be passed to NAESB for inclusion as a business practice.

13. 13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

☐ Yes

☒ No

Comments: MOD-001 should only deal with ATC? and AFC and not the components. The rules for consistent and accurate methods of determining the individual components will be very complicated and numerous. Attempting to place all of these rules for the components in MOD-001 will make MOD-001 very large and impossible to measure and monitor the requirements.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

☒ Yes — TTC and TC are the same

☐ No — TTC and TC are not the same

Comments: TTC and TC are the same value determined by the planners or operation personnel for planning and operating horizons, respectively. It is recommended eliminating one of the terms to avoid confusion.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

☐ Yes

☒ No

Comments: A Flowgate is another tool to plan and operate ~~to~~ the BES. The Flowgate development and assumptions will be developed by the planners or operation personnel depending on the time horizon. The flowgate rating is determined as part of the FAC package for system rating, SOL determinations, and TTC (TC) determinations.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

Comments: In determining ATC for the different time horizons the CBM must match the same time horizon. The definition of ***Capacity Benefit Margin (CBM)*** *is defined as that amount of transmission transfer capability reserved by load serving entities to ensure access to generation from interconnected systems to meet generation reliability requirements.* The primary responsibility of the CBM for the Hourly ATC will be the LSE to meet its responsibility of providing all energy and capacity for load, including operating reserves for the upcoming hours. The Monthly and Daily ATC values are long and short term planning issues where the planners project how much transmission capacity will be needed to ensure access to generation from interconnected systems to meet generation reliability requirements.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: In determining ATC for the different time horizons the TRM must match the same time horizon. The planners that plan at the different time horizons would be the best. The SDT has come up with a proposal of using a percentage of one of the system values that has been determined by the planners. This would be a very good ~~comprise~~ compromise and promotes a level of consistent calculations.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: NO.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: MOD-001 needs to address how the AFC calculations should be converted to the ATC calculations. MOD-001 needs to show that the ATC formulas for Monthly, Daily, and Hourly calculations are for different paths or networks. MOD-001 needs to show the formula to determine $ATC_{nonfirm}$ for Monthly, Weekly, and Daily calculations. The "future development plan must be modified to include the introduction and assistance of the NERC Compliance Staff to assist the team in developing Measurements, VRFs, and suggested terms of the compliance sections of the Standard.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

[1] http://www.ferc.gov/whats-new/comm-meet/051806/E-1.pdf

**You do not have to answer all questions.**
*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for ‘Existing Transmission Commitments (ETCs)’ — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☒ Yes

   ☐ No

   Comments:

2. This is the proposed definition for ‘Transmission Service Request’ — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☒ No

   Comments:

3. This is the proposed definition for ‘Flowgate’ — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☒ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☒ Yes

   ☐ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments:

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☒ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☒ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☒ Yes

    ☐ No

    Comments:

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☒ No

    Comments: TFC is well defined in the definitiond of terms in the standard section

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: Operating Horizon - hourly and daily
    Planning Horizon - weekly and monthly

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: Operating Horizon - hourly and daily

    Planning Horizon - weekly and monthly

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

Comments: No

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: The standard does not provide a clear distiction for use of ATC verses AFC. It is our understanding that Requirements R1-R3 do not apply if the AFC methodology is used. For R4 to R6 if the AFC methodology is used then the TSP is not required to post ATC values, however AFC values would be posted.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☒ Yes

   ☐ No

   Comments:

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☒ No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☒ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: To avoid confusion and future problems, the terms definitions should be consistent with Order 890. In which case, Operations and Long-Term Planning Horizons would not be broken out, rather would simply be "Planning Horizon."

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: The Transmission Service Provider should have no more than an hour to perform its recalculation of ATC. In the west, the clock should only start after it is determined that the TTC needs changing.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☐ No

   Comments: Not applicable

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☒ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments: Requirement 13 needs clarification, not sure if agree or dissagree.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☒ No

    Comments: The requirements in R11.2, R11.3, R11.4, R11.5 and R12 do not apply to entities that use the Rated System Path method and should not apply to their ATC calculations. For those that use the Rated System Path method these requirments should apply to the TTC calculations.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments: There should be standardization of the components used in the calculation of ATC and AFC. These standards do not have to be in this standard, however if there are new standards for these components and the new standards should take into account this standard.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments:

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: The Load Serving Entity should make the CBM calculations for all the time horizons (monthly, daily, weekly and hourly) listed above.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: TheTransmission Service Provider should make the TRM calculations for all the time horizons (monthly, daily, weekly and hourly) listed above.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: None

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: None

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: This definition merely describes a universe of explicit contractual or planning commitments that can be included in the calculation of ETC. To actually calculate ETC, however, these commitments must be translated into a representation of power transfers, i.e., the use of transfer capability. BPA does not agree that ETC should be addressed as a subcomponent of MOD-001-1 as suggested in P243 or Order 890; rather, it should be addressed in its own standard.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: The definition as written implies that the request is for the physical movement of power from a specific generator to a requested point of delivery. In fact, the underlying nature of the service requested is to inject power into the grid at at a point of receipt, and to withdraw a like amount of power at a specific point on the grid for the benefit of an identified load.

   It is also not clear that a request for Network Integration Transmission Service would fall within this definition, because it may involve multiple PORs and PODs.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

☒ Proposed definition

☐ Already approved definition

Comments: Although the proposed definition is superior to the existing NERC definition, BPA believes that it may be too expansive. Specifically, the proposed definition does not clarify what is contemplated by the term "any associated contingencies". If the proposed standards are intended to ensure specificity and transparency of the contingencies, margins and/or uncertainties that may be considered when determining ATC, then BPA thinks any contingencies should be explicitly identified and quantified in the determination of TTC/TFC, TRM and/or CBM, and not in the definition of a flowgate. Also, it is not clear why a definition for transfer distribution factors is included in the definition of a flowgate. It would seem more appropriate to provide a separate stand-alone definition of transfer distribution factors.

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☒ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: The definition of Network Response Method does not convey any substantive characteristics that describe what it is, or how to distinguish the method from the Rated System Path Method. The definition for Rated System Path likewise is insufficiently described and appears to merely describe a method that relies on a calculation of TTC for one or more paths. Since both methods appear to be based on the same formula (ATC/AFC = TTC/TFC-ETC-TRM-CBM), it is unclear what the substantive distinction is between the two methods.

   The Long-Term AFC/ATC Task Force April 14, 2005 report did not suggest that there were two fundamentally different methodological approaches to determining ATC. BPA recommends that the NERC ATC drafting team defer any efforts to refine the definitions of Rated System Path Method and Network Response Method until the standard requirements for calculating TFC, TRM, CBM and ETC are developed.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☐ Yes

   ☒ No

   Comments: See response to question 5.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: The transmission service provider should recalculate ATC comtemporaneously with any formal changes in TTC, TRM or CBM. The transmission provider should recalculate ATC immediately upon any event that changes ETC in the Operating Horizon and scheduling horizon. The transmission provider should recalculate ATC within two business days of any changes in ETC that affect the Operations Planning Horizon or beyond.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☒ No

   Comments: Requirement 6 appears to only apply to a transmission service provider that calculates AFC. BPA declines comment on this provision until such time as the distinction between the various methods becomes more clear. (see response to question #5.)

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☒ No

Comments: The substantive differences between the three aforementioned methods are not yet clear. However, if multiple methods are determined to be valid and acceptable approaches to calculating ATC/AFC, then the transmission provider should be able to employ multiple methods for calculating ATC/AFC on different parts of the transmission system, provided the various methods are applied consistently and are transparent.

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

☒ No

Comments: BPA does not understand requirement 13 as written. A transmission provider would normally approve a transmission request if transfer capability required by the request is LESS than the value of ATC available. If the transmission provider approves a request using a value for ATC lower than posted ATC, then the transmission provider should not have to identify or explain its actions. On the other hand, it would make sense to require an explanation if a transmission provider approves a transmission request using a value for ATC that is HIGHER than the value of ATC that is posted.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: See BPA's response to question 19.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments: As written, the proposed standard does not achieve standardization, due in part to the uncertainties and lack of clarity in the variables within the ATC/AFC calculation. However, BPA supports development of individual standards for each variable within the ATC/AFC calculation.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☐ Yes — TTC and TC are the same

    ☒ No — TTC and TC are not the same

    Comments: Uncertain. FAC-012 speaks to reliability margins that may be applied when calculating transfer capabilities. This may give rise to inconsistencies between TC which incorporates margins, and ATC standards which, as currently drafted, imply that TRM is calculated separately from TTC.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☒ No

    Comments: TFC is similar to TC and should be addressed similarly to TC by revising the existing Facility Rating FAC-012-1.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: BPA does not employ CBM and declines to comment.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

Comments: The issue of time horizons should be determined through development of the TRM standard. The Transmission Service Provider should be reponsible for determining TRM.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: No.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

    R4. The formula in R4 describing AFC calculations is not accurate in the way it describes the application of distribution factors. Distribution factors are not necessarily applied to all of the components of the AFC calculation. Distribution factors are applied to transactions to allocate the percentage of the transaction that will flow on each applicable flowgate.

    R14. The requirement to provide the ultimate source and sink on the Transmission Service request, especially when the source or sink is on the other side of an interchange point, is not necessarily required for a Transmission Service Provider to determine the ATC/AFC impacts of a request. Additionally, this requirement may create difficulties for Transmission Customers since the ultimate source and sink may not be known at the time of the request submittal.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

[2] ftp://www.nerc.com/pub/sys/all_updl/standards/rs/Glossary_02May06.pdf

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   X Yes

   ☐ No

   Comments:

   We agree with most of the components except "other pending potential uses of Transfer Capability". This component is subject to interpretation and is difficult to demonstrate the need and quantify it for inclusion. Also, we question the need to specify "exchanges" and "deliveries" given that purchases and sales are already included.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   XYes

   No

   Comments: Definition is already sufficient and should not be expanded or changed.

   The definition should be modified to recognize the need for transmission requests for A/S capacity, not just actual energy. Insert "and/or A/S" after the word "energy". The SDT should also review the definition of transmission service for consistency.

   The definition should include reference to ultimate Source and Sink. Add to end of proposed definition "… and from ultimate Source to ultimate Sink."

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

Which definition do you prefer?

X Proposed definition

☐ Already approved definition

Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   X N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   We do not agree but if there is a need to reference time periods in the requirements, they should be specified in the requirements themselves and not as universal terms due to the lack of specificity in these.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   X Agree

   ☐ Disagree

   Comments: Remaining definitions: AFC, Network Response Method, Rated System Path Method, TFC, Transmission Reservation are OK.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   X Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team

consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

X No

Comments: We think those are the common used methodologies, we don't know of any others that are widely used.

However, we do not understand why AFC calculation must be tied with the Network Response methodology. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates themselves could become the Rated Paths.

Hence, we question the need for the qualifying statement – "using a Network Response Methodology" in parentheses, after "calculates AFC" in each of R4, R5 and R6.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

Comments: We think one day is reasonable in case of TTC, TRM or CBM changes.

If ETC changes, then re-calculation should be done within 1 or 2 hours.

9. Do you agree with the frequency of exchanging data as specified Requirement 6?

X Yes

☐ No

Comments: While the seven days timeframe may be appropriate, the requirement's lack of specificity for the start of this timeframe (ie. Before changes, after a change, after seven days from an agreement) is confusing. Is "as agreed upon" acceptable if it is greater than every seven days?

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

X Yes

☐ No

Comments: We question why the SDT requires this single methodology. The SDT should provide an explanation of the reliability problem(s) associated with applying more than one methodology as long as any methodology used is used consistently with transparency.

E.g. - CAISO currently uses one method on its ties (rated path)to other TSPs and one method for internal (network response). Additionally, for ties if adjacent TSPs use differing methodologies, the rating would not agree, so are we looking at a situation where one methodology may have to be used for each interconnection?

The CAISO agrees with the WECC MIC MIS ATC Task Force that this requirement should be eliminated or the word sole removed.

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

X No

Comments: Approving a request with insufficient AFC might happen for next hour Non-Firm if available flow gate capacity in real time justifies accepting a Non-Firm request, while Non-Firm AFC (that still has some unused Reservations included in end-result) is insufficient. This is a common practice and should not have to be documented (justified) after the fact.

It might happen also if a re-dispatch agreement is accepted by a TP that requires a Transmission Customer to re-dispatch a certain amount to cover for the negative AFC created on flow gate by accepting Reservation. This is documented by the TP.

Approving a service request at a value less than the ATC or AFC is a commercial issue, which does not affect reliability. This issue should be addressed in the Business Practice.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

X Yes

X No

Comments:

R6.8.1 We are not re-sinking 7 days of hourly values every hour, however the way Oasis Automation works it updates AFC with every Reservation that is submitted and with every Reservations that changes status. (for example Study→refused).

R6.8.3 and R6.8.2 is same, if you have daily AFC for 30 days, you automatically have weeklies for 4 weeks, however not weekly value but daily values to represent the AFC of the 4 weeks. If that is the intension then we agree.

R6.9 Not sure what ETC is intended to be included in R6.9, Gen to Load ETC only or also ETC as result of Reservations? TP's typically exchange Net Interchange based on Schedules and sometimes reservations. However that assumes that all Reservations will be scheduled. It doesn't reflect directional ETC. A combination of

ETC for a Gen to Load situation and the Reservations as referenced in R6.10 will result in the "true" ETC of the system. It can not be provided in an initial Power Flow Model.

R6.10 We don't think the "once per hour" should apply to all types of Reservations such as Weekly, Monthly and Yearly. It should be based on term of Reservation.

R7 This requirement might have to be split up in a requirement for the Sending Entity and a requirement for the Receiving Entity. The Receiving Entity could update the AFC data on an hourly basis. If the Sending Entity doesn't update the data on an hourly basis, it is not effective.

R11.2 The term "same criteria" is too general, it should be more specific.

R11.4 The term "Identify contingencies" is too general. It is unclear whether this refer to outages or the contingency elements of flow gates.

R12 – First, this requirement should be placed under R11, because R11 contains the items that must be 'identified' in the TSPs ATC methodology

Second, exchanging data with neighboring TSPs is important only if the data held by one TSP is necessary for another TSP to calculate its ATC. Therefore, R12 should be redrafted to read as follows:

- "Identify any other Transmission Service Providers from which data is received for use in calculating its ATC or AFC"

Data exchanges that are required as part of the TTC calculation should be specified in the TTC Standard.

R14 Over stringent, particularly if AFCs are not calculated to the level or scope of granularity.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    X Yes

    ☐ No

    Comments: NERC should develop some general criteria: What should be included in the TTC, TFC, ETC, TRM, CBM? How should they be calculated (high level guidelines) and what the purpose is of including them in the AFC calculation?

    Any additional standardization of the other components should be contained in those specific standards not in MOD-001. However, it is important that the details of the methodology for determining TTC, TFC, ETC, TRM and CBM must be permissive to allow for continued operation of markets in those TSPs that do not utilize a physical-rights based system for providing transmission service.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    X Yes — TTC and TC are the same

    X No — TTC and TC are not the same

    Comments: This question should probably be asked of the drafting team of FAC-012-1 / FAC-013-1 if they have the same definition in mind. When reading FAC-012-1 it is optional to apply a described methodology to an operating and/or planning horizon. The TTC as described in MOD-001-1 should be applied to all Horizons listed under question 4 of the Comment Form. We believe TTC should be added into the FAC requirements as a defined term.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    X No

    Comments:

    TTC and TFC are reliability parameters that are determined by the transfer capability methodologies stipulated in FAC-012. These values are not determined by the TSP but by the RC or TOP. In ATC and AFC calculations, these values serve as the upper bound for assessing and managing available transmission services only.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments:

    The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for CBM.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments:

    The question is inappropriate, because the standard does not attempt to define the methodology for TRM.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: To provide clarity and uniform application in the calculation of AFC and ATC the CAISO offers the following: When calculating AFC in the forward markets, this calculation should include counter transmission service requests. In WECC, there is currently no virtual schedules and transmission reservations are expected to provide energy flows real-time (or adjustments are made in real-time to ensure ties are not overscheduled). The formula for AFC would look like: AFC=TFC-(TRM*distribution factor) –(CBM*distribution factor)- the sum of(ETC impacts * respective Distribution Factors) + (counter transmission reservations *respective distribution factions). A similar formula could be provided for calculation of ATC.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

[1] http://www.ferc.gov/whats-new/comm-meet/051806/E-1.pdf
[2] ftp://www.nerc.com/pub/sys/all_updl/standards/rs/Glossary_02May06.pdf

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: Phrase "other pending potential uses" too broad and open to interpretation and could allow discrimination. Order 890 states that ETC should include: native load commitments, grandfathered transmission rights, point-to-point reservations, rollover rights, and other **uses identified through the NERC process**. We feel that "other pending potential uses" does not comply with Order 890. All components of ETC should be specifically defined.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☒ No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☐ Proposed definition

   ☒ Already approved definition

Comments: But change to, “A designated point, element or group of elements on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.”

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☐ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☐ Yes

   ☐ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments:

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☒ No

***Comments:***

We disagree with R14, which would require a Transmission Service Provider to require Transmission Customers to provide ultimate source and ultimate sink on Transmission Service Requests and further would require that Transmission Customers must use the same source and sink on Interchange Transaction Tags. Our reasons for not supporting this requirement are several, based on our belief that the requirement (1) is impractical under well-established trading and scheduling practices, (2) has not been shown to be necessary to the reliability of the North American bulk electric system, (3) is not consistent with the Market Interface Principles, which are an integral part of NERC's *Reliability Standards Development Procedure* and (4) conflicts with Order 890. Further, it is not apparent from the records of the draft team's development process that due consideration was given to whether the source/sink requirement adheres to NERC's *Reliability and Market Interface Principles*.

The source/sink requirement is incompatible with the market's trading and scheduling practices. Forward hedging is commonly transacted at Hubs, with the product defined as an "into-*HUB*," (e.g./ into-Entergy). A supplier who delivers energy to an "into-Hub" sale cannot foresee where the buyer will ultimately sink the energy. That supplier may need to purchase transmission to the Hub's interface, but cannot know in advance what sink to input in a Transmission Service Request on an upstream system. Likewise, the buyer does not know the source until the time of day-ahead scheduling, and, therefore, cannot plan his transmission purchases to coordinate with his into-Hub energy purchase. The seller may choose to deliver the "into-HUB" energy at different interfaces day to day.

When scheduling energy flows between regions, the timelines for notifying counterparties of sources/sinks may not be consistent. Though a Purchasing-Selling Entity may learn by 10:00 AM where his purchase is being generated for the next day, he may not know until 11:00 AM where that energy is sinking. The party responsible for transmission in the upstream path may have to submit a Transmission Service Request, due to a transmission provider's timing requirements, before the downstream must declare a sink. So transmission providers' timing requirements may not coincide with scheduling and tagging timelines. Further, characteristics of today's organized electricity markets are not compatible with the proposed source/sink requirement.

When energy is sourced from an organized market (i.e./ LMP system), the actual generating source cannot be identified, as economic dispatch determines generation levels on 5-minute intervals. Thus, for a transaction tagged with a source in an LMP system, the Transmission Service Request and Interchange Transaction Tag may <u>never</u> match. Similarly, in the WECC when a Mid-C product is purchased and taken to delivery, it could be generated at any of numerous hydro-generation facilities, all included in the definition of the Mid-C energy product. The proposed source/sink requirement would put certain market participants at a disadvantage. A Purchasing-Selling Entity who intends to buy transmission to move purchased energy from a Hub to a customer who will transmit the energy downstream beyond the Hub is at the greatest disadvantage with a source/sink requirement. Such a Purchasing-Selling Entity, without known generation or load, may be ignorant of both the source and the sink until the time of scheduling. It is important that the proposed standard is incompatible with trading and scheduling practices. The following is taken from NERC's Reliability Standards Development Procedure: "While NERC reliability standards are intended to promote reliability, they must at the same time accommodate competitive electricity markets."

The MOD-001-1 drafting team recognizes at least two distinct methods for ATC calculations, the Rated System Path Methodology and the Network Response Methodology. The addition of the source/sink requirement in R14, however, seems to ignore the key difference in the two methods. The Rated Path method looks at the capability of the direct wires between two points, and those points are not necessarily the source or the sink. The draft team's records do not disclose claims that the lack of the proposed source/sink requirement has degraded reliability in those systems where the Rated System Path method is employed. Apparently, source/sink requirements such as proposed in R14 are not necessary to the reliability of the North American Bulk Electric system for those areas using the Rated System Path method. In fact, it is documented in the draft team's working papers that source/sink modeling identification is "not relevant for Rated System Path Method for ATC Modeling." (See draft team's document titled NOPRitems.XLS at http://www.nerc.com/~filez/standards/MOD-V0-Revision-RF.html, dated 7/19/06.) The reason for the subsequent addition of the source/sink requirement to the proposed standard cannot be determined from the draft team's records.

The impetus for the development and revision of MOD-001-1 was the Final Report of the Long-Term AFC/ATC Task Force. In that report, in the section titled "Source and Sink Points – Calculation Process for AFC/ATC," is the following statement: "The task force suggests that the sources and sinks (injections and withdrawals) used in the calculation of AFC/ATC and the evaluation of transmission service requests should *replicate* the anticipated use of service when utilized." (Emphasis added.) This statement assumes that requiring source/sink information with a Transmission Service Request and requiring that information to match the Interchange Transaction Tag is <u>not</u> necessary. The next sentence in the report states, "It is important that Transmission Service Providers have business practices outlining when they will allow confirmed transmission reservations to be used in a manner that is not equivalent to how the request for the service was evaluated." Once again, it is granted that source/sink information is not required to match from reservation to tag. And Appendix B of the report states the case even more plainly: "Source and sink points … do not necessarily correspond to the source or sink fields on a transmission reservation, but are constructs that mimic the expected actual change in generation dispatch that would be used to affect that power transfer in real-time."

Further practical considerations show that the R14 source/sink requirement is not necessary to the reliability of the bulk electric system. For instance, Southwest Power Pool (SPP) employs an "electrical equivalent" concept. According to SPP's Business Practices an exception is allowed when the source/sink of a reservation does not match the source/sink of the tag, so long as the source/sink on the reservation is considered electrically equivalent to the source/sink on the tag. SPP also allows an exception when a customer combines two SPP reservations on the same tag, so long as one reservation has the correct source/sink (or electrical equivalent) and the PORs and PODs are contiguous, such a scheduled reservation/tag is valid. (See 4.3 of SPP's Open Access Transmission Tariff Business Practices.) Additionally, consider schedules that flow across DC ties. There is no need, for the purposes of calculating ATC, for transmission providers in the WECC to know where in the Eastern Interconnect a transaction flowing west to east on one of the DC ties is sinking. Likewise, for an energy schedule sourced in ERCOT to a sink in SERC, there is no need for the transmission providers in ERCOT to know the ultimate sink. And no need for the transmission providers in the Eastern Interconnect to know the ultimate source. Source/sink information matching from reservation to tag is not necessary to reliability in these cases.

The proposed source/sink requirement conflicts with NERC's Reliability Standards Development Procedure, which includes two sets of guiding principles, Reliability Principles and Market Interface Principles. "Consideration of the market interface principles is intended to ensure that reliability standards are written such that they achieve their reliability objective without causing undue restrictions or adverse impacts on competitive electricity markets."

Market Interface Principle 2 states, "An Organization Standard shall not give any market participant an unfair competitive advantage." As mentioned earlier, market participants without known generation resources or load obligations can be put at a definite disadvantage with the proposed source/sink requirement. Market Interface Principle 3 states, "An Organization Standard shall neither mandate nor prohibit any specific market structure." The indirect result of R14 would be to so inhibit markets operated with the Rated System Path Methodology so as to essentially prohibit the prevailing market structure operating where that method is employed. Transmission providers and customers would be forced to transact differently, potentially disrupting long-established and efficient markets. Most importantly, Market Interface Principle 4 states, "An Organization Standard shall not preclude market solutions to achieving compliance with that standard." The title of the standard at issue is *ATC and AFC Calculation Methodologies*. Yet no explanation can be found in the draft team's records as to how the source/sink requirement in R14 will improve ATC calculations. In reviewing the records of the drafting team, no examples can be found showing that the lack of the source/sink requirement causes degraded reliability. In fact, markets that do not require that ultimate source/sink be provided on a reservation and then match on an Interchange Transaction Tag have obviously determined and implemented solutions to calculating ATC, without such a requirement. The record of the drafting team simply does not provide evidence to the contrary.

Finally, in reviewing FERC's Order 890, it is apparent that R14's source/sink requirement is inconsistent with established protocols for transmission service reservations. At paragraph 297 of Order 890 the Commission states, "Regarding transmission reservations modeling, we direct public utilities, working through NERC, to develop requirements in reliability standard MOD-001 that specify (1) a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown and (2) how to model existing reservations." Obviously, it is understood that not only existing reservations may not have provided source/sink information, but also, by distinguishing **existing** reservations, FERC has assumed that future transmission service requests may not provide source/sink information. Indeed the definition of Transmission Service Reservation proposed in the MOD-001-0 standard references Point of Receipt and Point of Delivery, but not source and sink (see 2. at page 4 of this document.)

In summary, the proposed source/sink requirement is inconsistent with established trading and scheduling protocols, is not necessary to the reliability of the bulk electric system, conflicts with the principles established to guide the development of reliability standards and is inconsistent with FERC Order 890. For the reasons stated herein, we disagree with the proposed source/sink requirement in MOD-001-1.

***Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.***

☐ Yes

☐ No

Comments:

~~14.~~13. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

☐ Yes — TTC and TC are the same

☐ No — TTC and TC are not the same

Comments:

~~15.~~14. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

☐ Yes

☐ No

Comments:

~~16.~~15. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

Comments:

~~17.~~16. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

Comments:

~~18.~~17. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

Comments:

~~19.~~18. Do you have other comments that you haven't already provided above on the proposed standard?

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

[2] ftp://www.nerc.com/pub/sys/all_updl/standards/rs/Glossary_02May06.pdf

**You do not have to answer all questions.**
*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for ‘Existing Transmission Commitments (ETCs)’ — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: The definition of ETC is too ill defined. There probably needs to be a separate standard for ETC (as exists for TRM and CBM). "Native load" should be "Network/Native load". All Contingency Reserves has too general to be used for ETC calculation - only reserves considered under TRM and CBM should be allowable for ETC calculation. What are the "existing commitments for purchases, exchanges, deliveries, or sales" that do not fall under the "existing commitments for transmission service" category? This phrase should be eliminated from the definition.

2. This is the proposed definition for ‘Transmission Service Request’ — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: 'Transmission Service Request' - An OASIS request by the Transmission Customer to reserve transmission capacity for the purpose of moving energy from a point of receipt to a point of delivery.

3. This is the proposed definition for ‘Flowgate’ — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

☐ Already approved definition

Comments: Delete the second sentence of the proposed definition

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☒ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☒ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: Need to define the precise time periods in Operating Horizon and Scheduling Horizon (i.e. 12:00 midnight, etc.)

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: The definitions of Network Response Method and Rated System Path Method are too vague.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments:

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☐ No

   Comments: Frequency should be as agreed upon or 30 days.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments: One methodology is sufficient for Duke Energy

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☒ No

    Comments: Delete Requirement 13.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☒ No

    Comments: R11.4 and R11.5 should be moved to FAC-012, since contingencies are modeled in the TTC calculation.

    As written with the requirement to provide ultimate source and ultimate sink, R14 should only apply to reservations and tags on systems that calculate AFC. In general, on systems that calculate ATC or AFC, source and sink granularity on the reservation must be sufficient to allow adequate assessment of the impact on the capacity offering (ATC or AFC). Source and sink granularity on the e-tag must be sufficient to allow adequate assessment of the e-tag's impact on the transmission system. The Point of Receipt (POR) and the Point of Delivery (POD) must be the same on the reservation and the e-tag. If the source or sink on the e-tag is different from the source and sink on the reservation and the impact is substantially different from the expected impact of the reservation, the TP may deny or curtail the e-tag..

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments: See response to Q. #1. TRM, CBM, etc, are defined in other standards

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☐ Yes — TTC and TC are the same

    ☒ No — TTC and TC are not the same

    Comments: FAC-012 should apply to TC, which indicates the ability to reliability move large amounts of power between regions, sub-regions and control areas. Test of TC identifies potential transfer limits that may result from loop flows, market activity or contingencies. TTC calculation is required to support market operation without impacting reliability in a negative manner.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☒ Yes

    ☐ No

    Comments: TFC and AFC need to be in the same standard because they are interlinked with market issues. FAC-012 and FAC-013 focus on calculation of TC for reliability studies.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: Resource Planner should make the calculation.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: TRM should be looked at as a seasonal requirement, and Duke Energy would use the same TRM value for monthly, daily and hourly calculations. Transmission Planner makes the TRM calculation.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: We understand that the drafting team is examining the impacts of FERC Order 890 for conflicts with the proposed standard

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: We have not factored impacts of FERC Order 890 into these comments. Editorial comment on R.12 - should read "Each Transmission Service Provider shall identify other Transmission Service Providers with which the data used in the calculation of ATC or AFC is exchanged."

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. ## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: Definition of ETC is broad and can not be used to calculate the ETC in a consistent and reliable manner. Since ETC will vary depending on what ATC calculations this is used for, its components can vary. For example, for Firm ATC calculation, there is no need to include non-firm reservations. A detailed Standard could to be developed or details included in MOD-001 for ETC calculations that should describe requirements and components to be included in ETC calculations. However, in view of para 243 of FERC Order 890, ETC should be addressed by including the requirements in MOD-001 rather than through a separate reliability standard.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☒ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: Time frames (real-time; same day; day-ahead; and from day-ahead up to 13 months) as included in the standard are clear. There is no need to define these terms in this standard as these may conflict with the intent of these terms used in other standards.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: Definitions of Network Response Method and Rated System Path Method are not clear. It is not clear what is meant by "…customer Demand, generation resources, and the Transmission systems are closely interconnected" in Network Response Method, as they are always closely interconnected. This definition does not reflect that the Transfer Capability is calculated using response of the system or by simulating the impact of flows on the system. The Rated System Path Method appears to be using only the critical path ratings. It is not clear how critical paths are determined and what ratings are used for those. Since there is no difference in calculation of ATCs by either Network Response Method or Rated System Path Method, there does not seem to be any need for including the definition in this standard. If these definitions are applicable only for TTC calculations, these terms should be defined and included in standard dealing with TTC (FAC-012). If included in FAC-012, these definitions should reflect clearly how calculations are performed under each method.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

☐ No

Comments: Since ATC and AFC calculations are performed for selling the Transmission Service (Capability) to customers based on the Open Access Transmission Tariff which is administered by the Transmission Service Provider, it makes sense to assign requirements for ATC and AFC calculations to Transmission Service Providers.

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments: There does not appear to be any difference for ATC calculations for Network Response Method and Rated System Path Method, therefore for the purpose of ATC calculations it does not matter how TTCs are calculated. If the difference will become clear in the TTC calculation method standard, then these definitions and methodologies should be included in that standard (FAC-012) and removed from this standard. There are clearly two methods of Transmission Capability calculations, ATC method and AFC method and only these should be included in the current standard.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

Comments: Calculation and posting of ATC for Constrained Path is included in FERC Order 889 section 37.6(3)(i)(C)(2) as " The capability posted ………. must be updated when transactions are reserved or service ends or whenever the TTC estimate for the Path changes by more than 10 percent. Calculations and posting of ATC for Unconstrained Paths are included in FERC Order 889 section 37.6(3)(ii)(A) as " ….These postings are to be updated whenever the ATC value changes for more than 20 percent. " Therefore, calculation of ATC values on all paths when any of the components changes may not be required. If the ATC is recalculated and not posted it does not do any good. Timing of Posting on OASIS should determine when the ATC and AFC values should be recalculated. Since these timing requirements will be included in NAESB Business Practice Standard there is no need for a requirement R2 in MOD-001 for recalculation of ATC values.

9. Do you agree with the frequency of exchanging data as specified Requirement 6?

☐ Yes

☒ No

Comments: A limit of 7 days does not appear real. The Data Exchange should be on an agreed upon schedule as some data like line and generation outages, if exchanged within 7 days may not be of any use for calculations of real time or day ahead ATCs and AFCs. Since the data is exchanged for coordinating ATCs and AFCs it should be left to the entities that need this information to develop frequency of daa exchange rather than this standard putting some upper limit. In addition, current Requirement 6 applies only to Transmission Service Providers using AFC Method. Data need to be exchanged for ATC calculation also for coordination with the neighboring systems. Several items in Requirement 6 are applicable to ATC calculation such as TTC, ETC etc. This is especially true if a Transmission Provider is using a Network Response Method for calculation of ATC values.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

☐ Yes

☐ No

Comments: Only one method for calculation of ATC or AFC should be used for each system so that there is consistency between the method used for approving transmission service requests and for planning and operation of the system as required in R 11.2. In case more than one method is used it will be difficult to make these methods consistent.

11. Do you think that Requirement 13 in this proposed standard necessary?

☒ Yes

☐ No

Comments: Transmission Service Provider may allocate capability of transmission element to different users based on their ownership interest and any other agreements. This requirement allows use of different ATC or AFC values based on such arrangements. However, it does not have to be limited to only lesser of the calculated value used for approving Transmission Service Request. In case a Transmission Service Provider is using higher than the calculated value (in some emergency cases, TP may use emergency rating of limiting line/equipment which may result in higher than the normal calculated ATC value), it may be putting the reliability of the system at risk. Therefore, the Transmission Service Provider should identify how it determines ATC values for approving Transmission Service Requests if those are different from the calculated values, whether higher or lesser than the calculated value.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: (R3.) There is no need to include ATC and TTC values to be provided when requested within 7 days as these are expected to be posted on OASIS and be available per OATT requirement. (R4.) The equation assumes that the TRM, CBM and ETC are for each path that has a Distribution Factor factor to each flowgate. Therefore, the language in the standard should be changed to include "respective" before the Distribution Factor for TRM and CBM. In addition, the definition of Distribution Factor included in the NERC Standard Booklet "The portion of Interchange Transaction, typically expressed in per unit that flows across a transmission facility (Flowgate)" can only be used if the TRM, CBM and ETC are allocated on each Interchange Transaction which is from control area to control area. If the TRM, CBM and ETC standards do not require such allocation, the formula will be invalid. (R5.1) This requirement should also be applicable to ATC calculations if Transmission Service Provider uses impact on interface differently for the Firm and Non-Firm reservation. At a minimum Transmission Service Provider should be required to include method of adjusting the ATCs for Firm and Non-Firm Reservations for transparency purposes. (R5.2) Comment similar to that for R5.1 applies to this requirement as this requirement should be applicable to ATC calculation. (R 5.3) This requirement is poorly written as it is not clear what is required to be on OASIS, Is assumptions used for base case and transfer generation dispatch for both external and internal system need to be on OASIS? If so, it does not make sense. (R6.3) The monitoring of the requirement of exchanging generation dispatch order that is updated at least prior to each peak load season or the generation participation factors of all units on an affected Balancing Authority basis that is updated as required by changes in the status of the unit will be difficult as these are inconsistent. The participation factors theoretically will change any time the generator status changes and will have to be recalculated and shared with all entities. Transmission Service Providers should be required to exchange participation factors when updated and at a minimum prior to each peak load season rather than required to calculate when generator status changes. (R6.8) This requirement is applicable only to AFC calculations as AFC values for different periods need to be updated at certain interval. First this requirement is based on FERC Order 889 and is of commercial nature, therefore, it should be included in NAESB business practices. Secondly, this requirement is also applilcable to ATC values, if it is included in this standard, this should also be made applicable to ATC calculations. (R 6.10) Transmission Service Reservations are available on line on OASIS and need not be included in this standard to be exchanged. Also Transmission Service Reservations may be included in ETC when standard for ETC is developed. (R7) The requirement for updating AFC values should be in NAESB Business Practices. This requirement is also applicable to ATC calculations. (R11) There are more requirements to be included in the AFC methodlogy than the ATC methodology (R5 and R11 are applicable to AFC, and only R11 is applicable to ATC). There does not appear to be a requirement for Transmission Providers using ATC to include items in R1 - R3 in ATC calculation Methodology. It should be made consistent. (R12), (R13), (R14) These requirements can be included in R11 as additional sub requirements. There does not seem to be any justification to keep them as separate requirements and not to be included in the calculation methodology.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☒ Yes

    ☐ No

    Comments: Yes, these details should be included in standard for TTC, TFC, TRM and CBM

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments: TTC and TC are same. However FAC-012 is written for reliabiliy assessment of Bulk System. Since Transfer Capability calculations use same algorithm but different base case models, FAC-012 should be modified to include calculation of TTC that can be used for ATC calculations as described in MOD-001.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☒ No

    Comments: TFC and TTC methodology should be included in the same standard. Since FAC-012 includes TTC, the same standard should include requirements for TFC calculations.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: There can be different CBM for different time horizons. CBM should be calculated based on the uncertainties of generation available within the Transmission Service Provider area to meet loads. Load Serving Entities should calculate CBM for their loads based on their loads and generation available to serve these loads. In case of Reserve Sharing Groups, loads and generation for the entire group should be included to calculate CBM. Or if CBM calculations are performed on a Balancing Authority Area basis, the entire load and genereation in that area should be used for these calculations, even if there are more than one LSEs within that area.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: There can be different TRM for different time horizons. Farther in future, less certain are the conditions, therefore, higher TRM. Since TRM is based on combination of uncertainties of different elements, each components will have different contributions to TRM for different time horizons.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: No, however requirements in the proposed standards should be consistent with those included in FERC OATT, Orders 888, 889, and recently issued FERC Order 890.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: The Standard Drafting Team has a difficult task of including FERC expectation of making ATC calculations consistent and transparent. Due to different operating practices in different regions of the country, it will be difficult to come up with consistent (one size fits all) method. Regional differences should be recognized keeping in view how these are affecting reliability. Any issues that are commercial in nature should be left to NAESB to include in their Business Practices Standards.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☐ No

   Comments: ERCOT does not have a transmission service market. Therefore, this concept does not have meaning in ERCOT operations as described in this definition.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☐ No

   Comments: ERCOT does not have a transmission service market. Therefore, this concept does not have meaning in ERCOT operations as described in this definition.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☐ Proposed definition

   ☐ Already approved definition

   Comments: ERCOT does not typically use the term "Flowgate". ERCOT analysis considers monitored elements and a list of contingencies used in contingency analysis. However, the definition of monitored element, while similar to Flowgate, does not require the inclusion of associated contingencies. Both definitions, as prescribed, do not have meaning in ERCOT operations.

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☒ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: I am concerned that there may be multiple efforts underway on various SARs and Standards as well as the Operating Limit Definition Task Force that may be using variations of this concept. I do agree that a uniform understanding and set of terms for these timeframes would be useful and may help to avoid contradictions and confusion, but I am uncertain whether this standard is the place for this to be decided. They should not be offered as "definitions", which I understand the standards development process requires to become a part of the NERC Glossary. Perhaps the standard should clarify what is meant for the purposes of this standard, but it should not be proposed as official "definitions" which must apply in all standards.

   In general, I believe that all of the horizons listed, with the exception of the "Scheduling Horizon" exist with some consistency of understanding (although not always with exactly the same durations specified). The Operations Planning "horizon" is typically discussed as representing from Real-Time through Day-Ahead and on up to one year. The "Planning Horizon" is typically discussed as representing one year and longer; this would correspond closely, but not exactly with the "Long-term Planning Horizon" proposed above. Some difficulty arises because many of the differing contractual agreements, organizational arrangements, and market rules define these terms differently at different locations. This may be true even for such arrangements which cross Regions or even Interconnections.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☐ Disagree

   Comments: ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☐ Yes

   ☒ No

   Comments: The transmission service provider seems appropriate, however, there is need for a broader oversight or review to coordinate. Without such an "umbrella" there is likely to be differing values calculated by different transmission service providers for the same parts of the transmission system

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☐ Yes

   ☐ No

   Comments: ERCOT does not use these values in its operations.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: ERCOT does not have a transmission service market and does not use this methodology.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☐ No

   Comments: ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

Comments: ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology.

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments: ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☐ No

    Comments: ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☐ No

    Comments: ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☐ Yes — TTC and TC are the same

    ☒ No — TTC and TC are not the same

    Comments: As I recall, the FAC drafting team recognized similarities, but used a different name because they were not considered to be the same. The FAC standards relate more to operational system capabilities and different timeframes, not to the in-advance nature of TTC used in the transmission service market. The FAC drafting team included in the FAC standards that the TTC methodologies shall respect the System Operating Limits which relate to the TC described in the FAC standards.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments: ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

Comments: ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology. In addition, ERCOT presently has set TRM and CBM to zero in its operating and market activities.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: No.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: Yes. No Regional Differences are identified in this draft. However, ERCOT does not use this methodology and therefore this shall not apply to operating activities and market activities in ERCOT. The standard should provide for ERCOT's non-transaction-based methodology.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☒ Yes

   ☐ No

   Comments:

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☒ No

   Comments: Should specify that it must be done on OASIS and should be broad enough to include network integration transmission service also. Suggested wording: A service requested on the OASIS by a transmission customer of the transmission service provider to move energy out of, across, or into the transmission service provider's transmission system.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments: Last sentense of new definition is not necessary. It is extraneous to the definition.

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☒ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: Requirement R11.5 should use the term " Long-term planning horizon" as defined above rather than " for use in the 13 months and longer time frame".

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☐ Yes

   ☒ No

   Comments: The B.A. and LSE should have obligations to provide the information in R6 i.e. dispatch order, forecasted loads, etc that are applicable.

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments: The standard should allow a Transmission Provider flexibilityto use different methodologies depending on seam and other factors.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: The amount of time needs to correlate with the product and the timeframe effected. For example, an ETC change in future month 8 the length of time to update the posting should be days. If a line trips changing the TTC for the next day then the length of time to update should be hours.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☒ No

   Comments: General requirement of (7) calandar days referenced in general requirement R6 is inconsistant with the individual requirements contained in R6.1.- r6.10 which often reference specfic time frames example R6.10 says " when revised once per hour" or R6.2 that states " as changes occur"

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

   ☒ Yes

   ☐ No

Comments: Different method are needed to address seams issues between areas that select different methodologies, different methods may be applicable to different interfaces etc. The transmission provider should have the flexibility to select the appropriate method.

11. Do you think that Requirement 13 in this proposed standard necessary?

   ☒ Yes

   ☐ No

   Comments: There is a strong reliability need for this. It is believed that the word " posted" needs to be inserted in front of the word value in the statement " other than and less than its value" i.e. the statement should read " other than and less than its posted value".

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☒ Yes

☐ No

Comments:

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments: Separate standards are being developed that address the components

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments: The TTC definition should be retained.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☒ Yes

    ☐ No

    Comments: All transfer related matters need to be contained in one standard not spead out over multiple documents.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments:

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: The TRM should relate to the time horizon of the product. TRM is indtend to account for uncertainties in the bulk electric system and should be determined by the Transmission Service provider. The degree of uncertainty increases in relationship to the product timeframe. The system conditions for hourly are known with a much greater degree of accuracy than for the 13th month. Additionally, the period of exposure to a risk is much greater on a month product than on an hourly product. The probability of a unit or line tripping during the period of a confirmed transaction is much greater for a monthly product than for a daily product.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: I have no specific suggestions, but in reading the definition for the first time, I am not sure how to interpret this. I have had to read it several times, and could interperet the defintion several ways as to our situation. Dynamic (and or psudo tie) uses for wind, and hydro generation, grandfathered system rights, and flow through from other systems that don't follow schedule paths, but physical paths, could all be problematic.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: Who's POR or POD? I am sure I know what the intent is, some may read this, as written to mean the whole path.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☐ Proposed definition

   ☒ Already approved definition

Comments: We start to create a problem if standards have their own meanings for a term. This creates an abiguity and needs to be avoided at all costs.

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☒ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: I would avoid the need to create more defined terms. Long lists of defined terms cause confusion and misunderstanding. Perhaps a simpler solution would be to use the term in the text, explain it there when it is first introduced, and then continue to use the term. This makes the document a little easier to read, and keeps the definition in context. It is my experience that in the effort to create a good document, we write at a level that is above many readers comprehension level.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: I have no problems with the definitions themselves. I do stress again to avoid long lists of defined terms, since they make the document more difficult to read, and comprehend. One other point would be that if these terms are used in other standards, they could be defined slightly different causing confusion.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments: This is consistent with the Functional Model

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path

methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments: However, the standard should be written in a way that if there are other methodologies, now or in the future, they could somehow be accomodated. This thought is based on the concept that the new methodology is defensible.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: Specifying a time is difficult, since it is arbitrary. If the process is automated, it could be immediately. If it is manual, more time is needed. If extensive study is needed, it could take some time, especially if it has to be coordinated with another TSP. It should be as soon as reasonably practicable.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☐ No

   Comments: As long as this is not overly burdensome on smaller TSPs

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

   ☐ Yes

   ☒ No

Comments: Its hard to answer this question without more detail to the ATC calculations.

11. Do you think that Requirement 13 in this proposed standard necessary?

   ☐ Yes

   ☒ No

   Comments: No one would have an issue if the Transmission Service Requests are approved. When they are denied justification needs to be made.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: "R11.4 Identify the contingencies considered in the ATC and AFC calculation methodology". Is this appropriate? This could be an extensive list in some cases, it could create a security risk, or it could be leveraged for market power.

"R14 The Transmission Service Provider shall require that the Transmission Customer provide both ultimate source and sink on the Transmission Service Request and shall require that that Transmission Customer use the same source and sink on the Interchange Transaction Tags." Shouldn't the TSP only focus on that part of the transmission that he is providing service for? POD and POR? I am not sure if the intent here is to do specific point of generation to point of usage scheduling. If it is, this is not appropriate for our situation. We meet our schedules with a portfolio of generation and meet our loads with a series of contiguous PORs. We do not to be overly specific and burdensome.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments: Being too presciptive will raise issues of entities seeking exemptions for one reason or another, there by confusing the compliance.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments: No opinion.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: The Transmission Operator should be continuously be updating all of these values.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: The Transmission Operator should be continuously be updating all of these values.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: No

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: Thank you for the opportunity to comment. Other comments will arise after further refinement of this standard, and our further study of it.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. ## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☒ Yes

   ☐ No

   Comments: We question the use of "other pending potential uses of Transfer Capability". This component is subject to interpretation and is difficult to demonstrate the need and quantify it for inclusion.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☒ No

   Comments: Point of receipt and point of delivery shall be defined. Considerations shall be taken for POR and POD from different asynchronous Interconnection

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments: "any associated contingency" needs to be explained. Why should contingencies be associated to an element or group of transmission elements?

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☒ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: Considerations should be made for the transition from the Scheduling and the operating. Exemple transition is performed each day at 16:00

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☒ Yes

☒ No

Comments: R5, R6, R7 Companion's requirements for Rated system path are not specified

R1 request TTC/TFC being calculate first than

ATC/AFC : TTC/TFC - TRM-CBM-ETC

TSP shall have the possibility to calcualte available Incremental ATC (IATC) ATC/AFC first based on ETC than TTC/TFC should egual:

TTC = IATC+ETC

R9 TSP methodology shall be consistently tied with the "path" and TSP may use different set of assumptions pending the time frame for which the TTC,ATC, etc are calculated

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: will depend on the Time Frame

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider’s entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☒ No

Comments: Methodology choice shall be solely based on the system topology and the path requirements

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☒ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

☒ No

Comments: refer to 7

R12 – First, this requirement should be placed under R11, because R11 contains the items that must be ‘identified’ in the TSPs ATC methodology

Second, exchanging data with neighboring TSPs is important only if the data held by one TSP is necessary for another TSP to calculate its ATC. Therefore, R12 should be redrafted to read as follows:

•“Identify any other Transmission Service Providers from which data is received for use in calculating its ATC or AFC”

Data exchanges that are required as part of the TTC calculation should be specified in the TTC Standard.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments: Any additional standardization of the other components should be contained in those specific standards not in MOD-001. However, it is important that the details of the methodology for determining TTC, TFC, ETC, TRM and CBM must be permissive to allow for continued operation of markets in those TSPs that do not utilize a physical-rights based system for providing transmission service.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments: This question should probably be asked to the drafting team of FAC-012-1 / FAC-013-1 if they have the same definition in mind.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☒ No

    Comments: If TFC is similar to TTC, it should be dealt in another Standard e.g. the same one that would deal with TTC.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: The question is inappropriate, because the standard does not attempt to define the methodology for CBM.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: The question is inappropriate, because the standard does not attempt to define the methodology for TRM.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: The drafting team must engage in additional drafting to address the concerns raised by Order No 890.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012. Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☒ Yes

   ☒ No

   Comments: We agree with most of the components except "…other pending potential uses of Transfer Capability". This component is subject to interpretation and it is difficult to demonstrate a quantifiable need for the inclusion of this component. Also, we question the need to specify "exchanges" and "deliveries" given that "purchases" and "sales" are already included in the definition.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☒ No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency (ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☒ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☒ Yes

   ☒ No

Comments: We are not suggesting that the SDT consider other methodologies. However, we do not understand why AFC calculation must be tied with the Network Response methodology only. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates themselves could become the Rated Paths.

Hence, we question the need for the qualifying statement – “using a Network Response Methodology” in parentheses, after “calculates AFC” in each of the requirements R4, R5 and R6.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: No more than 1 hour.

9. Do you agree (?) with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☒ No

   Comments: We agree with the frequency of exchanging data as specified in Requirement 6. However, we do not agree with the sub-requirement 6.5.

   Not all TSPs perform load forecasting. They should not be required to provide this information. Beside, load forecast information is already included in the base model a TSP uses in calculating AFCs. This is met by virtue of meeting R6.4.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider’s entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☒ Yes

    ☒ No

    Comments: See comments under Q7 on Rated Path Methodology – AFC (not included in the 3 methods).

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☒ No

    Comments: Requirement 13 is not required. Approving a service request at a value less than the ATC or AFC is a commercial issue, which does not affect reliability. This issue can be addressed in the Business Practice.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: We do not agree with the following:

(i) The text box next to R5 says: [Please note that it may appear that the AFC methodology contains more requirements than that ATC methodology. Due to the characteristics of the ATC methodology, the corresponding level of detail will be contained in the standard that determines TTC (e.g. FAC 12 or FAC 13) when it is revised.]

We interpret this text box applies to both R5 and R6.

We agree that the two methods are different and therefore may need different detailed requirements in certain aspects. However, many of the sub-requirements in R5 and R6 appear to be applicable to the ATC calculation methodology as well hence the detailed requirements can also be addressed in this standard. Moreover, addressing detailed ATC calculation requirements in FAC-012 or –013 appears to be a misfit since the latter standards deal with Transfer Capabilities (and to be revised to deal with Total Transfer Capabilities as suggested in Q14, below), which are solely reliability parameters. Moreover, having the detailed ATC calculation requirements placed in a separate standard would leave room for confusion to the standard users.

(ii) R6.5. Please see comments under Q9.

(iii) R11.4 The contingencies considered and applied in determining the ATC or AFC would be the same sets used for operating studies and planning studies which could include all possible Category B and Category C contingencies on the TSP's system. It would be near impossible to identify them all. This requirement is implied by R11.2, and where necessary, R11.2 can be expanded to ensure that the ATC and AFC shall be determined with the same set of contingency criteria applicable to the reliability assessment of the like time frame.

(iv) R11.5 We do not understand this requirement. Does it mean that for ATC and AFC calculation, the model and assumptions must be the same as those used for expansion planning? Note that calculations of ATC and AFC need to consider planned outages to BES facilities, whereas expansion planning may not. Also, if this is the requirement, what are the parallel requirements for ATC and AFC calculation in time frames less than 13 months?

.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☒ Yes

    ☐ No

    Comments: Some general criteria (the basis) for determining CBM and TRM should be developed so that a consistent approach is used by all TSPs.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☒ No

    Comments: TTC and TFC are reliability parameters that are determined by the facility rating methodologies stipulated in FAC-012 and FAC-013, and these values are not determined by the TSP. In ATC and AFC calculations, these values serve as the upper bound for assessing and managing available transmission services only.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: All time horizons should be used in accordance with the corresponding ATC calculation time frame. The value of CBM should be determined by the TSP based on the need demonstrated by the LSE.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: All time horizons should be used in accordance with the corresponding ATC calculation time frame. The value of TRM should be determined by the TOP and

RC depending on the reason for the need of interconnection assistance to cover uncertainties that could affect transmission reliability.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: No conflicts. But there are markets that do not provide physical transmission services which require the calculation and posting of ATCs and AFCs. In addition, there are entities that are not under FERC's jurisdiction and hence may not provide any transmission services.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: Requirement 12 should be R11.6

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. ## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

[2] ftp://www.nerc.com/pub/sys/all_updl/standards/rs/Glossary_02May06.pdf

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   X Yes

   X No

   Comments:

   We agree with most of the components except "other pending potential uses of Transfer Capability". This component is subject to interpretation and is difficult to demonstrate the need and quantify it for inclusion. Also, we question the need to specify "exchanges" and "deliveries" given that purchases and sales are already included.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   X Yes

   No

   Comments:

   The definition should be modified to recognize the need for transmission requests for A/S capacity, not just actual energy. Insert "and/or A/S" after the word "energy". The SDT should also review the definition of transmission service for consistency.

   The definition should include reference to ultimate Source and Sink. Add to end of proposed definition "… and from ultimate Source to ultimate Sink."

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the

Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

Which definition do you prefer?

X Proposed definition

☐ Already approved definition

Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   X N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   We do not agree but if there is a need to reference time periods in the requirements, they should be specified in the requirements themselves and not as universal terms due to the lack of specificity in these.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   X Agree

   ☐ Disagree

   Comments: Remaining definitions: AFC, Network Response Method, Rated System Path Method, TFC, Transmission Reservation are OK.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   X Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating

ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

X No

Comments: We think those are the common used methodologies, we don't know of any others that are widely used.

However, we do not understand why AFC calculation must be tied with the Network Response methodology. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates themselves could become the Rated Paths.

Hence, we question the need for the qualifying statement – "using a Network Response Methodology" in parentheses, after "calculates AFC" in each of R4, R5 and R6.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

Comments: We think one day is reasonable in case of TTC, TRM or CBM changes.

If ETC changes, then re-calculation should be done within 1 or 2 hours.

9. Do you with the frequency of exchanging data as specified Requirement 6?

X Yes

☐ No

Comments: While the seven days timeframe may be appropriate, the requirement's lack of specificity for the start of this timeframe (ie. Before changes, after a change, after seven days from an agreement) is confusing. Is "as agreed upon" acceptable if it is greater than every seven days?

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

X Yes

☐ No

Comments: We question why the SDT requires this single methodology. The SDT should provide an explanation of the reliability problem(s) associated with applying more than one methodology.

*E.g. - CAISO currently uses one method on its ties (rated path)to other TSPs and one method for internal (network response). Additionally, for ties if adjacent TSPs use differing methodologies, the rating would not agree, so are we looking at a situation where one methodology may have to be used for each interconnection?*

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

X No

Comments: Approving a request with insufficient AFC might happen for next hour Non-Firm if available flow gate capacity in real time justifies accepting a Non-Firm request, while Non-Firm AFC (that still has some unused Reservations included in end-result) is insufficient. This is a common practice and should not have to be documented (justified) after the fact.

It might happen also if a re-dispatch agreement is accepted by a TP that requires a Transmission Customer to re-dispatch a certain amount to cover for the negative AFC created on flow gate by accepting Reservation. This is documented by the TP.

Approving a service request at a value less than the ATC or AFC is a commercial issue, which does not affect reliability. This issue should be addressed in the Business Practice.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

X Yes

X No

Comments:

R6.8.1 We are not re-sinking 7 days of hourly values every hour, however the way Oasis Automation works it updates AFC with every Reservation that is submitted and with every Reservations that changes status. (for example Study→refused).

R6.8.3 and R6.8.2 is same, if you have daily AFC for 30 days, you automatically have weeklies for 4 weeks, however not weekly value but daily values to represent the AFC of the 4 weeks. If that is the intension then we agree.

R6.9 Not sure what ETC is intended to be included in R6.9, Gen to Load ETC only or also ETC as result of Reservations? TP's typically exchange Net Interchange based on Schedules and sometimes reservations. However that assumes that all Reservations will be scheduled. It doesn't reflect directional ETC. A combination of ETC for a Gen to Load situation and the Reservations as referenced in R6.10 will result in the "true" ETC of the system. It can not be provided in an initial Power Flow Model.

R6.10 We don't think the "once per hour" should apply to all types of Reservations such as Weekly, Monthly and Yearly. It should be based on term of Reservation.

R7 This requirement might have to be split up in a requirement for the Sending Entity and a requirement for the Receiving Entity. The Receiving Entity could update the AFC data on an hourly basis. If the Sending Entity doesn't update the data on an hourly basis, it is not effective.

R11.2 The term "same criteria" is too general, it should be more specific.

R11.4 The term "Identify contingencies" is too general. It is unclear whether this refer to outages or the contingency elements of flow gates.

R12 – First, this requirement should be placed under R11, because R11 contains the items that must be 'identified' in the TSPs ATC methodology

Second, exchanging data with neighboring TSPs is important only if the data held by one TSP is necessary for another TSP to calculate its ATC. Therefore, R12 should be redrafted to read as follows:

- "Identify any other Transmission Service Providers from which data is received for use in calculating its ATC or AFC"

Data exchanges that is required as part of the TTC calculation should be specified in the TTC Standard.

R14 Over stringent, particularly if AFCs are not calculated to the level or scope of granularity.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    X Yes

    ☐ No

    Comments: NERC should develop some general criteria: What should be included in the TTC, TFC, ETC, TRM, CBM? How should they be calculated (high level guidelines) and what the purpose is of including them in the AFC calculation?

    Any additional standardization of the other components should be contained in those specific standards not in MOD-001. However, it is important that the details of the methodology for determining TTC, TFC, ETC, TRM and CBM must be permissive to allow for continued operation of markets in those TSPs that do not utilize a physical-rights based system for providing transmission service.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    X Yes — TTC and TC are the same

    X No — TTC and TC are not the same

    Comments: This question should probably be asked of the drafting team of FAC-012-1 / FAC-013-1 if they have the same definition in mind. When reading FAC-012-1 it is optional to apply a described methodology to an operating and/or planning horizon. The TTC as described in MOD-001-1 should be applied to all Horizons listed under question 4 of the Comment Form. We believe TTC should be added into the FAC requirements as a defined term.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    X No

    Comments:

    TTC and TFC are reliability parameters that are determined by the transfer capability methodologies stipulated in FAC-012. These values are not determined by the TSP but by the RC or TOP. In ATC and AFC calculations, these values serve as the upper bound for assessing and managing available transmission services only.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments:

    The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for CBM.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments:

    The question is inappropriate, because the standard does not attempt to define the methodology for TRM.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:
    We are not aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement, because the proposed language is broad enough to accommodate the manner in which ISOs/RTOs provide transmission service in a market-based environment. As NERC continues to develop Standards to govern reliability practices surrounding the calculation of ATC/TTC/AFC/etc... (and coordinate with NAESB regarding its development of associated business/commercial practices) in response to the Commission directive in Order No. 890, NERC's Standards must be broad enough so as not to frustrate the market-based manner in which ISOs/RTOs provide transmission service.

    As the Commission ruled in Order No. 890 with regard to, among other things, the standardization of ATC calculations, "some of the changes adopted in the Final Rule may not be as relevant to ISO/RTO transmission providers as they are to non-independent transmission providers. For example, many ISOs and RTOs use bid-based locational markets and financial rights to address transmission congestion, rather than the first-come, first-served physical rights model set forth in the pro forma OATT. As we indicated in the NOPR, nothing in this rulemaking is intended to upset the market designs used by existing ISOs and RTOs."
    See Order No. 890 at P158. The proposed MOD-001 Standard appears to be in line with this direction.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: None

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   X Yes

   ☐ No

   Comments:

   We agree with most of the components except "other pending potential uses of Transfer Capability". This component is subject to interpretation and is difficult to demonstrate the need and quantify it for inclusion. Also, we question the need to specify "exchanges" and "deliveries" given that purchases and sales are already included.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   No

   Comments: Definition is already sufficient and should not be expanded or changed.

   The definition should be modified to recognize the need for transmission requests for A/S capacity, not just actual energy. Insert "and/or A/S" after the word "energy." The SDT should also review the definition of transmission service for consistency.

   The definition should include reference to ultimate Source and Sink. Add to end of proposed definition "… and from ultimate Source to ultimate Sink."

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the

Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

Which definition do you prefer?

X Proposed definition

☐ Already approved definition

Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☒ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   We do not agree but if there is a need to reference time periods in the requirements, they should be specified in the requirements themselves and not as universal terms due to the lack of specificity in these.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   X Agree

   ☐ Disagree

   Comments: Remaining definitions: AFC, Network Response Method, Rated System Path Method, TFC, Transmission Reservation are OK.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   X Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed

changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

X No

Comments: We think those are the common used methodologies, we don't know of any others that are widely used.

However, we do not understand why AFC calculation must be tied with the Network Response methodology. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates themselves could become the Rated Paths.

Hence, we question the need for the qualifying statement – "using a Network Response Methodology" in parentheses, after "calculates AFC" in each of R4, R5 and R6.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

Comments: We think one day is reasonable in case of TTC, TRM or CBM changes.

If ETC changes, then re-calculation should be done within 1 or 2 hours.

9. Do you with the frequency of exchanging data as specified Requirement 6?

X Yes

☐ No

Comments: While the seven days timeframe may be appropriate, the requirement's lack of specificity for the start of this timeframe (i.e. Before changes, after a change, after seven days from an agreement) is confusing. Is "as agreed upon" acceptable if it is greater than every seven days?

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

X Yes

☐ No

Comments: We question why the SDT requires this single methodology. The SDT should provide an explanation of the reliability problem(s) associated with applying more than one methodology.

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

X No

Comments: Approving a request with insufficient AFC might happen for next hour Non-Firm if available flow gate capacity in real time justifies accepting a Non-Firm request, while Non-Firm AFC (that still has some unused Reservations included in end-result) is insufficient. This is a common practice and should not have to be documented (justified) after the fact.

It might happen also if a re-dispatch agreement is accepted by a TP that requires a Transmission Customer to re-dispatch a certain amount to cover for the negative AFC created on flow gate by accepting Reservation. This is documented by the TP.

Approving a service request at a value less than the ATC or AFC is a commercial issue, which does not affect reliability. This issue should be addressed in the Business Practice.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

X Yes

X No

Comments:

R6.8.1 We are not re-sinking 7 days of hourly values every hour, however the way Oasis Automation works it updates AFC with every Reservation that is submitted and with every Reservations that changes status. (for example Study→refused).

R6.8.3 and R6.8.2 is same, if you have daily AFC for 30 days, you automatically have weeklies for 4 weeks, however not weekly value but daily values to represent the AFC of the 4 weeks. If that is the intension then we agree.

R6.9 Not sure what ETC is intended to be included in R6.9, Gen to Load ETC only or also ETC as result of Reservations? TP's typically exchange Net Interchange based on Schedules and sometimes reservations. However that assumes that all Reservations will be scheduled. It doesn't reflect directional ETC. A combination of ETC for a Gen to Load situation and the Reservations as referenced in R6.10 will result in the "true" ETC of the system. It can not be provided in an initial Power Flow Model.

R6.10 We don't think the "once per hour" should apply to all types of Reservations such as Weekly, Monthly and Yearly. It should be based on term of Reservation.

R7 This requirement might have to be split up in a requirement for the Sending Entity and a requirement for the Receiving Entity. The Receiving Entity could update the AFC data on an hourly basis. If the Sending Entity doesn't update the data on an hourly basis, it is not effective.

R11.2 The term "same criteria" is too general, it should be more specific.

R11.4 The term "Identify contingencies" is too general. It is unclear whether this refer to outages or the contingency elements of flow gates.

R12 – First, this requirement should be placed under R11, because R11 contains the items that must be 'identified' in the TSPs ATC methodology

Second, exchanging data with neighboring TSPs is important only if the data held by one TSP is necessary for another TSP to calculate its ATC. Therefore, R12 should be redrafted to read as follows:

- "Identify any other Transmission Service Providers from which data is received for use in calculating its ATC or AFC"

Data exchanges that are required as part of the TTC calculation should be specified in the TTC Standard.

R14 Over stringent, particularly if AFCs are not calculated to the level or scope of granularity.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    X Yes

    ☐ No

    Comments: NERC should develop some general criteria: What should be included in the TTC, TFC, ETC, TRM, CBM? How should they be calculated (high level guidelines) and what the purpose is of including them in the AFC calculation?

    Any additional standardization of the other components should be contained in those specific standards not in MOD-001. However, it is important that the details of the methodology for determining TTC, TFC, ETC, TRM and CBM must be permissive to allow for continued operation of markets in those TSPs that do not utilize a physical-rights based system for providing transmission service.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    X Yes — TTC and TC are the same

    X No — TTC and TC are not the same

    Comments: This question should probably be asked of the drafting team of FAC-012-1 / FAC-013-1 if they have the same definition in mind. When reading FAC-012-1 it is optional to apply a described methodology to an operating and/or planning horizon. The TTC as described in MOD-001-1 should be applied to all Horizons listed under question 4 of the Comment Form. We believe TTC should be added into the FAC requirements as a defined term.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    X No

    Comments: TTC and TFC are reliability parameters that are determined by the transfer capability methodologies stipulated in FAC-012. These values are not determined by the TSP but by the RC or TOP. In ATC and AFC calculations, these values serve as the upper bound for assessing and managing available transmission services only.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for CBM.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments:

    The question is inappropriate, because the standard does not attempt to define the methodology for TRM.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: We are not aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement, because the proposed language is broad enough to accommodate the manner in which ISOs/RTOs provide transmission service in a market-based environment. As NERC continues to develop Standards to govern reliability practices surrounding the calculation of ATC/TTC/AFC/etc... (and coordinate with NAESB regarding its development of associated business/commercial practices) in response to the Commission directive in Order No. 890, NERC's Standards must be broad enough so as not to frustrate the market-based manner in which ISOs/RTOs provide transmission service.

    As the Commission ruled in Order No. 890 with regard to, among other things, the standardization of ATC calculations, "some of the changes adopted in the Final Rule may not be as relevant to ISO/RTO transmission providers as they are to non-independent transmission providers. For example, many ISOs and RTOs use bid-based locational markets and financial rights to address transmission congestion, rather than the first-come, first-served physical rights model set forth in the pro forma OATT. As we indicated in the NOPR, nothing in this rulemaking is intended to upset the market designs used by existing ISOs and RTOs."

    See Order No. 890 at P158. The proposed MOD-001 Standard appears to be in line with this direction.

19. Do you have other comments that you haven't already provided above on the proposed standard?

Comments: None

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: "Other pending potential uses" does not sound like an existing commitment. The definition should reference "other uses" or "other pending uses" or "other committed uses" but a "potential use" is not a commitment. There are lots of potential uses of the transmission system, but the only ones that matter in the context of this definition are those for which transmission capacity needs to be reserved.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: It may be semantics, but NITS generally does not have "a point" of receipt or delivery. The definition could refer to sources and sinks rather than PORs and PODs.

   Also, why is this term being defined? It is virtually identical to the definition of Transmission Service, only with the phrase "provided to" replaced by "requested by." The Standards should not define the obvious.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

Which definition do you prefer?

☒ Proposed definition

☐ Already approved definition

Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☒ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: For bettor or for worse, the Standards are now using violation mitigation time horizons. These include time horizons for "Long Term Planning," "Operations Planning," "Same Day Operations," "Real-Time Operations," and "Operations Assessment." The Transmission Planning Standards (notably TPL-001 through -004) have also had a near-term and a longer-term planning horizon to further segment the Long-term Planning Horizon. Rather that create yet another set of time horizons for this standard, NERC should consider standardizing the time horizons, or at least re-using some of them when they could suffice for a particular scenario. In this instance, it appears that the time horizons for MOD-001 could be made to work with the Time Horizons for violation mitigation with only a little bit of tweaking.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team

consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☒ Yes

☐ No

Comments: The drafting team should consider other methodologies if they are aware of any entities using another methodology and achieving reliable results.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments:

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☒ No

    Comments: The requirement is curious. If a service request is approved, who cares if the Service Provider used an ATC/AFC lower than its posted ATC/AFC? I'd be more concerned about a TSR that was rejected because of a lower ATC/AFC, and would want to know how the TSP calculated the lesser value.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☒ Yes

☐ No

Comments:

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments:

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments:

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments:

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

[2] ftp://www.nerc.com/pub/sys/all_updl/standards/rs/Glossary_02May06.pdf

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: This definition is open ended. It would be better as a definition to include all components that can be thought of and amend the definition as the need arises. This definition needs to stand alone and not make reference to TRM and CBM. If there are items missing from the TRM and CBM that need to included in them, then it should be included and not left for ETC to clean up.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☒ No

   Comments: This definition has already been adopted in the current NERC Glossary and is sufficient.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments: Propose the following refinement to the proposed definition:

Flowgate - a single transmission element or group of transmission elements that may include an associated transmission contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage by the use of Transfer Distribution Factors.

Transmission Distribution Factor is not included in the NERC Glossary. Should Transmission Distribution Factor be defined or should it be excluded from the above definition?

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☒ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: Available Flowgate Capacity: The definition should end at "Existing Transmission Commitments". If "retail customer service" should be included in ETC, then it should be in the definition and subsequent reliability standards for the development of ETC.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: Recalculation of ATC may be in the OATT agreements and is not needed here.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☒ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☒ Yes

    ☐ No

    Comments: Please consider changing "identify how it calculated" to "provide the basis for calculating" in the R13 Reliability Standard. I think it is more important to know why the value changed rather than how the value changed.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☒ Yes

    ☐ No

    Comments:

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☒ Yes

    ☐ No

    Comments: The purpose of the MOD Reliability Standards is to provide the "how to" for modeling and determining operating parameters. The purpose of the FAC Reliability Standards is to provide "you will use" the results of the MOD to operate the bulk electric system. TFC methodology should be defined in the MOD and then how it is used in the FAC.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: MOD-004-0 R1.2 already requires that the frequency for CBM updates be identified by the Regional Reliability Organinzation and its members and it should be left that way. CBM should be used in all time horizons.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: MOD-008-0 R1.1 already requires that the frequency for TRM updates be identified by the (a) Regional Reliability Organinzation and its members and it should be left that way. TRM should be used in all time horizons.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: No.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: No.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). ## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: Manitoba Hydro believes that the definition is close but you would have to develop the definition further to describe when it is appropriate to describe reserves as ETC.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☒ No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☐ Proposed definition

   ☒ Already approved definition

   Comments: Between the two definitions the second is clear enough to be used in a standard. Manitoba Hydro believes you could work on the proposed definition to improve it without changing the meaning. For example, the phrase "model MW flow impact relating to transmission limitations and transmission service usage" could be replaced with "model congestion through all Horizons"

I suggest that the team has erred in including the contingencies in the definition of the flowgate. The contingency may define what type of flowgate it is, e.g. OTDF as compared to PTDF, and will certainly define where the location of the flowgate is but it does not define what a flowgate is. A flowgate could be created by a planned/forced transmission outage, a planned/forced generator outage, or a by an interregional stability concern. It may be good practice to include the contingency in the naming of flowgates, e.g. x for loss of y, but in my opinion y is not part of the flowgate.

In defining a flowgate as a single transmission element or a group of transmission elements, I believe the team would be doing a great service to the industry by determining if one type of flowgate, single transmission element or group of transmission elements, is preferable. There is a concern that multi-facility flowgates provide less overall reliability (by their proxy nature) than single element flowgates. The team should also determine if and when it is appropriate to use proxy flowgates.

Finally I believe "that Transfer Distribution Factors are used to approximate MW flow on a Flowgate… " is actually a second definition (Flowgate Impact). The information is useful but extraneous when defining what a flowgate is.

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☒ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: In the Operations Planning Horizon, I believe that the word "up" should be removed. It is important to coordinate the length of the Horizons. This will allow all transmission providers to use simular assumptions when studying congestion on flowgates.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments: I think it is of paramount importance that only one methodology is used within an interconnection (i.e. the east and the west can use different methodologies but within each interconnection should only use one methodology). My reasoning for this is is tied to consistent assumptions. Each transmission privider will develop and study flowgates using a single methodology. If a neighbouring transmission provider is studying inpacts on that flowgate using a different set of assumptions or methodolgy then reliability would be inpacted.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: In an automated system, why wouldn't this be immediately (or as soon as the information is loaded into the system that calculates ATC/AFC

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

Comments: Requirement 9 should be interconnection wide. TSPs do not only calculate ATC on their own systems, they calculate inpacts on a set of flowgates on neighbouring systems. Using a differing methodology would needless impact reliability on those systems.

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments: It is hard to say as requirement 13 seems unclear

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

☐ No

Comments:

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☐ No

    Comments: With CBM I believe that the only reliability portion is the recognition of an adeqacy criteria (i.e. the LOLE study) Once that is established CBM could be defined many ways and is likely in the realm of NAESB

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☒ No

    Comments: I think that the team was well advised to defer this to the facility rating standard team. However a flowgate can be defined by single or multi elements. the team should ensure that the team developing FAC-012 and/or FAC-013 is cover both as well.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: I believe this and other features of CBM should be determined by NAESB

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: This would depend on the need for TRM. IF TRM is required to coordinate interregional stability concerns, it may needed in all horizons. If TRM is used to compensate for uncertainty in Load Forecasts, it should not be used in the operating or day ahead horizon.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: It is of paramount that a standard is developed that standardizes assumptions and processes. There are many reasonable processes available to develop and study impacts on flowgates. If all transmission providers would be able to contain all the impacts from their operation on their systems, there would not bee the need for this standard. Each transmission provider could use what ever set of assumptions that the wished as long a reliability on their system was maintain. But the very fact that this is not possible to contain impacts requires standardization of assumptions and processes. This is required to insure that when a transmission provider is assessing the impact on a flowgate in a neighbouring system that the assumptions used to assess the impacts are the same assumptions used to develop and study the flowgate. This can only be done if every transmission provider is using one set of assumptions and on set of processes.

    It appears by what has been presented here that the team is trying to accommodate various processes that are used by the industry today. In my opinion, this can only be done by compromising the reliability.

    It also appears (and I may be wrong) that the team has not fully come to terms with what is a reliability concern and what is a commercial concern. For example, in my opinion, CBM is mostly a commercial concern. CBM has historically been used to account for shortfalls in adequacy studies. I am the first to admit that this is purely a reliability concern. However once the adequacy study has determined the shortfall, there are many methods of mitigating that shortfall ranging from simply putting a CBM value on the ties with your neighbour who is most likely to have excess capacity when you need it to belong to a capacity reserve sharing pool that will reserve transmission through the use of CBM. The only reliability concern in all of this is the identification of the adequacy concern and need to have a posting value to mitigate the adequacy concern. The commercial concerns of how to mitigate those concerns should be left to NAESB.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☐ No

    Comments:

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☐ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments:

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: Since CBM is a reliability margin, the long term or annual value should be used for the monthly, daily and weekly ATC calculations. It should be calculated by LSE.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: Since TRM is a reliability margin, the long term or annual value should be used for the monthly, daily and weekly ATC calculations. It should be calculated by TP.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

General MidAmerican Comments

Since the first draft of reliability standard MOD-001-1 was posted for comment on February 15, the Commission has issued Order No. 890. Order No. 890 imposes a number of specific requirements on this reliability standard. MidAmerican does not believe the standard, as currently drafted, meets the requirements of Order No. 890 and that significant modifications will be required before another draft is issued. Order No. 890 includes the following specific provisions related to MOD-001:

- In order to have consistent posting of the ATC, TTC, CBM, and TRM values on OASIS, we direct public utilities, working through NERC, to develop in the MOD-001 standard a rule to convert AFC into ATC values to be used by transmission providers that currently use the flowgate methodology. (Paragraph 211)

- We expect that NERC will address ETC through the MOD-001 reliability standard rather than through a separate reliability standard. By using MOD-001, the ETC calculation can be adjusted to be applicable to each of the three ATC methodologies under development by NERC. (P 243)

- ETC should be defined to include committed uses of the transmission system, including (1) native load commitments (including network service), (2) grandfathered transmission rights, (3) appropriate point-to-point reservations, (4) rollover rights associated with long-term firm service, and (5) other uses identified through the process. (P 244; footnote 170 defines "appropriate" point-to-point reservations to mean that "reservations accounted for under ETC depend on the firmness and duration of the reservation," with the specific characteristics to be developed in the reliability standard.)

- ETC should not be used to set aside transfer capability for any type of planning or contingency reserve, which are to be addressed through CBM and TRM. In addition, in the short-term ATC calculation, all reserved but unused transfer capability (non-scheduled) shall be released as non-firm ATC. (P 244; footnote 171 defines TRM to include "such things as loop flow and parallel path flow.")

- Reservations that have the same point of receipt (POR) (generator) but different point of delivery (POD) (load), for the same time frame, should not be modeled in the ETC calculation simultaneously if their combined reserved transmission capacity exceeds the generator's nameplate capacity at POR…. We direct public utilities, working through NERC, to develop requirements in MOD-001 that lay out clear instructions on how these reservations should be accounted. (P 245)

- We direct public utilities, working through NERC, to develop consistent requirements for modeling load levels in MOD-001 for the services offered under the pro forma OATT. (P 295)

- We direct public utilities, working through NERC, to develop requirements in NERC's MOD-001 reliability standard specifying how transmission providers shall determine which generators should be modeled in service, including guidance on how independent generation should be considered…. We direct public utilities, working through NERC, to revise reliability standard MOD-001 by specifying that base generation dispatch will model (1) all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run and (2) uncommitted resources that are deliverable within the control area, economically dispatched as necessary to meet balancing requirements. (P296)

- We direct public utilities, working through NERC, to develop requirements in reliability standard MOD-001 that specify (1) a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown and (2) how to model existing reservations. (P 297)

- The Commission thus directs public utilities, working through NERC and NAESB, to revise reliability standard MOD-001 to require ATC to be recalculated by all transmission providers on a consistent time interval and in a manner that closely reflects the actual topology of the system, e.g., generation and transmission outages, load forecast, interchange schedules, transmission reservations, facility ratings, and other necessary data. This process must also consider whether ATC should be calculated more frequently for constrained facilities. (P 301)

Responses to Specific Questions

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   X No

   Comments: The definition of ETC must be modified to comply with Order 890, Paragraph 244. In addition, the definition does not define "other pending potential uses" of Transfer Capability, or explain how the other individual components of ETC are to be calculated.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   X No

Comments: This is not a proposed definition. This is the current definition in the NERC glossary.

The new definition should defines the transmission service request as a request for transmitting capacity and energy.

3. This is the proposed definition for ‘Flowgate’ — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   X Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   X N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don’t agree with the proposed definitions

   Comments:
   MidAmerican is unable to find any of these terms in the standard as it’s currently drafted.

   If these terms are used in the standard, these terms should be revised to use 12 months or longer to refer to the long-term planning horizon and operations planning horizon for up to 12 months as used in other standards such as TPL-001 through TPL-004.

To the extent these terms *are* used in the standard, we believe the resolution of this question should be deferred until the standard is redrafted to be compliant with order No. 890.

If the proposed definitions are retained, it would appear that new definitions would be required for these terms:

- day-ahead
- real-time (Although this term is already defined in the NERC Glossary of Terms, the intent in MOD-001 may not match that existing definition.)
- same-day
- 13 months (This should be changed to 12 months to be consistent with the definition that is being clarified by TPL-001 through TPL-004.)

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   X Agree

   ☐ Disagree

   Comments: The AFC definition is acceptable, but the equation in R4 does not match the definition. The equation in R4 should read:

   ATC = TTC – TRM – CBM – ETC

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   X Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☒ Yes

   X No

Comments: It should require that each of the three methodologies be standardized such that any provider utilizing that methodology can duplicate the results from the input data.

8. In Requirement 2, the Transmission Service Provide[r] that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: The timing requirements of R2 should be the same as the timing requirements of R7.

9. Do you [agree] with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   X No

   Comments: In the Eastern Interconnection, the timing requirements of R6 should match the related timing requirements of the MISO/MAPP/PJM/SPP/TVA SOAs/JOAs.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☒ No

    Comments: A single methodology should be required not only within each TSP's system, but across a larger footprint, such as an RRO.

11. Do you think that Requirement 13 in this proposed standard necessary?

    X Yes

    ☐ No

    Comments: The phrasing of R13 should be clarified. As currently drafted, it reads:

    > If the Transmission Service Provider approves a Transmission Service Request using a value other than and less than its value for ATC or AFC, then the Transmission Service Provider shall identify how it calculated the lesser value.

    MidAmerican believes this is intended to mean, and should be clarified to say:

    > If the Transmission Service Provider denies a Transmission Service Request for less than its value for ATC or AFC (or for less than its share of ATC or AFC on reciprocal coordinated flowgates), then the Transmission Service Provider shall identify why the service was denied. This calculation methodology should also be posted.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

X No

Comments: As noted in our General Comments above, MidAmerican does not believe the standard as currently drafted complies with FERC Order No. 890.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    XYes

    ☐ No

    Comments: See General Comments above. In addition to changes required to comply with Order No. 890, the process should be standardized and transparent to the point that another provider, using the same methodology and input data, could duplicate the results of any provider.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☐ Yes — TTC and TC are the same

    X No — TTC and TC are not the same

    Comments:

    Given the new requirements in Order No. 890, the definitions TTC and TC must be consistent since Order No. 890 requires consistent methodologies for use in i) planning, and ii) ATC or AFC calculations.

    It should be noted that TC is used for planning and security coordination purposes, while TTC is commercial in nature and must be updated with each ATC calculation to reflect operational conditions. As a result, there may be points in time when TC is not equal to TTC due to the frequency of updates.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    X Yes

    ☐ No

    Comments: MOD-001 should address the methodology and documentation.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: The TSP should calculate the CBM and the timing and methodology should be well documented.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: The TSP should calculate the TRM and the timing and methodology should be well documented.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: See General Comments above. FERC Order No. 890 makes the current standard obsolete and it must be significantly revised.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: See General Comments above. FERC Order No. 890 makes the current standard obsolete and it must be significantly revised.

    In addition, each of the three methodologies should address contract path limitations. Not only should each methodology address physical limitations of the system, but contractual limitations as well.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: The definition for ETC is very generic. With the FERC Order 890 requirements of transparency in ATC/AFC calculations, this definition needs to be revisited to add more speficity to it. The definition specifically needs to include modeling of transmission commitments due to transmission service from other transmission providers. Midwest ISO is currently addressing this through two approaches – 1. Seams agreements that address modeling of transmission commitments from other entities. 2. a forecast error term which is currently under development that will address AFC predictions in real time to accommodate for errors in load, generation outage and loopflow forecasts. The standard needs to be revisited to make the computation of transmission commitments in both AFC and ATC methodologies transparent to transmission customers. Include thirdy party generation to load impacts.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: This definition itself would have been fine if the terms "Point of Receipt" and "Point of Delivery" were consistently treated by the various transmission providers. With the FERC order 890 requirements of consistency in AFC/ATC calculations, the standards needs to be revisited to address the consistent and transparent treatment of Point of Receipt, Point of Delivery, Source and Sink usage as applicable to a TSR within AFC/ATC calculations. A suggested industry wide definition for Transmission Service Request could be "a request for using the transmission system submitted to a transmission provider (typically through an OASIS system) to move power (MWs) either into, out of, within or across the footprint of the transmission provider (with specific start time and stop times, class of service (firm/nonfirm) and service increment (hourly,daily weekly etc.,)"

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer

Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

Which definition do you prefer?

☐ Proposed definition

☐ Already approved definition

Comments: Neither - The proposed definition and NERC definition creates the impression that any set of transmission elements could be used to make up a flowgate resulting in inconsistencies in flowgate usage between selling transmission service and curtailing transmission service. "Flowgates are pre determined set of constraints on the transmission system that are expected to experience loading problems in real-time. " This should result in neighbouring transmission providers using consistent set of flowgates for evaluating transmission service. The requirements should address making this list of flowgates and their parameters transparent

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☒ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: These terms and frequency of calculations are business practices of each individual transmission provider. Defining these terms in the standard and only transmission providers using Network Response Method (AFC/ATC) calculations does not appear to be consistent with Order 890 requirements of consistency. The requirements should more along the lines of allowing each Transmission provider irrespective of the methodology used to make available business practices that describe the time horizons and frequency of calculations.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: The definitions do not include TTC and ATC. All definitions related to this standard should be in a single place (TFC and AFC are defined). The Rated System Path method and the Network Response Method are both approaches for facilitating the processing of Transmission Service Request and need to be measured against similar requirements.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments: The standard is very generic for the ATC methodology/rated system path method. The standard does not provide for transparent and consistent computation of ETC which is the biggest driver in ATC/AFC calculations.To address the Order 890 requirements of consistency and transparency, the standard needs to be methodology neutral.

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☒ Yes

☐ No

Comments: Same comment as previously; to address the Order 890 requirements of consistency and transparency, the standard needs to be methodology neutral.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

Comments: The calculation frequency should be the same regardless of the calculation methodology

9. Do you with the frequency of exchanging data as specified Requirement 6?

☐ Yes

☒ No

Comments: The frequency does not allow for any analysis before the ATC/AFC values are posted to the OASIS. The requirements should be more along the lines of using same ATC/AFC values and providing the same to the neighbouring transmission providers

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

☐ Yes

☐ No

Comments: If the questions is one method only for one TP, the answer is no. Due to contract obligations between transmission providers, there is a need to maitain a few contract paths while maintaining Network response method for AFC/ATC calculations.

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

☒ No

Comments: This requires policing the tags after the fact, and really has nothing to do with the calculation of ATC/AFC.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: The standard needs to be revisited in light of the Order 890 to make sure consistent measures are applied to all calculations.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☒ Yes

    ☐ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☒ No

    Comments: As explained earlier, the standard needs to be methodology neutral

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: These parameters are individual transmission providers business practices.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: These parameters are individual transmission providers business practices.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: The FERC order 890 calls for more transparency in the AFC/ATC calculations. This standard did not seem to focus on that aspect, in fact, it gives two different standards for transparency: ATC methods have no transparency, and AFC methods are completely open. In light of the goals expressed in FERC's final rule on this issue, for both transparency and consistency of calculation, the committee should withdraw this proposal and review it carefully in light of FERC's Order 890 While the committee has worked hard to bring the standard to this point, Midwest ISO believes this issue is too important to simply forge ahead without discussing the standard's present definitions and requirements in light of the FERC final rule on this subject, issued the same day this standard was released for comment.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: The standard include formulas. The formulas should be left to the business practices of the provider and the terms

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. ## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

---

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: a. It is not clear in the definition whether the words existing commitments is to apply only to purchases or also exchanges, deliveries, or sales. In other words, is it the intent of the Drafting Team that only existing commitments for exchanges, deliveries, or sales be included in ETC? If it is the latter than the definition should be changed to say existing commitments for exchanges, existing commitments for deliveries, or existing commitments for sales or else use punctuation such as semi-colons to make clear the meaning. If it is the former than the MRO suggests that exchanges deliveries, or sales be moved before the words existing commitments for purchases, such as exchanges, deliveries, or sales, existing commitments for purchases, existing commitments for transmission services, etc.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: The OATT definition for Point-To-Point Transmission Service indicates that it is a service for the receipt of capacity and energy at designated Points of Receipt and the transmission of such capacity and energy to designated Points of Delivery. The definition of Transmission Service Request should be revised to state that it is a request to move CAPACITY and energy from a Point of Receipt to a Point of Delivery. The added word is stated in all caps.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the

Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

Which definition do you prefer?

☒ Proposed definition

☐ Already approved definition

Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☒ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: These terms should be used consistently across the standards and inserted in the NERC glossary. Having individual definitions in an individual standard will only lead to confusion. The Operations Planning Horizon should be less than one year. Other NERC standards such as TPL-001 through TPL-004 are established assuming that one year or more falls into the Long-term Planning Horizon.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: a. The definition for AFC and ETC does not specifically refer to market flows. Are these considered a part of ETC or are they not to be included in the calculation of AFC? Please clarify where these are to be dealt with in the calculations. b. There is no specific reference to confirmed or non-confirmed transmission reservations in either AFC or ETC. Are these to be included in ETC? Please clarify the definitions in regard to such reservations.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☒ Yes

   ☐ No

   Comments: Contract Path Methodology should be considered.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: Once the TSP is aware that something has changed, then the TSP has to determine what changes in the components are appropriate via analysis which is often times off-line, then changes are perhaps incorporated into an automatic process for ATC postings. From the question it is the MRO's opinion that the Drafting Team is interested in getting a reading on the time required to post a change in ATCs once the amount of component change is determined. The entire process from the time that it is clear that a component needs to be changed to when new ATCs are posted typically takes two weeks. The time once the changes in the components are determined is typically a one day process. It is presumed that the latter time frame is the time frame in which the Drafting Team is interested.

9. Do you agree with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☒ No

   Comments:

   If the Transmission Service Reservation information can be provided every hour why can not the requirements of R6.5, R6.6, and R6.7 be revised to provide hourly reporting as well?

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

Comments: Transmission Service Provider may use contract Path methodology in addition to one of the methods provided in the proposed NERC standard.

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☒ Yes

    ☐ No

    Comments:

    Helps transparency.

    While this may help transparency how does using a lower value relate to reliability? This seems to be an OATT business practice issue.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☒ Yes

    ☐ No

    Comments:

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☐ Yes — TTC and TC are the same

    ☒ No — TTC and TC are not the same

    Comments:

    Typically, when determining transmission service the Total Transfer Capability (TTC) and the Transfer Capability (TC) are the same (when referencing to standards FAC-012-1 and/or FAC-013-1); however, there may be operating situations where these parameters are not the same. For example, the TC to be used in an operating guide may not be equal to the TTC that would be offered as transmission service.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments: Both MOD-001-1 and FAC-012-1 should reference the flowgate capability.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: At least calculate hourly CBM values for applicable entity TSP.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: At least calculate hourly TRM for applicable entity TSP.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: No.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

    a. With FAC 010, 011,012, and 013 why is MOD-001-1 needed for reliability? MOD 001-1 seems to be an OATT business practice issue.

    b. Informational references to the corresponding development of NAESB business are irrelevant in the Canadian context as Canadian jurisdictions are not obligated to follow NAESB business practices.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☐ No

   Comments:

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: A Transmission Service Request is a request to reserve Transmission Capacity. If accepted and confirmed, it is not necessary for the Transmission Customer to move energy on this Transmission Capacity. In fact, it may be used for operating reserves and energy would only be scheduled on this capacity if there was an emergency. The definition should read in a manner that the Transmission Customer is requesting Transmission Capacity from a point of receipt and points of delivery.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☐ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

    **Operating Horizon** — Time frames encompassing same-day and real-time periods.

    **Scheduling Horizon** — Time frames encompassing the day-ahead period.

    **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

    **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

    Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

    ☐ N/A — these terms do not need to be defined for use in this standard

    ☒ The terms do need to be defined and I do agree with the proposed definitions

    ☐ The terms do need to be defined but I don't agree with the proposed definitions

    Comments: Should the Scheduling Horizon be defined as "Time frames encompassing the ***business*** day-ahead period"? Most transmission customers schedule on Friday for Saturday, Sunday and Monday deliveries. Also, some transmission provider OASIS business practices recognize business days rather than calendar days. (e.g. Some TPs sell non-firm hourly transmission after noon for the next business day, which on Friday includes Saturday, Sunday and Monday.)

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

    ☐ Agree

    ☐ Disagree

    Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

    ☒ Yes

    ☐ No

    Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed

changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☐ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: ATC should be recalculated as soon as practical with the goal of getting the most accurate information to the market as quickly as possible. I would expect that most of these calculations are automated, and a change in any component would prompt an immediate recalculation and posting of ATC.

9. Do you agree with the frequency of exchanging data as specified in Requirement 6?

   ☐ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☒ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☒ No

    Comments: R14 should be eliminated. The proposed source/sink requirement is inconsistent with established trading and scheduling protocols, is not necessary to the reliability of the bulk electric system and conflicts with the principles established to guide the development of reliability standards. Requiring the same ultimate source and ultimate sink on the Transmission Service Request and the Interchange Transaction Tag will harm commercial use of transmission service. It will force transmission users to redirect transmission service on OASIS every time a source or sink changes, even in cases where the source/sink combinations are electrically equivalent. This new practice will provide little, if any, benefit for reliability.

If the drafting team feels this requirement is still needed, it should be passed to NAESB for inclusion as a business practice.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

☐ Yes

☐ No

Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

☐ Yes — TTC and TC are the same

☐ No — TTC and TC are not the same

Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

☐ Yes

☐ No

Comments:

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

Comments: In determining ATC for the different time horizons the CBM must match the same time horizon. The primary responsibility of the CBM for the Hourly ATC will be the LSE to meet its responsibility of providing all energy and capacity for load, including operating reserves for the upcoming hours.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: In determining ATC for the different time horizons the TRM must match the same time horizon. The planners that plan at the different time horizons would be the best.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). ## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☒ Yes

   ☐ No

   Comments:

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☒ No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☐ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

**Scheduling Horizon** — Time frames encompassing the day-ahead period.

**Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

**Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

☐ N/A — these terms do not need to be defined for use in this standard

☐ The terms do need to be defined and I do agree with the proposed definitions

☐ The terms do need to be defined but I don't agree with the proposed definitions

Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☐ Yes

   ☐ No

   Comments:

8. In Requirement 2, the Transmission Service Provide**[r]** that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments:

9. Do you **[agree]** with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☒ No

    Comments:

    R12 – First, this requirement should be placed under R11, because R11 contains the items that must be 'identified' in the TSPs ATC methodology

    Second, exchanging data with neighboring TSPs is important only if the data held by one TSP is necessary for another TSP to calculate its ATC. Therefore, R12 should be redrafted to read as follows:

    - "Identify any other Transmission Service Providers from which data is received for use in calculating its ATC or AFC"

Data exchanges that are required as part of the TTC calculation should be specified in the TTC Standard.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

☐ Yes

☒ No

Comments: Any additional standardization of the other components should be contained in those specific standards not in MOD-001. However, it is important that the details of the methodology for determining TTC, TFC, ETC, TRM and CBM must be permissive to allow for continued operation of markets in those TSPs that do not utilize a physical-rights based system for providing transmission service.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

☐ Yes — TTC and TC are the same

☐ No — TTC and TC are not the same

Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

☐ Yes

☐ No

Comments:

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

Comments: The question is inappropriate, because the standard does not attempt to define the methodology for CBM.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

Comments: The question is inappropriate, because the standard does not attempt to define the methodology for TRM.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

    No, As the Commission noted in Order No. 890, "some of the changes adopted in the Final Rule may not be as relevant to ISO/RTO transmission providers as they are to non-independent transmission providers. For example, many ISOs and RTOs use bid-based locational markets and financial rights to address transmission congestion, rather than the first-come, first-served physical rights model set forth in the pro forma OATT. As we indicated in the NOPR, nothing in this rulemaking is intended to upset the market designs used by existing ISOs and RTOs." See Order No. 890 at P158. We find that the language as proposed is broad enough to accommodate the manner in which ISOs/RTOs provide transmission service in a market-based environment and satisfies the Commissions note in Order No 890 on this subject.

    In short, so long as a TSP is following approved Market and Tariff rules that are part of a Commission-sanctioned market design, such rules should be deemed consistent with this Standard.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: The drafting team must engage in additional drafting to address the concerns raised by Order No 890.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

---

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☒ Yes

   ☐ No

   Comments: We agree with most of the components except "other pending potential uses of Transfer Capability". This component is subject to interpretation and is difficult to demonstrate the need and quantify it for inclusion. Also, we question the need to specify "exchanges" and "deliveries" given that purchases and sales are already included.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: Definition is already sufficient and should not be expanded or changed.

   The definition should be modified to recognize the need for transmission requests for A/S capacity, not just actual energy. Insert "and/or A/S" after the word "energy." The SDT should also review the definition of transmission service for consistency.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

☐ Already approved definition

Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☒ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☐ Yes

   ☒ No

Comments: We think those are the common used methodologies, we don't know of any others that are widely used.

However, we do not understand why AFC calculation must be tied with the Network Response methodology. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates themselves could become the Rated Paths.

Hence, we question the need for the qualifying statement – "using a Network Response Methodology" in parentheses, after "calculates AFC" in each of R4, R5 and R6.

The NYISO is concerned that the requirements identified in the standard may becoming to much of a 'how' vs. a 'what' needs to be done for reliability. The drafting team may not be able to satisfy all TSP and their associated Market Design requirements.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: We think one day is reasonable in case of TTC, TRM or CBM changes.

   If ETC changes, then re-calculation should be done within 1 or 2 hours.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☐ No

   Comments: While the seven days timeframe may be appropriate, the requirement's lack of specificity for the start of this timeframe (ie. Before changes, after a change, after seven days from an agreement) is confusing. Is "as agreed upon" acceptable if it is greater than every seven days?

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☒ Yes

    ☐ No

Comments: We question why the SDT requires this single methodology. The SDT should provide an explanation of the reliability problem(s) associated with applying more than one methodology.

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☒ No

Comments: Approving a request with insufficient AFC might happen for next hour Non-Firm if available flow gate capacity in real time justifies accepting a Non-Firm request, while Non-Firm AFC (that still has some unused Reservations included in end-result) is insufficient. This is a common practice and should not have to be documented (justified) after the fact.

It might happen also if a re-dispatch agreement is accepted by a TP that requires a Transmission Customer to re-dispatch a certain amount to cover for the negative AFC created on flow gate by accepting Reservation. This is documented by the TP.

Approving a service request at a value less than the ATC or AFC is a commercial issue, which does not affect reliability. This issue should be addressed in the Business Practice.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☒ Yes

☒ No

Comments:

R 6 - We suggest that we require that a requester must demonstrate a reliability related need for the data. This will ensure an effort to provide the data is warranted.

R 6.3 - It is unclear what the phrase 'generation dispatch order' refers to.

R6.8.1 We are not re-sinking 7 days of hourly values every hour, however the way Oasis Automation works it updates AFC with every Reservation that is submitted and with every Reservations that changes status. (for example Study refused).

R6.8.3 and R6.8.2 is same, if you have daily AFC for 30 days, you automatically have weeklies for 4 weeks, however not weekly value but daily values to represent the AFC of the 4 weeks. If that is the intension then we agree.

R6.9 Not sure what ETC is intended to be included in R6.9, Gen to Load ETC only or also ETC as result of Reservations? TP's typically exchange Net Interchange based on Schedules and sometimes reservations. However that assumes that all Reservations will be scheduled. It doesn't reflect directional ETC. A combination of ETC for a Gen to Load situation and the Reservations as referenced in R6.10 will result in the "true" ETC of the system. It can not be provided in an initial Power Flow Model.

R6.10 We don't think the "once per hour" should apply to all types of Reservations such as Weekly, Monthly and Yearly. It should be based on term of Reservation.

R7 This requirement might have to be split up in a requirement for the Sending Entity and a requirement for the Receiving Entity. The Receiving Entity could update the AFC data on an hourly basis. If the Sending Entity doesn't update the data on an hourly basis, it is not effective.

R11.2 The term "same criteria" is too general, it should be more specific.

R11.4 The term "Identify contingencies" is too general. It is unclear whether this refer to outages or the contingency elements of flow gates.

R12 – First, this requirement should be placed under R11, because R11 contains the items that must be 'identified' in the TSPs ATC methodology

Second, exchanging data with neighboring TSPs is important only if the data held by one TSP is necessary for another TSP to calculate its ATC. Therefore, R12 should be redrafted to read as follows:

•"Identify any other Transmission Service Providers from which data is received for use in calculating its ATC or AFC"

Data exchanges that is required as part of the TTC calculation should be specified in the TTC Standard.

R14 Over stringent, particularly if AFCs are not calculated to the level or scope of granularity.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☒ Yes

    ☐ No

    Comments: NERC should develop some general criteria: What should be included in the TTC, TFC, ETC, TRM, CBM? How should they be calculated (high level guidelines) and what the purpose is of including them in the AFC calculation?

    Any additional standardization of the other components should be contained in those specific standards not in MOD-001. However, it is important that the details of the methodology for determining TTC, TFC, ETC, TRM and CBM must be permissive to allow for continued operation of markets in those TSPs that do not utilize a physical-rights based system for providing transmission service.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☒ No — TTC and TC are not the same

    Comments: This question should probably be asked of the drafting team of FAC-012-1 / FAC-013-1 if they have the same definition in mind. When reading FAC-012-1 it is optional to apply a described methodology to an operating and/or planning horizon. The TTC as described in MOD-001-1 should be applied to all Horizons listed under question 4 of the Comment Form. We believe TTC should be added into the FAC requirements as a defined term.

    The Reliability Standards should consider a single term for all standards.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☒ No

    Comments: TTC and TFC are reliability parameters that are determined by the transfer capability methodologies stipulated in FAC-012. These values are not determined by the TSP but by the RC or TOP. In ATC and AFC calculations, these values serve as the upper bound for assessing and managing available transmission services only.

The drafting team needs to work with FAC-012/013 to coordinate the determination of TTC and TFC. We believe these values are closely related and are the same on a closed interface.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for CBM

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for TRM

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: We are not aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement, because the proposed language is broad enough to accommodate the manner in which ISOs/RTOs provide transmission service in a market-based environment. As NERC continues to develop Standards to govern reliability practices surrounding the calculation of ATC/TTC/AFC/etc... (and coordinate with NAESB regarding its development of associated business/commercial practices) in response to the Commission directive in Order No. 890, NERC's Standards must be broad enough so as not to frustrate the market-based manner in which ISOs/RTOs provide transmission service.

    As the Commission ruled in Order No. 890 with regard to, among other things, the standardization of ATC calculations, "some of the changes adopted in the Final Rule may not be as relevant to ISO/RTO transmission providers as they are to non-independent transmission providers. For example, many ISOs and RTOs use bid-based locational markets and financial rights to address transmission congestion, rather than the first-come, first-served physical rights model set forth in the pro forma OATT. As we indicated in the NOPR, nothing in this rulemaking is intended to upset the market designs used by existing ISOs and RTOs."

    See Order No. 890 at P158. The proposed MOD-001 Standard appears to be in line with this direction.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: The last catch all phrase of 'other pending potential uses of Transfer Capability' causes great concern. What does this mean? It is not clear, therefore, the definion of ETC is not clear. Should non-firm schedules be included, it is not clear from this definion, but it needs to be very clear so everyone is calulcating ETC the same way.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☒ No

   Comments: TSR is just a request for service. Definion reads that way so it is okay.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments: I prefer the new defiinion, but think we might be able to improve on it.

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☒ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments: Transmission Provider should be calculating the ATC and AFC by following details standards from NERC/NAESB on how to perform this task.

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☐ Yes

☒ No

Comments: These three are enough... It would be preferable to have only one for standardization across the NERC footprint.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: It needs to be a short time, but reasonable to meet for the TSP. I would say 15 minutes or less.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☒ No

    Comments: i think we need to have a firm definion for the ATC/CBM/TRM terms before a final standard on them should be voted upon as this will impact the language in the standard.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☒ Yes

    ☐ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments:

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: Must be the same time horizon for consistency.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: Must be the same time horizon for consistency.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

[2] ftp://www.nerc.com/pub/sys/all_updl/standards/rs/Glossary_02May06.pdf

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☐ No

   Comments:

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☐ No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☐ Proposed definition

   ☒ Already approved definition

   Comments: The alternative definition is confusing by including contingenies with transmission elements. It seems to assume that the contingencies that should be considered for each flowgate are fixed, but in reality, the contingencies that would have the most impacts on the power flow through a flowgate changes as the system change.

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☐ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☐ Yes

   ☐ No

Comments: More detail on each of the methodology is needed for meaningful comment. I look forward to more information.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments:

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☐ No

    Comments:

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

☐ Yes

☐ No

Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

☐ Yes — TTC and TC are the same

☐ No — TTC and TC are not the same

Comments: Since the TC is reliability based, if TTC is not the same as TC, then TTC should be no higher than the TC determined by the Planning Coordinator in the planning horizon and the Reliability Coordinator in the operating horizon.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

☐ Yes

☒ No

Comments: There is no reliability need to develop a TFC separate from that already developed in the FAC Standards by the Planning Coordinator in the planning horizon and the Reliability Coordinator in the operating horizon.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

Comments:

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

Comments:

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

☐ Yes

☐ No

Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: Progress Energy Marketing disagree with R14, which would require Transmission Customers to provide ultimate source/sink on the Transmission Service Request. By your own definition, a Transmission Service Request is a service request by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

The ultimate source/sink requirement is incompatible with the market's trading and scheduling practices. Forward hedging is commonly transacted at Hubs, with the product defined as an "into-HUB". A supplier who delivers energy to an "into-HUB" sale cannot foresee where the buyer will ultimately sink the energy. The supplier may need to purchase transmission to the Hub's interface, but cannot know in advance what sink to input in a transmission Service Request on an upstream system.

The ultimate source/sink requirement would have an adverse impact on market development as well as market activity

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   X Yes

   ☐ No

   Comments: The language "pending potential uses" seems too vague to be included in a standard. Also, do ETCs include Transmission Service Reservations that are approved but not confirmed, or do ETCs include only confirmed TSRs ?

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   X No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   X Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   X The terms do need to be defined but I don't agree with the proposed definitions

   Comments: Differentiating between the Operating and Scheduling Horizons is unnecessary; There should only be one term for real time, current day, and next day operating periods. We would like to see "Operations" refer to real time, today, and next day. "Operations Planning Horizon" should be changed to "Near-Term Planning Horizon".

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   X Disagree

   Comments:

   The definition of ETC should include the phrase "including retail customer service" and then that parenthetical should be removed from the definition of ATC;

   Clarification is needed for the Network Response Method and Rated System Path Method to reconcile with the 1995 and 1996 documents.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☐ Yes

   X No

   Comments: The standard should assign all requirements for developing ATC to the TSP ; AFC is just an engine. But "YES", the TSP, regardless of the engine and/or inputs it uses, should be responsible for developing its ATC methodology.

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

X Yes

☐ No

Comments: All methodologies that are used to calculate ATC should be included in this standard.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

Comments: For ATC calculations and posting of next-hour up through the next 14 days, the TSP should be given one hour to recalculate it's ATC and then it should post the new value as soon as practicable. For all longer term ATC calculations (e.g. 15 days out and further), ATC calculations and posting should have more time.

9. Do you with the frequency of exchanging data as specified Requirement 6?

☐ Yes

X No

Comments: The intent of R6 is unclear. It is unclear whether data exchange is for forward looking or historical time periods. The requirement for beginning data exchange within 7 days is ambitious. A realistic time frame would be 90 days if it is forward looking.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

☐ Yes

☐ No

Comments: One methodology should be used for the TSP's system. Change "its sole" to "a single" or to "one". Also, the standard should have only one requirement that defines the when and where of ATC methodology ; If you want the same process to be applied across the TSP's whole system and across all time horizons then say that plainly in one requirement instead of splitting the where and when between R9 and R11.

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    X No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    X No

    Comments: R3 – What is the intent of this requirement? If the intent is to provide data within 7 days of the request then the requirement needs to be reworded.

    R8 – R14 should apply to “ATC” not “ATC and AFC” because AFC is just an ATC engine, and these requirements should be moved to the beginning of the standard, followed by the engine-specific calculation requirements.

    R11.2 – “internal expansion plan” does not apply within 13 month horizon. Should instead be “internal near-term planning”

    R11.5 – reject inclusion of “use the same power flow model” as this is impossible to apply. Many ATC models use NERC MMWG models as their basis. In planning studies, additional lower voltage detail is included.

Also, the standard should have only one requirement that defines the when and where of ATC methodology ; If you want the same process to be applied across the whole system and across time horizons then say that plainly in one requirement instead of splitting the where and when between R9 and R11.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    X No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don’t believe these are the same, please explain what you feel are the differences between TC and TTC.

    Yes — TTC and TC are the same

No — TTC and TC are not the same

Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

X Yes

☐ No

Comments: **<u>All</u>** of the calculations related to ATC should be addressed in the same standard. PE suggests that all requirements be included in MOD-001.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

Comments:

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

Comments:

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

Comments: PE suggests renaming the Standard "ATC Calculation Methodologies" and restate Purpose. AFC is just one engine type used to calculate ATC.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: The ETC definition reference to "Native Load uses" is not applicable to ATC calculations. By definition, a transfer analysis determines the amount of import (or export) capacity possible in addition to the native load service modeled in the base case. Internal transfers to serve network loads are not included in TTC values and should not be subtracted from TTC to obtain ATC. Conversely, since TFC is similar to a facility rating, not a (n-1) transfer analysis , the impacts of serving native load must be considered in calculating AFC and are therefore appropriate in an AFC calculation.

   Either the ETC definition should be changed to reflect the differences between ATC and AFC calculations or the ATC formula should be changed to remove ETC from the calculation. This could be accomplished by using the following ATC calculations.

   Firm ATC = TTC - CBM - TRM - Firm Interface Commitments Non-firm ATC = TTC - All Interface Commitments + Postbacks of Unscheduled Service

   In addition, the ETC definition should be modified to remove references to Contingency Reserves, which are not an Existing Transmission Commitment. The ATC equations allow for uncertainties such as CBM and TRM. To the extent additional reserve margins are required, they should accounted for as such in the AFC or ATC equations, not by lumping them into ETC. Also, references to pending uses should be removed. ETC should include only commitments, not potential uses. A suggested ETC definition is provided below.

   ETC: Used in the context of calculating AFC, ETC reflects the impacts of power flows associated with serving native loads, commitments for firm and non-firm transmission service, and any other commitments for transmission service not covered by OATT requirements.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

Should this definition be expanded or changed?

☐ Yes

☒ No

Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: Clarification is needed for the Network Response Method and Rated System Path Method to reconcile with the 1995 and 1996 documents. As example, R1 is confusing using the definitions as stated in current draft. NRM has been applied to two separate calculations (FCITC and AFC). In R1, add "not used for AFC" following "Network Response Methodology" in the parenthetical.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☐ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed

changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☐ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

Comments:

9. Do you with the frequency of exchanging data as specified Requirement 6?

☐ Yes

☒ No

Comments: It is unclear whether data exchange is for forward looking or historical time periods. The requirement for beginning data exchange within 7 days is ambitious. A realistic time frame would be 90 days if it is forward-looking.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

☐ Yes

☐ No

Comments: Change "its sole" to "a single" or to "one." The statement in the question above is clear - the language of the requirement was not as clearly stated.

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

☐ No

Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: R3 - The requirement is not clear on timeframes. Is it talking about the current ATC values or values into the future? If so, how far into the future. What is intent? If the intent is to create the obligation to provide current data within 7 days of the request, then the requirement needs to be reworded.

R4 - IN AFC methodology, TRM and CBM are a flowgate attribute not a path attribute, therefore the formula should be modified.

R5.1 and R5.2 - Needs clarification of the clause "with respect to how each is treated in the Transmission Service Provider's counter flow rules." This clause appears to limite consideration to counterflows only when other issues impact firm versus non-firm reservations and schedules.

R5.3 - delete "on OASIS" since it is covered in R10.

R6 - specify whether forward-looking or historical;

R6.1 and 6.2- "coordinated transmission system element" is not understood. Rephrase to state "coordinated schedules of transmission system elements to be taken out of service"

R6.8.3 - This requirement should allow the use of a minimum daily value during a week for posting as weekly ATC.

6.10 - remove "when revised".

R7 - state "at the minimum frequency" to be consistent with R6.8.

R8-R14 all apply to ATC so remove "or AFC" - also move R8-R14 to the beginning of the standard, followed by the engine-specific calculation requirements.

R11.2 - "internal expansion plan" does not apply within 13 month horizon. Should instead be "internal operational planning".

R11.5, change "the same power flow models, and the same assumptions regarding load, generation dispatch, special protection systems, post contingency switching, and transmission and generation facility additions and retirements as those used in the expansion planning for the same time frame." to "power flow models containing assumptions consistent with expansion planning for the same time frame."

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments: However, there are different definitions for TTC and TC. The definitions should be the same thus the current definition needs to be clarified.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☒ Yes

    ☐ No

    Comments: All of the calculations related to ATC (TFC, TTC, AFC) should be addressed in the same standard. Suggest that all requirements be included in MOD-001 and that FAC-012 and FAC-103 should be retired.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments:

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments:

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

Comments: Some TSP's OATT have requirements that components of ATC be provided by third parties. For example, in one case, a TSP is required to use the AFC calculations provided by the Reliability Coordinator in determining its ATC.

19. Do you have other comments that you haven't already provided above on the proposed standard?

Comments: Suggest renaming standard to ATC Calculation Methodologies and restate Purpose. AFC is just one of the engines used to calculate ATC.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: The ETC definition reference to "Native Load uses" is not applicable to ATC calculations. By definition, a transfer analysis determines the amount of import (or export) capacity possible in addition to the native load service modeled in the base case. Internal transfers to serve network loads are not included in TTC values and should not be subtracted from TTC to obtain ATC. Conversely, since TFC is similar to a facility rating, not a (n-1) transfer analysis , the impacts of serving native load must be considered in calculating AFC and are therefore appropriate in an AFC calculation.

   Either the ETC definition should be changed to reflect the differences between ATC and AFC calculations or the ATC formula should be changed to remove ETC from the calculation. This could be accomplished by using the following ATC calculations.

   Firm ATC = TTC - CBM - TRM - Firm Interface Commitments Non-firm ATC = TTC - All Interface Commitments + Postbacks of Unscheduled Service

   In addition, the ETC definition should be modified to remove references to Contingency Reserves, which are not an Existing Transmission Commitment. The ATC equations allow for uncertainties such as CBM and TRM. To the extent additional reserve margins are required, they should accounted for as such in the AFC or ATC equations, not by lumping them into ETC. Also, references to pending uses should be removed. ETC should include only commitments, not potential uses. A suggested ETC definition is provided below.

   ETC: Used in the context of calculating AFC, ETC reflects the impacts of power flows associated with serving native loads, commitments for firm and non-firm transmission service, and any other commitments for transmission service not covered by OATT requirements.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

Should this definition be expanded or changed?

☐ Yes

☒ No

Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: Clarification is needed for the Network Response Method and Rated System Path Method to reconcile with the 1995 and 1996 documents. As example, R1 is confusing using the definitions as stated in current draft. NRM has been applied to two separate calculations (FCITC and AFC). In R1, add "not used for AFC" following "Network Response Methodology" in the parenthetical.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☐ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed

changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☐ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

Comments:

9. Do you with the frequency of exchanging data as specified Requirement 6?

☐ Yes

☒ No

Comments: It is unclear whether data exchange is for forward looking or historical time periods. The requirement for beginning data exchange within 7 days is ambitious. A realistic time frame would be 90 days if it is forward-looking.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

☐ Yes

☐ No

Comments: Change "its sole" to "a single" or to "one." The statement in the question above is clear - the language of the requirement was not as clearly stated.

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

☐ No

Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: R3 - The requirement is not clear on timeframes. Is it talking about the current ATC values or values into the future? If so, how far into the future. What is intent? If the intent is to create the obligation to provide current data within 7 days of the request, then the requirement needs to be reworded.

R4 - IN AFC methodology, TRM and CBM are a flowgate attribute not a path attribute, therefore the formula should be modified.

R5.1 and R5.2 - Needs clarification of the clause "with respect to how each is treated in the Transmission Service Provider's counter flow rules." This clause appears to limite consideration to counterflows only when other issues impact firm versus non-firm reservations and schedules.

R5.3 - delete "on OASIS" since it is covered in R10.

R6 - specify whether forward-looking or historical;

R6.1 and 6.2- "coordinated transmission system element" is not understood. Rephrase to state "coordinated schedules of transmission system elements to be taken out of service"

R6.8.3 - This requirement should allow the use of a minimum daily value during a week for posting as weekly ATC.

6.10 - remove "when revised".

R7 - state "at the minimum frequency" to be consistent with R6.8.

R8-R14 all apply to ATC so remove "or AFC" - also move R8-R14 to the beginning of the standard, followed by the engine-specific calculation requirements.

R11.2 - "internal expansion plan" does not apply within 13 month horizon. Should instead be "internal operational planning".

R11.5, change "the same power flow models, and the same assumptions regarding load, generation dispatch, special protection systems, post contingency switching, and transmission and generation facility additions and retirements as those used in the expansion planning for the same time frame." to "power flow models containing assumptions consistent with expansion planning for the same time frame."

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments: However, there are different definitions for TTC and TC. The definitions should be the same thus the current definition needs to be clarified.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☒ Yes

    ☐ No

    Comments: All of the calculations related to ATC (TFC, TTC, AFC) should be addressed in the same standard. Suggest that all requirements be included in MOD-001 and that FAC-012 and FAC-103 should be retired.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments:

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments:

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

Comments: Some TSP's OATT have requirements that components of ATC be provided by third parties. For example, in one case, a TSP is required to use the AFC calculations provided by the Reliability Coordinator in determining its ATC.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: Suggest renaming standard to ATC Calculation Methodologies and restate Purpose. AFC is just one of the engines used to calculate ATC.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments: The ETC definition reference to "Native Load uses" is not applicable to ATC calculations. By definition, a transfer analysis determines the amount of import (or export) capacity possible in addition to the native load service modeled in the base case. Internal transfers to serve network loads are not included in TTC values and should not be subtracted from TTC to obtain ATC. Conversely, since TFC is similar to a facility rating, not a (n-1) transfer analysis, the impacts of serving native load must be considered in calculating AFC and are therefore appropriate in an AFC calculation. Either the ETC definition should be changed to reflect the differences between ATC and AFC calculations or the ATC formula should be changed to remove ETC from the calculation. This could be accomplished by using the following ATC calculations.

   Firm ATC = TTC - CBM - TRM - Firm Interface Commitments

   Non-firm ATC = TTC - All Interface Commitments + Postbacks of Unscheduled Service

   In addition, the ETC definition should be modified to remove references to Contingency Reserves, which are not an Existing Transmission Commitment. The ATC equations allow for uncertainties such as CBM and TRM. To the extent additional reserve margins are required, they should accounted for as such in the AFC or ATC equations, not by lumping them into ETC. Also, references to pending uses should be removed. ETC should include only commitments, not potential uses. A suggested ETC definition is provided below.

   ETC: Used in the context of calculating AFC, ETC reflects the impacts of power flows associated with serving native loads, commitments for firm and non-firm transmission service, and any other commitments for transmission service not covered by OATT requirements

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

Comments: Is the service definition to include point-to-point and network. Suggested TSR definition is provided below:

TSR: The act of making a request for reservation and transmission of capacity and energy on either a firm or non-firm basis from the Point(s) or Receipt to the Point(s) of Delivery under Part II or III of the Tariff.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments: Make sure that the correlation to other standards is correct when making this change

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☒ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: Scheduling and Operating definitions need to be swapped. These are defined in Order 890 paragraph 323.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments: Define network response and rated system path method more implicit (wording and intent) to the methods of ATC and AFC. Look more to the explanations in the 96 documents (pp15). The present definitions for Network Response Method and Rated System Path Method are unclear and do not adequately describe the three methods in the standard. Throughout the document, the three methods are Rated System Path Method, Network Response ATC Method and Network Response AFC Method. The two terms were taken from the 1996 document. Network Response Method that is described in that document appears to reflect the AFC process. A suggestion would be to used the Network Response Method for the AFC process and the Area Interchange Method (1995 document) for the ATC process..

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response

— ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments: As discussed in ETC definition, ETC as currently defined is not applicable to the ATC calculation. Also, ATC should be expanded into separate firm and non-firm ATC calculations. ETC should be replaced by firm and non-firm interface usage. Internal native load serving uses are not a component of ATC. Non-firm ATC should reflect that CBM (and often TRM) are not deducted and also should reflect the postback of unscheduled service. Some discussion of adjustments for redirected service in interface usage amounts should be included. Indication of whether TTC values reflect simultaneous or non-simultaneous values should also be included. AFC should be expanded into separate firm and non-firm AFC calculations. Non-firm AFC should reflect that CBM (and often TRM) are not deducted and also should reflect the postback of unscheduled service. The formula seems to indicate TRM and CBM are MW values. Some TPs address TRM by derating TFC values by a percentage, such as 5%. Some discussion of this practice or alternate formulas for AFC for those utilizing this practice should be included. The alternate approach should include discussion of how TFC values are affected for both firm and non-firm AFC. The formula does not include how counterflows are treated. Since TFC is similar to a facility rating, not a (n-1) transfer analysis, the impacts of counterflows must be considered in calculating AFC and are therefore appropriate in an AFC calculation. Similarly, some discussion should be included of how inadvertent flows from neighboring areas (loop flows) are considered. An additional formula should be modified will be required to include the calculation of ATC from AFC. Some discussion of what rating is used for TFC (static, Rate A, Rate B, ambient adjusted, etc.) is used in which horizons should be included.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: We agree with this requirement for ATC. We do not agree that TTC should be recalculated whenever a parameter changes.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☒ No

   Comments: The posting and reposting of data in the OASIS system needs to be taken out of this standard and requirements be put into NAESB standards. Most of this we already do. G&T outages on SDX, dispatch order would be new, power flow model on request, load forecast will be posted on OASIS, Flowgates OK, TFC-our ratings are provided in our cases today, ETC=TSRs is on OASIS] Question: Is R6 dictating duplication of already available information in a different format?

Also, does 6.8 require 168 models to be created each hour, or just changes in 168 hours of AFC values based upon changes in transmission service requests? Same question for daily. The document refers to OASIS several times. Why specify update intervals here rather than simply referring to FERC OASIS requirements or NAESB business practices? This sets up possible conflict. There is no reliability driver for these particular update frequencies.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

☐ Yes

☐ No

Comments: One methodology is sufficient. For ATC, although there mat be situations where multiple approaches are appropriate to address radial vs. interdependent portions of a system. Also, flexibility may be required in calculating TTC. For example posting non-simultaneous values on radial interfaces and simultaneous values on interdependent paths.

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

☒ No

Comments: This was put in here to cover the AFC's AFTFC (?). If this requirement stays in the standard, a suggested rewording is needed. A value "less than" automatically implies a value "other than." The requirement states, "If the TSP approves a TSR...." What if the TSP denies a TSR? This reads like a policy, not a reliability requirement. TSPs already have requirements under the OATT to provide justifications from approving/denying service.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: R1 and R4 for calculations both firm and non-firm. All references to TTC and TFC need to be move off to FAC 12 and 13. R11.2 phrase "internal expansion planning" be removed. R11.2-11.5 is referencing to TTC and TFC/AFC calculations should be moved to FAC 12-13. R7 what updated information should be coordinated and for what purpose? Is this not a posting issue? The posting and reposting of data in the OASIS system needs to be taken out of this standard and requirements be put into NAESB. R14 the ultimate source and sink hold for

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☒ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☒ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments: the TFC methodology should be developed in the FAC12-13 standard and not in MOD-001

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: addressed in CBM standard. In general, CBM is applicable to each time horizon in the context of calculating firm import ATC.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: addressed in TRM standard. In general, TRM is applicable to each time horizon in the context of calculating firm import ATC. Discussion is needed to determine whether TRM should be included in determing non-firm ATC and in export ATC calculations.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: The drafting team should consider whether particular directives in Order 890 adversely impact reliability and respond appropriately.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: R5.1 and R5.2 only cover the aspects of non-firm with dealing with an entity's counter flow rules. This could be resolved by adding equations that outline the firm and non-firm aspects of AFC. Firm and non-firm also differ in the treatment of TRM/CBM and postbacks of unscheduled service.

    R8 If Firm and Non-firm equations are used for ATC/AFC this requirement would not be necessary.

    R11.2: There is no "internal expansion planning" during these time frames. The phrase should be deleted. It is unclear what is meant by "use the same criteria and assumptions used to conduct reliability assessments and internal expansion planning for different time frames"

    Generally, expansion planning considers an N-2 approach as opposed to an N-1 in the operating horizon. Expansion planning also generally considers more robust dispatch assumptions in the local area under review. Also, although transfer analysis is a consideration in expansion planning, generally expansion plans are driven by local load serving constraints (thermal or voltage), not ATC considerations (limits to transfers). It would be inappropriate to utilize the same assumptions for ATC as expansion planning.

    R11.3: R11.2 states that the same criteria should be used and R11.3 states that the rationale for any differences should be documented. Does this allow of differences in R11.2?

    R11.4: This is not a big deal, but contingencies would be considered in the TTC and not the ATC. It is unclear what is meant by "Identify the contingencies considered in ATC". Is this a general statement of N-1 or specific contingencies used in the TTC assessment?

    R11.5: This is a planning issue, but this requirement could be problematic and difficult to comply with, especially using the same power flow models. The intent was to make sure that the requirements that you use to grant service were no more stringent that those used to plan for system expansion. We might want to consider suggesting a rewording. Generic ATC values calculated beyond 13 months are not used for addressing TSRs. I am not aware of yearly transmission service being evaluated absent a TSR study of the specific transfers, which would be performed under the planning process, so the models would be one in the same. I assume the "for the same timeframe" language indicates that the assumptions for beyond 13 months do not need to match the assumptions within the 13 monthly timeframe. In addition to the differences in expansion planning discussed above, planning models generally include firm commitments for long term service which may be inappropriate to use in operations (such as CT plant modeled on in April).

    R14 Under the OATT, transmission customers are not required to buy full path transmission service. This would also seem to significantly complicate the redirecting of service, another customer right offered under the OATT.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☒ Yes

   ☐ No

   Comments:

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☒ Yes

   ☐ No

   Comments: Definition should include reference to Source, Sink .

   Add to end of proposed definition …… and from ultimate Source to ultimate Sink.

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☒ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: We think terms need to be defined however they should be more general to allow for regional differences.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☒ Agree

   ☐ Disagree

   Comments: Remaining definitions: AFC, Network Response Method, Rated System Path Method, TFC, Transmission Reservation are OK

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☒ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments: We think those are the common used methodologies, we don't know of any others

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments: We think one day is reasonable in case TTC, TRM or CBM changes.

   If ETC changes re-calculation should be done within 1 of 2 hours.

   TTC typically only changes with upgrade of the flow gate element. TRM values change when the TP re-calculates the TRM values, twice a year or something like that. So TTC and TRM don't change on a daily basis, more on a Seasonal Basis. It can take SAS 70 related Change Control Approvals to get the values changed in the AFC databases. Getting approvals can take an hour or more if it is defined as an Emergency Change. After adding the new values to the AFC databases, it can take an hour or more before all Horizons are updated in Oasis Automation. The EMS AFC Calculator has to re-run all hours and days of the Horizons and that takes a little more than an hour. So starting from the time a new TRM or TTC value is submitted to TP, it can take a few hours before it is in Oasis and Oasis Automation. Also in many cases the Transmission owner doesn't immediately inform the TP of an upgrade the minute it happens, most of time a few days later. So it is in general not considered critical to immediately update the ATC and AFC values when TTC or TRM changes.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☒ Yes

   ☐ No

   Comments: The requirement's are very general and don't specify data exchange before changes, after a change, after seven days from an agreement. It is not clear if "as agreed upon" is acceptable if it is greater than every seven days.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☒ Yes

    ☐ No

Comments: We convert AFC to ATC numbers on OASIS, however we start off from AFC numbers that are calculated using one and same methodology

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

☒ No

Comments: It might happen for next hour Non-Firm if available flow gate capacity in real time justifies accepting Non-Firm request, while Non-Firm AFC (that still has some unused Reservations included in end-result) is un-sufficient. This is a common practice and should not have to be documented (justified) after fact.

It might happen also if a re-dispatch agreement is accepted by TP that requires a Transmission Customer to re-dispatch a certain amount to cover for the negative AFC created on flow gate by accepting Reservation. This is documented by TP.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments:

R6.8.1 We are not re-sinking 7 days of hourly values every hour, however the way Oasis Automation works it updates AFC with every Reservation that is submitted and with every Reservations that changes status. (for example Study refused).

R6.8.3 and R6.8.2 is same, if you have daily AFC for 30 days, you automatically have weeklies for 4 weeks, however not weekly value but daily values to represent the AFC of the 4 weeks. If that is intension we are OK.

R6.9 Not sure what ETC is intended to be included in R6.9, Gen to Load ETC only or also ETC as result of Reservations. TP's typically exchange Net Interchange based on Schedules and sometimes Reservations , however that assumes that all Reservations will be scheduled. It doesn't reflect directional ETC. A combination of ETC for a Gen to Load situation and the Reservations as referenced in R6.10 will result in the "true" ETC of the system. It can not be provided in an initial Power Flow Model.

R6.10 We don't think the "once per hour" should apply to all types of Reservations such as Weekly, Monthly and Yearly. It should be based on term of Reservation.

R7 This requirement might have to be split up in a requirement for the Sending Entity and a requirement for the Receiving Entity. We (receiving Entity) update the AFC data on an hourly basis however if the Sending Entity doesn't update the data on an hourly basis, it is not effective.

R11.2 "same criteria" is to general, should be more specific

R11.4 "Identify contingencies" is to general. Does this refer to outages or the contingency elements of flow gates.

R14 Over stringent, particular if AFC aren't calculated to the level or scope of granularity.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☒ Yes

    ☐ No

    Comments: We recommend developing some general criteria, what should be included in the TTC, TFC, ETC, TRM, CBM, and how they should be calculated (high level guidelines) and what the purpose is of including them in the AFC calculation

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☐ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments: That question should probably be asked of the drafting team of FAC-012-1 / FAC-013-1 if they had same definition in mind. When reading FAC-012-1 it is optional to apply a described methodology to a operating and/or planning horizon. The TTC as described in MOD-001-1 should be applied to all Horizons listed under question 4. of the Comment Form. It looks like FAC-012-1 is more related to Reliability function (real time /semi real time) and MOD-001-1 is more related to Tariff function

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments: It looks like FAC-012-1 is more related to Reliability function and MOD-001-1 is more related to Tariff function. FAC-012 should probably describe how the Normal Rating and Emergency Rating should be calculated, using what weather conditions and what safety margin for equipment. MOD-001-1 could refer to those definitions and indicate (as an example) that Normal Rating could be used for single element PTDF flow gates and Emergency Rating for OTDF flow gates

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments: We don't use CBM, so we don't really have an opinion

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments: TP should calculate the TRM value. TRM should be a seasonal (or yearly value), based on the largest available resources (not scheduled to have maintenance) in that season. If it is a yearly value it should be based on the largest unit. We don't think TRM should be a Monthly value, because maintenance of Resources can change and you might sell service on a lower TRM based on scheduled maintenance of the largest unit. If the scheduled maintenance changes and largest unit moves back in that Month you could potential have oversold system. To play it safe TRM should be seasonal or yearly value. A TP could decide based on a current outage of the unit which was the basis for current TRM value, to lower TRM for the time frame of the outage however we don't think that this type of detail should be incorporated or described in the MOD-001-1.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: No, we are not aware of any. Some TP's may find the need to include more detail into MOD-001-1 to address the concerns raised in the FERC Order No. 890.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments: None.

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☐ No

   Comments:

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

   Should this definition be expanded or changed?

   ☐ Yes

   ☐ No

   Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☐ Proposed definition

   ☐ Already approved definition

   Comments:

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☐ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments:

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☐ Disagree

   Comments:

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

   ☐ Yes

   ☐ No

   Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

   ☐ Yes

   ☐ No

Comments:

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments:

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☐ No

   Comments:

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

    ☐ No

    Comments:

11. Do you think that Requirement 13 in this proposed standard necessary?

    ☐ Yes

    ☐ No

    Comments:

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

    ☐ Yes

    ☒ No

    Comments: We disagree with R14 which requires the Transmission Service Provider to require Transmission Customers to provide ultimate source and sink on Transmission Service Requests and Transmission Customers must use the same source and sink on Interchange Transaction Tags. The main reasons we disagree with this requirement are that it is incompatible with current market trading and scheduling practices and is not always relevant.

    When a Transmission Customer reserves transmission for use in a trading hub transaction (e.g., "into Entergy", "into Southern"), it is not always possible for the Transmission Customer to know what the actual source or sink will be at the time of making the reservation.

When the source or sink is within a pool, it is not possible to identify the actual generating source or ultimate sink.

When transactions cross a DC tie, it would not be necessary for reliability or calculating ATC to identify the true source or sink on the opposite side of the DC Tie.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

    ☐ Yes

    ☐ No

    Comments:

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

    ☐ Yes — TTC and TC are the same

    ☐ No — TTC and TC are not the same

    Comments:

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

    ☐ Yes

    ☐ No

    Comments:

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

    Comments:

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments:

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments:

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

Please use this form to submit comments on the first draft of the ATC/AFC Methodology Documentation Standard (MOD-001-1 ATC and AFC Calculation Methodologies). Comments must be submitted by **March 16, 2007**. You must submit the completed form by email to sarcomm@nerc.com with the words "ATC/AFC Methodology" in the subject line. If you have questions please contact Bill Lohrman at wwlohrman@praguepower.com or 908-630-0289.

## Background Information

The proposed standard labeled MOD-001-1 outlines requirements for the calculation of ATC and AFC, but does not provide requirements for the calculation of TFC or TTC. The proposed standard may (in the future) reference NERC Standard(s) FAC-012 and/or FAC-013 as the source for the requirements for calculation of TTC and/or TFC. Currently FAC-012 identifies requirements for the calculation of inter-regional and intra-regional Transfer Capabilities (TC). The term TTC is not mentioned in FAC-012, as described in the FERC NOPR[1].

A distinct definition for the TC and TTC terms appears in the NERC *Glossary of Terms Used in Reliability Standards*[2]. The members of the drafting team are proposing that they are basically the same quantity and should be covered in a single standard in FAC-012 . Consequently, the draft version of MOD-001-1 does not contain calculation requirements for TTC. The drafting team is seeking input from the industry on this question (see Comment Form questions 13 and 14). The comment form includes a question asking whether the values for TC and TTC should be considered the same value.

If the calculation of AFC and ATC are ultimately dependent upon values derived in the FAC-012 and/or the FAC-013 standard(s), the drafting team will revise FAC-012 and/or FAC-013 as necessary prior to balloting MOD-001-1 so that the industry will know how these precursor values will be developed. A partial list of these precursor values could include:

- Semi-annual summer and winter TTC values
- Assumptions used for modeling generation dispatch
- Transmission and generation outage schedules
- Power flow models
- Load forecasts
- Path definitions and facility ratings
- Algorithms

Clarification of Capacity Benefit Margin and Transmission Reserve Margin will be subsequently addressed by the drafting team in proposed revisions to the respective standards dealing with those values.

The Standard Drafting Team would like to receive industry comment on the proposed requirements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements.

**You do not have to answer all questions.**
*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability.

   Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.

   ☐ Yes

   ☒ No

   Comments:

   Although the definition is sufficient to "describe" Existing Transmission Commitments, it is not sufficient to "calculate the ETC." ETC is an essential variable in the ATC calculation on par with TTC, CBM and TRM. As such, ETC should be addressed in its own freestanding standard to be consistent with the other ATC variables and to further promote clarity, consistency and transparency of this essential ATC component. This group does not concur that ETC should be addressed as a subcomponent of MOD-01 as stipulated in P243 of Order 890.

   To bring the definition in line with Order 890, P. 244, this Team suggests:

   1) The following language should be used as the definition for Existing Transmission Commitments.
   2) To bring the definition into accord with Order 890, the Team suggests striking any reference to Contingency Reserves from the definition.

Existing Transmission Commitments (ETC):

Any combination of:

1) Native Load commitments (including network service),
2) Load forecast error
3) Losses
4) Existing commitments for energy purchases, exchanges, deliveries, or sales and existing commitments for transmission service,
5) Appropriate point-to-point reservations
6) Rollover rights associated with long-term service
7) Other pending potential uses of transfer capability, either TTC or AFC, identified through the NERC process.

2. This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

Should this definition be expanded or changed?

☐ Yes

☒ No

Comments:

3. This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements and any associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the Flowgate caused by power transfers.

   This is the definition of Flowgate in the NERC *Glossary of Terms Used in Reliability Standards:* A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

   Which definition do you prefer?

   ☒ Proposed definition

   ☐ Already approved definition

   Comments: The proposed definition is more descriptive than the definition in the NERC glossary.

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

   **Operating Horizon** — Time frames encompassing same-day and real-time periods.

   **Scheduling Horizon** — Time frames encompassing the day-ahead period.

   **Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months

   **Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

   Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

   ☐ N/A — these terms do not need to be defined for use in this standard

   ☒ The terms do need to be defined and I do agree with the proposed definitions

   ☐ The terms do need to be defined but I don't agree with the proposed definitions

   Comments: These definitions do not agree with the definitions identified in Order 890 (see P323) as follows:

   Operating Horizon – day ahead and pre-schedule

   Scheduling Horizon – same day and real-time

   Planning Horizon – beyond the operating horizon

   The fact that FERC and NERC do not agree on the definition of these terms confirms the need to formalize the definition.

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

   ☐ Agree

   ☒ Disagree

   Comments:

   The Network Response Method definition needs clarity and a stronger description.

   The NERC Team indicates in Q7 that there is a difference between the Network Response Methodology-ATC and Network Response Methodology-AFC that is not yet apparent. If this is correct, a separate free standing definition would be warranted for each of the methodologies.

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

☒ Yes

☐ No

Comments:

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies).

   Should the drafting team consider other methodologies?

(Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

☐ Yes

☒ No

Comments:

For purposes of MOD-01, the WECC Team does not believe the standing NERC / NAESB ATC Drafting Team should entertain any additional methodologies. Preclusion at this stage does not foreclose the future use of the NERC SAR process should a more efficacious approach arise from within the industry.

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

   Comments:

   The WECC Team concurs that ATC should be recalculated anytime there is a change to any of the ATC variables. However, once the ATC is recalculated, the periodicity of posting the ATC is a business practice that should be deferred to NAESB.

9. Do you with the frequency of exchanging data as specified Requirement 6?

   ☐ Yes

   ☐ No

   Comments: The question is specific to entities using the AFC methodology and should be reserved for comment by those entities.

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

    ☐ Yes

☐ No

Comments:

This requirement is unnecessary and should be deleted. If the NERC team will not delete the Requirement, at minimum the word "sole" must be deleted from the Requirement.

If, for example, a TSP has operational needs that dictate the use of the AFC Methodology for paths within its network and the Rated System Path for interfaces with its neighbors, either of these methodologies is allowed under MOD-01. So long as the TSP consistently and transparently applies any of the NERC approved methodologies to it facilities and communicates that application to all appropriate entities, this approach should be allowed as it has met FERC's core purposes without disrupting operations.

In contrast, this constrictive approach over reaches the FERC mandate of consistency and transparency, increases the potential for seams between interchanges and otherwise imposes a burden to alter operations where no remedy is needed.

In support of the WECC Team's position:

FERC found in Order 890 that "the potential for undue discrimination stems from two main sources: (1) variability in the calculation of the components that are used to determine ATC and (2) the lack of a detailed description of the ATC calculation methodology and the underlying assumptions used by the transmission provider." P. 209. Neither of these concerns is at issue should a TSP use more than one NERC authorized methodology.

Further, FERC found that so long as "all of the ATC components and certain data inputs and assumptions are consistent, the three ATC calculation methodologies being finalized by NERC through the reliability standards development process will produce predictable and sufficiently accurate, consistent, equivalent, and replicable results. It is therefore not necessary to require a single industry-wide ATC calculation methodology. ***The Commission instead concludes that use of the ATC calculation methodologies included in reliability standards currently being developed by NERC is acceptable."*** P. 210.

11. Do you think that Requirement 13 in this proposed standard necessary?

☐ Yes

☐ No

Comments:

The WECC Team would like an example as to why the NERC Team believes this Requirement is necessary.

The WECC Team believes that if ATC is posted on OASIS, the entire posted amount must be made available for purchase. For example, if an entity requests 100 MW of legitimately posted ATC and the TSP refuses the 100 MW request but grants 80 MW instead, that TSP must provide to the requesting entity a full and written explanation of why the full 100 MWs of posted ATC were not made available.

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

☐ Yes

☒ No

Comments: See our comments and answer to Question 19.

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

☐ Yes

☒ No

Comments: As clarity is essential for each ATC variable, the WECC Team suggests that any further prescription or standardization is addressed in a free standing standard specifically addressing each variable of the ATC calculation. For example, a free standing standard should be initiated for ETC.

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

☒ Yes — TTC and TC are the same

☐ No — TTC and TC are not the same

Comments: Additionally, the NERC Drafting Team should decide which of the NERC Glossary terms best describes this specific capacity and eliminate the other.

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer.

☐ Yes

☒ No

Comments: TFC methodology should be addressed in the same standard as is TTC methodology. This is the logical parallelism to addressing AFC and ATC in the same standard.

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain.

Comments:

This question is best deferred to the CBM standard.

That said, the LSE should be the entity that determines CBM and should also be allowed the authority to call on the CBM when appropriate.

In keeping with Order 890, P. 358 and also MOD-05 as currently implemented, the WECC Team suggests that CBM be recalculated no less than annually with allowance to recalculate more frequently as circumstances change.

To the extent CBM is not scheduled (remains "unused") CBM must be posted on OASIS on a non-firm basis. Order 890, P. 354.

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

    Comments:

    This question is best deferred to the TRM standard.

    That said, the Transmission Service Provider in conjunction with its Transmission Planner should determine the TRM.

    How often TRM should be calculated is dependent upon what elements go into the TRM as will be dictated in the TRM standard. If load forecast error becomes part of TRM, the TRM should be adjusted hourly. By contrast, if the TRM is solely to address seasonal changes that an annual then on/off peak recalculation may be in order.

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

    Comments: No.

19. Do you have other comments that you haven't already provided above on the proposed standard?

    Comments:

    Yes. The drafting team should be encouraged to include in the MOD-01 a formula describing how AFC is converted into ATC for the subsequent posting of ATC by those entities utilizing AFC.

    "The Commission also required each transmission provider using an Available Flowgate Capacity (AFC) methodology to explain its definition of AFC, its calculation methodology and assumptions, and its process for converting AFC into ATC." P. 189.

R3. This requirement states that the TSP "…shall, when requested, provide or make available, the following values…" What is the retention period for the TSP such that the data will still be available when requested? The drafting team should modify this requirement such that the TSP is only required to respond to requests for data that are within the time frames established within their filed Tariff. For example, TSP's should not have to provide ATC values that would require a System Impact Study.

R3. & R6. This requirement states that the TSP provide certain data when requested and when the requestor "…has a reliability related need for the values." How does the TSP judge whether the requester has a reliability related need or not? The drafting team needs to establish a criterion for the need or strike this phrase from the requirement.

R11.2 & R11.3 This requirement states that TSP's, "Require that the calculation of ATC or AFC use the same criteria and assumptions used to conduct reliability assessment and internal expansion planning for different time frames etc." and that they "Document the criteria used for calculating ATC or AFC values for the different time frames etc. and the rationale for any differences between these."

Those TSPs who use the Rated System Path Methodology rely heavily on criteria and assumptions for calculating the TTC for a path but not for the calculation of ATC. Once the TTC for a path is determined the determination of ATC is simple math with little concern for criteria or assumptions.

We recommend that the drafting team restrict these two requirements to those TSP's who use the AFC Calculation Methodology and create a parallel requirement for the calculation of TTC for those TSP's who use the Rated System Path Methodology.

R11.4 & R11.5 This requirement states that TSP's must "Identify the contingencies considered in the ATC and AFC calculation methodologies." and that they "..use the same power flow models, and the same assumptions regarding load, generation dispatch, special protection systems etc. as those used in the expansion planning for the same time frames." This would be important for those who use the AFC Calculation Methodology and build power flow models to determine if capacity will be available. For those using the Rated System Path Methodology these factors are important for the determination of TTC but not for the determination of ATC. Rated System Path Methodology users do not build power flow cases and study contingencies to determine "ATC"; rather, these case studies are done to determine the TTC rating of paths. Therefore we recommend that the drafting team restrict these two requirements to those TSP's who use the AFC Calculation Methodology and create a parallel requirement for the calculation of TTC for those TSP's who use the Rated System Path Methodology.

R12. This requirement states that TSP's must "Identify the Transmission Service Providers with which the data used in the calculation of ATC or AFC is exchanged." Coordination of data is important but for those using the Rated System Path Methodology this coordination takes place when the TTC for the path and not the ATC for the path is calculated. We recommend that the drafting team make this requirement apply only to those using the AFC Methodology in MOD 001 and create a comparable requirement in the TTC calculation standard for those using the Rated System Path Methodology.

R14. This requirement states that "The Transmission Service Provider shall require that the Transmission Customer provide both ultimate source and ultimate sink on the Transmission Service Request and shall require that the Transmission Customer use the same source and sink on Interchange Transaction Tags."

The WECC Team suggests this Requirement should be applicable only to entities using the AFC methodology.

For entities using the Rated System Path (re: the majority of WECC) the source and sink are already part of the Tagging system. At minimum that makes the Requirement redundant for the Rated System Path participants. Further, since Tagging is a business practice, this requirement would fall into the purview of NEASB. Lastly, unlike those using the AFC methodology, the source and sink of each request and subsequent schedule is not needed to determine ATC as it is for those determining AFC using Flowgates. Since entities calculating AFC need to know the source and sink for Flowgate modeling purposes (whereas those using the Rated System Path method do not), the logical application for this Requirement is to those using the AFC methodology.

The ATC Standard Drafting Team thanks all commenters who submitted comments on Draft 1 of the Available Transfer Capability (ATC) Standard (MOD-001). The standard was posted for a 30-day public comment period from February 15 through March 16, 2007. The drafting team asked stakeholders to provide feedback on the standard through a special standard Comment Form. There were 35 sets of comments, including comments from more than 91 different people from more than 52 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

Since the drafting team posted its first draft of MOD-001, FERC issued Order 890 and Order 693 – with very specific directives relative to ATC. The drafting team made significant changes to the first draft of MOD-001 in response to stakeholder comments and in response to the FERC Orders.

The changes to MOD-001 resulting from stakeholder comments and FERC directives were so extensive that the revised standard bears very little resemblance to the first draft of MOD-001.

- There was no consensus on several of the proposed definitions, and those that were not supported by stakeholders have either been removed or revised.

- The drafting team added much more detail to each of the methods of determining ATC and its related components and subdivided the requirements into a greater number of standards as follow:

  - MOD-001 - This is now an "umbrella" standard and contains the 'generic' requirements applicable to all methods of determining ATC. All of the equations have been removed from this standard.
  - MOD-028 – This standard addresses requirements unique to the Network Response method of determining ATC.
  - MOD-029 – This standard addresses requirements unique to the Rated System Path method of determining ATC.
  - MOD-030 – This standard addresses requirements unique to the Flowgate Network Response method of determining ATC, including requirements to convert AFC to ATC
  - MOD-004 – This standard addresses requirements for Capacity Benefit Margin (CBM)
  - MOD-008 – This standard addresses requirements for Transmission Reliability Margin (TRM).

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Director of Standards, Gerry Adamski, at

609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

**Index to Questions, Comments and Responses:**

1. **This is the proposed definition for 'Existing Transmission Commitments (ETCs)' — Any combination of Native Load uses, Contingency Reserves not included in Transmission Reliability Margin or Capacity Benefit Margin, existing commitments for purchases, exchanges, deliveries, or sales, existing commitments for transmission service, and other pending potential uses of Transfer Capability. Is this definition sufficient to calculate the ETC in a consistent and reliable manner? If not, please explain.**

**Summary Consideration:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify (in MOD-028, MOD-029, and MOD-030) the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components.

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ERCOT | | | ERCOT does not have a transmission service market. Therefore, this concept does not have meaning in ERCOT operations as described in this definition. |
| **Response:** Agreed. However, if ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| APPA | | ☑ | The definition is too vague to be used as a major component of the ATC Calculations. Therefore a Standard needs to be developed to determine the rules for what is ETC, where to post ETC, and the requirements for archiving the ETC for future Compliance Records and Auditing. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. | | | |
| BPA | | ☑ | This definition merely describes a universe of explicit contractual or planning commitments that can be included in the calculation of ETC. To actually calculate ETC, however, these commitments must be translated into a representation of power transfers, i.e., the use of transfer capability. BPA does not agree that ETC should be addressed as a subcomponent of MOD-001-1 as suggested in P243 or Order 890; rather, it should be addressed in its own standard. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the | | | |

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| components. | | | |
| Cargill | | ☑ | Phrase "other pending potential uses" too broad and open to interpretation and could allow discrimination. Order 890 states that ETC should include: native load commitments, grandfathered transmission rights, point-to-point reservations, rollover rights, and other uses identified through the NERC process. We feel that "other pending potential uses" does not comply with Order 890. All components of ETC should be specifically defined. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components, and includes a clearer definition of what was intended with the phrase, **"**pending potential uses of Transfer Capability". | | | |
| Duke Energy | | ☑ | The definition of ETC is too ill defined. There probably needs to be a separate standard for ETC (as exists for TRM and CBM). "Native load" should be "Network/Native load". All Contingency Reserves has too general to be used for ETC calculation - only reserves considered under TRM and CBM should be allowable for ETC calculation. What are the "existing commitments for purchases, exchanges, deliveries, or sales" that do not fall under the "existing commitments for transmission service" category? This phrase should be eliminated from the definition. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. The phrase, 'existing commitments for transmission service' is not used in the revised standards (MOD-001, MOD-028, MOD-09-29, MOD-030). | | | |
| Entergy | | ☑ | Definition of ETC is broad and can not be used to calculate the ETC in a consistent and reliable manner. Since ETC will vary depending on what ATC calculations this is used for, its components can vary. For example, for Firm ATC calculation, there is no need to include non-firm reservations. A detailed Standard could to be developed or details included in MOD-001 for ETC calculations that should describe requirements and components to be included in ETC calculations. However, in view of para 243 of FERC Order 890, ETC should be addressed by including the requirements in MOD-001 rather than through a separate reliability standard. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. | | | |
| Grant County PUD | | ☑ | I have no specific suggestions, but in reading the definition for the first time, I am not sure how to interpret this. I have had to read it several times, and could interperet the defintion several ways as to our situation. Dynamic (and or psudo tie) uses for wind, and hydro generation, grandfathered system rights, and flow through from other systems that don't follow schedule paths, but physical paths, could all be problematic. |

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. | | | |
| ITC Transco | | ☑ | Other pending potential uses" does not sound like an existing commitment. The definition should reference "other uses" or "other pending uses" or "other committed uses" but a "potential use" is not a commitment. There are lots of potential uses of the transmission system, but the only ones that matter in the context of this definition are those for which transmission capacity needs to be reserved. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. The proposed requirements provide an interpretation of what was intended with the use of the phrase, 'other pending potential uses'. | | | |
| KCPL | | ☑ | This definition is open ended. It would be better as a definition to include all components that can be thought of and amend the definition as the need arises. This definition needs to stand alone and not make reference to TRM and CBM. If there are items missing from the TRM and CBM that need to included in them, then it should be included and not left for ETC to clean up. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components.<br><br>Note that the drafting team did use CBM and TRM in the revised standards (MOD-028, MOD-09, and MOD-030) because these acronyms were used in FERC Order 890. | | | |
| Manitoba Hydro | | ☑ | Manitoba Hydro believes that the definition is close but you would have to develop the definition further to describe when it is appropriate to describe reserves as ETC. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. | | | |
| MidAmerican | | ☑ | The definition of ETC must be modified to comply with Order 890, Paragraph 244. In addition, the definition does not define "other pending potential uses" of Transfer Capability, or explain how the other individual components of ETC are to be calculated. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. The proposed requirements provide an interpretation of what was intended with the use of the phrase 'other pending potential uses'. | | | |

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| MISO | | ☑ | The definition for ETC is very generic. With the FERC Order 890 requirements of transparency in ATC/AFC calculations, this definition needs to be revisited to add more speficity to it. The definition specifically needs to include modeling of transmission commitments due to transmission service from other transmission providers. Midwest ISO is currently addressing this through two approaches – 1. Seams agreements that address modeling of transmission commitments from other entities. 2. a forecast error term which is currently under development that will address AFC predictions in real time to accommodate for errors in load, generation outage and loopflow forecasts. The standard needs to be revisited to make the computation of transmission commitments in both AFC and ATC methodologies transparent to transmission customers. Include thirdy party generation to load impacts. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. Transparency will be a key element in all standards developed pertaining to ATC. The Team will address modeling and forecasting concerns. | | | |
| MRO | | ☑ | It is not clear in the definition whether the words existing commitments is to apply only to purchases or also exchanges, deliveries, or sales. In other words, is it the intent of the Drafting Team that only existing commitments for exchanges, deliveries, or sales be included in ETC? If it is the latter than the definition should be changed to say existing commitments for exchanges, existing commitments for deliveries, or existing commitments for sales or else use punctuation such as semi-colons to make clear the meaning. If it is the former than the MRO suggests that exchanges deliveries, or sales be moved before the words existing commitments for purchases, such as exchanges, deliveries, or sales, existing commitments for purchases, existing commitments for transmission services, etc. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. Note that in the revised standards (MOD-001, MOD-028, MOD-029, MOD-030) the term, 'existing commitments' is not used. | | | |
| ODEC | | ☑ | The last catch all phrase of 'other pending potential uses of Transfer Capability' causes great concern. What does this mean? It is not clear, therefore, the definion of ETC is not clear. Should non-firm schedules be included, it is not clear from this definion, but it needs to be very clear so everyone is calulcating ETC the same way. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. . The revised standards (MOD-001, MOD-028, MOD-029, MOD-030) do not include the phrase, 'other pending potential uses'. | | | |
| SCE&G and<br>SERC ATCWG<br>Southern | | ☑ | The ETC definition reference to "Native Load uses" is not applicable to ATC calculations. By definition, a transfer analysis determines the amount of import (or export) capacity possible in addition to the native load service modeled in the base case. Internal transfers to serve network loads are not included in TTC values and should not be subtracted from TTC to obtain ATC. Conversely, since |

| **Question #1** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | TFC is similar to a facility rating, not a (n-1) transfer analysis , the impacts of serving native load must be considered in calculating AFC and are therefore appropriate in an AFC calculation.<br><br>Either the ETC definition should be changed to reflect the differences between ATC and AFC calculations or the ATC formula should be changed to remove ETC from the calculation. This could be accomplished by using the following ATC calculations.<br><br>Firm ATC = TTC - CBM - TRM - Firm Interface Commitments Non-firm ATC = TTC - All Interface Commitments + Postbacks of Unscheduled Service<br><br>In addition, the ETC definition should be modified to remove references to Contingency Reserves, which are not an Existing Transmission Commitment. The ATC equations allow for uncertainties such as CBM and TRM. To the extent additional reserve margins are required, they should accounted for as such in the AFC or ATC equations, not by lumping them into ETC. Also, references to pending uses should be removed. ETC should include only commitments, not potential uses. A suggested ETC definition is provided below.<br><br>ETC: Used in the context of calculating AFC, ETC reflects the impacts of power flows associated with serving native loads, commitments for firm and non-firm transmission service, and any other commitments for transmission service not covered by OATT requirements. |
| **Response:** Due to the different methods for determining TTC and ATC these comments may apply in some regions and not in other regions. Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. NAESB is expected to write a business practice that will provide more details for some of these items – for example NAESB is expected to clarify what can be included in Native Load. | | | |
| WECC ATC Team | | ☑ | Although the definition is sufficient to “describe” Existing Transmission Commitments, it is not sufficient to “calculate the ETC.” ETC is an essential variable in the ATC calculation on par with TTC, CBM and TRM. As such, ETC should be addressed in its own freestanding standard to be consistent with the other ATC variables and to further promote clarity, consistency and transparency of this essential ATC component. This group does not concur that ETC should be addressed as a subcomponent of MOD-01 as stipulated in P243 of Order 890.<br><br>To bring the definition in line with Order 890, P. 244, this Team suggests:<br><br>The following language should be used as the definition for Existing Transmission Commitments. |

| Question #1 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| | | | To bring the definition into accord with Order 890, the Team suggests striking any reference to Contingency Reserves from the definition.<br><br>Existing Transmission Commitments (ETC):<br>Any combination of:<br>1. Native Load commitments (including network service),<br>2. Load forecast error<br>3. Losses<br>4. Existing commitments for energy purchases, exchanges, deliveries, or sales and existing commitments for transmission service,<br>5. Appropriate point-to-point reservations<br>6. Rollover rights associated with long-term service<br>7. Other pending potential uses of transfer capability, either TTC or AFC, identified through the NERC process. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. | | | |
| IESO | ☑ | ☑ | We agree with most of the components except "…other pending potential uses of Transfer Capability". This component is subject to interpretation and it is difficult to demonstrate a quantifiable need for the inclusion of this component. Also, we question the need to specify "exchanges" and "deliveries" given that "purchases" and "sales" are already included in the definition. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. The drafting team elected to remove the definition, and instead specify the components of ETC as bulleted requirements. The proposed requirements include the components that go into ETC and provide a detailed method for determining each of the components. The revised standards (MOD-001, MOD-028, MOD-029, and MOD-030) do not include the phrase, 'other pending potential uses'. | | | |
| NYISO<br>CAISO<br>ISO-NE | ☑ | | We agree with most of the components except "other pending potential uses of Transfer Capability". This component is subject to interpretation and is difficult to demonstrate the need and quantify it for inclusion. Also, we question the need to specify "exchanges" and "deliveries" given that purchases and sales are already included. |
| **Response:** Most commenters disagreed with the proposed definition – several suggestions were provided for improving the definition, all requiring more details. | APS | ☑ | | |

2. **This is the proposed definition for 'Transmission Service Request' — A service requested by the Transmission Customer to the Transmission Service Provider that may move energy from a Point of Receipt to a Point of Delivery. Should this definition be expanded or changed?**

**Summary Consideration:** There was an error in the question – the proposed definition that was posted with the standard did not include the word, 'may – the proposed definition posted with the standard was:

Transmission Service Request: A service requested by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

The proposed definition uses the already approved definition of 'Transmission Service' and adds words to support 'request'. The approved definition of Transmission Service is: Services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.

The drafting team did not make any changes to the proposed definition.

<table>
<tr><th colspan="4">Question #2</th></tr>
<tr><th>Commenter</th><th>Yes</th><th>No</th><th>Comment</th></tr>
<tr><td>ERCOT</td><td></td><td></td><td>ERCOT does not have a transmission service market. Therefore, this concept does not have meaning in ERCOT operations as described in this definition.</td></tr>
<tr><td colspan="4">Response: Agreed. However, if ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration.</td></tr>
<tr><td>APPA</td><td>☑</td><td></td><td>A Transmission Service Request is a request to reserve Transmission Capacity. If accepted and confirmed, it is not necessary for the Transmission Customer to move energy on this Transmission Capacity. In fact, it may be used for operating reserves and energy would only be scheduled on this capacity if there was an emergency. The definition should read in a manner that the Transmission Customer is requesting Transmission Capacity from a point of receipt and points of delivery.</td></tr>
<tr><td colspan="4">Response: Agreed. The purpose of this definition was not to imply that energy must be scheduled or moved along the path for which the Transmission Capacity was reserved. The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." This should only imply that the ability to move energy along a transmission path should be available, if necessary.</td></tr>
</table>

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | |
| BPA | ☑ | | The definition as written implies that the request is for the physical movement of power from a specific generator to a requested point of delivery. In fact, the underlying nature of the service requested is to inject power into the grid at at a point of receipt, and to withdraw a like amount of power at a specific point on the grid for the benefit of an identified load.<br><br>It is also not clear that a request for Network Integration Transmission Service would fall within this definition, because it may involve multiple PORs and PODs. |
| **Response:** The purpose of this definition was not to imply that energy must be scheduled or moved along the path for which the Transmission Capacity was reserved. The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| CAISO<br>ISO-NE | ☑ | | Definition is already sufficient and should not be expanded or changed.<br><br>The definition should be modified to recognize the need for transmission requests for A/S capacity, not just actual energy. Insert "**and/or Ancillary/Services"** after the word "energy". The SDT should also review the definition of transmission service for consistency.<br><br>The definition should include reference to ultimate Source and Sink. Add to end of proposed definition "… and from ultimate Source to ultimate Sink." |
| **Response:**<br>The SDT thinks the comment "Definition is already sufficient and should not be expanded or changed" was made in error.<br>The SDT does not agree the ultimate Source and Sink are a requirement of every Transmission Service Request.<br>The reservation of Ancillary Services is a separate FERC requirement. The drafting team believes that Ancillary Services are not part of ATC/AFC, and should not be included in the definition of a transmission service request. The NERC glossary already has a definition for Ancillary Services. | | | |
| Duke Energy | ☑ | | 'Transmission Service Request' - An OASIS request by the Transmission Customer to reserve transmission capacity for the purpose of moving energy from a point of receipt to a point of delivery. |
| **Response:** The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| FRCC | ☑ | | Should specify that it must be done on OASIS and should be broad enough to include network integration transmission service also. Suggested wording: A service requested on the OASIS by a transmission customer of the transmission service provider to move energy out of, across, or into the transmission service provider's transmission system. |
| **Response:** The proposed definition of Transmission Service Request was intended to be very general and not to define a detailed process. | | | |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| Grant County PUD | ☑ | | Who's POR or POD? I am sure I know what the intent is, some may read this, as written to mean the whole path. |
| **Response:** The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| IRC | ☑ | | The definition should be modified to recognize the need for transmission requests for A/S capacity, not just actual energy. Insert "and/or A/S" after the word "energy". The SDT should also review the definition of transmission service for consistency.<br><br>The definition should include reference to ultimate Source and Sink. Add to end of proposed definition "… and from ultimate Source to ultimate Sink." |
| **Response:** The proposed definition of Transmission Service Request was intended to be very general and not to define a detailed process. The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery."<br>Ultimate Source and Sink are not required of every Transmission Service Request. | | | |
| ITC Transco | ☑ | | It may be semantics, but NITS generally does not have "a point" of receipt or delivery. The definition could refer to sources and sinks rather than PORs and PODs.<br><br>Also, why is this term being defined? It is virtually identical to the definition of Transmission Service, only with the phrase "provided to" replaced by "requested by." The Standards should not define the obvious. |
| **Response:** NITS should have a separate request for each different POR/POD combination for ATC calculation purposes. The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| MidAmerican | ☑ | ☑ | This is not a proposed definition. This is the current definition in the NERC glossary.<br>The new definition should defines the transmission service request as a request for transmitting capacity and energy. |
| **Response:** The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| MISO | ☑ | | This definition itself would have been fine if the terms "Point of Receipt" and "Point of Delivery" were consistently treated by the various transmission providers. With the FERC order 890 requirements of consistency in AFC/ATC calculations, the standards needs to be revisited to address the consistent |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | and transparent treatment of Point of Receipt, Point of Delivery, Source and Sink usage as applicable to a TSR within AFC/ATC calculations. A suggested industry wide definition for Transmission Service Request could be "a request for using the transmission system submitted to a transmission provider (typically through an OASIS system) to move power (MWs) either into, out of, within or across the footprint of the transmission provider (with specific start time and stop times, class of service (firm/non-firm) and service increment (hourly, daily weekly etc.,)" |
| **Response:** The SDT has addressed the directives in FERC order 890 and has made some conforming changes to the standard as suggested. The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| MRO | ☑ | | The OATT definition for Point-To-Point Transmission Service indicates that it is a service for the receipt of capacity and energy at designated Points of Receipt and the transmission of such capacity and energy to designated Points of Delivery. The definition of Transmission Service Request should be revised to state that it is a request to move CAPACITY and energy from a Point of Receipt to a Point of Delivery. The added word is stated in all caps. |
| **Response:** The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| NCMPA | ☑ | | A Transmission Service Request is a request to reserve Transmission Capacity. If accepted and confirmed, it is not necessary for the Transmission Customer to move energy on this Transmission Capacity. In fact, it may be used for operating reserves and energy would only be scheduled on this capacity if there was an emergency. The definition should read in a manner that the Transmission Customer is requesting Transmission Capacity from a point of receipt and points of delivery. |
| **Response:** The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| NYISO | ☑ | | Definition is already sufficient and should not be expanded or changed.<br><br>The definition should be modified to recognize the need for transmission requests for A/S capacity, not just actual energy. Insert "and/or A/S" after the word "energy." The SDT should also review the definition of transmission service for consistency. |
| **Response:** The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |
| Southern | ☑ | | Is the service definition to include point-to-point and network. Suggested TSR definition is provided below:<br><br>TSR: The act of making a request for reservation and transmission of capacity and energy on either a |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | firm or non-firm basis from the Point(s) or Receipt to the Point(s) of Delivery under Part II or III of the Tariff. |
| **Response:** The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." . | | | |
| SPP | ☑ | | Definition should include reference to Source, Sink .<br>Add to end of proposed definition …… and from ultimate Source to ultimate Sink. |
| **Response:** The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." The ultimate Source and Sink are not a requirement of every Transmission Service Request. | | | |
| Entergy | ☑ | | |
| HQT | ☑ | ☑ | Point of receipt and point of delivery shall be defined. Considerations shall be taken for POR and POD from different asynchronous Interconnection. |
| **Response:** The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery."<br>Point of Receipt and Point of Delivery are already approved terms in the NERC Glossary. | | | |
| ODEC | | ☑ | TSR is just a request for service. Definion reads that way so it is okay. |
| **Response:** Agree. | | | |
| KCPL | | ☑ | This definition has already been adopted in the current NERC Glossary and is sufficient. |
| **Response:** Not exactly – the definition in the NERC Glossary only addressed Transmission Service. The intent was to expand upon the already approved term, "Transmission Service," in the NERC Glossary to describe the act of making a request for Transmission Service. The definition of Transmission Service in the NERC Glossary is "services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery." | | | |

| WECC ATC Team | | ☑ | |

3. **This is the proposed definition for 'Flowgate' — A single transmission element, group of transmission elements that may include associated contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage. Transfer Distribution Factors are used to approximate MW flow impact on the flowgate caused by power transfers.**

**This is the definition of Flowgate in the NERC Glossary of Terms Used in Reliability Standards: A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.**

**Which definition do you prefer?**

**Summary Consideration:** Based on stakeholder comments, the drafting team removed the second sentence from the proposed definition so that the revised proposed definition is:

A single transmission element, or a group of transmission elements, or a single transmission element with one or more contingencies, or a group of transmission elements with one or more contingencies intended to model MW flow impact relating to transmission limitations and transmission service usage.

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Proposed** | **Already Approved** | **Comment** |
| ERCOT | | | ERCOT does not typically use the term "Flowgate". ERCOT analysis considers monitored elements and a list of contingencies used in contingency analysis. However, the definition of monitored element, while similar to Flowgate, does not require the inclusion of associated contingencies. Both definitions, as prescribed, do not have meaning in ERCOT operations. |
| **Response:** Agreed. However, if ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| APPA | ☑ | | Flowgate are also used in the Western Interconnection where there is not an IDC. |
| BPA | ☑ | | Although the proposed definition is superior to the existing NERC definition, BPA |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Proposed** | **Already Approved** | **Comment** |
| | | | believes that it may be too expansive. Specifically, the proposed definition does not clarify what is contemplated by the term "any associated contingencies". If the proposed standards are intended to ensure specificity and transparency of the contingencies, margins and/or uncertainties that may be considered when determining ATC, then BPA thinks any contingencies should be explicitly identified and quantified in the determination of TTC/TFC, TRM and/or CBM, and not in the definition of a flowgate. Also, it is not clear why a definition for transfer distribution factors is included in the definition of a flowgate. It would seem more appropriate to provide a separate stand-alone definition of transfer distribution factors. |
| **Response:** The Drafting Team feels the word contingencies is an industry accepted term that is defined in the NERC glossary as, "The unexpected failure or outage of a system component, such as a generator, transmission line, circuit breaker, switch or other electrical element." By using the term "Any associated contingencies", flexibility is given to allow a flowgate to be defined in such a way to keep the system reliable. The second sentence is not a definition of transfer distribution factors. It was intended to show how the MW impact of a power transfer can be applied to a flowgate. The Drafting Team removed the sentence that included text about transfer distribution factors. | | | |
| Duke Energy | ☑ | | Delete the second sentence of the proposed definition. |
| **Response:** The Drafting Team agrees and removed the second sentence from the definition. | | | |
| FRCC | ☑ | | Last sentence of new definition is not necessary. It is extraneous to the definition. |
| **Response:** The Drafting Team agrees and removed the second sentence from the definition. | | | |
| HQT | ☑ | | "any associated contingency" needs to be explained. Why should contingencies be associated to an element or group of transmission elements? |
| **Response:** The majority of monitored elements have a worst contingency that has the largest negative impact on the flows on that monitored element. When using flowgates to analyze a transmission system, instead of studying all contingencies for a monitored element, the worst contingency may be coupled with the monitored element and is called a flowgate. That is why when defining a flowgate the flexibility is given to include "any associated contingency or contingencies". However, as defined, it is not necessary to associate a flowgate with a contingency. | | | |
| KCPL | ☑ | | Propose the following refinement to the proposed definition:<br>Flowgate - a single transmission element or group of transmission elements that may include an associated transmission contingency(ies) intended to model MW flow impact relating to transmission limitations and transmission service usage by the use of Transfer Distribution Factors.<br><br>Transmission Distribution Factor is not included in the NERC Glossary. Should Transmission Distribution Factor be defined or should it be excluded from the above definition? |
| **Response:** The Drafting Team agrees and removed the second sentence from the definition. | | | |
| ODEC | ☑ | | I prefer the new defiinion, but think we might be able to improve on it. |

| Question #3 | | | |
|---|---|---|---|
| Commenter | Proposed | Already Approved | Comment |
| **Response:** Several commenters agreed that the definition needs modification and the Drafting Team agrees and removed the second sentence from the definition. | | | |
| Southern | ☑ | | Make sure that the correlation to other standards is correct when making this change. |
| **Response:** We agree. The other standards will be examined. | | | |
| SCE&G and SERC ATCWG | ☑ | | |
| SPP | ☑ | | |
| WECC ATC Team | ☑ | | |
| MEAG Power | ☑ | | |
| MidAmerican | ☑ | | |
| MRO | ☑ | | |
| NYISO | ☑ | | |
| AECI | ☑ | | |
| APS | ☑ | | |
| CAISO | ☑ | | |
| IESO | ☑ | | |
| IRC | ☑ | | |
| ISO-NE | ☑ | | |
| ITC Transco | ☑ | | |
| Entergy | ☑ | | |
| Progress Energy | ☑ | | |
| Cargill | | ☑ | But change to, "A designated point, element or group of elements on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions." |
| **Response:** Because the Western Interconnection does not use an IDC, the drafting team felt it should be removed from the definition. Flowgates can also be used in different types of load flow analysis not just in the IDC and therefore we felt a more general definition was warranted. | | | |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Proposed** | **Already Approved** | **Comment** |
| PG&E | | ☑ | The alternative definition is confusing by including contingenies with transmission elements. It seems to assume that the contingencies that should be considered for each flowgate are fixed, but in reality, the contingencies that would have the most impacts on the power flow through a flowgate changes as the system change. |
| **Response:** Flowgates are not necessarily only a monitored element. The majority of monitored elements have a worst contingency that has the largest negative impact on the flows on that monitored element. When using flowgates to analyze a transmission system, instead of studying all contingencies for a monitored element, the worst contingency is coupled with the monitored element and is called a flowgate. It is true that the contingencies that would have the most impacts on the power flow through an element can change as a system changes. That is why it is important to reevaluate flowgates often. | | | |
| Grant County PUD | | ☑ | We start to create a problem if standards have their own meanings for a term. This creates an abiguity and needs to be avoided at all costs. |
| **Response:** The drafting team agrees. We are proposing changing the definition in the NERC Glossary which is used by all standards. | | | |
| Manitoba Hydro | | ☑ | Between the two definitions the second is clear enough to be used in a standard. Manitoba Hydro believes you could work on the proposed definition to improve it without changing the meaning. For example, the phrase "model MW flow impact relating to transmission limitations and transmission service usage" could be replaced with "model congestion through all Horizons"<br><br>I suggest that the team has erred in including the contingencies in the definition of the flowgate. The contingency may define what type of flowgate it is, e.g. OTDF as compared to PTDF, and will certainly define where the location of the flowgate is but it does not define what a flowgate is. A flowgate could be created by a planned/forced transmission outage, a planned/forced generator outage, or a by an interregional stability concern. It may be good practice to include the contingency in the naming of flowgates, e.g. x for loss of y, but in my opinion y is not part of the flowgate.<br><br>In defining a flowgate as a single transmission element or a group of transmission elements, I believe the team would be doing a great service to the industry by determining if one type of flowgate, single transmission element or group of transmission elements, is preferable. There is a concern that multi-facility flowgates provide less overall reliability (by their proxy nature) than single element flowgates. The team should also determine if and when it is appropriate to use proxy flowgates.<br><br>Finally I believe "that Transfer Distribution Factors are used to approximate MW flow on a Flowgate… " is actually a second definition (Flowgate Impact). The information is useful but extraneous when defining what a flowgate is. |
| **Response:** Because the Western Interconnection does not use an IDC, the drafting team felt it should be removed from the definition. Flowgates can also be used in different types of load flow analysis not just in the IDC and therefore we felt a more general definition was | | | |

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Proposed** | **Already Approved** | **Comment** |
| warranted. Flowgates are not necessarily only a monitored element. The majority of monitored elements have a worst contingency that has the largest negative impact on the flows on that monitored element. When using flowgates to analyze a transmission system, instead of studying all contingencies for a monitored element, the worst contingency is coupled with the monitored element and is called a flowgate. That is why when defining a flowgate the flexibility is given to include "any associated contingency(ies)". The Drafting Team feels the word contingencies is an industry accepted term that is defined in the NERC glossary as, "The unexpected failure or outage of a system component, such as a generator, transmission line, circuit breaker, switch or other electrical element." By using the term "Any associated contingencies", flexibility is given to allow a flowgate to be defined in such a way to keep the system reliable.<br>The second sentence is not a definition of flow impact. It was intended to show how the MW impact of a power transfer can be applied to a flowgate. The Drafting Team now feels this second sentence is superfluous and has removed it. | | | |
| MISO | | | Neither – The proposed definition and NERC definition creates the impression that any set of transmission elements could be used to make up a flowgate resulting in inconsistencies in flowgate usage between selling transmission service and curtailing transmission service. "Flowgates are pre determined set of constraints on the transmission system that are expected to experience loading problems in real-time. " This should result in neighbouring transmission providers using consistent set of flowgates for evaluating transmission service. The requirements should address making this list of flowgates and their parameters transparent. |
| **Response:** The drafting team is strengthening the coordination and transparency in the standards referring to flowgates. The revised proposed standards do address the transparency of flowgates and their parameters and also addresses the coordination of flowgates. | | | |

4. The drafting team believes that formal definitions are needed for the various time frames used in the standard. As a straw man, the drafting team would like to have industry comment on the proposed definitions below:

**Operating Horizon** — Time frames encompassing same-day and real-time periods.
**Scheduling Horizon** — Time frames encompassing the day-ahead period.
**Operations Planning Horizon** — Time frames beyond the Scheduling Horizon up to 13 months
**Long-term Planning Horizon** — Time frames beyond the Operations Planning Horizon

Do you think that the above terms need to be defined for use in this standard — and if you do, then do you agree with the proposed definitions?

☐ N/A — these terms do not need to be defined for use in this standard

☐ The terms do need to be defined and I do agree with the proposed definitions

☐ The terms do need to be defined but I don't agree with the proposed definitions

**Summary Consideration:**
There was no consensus on this issue and rather than define these terms, the drafting team defaulted to using the descriptive language and terms used by FERC in Order 890.

| Question #4 | | | | |
|---|---|---|---|---|
| **Commenter** | **N/A** | **Do need to be defined and do agree.** | **Do need to be defined but don't agree.** | **Comment** |
| CAISO | ☑ | | | We do not agree but if there is a need to reference time periods in the requirements, they should be specified in the requirements themselves and not as universal terms due to the lack of specificity in these. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| Duke Energy | ☑ | | | Need to define the precise time periods in Operating Horizon and Scheduling Horizon (i.e. 12:00 midnight, etc.) |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| Entergy | ☑ | | | Time frames (real-time; same day; day-ahead; and from day-ahead up to 13 months) as included in the standard are clear. There is no need to define these terms in this standard as these may conflict with the intent of these terms used in other standards. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| IRC<br>ISO-NE | ☑ | | | We do not agree but if there is a need to reference time periods in the requirements, they should be specified in the requirements themselves and not as universal terms due to the lack of specificity in these. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |

| Question #4 | | | | |
|---|---|---|---|---|
| **Commenter** | **N/A** | **Do need to be defined and do agree.** | **Do need to be defined but don't agree.** | **Comment** |
| MidAmerican | ☑ | | | MidAmerican is unable to find any of these terms in the standard as it's currently drafted.<br><br>If these terms are used in the standard, these terms should be revised to use 12 months or longer to refer to the long-term planning horizon and operations planning horizon for up to 12 months as used in other standards such as TPL-001 through TPL-004.<br><br>To the extent these terms *are* used in the standard, we believe the resolution of this question should be deferred until the standard is redrafted to be compliant with order No. 890.<br><br>If the proposed definitions are retained, it would appear that new definitions would be required for these terms:<br>– day-ahead<br>– real-time (Although this term is already defined in the NERC Glossary of Terms, the intent in MOD-001 may not match that existing definition.)<br>– same-day<br>– 13 months (This should be changed to 12 months to be consistent with the definition that is being clarified by TPL-001 through TPL-004.) |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| MISO | ☑ | | | These terms and frequency of calculations are business practices of each individual transmission provider. Defining these terms in the standard and only transmission providers using Network Response Method (AFC/ATC) calculations does not appear to be consistent with Order 890 requirements of consistency. The requirements should more along the lines of allowing each Transmission provider irrespective of the methodology used to make available business practices that describe the time horizons and frequency of calculations. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| NYISO | ☑ | | | |

| Question #4 | | | | |
|---|---|---|---|---|
| Commenter | N/A | Do need to be defined and do agree. | Do need to be defined but don't agree. | Comment |
| NCMPA | | ☑ | | Should the Scheduling Horizon be defined as "Time frames encompassing the *business* day-ahead period"? Most transmission customers schedule on Friday for Saturday, Sunday and Monday deliveries. Also, some transmission provider OASIS business practices recognize business days rather than calendar days. (e.g. Some TPs sell non-firm hourly transmission after noon for the next business day, which on Friday includes Saturday, Sunday and Monday.) |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| WECC ATC Team | | ☑ | | These definitions do not agree with the definitions identified in Order 890 (see P323) as follows:<br>Operating Horizon – day ahead and pre-schedule<br>Scheduling Horizon – same day and real-time<br>Planning Horizon – beyond the operating horizon<br>The fact that FERC and NERC do not agree on the definition of these terms confirms the need to formalize the definition. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| FRCC | | ☑ | | Requirement R11.5 should use the term " Long-term planning horizon" as defined above rather than " for use in the 13 months and longer time frame". |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| HQT | | ☑ | | Considerations should be made for the transition from the Scheduling and the operating. Exemple transition is performed each day at 16:00 |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| ODEC | | ☑ | | |
| IESO | | ☑ | | |
| KCPL | | ☑ | | |
| AECI | | ☑ | | |
| BPA | | ☑ | | |
| APPA | | | ☑ | This Standard does not need to redefine what the planners and operators |

| Question #4 | | | | |
|---|---|---|---|---|
| Commenter | N/A | Do need to be defined and do agree. | Do need to be defined but don't agree. | Comment |
| | | | | of the BES has already defined. The Regions, Reliability Coordinator, Planners and Transmission Operators have established what is the Planning Horizons (T >= 1 Year) and Operating Horizon (T< 1 Year). |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| APS | | | ☑ | To avoid confusion and future problems, the terms definitions should be consistent with Order 890. In which case, Operations and Long-Term Planning Horizons would not be broken out, rather would simply be "Planning Horizon." |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| ERCOT | | | ☑ | I am concerned that there may be multiple efforts underway on various SARs and Standards as well as the Operating Limit Definition Task Force that may be using variations of this concept. I do agree that a uniform understanding and set of terms for these timeframes would be useful and may help to avoid contradictions and confusion, but I am uncertain whether this standard is the place for this to be decided. They should not be offered as "definitions", which I understand the standards development process requires to become a part of the NERC Glossary. Perhaps the standard should clarify what is meant for the purposes of this standard, but it should not be proposed as official "definitions" which must apply in all standards.<br><br>In general, I believe that all of the horizons listed, with the exception of the "Scheduling Horizon" exist with some consistency of understanding (although not always with exactly the same durations specified). The Operations Planning "horizon" is typically discussed as representing from Real-Time through Day-Ahead and on up to one year. The "Planning Horizon" is typically discussed as representing one year and longer; this would correspond closely, but not exactly with the "Long-term Planning Horizon" proposed above. Some difficulty arises because many of the differing contractual agreements, organizational arrangements, and market rules define these terms differently at different locations. This may be true even for such arrangements which cross Regions or even Interconnections. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |

| Question #4 | | | | |
|---|---|---|---|---|
| Commenter | N/A | Do need to be defined and do agree. | Do need to be defined but don't agree. | Comment |
| Grant County PUD | | | ☑ | I would avoid the need to create more defined terms. Long lists of defined terms cause confusion and misunderstanding. Perhaps a simpler solution would be to use the term in the text, explain it there when it is first introduced, and then continue to use the term. This makes the document a little easier to read, and keeps the definition in context. It is my experience that in the effort to create a good document, we write at a level that is above many readers comprehension level. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| Manitoba Hydro | | | ☑ | In the Operations Planning Horizon, I believe that the word "up" should be removed. It is important to coordinate the length of the Horizons. This will allow all transmission providers to use similar assumptions when studying congestion on flowgates. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| ITC Transco | | | ☑ | For bettor or for worse, the Standards are now using violation mitigation time horizons. These include time horizons for "Long Term Planning," "Operations Planning," "Same Day Operations," "Real-Time Operations," and "Operations Assessment." The Transmission Planning Standards (notably TPL-001 through -004) have also had a near-term and a longer-term planning horizon to further segment the Long-term Planning Horizon. Rather that create yet another set of time horizons for this standard, NERC should consider standardizing the time horizons, or at least re-using some of them when they could suffice for a particular scenario. In this instance, it appears that the time horizons for MOD-001 could be made to work with the Time Horizons for violation mitigation with only a little bit of tweaking. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| MRO | | | ☑ | These terms should be used consistently across the standards and inserted in the NERC glossary. Having individual definitions in an individual standard will only lead to confusion. The Operations Planning Horizon should be less than one year. Other NERC standards such as TPL-001 through TPL-004 are established assuming that one year or more falls into the Long-term Planning Horizon. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| Progress Energy | | | ☑ | Differentiating between the Operating and Scheduling Horizons is unnecessary; There should only be one term for real time, current day, and next day operating periods. We would like to see "Operations" refer to |

| Question #4 | | | | |
|---|---|---|---|---|
| **Commenter** | **N/A** | **Do need to be defined and do agree.** | **Do need to be defined but don't agree.** | **Comment** |
| | | | | real time, today, and next day. "Operations Planning Horizon" should be changed to "Near-Term Planning Horizon". |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| Southern | | | ☑ | Scheduling and Operating definitions need to be swapped. These are defined in Order 890 paragraph 323. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |
| SPP | | | ☑ | We think terms need to be defined however they should be more general to allow for regional differences. |
| **Response:** At this point in time, the SDT has elected to use the horizons defined in order 890. | | | | |

5. Do you agree with the remaining definition of terms used in the proposed standard? If not, please explain which terms need refinement and how.

**Summary Consideration:**
Most commenters suggested that the following terms need improved definitions and rather than try and obtain consensus on new definitions, the drafting team has elected to eliminate these as 'defined' terms:

- Rated System Path Method
- Network Response Method
- Existing Transmission Commitments

No changes were made to the following proposed definitions:

- Available Flowgate Capability (AFC
- Flowgate
- Total Flowgate Capability (TFC)
- Transmission Reservation
- Transmission Service Request

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Agree** | **Disagree** | **Comment** |
| ERCOT | | | ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology. |
| **Response:** If ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| APPA | | ☑ | This Standard Drafting Team should not try to define terms that have been used by planners, operators, and Reliability Coordinators for many years. The terms Rated System Path (RSP) Method and Network Response (NR) Method have already been defined or described in many white papers for operators and planners. Why is the following an incorrect statement; "The method (RSP, NR, or Flowgate) will be determined by the method that the planners and operators use for that part of the Bulk Electric System." |
| **Response:** There was no consensus on the proposed definitions for Rated System Path and Network Response and the drafting team will not try to include these as defined terms. | | | |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Agree** | **Disagree** | **Comment** |
| BPA | | ☑ | The definition of Network Response Method does not convey any substantive characteristics that describe what it is, or how to distinguish the method from the Rated System Path Method. The definition for Rated System Path likewise is insufficiently described and appears to merely describe a method that relies on a calculation of TTC for one or more paths. Since both methods appear to be based on the same formula (ATC/AFC = TTC/TFC-ETC-TRM-CBM), it is unclear what the substantive distinction is between the two methods.<br><br>The Long-Term AFC/ATC Task Force April 14, 2005 report did not suggest that there were two fundamentally different methodological approaches to determining ATC. BPA recommends that the NERC ATC drafting team defer any efforts to refine the definitions of Rated System Path Method and Network Response Method until the standard requirements for calculating TFC, TRM, CBM and ETC are developed. |
| **Response:** There was no consensus on the proposed definitions for Rated System Path and Network Response and the drafting team will not try to include these as defined terms. | | | |
| KCPL | | ☑ | Available Flowgate Capacity: The definition should end at "Existing Transmission Commitments". If "retail customer service" should be included in ETC, then it should be in the definition and subsequent reliability standards for the development of ETC. |
| **Response:** The drafting team is not going to pursue definitions for 'Available Flowgate Capability' and 'Existing Transmission Commitments.' | | | |
| MISO | | ☑ | The definitions do not include TTC and ATC. All definitions related to this standard should be in a single place (TFC and AFC are defined). The Rated System Path method and the Network Response Method are both approaches for facilitating the processing of Transmission Service Request and need to be measured against similar requirements. |
| **Response:** The ATC data exchange requirements are in the next version of the standards and clarify the difference. There was no consensus on the proposed definitions for Rated System Path and Network Response and the drafting team will not try to include these as defined terms. Note that TTC and ATC are already defined and are in the NERC Glossary of Reliability Terms. | | | |
| Duke Energy | | ☑ | The definitions of Network Response Method and Rated System Path Method are too vague. |
| **Response:** There was no consensus on the proposed definitions for Rated System Path and Network Response and the drafting team will not try to include these as defined terms. | | | |
| Entergy | | ☑ | Definitions of Network Response Method and Rated System Path Method are not clear. It is not clear what is meant by "…customer Demand, generation resources, and the Transmission systems are closely interconnected" in Network Response Method, as they are always closely interconnected. This definition does not reflect that the Transfer Capability is calculated using response of the system or by simulating the impact of flows on the system. The Rated System Path Method appears to be using only the critical path |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Agree** | **Disagree** | **Comment** |
| | | | ratings. It is not clear how critical paths are determined and what ratings are used for those. Since there is no difference in calculation of ATCs by either Network Response Method or Rated System Path Method, there does not seem to be any need for including the definition in this standard. If these definitions are applicable only for TTC calculations, these terms should be defined and included in standard dealing with TTC (FAC-012). If included in FAC-012, these definitions should reflect clearly how calculations are performed under each method. |
| **Response:** There was no consensus on the proposed definitions for Rated System Path and Network Response and the drafting team will not try to include these as defined terms. | | | |
| MRO | | ☑ | a. The definition for AFC and ETC does not specifically refer to market flows. Are these considered a part of ETC or are they not to be included in the calculation of AFC? Please clarify where these are to be dealt with in the calculations. b. There is no specific reference to confirmed or non-confirmed transmission reservations in either AFC or ETC. Are these to be included in ETC? Please clarify the definitions in regard to such reservations. |
| **Response:** The requirements for ETC are embedded in the three standards that include the details for three different methods for calculating ATC (MOD-028, MOD-029 and MOD-030). The drafting team is not going to pursue a definition 'Existing Transmission Commitments.' The revised standards include more specific requirements for constraints in determining ETC and contain much more explicit requirements for determining AFC. | | | |
| Grant County PUD | | ☑ | I have no problems with the definitions themselves. I do stress again to avoid long lists of defined terms, since they make the document more difficult to read, and comprehend. One other point would be that if these terms are used in other standards, they could be defined slightly different causing confusion. |
| **Response:** There wasn't consensus on most of the proposed definitions, and the drafting team eliminated most of these. | | | |
| Progress Energy | | ☑ | The definition of ETC should include the phrase "including retail customer service" and then that parenthetical should be removed from the definition of ATC; Clarification is needed for the Network Response Method and Rated System Path Method to reconcile with the 1995 and 1996 documents. |
| **Response:** Retail customer service is included in Native Load uses. There was no consensus on the proposed definitions for Rated System Path and Network Response and the drafting team will not try to include these as defined terms. | | | |
| Southern | | ☑ | Define network response and rated system path method more implicit (wording and intent) to the methods of ATC and AFC. Look more to the explanations in the 96 documents (pp15). The present definitions for Network Response Method and Rated System Path Method are unclear and do not adequately describe the three methods in the standard. Throughout the document, the three methods are Rated System Path Method, Network Response ATC Method and Network Response AFC Method. The two terms were taken from the 1996 document. Network Response Method that is described in that document appears to reflect the AFC process. A suggestion would be to used the Network |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Agree** | **Disagree** | **Comment** |
| | | | Response Method for the AFC process and the Area Interchange Method (1995 document) for the ATC process. |
| **Response:** There was no consensus on the proposed definitions for Rated System Path and Network Response and the drafting team will not try to include these as defined terms. | | | |
| WECC ATC Team | | ☑ | The Network Response Method definition needs clarity and a stronger description.<br>The NERC Team indicates in Q7 that there is a difference between the Network Response Methodology-ATC and Network Response Methodology-AFC that is not yet apparent. If this is correct, a separate free standing definition would be warranted for each of the methodologies. |
| **Response:** There was no consensus on the proposed definitions for Rated System Path and Network Response and the drafting team will not try to include these as defined terms. | | | |
| SCE&G and SERC ATCWG | | ☑ | Clarification is needed for the Network Response Method and Rated System Path Method to reconcile with the 1995 and 1996 documents. As example, R1 is confusing using the definitions as stated in current draft. NRM has been applied to two separate calculations (FCITC and AFC). In R1, add "not used for AFC" following "Network Response Methodology" in the parenthetical. |
| **Response:** There was no consensus on the proposed definitions for Rated System Path and Network Response and the drafting team will not try to include these as defined terms. | | | |
| ODEC | | ☑ | |
| CAISO<br>IRC<br>ISO-NE<br>SPP | ☑ | | Remaining definitions: AFC, Network Response Method, Rated System Path Method, TFC, Transmission Reservation are OK. |
| **Response:** Many stakeholders disagreed with the proposed definitions for AFC, Network Response Method, Rated System Path Method and | | | |
| MidAmerican | ☑ | | The AFC definition is acceptable, but the equation in R4 does not match the definition. The equation in R4 should read:<br><br>AFC = TFC – TRM – CBM – ETC |
| **Response:** The revised standard that addresses AFC (MOD-030) does not include any formal equations. Here is one of the requirements being proposed in the set of standards to address ATC – the new requirements are much more explicit:<br>The Transmission Service Provider shall calculate Firm AFC by reducing the TFC by the sum of the firm Existing Transmission Commitments (ETCs), the Capacity Benefit Margin (CBM), and the Transmission Reliability Margin (TRM) allocated to the Flowgate. | | | |
| HQT | ☑ | | |
| IESO | ☑ | | |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Agree** | **Disagree** | **Comment** |
| ITC Transco | ☑ | | |
| Manitoba Hydro | ☑ | | |
| FRCC | ☑ | | |
| AECI | ☑ | | |
| APS | ☑ | | |
| NPCC CP9 | ☑ | | |
| NYISO | ☑ | | |

6. The proposed standard assigns all requirements for developing ATC and AFC methodologies and values to the Transmission Service Provider. Do you agree with this? If not, please explain why.

**Summary Consideration:** Most commenters seemed to agree. The group will look at ensuring compliance is measurable, as well as consider overall coordination and review requirements. MOD-001 was revised and the intent of MOD-001 is now distributed between 4 standards – with MOD-001 as an 'umbrella' standard, and each of the other three standards (MOD-028, MOD-029, MOD-030) addressing one of the three methods of determining ATC.

| **Question #6** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | As written the Standard is unclear and could not be audited for compliance. Numerous requirements have been omitted or written so incomplete that it is uncertain what a Transmission Service Provider is to do to provide a accurate ATC/AFC that is consistent with other TSPs. Requirements listed in MOD-001, particularly for flowgate, are the responsibility of the planners and operators for determining transfer capability. Many of the requirements, particularly for Flowgate are rules for determining ETC, not posting ATC values. |
| **Response:** The drafting team recognizes these concerns, and will endeavor to ensure that compliance can be addressed as the compliance elements are written. | | | |
| ERCOT | | ☑ | The transmission service provider seems appropriate, however, there is need for a broader oversight or review to coordinate. Without such an "umbrella" there is likely to be differing values calculated by different transmission service providers for the same parts of the transmission system. |
| **Response:** To improve the accuracy of the values calculated, this standard requires the Transmission Service Provider to share and/or coordinate the data used to determine ATC and AFC with other TSPs and affected entities. However, even with this level of coordination, the calculated values for ATC and AFC can inherently be different between TSPs due to the differing of inputs (i.e. transmission service that is sold). | | | |
| Progress Energy | | ☑ | The standard should assign all requirements for developing ATC to the TSP ; AFC is just an engine. But "YES", the TSP, regardless of the engine and/or inputs it uses, should be responsible for developing its ATC methodology. |
| **Response:** MOD-001 was revised and the intent of MOD-001 is now distributed between 4 standards – with MOD-001 as an 'umbrella' standard, and each of the other three standards (MOD-028, MOD-029, MOD-030) addressing one of the three methods of determining ATC. In MOD-030, there are requirements to convert AFC to ATC. | | | |
| Entergy | ☑ | | Since ATC and AFC calculations are performed for selling the Transmission Service (Capability) to customers based on the Open Access Transmission Tariff which is administered by the Transmission Service Provider, it makes sense to assign requirements for ATC and AFC calculations to Transmission Service Providers. |
| **Response:** Agreed. | | | |
| MISO | ☑ | | The standard is very generic for the ATC methodology/rated system path method. The standard does not provide for transparent and consistent computation of ETC which is the biggest driver in ATC/AFC calculations. To address the Order 890 requirements of consistency and transparency, the standard |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | needs to be methodology neutral. |
| **Response:** MOD-001 was revised and the intent of MOD-001 is now distributed between 4 standards – with MOD-001 as an ‘umbrella’ standard, and each of the other three standards (MOD-028, MOD-029, MOD-030) addressing one of the three methods of determining ATC. In MOD-030, there are requirements to convert AFC to ATC. MOD-029 contains requirements for the Rated System Path method of determining ATC and also includes related requirements for ETC. The modifications are aimed at meeting stakeholder comments as well as the directives in Order 890. | | | |
| FRCC | ☑ | | The B.A. and LSE should have obligations to provide the information in R6 i.e. dispatch order, forecasted loads, etc that are applicable. |
| **Response:** These supporting tasks are at a much lower level than the level envisioned in this set of proposed standards. The revised proposed set of standards for calculating ATC do not contain any requirements for the BA or LSE. | | | |
| Grant County PUD | ☑ | | This is consistent with the Functional Model. |
| **Response:** Agreed. | | | |
| ODEC | ☑ | | Transmission Provider should be calculating the ATC and AFC by following details standards from NERC/NAESB on how to perform this task. |
| **Response:** MOD-001 was revised and the intent of MOD-001 is now distributed between 4 standards – with MOD-001 as an ‘umbrella’ standard, and each of the other three standards (MOD-028, MOD-029, MOD-030) addressing one of the three methods of determining ATC. NAESB is working on associated business practices that include tasks such as posting documents. | | | |
| AECI | ☑ | | |
| APS | ☑ | | |
| BPA | ☑ | | |

| Commenter | Yes | No | Comment |
| MidAmerican | ☑ | | |
| MRO | ☑ | | |
| NCMPA | ☑ | | |
| NPCC CP9 | ☑ | | |
| NYISO | ☑ | | |
| Southern | ☑ | | |
| SPP | ☑ | | |
| WECC ATC Team | ☑ | | |

7. In Requirements 1 and 4, the standard drafting team has identified three methodologies in which the ATC and AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). Should the drafting team consider other methodologies? (Note that the difference between the Rated System Path methodology for calculating ATC and the Network Response methodology for calculating ATC use identical equations, but there are distinct differences between these methodologies that will become more clear when the drafting team issues its proposed changes to the standards that address Total Transfer Capability or Transfer Capability.) Please explain.

**Summary Consideration:** The team recognizes that there are questions and concerns regarding this question. MOD-001 was revised and the intent of MOD-001 is now distributed between 4 standards – with MOD-001 as an 'umbrella' standard, and each of the other three standards (MOD-028, MOD-029, MOD-030) addressing one of the three methods of determining ATC. This division of methodologies is supported by the language in FERC Order 693.

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ERCOT | | | ERCOT does not use these values in its operations. |
| **Response:** Agreed. However, if ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| PG&E | | | More detail on each of the methodology is needed for meaningful comment. I look forward to more information. |
| **Response:** Please see the revised set of ATC-related standards. | | | |
| APPA | | ☑ | 1. A Transmission Service Provider (TSP) function will only sell excess transmission capacity and not determine what methodology that is used to plan and operate the BES. How would a TSP come up with a different method when it is the planners and operators that determine a method?<br>2. Requirements 1 and 4 do not address the formula for determining non-firm ATC;<br>3. does not address if TSP is Monthly, Daily, or Hourly in Requirement 1;<br>4. and does not address how many values of Monthly Daily, and Hourly ATC should be posted.<br>5. In addition, Requirement 4 does not address how the TSP will determine an ATC from the AFC calculations? How will these be handled? |
| **Response:** 1. The team recognizes this concern, and revised the standard to clarify that the TSP must 'agree upon' the method with its Planning Coordinator and Reliability Coordinator.<br>2. Please see the revised standards for ATC – they do include requirements to differentiate between calculations for 'firm' and 'non-firm' ATC as proposed. | | | |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| 3. Please see the revised standards for ATC- the revised standards to provide specificity regarding the frequency for calculating ATC.<br>4. Posting of ATC values is handled by NAESB.<br>5. Please see the proposed standard that addresses AFC (MOD-030) – this standard does include requirements that address converting AFC to ATC. | | | |
| CAISO | | ☑ | We think those are the common used methodologies, we don't know of any others that are widely used.<br><br>However, we do not understand why AFC calculation must be tied with the Network Response methodology. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates themselves could become the Rated Paths.<br><br>Hence, we question the need for the qualifying statement – "using a Network Response Methodology" in parentheses, after "calculates AFC" in each of R4, R5 and R6. |
| **Response:** The intent of the AFC approach was to describe how a single request can impact multiple posted ATC values. Since a request made to a TSP using the Rated System Path methodology would only impact one posted ATC value, it does not make sense to associate the AFC with the Rated System Path methodology | | | |
| Entergy | | ☑ | There does not appear to be any difference for ATC calculations for Network Response Method and Rated System Path Method, therefore for the purpose of ATC calculations it does not matter how TTCs are calculated. If the difference will become clear in the TTC calculation method standard, then these definitions and methodologies should be included in that standard (FAC-012) and removed from this standard. There are clearly two methods of Transmission Capability calculations, ATC method and AFC method and only these should be included in the current standard. |
| **Response:** Agree. Please see the revised set of ATC standards – the requirements for calculating ATC using the Network Response Method are in MOD-028 – and the requirements for calculating ATC using the Rated System Path method are in MOD-029. Each of these standards contains much more detail in calculating ATC and no longer use 'formulas.' | | | |
| FRCC | | ☑ | The standard should allow a Transmission Provider flexibility to use different methodologies depending on seam and other factors. |
| **Response:** A TSP should be allowed to use more than one ATC approach so long as the same approach is utilized consistently for all customers on a given POR-POD path for a specific time horizon. This is stated more clearly in the revised MOD-001. | | | |
| Grant County PUD | | ☑ | However, the standard should be written in a way that if there are other methodologies, now or in the future, they could somehow be accomodated. This thought is based on the concept that the new methodology is defensible. |
| **Response:** The inclusion of any methodologies that are not identified in the final set of ATC standards must occur through the NERC standard development process. | | | |
| IRC | | ☑ | We think those are the common used methodologies, we don't know of any others that are widely used.<br><br>However, we do not understand why AFC calculation must be tied with the Network Response methodology. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates themselves could become the Rated Paths.<br><br>Hence, we question the need for the qualifying statement – "using a Network Response Methodology" in parentheses, after "calculates AFC" in each of R4, R5 and R6. |
| **Response:** The intent of the AFC approach was to describe how a single request can impact multiple posted ATC values. Since a request made to a TSP using | | | |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| the Rated System Path methodology would only impact one posted ATC value, it does not make sense to associate the AFC with the Rated System Path methodology | | | |
| ISO-NE | | ☑ | We think those are the common used methodologies, we don't know of any others that are widely used.<br><br>However, we do not understand why AFC calculation must be tied with the Network Response methodology. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates themselves could become the Rated Paths.<br><br>Hence, we question the need for the qualifying statement – "using a Network Response Methodology" in parentheses, after "calculates AFC" in each of R4, R5 and R6. |
| **Response:** The intent of the AFC approach was to describe how a single request can impact multiple posted ATC values. Since a request made to a TSP using the Rated System Path methodology would only impact one posted ATC value, it does not make sense to associate the AFC with the Rated System Path methodology | | | |
| Manitoba Hydro | | ☑ | think it is of paramount importance that only one methodology is used within an interconnection (i.e. the east and the west can use different methodologies but within each interconnection should only use one methodology). My reasoning for this is is tied to consistent assumptions. Each transmission privider will develop and study flowgates using a single methodology. If a neighbouring transmission provider is studying inpacts on that flowgate using a different set of assumptions or methodolgy then reliability would be inpacted. |
| **Response:** The drafting team has recognized two fundamentally different approaches to calculating ATC and believes these two approaches can be used in a reliable manner within the same interconnection. | | | |
| NYISO | | ☑ | We think those are the common used methodologies, we don't know of any others that are widely used.<br><br>However, we do not understand why AFC calculation must be tied with the Network Response methodology. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates themselves could become the Rated Paths.<br><br>Hence, we question the need for the qualifying statement – "using a Network Response Methodology" in parentheses, after "calculates AFC" in each of R4, R5 and R6.<br>The NYISO is concerned that the requirements identified in the standard may becoming to much of a 'how' vs. a 'what' needs to be done for reliability. The drafting team may not be able to satisfy all TSP and their associated Market Design requirements. |
| **Response:** The intent of the AFC approach was to describe how a single request can impact multiple posted ATC values. Since a request made to a TSP using the Rated System Path methodology would only impact one posted ATC value, it does not make sense to associate the AFC with the Rated System Path methodology | | | |
| ODEC | | ☑ | These three are enough… It would be preferable to have only one for standardization across the NERC footprint. |
| **Response:** The drafting team has recognized two fundamentally different approaches to calculating ATC and believes these two approaches can be used in a reliable manner within the same interconnection. | | | |
| Southern | | ☑ | 1. As discussed in ETC definition, ETC as currently defined is not applicable to the ATC calculation.<br>2. ETC should be replaced by firm and non-firm interface usage.<br>3. Also, ATC should be expanded into separate firm and non-firm ATC calculations.<br>4. Internal native load serving uses are not a component of ATC. |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | 5. Non-firm ATC should reflect that CBM (and often TRM) are not deducted and also should reflect the postback of unscheduled service.<br>6. Some discussion of adjustments for redirected service in interface usage amounts should be included.<br>7. Indication of whether TTC values reflect simultaneous or non-simultaneous values should also be included.<br>8. AFC should be expanded into separate firm and non-firm AFC calculations.<br>9. Non-firm AFC should reflect that CBM (and often TRM) are not deducted and also should reflect the postback of unscheduled service.<br>10. The formula seems to indicate TRM and CBM are MW values. Some TPs address TRM by derating TFC values by a percentage, such as 5%. Some discussion of this practice or alternate formulas for AFC for those utilizing this practice should be included. The alternate approach should include discussion of how TFC values are affected for both firm and non-firm AFC.<br>11. The formula does not include how counterflows are treated.<br>12. Since TFC is similar to a facility rating, not a (n-1) transfer analysis, the impacts of counterflows must be considered in calculating AFC and are therefore appropriate in an AFC calculation.<br>13. Similarly, some discussion should be included of how inadvertent flows from neighboring areas (loop flows) are considered.<br>14. An additional formula should be modified will be required to include the calculation of ATC from AFC.<br>15. Some discussion of what rating is used for TFC (static, Rate A, Rate B, ambient adjusted, etc.) is used in which horizons should be included. |
| **Response:** 1,2,6: Please see the detailed requirements relative to ETC in the proposed MOD-028, MOD-029 and MOD-030. The new requirements support the FERC directives relative to ETC.<br>3,5,8,9 :Please see the detailed requirements relative to the calculation of ATC and AFC in MOD-028, MOD-029 and MOD-030. The new requirements are much more explicit than those in the first draft of MOD-001.<br>4: Internal native load is not directly a component of ATC, but should be considered as part of ETC.<br>7: Please review the new set of proposed standards and let us know if you still feel that this distinction is necessary. | | | |
| SPP | | ☑ | We think those are the common used methodologies, we don't know of any others. |
| **Response:** Agree. | | | |
| WECC ATC Team | | ☑ | For purposes of MOD-01, the WECC Team does not believe the standing NERC / NAESB ATC Drafting Team should entertain any additional methodologies. Preclusion at this stage does not foreclose the future use of the NERC SAR process should a more efficacious approach arise from within the industry. |
| **Response:** Agree. | | | |
| BPA | | ☑ | |
| APS | | ☑ | |
| Duke Energy | | ☑ | |
| KCPL | | ☑ | |
| IESO | ☑ | ☑ | We are not suggesting that the SDT consider other methodologies. However, we do not understand why AFC calculation must be tied with the Network Response methodology only. Use of Flowgate, and determining TFC and calculating AFC on the identified Flowgates can be applied to the Rated System Path methodology as well. In this case, the Flowgates |

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | themselves could become the Rated Paths.<br>Hence, we question the need for the qualifying statement – "using a Network Response Methodology" in parentheses, after "calculates AFC" in each of the requirements R4, R5 and R6. |
| **Response:** The intent of the AFC approach was to describe how a single request can impact multiple posted ATC values. Since a request made to a TSP using the Rated System Path methodology would only impact one posted ATC value, it does not make sense to associate the AFC with the Rated System Path methodology | | | |
| MidAmerican | ☑ | ☑ | It should require that each of the three methodologies be standardized such that any provider utilizing that methodology can duplicate the results from the input data. |
| **Response:** It is the intent of the Drafting Team to ensure enough information is provided regarding the ATC calculations that this is possible. | | | |
| HQT | ☑ | | 1. R5, R6, R7 Companion's requirements for Rated system path are not specified<br>2. R1 requires that TTC/TFC be calculate first then ATC/AFC : TTC/TFC - TRM-CBM-ETC.<br>The TSP shall have the possibility to calcualte available Incremental ATC (IATC) ATC/AFC first based on ETC than TTC/TFC should equal: TTC = IATC+ETC.<br>3. R9 TSP methodology shall be consistently tied with the "path" and TSP may use different set of assumptions pending the time frame for which the TTC,ATC, etc are calculated |
| **Response:** 1. The requirements R5, R6 and R7 are not required to perform the ATC calculation associated with the Rated System Path methodology. (Note that the original MOD-001 has now been subdivided and expanded – the requirements for calculating ATC using the Rated System Path method are now in MOD-029)<br>2. Please see the revised set of standards – these contain much more detail on these calculations.<br>3. Please see the revised set of standards - the Rated System Path methodology for calculating ATC is addressed in MOD-029 in much more detail than originally proposed. Each of the three new standards contains its own set of requirements – and there are variations as you proposed. | | | |
| ITC Transco | ☑ | | The drafting team should consider other methodologies if they are aware of any entities using another methodology and achieving reliable results. |
| **Response:** Based on FERC directives, the Drafting Team was given the objective to minimize the number of methodologies utilized in the industry to promote consistency. If there are other methodologies successfully utilized in the industry, those entities are responsible to bring them to the NERC Drafting Team for consideration during this drafting process. | | | |
| MISO | ☑ | | Same comment as previously; to address the Order 890 requirements of consistency and transparency, the standard needs to be methodology neutral. |
| **Response:** The MOD's need to be methodology specific, and more details are included in the revised set of standards. The exchange of data among TSPs should be consistent and is addressed in the revised MOD-001. | | | |
| MRO | ☑ | | Contract Path Methodology should be considered. |
| **Response:** Please review the proposed standard for 'Rated System Path'. | | | |
| Progress Energy | ☑ | | All methodologies that are used to calculate ATC should be included in this standard. |
| **Response:** Based on FERC directives, the Drafting Team was given the objective to minimize the number of methodologies utilized in the industry to promote consistency. If there are other methodologies successfully utilized in the industry, those entities are responsible to bring them to the NERC Drafting Team for consideration during this drafting process. | | | |
| AECI | ☑ | | |

8. In Requirement 2, the Transmission Service Provide that calculates ATC is required to recalculate ATC when there is a change to one of the values used to calculate ATC-TTC, TRM, CBM or ETC. When TTC, TRM, CBM or ETC changes, how much time should the Transmission Service Provider have to perform its recalculation of ATC?

**Summary Consideration:** There was no consensus on this issue. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'.

| Question #8 | |
|---|---|
| **Commenter** | **Comment** |
| APPA | This will depend on if you are talking about Monthly, Daily, or Hourly ATC. If you are talking about Hourly ATC the change will need to be made quickly; however, if the ETC for Monthly changes the need to repost is not so important since the need for the Transmission capacity is much further into the future. |
| **Response:** Agree. | |
| APS | The Transmission Service Provider should have no more than an hour to perform its recalculation of ATC. In the west, the clock should only start after it is determined that the TTC needs changing. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| BPA | The transmission service provider should recalculate ATC contemporaneously with any formal changes in TTC, TRM or CBM. The transmission provider should recalculate ATC immediately upon any event that changes ETC in the Operating Horizon and scheduling horizon. The transmission provider should recalculate ATC within two business days of any changes in ETC that affect the Operations Planning Horizon or beyond. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| Entergy | Calculation and posting of ATC for Constrained Path is included in FERC Order 889 section 37.6(3)(i)(C)(2) as "The capability posted ……… must be updated when transactions are reserved or service ends or whenever the TTC estimate for the Path changes by more than 10 percent. Calculations and posting of ATC for Unconstrained Paths are included in FERC Order 889 section 37.6(3)(ii)(A) as " ….These postings are to be updated whenever the ATC value changes for more than 20 percent. " Therefore, calculation of ATC values on all paths when any of the components changes may not be required. If the ATC is recalculated and not posted it does not do any good. Timing of Posting on OASIS should determine when the ATC and AFC values should be recalculated. Since these timing requirements will be included in NAESB Business Practice Standard there is no need for a requirement R2 in MOD-001 for recalculation of ATC values. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| ERCOT | ERCOT does not have a transmission service market and does not use this methodology. |
| **Response:** Agreed. However, if ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits | |

| Question #8 | |
|---|---|
| **Commenter** | **Comment** |
| one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | |
| FRCC | The amount of time needs to correlate with the product and the timeframe effected. For example, an ETC change in future month 8 the length of time to update the posting should be days. If a line trips changing the TTC for the next day then the length of time to update should be hours. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| Grant County PUD | Specifying a time is difficult, since it is arbitrary. If the process is automated, it could be immediately. If it is manual, more time is needed. If extensive study is needed, it could take some time, especially if it has to be coordinated with another TSP. It should be as soon as reasonably practicable. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| HQT | Will depend on the Time Frame. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| IESO | No more than 1 hour. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| SPP | We think one day is reasonable in case TTC, TRM or CBM changes.<br>If ETC changes re-calculation should be done within 1 of 2 hours.<br><br>TTC typically only changes with upgrade of the flow gate element. TRM values change when the TP re-calculates the TRM values, twice a year or something like that. So TTC and TRM don't change on a daily basis, more on a Seasonal Basis. It can take SAS 70 related Change Control Approvals to get the values changed in the AFC databases. Getting approvals can take an hour or more if it is defined as an Emergency Change. After adding the new values to the AFC databases, it can take an hour or more before all Horizons are updated in Oasis Automation. The EMS AFC Calculator has to re-run all hours and days of the Horizons and that takes a little more than an hour. So starting from the time a new TRM or TTC value is submitted to TP, it can take a few hours before it is in Oasis and Oasis Automation. Also in many cases the Transmission owner doesn't immediately inform the TP of an upgrade the minute it happens, most of time a few days later. So it is in general not considered critical to immediately update the ATC and AFC values when TTC or TRM changes. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| IRC<br>ISO-NE | We think one day is reasonable in case of TTC, TRM or CBM changes.<br>If ETC changes, then re-calculation should be done within 1 or 2 hours. |

| **Question #8** | |
|---|---|
| **Commenter** | **Comment** |
| NYISO<br>CAISO | |
| **Response:** It is not clear why you should differentiate the reason for the change in ATC, but rather that a change in ATC has occurred. The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| KCPL | Recalculation of ATC may be in the OATT agreements and is not needed here. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| Manitoba Hydro | In an automated system, why wouldn't this be immediately (or as soon as the information is loaded into the system that calculates ATC/AFC. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| MidAmerican | The timing requirements of R2 should be the same as the timing requirements of R7. |
| **Response:** In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| MISO | The calculation frequency should be the same regardless of the calculation methodology. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| MRO | Once the TSP is aware that something has changed, then the TSP has to determine what changes in the components are appropriate via analysis which is often times off-line, then changes are perhaps incorporated into an automatic process for ATC postings. From the question it is the MRO's opinion that the Drafting Team is interested in getting a reading on the time required to post a change in ATCs once the amount of component change is determined. The entire process from the time that it is clear that a component needs to be changed to when new ATCs are posted typically takes two weeks. The time once the changes in the components are determined is typically a one day process. It is presumed that the latter time frame is the time frame in which the Drafting Team is interested. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| ODEC | It needs to be a short time, but reasonable to meet for the TSP. I would say 15 minutes or less. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| Progress Energy | For ATC calculations and posting of next-hour up through the next 14 days, the TSP should be given one hour to recalculate it's ATC and then it should post the new value as soon as practicable. For all longer term ATC calculations (e.g. 15 days out and further), ATC calculations and posting should have more time. |
| **Response:** The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on 'changes to inputs'. | |
| Southern | We agree with this requirement for ATC. We do not agree that TTC should be recalculated whenever a parameter |

| Question #8 | |
|---|---|
| **Commenter** | **Comment** |
| | changes. |
| **Response:** This question is related to timing of recalculation of ATC. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on ‘changes to inputs’. | |
| WECC ATC Team | The WECC Team concurs that ATC should be recalculated anytime there is a change to any of the ATC variables. However, once the ATC is recalculated, the periodicity of posting the ATC is a business practice that should be deferred to NAESB. |
| **Response:** Agree. The frequency of updates should be consistent, regardless of methodology. In the revised MOD-001, the drafting team provided a minimum frequency for recalculating ATC without focusing on ‘changes to inputs’. | |

9. Do agree you with the frequency of exchanging data as specified Requirement 6?

**Summary Consideration:** There was no consensus on the appropriate frequency for exchanging data. One of the goals of this standard is to significantly increase the coordination between all Transmission Service Providers. Sharing data between providers is one of the keys to make this happen. If any transmission provider feels it should have data from one of its neighbors, the neighboring TSP should make all efforts to share this data with a frequency that makes the data useful.
The drafting team modified the data sharing requirement to clarify that the **all** TSPs must share data, not just those TSPs that are using the AFC methodology, but did not include a specific time constraint for this exchange. Additional specificity on timing of the data to be exchanged may be included in future drafts.

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APS | | | Not applicable. |
| ERCOT | | | ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology. |
| **Response:** If ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| Duke Energy | | | Frequency should be as agreed upon or 30 days. |
| **Response:** Exchanging hourly AFC values every 30 days doesn't seem to make much sense. Some data needs to be provided at a more frequent interval. | | | |
| WECC ATC Team | | | The question is specific to entities using the AFC methodology and should be reserved for comment by those entities. |
| **Response:** All entities are encouraged to provide comments that will assist the drafting team in developing this standard. Many entities that don't use an AFC methodology may be impacted by that methodology. | | | |
| BPA | | ☑ | Requirement 6 appears to only apply to a transmission service provider that calculates AFC. BPA declines comment on this provision until such time as the distinction between the various methods becomes more clear. (see response to question #5.) |
| **Response:** All entities are encouraged to provide comments that will assist the drafting team in developing this standard. Many entities that don't use an AFC methodology may be impacted by that methodology. | | | |
| Entergy | | ☑ | A limit of 7 days does not appear real. The Data Exchange should be on an agreed upon schedule as some data like line and generation outages, if exchanged within 7 days may not be of any use for calculations of real time or day ahead ATCs and AFCs. Since the data is exchanged for coordinating |

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | ATCs and AFCs it should be left to the entities that need this information to develop frequency of daa exchange rather than this standard putting some upper limit. In addition, current Requirement 6 applies only to Transmission Service Providers using AFC Method. Data need to be exchanged for ATC calculation also for coordination with the neighboring systems. Several items in Requirement 6 are applicable to ATC calculation such as TTC, ETC etc. This is especially true if a Transmission Provider is using a Network Response Method for calculation of ATC values. |
| **Response:** Your comments are very valid. The requirement has been reworded to include all TSPs that use any method of calculating ATC and the list of data to be exchanged between TSPs is identical.. | | | |
| FRCC | | ☑ | General requirement of (7) calendar days referenced in general requirement R6 is inconsistent with the individual requirements contained in R6.1.-r6.10 which often reference specific time frames example R6.10 says " when revised once per hour" or R6.2 that states " as changes occur." |
| **Response:** Your comments are very valid. The requirement has been reworded to include all TSPs that use any method of calculating ATC and the list of data to be exchanged between TSPs is identical. There was no consensus on how often data needs to be exchanged and the drafting team is trying to get agreement on what data needs to be exchanged before adding more requirements on how often the exchange must take place. | | | |
| ISO-NE | | ☑ | While the seven days timeframe may be appropriate, the requirement's lack of specificity for the start of this timeframe (i.e. Before changes, after a change, after seven days from an agreement) is confusing. Is "as agreed upon" acceptable if it is greater than every seven days? |
| **Response:** Your comment is very valid. The reference to 7 days was confusing and has been omitted in the revised standard. The requirement has been reworded to include all TSPs that use any method of calculating ATC and the list of data to be exchanged between TSPs is identical.. | | | |
| MidAmerican | | ☑ | In the Eastern Interconnection, the timing requirements of R6 should match the related timing requirements of the MISO/MAPP/PJM/SPP/TVA SOAs/JOAs. |
| **Response:** The requirement has been reworded to include all TSPs that use any method of calculating ATC and the list of data to be exchanged between TSPs is identical. Please advise us if the revised requirement causes a conflict. | | | |
| MISO | | ☑ | The frequency does not allow for any analysis before the ATC/AFC values are posted to the OASIS. The requirements should be more along the lines of using same ATC/AFC values and providing the same to the neighbouring transmission providers. |
| **Response:** The comment is a very valid. The requirement has been reworded to include all TSPs that use any method of calculating ATC and the list of data to be exchanged between TSPs is identical.. | | | |
| MRO | | ☑ | If the Transmission Service Reservation information can be provided every hour why can not the requirements of R6.5, R6.6, and R6.7 be revised to provide hourly reporting as well? |
| **Response:** The requirements for updating flowgates are now contained in MOD-030. There was no consensus on how often data needs to be exchanged and the drafting team is trying to get agreement on what data needs to be exchanged before adding more requirements on how often the exchange must take place. | | | |
| SCE&G and SERC ATCWG | | ☑ | It is unclear whether data exchange is for forward looking or historical time periods. The requirement for beginning data exchange within 7 days is ambitious. A realistic time frame would be 90 days if it is forward-looking. |

| Question #9 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| **Response:** The reference to 7 days is confusing and is not contained in the revised standard. There was no consensus on how often data needs to be exchanged and the drafting team is trying to get agreement on what data needs to be exchanged before adding more requirements on how often the exchange must take place. | | | |
| Progress Energy | | ☑ | The intent of R6 is unclear. It is unclear whether data exchange is for forward looking or historical time periods. The requirement for beginning data exchange within 7 days is ambitious. A realistic time frame would be 90 days if it is forward looking. |
| **Response:** The reference to 7 days is confusing and is not contained in the revised standard. There was no consensus on how often data needs to be exchanged and the drafting team is trying to get agreement on what data needs to be exchanged before adding more requirements on how often the exchange must take place. | | | |
| IESO | ☑ | ☑ | We agree with the frequency of exchanging data as specified in Requirement 6. However, we do not agree with the sub-requirement 6.5.<br>Not all TSPs perform load forecasting. They should not be required to provide this information. Beside, load forecast information is already included in the base model a TSP uses in calculating AFCs. This is met by virtue of meeting R6.4. |
| **Response:** The response to this is conditional upon finding out the frequency of update on the base model. Is the load forecast and model used a seasonal, monthly, weekly, or daily update? Updating uses of the transmission system, either with a model or data the goes into the model needs to be done. | | | |
| Southern | ☑ | ☑ | The posting and reposting of data in the OASIS system needs to be taken out of this standard and requirements be put into NAESB standards. Most of this we already do. G&T outages on SDX, dispatch order would be new, power flow model on request, load forecast will be posted on OASIS, Flowgates OK, TFC-our ratings are provided in our cases today, ETC=TSRs is on OASIS] Question: Is R6 dictating duplication of already available information in a different format?<br><br>Also, does 6.8 require 168 models to be created each hour, or just changes in 168 hours of AFC values based upon changes in transmission service requests? Same question for daily. The document refers to OASIS several times. Why specify update intervals here rather than simply referring to FERC OASIS requirements or NAESB business practices? This sets up possible conflict. There is no reliability driver for these particular update frequencies. |
| **Response:** R6 does not address the OASIS system in any manner. R6 is meant to require the sharing of data from the provider to entities that need the data. R6.8 is meant to be AFC values on that provider's flowgates. The requirement to exchange AFC is not in the revised standard for calculating AFC. In the revised set of standards, there is a timing requirement for posting AFC and ATC – and a separate requirement for 'exchanging data' between TSPs. If you are already providing data to a specific location and someone needing that data can get it from that same location, you can agree to use that location as a means to provide the data. The drafting team is working closely with NAESB to ensure that there is no duplication in the final, combined set of reliability standards and business practices. | | | |
| APPA | ☑ | | The need to exchange data will depend upon which component is changing. If the TTC or TFC is changing in the operating time horizon the Reliability Coordinator will need to exchange this information quickly to several Reliability Functions including Transmission Service Providers. Again in the operating time horizons if the ETC, CBM, or TRM changes the Transmission Service Providers |

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | need to recalculate ATC and post this new information quickly to keep the Transmission Customers updated in the quick moving operating horizon. |
| **Response:** The question is not answered in the response, but the drafting team agrees with the comments. | | | |
| CAISO | ☑ | | While the seven days timeframe may be appropriate, the requirement's lack of specificity for the start of this timeframe (i.e. Before changes, after a change, after seven days from an agreement) is confusing.  Is "as agreed upon" acceptable if it is greater than every seven days? |
| **Response:** Your comment is very valid.  The reference to 7 days is confusing and is not contained in the revised standard.  There was no consensus on how often data needs to be exchanged and the drafting team is trying to get agreement on what data needs to be exchanged before adding more requirements on how often the exchange must take place. | | | |
| Grant County PUD | ☑ | | As long as this is not overly burdensome on smaller TSPs. |
| **Response:** The standard's requirements are not linked to size. | | | |
| IRC | ☑ | | While the seven days timeframe may be appropriate, the requirement's lack of specificity for the start of this timeframe (ie. Before changes, after a change, after seven days from an agreement) is confusing.  Is "as agreed upon" acceptable if it is greater than every seven days? |
| **Response:** Your comment is very valid.  The reference to 7 days is confusing and is not contained in the revised standard.  There was no consensus on how often data needs to be exchanged and the drafting team is trying to get agreement on what data needs to be exchanged before adding more requirements on how often the exchange must take place. | | | |
| NYISO | ☑ | | While the seven days timeframe may be appropriate, the requirement's lack of specificity for the start of this timeframe (i.e. Before changes, after a change, after seven days from an agreement) is confusing.  Is "as agreed upon" acceptable if it is greater than every seven days? |
| **Response:** Your comment is very valid.  The reference to 7 days is confusing and is not contained in the revised standard.  There was no consensus on how often data needs to be exchanged and the drafting team is trying to get agreement on what data needs to be exchanged before adding more requirements on how often the exchange must take place. | | | |
| SPP | ☑ | | The requirement's are very general and don't specify data exchange before changes, after a change, after seven days from an agreement.  It is not clear if "as agreed upon" is acceptable if it is greater than every seven days. |
| **Response:** The reference to 7 days is confusing and is not contained in the revised standard.  There was no consensus on how often data needs to be exchanged and the drafting team is trying to get agreement on what data needs to be exchanged before adding more requirements on how often the exchange must take place. | | | |
| AECI | ☑ | | |
| HQT | ☑ | | |
| ITC Transco | ☑ | | |
| KCPL | ☑ | | |
| Manitoba Hydro | ☑ | | |

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ODEC | ☑ | | |

10. Requirement 9 indicates that the Transmission Service Provider shall have and consistently use only one methodology for the Transmission Service Provider's entire system in which the ATC or AFC are calculated (Rated System Path — ATC, Network Response — ATC and Network Response — AFC, methodologies). If choosing just one of these methods is not sufficient for your system, please explain why.

**Summary Consideration:** The Standards Drafting Team (SDT) has reconsidered the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001 posting and revised the requirement. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses but must have agreement on the method or methods with its Planning Coordinator and Reliability Coordinator.

| Question #10 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | This Standard is written to make the industry believe that only one ATC will be calculated for each Transmission Service Provider. In reality, the TSP will post several ATCs; one ATC for each path or network the TSP is marketing transmission capacity. Each individual path or network will only use one method, but a TSP's planners may use different methods to plan and operate different paths in their system. MISO and PJM are entities that use two methods to market transmission capacity in its system. They only uses AFC at the borders or seams of their system to determine how much transmission capacity is available at their seams, while they use LMP to determine how much transmission capacity is available on their interior system. BPA will use flowgates to determine how much ATC is available to its Transmission Customer on the interior of their system, while BPA uses Transfer Path on its seams to determine how much transmission capacity is available to Transmission Customers exterior to their system. |
| **Response:** The standard was revised to clarify that each TSP calculates ATC for each constrained path or AFC for each constrained flowgate/cutplane. TSPs will be permitted to use as many of the proposed methods as the TSP chooses, however, the TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| BPA | | ☑ | The substantive differences between the three aforementioned methods are not yet clear. However, if multiple methods are determined to be valid and acceptable approaches to calculating ATC/AFC, then the transmission provider should be able to employ multiple methods for calculating ATC/AFC on different parts of the transmission system, provided the various methods are applied consistently and are transparent. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, the TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| CAISO | ☑ | | Comments: We question why the SDT requires this single methodology. The SDT should provide an explanation of the reliability problem(s) associated with applying more than one methodology as long as any methodology used is used consistently with transparency. |

| Question #10 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | *E.g. - CAISO currently uses one method on its ties (rated path)to other TSPs and one method for internal (network response). Additionally, for ties if adjacent TSPs use differing methodologies, the rating would not agree, so are we looking at a situation where one methodology may have to be used for each interconnection?*<br><br>*The CAISO agrees with the WECC MIC MIS ATC Task Force that this requirement should be eliminated or the word sole removed.* |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| Cargill | | | No comment. |
| Duke Energy | | | One methodology is sufficient for Duke Energy. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| Entergy | | | Only one method for calculation of ATC or AFC should be used for each system so that there is consistency between the method used for approving transmission service requests and for planning and operation of the system as required in R 11.2. In case more than one method is used it will be difficult to make these methods consistent. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| ERCOT | | | ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology. |
| **Response:** If ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process. | | | |

| Question #10 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| FRCC | ☑ | | ifferent method are needed to address seams issues between areas that select different methodologies, different methods may be applicable to different interfaces etc. The transmission provider should have the flexibility to select the appropriate method. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| Grant County PUD | | ☑ | Its hard to answer this question without more detail to the ATC calculations. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| HQT | | ☑ | Methodology choice shall be solely based on the system topology and the path requirements. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used.. | | | |
| IESO | ☑ | ☑ | See comments under Q7 on Rated Path Methodology – AFC (not included in the 3 methods). |
| **Response:** See the response to your comments on Question 7. | | | |
| IRC | ☑ | | We question why the SDT requires this single methodology. The SDT should provide an explanation of the reliability problem(s) associated with applying more than one methodology.<br><br>*E.g. - CAISO currently uses one method on its ties (rated path)to other TSPs and one method for internal (network response). Additionally, for ties if adjacent TSPs use differing methodologies, the rating would not agree, so are we looking* |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |

| Question #10 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ISO-NE | ☑ | | We question why the SDT requires this single methodology. The SDT should provide an explanation of the reliability problem(s) associated with applying more than one methodology. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| KCPL | | ☑ | |
| Manitoba Hydro | | | Requirement 9 should be interconnection wide. TSPs do not only calculate ATC on their own systems, they calculate inpacts on a set of flowgates on neighbouring systems. Using a differing methodology would needless impact reliability on those systems. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| MidAmerican | | ☑ | A single methodology should be required not only within each TSP's system, but across a larger footprint, such as an RRO. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| MISO | | | If the questions is one method only for one TP, the answer is no. Due to contract obligations between transmission providers, there is a need to maitain a few contract paths while maintaining Network response method for AFC/ATC calculations. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| MRO | | | Transmission Service Provider may use contract Path methodology in addition to one of the methods provided in the proposed NERC standard. |
| **Response:** If MRO uses a method not captured in this proposed standard, please explain such method to the SDT. | | | |
| NYISO | ☑ | | We question why the SDT requires this single methodology. The SDT should provide an explanation of the reliability problem(s) associated with applying more than one methodology. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one | | | |

| Question #10 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ATC/AFC method in the original MOD-001. | | | |
| Progress Energy | | | One methodology should be used for the TSP's system. Change "its sole" to "a single" or to "one". Also, the standard should have only one requirement that defines the when and where of ATC methodology ; If you want the same process to be applied across the TSP's whole system and across all time horizons then say that plainly in one requirement instead of splitting the where and when between R9 and R11. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| SCE&G and SERC ATCWG | | | Change "its sole" to "a single" or to "one." The statement in the question above is clear — the language of the requirement was not as clearly stated. |
| **Response:** The Standards Drafting Team (SDT) has reconsidered the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001 posting and revised the requirement. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there will be a requirement that each TSP choose one method for each path/flowgate/cutplane. | | | |
| Southern | | | One methodology is sufficient. For ATC, although there mat be situations where multiple approaches are appropriate to address radial vs. interdependent portions of a system. Also, flexibility may be required in calculating TTC. For example posting non-simultaneous values on radial interfaces and simultaneous values on interdependent paths. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| SPP | ☑ | | We convert AFC to ATC numbers on OASIS, however we start off from AFC numbers that are calculated using one and same methodology. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| WECC ATC Team | | | This requirement is unnecessary and should be deleted. If the NERC team will not delete the Requirement, at minimum the word "sole" must be deleted from the Requirement.<br>If, for example, a TSP has operational needs that dictate the use of the AFC Methodology for paths within its network and the Rated System Path for interfaces with its neighbors, either of these |

| Question #10 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | methodologies is allowed under MOD-01. So long as the TSP consistently and transparently applies any of the NERC approved methodologies to it facilities and communicates that application to all appropriate entities, this approach should be allowed as it has met FERC's core purposes without disrupting operations.<br>In contrast, this constrictive approach over reaches the FERC mandate of consistency and transparency, increases the potential for seams between interchanges and otherwise imposes a burden to alter operations where no remedy is needed.<br>In support of the WECC Team's position:<br>FERC found in Order 890 that "the potential for undue discrimination stems from two main sources: (1) variability in the calculation of the components that are used to determine ATC and (2) the lack of a detailed description of the ATC calculation methodology and the underlying assumptions used by the transmission provider." P. 209. Neither of these concerns is at issue should a TSP use more than one NERC authorized methodology.<br>Further, FERC found that so long as "all of the ATC components and certain data inputs and assumptions are consistent, the three ATC calculation methodologies being finalized by NERC through the reliability standards development process will produce predictable and sufficiently accurate, consistent, equivalent, and replicable results. It is therefore not necessary to require a single industry-wide ATC calculation methodology. *The Commission instead concludes that use of the ATC calculation methodologies included in reliability standards currently being developed by NERC is acceptable."* P. 210. |
| **Response:** The Standards Drafting Team (SDT) has removed the requirement that each Transmission Service Provider (TSP) use only one ATC/AFC method in the original MOD-001. While one methodology may be sufficient for a TSP, limiting all TSPs to use of only one method for their systems may hinder reliability. Therefore, TSPs will be permitted to use as many of the proposed methods as the TSP chooses; however, there is a requirement that each TSP must have agreement with its Planning Coordinator and Reliability Coordinator on which method or methods will be used. | | | |
| AECI | ☑ | | |
| APS | ☑ | | |

11. Do you think that Requirement 13 in this proposed standard is necessary?

R13. If the Transmission Service Provider approves a Transmission Service Request using a value other than and less than its value for ATC or AFC, then the Transmission Service Provider shall identify how it calculated the lesser value.

**Summary Consideration:** The drafting team has removed this requirement, as Order 890 seems to already address the issue.

<table>
<tr><th colspan="4">Question #11</th></tr>

| Question #11 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | necessary for the Transmission Service Provider to post when showing the values of the components that was used to calculate the number for ATC. MOD-001 is only for the rule of calculating ATC, i.e. maximum time between calculations and rules for recalculations; and posting ATC values and posting values and assumptions for the components. Rules for the components are in other standards. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| IRC<br>CAISO<br>ISO-NE | | ☑ | Approving a request with insufficient AFC might happen for next hour Non-Firm if available flow gate capacity in real time justifies accepting a Non-Firm request, while Non-Firm AFC (that still has some unused Reservations included in end-result) is insufficient. This is a common practice and should not have to be documented (justified) after the fact.<br><br>It might happen also if a re-dispatch agreement is accepted by a TP that requires a Transmission Customer to re-dispatch a certain amount to cover for the negative AFC created on flow gate by accepting Reservation. This is documented by the TP.<br>Approving a service request at a value less than the ATC or AFC is a commercial issue, which does not affect reliability. This issue should be addressed in the Business Practice. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| BPA | | ☑ | BPA does not understand requirement 13 as written. A transmission provider would normally approve a transmission request if transfer capability required by the request is LESS than the value of ATC available. If the transmission provider approves a request using a value for ATC lower than posted ATC, then the transmission provider should not have to identify or explain its actions. On the other hand, it would make sense to require an explanation if a transmission provider approves a transmission request using a value for ATC that is HIGHER than the value of ATC that is posted. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| Duke Energy | | ☑ | Delete Requirement 13. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| ITC Transco | | ☑ | The requirement is curious. If a service request is approved, who cares if the Service Provider used an ATC/AFC lower than its posted ATC/AFC? I'd be more concerned about a TSR that was rejected because of a lower ATC/AFC, and would want to know how the TSP calculated the lesser value. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| Grant County PUD | | ☑ | No one would have an issue if the Transmission Service Requests are approved. When they are denied justification needs to be made. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |

| Question #11 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| | | | |
| IESO | | ☑ | Requirement 13 is not required. Approving a service request at a value less than the ATC or AFC is a commercial issue, which does not affect reliability. This issue can be addressed in the Business Practice. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| MISO | | ☑ | This requires policing the tags after the fact, and really has nothing to do with the calculation of ATC/AFC. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| Southern | | ☑ | This was put in here to cover the AFC's AFTFC (?). If this requirement stays in the standard, a suggested rewording is needed. A value "less than" automatically implies a value "other than." The requirement states, "If the TSP approves a TSR...." What if the TSP denies a TSR? This reads like a policy, not a reliability requirement. TSPs already have requirements under the OATT to provide justifications from approving/denying service. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| SPP | | ☑ | It might happen for next hour Non-Firm if available flow gate capacity in real time justifies accepting Non-Firm request, while Non-Firm AFC (that still has some unused Reservations included in end-result) is un-sufficient. This is a common practice and should not have to be documented (justified) after fact.<br><br>It might happen also if a re-dispatch agreement is accepted by TP that requires a Transmission Customer to re-dispatch a certain amount to cover for the negative AFC created on flow gate by accepting Reservation. This is documented by TP. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| Progress Energy | | ☑ | |
| Entergy | ☑ | | Transmission Service Provider may allocate capability of transmission element to different users based on their ownership interest and any other agreements. This requirement allows use of different ATC or AFC values based on such arrangements. However, it does not have to be limited to only lesser of the calculated value used for approving Transmission Service Request. In case a Transmission Service Provider is using higher than the calculated value (in some emergency cases, TP may use emergency rating of limiting line/equipment which may result in higher than the normal calculated ATC value), it may be putting the reliability of the system at risk. Therefore, the Transmission Service Provider should identify how it determines ATC values for approving Transmission Service Requests if those are different from the calculated values, whether higher or lesser than the calculated value. |

| Question #11 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| FRCC | ☑ | | There is a strong reliability need for this. It is believed that the word " posted" needs to be inserted in front of the word value in the statement " other than and less than its value" i.e. the statement should read " other than and less than its posted value." |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| KCPL | ☑ | | Please consider changing "identify how it calculated" to "provide the basis for calculating" in the R13 Reliability Standard. I think it is more important to know why the value changed rather than how the value changed. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| MidAmerican | ☑ | | The phrasing of R13 should be clarified. As currently drafted, it reads:<br><br>If the Transmission Service Provider approves a Transmission Service Request using a value other than and less than its value for ATC or AFC, then the Transmission Service Provider shall identify how it calculated the lesser value.<br><br>MidAmerican believes this is intended to mean, and should be clarified to say:<br><br>If the Transmission Service Provider denies a Transmission Service Request for less than its value for ATC or AFC (or for less than its share of ATC or AFC on reciprocal coordinated flowgates), then the Transmission Service Provider shall identify why the service was denied. This calculation methodology should also be posted. |
| **Response:** The drafting team has removed this requirement, as Order 890 seems to already address the issue. | | | |
| AECI | ☑ | | |
| HQT | ☑ | | |
| MRO | ☑ | | |
| NCMPA | ☑ | | |

12. Do you agree with the other proposed requirements included in the proposed standard? If not please explain with which requirements you do not agree and why.

**Summary Consideration**: There were many suggestions to modify the requirements in MOD-001. MOD-001 was revised and the intent of MOD-001 is now distributed between 4 standards – with MOD-001 as an 'umbrella' standard, and each of the other three standards (MOD-028, MOD-029, MOD-030) addressing one of the three methods of determining ATC. Each of the three standards that addresses one of the methods of determining ATC also includes related requirements for TTC (or TFC) and ETC.

Many stakeholders indicated that R14 should be removed and the drafting team did remove this requirement.

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | Many of the requirements listed in MOD-001 are requirements needed in the Standards that set the rules for TTC, TFC, CBM, TRM, and ETC. The characteristic of each component will be made available to the industry if the Standards for the components are written properly. If MOD-001 is written in a manner that requires those characteristic to be provided to the TSP and require the TSP the post characteristics the SDT will meet its obligations.<br><br>R14 should be eliminated. Requiring the same ultimate source and ultimate sink on the Transmission Service Request and the Interchange Transaction Tag will harm commercial use of transmission service. It will force transmission users to redirect transmission service on OASIS every time a source or sink changes, even within the same control areas, while providing little, if any, benefit for reliability. If the drafting team feels this requirement is still needed, it should be passed to NAESB for inclusion as a business practice. |
| **Response:** General: The drafting team agrees.<br>R14: The drafting team removed R14. Note that Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so eventually we will need to add a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). | | | |
| APS | | ☑ | The requirements in R11.2, R11.3, R11.4, R11.5 and R12 do not apply to entities that use the Rated System Path method and should not apply to their ATC calculations. For those that use the Rated System Path method these requirments should apply to the TTC calculations. |
| **Response:** The drafting team agrees that these requirements do not apply to ATC calculations for Rated System Path method. Please see the revised set of standards – the requirements for the Rated System Path method are now contained in MOD-029. | | | |
| BPA | | ☑ | See BPA's response to question 19. |
| **Response:** See drafting team response to Q19. | | | |
| CAISO | ☑ | ☑ | R6.8.1 We are not re-sinking 7 days of hourly values every hour, however the way Oasis Automation |

Does this refer to outages or the contingency elements of flow gates. |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | R14 Over stringent, particular if AFC aren't calculated to the level or scope of granularity. |
| **Response:** R6.8: The requirement is to recalculate and update the AFC once per hour for the rolling 168 hours with updated information.<br>R6.8.2 and R6.8.3. The requirements are to recalculate the different products at specific frequency. Although the frequency is the same, the products are not and may be subject to different requirements for determining TRM, CBM, or ETC.<br>R6.9: The revised standard does not list ETC as one of the types of data that must be exchanged between TSPs.<br><br>R6.10: The requirement to exchange transmission service reservation information remains in the revised standard, but the timing element of the original requirement (to provide this once per hour when revised) has been removed<br>R7: The standard was revised and no longer includes specific timing requirements for using the updated data.<br><br>R11.2: This requirement was modified and is now addressed more specifically in each of the new standards that identifies the requirements for one of the three ATC calculation methodologies (MOD-028, MOD-029, MOD-030). Please see the proposed standards.<br>R14: The drafting team removed R14. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice. | | | |
| HQT | | ☑ | Refer to 7<br><br>R12 – First, this requirement should be placed under R11, because R11 contains the items that must be 'identified' in the TSPs ATC methodology<br><br>Second, exchanging data with neighboring TSPs is important only if the data held by one TSP is necessary for another TSP to calculate its ATC. Therefore, R12 should be redrafted to read as follows:<br><br>•"Identify any other Transmission Service Providers from which data is received for use in calculating its ATC or AFC"<br>Data exchanges that are required as part of the TTC calculation should be specified in the TTC Standard. |
| **Response:** R12: The revised MOD-001 requires the TSP to develop a document called "Available Transfer Capability Implementation Document" and this document must contain the names of the TSPs with which the TSP exchanges data for use in determining ATC.<br>Note that the latest versions of the ATC-related standards include requirements for calculation of TTC within each of the three standards that addresses one of the methods of calculating ATC. | | | |
| Cargill | | ☑ | We disagree with R14, which would require a Transmission Service Provider to require Transmission Customers to provide ultimate source and ultimate sink on Transmission Service Requests and further would require that Transmission Customers must use the same source and sink on Interchange Transaction Tags. Our reasons for not supporting this requirement are several, based on our belief that the requirement (1) is impractical under well-established trading and scheduling |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | practices, (2) has not been shown to be necessary to the reliability of the North American bulk electric system, (3) is not consistent with the Market Interface Principles, which are an integral part of NERC's Reliability Standards Development Procedure and (4) conflicts with Order 890. Further, it is not apparent from the records of the draft team's development process that due consideration was given to whether the source/sink requirement adheres to NERC's Reliability and Market Interface Principles.<br><br>The source/sink requirement is incompatible with the market's trading and scheduling practices. Forward hedging is commonly transacted at Hubs, with the product defined as an "into-HUB," (e.g., into-Entergy). A supplier who delivers energy to an "into-Hub" sale cannot foresee where the buyer will ultimately sink the energy. That supplier may need to purchase transmission to the Hub's interface, but cannot know in advance what sink to input in a Transmission Service Request on an upstream system. Likewise, the buyer does not know the source until the time of day-ahead scheduling, and, therefore, cannot plan his transmission purchases to coordinate with his into-Hub energy purchase. The seller may choose to deliver the "into-HUB" energy at different interfaces day to day.<br><br>When scheduling energy flows between regions, the timelines for notifying counterparties of sources/sinks may not be consistent. Though a Purchasing-Selling Entity may learn by 10:00 AM where his purchase is being generated for the next day, he may not know until 11:00 AM where that energy is sinking. The party responsible for transmission in the upstream path may have to submit a Transmission Service Request, due to a transmission provider's timing requirements, before the downstream must declare a sink. So transmission providers' timing requirements may not coincide with scheduling and tagging timelines. Further, characteristics of today's organized electricity markets are not compatible with the proposed source/sink requirement.<br><br>When energy is sourced from an organized market (i.e./ LMP system), the actual generating source cannot be identified, as economic dispatch determines generation levels on 5-minute intervals. Thus, for a transaction tagged with a source in an LMP system, the Transmission Service Request and Interchange Transaction Tag may never match. Similarly, in the WECC when a Mid-C product is purchased and taken to delivery, it could be generated at any of numerous hydro-generation facilities, all included in the definition of the Mid-C energy product. The proposed source/sink requirement would put certain market participants at a disadvantage. A Purchasing-Selling Entity who intends to buy transmission to move purchased energy from a Hub to a customer who will transmit the energy downstream beyond the Hub is at the greatest disadvantage with a source/sink requirement. Such a Purchasing-Selling Entity, without known generation or load, may be ignorant of both the source and the sink until the time of scheduling. It is important that the proposed standard is incompatible with trading and scheduling practices. The following is taken from NERC's Reliability Standards Development Procedure: "While NERC reliability standards are intended to promote reliability, they must at the same time accommodate competitive electricity markets." |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | The MOD-001-1 drafting team recognizes at least two distinct methods for ATC calculations, the Rated System Path Methodology and the Network Response Methodology. The addition of the source/sink requirement in R14, however, seems to ignore the key difference in the two methods. The Rated Path method looks at the capability of the direct wires between two points, and those points are not necessarily the source or the sink. The draft team's records do not disclose claims that the lack of the proposed source/sink requirement has degraded reliability in those systems where the Rated System Path method is employed. Apparently, source/sink requirements such as proposed in R14 are not necessary to the reliability of the North American Bulk Electric system for those areas using the Rated System Path method. In fact, it is documented in the draft team's working papers that source/sink modeling identification is "not relevant for Rated System Path Method for ATC Modeling." (See draft team's document titled NOPRitems.XLS at http://www.nerc.com/~filez/standards/MOD-V0-Revision-RF.html, dated 7/19/06.) The reason for the subsequent addition of the source/sink requirement to the proposed standard cannot be determined from the draft team's records.<br><br>The impetus for the development and revision of MOD-001-1 was the Final Report of the Long-Term AFC/ATC Task Force. In that report, in the section titled "Source and Sink Points – Calculation Process for AFC/ATC," is the following statement: "The task force suggests that the sources and sinks (injections and withdrawals) used in the calculation of AFC/ATC and the evaluation of transmission service requests should replicate the anticipated use of service when utilized." (Emphasis added.) This statement assumes that requiring source/sink information with a Transmission Service Request and requiring that information to match the Interchange Transaction Tag is not necessary. The next sentence in the report states, "It is important that Transmission Service Providers have business practices outlining when they will allow confirmed transmission reservations to be used in a manner that is not equivalent to how the request for the service was evaluated." Once again, it is granted that source/sink information is not required to match from reservation to tag. And Appendix B of the report states the case even more plainly: "Source and sink points … do not necessarily correspond to the source or sink fields on a transmission reservation, but are constructs that mimic the expected actual change in generation dispatch that would be used to affect that power transfer in real-time."<br><br>Further practical considerations show that the R14 source/sink requirement is not necessary to the reliability of the bulk electric system. For instance, Southwest Power Pool (SPP) employs an "electrical equivalent" concept. According to SPP's Business Practices an exception is allowed when the source/sink of a reservation does not match the source/sink of the tag, so long as the source/sink on the reservation is considered electrically equivalent to the source/sink on the tag. SPP also allows an exception when a customer combines two SPP reservations on the same tag, so long as one reservation has the correct source/sink (or electrical equivalent) and the PORs and PODs are contiguous, such a scheduled reservation/tag is valid. (See 4.3 of SPP's Open Access Transmission Tariff Business Practices.) Additionally, consider schedules that flow across DC ties. There is no |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | need, for the purposes of calculating ATC, for transmission providers in the WECC to know where in the Eastern Interconnect a transaction flowing west to east on one of the DC ties is sinking. Likewise, for an energy schedule sourced in ERCOT to a sink in SERC, there is no need for the transmission providers in ERCOT to know the ultimate sink. And no need for the transmission providers in the Eastern Interconnect to know the ultimate source. Source/sink information matching from reservation to tag is not necessary to reliability in these cases.<br><br>The proposed source/sink requirement conflicts with NERC's Reliability Standards Development Procedure, which includes two sets of guiding principles, Reliability Principles and Market Interface Principles. "Consideration of the market interface principles is intended to ensure that reliability standards are written such that they achieve their reliability objective without causing undue restrictions or adverse impacts on competitive electricity markets." Market Interface Principle 2 states, "An Organization Standard shall not give any market participant an unfair competitive advantage." As mentioned earlier, market participants without known generation resources or load obligations can be put at a definite disadvantage with the proposed source/sink requirement. Market Interface Principle 3 states, "An Organization Standard shall neither mandate nor prohibit any specific market structure." The indirect result of R14 would be to so inhibit markets operated with the Rated System Path Methodology so as to essentially prohibit the prevailing market structure operating where that method is employed. Transmission providers and customers would be forced to transact differently, potentially disrupting long-established and efficient markets. Most importantly, Market Interface Principle 4 states, "An Organization Standard shall not preclude market solutions to achieving compliance with that standard." The title of the standard at issue is ATC and AFC Calculation Methodologies. Yet no explanation can be found in the draft team's records as to how the source/sink requirement in R14 will improve ATC calculations. In reviewing the records of the drafting team, no examples can be found showing that the lack of the source/sink requirement causes degraded reliability. In fact, markets that do not require that ultimate source/sink be provided on a reservation and then match on an Interchange Transaction Tag have obviously determined and implemented solutions to calculating ATC, without such a requirement. The record of the drafting team simply does not provide evidence to the contrary.<br><br>Finally, in reviewing FERC's Order 890, it is apparent that R14's source/sink requirement is inconsistent with established protocols for transmission service reservations. At paragraph 297 of Order 890 the Commission states, "Regarding transmission reservations modeling, we direct public utilities, working through NERC, to develop requirements in reliability standard MOD-001 that specify (1) a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown and (2) how to model existing reservations." Obviously, it is understood that not only existing reservations may not have provided source/sink information, but also, by distinguishing existing reservations, FERC has assumed that future transmission service requests may not provide source/sink information. Indeed the definition of Transmission Service |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | Reservation proposed in the MOD-001-0 standard references Point of Receipt and Point of Delivery, but not source and sink (see 2. at page 4 of this document.)<br><br>In summary, the proposed source/sink requirement is inconsistent with established trading and scheduling protocols, is not necessary to the reliability of the bulk electric system, conflicts with the principles established to guide the development of reliability standards and is inconsistent with FERC Order 890. For the reasons stated herein, we disagree with the proposed source/sink requirement in MOD-001-1. Cargill |
| **Response:** R14: The drafting team removed R14 from MOD-001. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice. | | | |
| Duke Energy | | ☑ | As written with the requirement to provide ultimate source and ultimate sink, R14 should only apply to reservations and tags on systems that calculate AFC. In general, on systems that calculate ATC or AFC, source and sink granularity on the reservation must be sufficient to allow adequate assessment of the impact on the capacity offering (ATC or AFC). Source and sink granularity on the e-tag must be sufficient to allow adequate assessment of the e-tag's impact on the transmission system. The Point of Receipt (POR) and the Point of Delivery (POD) must be the same on the reservation and the e-tag. If the source or sink on the e-tag is different from the source and sink on the reservation and the impact is substantially different from the expected impact of the reservation, the TP may deny or curtail the e-tag. |
| **Response:** R14: The drafting team removed R14 from MOD-001. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice. | | | |
| Entergy | | ☑ | (R3.) There is no need to include ATC and TTC values to be provided when requested within 7 days as these are expected to be posted on OASIS and be available per OATT requirement.<br>(R4.) The equation assumes that the TRM, CBM and ETC are for each path that has a Distribution Factor factor to each flowgate. Therefore, the language in the standard should be changed to include "respective" before the Distribution Factor for TRM and CBM. In addition, the definition of Distribution Factor included in the NERC Standard Booklet "The portion of Interchange Transaction, typically expressed in per unit that flows across a transmission facility (Flowgate)" can only be used if the TRM, CBM and ETC are allocated on each Interchange Transaction which is from control area to control area. If the TRM, CBM and ETC standards do not require such allocation, the formula will be invalid.<br>(R5.1) This requirement should also be applicable to ATC calculations if Transmission Service Provider uses impact on interface differently for the Firm and Non-Firm reservation. At a minimum Transmission Service Provider should be required to include method of adjusting the ATCs for Firm |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | and Non-Firm Reservations for transparency purposes.<br>(R5.2) Comment similar to that for R5.1 applies to this requirement as this requirement should be applicable to ATC calculation.<br>(R 5.3) This requirement is poorly written as it is not clear what is required to be on OASIS, Is assumptions used for base case and transfer generation dispatch for both external and internal system need to be on OASIS? If so, it does not make sense.<br>(R6.3) The monitoring of the requirement of exchanging generation dispatch order that is updated at least prior to each peak load season or the generation participation factors of all units on an affected Balancing Authority basis that is updated as required by changes in the status of the unit will be difficult as these are inconsistent. The participation factors theoretically will change any time the generator status changes and will have to be recalculated and shared with all entities. Transmission Service Providers should be required to exchange participation factors when updated and at a minimum prior to each peak load season rather than required to calculate when generator status changes.<br>(R6.8) This requirement is applicable only to AFC calculations as AFC values for different periods need to be updated at certain interval. First this requirement is based on FERC Order 889 and is of commercial nature, therefore, it should be included in NAESB business practices. Secondly, this requirement is also applilcable to ATC values, if it is included in this standard, this should also be made applicable to ATC calculations.<br>(R 6.10) Transmission Service Reservations are available on line on OASIS and need not be included in this standard to be exchanged. Also Transmission Service Reservations may be included in ETC when standard for ETC is developed.<br>(R7) The requirement for updating AFC values should be in NAESB Business Practices. This requirement is also applicable to ATC calculations.<br>(R11) There are more requirements to be included in the AFC methodlogy than the ATC methodology (R5 and R11 are applicable to AFC, and only R11 is applicable to ATC). There does not appear to be a requirement for Transmission Providers using ATC to include items in R1 - R3 in ATC calculation Methodology. It should be made consistent.<br>(R12), (R13), (R14) These requirements can be included in R11 as additional sub requirements. There does not seem to be any justification to keep them as separate requirements and not to be included in the calculation methodology. |
| **Response:**<br>R3: This information is needed for reliability-related needs. The requirement was revised and no longer includes any reference to the frequency for data exchange.<br>R4 The requirements for calculating AFC have been moved into their own standard and include much greater specificity than the equation that was used in the first draft of MOD-001. Please see MOD-030.<br>R5.1 The SDT agrees that this requirement applies to the rated system path methodology as far as requiring the Transmission Service Provider to identify his method of adjusting the ATCs for Firm and Non-Firm Reservations for transparency purposes. Please see the new requirements | | | |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| in MOD-028 and MOD-029.<br>R5.3 The revised standard (MOD-001) and proposed new standards for calculating ATC (MOD-028, MOD-029 and MOD-030) do not include any references to OASIS.<br>R6.3 The revised requirement for TSPs to exchange data still include the requirement to exchange the generation dispatch order, but the sub-requirement to update the order before each peak load season has been dropped from the revised requirement.<br>R6.8 and R7. AFC values should be converted to ATC at the same intervals and should be updated at the same intervals as ATC and this is reflected in the revised MOD-001 and new MOD-030<br>R6.10 The requirement to post the latest ATC value on OASIS is being addressed in a NAESB business practice.<br>R12. The revised MOD-001 requires the TSP to develop a document called "Available Transfer Capability Implementation Document" and this document must contain the names of the TSPs with which the TSP exchanges data for use in determining ATC.<br>R13: The drafting team does not agree that R13 should be included in R11 as a sub-requirement.<br>R14: The drafting team removed R14. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice. | | | |
| ERCOT | | | ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology. |
| **Response:** If ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| Grant County PUD | | ☑ | "R11.4 Identify the contingencies considered in the ATC and AFC calculation methodology". Is this appropriate? This could be an extensive list in some cases, it could create a security risk, or it could be leveraged for market power.<br><br>"R14 The Transmission Service Provider shall require that the Transmission Customer provide both ultimate source and sink on the Transmission Service Request and shall require that that Transmission Customer use the same source and sink on the Interchange Transaction Tags." Shouldn't the TSP only focus on that part of the transmission that he is providing service for? POD and POR? I am not sure if the intent here is to do specific point of generation to point of usage scheduling. If it is, this is not appropriate for our situation. We meet our schedules with a portfolio of generation and meet our loads with a series of contiguous PORs. We do not to be overly specific and |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | burdensome. |
| **Response:**<br>R11.4: Including or addressing the contingencies considered is appropriate to ensure consistency and transparency.<br>R14: The drafting team removed R14. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice. | | | |
| IESO | | ☑ | (i) The text box next to R5 says: [Please note that it may appear that the AFC methodology contains more requirements than that ATC methodology. Due to the characteristics of the ATC methodology, the corresponding level of detail will be contained in the standard that determines TTC (e.g. FAC 12 or FAC 13) when it is revised.]<br>We interpret this text box applies to both R5 and R6.<br>We agree that the two methods are different and therefore may need different detailed requirements in certain aspects. However, many of the sub-requirements in R5 and R6 appear to be applicable to the ATC calculation methodology as well hence the detailed requirements can also be addressed in this standard. Moreover, addressing detailed ATC calculation requirements in FAC-012 or –013 appears to be a misfit since the latter standards deal with Transfer Capabilities (and to be revised to deal with Total Transfer Capabilities as suggested in Q14, below), which are solely reliability parameters. Moreover, having the detailed ATC calculation requirements placed in a separate standard would leave room for confusion to the standard users.<br>(ii) R6.5. Please see comments under Q9.<br>(iii) R11.4 The contingencies considered and applied in determining the ATC or AFC would be the same sets used for operating studies and planning studies which could include all possible Category B and Category C contingencies on the TSP's system. It would be near impossible to identify them all. This requirement is implied by R11.2, and where necessary, R11.2 can be expanded to ensure that the ATC and AFC shall be determined with the same set of contingency criteria applicable to the reliability assessment of the like time frame.<br>R11.5 We do not understand this requirement. Does it mean that for ATC and AFC calculation, the model and assumptions must be the same as those used for expansion planning? Note that calculations of ATC and AFC need to consider planned outages to BES facilities, whereas expansion planning may not. Also, if this is the requirement, what are the parallel requirements for ATC and AFC calculation in time frames less than 13 months? |
| **Response:** | | | |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Response to all comments: MOD-001 was revised and the intent of MOD-001 is now distributed between 4 standards – with MOD-001 as an 'umbrella' standard, and each of the other three standards (MOD-028, MOD-029, MOD-030) addressing one of the three methods of determining ATC. Each of the three standards that addresses one of the methods of determining ATC also includes related requirements for TTC (or TFC) and ETC. With this rearrangement, each of the 'new' standards includes much more definition than was included with the first draft of MOD-001. Please review the proposed standards. | | | |
| AECI | ☑ | | |
| FRCC | ☑ | | |
| ITC Transco | ☑ | | |
| KCPL | ☑ | | |
| MRO | ☑ | | |
| MidAmerican | | ☑ | As noted in our General Comments above, MidAmerican does not believe the standard as currently drafted complies with FERC Order No. 890. |
| **Response:** The drafting team agrees that the first draft of MOD-001 needed to be revised in order to comply with FERC Order 890. Please see the new set of standards that relate to ATC. | | | |
| MISO | | ☑ | The standard needs to be revisited in light of the Order 890 to make sure consistent measures are applied to all calculations. |
| **Response:** The drafting team agrees that the first draft of MOD-001 needed to be revised in order to comply with FERC Order 890. Please see the new set of standards that relate to ATC. | | | |
| NCMPA | | ☑ | R14 should be eliminated. The proposed source/sink requirement is inconsistent with established trading and scheduling protocols, is not necessary to the reliability of the bulk electric system and conflicts with the principles established to guide the development of reliability standards. Requiring the same ultimate source and ultimate sink on the Transmission Service Request and the Interchange Transaction Tag will harm commercial use of transmission service. It will force transmission users to redirect transmission service on OASIS every time a source or sink changes, even in cases where the source/sink combinations are electrically equivalent. This new practice will provide little, if any, benefit for reliability.<br><br>If the drafting team feels this requirement is still needed, it should be passed to NAESB for inclusion as a business practice. |
| **Response:** R14: The drafting team removed R14. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice. | | | |

| Question #12 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| NPCC CP9 | | ☑ | R12 – First, this requirement should be placed under R11, because R11 contains the items that must be 'identified' in the TSPs ATC methodology<br>Second, exchanging data with neighboring TSPs is important only if the data held by one TSP is necessary for another TSP to calculate its ATC. Therefore, R12 should be redrafted to read as follows:<br><br>"Identify any other Transmission Service Providers from which data is received for use in calculating its ATC or AFC"<br><br>Data exchanges that are required as part of the TTC calculation should be specified in the TTC Standard. |
| **Response:** R12. The revised MOD-001 requires the TSP to develop a document called "Available Transfer Capability Implementation Document" and this document must contain the names of the TSPs with which the TSP exchanges data for use in determining ATC.<br>Note that there under the drafting team's proposal, there will not be a separate standard to address TTC. | | | |
| NYISO | ☑ | ☑ | R 6 - We suggest that we require that a requester must demonstrate a reliability related need for the data. This will ensure an effort to provide the data is warranted.<br><br>R 6.3 - It is unclear what the phrase 'generation dispatch order' refers to. |
| **Response:** R6: The requirement does include the proposed language.<br>R6.3 – in the revised MOD-001 this is R6.2 and states:<br><br>Generation dispatch, in the form of dispatch order, participation factors, or block dispatch.<br><br>Please let us know if additional clarification is needed. | | | |
| ODEC | | ☑ | I think we need to have a firm definion for the ATC/CBM/TRM terms before a final standard on them should be voted upon as this will impact the language in the standard. |
| **Response:** Agree. The standards on ATC/CBM/TRM/AFC/ETC should be voted upon as a complete package so that all definitions are understood in the context of related standards. | | | |
| Progress Energy Marketing | | ☑ | Progress Energy Marketing disagree with R14, which would require Transmission Customers to provide ultimate source/sink on the Transmission Service Request. By your own definition, a Transmission Service Request is a service request by the Transmission Customer to the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.<br><br>The ultimate source/sink requirement is incompatible with the market's trading and scheduling practices. Forward hedging is commonly transacted at Hubs, with the product defined as an "into-HUB". A supplier who delivers energy to an "into-HUB" sale cannot foresee where the buyer will ultimately sink the energy. The supplier may need to purchase transmission to the Hub's interface, but cannot know in advance what sink to input in a transmission Service Request on an upstream system.<br><br>The ultimate source/sink requirement would have an adverse impact on market development as well |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | as market activity |
| **Response:** R14: The drafting team removed R14. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice. | | | |
| Progress Energy | | ☑ | R3 – What is the intent of this requirement? If the intent is to provide data within 7 days of the request then the requirement needs to be reworded.<br><br>R8 – R14 should apply to "ATC" not "ATC and AFC" because AFC is just an ATC engine, and these requirements should be moved to the beginning of the standard, followed by the engine-specific calculation requirements.<br><br>R11.2 – "internal expansion plan" does not apply within 13 month horizon. Should instead be "internal near-term planning"<br><br>R11.5 – reject inclusion of "use the same power flow model" as this is impossible to apply. Many ATC models use NERC MMWG models as their basis. In planning studies, additional lower voltage detail is included.<br><br>Also, the standard should have only one requirement that defines the when and where of ATC methodology ; If you want the same process to be applied across the whole system and across time horizons then say that plainly in one requirement instead of splitting the where and when between R9 and R11. |
| **Response:** R3: The revised standard does not include this requirement.<br>R8 – R14 –Agree. The translation between AFC and ATC has been addressed in the proposed MOD-030.<br>R11.2 and R11.5 The revised MOD-001 does not include these requirements. Note that the new standards (MOD-028, MOD-029 and MOD-030) try to achieve the same objective. | | | |
| SCE&G and SERC ATCWG | | ☑ | R3 - The requirement is not clear on timeframes. Is it talking about the current ATC values or values into the future? If so, how far into the future. What is intent? If the intent is to create the obligation to provide current data within 7 days of the request, then the requirement needs to be reworded.<br><br>R4 - IN AFC methodology, TRM and CBM are a flowgate attribute not a path attribute, therefore the formula should be modified.<br><br>R5.1 and R5.2 - Needs clarification of the clause "with respect to how each is treated in the Transmission Service Provider's counter flow rules." This clause appears to limite consideration to counterflows only when other issues impact firm versus non-firm reservations and schedules.<br><br>R5.3 - delete "on OASIS" since it is covered in R10.<br><br>R6 - specify whether forward-looking or historical; |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | R6.1 and 6.2- "coordinated transmission system element" is not understood. Rephrase to state "coordinated schedules of transmission system elements to be taken out of service" R6.8.3 - This requirement should allow the use of a minimum daily value during a week for posting as weekly ATC.<br><br>6.10 - remove "when revised".<br><br>R7 - state "at the minimum frequency" to be consistent with R6.8.<br><br>R8-R14 all apply to ATC so remove "or AFC" - also move R8-R14 to the beginning of the standard, followed by the engine-specific calculation requirements.<br><br>R11.2 - "internal expansion plan" does not apply within 13 month horizon. Should instead be "internal operational planning".<br><br>R11.5, change "the same power flow models, and the same assumptions regarding load, generation dispatch, special protection systems, post contingency switching, and transmission and generation facility additions and retirements as those used in the expansion planning for the same time frame." to "power flow models containing assumptions consistent with expansion planning for the same time frame." |
| **Response:**<br>R3. The revised standard does not include this requirement.<br>R4 The SDT is unclear on the comment; however, TRM and CBM are attributes of all three methodologies.<br>R5.1, R5.2 The revised MOD-001 requires all TSPs to identify how they account for counter-flows..<br>R5.3 The revised standard does not include this requirement.<br>R6 The requirement to exchange data was updated and most of the sub-bullets were abbreviated to improve clarity – the sub-requirements that identified how often the data needed to be refreshed were removed.<br>R7. This requirement was removed from the revised standard.<br>R8-R14 The SDT revised MOD-001 so it only contains 'generic' ATC requirements applicable to all three methods of calculating ATC. Each of the three methods is treated in greater detail in a stand-alone standard (MOD-028, MOD-029, MOD-030)<br>R11.2 and R11.5 The revised MOD-001 does not include these requirements. Note that the new standards (MOD-028, MOD-029 and MOD-030) try to achieve the same objective. | | | |
| Southern | | ☑ | R1 and R4 for calculations both firm and non-firm. All references to TTC and TFC need to be move off to FAC 12 and 13. R11.2 phrase "internal expansion planning" be removed.<br>R11.2-11.5 is referencing to TTC and TFC/AFC calculations should be moved to FAC 12-13.<br>R7 what updated information should be coordinated and for what purpose? Is this not a posting issue? The posting and reposting of data in the OASIS system needs to be taken out of this standard and requirements be put into NAESB.<br>R14 the ultimate source and sink hold for. |
| **Response:**<br>R1 & R4 As TTC and TFC are both essential variables within the ATC calculation, they cannot be excluded from the formula. How these | | | |

| Question #12 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| variables are calculated can be correctly addressed in the FACs.<br>R11.2 and R11.5 The revised MOD-001 does not include these requirements. Note that the new standards (MOD-028, MOD-029 and MOD-030) try to achieve the same objective.<br>R14. The SDT does not understand the intent of the comment "the ultimate source and sink hold for" – however the drafting team did remover R14 from the revised standard. | | | |
| Tenaska | | ☑ | We disagree with R14 which requires the Transmission Service Provider to require Transmission Customers to provide ultimate source and sink on Transmission Service Requests and Transmission Customers must use the same source and sink on Interchange Transaction Tags. The main reasons we disagree with this requirement are that it is incompatible with current market trading and scheduling practices and is not always relevant.<br>When a Transmission Customer reserves transmission for use in a trading hub transaction (e.g., "into Entergy", "into Southern"), it is not always possible for the Transmission Customer to know what the actual source or sink will be at the time of making the reservation.<br>When the source or sink is within a pool, it is not possible to identify the actual generating source or ultimate sink. |
| **Response:** R14: The drafting team removed R14 from the revised standard. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice. | | | |
| WECC ATC Team | | ☑ | |

13. Should the proposed standard include further standardization for the components of the calculation of ATC or AFC (i.e., should the proposed standard be more prescriptive regarding the consistency and standardization of determining TTC, TFC, ETC, TRM, and CBM)? If so, please explain.

**Summary Consideration:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC.

| Question #13 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ERCOT | | | ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology. |
| **Response:** If ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| Manitoba Hydro | | | With CBM I believe that the only reliability portion is the recognition of an adeqacy criteria (i.e. the LOLE study) Once that is established CBM could be defined many ways and is likely in the realm of NAESB. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC. | | | |
| APPA | | ☑ | MOD-001 should only deal with ATC? and AFC and not the components. The rules for consistent and accurate methods of determining the individual components will be very complicated and numerous. Attempting to place all of these rules for the components in MOD-001 will make MOD-001 very large and impossible to measure and monitor the requirements. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of | | | |

| Question #13 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC. | | | |
| APS | | ☑ | There should be standardization of the components used in the calculation of ATC and AFC. These standards do not have to be in this standard, however if there are new standards for these components and the new standards should take into account this standard. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC. | | | |
| WECC ATC Team | | ☑ | As clarity is essential for each ATC variable, the WECC Team suggests that any further prescription or standardization is addressed in a free standing standard specifically addressing each variable of the ATC calculation. For example, a free standing standard should be initiated for ETC. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC. | | | |
| BPA | | ☑ | As written, the proposed standard does not achieve standardization, due in part to the uncertainties and lack of clarity in the variables within the ATC/AFC calculation. However, BPA supports development of individual standards for each variable within the ATC/AFC calculation. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC. | | | |
| Duke Energy | | ☑ | See response to Q. #1. TRM, CBM, etc, are defined in other standards. |
| **Response:** The drafting team has created separate standards for TRM and CBM. | | | |
| FRCC | | ☑ | Separate standards are being developed that address the components. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC. | | | |
| Grant County PUD | | ☑ | Being too presciptive will raise issues of entities seeking exemptions for one reason or another, there |

| Question #13 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | by confusing the compliance. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC. The drafting team is attempting to meet the FERC directives that aim to improve consistency and transparency in the processes used to determine ATC. | | | |
| HQT<br>NPCC CP9 | | ☑ | Any additional standardization of the other components should be contained in those specific standards not in MOD-001. However, it is important that the details of the methodology for determining TTC, TFC, ETC, TRM and CBM must be permissive to allow for continued operation of markets in those TSPs that do not utilize a physical-rights based system for providing transmission service. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. | NYISO<br>CAISO<br>ISO-NE | ☑ | | NERC should develop some general criteria: What should be included in the TTC, TFC, ETC, TRM, CBM? How should they be calculated (high level guidelines) and what the purpose is of including them in the AFC calculation? |

| Question #13 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | Any additional standardization of the other components should be contained in those specific standards not in MOD-001. However, it is important that the details of the methodology for determining TTC, TFC, ETC, TRM and CBM must be permissive to allow for continued operation of markets in those TSPs that do not utilize a physical-rights based system for providing transmission service. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC. The SDT is trying to propose Standards that provide for consistency throughout each interconnection to the maximum extent possible taking into account variations in market designs while protecting the Bulk Power System reliability. | | | |
| IESO | ☑ | | Some general criteria (the basis) for determining CBM and TRM should be developed so that a consistent approach is used by all TSPs. |
| **Response:** The drafting team has created separate standards for TRM and CBM. | | | |
| MidAmerican | ☑ | | See General Comments above. In addition to changes required to comply with Order No. 890, the process should be standardized and transparent to the point that another provider, using the same methodology and input data, could duplicate the results of any provider. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC. | | | |
| SPP | ☑ | | We recommend developing some general criteria, what should be included in the TTC, TFC, ETC, TRM, CBM, and how they should be calculated (high level guidelines) and what the purpose is of including them in the AFC calculation. |
| **Response:** The drafting team has created separate standards for TRM and CBM. TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. | MISO | ☑ | | |
| ODEC | ☑ | | |

14. Do you agree that Total Transfer Capability (TTC) referenced in the MOD standards and Transfer Capability (TC) references in the FAC-012-1 and/or FAC-013-1 standards are the same and should be treated as such in developing this standard? If you don't believe these are the same, please explain what you feel are the differences between TC and TTC.

☐ Yes — TTC and TC are the same
☐ No — TTC and TC are not the same

**Summary Consideration:** TTC and TFC are addressed in the proposed standards (MOD-028, MOD-029, and MOD-030). TTC/TFC, ETC, and ATC/AFC are too intertwined to effectively split, and the drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC.

| Question #14 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| PG&E | | | Since the TC is reliability based, if TTC is not the same as TC, then TTC should be no higher than the TC determined by the Planning Coordinator in the planning horizon and the Reliability Coordinator in the operating horizon. |
| **Response:** The ATC Standards Drafting Team has been asked to develop a definition for TTC. If it is determined that TTC and TC are the same values in the planning and operating horizons, then one will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. A clear distinction would recognize that TTC should be no higher than the TC determined by the Planning Coordinator and the Reliability Coordinator in each of their timeframes. | | | |
| ERCOT | | ☑ | As I recall, the FAC drafting team recognized similarities, but used a different name because they were not considered to be the same. The FAC standards relate more to operational system capabilities and different timeframes, not to the in-advance nature of TTC used in the transmission service market. The FAC drafting team included in the FAC standards that the TTC methodologies shall respect the System Operating Limits which relate to the TC described in the FAC standards. |
| **Response:** The TTC definition and the use of TTC in MOD-001-1 relate to all timeframes (operating and planning). The ATC Standards Drafting Team has been asked to develop a definition for TTC. If it is determined that TTC and TC are the same values in each timeframe, then one will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. TTC and TC (if TC is retained) definitions will respect System Operating Limits. | | | |
| Duke Energy | | ☑ | FAC-012 should apply to TC, which indicates the ability to reliability move large amounts of power between regions, sub-regions and control areas. Test of TC identifies potential transfer limits that may result from loop flows, market activity or contingencies. TTC calculation is required to support market operation without impacting reliability in a negative manner. |
| **Response:** The ATC Standards Drafting Team has been asked to create a clear distinction between TTC and TC or to eliminate one of the definitions. It is expected that the definition of TTC will identify potential transfer limits in each timeframe (e.g., planning horizon, operating horizon). Potential transfer limits in each timeframe may result from factors such as loop flows, market activity or contingencies, as well as support of market operation. It is expected that factors with the potential to cause a transfer limit can be included in the appropriate timeframe | | | |

| Question #14 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| of each TTC value. If it is determined that TTC and TC are the same values in each timeframe, then TC will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. | | | |
| MidAmerican | | ☑ | Given the new requirements in Order No. 890, the definitions TTC and TC must be consistent since Order No. 890 requires consistent methodologies for use in i) planning, and ii) ATC or AFC calculations.<br><br>It should be noted that TC is used for planning and security coordination purposes, while TTC is commercial in nature and must be updated with each ATC calculation to reflect operational conditions. As a result, there may be points in time when TC is not equal to TTC due to the frequency of updates. |
| **Response:** The TTC definition and the use of TTC in MOD-001-1 relate to all timeframes (operating and planning). The ATC Standards Drafting Team has been asked to develop a definition for TTC. If it is determined that TTC and TC are the same values in each timeframe, then one will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. TTC and TC (if TC is retained) definitions will respect System Operating Limits. | | | |
| MRO | | ☑ | |
| IRC<br>ISO-NE<br>CAISO | ☑ | ☑ | This question should probably be asked of the drafting team of FAC-012-1 / FAC-013-1 if they have the same definition in mind. When reading FAC-012-1 it is optional to apply a described methodology to an operating and/or planning horizon. The TTC as described in MOD-001-1 should be applied to all Horizons listed under question 4 of the Comment Form. We believe TTC should be added into the FAC requirements as a defined term. |
| **Response:** The ATC Standards Drafting Team has been asked to create a clear distinction between TTC and TC or to eliminate one of the definitions. If it is determined that TTC and TC are the same values in the planning and operating horizons, then TC will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. For reference, the team asked the chairman of the FAC Standards Drafting Team this question, and his response was, "Transfer Capability as required in FAC 012 and Total Transfer Capability as required by MOD 001 are indeed the same quantities." | | | |
| NYISO | ☑ | ☑ | This question should probably be asked of the drafting team of FAC-012-1 / FAC-013-1 if they have the same definition in mind. When reading FAC-012-1 it is optional to apply a described methodology to an operating and/or planning horizon. The TTC as described in MOD-001-1 should be applied to all Horizons listed under question 4 of the Comment Form. We believe TTC should be added into the FAC requirements as a defined term.<br><br>The Reliability Standards should consider a single term for all standards. |
| **Response:** The ATC Standards Drafting Team has been asked to create a clear distinction between TTC and TC or to eliminate one of the definitions. If it is determined that TTC and TC are the same values in the planning and operating horizons, then TC will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. For reference, the team asked the chairman of the FAC Standards Drafting Team this question, and his response was, "Transfer Capability as required in FAC 012 and Total Transfer Capability as required by MOD 001 are indeed the same quantities." | | | |

| Question #14 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| SPP | | | That question should probably be asked of the drafting team of FAC-012-1 / FAC-013-1 if they had same definition in mind. When reading FAC-012-1 it is optional to apply a described methodology to a operating and/or planning horizon. The TTC as described in MOD-001-1 should be applied to all Horizons listed under question 4. of the Comment Form. It looks like FAC-012-1 is more related to Reliability function (real time /semi real time) and MOD-001-1 is more related to Tariff function. |
| **Response:** The ATC Standards Drafting Team has been asked to create a clear distinction between TTC and TC or to eliminate one of the definitions. If it is determined that TTC and TC are the same values in the planning and operating horizons, then TC will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. For reference, the team asked the chairman of the FAC Standards Drafting Team this question, and his response was, "Transfer Capability as required in FAC 012 and Total Transfer Capability as required by MOD 001 are indeed the same quantities." | | | |
| HQT | ☑ | | This question should probably be asked to the drafting team of FAC-012-1 / FAC-013-1 if they have the same definition in mind. |
| **Response:** The ATC Standards Drafting Team has been asked to create a clear distinction between TTC and TC or to eliminate one of the definitions. If it is determined that TTC and TC are the same values in the planning and operating horizons, then TC will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. For reference, the team asked the chairman of the FAC Standards Drafting Team this question, and his response was, "Transfer Capability as required in FAC 012 and Total Transfer Capability as required by MOD 001 are indeed the same quantities." | | | |
| APPA | ☑ | | TTC and TC are the same value determined by the planners or operation personnel for planning and operating horizons, respectively. It is recommended eliminating one of the terms to avoid confusion. |
| **Response:** The ATC Standards Drafting Team has been asked to create a clear distinction between TTC and TC or to eliminate one of the definitions. If it is determined that TTC and TC are the same values in the planning and operating horizons, then TC will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. | | | |
| BPA | ☑ | | Uncertain. FAC-012 speaks to reliability margins that may be applied when calculating transfer capabilities. This may give rise to inconsistencies between TC which incorporates margins, and ATC standards which, as currently drafted, imply that TRM is calculated separately from TTC. |
| **Response:** The ATC Standards Drafting Team has been asked to create a clear distinction between TTC and TC or to eliminate one of the definitions. If it is determined that TTC and TC are the same values in the planning and operating horizons, then TC will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. | | | |
| Entergy | ☑ | | TTC and TC are same. However FAC-012 is written for reliabiliy assessment of Bulk System. Since Transfer Capability calculations use same algorithm but different base case models, FAC-012 should be modified to include calculation of TTC that can be used for ATC calculations as described in MOD-001. |
| **Response:** The ATC Standards Drafting Team has been asked to create a clear distinction between TTC and TC or to eliminate one of the definitions. If it is determined that TTC and TC are the same values in the planning and operating horizons, then TC will be eliminated. If it is determined that a definition of TC is needed, then a clear distinction between TTC and TC will be made. | | | |
| FRCC | ☑ | | The TTC definition should be retained. |
| **Response:** The ATC Standards Drafting Team has been asked to create a clear distinction between TTC and TC or to eliminate one of the the | | | |

15. As mentioned in the introduction, the drafting team has deferred development of requirements for the calculation of Total Flowgate Capability (TFC) pending industry comments. The drafting team would like to know whether the industry believes that MOD-001-1 needs to address TFC methodology and documentation as opposed to having the TFC methodology addressed by revising the existing Facility Rating FAC-012-1 and/or FAC-013-1 standards. Please explain your answer:

**Summary Consideration:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. The drafting team developed four proposed standards to address ATC – an 'umbrella' standard that provides a set of requirements that apply to all three methods of determining ATC, and then a separate standard for each of the three methods of determining ATC. Each of the standards that addresses a method for determining ATC, also contains the associated requirements for TTC and ETC.

| Question #15 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| ERCOT | | | ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology. |
| **Response:** If ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| Southern | | | The TFC methodology should be developed in the FAC12-13 standard and not in MOD-001. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| SPP | | | It looks like FAC-012-1 is more related to Reliability function and MOD-001-1 is more related to Tariff function. FAC-012 should probably describe how the Normal Rating and Emergency Rating should be calculated, using what weather conditions and what safety margin for equipment. MOD-001-1 could refer to those definitions and indicate (as an example) that Normal Rating could be used for single element PTDF flow gates and Emergency Rating for OTDF flow gates. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| MRO | | | Both MOD-001-1 and FAC-012-1 should reference the flowgate capability. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| AECI | | ☑ | TFC is well defined in the definitiond of terms in the standard section. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary | | | |

| Question #15 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| consideration. | | | |
| APPA | | ☑ | A Flowgate is another tool to plan and operate to the BES. The Flowgate development and assumptions will be developed by the planners or operation personnel depending on the time horizon. The flowgate rating is determined as part of the FAC package for system rating, SOL determinations, and TTC (TC) determinations. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| BPA | | ☑ | TFC is similar to TC and should be addressed similarly to TC by revising the existing Facility Rating FAC-012-1. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| Entergy | | ☑ | TFC and TTC methodology should be included in the same standard. Since FAC-012 includes TTC, the same standard should include requirements for TFC calculations. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| HQT | | ☑ | If TFC is similar to TTC, it should be dealt in another Standard e.g. the same one that would deal with TTC. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| IESO | | ☑ | TTC and TFC are reliability parameters that are determined by the facility rating methodologies stipulated in FAC-012 and FAC-013, and these values are not determined by the TSP. In ATC and AFC calculations, these values serve as the upper bound for assessing and managing available transmission services only. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| IRC<br>ISO-NE<br>CAISO | | ☑ | TTC and TFC are reliability parameters that are determined by the transfer capability methodologies stipulated in FAC-012. These values are not determined by the TSP but by the RC or TOP. In ATC and AFC calculations, these values serve as the upper bound for assessing and managing available transmission services only |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| NYISO | | ☑ | TTC and TFC are reliability parameters that are determined by the transfer capability methodologies stipulated in FAC-012. These values are not determined by the TSP but by the RC or TOP. In ATC and AFC calculations, these values serve as the upper bound for assessing and managing available transmission services only.<br><br>The drafting team needs to work with FAC-012/013 to coordinate the determination of TTC and TFC. We believe these values are closely related and are the same on a closed interface. |

| Question #15 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| Manitoba Hydro | | ☑ | I think that the team was well advised to defer this to the facility rating standard team. However a flowgate can be defined by single or multi elements. the team should ensure that the team developing FAC-012 and/or FAC-013 is cover both as well. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| MISO | | ☑ | As explained earlier, the standard needs to be methodology neutral. |
| **Response:** | | | |
| PG&E | | | There is no reliability need to develop a TFC separate from that already developed in the FAC Standards by the Planning Coordinator in the planning horizon and the Reliability Coordinator in the operating horizon. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| Progress Energy | ☑ | | All of the calculations related to ATC should be addressed in the same standard. PE suggests that all requirements be included in MOD-001. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| Duke Energy | ☑ | | TFC and AFC need to be in the same standard because they are interlinked with market issues. FAC-012 and FAC-013 focus on calculation of TC for reliability studies. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| FRCC | ☑ | | All transfer related matters need to be contained in one standard not spead out over multiple documents. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards Please see the summary consideration. | | | |
| SCE&G and SERC ATCWG | ☑ | | All of the calculations related to ATC (TFC, TTC, AFC) should be addressed in the same standard. Suggest that all requirements be included in MOD-001 and that FAC-012 and FAC-103 should be retired. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |
| KCPL | ☑ | | The purpose of the MOD Reliability Standards is to provide the "how to" for modeling and determining operating parameters. The purpose of the FAC Reliability Standards is to provide "you will use" the results of the MOD to operate the bulk electric system. TFC methodology should be defined in the MOD and then how it is used in the FAC. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. Please see the summary consideration. | | | |

| Question #15 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| MidAmerican | ☑ | | MOD-001 should address the methodology and documentation. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. The drafting team currently believes that | | | |
| WECC ATC Team | ☑ | | TFC methodology should be addressed in the same standard as is TTC methodology. This is the logical parallelism to addressing AFC and ATC in the same standard. |
| **Response:** TTC/TFC, ETC, and ATC/AFC are intertwined, and cannot easily be split into multiple standards. The drafting team currently believes that | | | |

16. When calculating ATC and monthly, daily, weekly, and hourly AFC values, what time horizon(s) for CBM should be used and which reliability function(s) should make the CBM calculations? Please explain

**Summary Response:**
The drafting team wanted input from all entities BEFORE writing the CBM standard and this was the most convenient place to ask this question. Based on stakeholder comments and FERC Orders 890 and 693, the drafting team has drafted a CBM standard (MOD-004) that includes the following:

- The TSP is assigned the responsibility for determining CBM
- The standard for CBM does not contain a requirement to update CBM on a fixed schedule as CBM is only set aside upon the request of an LSE- the proposed standard does include a requirement that the LSE make a request for CBM at least annually which will result in CBM being updated at least annually
- Each of the three standards that includes one of the methods of calculating ATC identifies how to use CBM in the determination of ATC and requires the use of CBM in calculating ATC over all time horizons.

This shall serve as the summary response to all opinions offered in response to this question.

| Question #16 | |
|---|---|
| **Commenter** | **Comment** |
| AECI | Operating Horizon - hourly and daily<br>Planning Horizon - weekly and monthly |
| APPA | In determining ATC for the different time horizons the CBM must match the same time horizon. The definition of ***Capacity Benefit Margin (CBM) is defined as that amount of transmission transfer capability reserved by load serving entities to ensure access to generation from interconnected systems to meet generation reliability requirements****.* The primary responsibility of the CBM for the Hourly ATC will be the LSE to meet its responsibility of providing all energy and capacity for load, including operating reserves for the upcoming hours. The Monthly and Daily ATC values are long and short term planning issues where the planners project how much transmission capacity will be needed to ensure access to generation from interconnected systems to meet generation reliability requirements. |
| APS | The Load Serving Entity should make the CBM calculations for all the time horizons (monthly, daily, weekly and hourly) listed above. |
| BPA | BPA does not employ CBM and declines to comment. |
| CAISO | The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for CBM. |
| Duke Energy | Resource Planner should make the calculation. |
| Entergy | There can be different CBM for different time horizons. CBM should be calculated based on the uncertainties of generation available within the Transmission Service Provider area to meet loads. Load Serving Entities should calculate CBM for their loads based on their loads and generation available to serve these loads. In case of Reserve Sharing Groups, loads and generation for the entire group should be included to calculate CBM. Or if CBM calculations are performed on a Balancing Authority Area basis, the entire load and genereation in that area should |

| Question #16 | |
|---|---|
| **Commenter** | **Comment** |
| | be used for these calculations, even if there are more than one LSEs within that area. |
| ERCOT | ERCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology. |
| **Response:** If ERCOT has comments that would assist the drafting team in improving the proposed definition, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | |
| Grant County PUD | The Transmission Operator should be continuously be updating all of these values. |
| HQT | The question is inappropriate, because the standard does not attempt to define the methodology for CBM. |
| IESO | All time horizons should be used in accordance with the corresponding ATC calculation time frame. The value of CBM should be determined by the TSP based on the need demonstrated by the LSE. |
| IRC | The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for CBM. |
| ISO-NE | The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for CBM. |
| KCPL | MOD-004-0 R1.2 already requires that the frequency for CBM updates be identified by the Regional Reliability Organization and its members and it should be left that way. CBM should be used in all time horizons. |
| **Response:** If left as is, this would be a 'fill-in-the-blank' requirement and is not enforceable. | |
| Manitoba Hydro | I believe this and other features of CBM should be determined by NAESB. |
| MEAG Power | Since CBM is a reliability margin, the long term or annual value should be used for the monthly, daily and weekly ATC calculations. It should be calculated by LSE. |
| MidAmerican | The TSP should calculate the CBM and the timing and methodology should be well documented. |
| MISO | These parameters are individual transmission providers business practices. |
| MRO | At least calculate hourly CBM values for applicable entity TSP. |
| NCMPA | In determining ATC for the different time horizons the CBM must match the same time horizon. The primary responsibility of the CBM for the Hourly ATC will be the LSE to meet its responsibility of providing all energy and capacity for load, including operating reserves for the upcoming hours. |
| NPCC CP9 | The question is inappropriate, because the standard does not attempt to define the methodology for CBM. |
| NYISO | The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for CBM. |
| ODEC | Must be the same time horizon for consistency. |

| Question #16 | |
|---|---|
| **Commenter** | **Comment** |
| Southern | Addressed in CBM standard. In general, CBM is applicable to each time horizon in the context of calculating firm import ATC. |
| SPP | We don’t use CBM, so we don’t really have an opinion. |
| WECC ATC Team | This question is best deferred to the CBM standard.<br><br>That said, the LSE should be the entity that determines CBM and should also be allowed the authority to call on the CBM when appropriate.<br><br>In keeping with Order 890, P. 358 and also MOD-05 as currently implemented, the WECC Team suggests that CBM be recalculated no less than annually with allowance to recalculate more frequently as circumstances change.<br><br>To the extent CBM is not scheduled (remains “unused”) CBM must be posted on OASIS on a non-firm basis. Order 890, P. 354. |

17. When calculating ATC and monthly, daily, and hourly AFC values, what time horizon(s) for TRM should be used, and which reliability function(s) should make the TRM calculations? Please explain.

**Summary Consideration:** The drafting team wanted input from all entities BEFORE writing the TRM standard and this was the most convenient place to ask this question. Based on the comments received, and consideration of the FERC Order 890 and 693, the drafting team is adding the following specificity to the standard for TRM (MOD-008)

- The Transmission Planner and Transmission Operator will be assigned responsibility for calculating TRM and providing the TRM value to their TSPs
- TRM will be calculated for each of the following time horizons to align with the time horizons for calculating ATC:

  **The TOP will be calculate TRM as follows:**
  Same day and real-time.

  Day-ahead and pre-schedule.

  **The Transmission Planner will calculate TRM as follows:**
  - Time period beyond the day-ahead and pre-schedule

  This shall serve as the summary response to all opinions offered.

| Question #17 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| AECI | | | Operating Horizon - hourly and daily<br>Planning Horizon - weekly and monthly |
| APPA | | | In determining ATC for the different time horizons the TRM must match the same time horizon. The planners that plan at the different time horizons would be the best. The SDT has come up with a proposal of using a percentage of one of the system values that has been determined by the planners. This would be a very good ~~comprise~~ compromise and promotes a level of consistent calculations. |
| APS | | | The Transmission Service Provider should make the TRM calculations for all the time horizons (monthly, daily, weekly and hourly) listed above. |
| BPA | | | The issue of time horizons should be determined through development of the TRM standard. The Transmission Service Provider should be reponsible for determining TRM. |
| CAISO<br>HQT<br>IRC<br>ISO-NE<br>NPCC CP9 | | | The question is inappropriate, because the standard does not attempt to define the methodology for TRM. |
| NYISO | | | The question is inappropriate for MOD-001, because the standard does not attempt to define the methodology for TRM. |
| Duke Energy | | | TRM should be looked at as a seasonal requirement, and Duke Energy would use the same TRM |

| Question #17 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | value for monthly, daily and hourly calculations. Transmission Planner makes the TRM calculation. |
| Entergy | | | There can be different TRM for different time horizons. Farther in future, less certain are the conditions, therefore, higher TRM. Since TRM is based on combination of uncertainties of different elements, each components will have different contributions to TRM for different time horizons. |
| ERCOT | | | RCOT does not use this methodology and has no comment. The standard should provide for ERCOT's non-transaction-based methodology. In addition, ERCOT presently has set TRM and CBM to zero in its operating and market activities. |
| **Response:** If ERCOT has comments that would assist the drafting team in improving the proposed standards, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint's proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | | | |
| FRCC | | | The TRM should relate to the time horizon of the product. TRM is indtend to account for uncertainties in the bulk electric system and should be determined by the Transmission Service provider. The degree of uncertainty increases in relationship to the product timeframe. The system conditions for hourly are known with a much greater degree of accuracy than for the 13th month. Additionally, the period of exposure to a risk is much greater on a month product than on an hourly product. The probability of a unit or line tripping during the period of a confirmed transaction is much greater for a monthly product than for a daily product. |
| Grant County PUD | | | The Transmission Operator should be continuously be updating all of these values. |
| IESO | | | All time horizons should be used in accordance with the corresponding ATC calculation time frame. The value of TRM should be determined by the TOP and RC depending on the reason for the need of interconnection assistance to cover uncertainties that could affect transmission reliability. |
| KCPL | | | MOD-008-0 R1.1 already requires that the frequency for TRM updates be identified by the (a) Regional Reliability Organinzation and its members and it should be left that way. TRM should be used in all time horizons. |
| Manitoba Hydro | | | This would depend on the need for TRM. IF TRM is required to coordinate interregional stability concerns, it may needed in all horizons. If TRM is used to compensate for uncertainty in Load Forecasts, it should not be used in the operating or day ahead horizon. |
| MEAG Power | | | Since TRM is a reliability margin, the long term or annual value should be used for the monthly, daily and weekly ATC calculations. It should be calculated by TP. |
| MidAmerican | | | The TSP should calculate the TRM and the timing and methodology should be well documented. |
| MISO | | | These parameters are individual transmission providers business practices. |

| Question #17 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| MRO | | | At least calculate hourly TRM for applicable entity TSP. |
| NCMPA | | | In determining ATC for the different time horizons the TRM must match the same time horizon. The planners that plan at the different time horizons would be the best. |
| ODEC | | | Must be the same time horizon for consistency. |
| Southern | | | Addressed in TRM standard. In general, TRM is applicable to each time horizon in the context of calculating firm import ATC. Discussion is needed to determine whether TRM should be included in determing non-firm ATC and in export ATC calculations. |
| SPP | | | TP should calculate the TRM value. TRM should be a seasonal (or yearly value), based on the largest available resources (not scheduled to have maintenance) in that season. If it is a yearly value it should be based on the largest unit. We don't think TRM should be a Monthly value, because maintenance of Resources can change and you might sell service on a lower TRM based on scheduled maintenance of the largest unit. If the scheduled maintenance changes and largest unit moves back in that Month you could potential have oversold system. To play it safe TRM should be seasonal or yearly value. A TP could decide based on a current outage of the unit which was the basis for current TRM value, to lower TRM for the time frame of the outage however we don't think that this type of detail should be incorporated or described in the MOD-001-1. |
| WECC ATC Team | | | This question is best deferred to the TRM standard.<br><br>That said, the Transmission Service Provider in conjunction with its Transmission Planner should determine the TRM.<br><br>How often TRM should be calculated is dependent upon what elements go into the TRM as will be dictated in the TRM standard. If load forecast error becomes part of TRM, the TRM should be adjusted hourly. By contrast, if the TRM is solely to address seasonal changes that an annual then on/off peak recalculation may be in order. |

18. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

**Summary Consideration:**
Most commenters had no concerns, other than to say that the drafting team should be consistent with Order 890 and 693.

| Question #18 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Duke Energy | | | We understand that the drafting team is examining the impacts of FERC Order 890 for conflicts with the proposed standard. |
| **Response:** The drafting team has addressed FERC Order 890 and FERC Order 693 with respect to the set of ATC/TTC CBM/TRM standards. | | | |
| Entergy | | | No, however requirements in the proposed standards should be consistent with those included in FERC OATT, Orders 888, 889, and recently issued FERC Order 890. |
| **Response:** The drafting team has addressed FERC Order 890 and FERC Order 693 with respect to the set of ATC/TTC CBM/TRM standards. | | | |
| IESO | | | No conflicts. But there are markets that do not provide physical transmission services which require the calculation and posting of ATCs and AFCs. In addition, there are entities that are not under FERC's jurisdiction and hence may not provide any transmission services. |
| **Response:** The drafting team acknowledges your comments. | | | |
| IRC<br>ISO-NE<br>NYISO | | | We are not aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement, because the proposed language is broad enough to accommodate the manner in which ISOs/RTOs provide transmission service in a market-based environment. As NERC continues to develop Standards to govern reliability practices surrounding the calculation of ATC/TTC/AFC/etc... (and coordinate with NAESB regarding its development of associated business/commercial practices) in response to the Commission directive in Order No. 890, NERC's Standards must be broad enough so as not to frustrate the market-based manner in which ISOs/RTOs provide transmission service.<br><br>As the Commission ruled in Order No. 890 with regard to, among other things, the standardization of ATC calculations, "some of the changes adopted in the Final Rule may not be as relevant to ISO/RTO transmission providers as they are to non-independent transmission providers. For example, many ISOs and RTOs use bid-based locational markets and financial rights to address transmission congestion, rather than the first-come, first-served physical rights model set forth in the pro forma OATT. As we indicated in the NOPR, nothing in this rulemaking is intended to upset the market designs used by existing ISOs and RTOs."<br><br>See Order No. 890 at P158. The proposed MOD-001 Standard appears to be in line with this direction. |
| **Response:** The drafting team acknowledges your comments. | | | |
| MidAmerican | | | See General Comments above. FERC Order No. 890 makes the current standard obsolete and it |

| Question #18 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| | | | must be significantly revised. |
| **Response:** The drafting team acknowledges your comments. | | | |
| MISO | | | The FERC order 890 calls for more transparency in the AFC/ATC calculations. This standard did not seem to focus on that aspect, in fact, it gives two different standards for transparency: ATC methods have no transparency, and AFC methods are completely open. In light of the goals expressed in FERC's final rule on this issue, for both transparency and consistency of calculation, the committee should withdraw this proposal and review it carefully in light of FERC's Order 890 While the committee has worked hard to bring the standard to this point, Midwest ISO believes this issue is too important to simply forge ahead without discussing the standard's present definitions and requirements in light of the FERC final rule on this subject, issued the same day this standard was released for comment. |
| **Response:** The drafting team acknowledges your comments. | | | |
| NPCC CP9 | | | No, As the Commission noted in Order No. 890, "some of the changes adopted in the Final Rule may not be as relevant to ISO/RTO transmission providers as they are to non-independent transmission providers. For example, many ISOs and RTOs use bid-based locational markets and financial rights to address transmission congestion, rather than the first-come, first-served physical rights model set forth in the pro forma OATT. As we indicated in the NOPR, nothing in this rulemaking is intended to upset the market designs used by existing ISOs and RTOs." See Order No. 890 at P158. We find that the language as proposed is broad enough to accommodate the manner in which ISOs/RTOs provide transmission service in a market-based environment and satisfies the Commissions note in Order No 890 on this subject.<br><br>In short, so long as a TSP is following approved Market and Tariff rules that are part of a Commission-sanctioned market design, such rules should be deemed consistent with this Standard. |
| **Response:** The drafting team acknowledges your comments. | | | |
| SCE&G and SERC ATCWG | | | Some TSP's OATT have requirements that components of ATC be provided by third parties. For example, in one case, a TSP is required to use the AFC calculations provided by the Reliability Coordinator in determining its ATC. |
| **Response:** The drafting team acknowledges your comments. | | | |
| Southern | | | The drafting team should consider whether particular directives in Order 890 adversely impact reliability and respond appropriately. |
| **Response:** The drafting team acknowledges your comments. | | | |
| SPP | | | No, we are not aware of any. Some TP's may find the need to include more detail into MOD-001-1 to address the concerns raised in the FERC Order No. 890. |
| **Response:** The drafting team acknowledges your comments. | | | |

19. Do you have other comments that you haven't already provided above on the proposed standard?

| Question #19 | |
|---|---|
| **Commenter** | **Comment** |
| AECI | The standard does not provide a clear distiction for use of ATC verses AFC. It is our understanding that Requirements R1-R3 do not apply if the AFC methodology is used. For R4 to R6 if the AFC methodology is used then the TSP is not required to post ATC values, however AFC values would be posted. |
| **Response:** As originally envisioned, requirements R1-R3 would have applied to all of the methods because ATC is required to be calculated by whichever method is chosen. Note that MOD-001 was significantly revised and no longer contains these requirements. | |
| APPA | MOD-001 needs to address how the AFC calculations should be converted to the ATC calculations.<br>MOD-001 needs to show that the ATC formulas for Monthly, Daily, and Hourly calculations are for different paths or networks. MOD-001 needs to show the formula to determine $ATC_{nonfirm}$ for Monthly, Weekly, and Daily calculations.<br>The "future development plan must be modified to include the introduction and assistance of the NERC Compliance Staff to assist the team in developing Measurements, VRFs, and suggested terms of the compliance sections of the Standard. |
| **Response:** Please see the proposed MOD-030. This new standard addresses ATC developed using the flowgate network response method and includes requirements for converting AFC to ATC.<br>The proposed standards (MOD-028, MOD-029, and MOD-030) do not include the formulas that were included in the first draft of MOD-001. The proposed standards all include much more detail in what is required to calculate ATC. Each of the three new standards has clear requirements to distinguish between 'firm' and 'non-firm' ATC.<br>The drafting team wants to move towards consensus on the requirements in the proposed standards before adding all of the compliance elements, | |
| BPA | R4. The formula in R4 describing AFC calculations is not accurate in the way it describes the application of distribution factors. Distribution factors are not necessarily applied to all of the components of the AFC calculation. Distribution factors are applied to transactions to allocate the percentage of the transaction that will flow on each applicable flowgate.<br><br>R14. The requirement to provide the ultimate source and sink on the Transmission Service request, especially when the source or sink is on the other side of an interchange point, is not necessarily required for a Transmission Service Provider to determine the ATC/AFC impacts of a request. Additionally, this requirement may create difficulties for Transmission Customers since the ultimate source and sink may not be known at the time of the request submittal. |
| **Response:** R4. The treatment of the flowgate network response method of calculating ATC is now addressed in MOD-030 and does includes much more specificity on the use of distribution factors.<br>R14: The drafting team removed R14. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice. | |
| CAISO | To provide clarity and uniform application in the calculation of AFC and ATC the CAISO offers the following: When |

| Question #19 | |
|---|---|
| **Commenter** | **Comment** |
| | calculating AFC in the forward markets, this calculation should include counter transmission service requests. In WECC, there is currently no virtual schedules and transmission reservations are expected to provide energy flows real-time (or adjustments are made in real-time to ensure ties are not overscheduled). The formula for AFC would look like: AFC=TFC-(TRM*distribution factor) –(CBM*distribution factor)- the sum of(ETC impacts * respective Distribution Factors) + (counter transmission reservations *respective distribution factions). A similar formula could be provided for calculation of ATC. |
| **Response:** Counter-flow requests cannot always be considered in the AFC (or ATC) calculation because the transmission created by a requested counter-flow transaction is not “available” until the requested transaction is confirmed, in which case the transaction becomes part of ETC. Please review the proposed MOD-030. | |
| Duke Energy | We have not factored impacts of FERC Order 890 into these comments.<br>Editorial comment on R.12 - should read "Each Transmission Service Provider shall identify other Transmission Service Providers with which the data used in the calculation of ATC or AFC is exchanged." |
| **Response:** The first draft of MOD-001 has been significantly revised to address FERC Order 890 and Order 693. The first draft of MOD-001 was posted before FERC Order 890 was released.<br>R12: The revised MOD-001 requires the TSP to develop a document called “Available Transfer Capability Implementation Document” and this document must contain the names of the TSPs with which the TSP exchanges data for use in determining ATC. | |
| Entergy | The Standard Drafting Team has a difficult task of including FERC expectation of making ATC calculations consistent and transparent. Due to different operating practices in different regions of the country, it will be difficult to come up with consistent (one size fits all) method. Regional differences should be recognized keeping in view how these are affecting reliability. Any issues that are commercial in nature should be left to NAESB to include in their Business Practices Standards. |
| **Response:** The drafting team agrees with all of these comments. | |
| ERCOT | Yes. No Regional Differences are identified in this draft. However, ERCOT does not use this methodology and therefore this shall not apply to operating activities and market activities in ERCOT. The standard should provide for ERCOT's non-transaction-based methodology. |
| **Response:** If ERCOT has comments that would assist the drafting team in improving the proposed definition, those comments would be welcome. Within Order 693, the FERC states in paragraph 1007 the following:<br><br>Responding to CenterPoint’s proposal to exempt ERCOT from the MOD Reliability Standards that address available transfer capability, the Commission explained (in the NOPR) that it would consider any regional difference at the time NERC submits one for Commission review. Therefore, the Commission stated that if ERCOT wished to request a regional difference, it should do so through the ERO process.<br><br>As such, we suggest that ERCOT consider this as a possible avenue for further exploration. | |
| Grant County PUD | Thank you for the opportunity to comment. Other comments will arise after further refinement of this standard, and our further study of it. |
| **Response:** The drafting team also thanks you for your comments. | |

| Question #19 | |
|---|---|
| **Commenter** | **Comment** |
| HQT | The drafting team must engage in additional drafting to address the concerns raised by Order No 890. |
| **Response:** The drafting team agrees that the current standard must be significantly revised. The draft standard was posted before FERC Order 890 was released. | |
| IESO | Requirement 12 should be R11.6. |
| **Response:** R12: The drafting team will reword the requirement and consider moving it to a sub-requirement of R11. | |
| KCPL | No. |
| Manitoba Hydro | It is of paramount that a standard is developed that standardizes assumptions and processes. There are many reasonable processes available to develop and study impacts on flowgates. If all transmission providers would be able to contain all the impacts from their operation on their systems, there would not bee the need for this standard. Each transmission provider could use what ever set of assumptions that the wished as long a reliability on their system was maintain. But the very fact that this is not possible to contain impacts requires standardization of assumptions and processes. This is required to insure that when a transmission provider is assessing the impact on a flowgate in a neighbouring system that the assumptions used to assess the impacts are the same assumptions used to develop and study the flowgate. This can only be done if every transmission provider is using one set of assumptions and on set of processes.<br>It appears by what has been presented here that the team is trying to accommodate various processes that are used by the industry today. In my opinion, this can only be done by compromising the reliability.<br><br>It also appears (and I may be wrong) that the team has not fully come to terms with what is a reliability concern and what is a commercial concern. For example, in my opinion, CBM is mostly a commercial concern. CBM has historically been used to account for shortfalls in adequacy studies. I am the first to admit that this is purely a reliability concern. However once the adequacy study has determined the shortfall, there are many methods of mitigating that shortfall ranging from simply putting a CBM value on the ties with your neighbour who is most likely to have excess capacity when you need it to belong to a capacity reserve sharing pool that will reserve transmission through the use of CBM. The only reliability concern in all of this is the identification of the adequacy concern and need to have a posting value to mitigate the adequacy concern. The commercial concerns of how to mitigate those concerns should be left to NAESB. |
| **Response:**<br>The SDT concurs with Manitoba as well as FERC that the fine line between reliability and commercial interests is not easily discernable. The SDT further concurs that business practices should be left to NAESB as is the parallel NAESB process currently underway | |
| MidAmerican | See General Comments above. FERC Order No. 890 makes the current standard obsolete and it must be significantly revised.<br><br>In addition, each of the three methodologies should address contract path limitations. Not only should each methodology address physical limitations of the system, but contractual limitations as well. |
| **Response:** The first draft of MOD-001 has been significantly revised to address FERC Order 890 and Order 693. The first draft of MOD-001 was posted before FERC Order 890 was released.<br>The drafting team also agrees that contract path limitations must be addressed by all three methodologies, probably more appropriately in the | |

| Question #19 | |
|---|---|
| **Commenter** | **Comment** |
| calculation of TTC. | |
| MISO | The standard includes formulas. The formulas should be left to the business practices of the provider and the terms. |
| **Response:** A standard that is intended to make the calculation of values consistent for the purpose of maintaining a reliable system should include the formulas needed to make the calculations. | |
| MRO | a. With FAC 010, 011,012, and 013 why is MOD-001-1 needed for reliability? MOD 001-1 seems to be an OATT business practice issue.<br>b. Informational references to the corresponding development of NAESB business are irrelevant in the Canadian context as Canadian jurisdictions are not obligated to follow NAESB business practices. |
| **Response:** MOD-001 is not a business practice issue. NERC and NAESB are working together to draft companion standards where NERC requirements address reliability concerns and NAESB addresses business practices. | |
| NPCC CP9 | The drafting team must engage in additional drafting to address the concerns raised by Order No 890. |
| **Response:** Agree. The first draft of MOD-001 has been significantly revised to address FERC Order 890 and Order 693. The first draft of MOD-001 was posted before FERC Order 890 was released. | |
| Progress Energy | PE suggests renaming the Standard "ATC Calculation Methodologies" and restate Purpose. AFC is just one engine type used to calculate ATC. |
| **Response:** The drafting team will consider re-titling the standard, in light of the FERC Order 890 requirement to convert AFC to ATC. The standard drafting team does not understand the comment "AFC is just one engine type used to calculate ATC." | |
| SCE&G and SERC ATCWG | Suggest renaming standard to ATC Calculation Methodologies and restate Purpose. AFC is just one of the engines used to calculate ATC. |
| **Response:** The drafting team will consider re-titling the standard, in light of the FERC Order 890 requirement to convert AFC to ATC. The standard drafting team does not understand the comment "AFC is just one engine type used to calculate ATC." | |
| Southern | R5.1 and R5.2 only cover the aspects of non-firm with dealing with an entity's counter flow rules. This could be resolved by adding equations that outline the firm and non-firm aspects of AFC. Firm and non-firm also differ in the treatment of TRM/CBM and postbacks of unscheduled service.<br><br>R8 If Firm and Non-firm equations are used for ATC/AFC this requirement would not be necessary.<br><br>R11.2: There is no "internal expansion planning" during these time frames. The phrase should be deleted. It is unclear what is meant by "use the same criteria and assumptions used to conduct reliability assessments and internal expansion planning for different time frames"<br><br>Generally, expansion planning considers an N-2 approach as opposed to an N-1 in the operating horizon. Expansion planning also generally considers more robust dispatch assumptions in the local area under review. Also, although transfer analysis is a consideration in expansion planning, generally expansion plans are driven by local load serving constraints (thermal or voltage), not ATC considerations (limits to transfers). It would be inappropriate to utilize the same assumptions for ATC as expansion planning.<br><br>R11.3: R11.2 states that the same criteria should be used and R11.3 states that the rationale for any differences should be documented. Does this allow of differences in R11.2? |

| Question #19 | |
|---|---|
| **Commenter** | **Comment** |
| | R11.4: This is not a big deal, but contingencies would be considered in the TTC and not the ATC. It is unclear what is meant by "Identify the contingencies considered in ATC". Is this a general statement of N-1 or specific contingencies used in the TTC assessment?<br>R11.5: This is a planning issue, but this requirement could be problematic and difficult to comply with, especially using the same power flow models. The intent was to make sure that the requirements that you use to grant service were no more stringent that those used to plan for system expansion. We might want to consider suggesting a rewording. Generic ATC values calculated beyond 13 months are not used for addressing TSRs. I am not aware of yearly transmission service being evaluated absent a TSR study of the specific transfers, which would be performed under the planning process, so the models would be one in the same. I assume the "for the same timeframe" language indicates that the assumptions for beyond 13 months do not need to match the assumptions within the 13 monthly timeframe. In addition to the differences in expansion planning discussed above, planning models generally include firm commitments for long term service which may be inappropriate to use in operations (such as CT plant modeled on in April).<br><br>R14 Under the OATT, transmission customers are not required to buy full path transmission service. This would also seem to significantly complicate the redirecting of service, another customer right offered under the OATT. |
| **Response:**<br>R5.1 & R5.2 The revised standard requires the TSP to identify how it accounts for counter-flows – and each of the three standards that includes requirements for developing ATC includes additional requirements related to counter-flows.<br>R8. With the revised standards, each of the three standards that addresses one of the methodologies for determining ATC includes its own requirements for calculating 'firm' and 'non-firm' ATC.<br>R11.2-11.5 - R11.2-11.5 do not apply to users of the Rated System Path Methodology for the calculation of ATC. They do apply to the Rated System Path Methodology for the calculation of TTC and have been translated the intent of these requirements into the new MOD-029.<br>R14. The SDT will consider this comment as it develops the next version of the standards. | |
| WECC ATC Team | Yes. The drafting team should be encouraged to include in the MOD-01 a formula describing how AFC is converted into ATC for the subsequent posting of ATC by those entities utilizing AFC.<br><br>"The Commission also required each transmission provider using an Available Flowgate Capacity (AFC) methodology to explain its definition of AFC, its calculation methodology and assumptions, and its process for converting AFC into ATC." P. 189.<br>R3. This requirement states that the TSP "…shall, when requested, provide or make available, the following values…" What is the retention period for the TSP such that the data will still be available when requested? The drafting team should modify this requirement such that the TSP is only required to respond to requests for data that are within the time frames established within their filed Tariff. For example, TSP's should not have to provide ATC values that would require a System Impact Study.<br>R3. & R6. This requirement states that the TSP provide certain data when requested and when the requestor "…has a reliability related need for the values." How does the TSP judge whether the requester has a reliability related need or not? The drafting team needs to establish a criterion for the need or strike this phrase from the requirement. |

| Question #19 | |
|---|---|
| **Commenter** | **Comment** |
| | R11.2 & R11.3 This requirement states that TSP's, "Require that the calculation of ATC or AFC use the same criteria and assumptions used to conduct reliability assessment and internal expansion planning for different time frames etc." and that they "Document the criteria used for calculating ATC or AFC values for the different time frames etc. and the rationale for any differences between these."<br><br>Those TSPs who use the Rated System Path Methodology rely heavily on criteria and assumptions for calculating the TTC for a path but not for the calculation of ATC. Once the TTC for a path is determined the determination of ATC is simple math with little concern for criteria or assumptions.<br><br>We recommend that the drafting team restrict these two requirements to those TSP's who use the AFC Calculation Methodology and create a parallel requirement for the calculation of TTC for those TSP's who use the Rated System Path Methodology.<br><br>R11.4 & R11.5 This requirement states that TSP's must "Identify the contingencies considered in the ATC and AFC calculation methodologies." and that they "..use the same power flow models, and the same assumptions regarding load, generation dispatch, special protection systems etc. as those used in the expansion planning for the same time frames." This would be important for those who use the AFC Calculation Methodology and build power flow models to determine if capacity will be available. For those using the Rated System Path Methodology these factors are important for the determination of TTC but not for the determination of ATC. Rated System Path Methodology users do not build power flow cases and study contingencies to determine "ATC"; rather, these case studies are done to determine the TTC rating of paths. Therefore we recommend that the drafting team restrict these two requirements to those TSP's who use the AFC Calculation Methodology and create a parallel requirement for the calculation of TTC for those TSP's who use the Rated System Path Methodology.<br><br>R12. This requirement states that TSP's must "Identify the Transmission Service Providers with which the data used in the calculation of ATC or AFC is exchanged." Coordination of data is important but for those using the Rated System Path Methodology this coordination takes place when the TTC for the path and not the ATC for the path is calculated. We recommend that the drafting team make this requirement apply only to those using the AFC Methodology in MOD 001 and create a comparable requirement in the TTC calculation standard for those using the Rated System Path Methodology.<br><br>R14. This requirement states that "The Transmission Service Provider shall require that the Transmission Customer provide both ultimate source and ultimate sink on the Transmission Service Request and shall require that the Transmission Customer use the same source and sink on Interchange Transaction Tags."<br><br>The WECC Team suggests this Requirement should be applicable only to entities using the AFC methodology. |

| Question #19 | |
|---|---|
| **Commenter** | **Comment** |
| | For entities using the Rated System Path (re: the majority of WECC) the source and sink are already part of the Tagging system. At minimum that makes the Requirement redundant for the Rated System Path participants. Further, since Tagging is a business practice, this requirement would fall into the purview of NEASB. Lastly, unlike those using the AFC methodology, the source and sink of each request and subsequent schedule is not needed to determine ATC as it is for those determining AFC using Flowgates. Since entities calculating AFC need to know the source and sink for Flowgate modeling purposes (whereas those using the Rated System Path method do not), the logical application for this Requirement is to those using the AFC methodology. |

**Response:**
Please see the proposed MOD-030 – this standard does include requirements to convert AFC to ATC.
Order 693, P. 1031 / issued after the Standard was drafted states, "Accordingly, transmission providers using an AFC methodology must convert flowgate (AFC) values into path (ATC) values for OASIS posting. See also Order 890, P. P. 211
R3. The revised standard does not include R3.
R6 The SDT agrees it may need to establish a criterion for the "reliability need for the values" or strike this phrase from the requirement. The next draft of the standard will address this.
R11.The revised MOD-001 only includes 'generic' ATC requirements – the requirements for each of the three different methods of calculating ATC have been moved into separate standards, and each of the separate standards includes much more specificity than had been included in MOD-001. Please review MOD-028, MOD-029 and MOD-030.

R12: The revised MOD-001 requires the TSP to develop a document called "Available Transfer Capability Implementation Document" and this document must contain the names of the TSPs with which the TSP exchanges data for use in determining ATC.
R14: The drafting team removed this requirement. Order 890 requires NERC to develop requirements in MOD-001 that specify "a consistent approach on how to simulate reservations from points of receipt to points of delivery when sources and sinks are unknown" so there will be a requirement that addresses sources and sinks and how they are to be consistently modeled (simulated). The drafting team will consider moving the tagging requirement to a NAESB practice.

# Standard Authorization Request Form

| | |
|---|---|
| Title of Proposed Standard: Revisions to existing Standards MOD-001 through MOD-009; FAC-012 through FAC-013. (This SAR is intended to supplement the two already approved SARs for "Revision to Existing Standard MOD-001" dated 2/15/2006 and "Revision to Standards MOD-004, MOD-005, MOD-006, MOD-008, MOD-009" ) | |
| Request Date: | May 23, 2007 |

| **SAR Requester Information** | **SAR Type** (*Check a box for each one that applies.*) | |
|---|---|---|
| Name: The following members of the ATCT Drafting Team:<br>Larry Middleton<br>Chuck Falls<br>Ross Kovacs<br>Laura Lee<br>Cheryl Mendrala<br>Nate Schweighart | ☐ | New Standard |
| Primary Contact: Laura Lee | ☒ | Revision to existing Standard |
| Telephone: (704) 382-3625<br>Fax: | ☒ | Withdrawal of existing Standard (possible) |
| E-mail: | ☐ | Urgent Action |

**Purpose**

This SAR is intended to supplement the SAR for "Revision to Existing Standard MOD-001" dated 2/15/2006, in response to FERC Orders 890 and 693. In evaluating the Orders, it has been discovered that additional modifications will be required to ensure clarity and consistency. Specifically, the following Standards may be modified, transferred to NAESB, or retired:

FAC-012 Transfer Capability Methodology
FAC-013 Establish and Communicate Transfer Capabilities
MOD-002 Review of TTC and ATC Calculations and Results
MOD-003 Procedure for Input on TTC and ATC Methodologies and Values
MOD-007 Documentation of the Use of CBM

**Industry Need** The FERC has directed NERC to provide these changes and clarifications in support of Preventing Undue Discrimination and Preference in Transmission Service, as well in support of Mandatory Reliability Standards for the Bulk Power System.

NERC, as the ERO is required to comply with all FERC directives.

**Brief Description** As directed by the FERC, the drafting team is developing proposed requirements to bring greater consistency and transparency to the calculation of TTC/TFC, ATC/AFC, ETC, CBM, and TRM. The modifications include elimination of the 'fill-in-the-blank' requirements. This possibility was identified in the original SAR; this supplemental SAR is requesting explicit ability to take action on these other standards as a part of the entire standards effort.

**Detailed Description**

Actions of the drafting team may include:

- FAC-012 Transfer Capability Methodology
  - Retirement and movement to a new MOD standard. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical constructs used to analyze the bulk electric system for the purposes o maintaining reliability.
- FAC-013 Establish and Communicate Transfer Capabilities
  - Incorporation into the new MOD standard and retirement. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical constructs used to analyze the bulk electric system for the purposes o maintaining reliability.
- MOD-002 Review of TTC and ATC Calculations and Results
  - Incorporation into MOD-001 and retirement. It is believed that much of this is related to the measurement and compliance aspects of Available Transfer Capability, and will be handled as such.
- MOD-003 Procedure for Input on TTC and ATC Methodologies and Values
  - Transfer to NAESB and retirement. It is believed that this standard is more focused on business practices.
- MOD-007 Documentation of the Use of CBM
  - Incorporation into MOD-004 and retirement. It is believed that much of this is related to the measurement and compliance aspects of CBM, and will be handled as such.

The drafting team will address all of the directives in FERC Order 693 and FERC Order 890 listed in Attachment 1.

***Reliability Functions***

| **The Standard will Apply to the Following Functions** *(Check box for each one that applies.)* | | |
|---|---|---|
| ☒ | Reliability Coordinator | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view. |
| ☒ | Balancing Authority | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time. |
| ☐ | Interchange Coordinator | Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas. |
| ☒ | Planning Coordinator | Assesses the longer-term reliability of its Planning Coordinator Area. |
| ☐ | Resource Planner | Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area. |
| ☒ | Transmission Planner | Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area. |
| ☒ | Transmission Service Provider | Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff). |
| ☒ | Transmission Owner | Owns and maintains transmission facilities. |
| ☒ | Transmission Operator | Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area. |
| ☐ | Distribution Provider | Delivers electrical energy to the End-use customer. |
| ☒ | Generator Owner | Owns and maintains generation facilities. |
| ☐ | Generator Operator | Operates generation unit(s) to provide real and reactive power. |
| ☒ | Purchasing-Selling Entity | Purchases or sells energy, capacity, and necessary reliability-related services as required. |
| ☐ | Market Operator | Interface point for reliability functions with commercial functions. |
| ☒ | Load-Serving Entity | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view. |

***Reliability and Market Interface Principles***

| **Applicable Reliability Principles** *(Check box for all that apply.)* | |
|---|---|
| ☒ | 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards. |
| ☐ | 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand. |
| ☒ | 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| ☐ | 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented. |
| ☐ | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems. |
| ☒ | 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions. |
| ☐ | 7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis. |
| ☐ | 8. Bulk power systems shall be protected from malicious physical or cyber attacks. |

| **Does the proposed Standard comply with all of the following Market Interface Principles?** *(Select 'yes' or 'no' from the drop-down box.)* |
|---|
| 1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes |
| 2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes |
| 3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes |
| 4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes |

**Directives from Order 693 and 890 related to ATC Standards**

693-1057 Develop non-fill-in-the-blank Standard
693-1057 Define information to be shared between TSPs for ATC calculations
693-1057 Planning Assumptions and ATC Assumptions should be the same
890-292 Planning Assumptions and ATC Assumptions should be the same
890-292 Load levels the same plan/ops vs. ATC
890-292 Gen Dispatch the same plan/ops vs. ATC
890-292 TX and Gen Facilities maintenance the same plan/ops vs. ATC
890-292 Contingency outages the same plan/ops vs. ATC
890-292 Topology the same plan/ops vs. ATC
890-292 TX Reservations the same plan/ops vs. ATC
890-292 Assumptions re: additions and retirements the same plan/ops vs. ATC
890-292 Counter-flows the same plan/ops vs. ATC
890-295 Load level modeling methodology the same
890-296 Dispatch should include all DNRs and committed resources as expected to run, and uncommitted resources deliverable within CA, economically dispatched to meet balancing needs
890-297 How to model POR to POD without source/sink
890-297 How to model existing reservations
693-1057 ATC should be updated on a consistent schedule
693-1057 ATC/TTC Assumptions and Contingencies must be made available
693-1057 Put TTC in FAC section
693-1057 Identify applicable entities
693-1105 CBM must be 0 in non-firm ATC
890-262 CBM =0 in Non-Firm Calc
890-273 TRM <> =0 in Non-Firm Calc
890-211 Standard AFC->ATC Calculation
890-212 Firm ATC uses only Firm Commitments
890-212 Non-Firm ATC uses firm and non-firm commitments, post-backs or redirected services, unscheduled service, and counter-flows
890-237 Address differences between Pro-Forma TTC and Native Load/Reliability Assessment TTC
890-243 Standard calc of native load use - include in MOD-001
890-244 ETC = Native load (including Network)
890-244 ETC = Grandfathered
890-244 ETC = Appropriate PTP
890-244 ETC = Long-term Rollover rights
890-244 Define any additional ETC components
890-245 Reservations with Same POR whose SUM would exceed gen nameplate must be addressed
890-310 Mandatory Data Exchange for ATC
890-310 DEX Load
890-310 DEX TX Plan and Contingency outages
890-310 DEX Gen Plan and Contingency outages
890-310 DEX Base dispatch
890-310 DEX existing reservations including counter-flows
890-310 DEX ATC recalculation frequencies and times
890-310 DEX Source sink modeling identification
890=389 Unscheduled Reservation released on non-firm and posted on OASIS

**Directives from Order 693 and 890 related to CBM Standard**

693-1082 CBM set aside at verified request of LSE
693-1082 Require disclosure of CBM studies
693-1082 Define flowgate/path allocation process for CBM
693-1082 No double counting
693-1082 Add LSE, BA as applicable entity where necessary
693-1105 CBM Must be used only for generation deficiencies
693-1105 Generation Deficiency must be states as an EEA level
890-260 Define flowgate/path allocation process for CBM
890-262 CBM Must be used only for generation deficiencies
890-358 yearly CBM studies
693-1081 What to do if CBM exceeds ATC?

**Directives from Order 693 and 890 related to TRM Standard**

693-1122 Define flowgate/path allocation process for TRM
693-1126 Explicit definition of what goes into TRM
693-1122 TRM = Load Forecast and Load Distribution Error
693-1122 TRM = Variation in facility loading
693-1122 TRM = uncertainty in transmission topology
693-1122 TRM = loop flow
693-1122 TRM = variations in dispatch
693-1122 TRM = ARS
693-1122 Define any additional uses
890-273 Explicit definition of what goes into TRM
890-273 TRM = Load Forecast and Load Distribution Error
890-273 TRM = Variation in facility loading
890-273 TRM = uncertainty in tx topology
890-273 TRM = loop flow
890-273 TRM = variations in dispatch
890-273 TRM = ARS
890-273 Define any additional uses
693-1082 No double counting
890-273 No double counting
693-1126 Max TRM Calc
890-275 Max TRM Calc
693-1126 Standard on How TRM to be calculated
693-1126 Add PC, RE to applicable entities

Ladies and Gentlemen:

## Announcement: Comment Period Opens

**The Standards Committee (SC) announces the following standards actions:**

### SAR and Draft Standards for Available Transfer Capability (Project 2006-07) Posted for 30-day Comment Period May 25–June 24, 2007

To fully address the directives in FERC Orders 890 and 693 relative to Available Transfer Capability (ATC), a "Supplemental ATC SAR" has been posted for a 30-day comment period. Please use the comment form to provide comments on this SAR.

The ATC Standard Drafting Team has posted a set of requirements distributed amongst six standards aimed at meeting the intent of the originally approved SARs for ATC/TTC/AFC and CBM/TRM as well as the directives in FERC Orders 890 and 693. The drafting team also posted a white paper that explains the following proposed organization of the revised set of standards:

- There is one "umbrella" standard with requirements related to ATC (MOD-001 and comment form)
- There are three separate standards to address the determination of ATC, with each also addressing associated requirements for TTC and ETC:
  - Network Response method of calculating ATC (MOD-028 and comment form)
  - Rated System Path method of calculating ATC (MOD-029 and comment form)
  - Flowgate Network Response method of calculating ATC (MOD-030 and comment form)
- There is a separate standard to address Capacity Benefit Margin (MOD-004 and comment form)
- There is a separate standard to address Transmission Reliability Margin (MOD-008 and comment form).

Because the modifications made to the standards are so extensive, no "redline" versions of the standards have been developed. The versions of the standards that have been posted contain only requirements — there are no measures or compliance elements. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please use the comment forms posted with the proposed standards to provide comments on this set of standards.

## Standards Development Process

The *Reliability Standards Development Procedure* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. If you have any questions, please contact me at 813-468-5998 or maureen.long@nerc.net.

Sincerely,

Maureen E. Long

## Background Information

This SAR is intended to supplement the already approved SARs to modify ATC/TTC/AFC and CBM/TRM. The expanded scope will bring the set of standards into compliance with the latest versions of the Reliability Standards Procedure Manual and the ERO's Sanctions Guidelines and will address the directives relative to ATC in FERC Orders 890 and 693.

In addition to making all required modifications to MOD-001, MOD-004, and MOD-008, the following standards may be modified, transferred to NAESB, or retired in accordance with stakeholder comments and FERC directives:

FAC-012 – Transfer Capability Methodology
FAC-013 – Establish and Communicate Transfer Capabilities
MOD-002 – Review of TTC and ATC Calculations and Results
MOD-003 – Procedure for Input on TTC and ATC Methodologies and Values
MOD-007 – Documentation of the Use of CBM

The requesters would like to receive industry comments on this SAR. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.net with the subject "ATC Supplement SAR" by **June 24, 2007**.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. NERC must address the directives in FERC Orders 890 and 693. Do you agree that this SAR is comprehensive enough to fully address the directives relative to ATC that are included in these Orders? If not, please explain in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. Please provide any other comments you have on the SAR.

   Comments:

Please return this form to sarcomm@nerc.net by **June 8, 2007** with "ATC Supplement Nomination" in the subject line. For questions, please contact Andy Rodriquez at 609-947-3885 or Andy.Rodriquez@nerc.net.

1. NERC must address the directives in FERC Orders 890 and 693. Do you agree that this SAR is comprehensive enough to fully address the directives relative to ATC that are included in these Orders? If not, please explain in the comments area.

   ☒ Yes

   ☐ No

   Comments: While the summary of FERC Directives contained on pages SAR-6 and SAR-7 appears very complete, the summary uses a shorthad notation that it is somewhat cryptic and difficult to decypher. However, there appear to have been some ommissions as follows:
   890-237 Consistent practices for calculating TTC/TFC
   890-244 In short-term ATC calclulations all reserved but unused transfer capability shall be released as non-firm ATC
   890-257 Develop standards for CBM determination, allocation and use
   890-259 CBM only used to allow LSE to meet its generation reliaibility criteria
   890-293 Approach for accounting for counter flows in ATC standards
   890-301 ATC recalculation by TSP on a consistent time interval and in a manner tha closely reflects actual system topology
   890-354 Unused transfer capability set aside for CBM made available for non-firm use and posted on OASIS
   890-416 Posting of load data on LSE or BAA level of granularity rather than RTO/ISO total load

2. Please provide any other comments you have on the SAR.

   Comments: Page SAR-2 paragraph FAC-012 and FAC-013 have misspellings "purposes o maintaining" should say "purpose of maintaining."

Please use this form to submit comments on the proposed Supplemental SAR for Revisions to MOD-001 through MOD-009; FAC-012 through FAC-013. Comments must be submitted by **June 24, 2007**. MOD-007 – Documentation of the Use of CBM

The requesters would like to receive industry comments on this SAR. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.net with the subject "ATC Supplement SAR" by **June 24, 2007**.

**You do not have to answer all questions.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. NERC must address the directives in FERC Orders 890 and 693. Do you agree that this SAR is comprehensive enough to fully address the directives relative to ATC that are included in these Orders? If not, please explain in the comments area.

   ☒ Yes

   ☒ No

   Comments: The SAR will address all of the 77 directives from Orders 693 and 890 that are listed in Attachment 1. It is not clear if this list is comprehensive. Does the list include references have already been handled in the MOD standards currently under review, or does the list only included references yet to be addressed?

2. Please provide any other comments you have on the SAR.

   Comments: Is it possible that the proposed SAR drafting team will revise the standards MOD-001, MOD-004, MOD-008, MOD-028, MOD-029 and MOD-030 that are currently under review?

Please use this form to submit comments on the proposed Supplemental SAR for Revisions to MOD-001 through MOD-009; FAC-012 through FAC-013. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "ATC Supplement SAR" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

MOD-003 – Procedure for Input on TTC and ATC Methodologies and Values
MOD-007 – Documentation of the Use of CBM

The requesters would like to receive industry comments on this SAR. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.net with the subject "ATC Supplement SAR" by **June 24, 2007**.

## You do not have to answer all questions.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. NERC must address the directives in FERC Orders 890 and 693. Do you agree that this SAR is comprehensive enough to fully address the directives relative to ATC that are included in these Orders? If not, please explain in the comments area.

   ☒ Yes

   ☒ No

   Comments: The SAR proposes to address all of the 77 directives from Orders 693 and 890 that are listed in Attachment 1. However, it is not clear if this list is comprehensive. Does the list include references have already been handled in the MOD standards which are currently under review (MOD-001-1, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1) or does the list only included those references which are not addressed by the above-mentioned standards under review currently?

2. Please provide any other comments you have on the SAR.

   Comments: Is it possible that the proposed SAR drafting team will revise the standards MOD-001, MOD-004, MOD-008, MOD-028, MOD-029 and MOD-030 that are currently under review? It might have been better that this SAR was addressed first and then the mentioned MOD standards if these were to be revised as a result of this supplemental SAR.

   We do not agree with making the MOD-004 standard, a cluttered standard. This coupled with the need to make a distinction between the ATC calculation methods used and the descriptive procedure for resource adequacy assessment has made the new MOD-004 very convoluted, and the requirements difficult to follow and measure. If combining some standards of related objective is desired, a more manageable and appropriate alternative is to divide these 4 standards into two groups - one on the determining and verifying the calculation of CBM (Methodology, Assumptions, and Documentation) and the other on the use and reporting of use of CBM (Applicability and Reporting).

   The roles of the Reliability Coordinator, Planning Coordinator, Transmission Owner, and the Transmission Service Provider must be clearly articulated in these standards as well as the new MOD standard that will come into effect as a result of FAC-012 and FAC-013.

Please use this form to submit comments on the proposed Supplemental SAR for Revisions to MOD-001 through MOD-009; FAC-012 through FAC-013. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "ATC Supplement SAR" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

This SAR is intended to supplement the already approved SARs to modify ATC/TTC/AFC and CBM/TRM. The expanded scope will bring the set of standards into compliance with the latest versions of the Reliability Standards Procedure Manual and the ERO's Sanctions Guidelines and will address the directives relative to ATC in FERC Orders 890 and 693.

In addition to making all required modifications to MOD-001, MOD-004, and MOD-008, the following standards may be modified, transferred to NAESB, or retired in accordance with stakeholder comments and FERC directives:

FAC-012 – Transfer Capability Methodology
FAC-013 – Establish and Communicate Transfer Capabilities
MOD-002 – Review of TTC and ATC Calculations and Results
MOD-003 – Procedure for Input on TTC and ATC Methodologies and Values
MOD-007 – Documentation of the Use of CBM

The requesters would like to receive industry comments on this SAR. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.net with the subject "ATC Supplement SAR" by **June 24, 2007**.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. NERC must address the directives in FERC Orders 890 and 693. Do you agree that this SAR is comprehensive enough to fully address the directives relative to ATC that are included in these Orders? If not, please explain in the comments area.

   ☐ Yes

   ☒ No

   Comments: We agree that the SAR is comprehensive in addressing the FERC directives, and that changes to the MOD standards must be made to comply with the directives. However, this SAR is not comprehensive enough to provide the rationale and proposed scope and description on the restructuring of MOD-001, viz. the creation of MOD-028, MOD-029 and MOD-030, and more importantly, the retirement of FAC-012 and -013. And the revised SAR has not gone through a review and comment period before the newly created MOD-028, etc. are posted for comments.

   The proposed restructuring of MOD-001, the creation of new standards and the retirement of FAC Standards are substantive changes to the original SAR. As such, the rationale and details need to be provided to the revised SAR and posted for comment. The industry needs to be given an opportunity to comment on the need and appropriateness of spliting the standards in this fashion, and the scope of each of the split standards.

   The industry is now asked to comment both on the SAR and the revised and new MOD standards, which in our view makes commenting on the SAR as relates to the development of new MOD Standards almost irrelevant.

2. Please provide any other comments you have on the SAR.

   Comments: From a process viewpoint, 3 new standards are created, and two standards are considered to be retired, without a SAR. This SAR that we are commenting on only provides the basis for making changes to address FERC directives, but does not list and provide the rationale for the new standards or the retirement of standards. This doesn't seem to be consistent with the reliability standards development procedure.

   Similarly, there is no SAR or any mention in this SAR to combine MOD-004 to MOD-007. This is also a major change to the existing standards. A SAR to provide the rationale for the change, and the proposed scope of the consolidated standard need to be provided for industry comment, with sufficient time before any standard drafting work is done and the revised standards posted.

Please use this form to submit comments on the proposed Supplemental SAR for Revisions to MOD-001 through MOD-009; FAC-012 through FAC-013. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "ATC Supplement SAR" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

1. NERC must address the directives in FERC Orders 890 and 693. Do you agree that this SAR is comprehensive enough to fully address the directives relative to ATC that are included in these Orders? If not, please explain in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. Please provide any other comments you have on the SAR.

   Comments: This SAR appears to be necessary to inform FERC of potential inconsistencies in the propose standards that might be caused by a small number of the FERC orders. TTC for AFC/ATC does not belong in FAC-012 for example, even though FERC directed this. It's based on a misunderstanding of the original intent of FAC-012. As such, we support any work to clarify the meaning and intent of standards that are needed to meet FERC orders.

Please use this form to submit comments on the proposed Supplemental SAR for Revisions to MOD-001 through MOD-009; FAC-012 through FAC-013. Comments must be submitted by **June 24, 2007**. *If more than one Region or Segment applies, indicate the best fit for the purpose of these comments. Regional acronyms and segment numbers are shown on prior page.

## Background Information

This SAR is intended to supplement the already approved SARs to modify ATC/TTC/AFC and CBM/TRM. The expanded scope will bring the set of standards into compliance with the latest versions of the Reliability Standards Procedure Manual and the ERO's Sanctions Guidelines and will address the directives relative to ATC in FERC Orders 890 and 693.

In addition to making all required modifications to MOD-001, MOD-004, and MOD-008, the following standards may be modified, transferred to NAESB, or retired in accordance with stakeholder comments and FERC directives:

FAC-012 – Transfer Capability Methodology
FAC-013 – Establish and Communicate Transfer Capabilities
MOD-002 – Review of TTC and ATC Calculations and Results
MOD-003 – Procedure for Input on TTC and ATC Methodologies and Values
MOD-007 – Documentation of the Use of CBM

The requesters would like to receive industry comments on this SAR. Accordingly, we request that you include your comments on this form and e-mail to sarcomm@nerc.net with the subject "ATC Supplement SAR" by **June 24, 2007**.

**You do not have to answer all questions.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. NERC must address the directives in FERC Orders 890 and 693. Do you agree that this SAR is comprehensive enough to fully address the directives relative to ATC that are included in these Orders? If not, please explain in the comments area.

   ☒ Yes

   ☒ No

   Comments: The SAR will address all of the 77 directives from Orders 693 and 890 that are listed in Attachment 1. It is not clear if this list is comprehensive. Does the list include references have already been handled in the MOD standards currently under review, or does the list only included references yet to be addressed?

2. Please provide any other comments you have on the SAR.

   Comments: Is it possible that the proposed SAR drafting team will revise the standards MOD-001, MOD-004, MOD-008, MOD-028, MOD-029 and MOD-030 that are currently under review?

Please use this form to submit comments on the proposed Supplemental SAR for Revisions to MOD-001 through MOD-009; FAC-012 through FAC-013. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with the words "ATC Supplement SAR" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

# Standard Authorization Request Form

## Attachment to the Supplemental SAR

Formatted: Font: Arial

| | |
|---|---|
| Title of Proposed Standard | Revisions to existing Standards MOD-001 through MOD-009; FAC-012 through FAC-013. (This SAR is intended to supplement the two already approved SARs for "Revision to Existing Standard MOD-001" dated 2/15/2006 and "Revision to Standards MOD-004, MOD-005, MOD-006, MOD-008, MOD-009" ) |
| Request Date | May 23, 2007 |

| SAR Requester Information | SAR Type (*Check a box for each one that applies.*) | |
|---|---|---|
| Name The following members of the ATCT Drafting Team: | ☐ | New Standard |
| Primary Contact | ☒ | Revision to existing Standard |
| Telephone<br>Fax | ☒ | Withdrawal of existing Standard (possible) |
| E-mail | ☐ | Urgent Action |

Formatted: Indent: Left: 36 pt

**Purpose**

This SAR is intended to supplement the SAR for "Revision to Existing Standard MOD-001" dated 2/15/2006, in response to FERC Orders 890 and 693. In evaluating the Orders, it has been discovered that additional modifications will be required to ensure clarity and consistency. Specifically, the following Standards may be modified, transferred to NAESB, or retired:

FAC-012 Transfer Capability Methodology
FAC-013 Establish and Communicate Transfer Capabilities
MOD-002 Review of TTC and ATC Calculations and Results
MOD-003 Procedure for Input on TTC and ATC Methodologies and Values
MOD-007 Documentation of the Use of CBM

**Industry Need** The FERC has directed NERC to provide these changes and clarifications in support of Preventing Undue Discrimination and Preference in Transmission Service, as well in support of Mandatory Reliability Standards for the Bulk Power System. NERC and the Industry will provide these changes and clarifications in support of Consistent Modeling Methods and Principles for Simulating Power Transfers and Determination of Transfer Capabilities, Timely and Accurate Communication of the Values of the TTC/TFC and the Assumptions Used to Calculate the TTC/TFC, and eliminating a fill-in-the-blank Standards.

NERC, as the ERO, is required to comply with all FERC directives.

Formatted: Font: Not Bold

Deleted: .

Formatted: Font: Not Bold, Not Highlight

Formatted: Font: Not Bold, Not Highlight

Formatted: Font: Arial, 11 pt

**Brief Description** As directed by the FERC, the drafting team is developing proposed requirements to bring greater consistency and transparency to the calculation of TTC/TFC, ATC/AFC, ETC, CBM, and TRM. The modifications include elimination of the 'fill-in-the-blank' requirements. This possibility was identified in the original SAR; this supplemental SAR is requesting explicit ability to take action on these other standards as a part of the entire standards effort. This will be accomplished by the expansion of the exiting MOD-001 through 009 Standard Drafting Team. The expanded MOD-001 through 009 Standard Drafting Team will be comprised of personnel experienced and qualified in the calculation of the TTC/TFC for the planning and operating horizons and communicating those values and assumptions in a manner that will support the planning and operations of the BES and support efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers.

**Detailed Description**

Actions of the drafting team may include:

FAC-012 Transfer Capability Methodology

Modification of FAC-012 or retirement of FAC-012 and movement to a new MOD standard. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical modeling used to analyze the bulk electric system for the purposes of maintaining reliable planning and operation of the BES and supporting efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers. However, all of the FAC Standards series are relate and the modeling in Standard FAC -012 is directly related to FAC 001 through 011.

Prepare for approval by the Industry, NERC BOT, and FERC a detailed standard that will provide the necessary requirements for the industry to develop Total Transfer Capabilities or Total Flowgate Capabilities utilizing methods that will meet the following requirements:

- Eliminate the "fill-in-blank" format of FAC-012-1
- The Standard will be written in a detailed format that incorporates the principles of calculating Total Transfer Capabilities or Total Flowgate Capabilities contained in "A Reference Document for Calculating and Reporting the Electric Power Transfer Capability of Interconnected Electric Systems;" dated 1995; Titled Transmission Transfer Capability; published by the North American Electric Reliability Council.
- The Standard will be written to include detailed requirements for eliminating discontinuity at the seams between Regions that utilize different methods of calculating Total Transfer Capability or Total Flowgate Capabilities.
- The Standard will retire the glossary term Transfer Capability and modify, if necessary, the glossary term Total Transfer Capability to be consistent with the principles contained in the this Standard.
- The Standard will insure that the Applicable Reliability Functions calculate the values of the Total Transfer Capabilities or Total Flowgate Capabilities for planning and operating horizons in a timely manner that will support the planning and operations of the BES and support marketing effort to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers.

FAC-013 Establish and Communicate Transfer Capabilities

Modification of FAC-013 or retirement of FAC-013 and incorporation into a new MOD standard. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical modeling used to analyze the bulk electric system for the purposes of maintaining reliable planning and operation of the BES and supporting efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers.

Prepare for approval by the Industry, NERC BOT, and FERC a detailed standard that will provide the necessary requirements for the industry to timely communicate the values of the Total Transfer Capability or Total Flowgate Capability calculated in accordance with the requirements of FAC-012; and to communicate, when required by other Standards, the assumptions used to calculate the values of the Total Transfer Capability or Total Flowgate Capability to support reliable operations and the marketing requirements of Available Transfer Capability.

The assumptions used to determine the Total Transfer Capability or Total Flow Capability communicated to the industry shall, without violating confidentially or security requirements, include, but not be limited to:

- Existing Transmission Commitments Used for Planned Scheduled Energy Transfers
- Projected Loads
- Planned Generator Unit Commitments
- Planned System Configuration of the Interconnected System
- System Contingencies Assumed During the Studies
- Impacts of Neighboring Systems
- Impacts on Neighboring Systems

Formatted: Bullets and Numbering

MOD-002 Review of TTC and ATC Calculations and Results

Incorporation into MOD-001 and retirement. It is believed that much of this is related to the measurement and compliance aspects of Available Transfer Capability, and will be handled as such.

MOD-003 Procedure for Input on TTC and ATC Methodologies and Values

Transfer to NAESB and retirement. It is believed that this standard is more focused on business practices.

MOD-007 Documentation of the Use of CBM

Incorporation into MOD-004 and retirement. It is believed that much of this is related to the measurement and compliance aspects of CBM, and will be handled as such.

The drafting team will address all of the directives in FERC Order 693 and FERC Order 890 listed in Attachment 1.

***Reliability Functions***

| **The Standard will Apply to the Following Functions** *(Check box for each one that applies.)* | | |
|---|---|---|
| ☒ | Reliability Coordinator | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view. |
| ☒ | Balancing Authority | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time. |
| ☐ | Interchange Coordinator | Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas. |
| ☒ | Planning Coordinator | Assesses the longer-term reliability of its Planning Coordinator Area. |
| ☐ | Resource Planner | Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area. |
| ☒ | Transmission Planner | Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area. |
| ☒ | Transmission Service Provider | Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff). |
| ☒ | Transmission Owner | Owns and maintains transmission facilities. |
| ☒ | Transmission Operator | Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area. |
| ☐ | Distribution Provider | Delivers electrical energy to the End-use customer. |
| ☒ | Generator Owner | Owns and maintains generation facilities. |
| ☐ | Generator Operator | Operates generation unit(s) to provide real and reactive power. |
| ☒ | Purchasing-Selling Entity | Purchases or sells energy, capacity, and necessary reliability-related services as required. |
| ☐ | Market Operator | Interface point for reliability functions with commercial functions. |
| ☒ | Load-Serving Entity | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view. |

***Reliability and Market Interface Principles***

| **Applicable Reliability Principles** *(Check box for all that apply.)* | |
|---|---|
| ☒ | 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards. |
| ☐ | 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand. |
| ☒ | 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| ☐ | 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented. |
| ☐ | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems. |
| ☒ | 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions. |
| ☐ | 7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis. |
| ☐ | 8. Bulk power systems shall be protected from malicious physical or cyber attacks. |

| **Does the proposed Standard comply with all of the following Market Interface Principles?** *(Select 'yes' or 'no' from the drop-down box.)* |
|---|
| 1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes |
| 2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes |
| 3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes |
| 4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes |

**Directives from Order 693 and 890 related to ATC Standards**

**693-782 Directs the ERO to modify FAC-012 to calculate transfer capability for ATC calculations and eliminate fill-in-the-blank format.**
**693-783 Recognized that the change for FAC-012 is on the schedule set in Order 890**
**693-1050 TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0.**
**693-1051 The Commission directs the ERO, through the Reliability Standards development process, to modify FAC-012-1 and any other appropriate Reliability Standards to assure consistency in the determination of TTC/TFC for services provided under the pro forma OATT,**

Formatted: Box Text, Font: Verdana, 12 pt, Bold

Formatted: Box Text, Font: Verdana, 12 pt, Bold

693-1057 Develop non-fill-in-the-blank Standard
693-1057 Define information to be shared between TSPs for ATC calculations
693-1057 Planning Assumptions and ATC Assumptions should be the same
890-292 Planning Assumptions and ATC Assumptions should be the same
890-292 Load levels the same plan/ops vs. ATC
890-292 Gen Dispatch the same plan/ops vs. ATC
890-292 TX and Gen Facilities maintenance the same plan/ops vs. ATC
890-292 Contingency outages the same plan/ops vs. ATC
890-292 Topology the same plan/ops vs. ATC
890-292 TX Reservations the same plan/ops vs. ATC
890-292 Assumptions re: additions and retirements the same plan/ops vs. ATC
890-292 Counterlfows the same plan/ops vs. ATC
890-295 Load level modeling methodology the same
890-296 Dispatch should include all DNRs and committed resources as expected to run, and uncommitted resources deliverable within CA, economically dispatched to meet balancing needs
890-297 How to model POR to POD without source/sink
890-297 How to model existing reservations
693-1057 ATC should be updated on a consistent schedule
693-1057 ATC/TTC Assumptions and Contingencies must be made available
693-1057 Put TTC in FAC section
693-1057 Identify applicable entities
693-1105 CBM must be 0 in non-firm ATC
890-262 CBM =0 in Non-Firm Calc
890-273 TRM <> =0 in Non-Firm Calc
890-211 Standard AFC->ATC Calculation
890-212 Firm ATC uses only Firm Commitments
890-212 Non-Firm ATC uses firm and non-firm commitments, postbacks or redirected services, unscheduled service, and counterflows
890-237 Address differencess between Pro-Forma TTC and Native Load/Reliability Assessment TTC
890-243 Standard calc of native load use - include in MOD-001
890-244 ETC = Native load (including Network)
890-244 ETC = Grandfathered
890-244 ETC = Appropriate PTP
890-244 ETC = Long-term Rollover rights
890-244 Define any additional ETC components
890-245 Reservations with Same POR whose SUM would exceed gen nameplate must be addressed
890-310 Mandatory Data Exchange for ATC
890-310 DEX Load
890-310 DEX TX Plan and Contingency outages
890-310 DEX Gen Plan and Contingency outages

890-310 DEX Base dispatch
890-310 DEX existing reservations incl counterflows
890-310 DEX ATC recalc frequencies and times
890-310 DEX Source sink modeling identification
890=389 Unscheduled Reservation released on non-firm and posted on OASIS

| Directives from Order 693 and 890 related to CBM Standard |
|---|
| 693-1082 CBM set aside at verified request of LSE |
| 693-1082 Require disclosure of CBM studies |
| 693-1082 Define flowgate/path allocation process for CBM |
| 693-1082 No double counting |
| 693-1082 Add LSE, BA as applicable entity where necessary |
| 693-1105 CBM Must be used only for generation deficiencies |
| 693-1105 Generation Deficiency must be states as an EEA level |
| 890-260 Define flowgate/path allocation process for CBM |
| 890-262 CBM Must be used only for generation deficiencies |
| 890-358 yearly CBM studies |
| 693-1081 What to do if CBM exceeds ATC? |
| **Directives from Order 693 and 890 related to TRM Standard** |
| 693-1122 Define flowgate/path allocation process for TRM |
| 693-1126 Explicit definition of what goes into TRM |
| 693-1122 TRM = Load Forecast and Load Distribution Error |
| 693-1122 TRM = Variation in facility loading |
| 693-1122 TRM = uncertainty in transmission topology |
| 693-1122 TRM = loop flow |
| 693-1122 TRM = variations in dispatch |
| 693-1122 TRM = ARS |
| 693-1122 Define any additional uses |
| 890-273 Explicit definition of what goes into TRM |
| 890-273 TRM = Load Forecast and Load Distribution Error |
| 890-273 TRM = Variation in facility loading |
| 890-273 TRM = uncertainty in tx topology |
| 890-273 TRM = loop flow |
| 890-273 TRM = variations in dispatch |
| 890-273 TRM = ARS |
| 890-273 Define any additional uses |
| 693-1082 No double counting |
| 890-273 No double counting |
| 693-1126 Max TRM Calc |
| 890-275 Max TRM Calc |
| 693-1126 Standard on How TRM to be calculated |
| 693-1126 Add PC, RE to applicable entities |

**Consideration of Comments — (Supplemental) SAR for Revisions to Standards MOD-001 through MOD-009; FAC-012 through FAC-013**

The requesters thank all commenters who submitted comments on the (Supplemental) SAR for Revisions to Standards MOD-001 through MOD-009; FAC-012 through FAC-013. This SAR was posted for a 30-day public comment period from May 24 through June 25, 2007. The requesters asked stakeholders to provide feedback on the standard through a special standard Comment Form. There were 12 sets of comments, including comments from 40 different people from more than 30 companies representing 7 of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received, the drafting team has made the following minor changes to the SAR and is recommending that the Standards Committee authorize the standard drafting team to continue its work on the associated standards without posting the SAR for another comment period.

- The drafting team added some clarifying words to improve the description of the proposed changes to FAC-012 and FAC-013
- The drafting team added several references to paragraphs in FERC Order 693 and FERC Order 890 that were omitted in the first posting of the SAR

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

## Index to Questions, Comments, and Responses

1. NERC must address the directives in FERC Orders 890 and 693. Do you agree that this SAR is comprehensive enough to fully address the directives relative to ATC that are included in these Orders? If not, please explain in the comments area.

**Summary Consideration:** While most commenters indicated they do agree that the SAR is comprehensive enough to fully address the directives relative to ATC that are included in FERC Orders 890 and 693, there were some commenters who provided suggestions to further clarify the scope of additional work needed to fully comply with the directives and the SDT made the following changes to the SAR in support of those suggestions:

| Question #1 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| APPA | | ☑ | The Supplemental SAR is incomplete and vague in directing the SDT as to its objective in providing new standards that will insure and/or improve the reliability of the BES. |
| **Response:** We have clarified the purpose statement to indicate that the changes being undertaken are to address the issues required in Orders 890 and 693 as described later in the SAR. | | | |
| IRC SRC | | ☑ | We agree that the SAR is comprehensive in addressing the FERC directives, and that changes to the MOD standards must be made to comply with the directives. However, this SAR is not comprehensive enough to provide the rationale and proposed scope and description on the restructuring of MOD-001, viz. the creation of MOD-028, MOD-029 and MOD-030, and more importantly, the retirement of FAC-012 and -013. And the revised SAR has not gone through a review and comment period before the newly created MOD-028, etc. are posted for comments.<br><br>The proposed restructuring of MOD-001, the creation of new standards and the retirement of FAC Standards are substantive changes to the original SAR. As such, the rationale and details need to be provided to the revised SAR and posted for comment. The industry needs to be given an opportunity to comment on the need and appropriateness of spliting the standards in this fashion, and the scope of each of the split standards.<br><br>The industry is now asked to comment both on the SAR and the revised and new MOD standards, which in our view makes commenting on the SAR as relates to the development of new MOD Standards almost irrelevant. |
| **Response:** The supplemental SAR is not intended to replace the SAR already approved to support modifications to MOD-001. The SAR for modifications to MOD-001 did envision having multiple processes for determining ATC or AFC – if all requirements are included in a single standard the standard would be extremely long and difficult to follow. The SDT has asked stakeholders for feedback on the acceptability of this division. A detailed explanation of this was included with the posted standard. | | | |

| Question #1 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| Regarding the FAC-012 and -013 changes, we are not indicating that we are making this change; we are asking for the ability to make this change if the industry indicates that it should be made. We have asked the industry to comment on the retirement of FAC-012 and -013, and will take action based on those comments.<br><br>As far as the issue related to commenting on both the SAR and the MOD standards simultaneously, we recognize the concern expressed by the IRC. However, we are attempting to both address the needs of the industry and the need to comply with the FERC Order, and felt this was the best way to meet both the requirements of the NERC process and be responsive to the Commission. Note that the Reliability Standards Development Procedure does include the capability of posting a SAR and its associated standard(s) simultaneously. | | | |
| NPCC CP9 RSWG<br>HQT | ☑ | ☑ | The SAR will address all of the 77 directives from Orders 693 and 890 that are listed in Attachment 1. It is not clear if this list is comprehensive. Does the list include references have already been handled in the MOD standards currently under review, or does the list only included references yet to be addressed? |
| **Response:** The intent is for this list to be comprehensive. It includes both items that are currently being developed under the existing approved SARs, as well as items we expect to address under this supplemental SAR. | | | |
| IESO | ☑ | ☑ | The SAR proposes to address all of the 77 directives from Orders 693 and 890 that are listed in Attachment 1. However, it is not clear if this list is comprehensive. Does the list include references have already been handled in the MOD standards which are currently under review (MOD-001-1, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1, and MOD-030-1) or does the list only included those references which are not addressed by the above-mentioned standards under review currently? |
| **Response:** The intent is for this list to be comprehensive. It includes both items that are currently being developed under the existing SARs (in MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, and MOD-030), as well as items we expect to address under this supplemental SAR. | | | |
| FirstEnergy | ☑ | | While the summary of FERC Directives contained on pages SAR-6 and SAR-7 appears very complete, the summary uses a shorthad notation that it is somewhat cryptic and difficult to decypher. However, there appear to have been some ommissions as follows:<br>890-237 Consistent practices for calculating TTC/TFC<br>890-244 In short-term ATC calclulations all reserved but unused transfer capability shall be released as non-firm ATC<br>890-257 Develop standards for CBM determination, allocation and use<br>890-259 CBM only used to allow LSE to meet its generation reliaibility criteria<br>890-293 Approach for accounting for counter flows in ATC standards<br>890-301 ATC recalculation by TSP on a consistent time interval and in a manner tha closely reflects actual system topology<br>890-354 Unused transfer capability set aside for CBM made available for non-firm use and posted on OASIS<br>890-416 Posting of load data on LSE or BAA level of granularity rather than RTO/ISO total load |

| Question #1 | | | |
|---|---|---|---|
| Commenter | Yes | No | Comment |
| **Response:** We have included the references you suggested in the modified SAR. | | | |
| Duke Energy | ☑ | | |
| ITC | ☑ | | |
| Manitoba Hydro | ☑ | | |
| MEC | ☑ | | |
| MRO | ☑ | | |
| PSC SC | ☑ | | |

2. Please provide any other comments you have on the SAR.

**Summary Consideration:** There was a suggestion (see attached red-lined SAR from APPA) to provide more details to the scope of modifications proposed. Some of these modifications were adopted and are reflected in the revised SAR.

| Question #2 | |
|---|---|
| **Commenter** | **Comment** |
| APPA | The Following attach file contains modified versions of the Supplemental SAR sections that explains in detail the objective of the Supplemental SAR. These are recommended changes to SAR. See the Attached File with the recommended Changes. |
| **Response:** We have reviewed the suggestions and adopted the ones we believed were appropriate. Please see the comments on the attached file. | |
| FirstEnergy | Page SAR-2 paragraph FAC-012 and FAC-013 have misspellings "purposes o maintaining" should say "purpose of maintaining." |
| **Response:** We have fixed this error. | |
| NPCC CP9 RSWG HQT | Is it possible that the proposed SAR drafting team will revise the standards MOD-001, MOD-004, MOD-008, MOD-028, MOD-029 and MOD-030 that are currently under review? |
| **Response:** Yes, we will be modifying the MOD standards. This SAR is intended to supplement the existing work and team, not create a new team. | |
| IESO | Is it possible that the proposed SAR drafting team will revise the standards MOD-001, MOD-004, MOD-008, MOD-028, MOD-029 and MOD-030 that are currently under review? It might have been better that this SAR was addressed first and then the mentioned MOD standards if these were to be revised as a result of this supplemental SAR.<br><br>We do not agree with making the MOD-004 standard, a cluttered standard. This coupled with the need to make a distinction between the ATC calculation methods used and the descriptive procedure for resource adequacy assessment has made the new MOD-004 very convoluted, and the requirements difficult to follow and measure. If combining some standards of related objective is desired, a more manageable and appropriate alternative is to divide these 4 standards into two groups - one on the determining and verifying the calculation of CBM (Methodology, Assumptions, and Documentation) and the other on the use and reporting of use of CBM (Applicability and Reporting).<br><br>The roles of the Reliability Coordinator, Planning Coordinator, Transmission Owner, and the Transmission Service Provider must be clearly articulated in these standards as well as the new MOD standard that will come into effect as a result of FAC-012 and FAC-013. |
| **Response:** Yes, we will be modifying the MOD standards. This SAR is intended to supplement the existing work and team, not create a new team. | |

| **Question #2** | |
|---|---|
| **Commenter** | **Comment** |
| Regarding the MOD-004 changes, we will address this in the MOD-004 comments.<br><br>We will ensure the roles of the RC, PC, RO, TSP, and any other functional entities are clearly articulated. | |
| IRC SRC | From a process viewpoint, 3 new standards are created, and two standards are considered to be retired, without a SAR. This SAR that we are commenting on only provides the basis for making changes to address FERC directives, but does not list and provide the rationale for the new standards or the retirement of standards. This doesn't seem to be consistent with the reliability standards development procedure.<br><br>Similarly, there is no SAR or any mention in this SAR to combine MOD-004 to MOD-007. This is also a major change to the existing standards. A SAR to provide the rationale for the change, and the proposed scope of the consolidated standard need to be provided for industry comment, with sufficient time before any standard drafting work is done and the revised standards posted. |
| **Response:**<br>This supplemental SAR has been proposed to obtain stakeholder support on the expanded scope of work associated with full compliance with FERC Order 693 and FERC Order 890 relative to ATC, TTC, CBM, TRM and ETC<br>A SAR sets the scope of the technical content of the work, but leaves the structure of the actual standards to the Drafting Team's discretion. We currently have a SAR that allows us to address CBM and making changes to MOD-004, MOD -005, MOD -006, and MOD -008 (Feb 15 2006, "Revision to Standards MOD-004, MOD-005, MOD-006, MOD-008, and MOD-009"). We also have a SAR that allows us to address ATC and make changes to MOD-001 (Feb 15, 2005 "Revision to Existing Standard MOD-001-0"). The MOD-001 SAR does not preclude the Drafting Team from creating new standards. This Supplemental SAR is intended to address changes to MOD-002, MOD-003, MOD-007, FAC-012, and FAC-013 explicitly and to expand the scope of work done on MOD-001, MOD-004, MOD-005, MOD-006, MOD-008 and MOD-009 to fully address the directives in FERC Orders 693 and 890. | |
| ITC | This SAR appears to be necessary to inform FERC of potential inconsistencies in the propose standards that might be caused by a small number of the FERC orders. TTC for AFC/ATC does not belong in FAC-012 for example, even though FERC directed this. It's based on a misunderstanding of the original intent of FAC-012. As such, we support any work to clarify the meaning and intent of standards that are needed to meet FERC orders. |
| **Response:** We agree. | |
| MEC | I have no comment except to commend the Standards Drafting Team on doing a good job at developing the supplemental SAR and the revised standards to incorporate the FERC Orders. While I have comments on them, these revised standards as well as the supplemental SAR gets the NERC well on the way to responding to the FERC orders. |
| **Response:** Thank you. | |
| MRO | The MRO has no comment except to commend the Standards Drafting Team on doing a good job at developing the |

| Question #2 | |
|---|---|
| **Commenter** | **Comment** |
| | supplemental SAR and the revised standards to incorporate the FERC Orders. While the MRO has comments on them, these revised standards as well as the supplemental SAR gets the NERC well on the way to responding to the FERC orders. |
| **Response:** Thank you. | |

**Consideration of Comments on ATC Supplemental SAR**
**Attachment 1**

3. Attachment to the Supplemental SAR Comments from APPA

| | |
|---|---|
| Title of Proposed Standard | Revisions to existing Standards MOD-001 through MOD-009; FAC-012 through FAC-013. (This SAR is intended to supplement the two already approved SARs for "Revision to Existing Standard MOD-001" dated 2/15/2006 and "Revision to Standards MOD-004, MOD-005, MOD-006, MOD-008, MOD-009" ) |
| Request Date | May 23, 2007 |

| SAR Requester Information | SAR Type (***Check a box for each one that applies.***) | |
|---|---|---|
| Name The following members of the ATCT Drafting Team: | ☐<br>☐ | New Standard |
| Primary Contact | ☒ | Revision to existing Standard |
| Telephone<br>Fax | ☒<br>☐ | Withdrawal of existing Standard (possible) |
| E-mail | ☐<br>☐ | Urgent Action |

**Purpose**

This SAR is intended to supplement the SAR for "Revision to Existing Standard MOD-001" dated 2/15/2006, in response to FERC Orders 890 and 693. In evaluating the Orders, it has been discovered that additional modifications will be required to ensure clarity and consistency. Specifically, the following Standards may be modified, transferred to NAESB, or retired:

FAC-012 Transfer Capability Methodology
FAC-013 Establish and Communicate Transfer Capabilities
MOD-002 Review of TTC and ATC Calculations and Results
MOD-003 Procedure for Input on TTC and ATC Methodologies and Values
MOD-007 Documentation of the Use of CBM

**Industry Need** The FERC has directed NERC to provide these changes and clarifications in support of Preventing Undue Discrimination and Preference in Transmission Service, as well in support of Mandatory Reliability Standards for the Bulk Power System. NERC and the Industry will provide these changes and clarifications in support of Consistent Modeling Methods and Principles for Simulating Power Transfers and Determination of Transfer Capabilities, Timely and Accurate Communication of the Values of the TTC/TFC and the Assumptions Used to Calculate the TTC/TFC, and eliminating a fill-in-the-blank Standards.

NERC, as the ERO, is required to comply with all FERC directives.

**Drafting Team's response to proposed addition:** The industry need explains 'why' the SAR has been proposed but is not intended to identify the scope of proposed changes – the scope is addressed in the Brief Description and Detailed Description.

**Formatted:** Font: Bold, Font color: Light Blue

**Brief Description** As directed by the FERC, the drafting team is developing proposed requirements to bring greater consistency and transparency to the calculation of TTC/TFC, ATC/AFC, ETC, CBM, and TRM. The modifications include elimination of the 'fill-in-the-blank' requirements. This possibility was identified in the original SAR; this supplemental SAR is requesting explicit ability to take action on these other standards as a part of the entire standards effort. This will be accomplished by the expansion of the exiting MOD-001 through 009 Standard Drafting Team. The expanded MOD-001 through 009 Standard Drafting Team will be comprised of personnel experienced and qualified in the calculation of the TTC/TFC for the planning and operating horizons and communicating those values and assumptions in a manner that will support the planning and operations of the BES and support efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers.

Formatted: Not Highlight

**Drafting Team's response to proposed addition:** The Standards Committee has control over appointments to drafting teams and it is not appropriate to add language in the SAR that controls the Standards Committee's actions. The intent of the Brief Description is to provide an overview of 'what' is proposed, not 'how' the team will achieve its proposed modifications.

**Detailed Description**
Actions of the drafting team may include:

FAC-012 Transfer Capability Methodology

Modification of FAC-012 or retirement of FAC-012 and movement to a new MOD standard. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical modeling used to analyze the bulk electric system for the purposes of maintaining reliable planning and operation of the BES and supporting efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers. However, all of the FAC Standards series are relate and the modeling in Standard FAC -012 is directly related to FAC 001 through 011.

Deleted: ¶

Deleted: Retirement

Deleted: constructs

Deleted: reliability

Formatted: Highlight

Prepare for approval by the Industry, NERC BOT, and FERC a detailed standard that will provide the necessary requirements for the industry to develop Total Transfer Capabilities or Total Flowgate Capabilities utilizing methods that will meet the following requirements:

- Eliminate the "fill-in-blank" format of FAC-012-1
- The Standard will be written in a detailed format that incorporates the principles of calculating Total Transfer Capabilities or Total Flowgate Capabilities contained in "A Reference Document for Calculating and Reporting the Electric Power Transfer Capability of Interconnected Electric Systems;" dated 1995; Titled Transmission Transfer Capability; published by the North American Electric Reliability Council.
- The Standard will be written to include detailed requirements for eliminating discontinuity at the seams between Regions that utilize different methods of calculating Total Transfer Capability or Total Flowgate Capabilities.
- The Standard will retire the glossary term Transfer Capability and modify, if necessary, the glossary term Total Transfer Capability to be consistent with the principles contained in the this Standard.
- The Standard will insure that the Applicable Reliability Functions calculate the values of the Total Transfer Capabilities or Total Flowgate Capabilities for planning and operating horizons in a timely manner that will support the planning and operations of the BES and support

Formatted: Highlight

Formatted: Bullets and Numbering

marketing effort to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers.

FAC-013 Establish and Communicate Transfer Capabilities
Modification of FAC-013 or retirement of FAC-013 and incorporation into a new MOD standard. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical modeling used to analyze the bulk electric system for the purposes of maintaining reliable planning and operation of the BES and supporting efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers.

Prepare for approval by the Industry, NERC BOT, and FERC a detailed standard that will provide the necessary requirements for the industry to timely communicate the values of the Total Transfer Capability or Total Flowgate Capability calculated in accordance with the requirements of FAC-012; and to communicate, when required by other Standards, the assumptions used to calculate the values of the Total Transfer Capability or Total Flowgate Capability to support reliable operations and the marketing requirements of Available Transfer Capability.
The assumptions used to determine the Total Transfer Capability or Total Flow Capability communicated to the industry shall, without violating confidentially or security requirements, include, but not be limited to:

- Existing Transmission Commitments Used for Planned Scheduled Energy Transfers
- Projected Loads
- Planned Generator Unit Commitments
- Planned System Configuration of the Interconnected System
- System Contingencies Assumed During the Studies
- Impacts of Neighboring Systems
- Impacts on Neighboring Systems

MOD-002 Review of TTC and ATC Calculations and Results
Incorporation into MOD-001 and retirement. It is believed that much of this is related to the measurement and compliance aspects of Available Transfer Capability, and will be handled as such.
MOD-003 Procedure for Input on TTC and ATC Methodologies and Values
Transfer to NAESB and retirement. It is believed that this standard is more focused on business practices.
MOD-007 Documentation of the Use of CBM
Incorporation into MOD-004 and retirement. It is believed that much of this is related to the measurement and compliance aspects of CBM, and will be handled as such.

The drafting team will address all of the directives in FERC Order 693 and FERC Order 890 listed in Attachment 1.

**Drafting Team's response to proposed additions:** The drafting team adopted the proposed additions that provide clarification but determined that the proposed modifications highlighted in yellow either provided information that is not needed for the revisions proposed under this SAR or propose additional requirements beyond those associated with compliance with the FERC Orders.

**Reliability Functions**

| The Standard will Apply to the Following Functions *(Check box for each one that applies.)* | | |
|---|---|---|
| ☒ | Reliability Coordinator | **Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.** |
| ☒ | Balancing Authority | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time. |
| ☐ | Interchange Coordinator | Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas. |
| ☒ | Planning Coordinator | Assesses the longer-term reliability of its Planning Coordinator Area. |
| ☐ | Resource Planner | Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area. |
| ☒ | Transmission Planner | Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area. |
| ☒ | Transmission Service Provider | Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff). |
| ☒ | Transmission Owner | Owns and maintains transmission facilities. |
| ☒ | Transmission Operator | Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area. |
| ☐ | Distribution Provider | Delivers electrical energy to the End-use customer. |
| ☒ | Generator Owner | Owns and maintains generation facilities. |
| ☐ | Generator Operator | Operates generation unit(s) to provide real and reactive power. |
| ☒ | Purchasing-Selling Entity | Purchases or sells energy, capacity, and necessary reliability-related services as required. |
| ☐ | Market Operator | Interface point for reliability functions with commercial functions. |
| ☒ | Load-Serving Entity | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view. |

**Reliability and Market Interface Principles**

| Applicable Reliability Principles ***(Check box for all that apply.)*** | |
|---|---|
| ☒ | 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards. |
| ☐ | 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand. |
| ☒ | 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| ☐ | 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented. |
| ☐ | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems. |
| ☒ | 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions. |
| ☐ | 7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis. |
| ☐ | 8. Bulk power systems shall be protected from malicious physical or cyber attacks. |

| Does the proposed Standard comply with all of the following Market Interface Principles? ***(Select 'yes' or 'no' from the drop-down box.)*** |
|---|
| A reliability standard shall not give any market participant an unfair competitive advantage. Yes |
| A reliability standard shall neither mandate nor prohibit any specific market structure. Yes |
| A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes |
| A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes |

| **Directives from Order 693 and 890 related to ATC Standards** |
|---|
| 693-782 Directs the ERO to modify FAC-012 to calculate transfer capability for ATC calculations and eliminate fill-in-the-blank format. |
| 693-783 Recognized that the change for FAC-012 is on the schedule set in Order 890 |
| 693-1050 TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. |
| 693-1051 The Commission directs the ERO, through the Reliability Standards development process, to modify FAC-012-1 and any other appropriate Reliability Standards to assure consistency in the determination of TTC/TFC for services provided under the pro forma OATT, |
| 693-1057 Develop non-fill-in-the-blank Standard |
| 693-1057 Define information to be shared between TSPs for ATC calculations |
| 693-1057 Planning Assumptions and ATC Assumptions should be the same |
| 890-292 Planning Assumptions and ATC Assumptions should be the same |
| 890-292 Load levels the same plan/ops vs. ATC |
| 890-292 Gen Dispatch the same plan/ops vs. ATC |
| 890-292 TX and Gen Facilities maintenance the same plan/ops vs. ATC |
| 890-292 Contingency outages the same plan/ops vs. ATC |
| 890-292 Topology the same plan/ops vs. ATC |
| 890-292 TX Reservations the same plan/ops vs. ATC |
| 890-292 Assumptions re: additions and retirements the same plan/ops vs. ATC |
| 890-292 Counterlfows the same plan/ops vs. ATC |
| 890-295 Load level modeling methodology the same |
| 890-296 Dispatch should include all DNRs and committed resources as expected to run, and uncommitted resources deliverable within CA, economically dispatched to meet balancing needs |
| 890-297 How to model POR to POD without source/sink |
| 890-297 How to model existing reservations |
| 693-1057 ATC should be updated on a consistent schedule |
| 693-1057 ATC/TTC Assumptions and Contingencies must be made available |
| 693-1057 Put TTC in FAC section |
| 693-1057 Identify applicable entities |
| 693-1105 CBM must be 0 in non-firm ATC |
| 890-262 CBM =0 in Non-Firm Calc |
| 890-273 TRM <> =0 in Non-Firm Calc |
| 890-211 Standard AFC->ATC Calculation |

**Formatted:** Box Text, Font: Verdana, 12 pt

**Formatted:** Box Text, Font: Verdana, 12 pt

890-212 Firm ATC uses only Firm Commitments
890-212 Non-Firm ATC uses firm and non-firm commitments, postbacks or redirected services, unscheduled service, and counterflows
890-237 Address differencess between Pro-Forma TTC and Native Load/Reliability Assessment TTC
890-243 Standard calc of native load use - include in MOD-001
890-244 ETC = Native load (including Network)
890-244 ETC = Grandfathered
890-244 ETC = Appropriate PTP
890-244 ETC = Long-term Rollover rights
890-244 Define any additional ETC components
890-245 Reservations with Same POR whose SUM would exceed gen nameplate must be addressed
890-310 Mandatory Data Exchange for ATC
890-310 DEX Load
890-310 DEX TX Plan and Contingency outages
890-310 DEX Gen Plan and Contingency outages
890-310 DEX Base dispatch
890-310 DEX existing reservations incl counterflows
890-310 DEX ATC recalc frequencies and times
890-310 DEX Source sink modeling identification
890=389 Unscheduled Reservation released on non-firm and posted on OASIS

**Drafting Team's response to suggested additions:**

- Order 693, paragraph 782 does not include the referenced language.
- Order 693, paragraph 783 does not include a directive.
- Order 693, paragraph 1050 - the notation provided was added to the revised SAR
- Order 693, paragraph 1051 – the notation provided was added to the revised SAR

| Title of Proposed Standard | Revisions to existing Standards MOD-001 through MOD-009; FAC-012 through FAC-013. (This SAR is intended to supplement the two already approved SARs for "Revision to Existing Standard MOD-001" dated 2/15/2006 and "Revision to Standards MOD-004, MOD-005, MOD-006, MOD-008, MOD-009" ) |
| Request Date | May 23, 2007 |
| Revised Date | July 31, 2007 |

| **SAR Requester Information** | | **SAR Type** (*Check a box for each one that applies.*) |
|---|---|---|
| Name The following members of the ATCT Drafting Team:<br>Chuck Falls<br>Ross Kovacs<br>Laura Lee<br>Cheryl Mendrala<br>Nate Schweighart | ☐ | New Standard |
| Primary Contact Laura Lee | ☒ | Revision to existing Standard |
| Telephone (704) 382-3625<br>Fax | ☒ | Withdrawal of existing Standard (possible) |
| E-mail | ☐ | Urgent Action |

**Purpose**

This SAR is intended to supplement the SAR for "Revision to Existing Standard MOD-001" dated 2/15/2006, in response to FERC Orders 890 and 693. In evaluating the Orders, it has been discovered that additional modifications will be required to ensure clarity and consistency. Specifically, the following Standards may be modified per the items described herein, transferred to NAESB, or retired:

FAC-012 Transfer Capability Methodology
FAC-013 Establish and Communicate Transfer Capabilities
MOD-002 Review of TTC and ATC Calculations and Results
MOD-003 Procedure for Input on TTC and ATC Methodologies and Values
MOD-007 Documentation of the Use of CBM

**Industry Need** The FERC has directed NERC to provide these changes and clarifications in support of Preventing Undue Discrimination and Preference in Transmission Service, as well in support of Mandatory Reliability Standards for the Bulk Power System.

NERC, as the ERO is required to comply with all FERC directives.

**Brief Description** As directed by the FERC, the drafting team is developing proposed requirements to bring greater consistency and transparency to the calculation of TTC/TFC, ATC/AFC, ETC, CBM, and TRM. The modifications include elimination of the 'fill-in-the-blank' requirements. This possibility was identified in the original SAR; this supplemental SAR is requesting explicit ability to take action on these other standards as a part of the entire standards effort.

**Detailed Description**

Actions of the drafting team may include:

FAC-012 Transfer Capability Methodology

Modification of FAC-012 or retirement of FAC-012 and movement to a new MOD standard. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical modeling used to analyze the Bulk Electric System (BES) for the purposes of maintaining reliable planning and operation of the BES and supporting efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers..

FAC-013 Establish and Communicate Transfer Capabilities

Modification of FAC-013 or retirement of FAC-013 and incorporation into a new MOD standard. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical modeling used to analyze the bulk electric system for the purposes of maintaining reliable planning and operation of the BES and supporting efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers.

MOD-002 Review of TTC and ATC Calculations and Results

Incorporation into MOD-001 and retirement. It is believed that much of this is related to the measurement and compliance aspects of Available Transfer Capability, and will be handled as such.

MOD-003 Procedure for Input on TTC and ATC Methodologies and Values

Transfer to NAESB and retirement. It is believed that this standard is more focused on business practices.

MOD-007 Documentation of the Use of CBM

Incorporation into MOD-004 and retirement. It is believed that much of this is related to the measurement and compliance aspects of CBM, and will be handled as such.

The drafting team will address all of the directives in FERC Order 693 and FERC Order 890 listed in Attachment 1.

***Reliability Functions***

| **The Standard will Apply to the Following Functions** *(Check box for each one that applies.)* | | |
|---|---|---|
| ☒ | Reliability Coordinator | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view. |
| ☒ | Balancing Authority | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time. |
| ☐ | Interchange Coordinator | Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas. |
| ☒ | Planning Coordinator | Assesses the longer-term reliability of its Planning Coordinator Area. |
| ☐ | Resource Planner | Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area. |
| ☒ | Transmission Planner | Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area. |
| ☒ | Transmission Service Provider | Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff). |
| ☒ | Transmission Owner | Owns and maintains transmission facilities. |
| ☒ | Transmission Operator | Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area. |
| ☐ | Distribution Provider | Delivers electrical energy to the End-use customer. |
| ☒ | Generator Owner | Owns and maintains generation facilities. |
| ☐ | Generator Operator | Operates generation unit(s) to provide real and reactive power. |
| ☒ | Purchasing-Selling Entity | Purchases or sells energy, capacity, and necessary reliability-related services as required. |
| ☐ | Market Operator | Interface point for reliability functions with commercial functions. |
| ☒ | Load-Serving Entity | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view. |

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

***Reliability and Market Interface Principles***

| **Applicable Reliability Principles** *(Check box for all that apply.)* | |
|---|---|
| ☒ | 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards. |
| ☐ | 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand. |
| ☒ | 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| ☐ | 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented. |
| ☐ | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems. |
| ☒ | 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions. |
| ☐ | 7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis. |
| ☐ | 8. Bulk power systems shall be protected from malicious physical or cyber attacks. |

| **Does the proposed Standard comply with all of the following Market Interface Principles?** *(Select 'yes' or 'no' from the drop-down box.)* |
|---|
| 1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes |
| 2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes |
| 3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes |
| 4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes |

**Directives from Order 693 and 890 related to ATC Standards (including TTC)**

693-1050 TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0.
693-1051 Modify FAC-012-1 and any other appropriate Reliability Standards to assure consistency in the determination of TTC/TFC for services provided under the pro forma OATT
693-1057 Develop non-fill-in-the-blank Standard
693-1057 Define information to be shared between TSPs for ATC calculations
693-1057 Planning Assumptions and ATC Assumptions should be the same
890-292 Planning Assumptions and ATC Assumptions should be the same
890-292 Load levels the same plan/ops vs. ATC
890-292 Gen Dispatch the same plan/ops vs. ATC
890-292 TX and Gen Facilities maintenance the same plan/ops vs. ATC
890-292 Contingency outages the same plan/ops vs. ATC
890-292 Topology the same plan/ops vs. ATC
890-292 TX Reservations the same plan/ops vs. ATC
890-292 Assumptions re: additions and retirements the same plan/ops vs. ATC
890-292 Counterlfows the same plan/ops vs. ATC
890-295 Load level modeling methodology the same
890-296 Dispatch should include all DNRs and committed resources as expected to run, and uncommitted resources deliverable within CA, economically dispatched to meet balancing needs
890-297 How to model POR to POD without source/sink
890-297 How to model existing reservations
693-782 Criteria used to calculate transfer capabilities for use in determining ATC must be identical to those used in planning and operating the system.
693-1057 ATC should be updated on a consistent schedule
693-1057 ATC/TTC Assumptions and Contingencies must be made available
693-1057 Put TTC in FAC section
693-1057 Identify applicable entities
693-1105 CBM must be 0 in non-firm ATC
890-262 CBM =0 in Non-Firm Calc
890-273 TRM <> =0 in Non-Firm Calc
890-211 Standard AFC->ATC Calculation
890-212 Firm ATC uses only Firm Commitments
890-212 Non-Firm ATC uses firm and non-firm commitments, postbacks or redirected services, unscheduled service, and counterflows
890-237 Develop consistent practices for calculating TTC/TFC
890-237 Address differences between Pro-Forma TTC and Native Load/Reliability Assessment TTC
890-243 Standard calc of native load use - include in MOD-001
890-244 In the short-term ATC calculation, all reserved but unused transfer capability (non-scheduled) shall be released as non-firm ATC.
890-244 ETC = Native load (including Network)
890-244 ETC = Grandfathered
890-244 ETC = Appropriate PTP
890-244 ETC = Long-term Rollover rights
890-244 Define any additional ETC components
890-245 Reservations with Same POR whose SUM would exceed gen nameplate must be addressed
890-293 Develop an approach for accounting for counterflows, in the relevant ATC standards and business practices.
890-301 ATC to be recalculated by all transmission providers on a consistent time interval and in a manner that closely reflects the actual topology of the system,
890-310 Mandatory Data Exchange for ATC

890-310 DEX Load
890-310 DEX TX Plan and Contingency outages
890-310 DEX Gen Plan and Contingency outages
890-310 DEX Base dispatch
890-310 DEX existing reservations incl counterflows
890-310 DEX ATC recalc frequencies and times
890-310 DEX Source sink modeling identification
890-389 Unscheduled Reservation released on non-firm and posted on OASIS
890-237 Develop consistent practices for calculating TTC/TFC
890-244 In the short-term ATC calclulation, all reserved but unused transfer capability (non-scheduled) shall be released as non-firm ATC.
890-293 Develop an approach for accounting for counterflows, in the relevant ATC standards and business practices.
890-301 ATC to be recalculated by all transmission providers on a consistent time interval and in a manner that closely reflects the actual topology of the system,
890-416 Direct ISOs and RTOs to post load data for the entire ISO/RTO footprint and for each LSE or control area footprint within the ISO/RTO.

| Directives from Order 693 and 890 related to CBM Standard |
|---|
| 693-1082 CBM set aside at verified request of LSE |
| 693-1082 Require disclosure of CBM studies |
| 693-1082 Define flowgate/path allocation process for CBM |
| 693-1082 No double counting |
| 693-1082 Add LSE, BA as applicable entity where necessary |
| 693-1105 CBM Must be used only for generation deficiencies |
| 693-1105 Generation Deficiency must be states as an EEA level |
| 890-257 Develop clear standards for how the CBM value shall be determined, allocated across transmission paths, and used. |
| 890-259 CBM shall only used to allow LSE to meet its generation reliability criteria |
| 890-260 Define flowgate/path allocation process for CBM |
| 890-262 CBM Must be used only for generation deficiencies |
| 890-354 Commission requires transmission providers to make any transfer capability set aside for CBM but unused for such purpose available on a non-firm basis and to post this availability on OASIS. |
| 890-358 yearly CBM studies |
| 693-1081 What to do if CBM exceeds ATC? |
| **Directives from Order 693 and 890 related to TRM Standard** |
| 693-1122 Define flowgate/path allocation process for TRM |
| 693-1126 Explicit definition of what goes into TRM |
| 693-1122 TRM = Load Forecast and Load Distribution Error |
| 693-1122 TRM = Variation in facility loading |
| 693-1122 TRM = uncertainty in transmission topology |
| 693-1122 TRM = loop flow |
| 693-1122 TRM = variations in dispatch |
| 693-1122 TRM = ARS |
| 693-1122 Define any additional uses |
| 890-273 Explicit definition of what goes into TRM |
| 890-273 TRM = Load Forecast and Load Distribution Error |
| 890-273 TRM = Variation in facility loading |
| 890-273 TRM = uncertainty in tx topology |
| 890-273 TRM = loop flow |
| 890-273 TRM = variations in dispatch |
| 890-273 TRM = ARS |
| 890-273 Define any additional uses |
| 693-1082 No double counting |
| 890-273 No double counting |
| 693-1126 Max TRM Calc |
| 890-275 Max TRM Calc |
| 693-1126 Standard on How TRM to be calculated |
| 693-1126 Add PC, RE to applicable entities |

| Telephone (704) 382-3625<br>Fax | ☒ | Withdrawal of existing Standard (possible) |
| E-mail | ☐ | Urgent Action |

**Purpose**

This SAR is intended to supplement the SAR for "Revision to Existing Standard MOD-001" dated 2/15/2006, in response to FERC Orders 890 and 693. In evaluating the Orders, it has been discovered that additional modifications will be required to ensure clarity and consistency. Specifically, the following Standards may be modified per the items described herein, transferred to NAESB, or retired:

FAC-012 Transfer Capability Methodology
FAC-013 Establish and Communicate Transfer Capabilities
MOD-002 Review of TTC and ATC Calculations and Results
MOD-003 Procedure for Input on TTC and ATC Methodologies and Values
MOD-007 Documentation of the Use of CBM

**Industry Need** The FERC has directed NERC to provide these changes and clarifications in support of Preventing Undue Discrimination and Preference in Transmission Service, as well in support of Mandatory Reliability Standards for the Bulk Power System.

NERC, as the ERO is required to comply with all FERC directives.

**Brief Description** As directed by the FERC, the drafting team is developing proposed requirements to bring greater consistency and transparency to the calculation of TTC/TFC, ATC/AFC, ETC, CBM, and TRM. The modifications include elimination of the 'fill-in-the-blank' requirements. This possibility was identified in the original SAR; this supplemental SAR is requesting explicit ability to take action on these other standards as a part of the entire standards effort.

**Detailed Description**

Actions of the drafting team may include:

FAC-012 Transfer Capability Methodology

Modification of FAC-012 or retirement of FAC-012 and movement to a new MOD standard. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical modeling used to analyze the Bulk Electric System (BES) for the purposes of maintaining reliable planning and operation of the BES and supporting efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers.

FAC-013 Establish and Communicate Transfer Capabilities

Modification of FAC-013 or retirement of FAC-013 and incorporation into a new MOD standard. These standards are not related to Facility Design, Construction, and Maintenance. Rather, they are about the mathematical modeling used to analyze the bulk electric system for the purposes of maintaining reliable planning and operation of the BES and supporting efforts to make Available Transfer Capability methods and results transparent to the industry's Transmission Customers.

MOD-002 Review of TTC and ATC Calculations and Results

Incorporation into MOD-001 and retirement. It is believed that much of this is related to the measurement and compliance aspects of Available Transfer Capability, and will be handled as such.

MOD-003 Procedure for Input on TTC and ATC Methodologies and Values

Transfer to NAESB and retirement. It is believed that this standard is more focused on business practices.

MOD-007 Documentation of the Use of CBM

Incorporation into MOD-004 and retirement. It is believed that much of this

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a standard drafting team on March 17, 2006.

**Description of Current Draft:**

This is the first draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to comments. | TBD |
| 2. Post revised standard for stakeholder comment. | TBD |
| 3. Respond to comments. | TBD |
| 4. Post for 30-day pre-ballot review. | TBD |
| 5. First ballot of standard. | TBD |
| 6. Respond to comments. | TBD |
| 7. Recirculation ballot. | TBD |
| 8. 30-day posting before board adoption. | TBD |
| 9. Board adoption. | TBD |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**None.**

## A. Introduction

1. **Title:** **Flowgate Network Response Available Transfer Capability**

2. **Number:** MOD-030-1

3. **Purpose:** To promote the consistent and uniform application and documentation of Available Transfer Capability (ATC) calculations performed using the Flowgate Network Response method for reliable system operations.

4. **Applicability:**

   **4.1.** Each Planning Coordinator that uses the Flowgate Network Response method to calculate Available Transfer Capabilities for paths identified in an Available Transfer Capability Implementation Document.

   **4.2.** Each Reliability Coordinator that uses the Flowgate Network Response method to calculate Available Transfer Capabilities for paths identified in an Available Transfer Capability Implementation Document.

   **4.3.** Each Transmission Service Provider that uses the Flowgate Network Response method to calculate Available Transfer Capabilities for paths identified in an Available Transfer Capability Implementation Document.

5. **Proposed Effective Date:** To be determined.

## B. Requirements

**R1.** Each Planning Coordinator and Reliability Coordinator shall include, in its "Available Transfer Capability Implementation Document" for a specific Transmission Service Provider, the criteria used to identify sets of transmission Facilities as Flowgates that are to be considered by the Transmission Service Provider when analyzing requests for service. At a minimum, the criteria shall specify:

**R1.1.** How the methodology meets the planning criteria in TPL-001 and TPL-002, for the Contingencies in Table 1, Category B or the successor criteria.

**R1.2.** How the methodology identifies transmission Facilities that are expected by the AFC calculator to cause congestion on the transmission system.

**R1.3.** The treatment of transmission Facilities that have historically been constrained.

**R2.** Each Planning Coordinator and Reliability Coordinator associated with a Transmission Service Provider shall, at a minimum, create, modify, or delete Flowgates as necessary at the beginning of every calendar quarter, based on the criteria specified in R1.

**R3.** The Transmission Service Provider shall ensure the definitions of all Flowgates specified by the Planning Coordinator and Reliability Coordinator are made publicly available, including the type of Flowgate (thermal, voltage, or stability).

**R4.** Each Transmission Owner and Transmission Planner shall provide its Transmission Service Provider with the current thermal limits for thermally limited Flowgates.

**R5.** The Transmission Service Provider shall use the current thermal limits provided by the Transmission Planner and Transmission Operator as the Total Flowgate Capability (TFC).

**R6.** Each Planning Coordinator and Reliability Coordinator shall provide its Transmission Service Provider with the current voltage and stability limits for voltage or stability limited Flowgates, respectively.

**R7.** The Transmission Service Provider shall use the voltage and stability limits provided by its Planning Coordinator and Reliability Coordinator as the TFC.

**R8.** Each Planning Coordinator and Reliability Coordinator associated with a Transmission Service Provider shall ensure that TFC for each of the specified Flowgates for that Transmission Service Provider is equal to the lesser of:

- The Thermal Rating of the Flowgate, or
- The voltage limit of power transferred across the Flowgate, if applicable, or
- The Stability Limit of power transferred across the Flowgate, if applicable.

**R9.** Each Planning Coordinator and Reliability Coordinator associated with a Transmission Service Provider shall ensure that TFC for all the specified Flowgates for that Transmission Service Provider are calculated for use within the Transfer Capability time horizons specified in MOD-001.

**R10.** Each Planning Coordinator and Reliability Coordinator shall make available to its Transmission Service Provider the results of the calculations of TFC for all the specified Flowgates of that Transmission Service Provider upon completion of the calculation.

**R11.** The Transmission Service Provider shall make publicly available the results of the calculations of TFC provided by the Planning Coordinator and Reliability Coordinator upon their being made available to the Transmission Service Provider.

**R12.** The Transmission Service Provider shall calculate Available Flowgate Capability (AFC) for the time horizons specified in MOD-001 R2 according to the ATC schedule specified in MOD-001 R5.

**R13.** The Transmission Service Provider shall calculate Firm AFC by reducing the TFC by the sum of the firm Existing Transmission Commitments (ETCs), the Capacity Benefit Margin (CBM), and the Transmission Reliability Margin (TRM) allocated to the Flowgate.

**R14.** The Transmission Service Provider shall determine the impact of firm ETCs based on the following inputs:

- The transmission capability utilized in serving Native Load commitments, to include Native Load growth, Load forecast error and losses not otherwise included in TRM or CBM.
- The impact of Firm Network Integration Transmission Service serving Load, to include Load forecast error and losses not otherwise included in TRM or CBM.
- The impact of grandfathered firm Transmission Service Agreements and bundled contracts for energy and transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or Safe Harbor Tariff accepted by FERC.

- The impact of Firm Point to Point Transmission Service,
- The impact of maintaining roll-over rights for Firm Transmission Service contracts, five years or longer in duration, granting Transmission Customers the right of first refusal to take or continue to take Transmission Service from a Transmission Owner when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.
- The impact of any Ancillary Services not otherwise included in CBM or TRM.
- Post-backs of redirected or released Firm services.
- The impact of counter-flows not otherwise accounted for in the AFC calculation.
- The impact of any other services, contracts, or agreements not specified above using transmission that serves Native Load or Firm Network Integration Transmission Service
- The impact of any relevant third-party Firm Transmission Service that has not already been accounted for.

**R15.** The Transmission Service Provider shall limit the total impact of all Transmission Service from a specific source to not exceed sum of the nameplate ratings of all generators at that source.

**R16.** The Transmission Service Provider shall incorporate the following into relevant third-party Transmission Service:

- The transmission capability associated with serving the third-party's Native Load that impacts the Transmission Service Providers system by more than 3%.
- The impact of confirmed Network Integrated Transmission Service utilized on the third-party's system that impacts the Transmission Service Provider's system by more than 3%.
- The impact of confirmed Point to Point Transmission Service utilized on the third-party's system, based on expected source and sink, which does not source or sink within the Transmission Service Provider's own system and impacts the Transmission Service Provider's system by more than 3%.
- The impact of any roll-over rights on the third-party's system that impact the Transmission Service Provider's system by more than 3%.
- The impact of grandfathered Agreements on the third-party's system that impact the Transmission Service Provider's system by more than 3%.
- The impact of any required Ancillary Services not included in CBM or TRM on the third-party's system that impact the Transmission Service Provider's system by more than 3%.

**R17.** The Transmission Service Provider shall calculate non-firm AFC by reducing the TFC by the sum of the firm ETCs, the non-firm ETCs, and the TRM that the Transmission Service Provider has not elected to release allocated to the path.

**R18.** The Transmission Service Provider shall determine the impact of non-firm ETCs based on the following inputs:

- The impact of Non-Firm Network Integration Transmission Service serving Load, to include Load forecast error and losses not otherwise included in TRM or CBM.
- The impact of grandfathered non-firm Transmission Service Agreements and bundled contracts for energy and transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or Safe Harbor Tariff accepted by FERC.
- The impact of Non-firm Point to Point Transmission Service.
- The impact of counter flows not otherwise accounted for in the ATC calculation.
- Capacity utilized for TRM that the Transmission Service Provider has elected to be released for as non-firm ATC.
- Postbacks due to the reinstating of Firm from a "Firm-to-Non-Firm" redirect
- The impact of any relevant third-party Non-Firm Transmission Service that has not already been accounted for.

**R19.** For Point-to-Point Transmission Service where the source has not been specified, the Transmission Service Provider shall assume the source to be the adjacent Balancing Authority most electrically equivalent to the Point-of-Receipt.

**R20.** For Point-to-Point Transmission Service where the sink has not been specified, the Transmission Service Provider shall assume the sink to be the adjacent Balancing Authority most electrically equivalent to the Point-of-Delivery.

**R21.** The Transmission Service Provider shall make publicly available the results of the calculations of AFC upon calculation.

**R22.** The Transmission Service Provider shall covert Flowgate AFCs to path ATCs based on the following process:

*Flowgate(1), ... , Flowgate(n) = all Flowgates managed by a Transmission Service Provider*

*AFC of a Flowgate(n) impacted by a path, divided by the Distribution Factor for the path on the Flowgate(n) = "Partial ATC(n)"*

*ATC for a path = the lowest of all Partial ATC(1), ... , Partial ATC(n)*

- For each Flowgate honored by the Transmission Service Provider, the Transmission Service Provider shall calculate the partial AFC of that Flowgate by dividing the current AFC of that Flowgate by the path's power transfer distribution factor for that Flowgate.
- The Transmission Service Provider shall set the ATC for the path equal to the lowest of the partial AFCs of those Flowgates.

**R23.** The Transmission Service Provider shall increase non-firm ATC by the amount of capacity associated with unscheduled Transmission Service accounted for within firm and non-firm ETC, to the extent allowable by the agreement associated with the service, in accordance with established business practices.

**R24.** The Transmission Service Provider shall make publicly available the ATC for each path.

## C. Compliance

To be added with next posting.

## D. Measures

To be added with next posting.

## E. Regional Differences

None.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**2.** Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**3.** Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**4.** Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**5.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☐ No

Comments:

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

**1.** Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: These requirements should be in the FAC series and developed by personnel who are experienced in the determination of flowgates and their limitations. The requirements, as written are requiring improper use of the values stated in the requirements.

**2.** Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: These requirements are tariff or contract requirements that will be contained in or a part of a regulatory or legal document. Some of these requirements are not a reliability issues since and should be removed. Those statements that want to know the effects of actions that are of a reliability nature will be determined by other functions not the TSP, which just sell transmission capacity.

**3.** Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: Need to let the expanded SDT review this by personnel knowledgeable in development of AFT and distribution factors.

**4.** Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

☒ Yes

☐ No

Comments: This Standard trys to provide detail requirements for AFT, ATC, ETC and the requirements of 3 different functional entities and it is written in a manner that will not support a Compliance program.

**5.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: The Federal Energy Regulatory Commission (FERC) has requested Standards that determine the requirements to calculate TTC will be handled in the FAC Standards. Order 693 States the following: 1050. We adopt the NOPR proposal and require that TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. The FAC series of standards contain the Reliability Standards that form the technical and procedural basis for calculating transfer capabilities. FAC-008-1 provides the basis for determining the thermal ratings of facilities while FAC-009-1 provides the basis for communicating those ratings. FAC-010-1 and FAC-011-1 provide the system operating limits methodologies for the planning and operational horizon respectively and FAC-014 provides for the communication of those ratings.
FERC has correctly recognized that FAC-012 and FAC-013, while associated with modeling is highly dependent on the previous FAC Standards as noted by FERC.

**6.** Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☐ No

Comments:

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If “No,” please suggest how you believe the Order’s requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If “No,” please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments:

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority.

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The impact of load growth for Network Integration Transmission Service should be included in the second sub-bullet of R14.
   The "five years or longer in duration" language should be removed from the fifth sub-bullet of R14. due to the fact that this element of Order 890 is only to be implemented by a Transmission Service Provider (TSP) once the FERC has approved the TSP's Attachment K -- this may not occur for some TSPs until after the standards are to be implemented. Additionally, regardless of whether a TSP's Attachment K is approved, there will be a transition period (to be developed by each TSP) from the old 1-year/60-day roll-over paradigm to the 5-year/1-year -- the standard should not preclude a TSP from encumbering capacity for those existing Customers who have not yet been required to commit to five years of service to retain their roll-over rights.
   The ninth sub-bullet should include all other impacts and not just the impacts using transmission service to service Native Load or firm Network Integration load. Therefore, "using transmission that serves Native Load or Firm Network Integration Transmission Service" should be deleted.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: However, for the reasons explained in our response to the MOD-030-1 Comment Form's question 4, BPA suggests that R22. be modified to the following:
   " The Transmission Service Provider shall make publicly available a mechanism for interested parties to convert Flowgate AFCs to path ATCs based on…"

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☒ Yes

   ☐ No

Comments: Under the flowgate methodology, ATC is a value derived from an analysis of the expected powerflow impacts of a reservation across multiple flowgates. Consequently, it is the posting of AFC and timely posting of changes to AFC that inform whether transfer capability exists to support a request for transmission service. ATC for a POR-POD path is derived from posted AFC. When posting both ATC by path as well as AFC by Flowgate, there is a risk that the AFC and ATC values could get "out of sync" due to automation lag-time, etc. BPA believes that greater consistency and transparency is achieved if only AFC values are posted for each Flowgate, and requestors are provided with a "conversion calculator" that calculates ATC for their requested path based on posted AFC's.

**5.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority.

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: The threshold of 3% appears to be an arbitrary level. This level may be rooted in Operational and Planning studies that consider impacts from outages on one TP's system that increase loading on an element of another TP's system by 3% or more. While this level may be a good indicator of impact, it may not provide an indicator of which party's ownership or allocation of facilities is being used. It does not assure TPs will be able to preserve their rights (i.e. by contractual allocation) with a fixed threshold of 3%.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments: The ATC MODs (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) do not clearly distinguish the methodologies and their applications. Please provide descriptions of these methodologies.

The Applicability section 4.1. through 4.3. should have the phrase "Available Transfer Capabilities for paths" replaced with "Available Flowgates Capabilities for Flowgates".

R1.2. should be modified due to the fact that Facilities don't cause congestion, rather they experience congestion. The following change to the language would be more accurate:

"How the methodology identifies transmisison Facilities that are expected by the AFC calculator to experience congestion on the transmission system."

R3. A Flowgate should not be defined as a thermal, voltage, or stability type due to the fact that Flowgates are limited by thermal, voltage, or stability problems that can vary depending on system conditions.

R4. through R8. should be combined into two requirements:

1) Each entity generating Flowgate limit values (note that it's not clear if this should be the Transmission Owner, Transmission Planner, Planning Coordinator, and/or Reliability Coordinator) shall provide current Flowgate limit data to Transmission Service Providers (TSPs); and

2) TSPs shall use the lesser of the thermal, voltage, or stability limits that apply to the current system conditions.

R18.-sub-bullet 5, R23., and R24. should each have the "ATC"s replaced with "AFC"s, for the reasons explained in our response to the MOD-030-1 Comment Form's question 4.

R24. should have "path" replaced with "Flowgate", for the reasons explained in our response to the MOD-030-1 Comment Form's question 4.

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

   ☐ Yes

   ☐ No

   Comments:

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

5. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: Conditional Firm Service (CFS) and Planning Redispatch Service (PRS) under Order No. 890 create new issues relating to modeling and calculating ATC. Specifically, when PRS is offered to maintain service, modeling for ATC calculations will be impacted during these periods. TTC must be modeled/calculated accounting for the new CFS/PRS requirements.

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☐ No

Comments:

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). ☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments: R1.1 does not create the same level of transmission service as created in MOD-028. MOD 028 R6.1 involves N-1 transmission contingency AND ramping/partial contingency of generation. MOD-030 R1.1 appears to only require N-1 transmission or generation contingency. This is not comparable service.

For R3. need to also include why the Flowgate is a limit

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: R5 reference to Transmission Operator should be changed to Transmission Owner.

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: Sub requirements shown as bullets should be changed to numbered subrequirements in R14, R16 and R18.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The requirement should be worded in simple language to reflect how AFCs are determined rather than an equation that a program can use in developing program.

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: AFCs are not required to be posted as these do not mean much to the users, therefore, R21 should be deleted.

5. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☒ Yes

☐ No

Comments:

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☒ Yes

☐ No

Comments:

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: The threshold level of 3% for third party should not be included in this standard since there is no such threshold level for Transmission Service Provider's own data.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the ‘White Paper’ and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “NRFG ATC Standard” in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: See IRC comments submitted by Charles Yeung.

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: See IRC comments submitted by Charles Yeung.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: See IRC comments submitted by Charles Yeung.

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: See comment 9.

5. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: See IRC comments submitted by Charles Yeung.

**6.** Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If “No,” please suggest how you believe the Order’s requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If “No,” please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please the conflict in the comments area.

☒ Yes

☐ No

Comments: ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT Interconnection. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority Interconnection and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area and there has been no reservation of transmission capacity in ERCOT.

Available Transfer Capability is defined as the measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin. The ERCOT Interconnection has already moved “beyond” ATC and into a Market design which resulted in the disappearance of an explicit transmission service product. In addition the DC Tie transfer capability is planned and coordinated by a TSP that is a member of both Regions and therfore both ERCOT and SPP are notified when the DC Tie capability is reduced.

Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. Currently ERCOT employs a zonal congestion management scheme that is flow-based, whereby the ERCOT transmission grid, including attached generation resources and load, are divided into a predetermined number of congestion zones. This congestion management scheme applies zonal shift factors, determined by ERCOT, to predict potential congestion under the known topology of the ERCOT System. This scheme is used in the Day Ahead and Adjustment Periods to evaluate potential congestion. During the operating period ERCOT uses zonal shift factors to determine zonal Redispatch deployments needed to maintain flows within zonal limits. The local congestion management scheme relies on a more detailed Operational Model to determine how each particular Resource or Load impacts the transmission system. This model uses the current known topology of the transmission system. Unit specific Redispatch instructions are then issued to manage local congestion.

In the future ERCOT will be transitioning from a Zonal Market to a full LMP market. This system is designed to manage congestion in the Day Ahead and Real-Time on a Resource specific basis. Under both of these market designs transmission facility limits are established in advance and updated based on coordinated exchange of information between transmission providers and ERCOT in planning and operating periods.

In the current and future ERCOT market design the method of calculating ATC, TTC and the use of CBM and TRM are not applicable to the ERCOT Region. ERCOT does not have a synchronous connection with any other Balancing Authority Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Control Areas and/or offer transmission reservations and schedules within the interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments:

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments: However, the term "Post-backs" is industry jargon and should be replaced with the term "reinstatement" to add clarity.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

☒ Yes

☐ No

Comments: The standard should include specifics of methods for complying with the term "publicly available" such as posting on OASIS, a corporate web page, etc. (This concept is mentioned in all MOD-028, MOD-029, and MOD-030.)

5. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities to whom you believe the standard should apply and why.

☒ Yes

☐ No

Comments: MOD-001, 028, 029, and 030 should be combined into one standard to eliminate the need to reference several standards at once, eliminate duplication, and simplify the applicability sections of MOD-028, 029, and 030

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If “No,” please suggest how you believe the Order’s requirements from paragraph 245 should be addressed in the comments area.

☒ Yes

☐ No

Comments: However, the phrase "not exceed" can be replaced with the word "the" since the term "limiting the total impact" is synonomous.

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If “No,” please specify what percent or alternate approach should be used and explain why in the comment area below.

☒ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments:

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If “No,” please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If “No,” please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: R14:
   It is not clear if the standard requires all inputs to be included in the calculation of the impact of Firm ETC. If so, 2 of bullet points are questionable:
   • FIRM NITS Reservations (second bullet point) are only explicitly incorporated in ETC if they cross control area boundaries. (POR not equal to POD) Otherwise they are part of the base-flow calculations - Designated Network Resources (DNRs) serving Native Load (first bullet point). In order to clarify, we could add to the second bullet: "not otherwise included in TRM or CBM or in the impacts of Native Load commitments"

   • Impact of Ancillary Services not included already in TRM, is very difficult to quantify and include in ETC.

   R18
   • Non-Firm ETC calculations use the same base flow based on resources serving native load commitments as Firm ETC Calculations. Non-Firm NITS Reservations (second bullet point) are only explicitly incorporated in ETC if they cross control area boundaries (POR not equal to POD). Otherwise they are part of the base-flow calculations.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If “No,” please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: Yes, the conversion is described adequately.

   In the first bullet point, "…the Transmission Service Provider shall calculate the partial AFC of that…" should be written as "…the Transmission Service Provider shall calculate the partial ATC of that…"

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If “Yes,” please explain why in the comments area.

☒ Yes

☐ No

Comments: R21 and R24
Current tools allow the submission of requests and retrieval of available and calculated AFC and ATC data. It is questionable if that is considered being compliant with R21 and R24. If not, changes to the software might be required to meet the requirements of R21 and R24.

**5.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: Note - We don't have a complete overview of all directives to answer this question.

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: TSP is the sole entity responsible for performing calculations, and posting of the results. The PC, RC, and TO only submit data to the TSP, such as list of OTDF and PTDF flow gates, seasonal limits of flow gates, flowgate components, flow directions on flowgate components etc. They do not calculate ATC, hence R1 is irrelevant.

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☒ No

Comments: No. R15 doesn't meet the intend of paragraph 245. Most of the PtP Reservations don't have specific resources as Source, they typically source from a group of commonly dispatched units. Also most Tariff's allow re-direct of Reservations to different Sources, so excluding Reservations from impact calculations could possibly result in overselling the system if the excluded reservation is re-directed to a different source. It might be possible to make some general guidelines to address the paragraph 245 of Order 890 such as:

• Total sum of Reservations (Confirmed, Approved, Study) impacting a specific corridor, such as a DC tie should not exceed the total capacity of the corridor.
• Total sum of Reservations (Confirmed, Approved, Study) sinking in a Control Area should not exceed the total Load of the Control Area.
• Total sum of Reservations ((Confirmed, Approved, Study) sourcing from a group of commonly dispatched units should not exceed the total available generation capacity of that group of units.

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: We assume the third party is a 1 tier or 2 tier Control Area adjacent to the Tariff footprint of the TSP. Some questions:
• Paragraph talks about impact transmission capability with 3%. Does this mean impact any flow gate within the Tariff footprint of the TSP with 3%. What about flow gates that are tie lines between Tariff footprint and 1tier and limiting element is in 1tier.
• What participation factors and generators should be used to determine if the GLDF of commonly dispatched units of 1tier Control Area is >3%. NERC IDC?
• Is the data listed in bullet point 2,3,4,5,6 of R16 going to be submitted by neighbor TSP. If so it is sufficient to specify that a TSP is getting the list of Reservations as specified in 2,3,4,5,6 of R16 from a neighboring TSP without having to know detail as specified in the bullet points.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments:

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: R14:
   It is not clear if the standard requires all inputs to be included in the calculation of the impact of Firm ETC. If so, 2 of bullet points are questionable:
   • FIRM NITS Reservations (second bullet point) are only explicitly incorporated in ETC if they cross control area boundaries. (POR not equal to POD) Otherwise they are part of the base-flow calculations, DNR's serving Native Load. (first bullet point). Maybe add to second bullet: not otherwise included in TRM or CBM or in the impacts of Native Load commitments of first bullet point.
   • Impact of Ancillary Services not included already in TRM, is very difficult to quantify and include in ETC.

   R18
   • Non-Firm ETC calculations are using same base flow based on Resources serving Native Load commitments as Firm ETC Calculations. The base flow calculations don't make a distinguishion between Non-Firm or Firm, only if part of the Native Load is supplied by DNR from outside the Control Area. Non-Firm NITS Reservations (second bullet point) are only explicitly incorporated in ETC if they cross control area boundaries. Otherwise they are part of the base-flow calculations.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: Yes, conversion described adequate.
   • Partial AFC should be partial ATC in first bullet point.

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☒ Yes

☐ No

Comments: R21 and R24
Current tools allow to submit test requests and get AFC and ATC data available. It is questionable if that is considered being compliant with R21 and R24. If not, changes to software are required to meet the requirements of R21 and R24.

**5.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

☐ Yes

☒ No

Comments: Note - Don't have a complete overview of all directives to answer that question. This is time intensive!!!!

6. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: TSP is responsible to perform calculations, and post the results, the PC and RC and TO only submit data to TSP, such as list of flow gates, limits of flow gates. They do not calculate ATC, hence R1 is irrelevant.

7. In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☒ No

Comments: No R15 doesn't meet the intend of paragraph 245. Most of the PtP Reservations don't have specific resources as Source, they typically source from a group of commonly dispatched units. Also most Tariff's allow re-direct of Reservations to different Sources, so excluding Reservations from impact calculations could possibly result in overselling the system if the excluded reservation is re-directed to a different source. It might be possible to make some general guidelines to address the paragraph 245 of Order 890 such as:

- Total sum of Reservations (Confirmed, Approved, Study) impacting a specific corridor, such as a DC tie should not exceed the total capacity of the corridor.
- Total sum of Reservations (Confirmed, Approved, Study) sinking in a Control Area should not exceed the total Load of the Control Area.
- Total sum of Reservations ((Confirmed, Approved, Study) sourcing from a group of commonly dispatched units should not exceed the total available generation capacity of that group of units.

8. Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: We assume third party is a 1 tier or 2 tier Control Area adjacent to the Tariff footprint of the TSP. Some questions:

- Paragraph talks about impact transmission capability with 3%. Does this mean impact any flow gate within the Tariff footprint of the TSP with 3%. What about flow gates that are tie lines between Tariff footprint and 1tier and limiting element is in 1tier.
- What participation factors and generators should be used to determine if the GLDF of commonly dispatched units of 1tier Control Area is >3%. NERC IDC?
- Is the data listed in bullet point 2,3,4,5,6 of R16 going to be submitted by neighbor TSP. If so it is sufficient to specify that a TSP is getting the list of Reservations as specified in 2,3,4,5,6 of R16 from a neighboring TSP without having to know detail as specified in the bullet points.

9. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments:

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If “No,” please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: ITC agrees with the requirements, themselves, but disagrees with the responsible entities. The Transmission Owner and/or Transmission Operator should be responsible for determing all limits (thermal, voltage, stability) of the transmission facilities. The TO/TOP may choose to delegate the activities, but the requirements in this Standard have put the responsibility on the wrong entity. The RC should not be involved in the determination of facility limits unless so designated to do so. R4 and R5 are appropriate in that respect, but the others are not. As a Transmission Owner/Operator, ITC would be object to any rating greater than one we would provide. This is a dangerous possibility as currently written particularly if commericial interests could affect reliability considerations.

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If “No,” please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: It is not clear that any "allocations" of flowgate capacity, such as in the MISO/PJM Seams agreement, are covered here. These allocations, while technically covered by the 2nd to last bullet, need to be addressed by stronger language than a blanket "any other agreements" clause.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If “No,” please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The conversion of AFC to ATC is covered, but it is not clear. The original SAR for this standard included a white paper with appropriate coversion formulae. Please consult and include the translation equations.

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If “Yes,” please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: A ridiculous amount of paper or web space will be used if all ATC path values are posted for large footprints. Flowgates can be in the thousands but ATC paths are quadratic functions of the number of Sources/Sinks (ie, too many paths to print). ATC for a given path should be on request. (i.e., ask for the path and the TSP provides that specific path ATC via

OASIS). This should be either through manual entry by the requestor or electronically via a requestor electronic query tool (i.e., computer program query).

**5.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments:

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: Applicable Entity 4.2 is not appropriate. Reliability Coordinators should not be calculating ATC. According to the Functional Model, ATC Calculations are performed by the Transmission Service Provider (Task #2, "Determine and post available transfer capability values.") R4 and R5 identify the TO and TP as responsible entities, and need to be included in the applicability sections.

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☒ No

Comments: It meets the intent but is subject to potentiallt adverse interpretation. It is true that a POR may not exceed Pmax for the installed generation; however, when multiple requests are received for the POR that exceed Pmax, should the requests be taken first-come-first-served until Pmax is reached? Should the worst-case scenario be studied and used to set limits? Should the requests be pro-rated until the sum of the requests is reduced to Pmax? We believe the TSP should be allowed some leeway in how they model these situations, in order to prevent reliability problems.

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☒ Yes

☐ No

Comments: This is overdue in our estimation. Using 5%, as some have done, has resulted in unnecessary TLRs, particularly on lower voltage (138kV and below) systems.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☒ No

Comments: There are 3 methods, pick the one that works. We have noted in our other comments that some entities, such as New England, have approved tariffs that don't require the sale of transmission service. They should not have to pick any method but should, as we have noted, be required to provide data to neighboring TSPs that do sell transmission service.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments: We think this is a much better standard than MOD-028 and -029. It should provide for greater flexibility and reliability. We think all methods should be examined closely if there is any evidence of overselling (as evidenced byTLRs and market congestion) or underselling (as evidenced by denial of service without TLRs or market congestion).

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. *Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments: The functional model doesn't necessarily translate to reality so this is hard to answer.

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

5. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: Standard is a fill-in-the-blank

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☐ No

Comments:

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☒ Yes

☐ No

Comments: The words meet the intent of the order, but the order may not be technically correct, nor constistent with other OATT requirements.

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: If is this appropriate for MOD-30, it is appropriate for MOD-28. Why do you specifically spell out a requirement for MOD-30 but not MOD-28?

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☒ Yes

☐ No

Comments: This standard is not requiring consistenecy per the requirement of FERC Order 890.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments: This MOD should be combined with MOD-28 and everyone using a distribution factor based analysis should use the same methodology and the amount of constistency should be increased significantly.

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: For R6, R8, R9, R10, R11 the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as appropriate", do these requirements in the standard. Further R1 and R2 should also be revised for this reaons to also refer to the "Transmission Service Provider, the Reliabiltiy Coordinator and/or the Planning Coordinator, as appropriate."

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: 1. R1.1, R3, R11and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available publicly "on the OASIS" so that this information is not made publicly without registration. 2. R14 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an appropriate level of " the following inputs. 3. R16 the impacts by more than 3% are consistent with post-contingent flowgates. It should be noted that there are continuing to exist in the area, pre-contingent flowgates which would be inproperly represented by post-contingent flowgates. The pre-contingent flowgates in the area generally only consider signficant third-party impacts that are at 5% or more. Therefore, provisions should be made in R16 to allow the appropriate screen, 3% or 5%, for the appropriate type of flowgate, post-contingent or pre-contingent. 4. R18 should be expanded to include the use of metered data to forecast non-firm ETC in the operating horizon and therefore, allowing the release of non-firm ETC for non-firm ATCs in the operating horizon. This method is being used in the area to maximize the non-firm offerings in the operating horizon. I suggest wording such as the following for R18 or as a subrequirement: "Forecasts of non-firm ETC may be made using metered data so as to allow the release of non-firm ETC in the operating horizon. When such forecasting methods are used, it may be assumed that reductions in metered flows in the operating horizon are due to reductions in non-firm ETC." 5. Either use existing transmission commitments in lower case or else provide a definition for the NERC Glossary.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The R22 is inadequate in describing what must be done. It is unclear what path the flowgates are to be converted to. Are the flowgate quantities to be converted into equivalent control area to control area path quantities? Are the flowgate quantities to be converted into flowgate path quantities? If it is the latter, what are the definitions and purposes of the flowgate path quantities? In addition, I do not understand what the benefits are in converting Flowgate AFCs to path AFCs. It seems to be an unnecessary and confusing requirement albeit one in FERC Order 890.

**4.** Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

☒ Yes

☐ No

Comments: It will be incredibly confusing posting both AFCs and ATCs for the same transmission service. I agree that this is in accordance with the FERC Order 890; however, I do not understand what the benefits of this conversion to open transmission service and reliability. I ask the SDT to clarify.

**5.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: It is not appropriate to qualify the Functional Entity as provided in A.4.1 through A.4.3, that is, A.4.1 through A.4.3 should just list the NERC functions from the NERC functional model and not qualify it. For example, 4.1 should be "Planning Coordinator" not "Each Planning Coordinator that uses the Flowgate Network Response method to calculate…..". Then it is up to Planning Coordinators etc. to review the standard to see how the requirements are to be applied, if at all.

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☒ Yes

☒ No

Comments: The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. Also, this requirement is a transmission service request evaluation process requirement and does not belong in its present form in a standard concerning ATCs calculation. Also, there are issues with implementing this requirement. When there are numerous point to point requests for transmission service where some of them are partial path requests, it is not clear how to enforce the impacts of all transmission service shall not exceed the source at a particular point. If the Standards Drafting Team intends to continue with this requirement, the Standards Drafting Team should outline some subrequirements which explain how the Transmission Service Provider is to do this. It would be helpful if the SDT would develop an example of multiple requests some of which are partial path requests to the source point where subsequent requests will result in power being moved away from the point and show how the Transmission Service Provider than reviews the impacts to meet the requirement.

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: The impacts by more than 3% are consistent with post-contigent flowgates. It should be noted that pre-contingent flowgates are continuing to exist in the area. Such pre-contingent flowgates have physical conditions that would be improperly represented by post-contingent flowgates so the pre-contingent flowgates must remain in place. The pre-contingent flowgates in the area generally only consider signficant those third-party impacts that are at 5% or more. Therefore, provisions should be made in R16 to allow the appropriate screen, 3% or 5%, for the appropriate type of flowgate, post-contingent or pre-contingent.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments: 1. R1.1 implies that the only planning criteria that should be used in ATC calculations is Category B in Table 1 of the NERC Standards. That is incorrect, the methodology should describe how it meets the planning criteria that is appropriate for posted values including applicable NERC Standards, regional criteria, Transmission Owner criteria, etc. Therefore, R1.1 should state that "How methodology meets the planning criteria in NERC Standards, regional standards, Transmission Owner's planning criteria, Transmission Planner's planning criteria, and other applicable planning criteria used by the Transmission Planner to plan the system. 2. R8 does not cover all the limitations that are possible for flowgates, for example, the limitation may be due to high transfers causing low voltage on the system after the next condition. This is not an example of a thermal rating or a voltage limit of the power transfer. I suggest that an additional bullet be added to R8 stating "Any other constraint to power transferred across the Flowgate, if applicable. For such constraints, the constraint should be defined, explained, and examples given in the methodology so as to ensure that the ATC methodology is transparent." As an alternative, a bullet should be added for "Steady-state voltage constraint." 3. The scheduling time horizon should be clarified. 4. The Standards Drafting Team indicated that they have decided not to define the term Existing Transmission Commitments, yet R13 uses that defined term with capital letters. The words Existing Transmission Commitments in R13 and elsewhere in the standard should not be capitalized so as not to indicate a defined term. 5. R22 change "covert" to "convert".

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. 1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: I don't believe there should be a conversion it only leads to uncertainty. I believe that the committee should be able to standardize on one technique.

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

5. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☒ Yes

☐ No

Comments:

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: During a TLR or redispatch, a 3% cutoff would require the third party to adjust their resources by up to 33 MW for every 1MW of relief. I believe that this is too much. I would recommend third party mitigation has to be a balance of impact and ability for relief and that 3% biases that balance. I would recommend that the 5% impact which still requires a potential 20 MW adjustment for every 1 MW of relief maintains the balance between impact and ability for relief.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☒ No

Comments:

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The MRO believes that for R6, R8, R9, R10, R11 the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as appropriate", do these requirements in the standard. Further R1 and R2 should also be revised for this reaons to also refer to the "Transmission Service Provider, the Reliabiltiy Coordinator and/or the Planning Coordinator, as appropriate."

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: 1. R1.1, R3, R11and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available publicly "on the OASIS" so that this information is not made publicly without registration. 2. R14 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an appropraite level of " the following inputs. 3. R16 the impacts by more than 3% are consistent with post-contingent flowgates. It should be noted that there are continuing to exist in the MRO area, pre-contingent flowgates which would be inproperly represented by post-contingent flowgates. The pre-contingent flowgates in the MRO generally only consider signficant third-party impacts that are at 5% or more. Therefore, provisions should be made in R16 to allow the appropriate screen, 3% or 5%, for the appropriate type of flowgate, post-contingent or pre-contingent. 4. R18 should be expanded to include the use of metered data to forecast non-firm ETC in the operating horizon and therefore, allowing the release of non-firm ETC for non-firm ATCs in the operating horizon. This method is being used in the MRO to maximize the non-firm offerings in the operating horizon. The MRO suggests wording such as the following for R18 or as a subrequirement: "Forecasts of non-firm ETC may be made using metered data so as to allow the release of non-firm ETC in the operating horizon. When such forecasting methods are used, it may be assumed that reductions in metered flows in the operating horizon are due to reductions in non-firm ETC." 5. Either use existing transmission commitments in lower case or else provide a definition for the NERC Glossary.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The MRO believes that the R22 is inadequate in describing what must be done. It is unclear what path the flowgates are to be converted to. Are the flowgate quantities to be converted into equivalent control area to control area path quantities?  Are the flowgate quantities to be converted into flowgate path quantities?  If it is the latter, what are the defintions and purposes of the flowgate path quantities?  In addition, the MRO does not understand what the benefits are in converting Flowgate AFCs to path AFCs.  It seems to be an unnecessary and confusing requirement albeit one in FERC Order 890.

**4.** Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard?  If "Yes," please explain why in the comments area.

☒ Yes

☐ No

Comments: It will be incredibly confusing posting both AFCs and ATCs for the same transmission service.  The MRO agrees that this is in accordance with the FERC Order 890; however, the MRO does not understand what the benefits of this conversion to open transmission service and reliability.  The MRO asks the SDT to clarify.

**5.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC.  Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1?  If "No," please explain why in the comments area.

☒ Yes

☐ No

Comments:

6. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: The MRO believes it is not appropriate to qualify the Functional Entity as provided in A.4.1 through A.4.3, that is, the MRO recommends that A.4.1 through A.4.3 just list the NERC functions from the NERC functional model and not qualify it. For example, 4.1 should be "Planning Coordinator" not "Each Planning Coordinator that uses the Flowgate Network Response method to calculate…..". Then it is up to Planning Coordinators etc. to review the standard to see how the requirements are to be applied, if at all.

7. In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☒ Yes

☒ No

Comments: The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. Also, this requirement is a transmission service request evaluation process requirement and does not belong in its present form in a standard concerning ATCs calculation. Also, there are issues with implementing this requirement. When there are numerous point to point requests for transmission service where some of them are partial path requests, it is not clear how to enforce the impacts of all transmission service shall not exceed the source at a particular point. If the Standards Drafting Team intends to continue with this requirement, the Standards Drafting Team should outline some subrequirements which explain how the Transmission Service Provider is to do this. It would be helpful if the SDT would develop an example of multiple requests some of which are partial path requests to the source point where subsequent requests will result in power being moved away from the point and show how the Transmission Service Provider than reviews the impacts to meet the requirement.

8. Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: The impacts by more than 3% are consistent with post-contigent flowgates. It should be noted that pre-contingent flowgates are continuing to exist in the MRO area. Such pre-contingent flowgates have physical conditions that would be improperly represented by post-contingent flowgates so the pre-contingent flowgates must remain in place. The pre-contingent flowgates in the MRO generally only consider signficant those third-party impacts that are at 5% or more. Therefore, provisions should be made in R16 to allow the appropriate screen, 3% or 5%, for the appropriate type of flowgate, post-contingent or pre-contingent.

9. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments: 1. R1.1 implies that the only planning criteria that should be used in ATC calculations is Category B in Table 1 of the NERC Standards. That is incorrect, the methodology should describe how it meets the planning criteria that is appropriate for posted values including applicable NERC Standards, regional criteria, Transmission Owner criteria, etc. Therefore, R1.1 should state that "How methodology meets the planning criteria in NERC Standards, regional standards, Transmission Owner's planning criteria, Transmission Planner's planning criteria, and other applicable planning criteria used by the Transmission Planner to plan the system. 2. R8 does not cover all the limitations that are possible for flowgates, for example, the limitation may be due to high transfers causing low voltage on the system after the next condition. This is not an example of a thermal rating or a voltage limit of the power transfer. The MRO suggests that an additional bullet be added to R8 stating "Any other constraint to power transferred across the Flowgate, if applicable. For such constraints, the constraint should be defined, explained, and examples given in the methodology so as to ensure that the ATC methodology is transparent." As an alternative, the MRO recommends that a bullet be added for "Steady-state voltage constraint." 3. MRO believes the scheduling time horizon should be clarified. 4. The Standards Drafting Team indicated that they have decided not to define the term Existing Transmission Commitments, yet R13 uses that defined term with capital letters. The words Existing Transmission Commitments in R13 and elsewhere in the standard should not be capitalized so as not to indicate a defined term. 5. R22 change "covert" to "convert".

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: see answer to #6.

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The definition provided in the SAR was clearer than the current definition. The new definition introduces new terms into the process that are not industry standard or recognizable.

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments: Posting the AFC numbers provide no additional value if the ATC numbers are posted.

5. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

6. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: The applicability section needs clarification. Referencing R1,6,8,9 and 10 they should apply only to those entities performing the function. The standard should not require the calculations be made by the PC and RC, but should be applicable to the designated entitiy performing these calculations . The designated entity must be specified as a requirement in this standard. For example: The TSP, PC and RC must specify and agree to the entity that performs this function in the TSP's ATCID as required in MOD 1. The current revision of MOD-001 states the following requirement as R1: "Each Transmission Service Provider, and its associated Planning Coordinators and Reliability Coordinators, shall agree upon and implement one or more of the ATC methodologies specified in Reliability Standard MOD-028, MOD-029, and MOD-030 for use in determining Transfer Capabilities of those Facilities under the tariff administration of that Transmission Service Provider." The requirements of MOD-0028 should refer to the Designated Entity specified through this requirement. The following are examples of how this would be implemented in the standard:

B. Requirements
R4. Each Designated Entity shall ensure that the Total Transfer Capability (TTC) for each of its Transmission Service Provider's POR to POD Paths is calculated and up-to-date for use within the Transfer Capability time horizons specified in MOD-001 R2.
R5. Prior to calculating TTC, each Designated Entity shall update the following components of the base case power flow model it uses to calculate TTC for the time horizon being studied:

7. In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

8. Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☐ No

Comments:

9. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments: The updating of flowgates as specified in Requirement 2 should be annually rather than quarterly.

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with “NRFG ATC Standard” in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: "Planning Coordinator" is not a defined term. Pleae correct.

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☐ Yes

   ☒ No

   Comments: The impact of load growth for Network Integration Transmission Service should be included in the second sub-bullet of R14.

   The "five years or longer in duration" language should be removed from the fifth sub-bullet of R14. due to the fact that this element of Order 890 is only to be implemented by a TSP once the FERC has approved the TSP's Attachment K -- this may not occur for some TSPs until after the standards are to be implemented. Additionally, regardless of whether a TSP's Attachment K is approved, there will be a transition period (to be developed by each TSP) from the old 1-year/60-day roll-over paradigm to the 5-year/1-year -- the standard should not preclude a TSP from encumbering capacity for those exisitng Customers who have not yet been required to commit to five years of service to retain their roll-over rights.

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments: No comment.

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☒ Yes

   ☐ No

   Comments:
   (The below statement is proposed by BPA. Is the WECC Team OK with supporting it?)

Under the flowgate methodology, ATC is a value derived from an analysis of the expected powerflow impacts of a reservation across multiple flowgates. Consequently, it is the posting of AFC and timely posting of changes to AFC that inform whether transfer capability exists to support a request for transmission service. ATC for a POR-POD path is derived from posted AFC. When posting both ATC by path as well as AFC by flowgate, there is a risk that the AFC and ATC values could get "out of sync" due to automation lag-time, etc. BPA believes that greater consistency and transparency is achieved if only AFC values are posted for each flowgate, and requestors are provided with a "conversion calculator" that calculates ATC for their requested path based on posted AFC's.

**5.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

☐ Yes

☐ No

Comments: No comment.

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☐ No

Comments: See above on defining Planning Coordinatior.

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☒ Yes

☐ No

Comments:

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☒ No

Comments: The threshold of 3% appears to be an arbitrary level. This level may be rooted in Operational and Planning studies that consider impacts from outages on one TP's system that increase loading on an element of another TP's system by 3% or more. While this level may be a good indicator of impact, it may not provide an indicator of which party's ownership or allocation of facilities is being used. It does not assure TPs will be able to preserve their rights (i.e. by contractual allocation) with a fixed threshold of 3%.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments:

A.

R1.2 should be modified due to the fact that Facilities don't cause congestion, rather they experience congestion. The following change to the language would be more accurate:

"How the methodology identifies transmisison Facilities that are expected by the AFC calculator to experience congestion on the transmission system."

B.

See comments on MOD-29.

In the "Applicability" section, the term "Available Transfer Capability Implementation Document" is used as a defined term. The term is used in MOD-01 R3. At minimum the ATCID either needs to be defined or a reference to the MOD-01 must be inserted for cross reference.

C.

R.1 through R.3. appear to be a prohibited "fill-in-the-blank."

D.

R22. Typo. Change "covert" to "convert."

Please use this form to submit comments on the 1st draft of standard MOD-030-1 Network Response Flowgate ATC. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the modeling standards to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-030-0 Network Response Flowgate ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-030-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "NRFG ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

5. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

   ☐ Yes

   ☐ No

   Comments:

**6.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☐ No

Comments:

**7.** In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

☐ Yes

☐ No

Comments:

**8.** Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

Comments:

The standard should describe how flowgates and reliability limits should be determined such as is done for the Network Response Methodology MOD028 in requirement R6 and is done for the Rated System Path Methodology MOD029 in requirement R6.

Requirements R1.1, R1.2 & R1.3 are fill-in-the-blank requirements and need to specify rather than ask the tsp to explain what they do.

R8 - The standard should specify how the thermal, voltage and stability limited are determined. For example, are these n-0 or n-1 limits and are they transient or post-transient?

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

**Consideration of Comments on 1st Draft of Standard MOD-030-1 — Network Response Flowgate ATC (Project 2006-07)**

The ATC Standard Drafting Team requesters thank all commenters who submitted comments on the first draft of standard MOD-030-1, Network Response Flowgate ATC (Project 2006-07). This standard was posted for a 30-day public comment period from May 25 through June 24, 2007. The requesters asked stakeholders to provide feedback on the standard through a special standard Comment Form. There were 17 sets of comments, including comments from 83 different people from more than 40 companies representing all of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received from stakeholders, comments from the cooperative effort with NAESB in developing associated business practices, and comments received from FERC staff, the drafting team has significantly redrafted the standard. The changes have been so extensive that the revised standard bears very little resemblance to the last posted draft. Major changes include:

- Added definitions for the following terms:
  - Flowgate
  - Total Flowgate Capability
  - Available Flowgate Capability
  - Power Transfer Distribution Factor
  - Outage Transfer Distribution Factor
  - Flowgate Methodology
- Changed the title of the standard to just, 'Flowgate Methodology'
- Modified the purpose to clarify that the intent is to support 'consistency and transparency of transfer capability calculations' rather than 'consistency and uniformity of ATC calculations'
- Modified the applicability so that the requirements apply to the Transmission Service Provider and the Transmission Operator – the Planning Coordinator and Reliability Coordinator were removed as applicable entities
- R1 was revised so that, instead of being assigned to the Planning Coordinator and Reliability Coordinator, R1 in the revised standard applies to the Transmission Service Provider to align with the revisions made to MOD-001 – Available Transfer Capability – where responsibility for the Available Transfer Capability Identification Document is assigned to the Transmission Service Provider. The sub-requirements were removed and added to R2.
- R2 was revised so that instead of he Planning Coordinator and Reliability Coordinator identifying Flowgates based on criteria in R1, the requirement was assigned to the Transmission Operator, and the criteria in R1 (sub-bullets R1.1 through R1.3) were clarified and added to R2. R2 was expanded to include the process for identifying Flowgates.
- R3 – was a requirement to make Flowgates 'publicly available' and this has been deleted. NAESB business practices will address all posting requirements. The NERC reliability standards stop at the point where the data or information is provided to the entity responsible for the posting.

- R4 was deleted from the revised standard. This requirement was assigned to the Transmission Owner and Transmission Planner and required that limits be provided to the Transmission Service Provider for use in determining Total Flowgate Capability. Since the standard was revised and the responsibility for determining TFC is now assigned the Transmission Operator this requirement is no longer needed as the Transmission Operator should already have these limits.
- R5 was a requirement for the Transmission Service Provider to use specific thermal limits in the determination of TFC. This requirement was merged into R2 and is assigned to the Transmission Operator. (See R2.3 in the revised standard.)
- R6 was deleted from the revised standard. R6 required the Planning Coordinator ad Reliability Coordinator to provide the Transmission Service Provider with voltage and stability limits – the revised standard assigns the Transmission Operator responsibility for determining TFCs, and assumes that the Transmission Operator already has these limits.
- R7 was a requirement for the Transmission Service Provider to use specific voltage and stability limits in the determination of TFC. This requirement was merged into R2 and is assigned to the Transmission Operator. (See R2.3 in the revised standard.)
- R8 was a step in the determination of TFC and had been assigned to the Planning Coordinator and Reliability Coordinator. In the revised standard this requirement is assigned to the Transmission Operator (see R2.3 in the revised standard)
- R9 required the Planning Coordinator and Reliability Coordinator to ensure TFCs were calculated in accordance with various time periods. In the revised standard, the Transmission Operator is responsible for calculating TFCs. (see R2.4 in the revised standard)
- R10 required the Planning Coordinator and Reliability Coordinator to distribute their TFCs, and in the revised standard this requirement is assigned to the Transmission Operator. (see R2.5 in the revised standard)
- R11 required public posting of TFCs and this requirement has been deleted from the revised standard. All ATC-related posting requirements are being addressed by NAESB in business practices.
- R12 was a requirement to calculate AFC at specific intervals and this is now addressed in MOD-001 — Available Transfer Capability.
- R13 was a requirement to determine Firm AFC and this has been revised to add more specificity. In the revised standard this is R8 and includes a specific algorithm for determining Firm AFC, with each element of the algorithm clearly defined.
- R14 identified the 'inputs' to use to determine the impact of firm ETC and this has been revised to require the calculation of the impact of firm ETC based on specific time periods. Much more specificity has been added to the description of this process. See R6 in the revised standard.
- R15 required the Transmission Service Provider to limit the total impact of all transmission service from a specific resource to not exceed the sum of the nameplate ratings of all generators at that source. The drafting team could not find a reliable approach to specifying how this could be implemented and the requirement was deleted.
- R16 was modified such that the 3% specified for including third party impacts applies only to 1st tier TSPs and those TSPS with which coordination agreements have been

executed. The elements of this requirement have been moved into R6 and R7 in the revised standard.

- R17 identified a process for calculating non-firm AFC and this has been revised. In the revised standard the process has been converted into an algorithm with each element in the algorithm clearly defined. See R9 in the revised standard.
- R18 identified the 'inputs' to use to determine the impact of non-firm ETC and this has been revised to require the calculation of the impact of ETC on non-firm commitments. See R6 in the revised standard.
- R19 and R20 required specific criteria be met in the modeling of the source and sink, and these requirements were merged into the modeling requirements for the Transmission Service Provider's calculation of AFC. See R4 in the revised standard.
- R21 was a requirement to make AFC calculation results 'publicly available' and this requirement has been deleted from the revised standard because it is being addressed by NAESB in a business practice.
- R22 was a requirement to convert AFC to ATC and this has been modified so that in the revised standard, the process for this conversion is addressed with an algorithm where each element of the algorithm is clearly defined. See R 10 in the revised standard.
- R23 was removed because the release of unscheduled Transmission Service for resale will be addressed by NAESB.
- R24 was a requirement to make ATC 'publicly available' and this requirement has been deleted from the revised standard because it is being addressed by NAESB in a business practice.
- Measures and compliance elements were added.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

## Index to Questions, Comments, and Responses

1. Do you agree with the responsible entities described in Requirements four through seven and eleven (R4-R7 and R11)? If "No," please explain why in the comments area.

**Summary Consideration:** Most stakeholders who responded to this question indicated that the applicability section of the standard needed revision. The drafting team has redrafted the standard based on a more in-depth reading of the functional model, and we believe it should address the majority of the concerns expressed by the industry. The applicability section of the standard was modified so that there are no requirements in the revised standard applied to the Reliability Coordinator or the Planning Coordinator – and the Transmission Operator was added as an applicable functional entity.

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF | | ☑ | "Planning Coordinator" is not a defined term. **Pleae** correct. |
| **Response:** We have drafted a definition to address this on an interim basis, until the Functional Model Drafting Team addresses it in more detail. According to members of the Functional Model Working Group, the terms 'Planning Authority' and 'Planning Coordinator' are equivalent. | | | |
| APPA | | ☑ | These requirements should be in the FAC series and developed by personnel who are experienced in the determination of flowgates and their limitations. The requirements, as written are requiring improper use of the values stated in the requirements. |
| **Response:** The drafting team drafted a Supplemental SAR and has expanded the membership of the drafting team to address this concern. | | | |
| BPA | | ☑ | "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority. |
| **Response:** We have drafted a definition to address this on an interim basis, until the Functional Model Drafting Team addresses it in more detail. According to members of the Functional Model Working Group, the terms 'Planning Authority' and 'Planning Coordinator' are equivalent. | | | |
| Entergy | | ☑ | R5 reference to Transmission Operator should be changed to Transmission Owner. |
| **Response:** We have included references to the transmission Owner with regard to Facility Ratings. (See R3 in the revised standard.) | | | |
| ITC | | ☑ | ITC agrees with the requirements, themselves, but disagrees with the responsible entities. The Transmission Owner and/or Transmission Operator should be responsible for determing all limits (thermal, voltage, stability) of the transmission facilities. The TO/TOP may choose to delegate the activities, but the requirements in this Standard have put the responsibility on the wrong entity. The RC should not be involved in the determination of facility limits unless so designated to do so. R4 and R5 are appropriate in that respect, but the others are not. As a Transmission Owner/Operator, ITC would be object to any rating greater than one we would provide. This is a dangerous possibility as currently written particularly if commericial interests could affect reliability considerations. |

| Question #1 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** We have revised the standard so that it now requires the Transmission Operator to set TFC, but we have not specified how thermal, voltage, or stability limits are determined. The revised standard does indicate (R3) that the Facility Ratings in the transmission model used to determine AFC must include the Facility Ratings provided by Transmission Owners and Generator Owners. | | | |
| MEC Trading | | | The functional model doesn't necessarily translate to reality so this is hard to answer. |
| **Response:** The drafting team appreciates your comment, and has attempted to redraft the standard based on a more in-depth reading of the functional model. | | | |
| MEC | | ☑ | For R6, R8, R9, R10, R11 the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as appropriate", do these requirements in the standard. Further R1 and R2 should also be revised for this reaons to also refer to the "Transmission Service Provider, the Reliabiltiy Coordinator and/or the Planning Coordinator, as appropriate." |
| **Response:** Most stakeholders who responded to this question and to similar questions for MOD-028 and MOD-029, indicated that the Transmission Operator should calculate TTC/TFC.<br>The drafting team deleted R6 from the revised standard. R6 required the Planning Coordinator ad Reliability Coordinator to provide the Transmission Service Provider with voltage and stability limits – the revised standard assigns the Transmission Operator responsibility for determining TFCs, and assumes that the Transmission Operator already has these limits.<br>R8, R9, and R10 are all related to the determination and dissemination of TFCs – these requirements had assigned to the Planning Coordinator and Reliability Coordinator and in the revised standard all are assigned to the Transmission Operator (see R2.3, R2.4 and R2.5 in the revised standard)<br>R11 required public posting of TFCs and this requirement has been deleted from the revised standard. All ATC-related posting requirements are being addressed by NAESB in business practices.<br>R1 was revised so that, instead of being assigned to the Planning Coordinator and Reliability Coordinator, R1 in the revised standard applies to the Transmission Service Provider to align with the revisions made to MOD-001 – Available Transfer Capability – where responsibility for the Available Transfer Capability Identification Document is assigned to the Transmission Service Provider. | | | |
| MRO | | ☑ | The MRO believes that for R6, R8, R9, R10, R11 the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as appropriate", do these requirements in the standard. Further R1 and R2 should also be revised for this reaons to also refer to the "Transmission Service Provider, the Reliabiltiy Coordinator and/or the Planning Coordinator, as appropriate." |
| **Response:** Most stakeholders who responded to this question and to similar questions for MOD-028 and MOD-029, indicated that the Transmission Operator should calculate TTC/TFC. | | | |

| **Question #1** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| The drafting team deleted R6 from the revised standard. R6 required the Planning Coordinator ad Reliability Coordinator to provide the Transmission Service Provider with voltage and stability limits – the revised standard assigns the Transmission Operator responsibility for determining TFCs, and assumes that the Transmission Operator already has these limits.<br>R8, R9, and R10 are all related to the determination and dissemination of TFCs – these requirements had assigned to the Planning Coordinator and Reliability Coordinator and in the revised standard all are assigned to the Transmission Operator (see R2.3, R2.4 and R2.5 in the revised standard)<br>R11 required public posting of TFCs and this requirement has been deleted from the revised standard. | Manitoba Hydro | ☑ | | |
| PSC SC | ☑ | | |

2. Do you believe that all elements of ETC have been adequately captured in Requirements fourteen and eighteen (R14 and R18)? If "No," please explain why in the comments area.

**Summary Consideration:** The drafting team has re-written the requirement describing how to determine ETC.

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF | | ☑ | The impact of load growth for Network Integration Transmission Service should be included in the second sub-bullet of R14.<br><br>The "five years or longer in duration" language should be removed from the fifth sub-bullet of R14. due to the fact that this element of Order 890 is only to be implemented by a TSP once the FERC has approved the TSP's Attachment K -- this may not occur for some TSPs until after the standards are to be implemented. Additionally, regardless of whether a TSP's Attachment K is approved, there will be a transition period (to be developed by each TSP) from the old 1-year/60-day roll-over paradigm to the 5-year/1-year -- the standard should not preclude a TSP from encumbering capacity for those exisitng Customers who have not yet been required to commit to five years of service to retain their roll-over rights. |
| **Response:** In response to this comment, the drafting team has written a more detailed description of how to determine ETC. R14 has been revised (now R6) to base the impact of Firm Network and native Load Service on peak load forecasts for the applicable periods, which would include load growth. The 'five years or longer in duration' was removed in support of your suggestion. (See R6.2 in the revised standard.) | | | |
| APPA | | ☑ | These requirements are tariff or contract requirements that will be contained in or a part of a regulatory or legal document. Some of these requirements are not a reliability issues since and should be removed. Those statements that want to know the effects of actions that are of a reliability nature will be determined by other functions not the TSP, which just sell transmission capacity. |
| **Response:** The requirement to calculate TFC was revised so that it applies to the Transmission Operator rather than the Transmission Service Provider. | | | |
| BPA | | ☑ | The impact of load growth for Network Integration Transmission Service should be included in the second sub-bullet of R14.<br><br>The "five years or longer in duration" language should be removed from the fifth sub-bullet of R14. due to the fact that this element of Order 890 is only to be implemented by a Transmission Service Provider (TSP) once the FERC has approved the TSP's Attachment K -- this may not occur for some TSPs until after the standards are to be implemented. Additionally, regardless of whether a TSP's Attachment K is approved, there will be a transition period (to be developed by each TSP) from the old 1-year/60-day roll-over paradigm to the 5-year/1-year -- the standard should not preclude a TSP from encumbering capacity for those existing Customers who have not yet been required to commit to five years of service to retain their roll-over rights. |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | The ninth sub-bullet should include all other impacts and not just the impacts using transmission service to service Native Load or firm Network Integration load. Therefore, "using transmission that serves Native Load or Firm Network Integration Transmission Service" should be deleted. |
| **Response:** In response to this comment, the drafting team has written a more detailed description of how to determine ETC. R14 has been revised (now R6) to base the impact of Firm Network and native Load Service on peak load forecasts for the applicable periods, which would include load growth.<br>The suggestion for deleting the phrase, 'using transmission that serves Native Load or Firm Network Integration Transmission Service' was adopted. In the revised standard the 'options' have been revised and restarted as elements that must be identified and included in the calculation for determining firm ETC. (See R6.1 in the revised standard)<br>The 'five years or longer in duration' was removed in support of your suggestion. (See R6.2 in the revised standard.) | | | |
| IESO<br>IRC | | ☑ | R14: It is not clear if the standard requires all inputs to be included in the calculation of the impact of Firm ETC. If so, 2 of bullet points are questionable:<br>• FIRM NITS Reservations (second bullet point) are only explicitly incorporated in ETC if they cross control area boundaries. (POR not equal to POD) Otherwise they are part of the base-flow calculations<br>- Designated Network Resources (DNRs) serving Native Load (first bullet point). In order to clarify, we could add to the second bullet: "not otherwise included in TRM or CBM or in the impacts of Native Load commitments"<br>• Impact of Ancillary Services not included already in TRM, is very difficult to quantify and include in ETC.<br>R18<br>• Non-Firm ETC calculations use the same base flow based on resources serving native load commitments as Firm ETC Calculations. Non-Firm NITS Reservations (second bullet point) are only explicitly incorporated in ETC if they cross control area boundaries (POR not equal to POD). Otherwise they are part of the base-flow calculations. |
| **Response:** In response to this comment, the drafting team has written a more detailed description of how to determine ETC. See R6 and R7 in the revised standard. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See the response to IRC's comments. | | | |
| ITC | | ☑ | It is not clear that any "allocations" of flowgate capacity, such as in the MISO/PJM Seams agreement, are covered here. These allocations, while technically covered by the 2nd to last bullet, need to be addressed by stronger language than a blanket "any other agreements" clause. |
| **Response:** The reliability standard refers only to the allocation of TTC from an ownership standpoint. It does not address contractual allocations of ATC. | | | |
| MEC | | ☑ | 1. R1.1, R3, R11and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available publicly "on the OASIS" so that this |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | information is not made publicly without registration.<br><br>2. R14 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an appropriate level of " the following inputs.<br><br>3. R16 the impacts by more than 3% are consistent with post-contingent flowgates. It should be noted that there are continuing to exist in the area, pre-contingent flowgates which would be inproperly represented by post-contingent flowgates. The pre-contingent flowgates in the area generally only consider signficant third-party impacts that are at 5% or more. Therefore, provisions should be made in R16 to allow the appropriate screen, 3% or 5%, for the appropriate type of flowgate, post-contingent or pre-contingent.<br><br>4. R18 should be expanded to include the use of metered data to forecast non-firm ETC in the operating horizon and therefore, allowing the release of non-firm ETC for non-firm ATCs in the operating horizon. This method is being used in the area to maximize the non-firm offerings in the operating horizon. I suggest wording such as the following for R18 or as a subrequirement: "Forecasts of non-firm ETC may be made using metered data so as to allow the release of non-firm ETC in the operating horizon. When such forecasting methods are used, it may be assumed that reductions in metered flows in the operating horizon are due to reductions in non-firm ETC."<br><br>5. Either use existing transmission commitments in lower case or else provide a definition for the NERC Glossary. |
| **Response:** 1. The team has removed all requirements that included make data or information, publicly available', as NAESB will address all the posting requirements.<br>2. The term "an appropriate level of" may not allow for an accurate measurement of compliance. We have redrafted this language significantly, which may address your concerns.<br>3. The group has elected to use a 3% threshold, based on the work of the Alliant West TLR Task Force.<br>4. The standard allows for, but does not require, the use of meter data in the components used to determine ETC.<br>5. We have provided a definition of ETC, and each standard (MOD-028, MOD-029, MOD-030) explains the calculation of ETC. | | | |
| MRO | | ☑ | 1. R1.1, R3, R11and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available publicly "on the OASIS" so that this information is not made publicly without registration.<br>2. R14 should be revised to indicated that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an appropraite level of " the following inputs.<br>3. R16 the impacts by more than 3% are consistent with post-contingent flowgates. It should be noted that there are continuing to exist in the MRO area, pre-contingent flowgates which would be inproperly represented by post-contingent flowgates. The pre-contingent flowgates in the MRO generally only |

| Question #2 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | consider signficant third-party impacts that are at 5% or more. Therefore, provisions should be made in R16 to allow the appropriate screen, 3% or 5%, for the appropriate type of flowgate, post-contingent or pre-contingent.<br>4. R18 should be expanded to include the use of metered data to forecast non-firm ETC in the operating horizon and therefore, allowing the release of non-firm ETC for non-firm ATCs in the operating horizon. This method is being used in the MRO to maximize the non-firm offerings in the operating horizon. The MRO suggests wording such as the following for R18 or as a subrequirement: "Forecasts of non-firm ETC may be made using metered data so as to allow the release of non-firm ETC in the operating horizon. When such forecasting methods are used, it may be assumed that reductions in metered flows in the operating horizon are due to reductions in non-firm ETC."<br>5. | PSC SC | ☑ | | |
| SERC ATCWG | ☑ | | |

3. Is the conversion of AFC to ATC adequately described in Requirement twenty-two (R22)? If "No," please explain why in the comments area.

**Summary Consideration:** There was no consensus amongst the stakeholders who responded to this question. The drafting team has rewritten the requirement describing the conversion to be clearer and provide more detail.
The changes made include the addition of the following algorithm:

$$TC = \min\{PTC_1, PTC_2, \ldots PTC_n\} \text{ And } PTC_n = \frac{FC_n}{DF_{np}}$$

**Where:**

**TC** is the Transfer Capability (either 'Available' or 'Total').

**P** is the set of partial Transfer Capabilities (either available or total) for all "impacted" Flowgates honored by the Transmission Service Provider; a Flowgate is considered "impacted" by a path if the Distribution Factor for that path is greater than 3% on an OTDF Flowgate or PTDF Flowgate.

**$PTC_n$** is the partial Transfer Capability (either 'Available' or 'Total') for a path relative to a Flowgate *n*.

**$FC_n$** is the Flowgate Capability ('Available' or 'Total') of a Flowgate *n*.

**$DF_{np}$** is the distribution factor for Flowgate *n* relative to path *p*.

| Question #3 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | Need to let the expanded SDT review this by personnel knowledgeable in development of AFT and distribution factors |
| **Response:** The SDT was expanded and the revised standard reflects the requested actions. | | | |
| Entergy | | ☑ | The requirement should be worded in simple language to reflect how AFCs are determined rather than an equation that a program can use in developing program. |
| **Response:** We have expanded the details in the standard to better explain the process. Most comments wanted more specific details, and the most effective way of providing those details was in an algorithm. The revised standard includes the algorithm and defines each of the elements in the algorithm – while this doesn't support your specific request, the additional specificity should support the intent of your request. | | | |
| ITC | | ☑ | The conversion of AFC to ATC is covered, but it is not clear. The original SAR for this standard included a white paper with appropriate coversion formulae. Please consult and include the translation equations. |
| **Response:** We replaced the requirement with a more detailed algorithm that includes a definition of each of the elements | | | |

| **Question #3** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| in the algorithm. | | | |
| MEC | | ☑ | The R22 is inadequate in describing what must be done. It is unclear what path the flowgates are to be converted to. Are the flowgate quantities to be converted into equivalent control area to control area path quantities? Are the flowgate quantities to be converted into flowgate path quantities? If it is the latter, what are the definitions and purposes of the flowgate path quantities? In addition, I do not understand what the benefits are in converting Flowgate AFCs to path AFCs. It seems to be an unnecessary and confusing requirement albeit one in FERC Order 890. |
| **Response:** We replaced the requirement with a more detailed algorithm that includes a definition of each of the elements in the algorithm. Generally transmission service is sold on a path basis, with the limit being the most limiting Flowgate above the threshold limit. | | | |
| Manitoba Hydro | | ☑ | I don't believe there should be a conversion it only leads to uncertainty. I believe that the committee should be able to standardize on one technique. |
| **Response:** Order 890 allows for three methodologies, and the conversion explains how to post the results of one methodology in the terms used by the other two. | | | |
| MRO | | ☑ | The MRO believes that the R22 is inadequate in describing what must be done. It is unclear what path the flowgates are to be converted to. Are the flowgate quantities to be converted into equivalent control area to control area path quantities? Are the flowgate quantities to be converted into flowgate path quantities? If it is the latter, what are the definitions and purposes of the flowgate path quantities? In addition, the MRO does not understand what the benefits are in converting Flowgate AFCs to path AFCs. It seems to be an unnecessary and confusing requirement albeit one in FERC Order 890. |
| **Response:** We replaced the requirement with a more detailed algorithm that includes a definition of each of the elements in the algorithm. Generally transmission service is sold on a path basis, with the limit being the most limiting Flowgate above the threshold limit. | | | |
| SERC ATCWG | | ☑ | The definition provided in the SAR was clearer than the current definition. The new definition introduces new terms into the process that are not industry standard or recognizable. |
| **Response:** We replaced the requirement with a more detailed algorithm that includes a definition of each of the elements in the algorithm. We believe all terms are either in the NERC Glossary or are proposed by the updated MOD Standards. | | | |
| ERCOT | ☑ | | See IRC comments submitted by Charles Yeung. |
| **Response:** See the response to IRC's comments | | | |
| BPA | ☑ | | However, for the reasons explained in our response to the MOD-030-1 Comment Form's question 4, BPA suggests that R22. be modified to the following:<br>" The Transmission Service Provider shall make publicly available a mechanism for interested parties to convert Flowgate AFCs to path ATCs based on…" |
| **Response:** FERC has directed that path ATCs be posted. NAESB will be addressing what needs to be posted and how. | | | |
| IESO | ☑ | | Yes, the conversion is described adequately. In the first bullet point, "…the Transmission Service |

| **Question #3** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | Provider shall calculate the partial AFC of that…" should be written as "…the Transmission Service Provider shall calculate the partial ATC of that…" |
| **Response:** The drafting team appreciates your response. You are correct, 'partial AFC should have been partial ATC.' | | | |
| IRC | ☑ | | Yes, conversion described adequate.<br>• Partial AFC should be partial ATC in first bullet point. |
| **Response:** The drafting team appreciates your response. You are correct, 'partial AFC should have been partial ATC.' | | | |
| MEC Trading | ☑ | | |
| PSC SC | ☑ | | |
| FirstEnergy | ☑ | | |

4. Do you anticipate any problems with posting both AFCs and ATCs as described in Requirements twenty-one and twenty-four (R21 and R24) in this draft standard? If "Yes," please explain why in the comments area.

**Summary Consideration:** Most stakeholders who responded to this question indicated that there would be problems in complying with the originally proposed R21 and R24. The drafting team has removed the posting requirements from the standard. NAESB will be addressing what needs to be posted and how in business practices.

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| Entergy | | ☑ | AFCs are not required to be posted as these do not mean much to the users, therefore, R21 should be deleted. |
| **Response:** R21 was deleted from the revised standard. NAESB will be making the determination if these need to be posted or not. | | | |
| PSC SC | | ☑ | |
| WECC MIC MIS ATC TF | ☑ | | (The below statement is proposed by BPA. Is the WECC Team OK with supporting it?) Under the flowgate methodology, ATC is a value derived from an analysis of the expected powerflow impacts of a reservation across multiple flowgates. Consequently, it is the posting of AFC and timely posting of changes to AFC that inform whether transfer capability exists to support a request for transmission service. ATC for a POR-POD path is derived from posted AFC. When posting both ATC by path as well as AFC by flowgate, there is a risk that the AFC and ATC values could get "out of sync" due to automation lag-time, etc. BPA believes that greater consistency and transparency is achieved if only AFC values are posted for each flowgate, and requestors are provided with a "conversion calculator" that calculates ATC for their requested path based on posted AFC's. |
| **Response:** FERC has directed that path ATCs be posted. NAESB will be addressing what needs to be posted and how. | | | |
| APPA | ☑ | | This Standard trys to provide detail requirements for AFT, ATC, ETC and the requirements of 3 different functional entities and it is written in a manner that will not support a Compliance program. |
| **Response:** We have redrafted the standards to address this concern. The applicability of the standard was revised and the Planning Coordinator and Reliability Coordinator are not assigned responsibility for any requirements. | | | |
| BPA | ☑ | | Under the flowgate methodology, ATC is a value derived from an analysis of the expected powerflow impacts of a reservation across multiple flowgates. Consequently, it is the posting of AFC and timely posting of changes to AFC that inform whether transfer capability exists to support a request for transmission service. ATC for a POR-POD path is derived from posted AFC. When posting both ATC by path as well as AFC by Flowgate, there is a risk that the AFC and ATC values could get "out of sync" due to automation lag-time, etc. BPA believes that greater consistency and transparency is achieved if only AFC values are posted for each Flowgate, and requestors are provided with a "conversion calculator" that calculates ATC for their requested path based on posted AFC's. |
| **Response:** FERC has directed that path ATCs be posted. NAESB will be addressing what needs to be posted and how. | | | |
| ERCOT | ☑ | | See comment 9. |

| Question #4 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** | | | |
| FirstEnergy | ☑ | | The standard should include specifics of methods for complying with the term "publicly available" such as posting on OASIS, a corporate web page, etc. (This concept is mentioned in all MOD-028, MOD-029, and MOD-030.) |
| **Response:** The SDT has eliminated this language, and will let NAESB specify the manner in which information is to be posted. | | | |
| IESO<br>IRC | ☑ | | R21 and R24<br>Current tools allow the submission of requests and retrieval of available and calculated AFC and ATC data. It is questionable if that is considered being compliant with R21 and R24. If not, changes to the software might be required to meet the requirements of R21 and R24. |
| **Response:** R21 and R24 have been deleted from the revised standard as they were requirements to make information publicly available and NAESB is addressing these requirements in its business practices. | | | |
| ITC | ☑ | | A ridiculous amount of paper or web space will be used if all ATC path values are posted for large footprints. Flowgates can be in the thousands but ATC paths are quadratic functions of the number of Sources/Sinks (i.e., too many paths to print). ATC for a given path should be on request. (i.e., ask for the path and the TSP provides that specific path ATC via OASIS). This should be either through manual entry by the requestor or electronically via a requestor electronic query tool (i.e., computer program query). |
| **Response:** FERC has directed that path ATCs be posted. R21 and R24 have been deleted from the revised standard. NAESB will be addressing what needs to be posted and how. | | | |
| MEC | ☑ | | It will be incredibly confusing posting both AFCs and ATCs for the same transmission service. I agree that this is in accordance with the FERC Order 890; however, I do not understand what the benefits of this conversion to open transmission service and reliability. I ask the SDT to clarify. |
| **Response:** R21 and R24 have been deleted from the revised standard. NAESB will be addressing what needs to be posted and how. | | | |
| MRO | ☑ | | It will be incredibly confusing posting both AFCs and ATCs for the same transmission service. The MRO agrees that this is in accordance with the FERC Order 890; however, the MRO does not understand what the benefits of this conversion to open transmission service and reliability. The MRO asks the SDT to clarify. |
| **Response:** R21 and R24 have been deleted from the revised standard. NAESB will be addressing what needs to be posted and how. | | | |
| SERC ATCWG | ☑ | | Posting the AFC numbers provide no additional value if the ATC numbers are posted. |
| **Response:** R21 and R24 have been deleted from the revised standard. NAESB will be addressing what needs to be posted and how. | | | |

5. The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to AFC, as it relates to ATC. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to AFC in this draft of MOD-030-1? If "No," please explain why in the comments area.

**Summary Consideration:** The drafting team disagreed with the suggestions regarding FAC-012. Other comments suggested a general concern with a lack of clarity and detail regarding the Order, which is beyond the scope of the drafting teams work.

| **Question #5** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | The Federal Energy Regulatory Commission (FERC) has requested Standards that determine the requirements to calculate TTC will be handled in the FAC Standards. Order 693 States the following: 1050. We adopt the NOPR proposal and require that TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. The FAC series of standards contain the Reliability Standards that form the technical and procedural basis for calculating transfer capabilities. FAC-008-1 provides the basis for determining the thermal ratings of facilities while FAC-009-1 provides the basis for communicating those ratings. FAC-010-1 and FAC-011-1 provide the system operating limits methodologies for the planning and operational horizon respectively and FAC-014 provides for the communication of those ratings. FERC has correctly recognized that FAC-012 and FAC-013, while associated with modeling is highly dependent on the previous FAC Standards as noted by FERC. |
| **Response:** We agree the FERC order requires this; however, we believe we have good technical reasons for writing the standard otherwise. | | | |
| Duke | | ☑ | Conditional Firm Service (CFS) and Planning Redispatch Service (PRS) under Order No. 890 create new issues relating to modeling and calculating ATC. Specifically, when PRS is offered to maintain service, modeling for ATC calculations will be impacted during these periods. TTC must be modeled/calculated accounting for the new CFS/PRS requirements. |
| **Response:** Since these concepts have not been fully developed, the standard as drafted allows for the inclusion of CFS and PRS when modeling usage of the system. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** Please see the response to IRC's comments. | | | |
| IESO | | ☑ | Note - We don't have a complete overview of all directives to answer this question. |
| **Response:** The drafting team will post a table that includes all relevant directives from FERC Order 693 and 890 to show the standard and requirement that addresses each directive. | | | |
| IRC | | ☑ | Note - Don't have a complete overview of all directives to answer that question. This is time intensive!!!! |

| Question #5 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** The drafting team will post a table that includes all relevant directives from FERC Order 693 and 890 to show the standard and requirement that addresses each directive. | | | |
| MEC Trading | | ☑ | Standard is a fill-in-the-blank |
| **Response:** The SDT has added significant detail to address this concern. | | | |
| FirstEnergy | ☑ | | |
| Entergy | ☑ | | |
| MEC | ☑ | | |
| MRO | ☑ | | |
| PSC SC | ☑ | | |

6. Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

**Summary Consideration**: Most stakeholders who responded to this question indicated that they disagreed with the applicability section of the standard. The SDT made changes to the functional entities based on commenters' suggestions, and the revised standard does not include either the Planning Coordinator or the Reliability Coordinator as responsible entities – and the Transmission Operator has been added as a responsible entity**.**

The drafting team modified MOD-001 — Available Transfer Capability to assign the Transmission Service Provider with the responsibility for having an Available Transfer Capability Implementation Document – and modified all the standards in this set (MOD-028, MOD-029, MOD-030) to clarify that the Transmission Operator and Transmission Service Provider are the entities with responsibility for developing the calculations used to determine ATC. The Transmission Operator determines the Transfer Capabilities and the Transmission Service Provider determines ATC.

| **Question #6** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF | | | See above on defining Planning Coordinator. |
| **Response:** We have removed the PC from the standard. | | | |
| BPA | | ☑ | "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority. |
| **Response:** We have removed the PC from the standard. | | | |
| IESO | | ☑ | TSP is the sole entity responsible for performing calculations, and posting of the results. The PC, RC, and TO only submit data to the TSP, such as list of OTDF and PTDF flow gates, seasonal limits of flow gates, flowgate components, flow directions on flowgate components etc. They do not calculate ATC, hence R1 is irrelevant. |
| **Response:** The drafting team modified MOD-001 — Available Transfer Capability to assign the Transmission Service Provider with the responsibility for having an Available Transfer Capability Implementation Document (ATCID)– and modified all the standards in this set to clarify that the Transmission Operator and Transmission Service Provider are the entities with responsibility for developing the calculations used to determine ATC. The Transmission Operator determines the Transfer Capabilities and the Transmission Service Provider determines ATC.<br>R1 addresses the ATCID and in the revised standard is assigned to the Transmission Service Provider.<br>Note that all posting requirements have been removed from the revised standards. | | | |
| IRC | | ☑ | TSP is responsible to perform calculations, and post the results, the PC and RC and TO only submit data to TSP, such as list of flow gates, limits of flow gates. They do not calculate ATC, hence R1 is irrelevant. |

| Question #6 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| **Response:** The drafting team modified MOD-001 — Available Transfer Capability to assign the Transmission Service Provider with the responsibility for having an Available Transfer Capability Implementation Document (ATCID)– and modified all the standards in this set (MOD-028, MOD-029, MOD-030)to clarify that the Transmission Operator and Transmission Service Provider are the entities with responsibility for developing the calculations used to determine ATC. The Transmission Operator determines the Transfer Capabilities and the Transmission Service Provider determines ATC.<br>R1 addresses the ATCID and in the revised standard is assigned to the Transmission Service Provider.<br>Note that all posting requirements have been removed from the revised standards. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** Please see the response to IRC's comments. | | | |
| ITC | | ☑ | Applicable Entity 4.2 is not appropriate. Reliability Coordinators should not be calculating ATC. According to the Functional Model, ATC Calculations are performed by the Transmission Service Provider (Task #2, "Determine and post available transfer capability values.") R4 and R5 identify the TO and TP as responsible entities, and need to be included in the applicability sections. |
| **Response:** The drafting team modified MOD-001 — Available Transfer Capability to assign the Transmission Service Provider with the responsibility for having an Available Transfer Capability Implementation Document (ATCID)– and modified all the standards in this set (MOD-028, MOD-029, MOD-030) to clarify that the Transmission Operator and Transmission Service Provider are the entities with responsibility for developing the calculations used to determine ATC. The Transmission Operator determines the Transfer Capabilities and the Transmission Service Provider determines ATC. We do not agree that the Transmission Planner is applicable. R4 was deleted from the revised standard as the Transmission Operator will already have these limits – and R5 was merged with other requirements into R2 which is assigned to the Transmission Operator (see 42.3 in the revised standard.) | | | |
| MEC | | ☑ | It is not appropriate to qualify the Functional Entity as provided in A.4.1 through A.4.3, that is, A.4.1 through A.4.3 should just list the NERC functions from the NERC functional model and not qualify it. For example, 4.1 should be "Planning Coordinator" not "Each Planning Coordinator that uses the Flowgate Network Response method to calculate…..". Then it is up to Planning Coordinators etc. to review the standard to see how the requirements are to be applied, if at all. |
| **Response:** The NERC Standards Development Process encourages the qualification of applicable entities to ensure only the appropriate entities are required to adhere to the standard. | | | |
| MRO | | ☑ | The MRO believes it is not appropriate to qualify the Functional Entity as provided in A.4.1 through A.4.3, that is, the MRO recommends that A.4.1 through A.4.3 just list the NERC functions from the NERC functional model and not qualify it. For example, 4.1 should be "Planning Coordinator" not "Each Planning Coordinator that uses the Flowgate Network Response method to calculate…..". Then it is up to Planning Coordinators etc. to review the standard to see how the requirements are to be applied, if at all. |
| **Response:** The NERC Standards Development Process encourages the qualification of applicable entities to ensure only the appropriate entities are required to adhere to the standard. | | | |

| **Question #6** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| SERC ATCWG | | ☑ | The applicability section needs clarification. Referencing R1,6,8,9 and 10 they should apply only to those entities performing the function. The standard should not require the calculations be made by the PC and RC, but should be applicable to the designated entitiy performing these calculations . The designated entity must be specified as a requirement in this standard. For example: The TSP, PC and RC must specify and agree to the entity that performs this function in the TSP's ATCID as required in MOD 1. The current revision of MOD-001 states the following requirement as R1: "Each Transmission Service Provider, and its associated Planning Coordinators and Reliability Coordinators, shall agree upon and implement one or more of the ATC methodologies specified in Reliability Standard MOD-028, MOD-029, and MOD-030 for use in determining Transfer Capabilities of those Facilities under the tariff administration of that Transmission Service Provider." The requirements of MOD-0028 should refer to the Designated Entity specified through this requirement. The following are examples of how this would be implemented in the standard:<br><br>B. Requirements<br>R4. Each Designated Entity shall ensure that the Total Transfer Capability (TTC) for each of its Transmission Service Provider's POR to POD Paths is calculated and up-to-date for use within the Transfer Capability time horizons specified in MOD-001 R2.<br>R5. Prior to calculating TTC, each Designated Entity shall update the following components of the base case power flow model it uses to calculate TTC for the time horizon being studied: |
| **Response:** We have changed the functional entities referenced to address your concerns.<br>R1 was revised so that, instead of being assigned to the Planning Coordinator and Reliability Coordinator, R1 in the revised standard applies to the Transmission Service Provider to align with the revisions made to MOD-001 – Available Transfer Capability – where responsibility for the Available Transfer Capability Identification Document is assigned to the Transmission Service Provider. Note that MOD-001 was also revised to clarify that the Transmission Service Provider calculates ATC.<br>The drafting team deleted R6 from the revised standard. R6 required the Planning Coordinator ad Reliability Coordinator to provide the Transmission Service Provider with voltage and stability limits – the revised standard assigns the Transmission Operator responsibility for determining TFCs, and assumes that the Transmission Operator already has these limits.<br>R8, R9, and R10 are all related to the determination and dissemination of TFCs – these requirements had assigned to the Planning Coordinator and Reliability Coordinator and in the revised standard all are assigned to the Transmission Operator (see R2.3, R2.4 and R2.5 in the revised standard)<br><br>"Designated Entity" is inappropriate for a responsible entity. The Functional Entity may delegate tasks, but the Functional Entity remains the responsible entity. | | | |

7. In R15, we provided a preliminary response to Order 890s paragraph 245, which deals with reservations that have the same POR (generator) but different PODs (loads). Do you agree that R15 meets the intent of order 890? If "No," please suggest how you believe the Order's requirements from paragraph 245 should be addressed in the comments area.

**Summary Consideration:** There was no consensus amongst the stakeholders who responded to this question. The DT discussed this issue in an attempt to define specific requirements to ensure consistent implementation. Several different approaches were discussed; however, talking through examples it was determined that each implementation would have a detrimental impact on either reliability or Open Access. Therefore this requirement was removed. This shall serve as a single response to opinions offered in response to this question.

| Question #7 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| IRC | | ☑ | No R15 doesn't meet the intend of paragraph 245. Most of the PtP Reservations don't have specific resources as Source, they typically source from a group of commonly dispatched units. Also most Tariff's allow re-direct of Reservations to different Sources, so excluding Reservations from impact calculations could possibly result in overselling the system if the excluded reservation is re-directed to a different source. It might be possible to make some general guidelines to address the paragraph 245 of Order 890 such as:<br>• Total sum of Reservations (Confirmed, Approved, Study) impacting a specific corridor, such as a DC tie should not exceed the total capacity of the corridor.<br>• Total sum of Reservations (Confirmed, Approved, Study) sinking in a Control Area should not exceed the total Load of the Control Area.<br>• Total sum of Reservations ((Confirmed, Approved, Study) sourcing from a group of commonly dispatched units should not exceed the total available generation capacity of that group of units. |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| ITC | | ☑ | It meets the intent but is subject to potentiallt adverse interpretation. It is true that a POR may not exceed Pmax for the installed generation; however, when multiple requests are received for the POR that exceed Pmax, should the requests be taken first-come-first-served until Pmax is reached? Should the worst-case scenario be studied and used to set limits? Should the requests be pro-rated until the sum of the requests is reduced to Pmax? We believe the TSP should be allowed some leeway in how they model these situations, in order to prevent reliability problems. |
| IESO | | ☑ | No. R15 doesn't meet the intend of paragraph 245. Most of the PtP Reservations don't have specific resources as Source, they typically source from a group of commonly dispatched units. Also most Tariff's allow re-direct of Reservations to different Sources, so excluding Reservations from impact calculations could possibly result in overselling the system if the excluded reservation is re-directed to a different source. It might be possible to make some general guidelines to address the paragraph 245 of Order 890 such as: |

| MEC | ☑ | ☑ | The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. Also, this requirement is a transmission service request evaluation process requirement and does not belong in its present form in a standard concerning ATCs calculation. Also, there are issues with implementing this requirement. When there are numerous point to point requests for transmission service where some of them are partial path requests, it is not clear how to enforce the impacts of all transmission service shall not exceed the source at a particular point. If the Standards Drafting Team intends to continue with this requirement, the Standards Drafting Team should outline some subrequirements which explain how the Transmission Service Provider is to do this. It would be helpful if the SDT would develop an example of multiple requests some of which are partial path requests to the source point where subsequent requests will result in power being moved away from the point and show how the Transmission Service Provider than reviews the impacts to meet the requirement. |
| MRO | ☑ | ☑ | The words seem to meet the requirement although developing a process which meets the requirment is very difficult to do. | FirstEnergy | ☑ | | MOD-001, 028, 029, and 030 should be combined into one standard to eliminate the need to reference several standards at once, eliminate duplication, and simplify the applicability sections of MOD-028, 029, and 030 |
| **Response:** It was the decision of the SDT, supported by stakeholder comments, that MOD-001 be an overview, while MOD-028,-029-030 are separated to address various methods of calculation of TTC/ATC/AFC. The Order allows for more than one method; the SDT believe this approach is more clear and transparent to the industry. | | | |

| **Question #7** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| FirstEnergy | ☑ | | However, the phrase "not exceed" can be replaced with the word "the" since the term "limiting the total impact" is synonomous. |
| MEC Trading | ☑ | | The words meet the intent of the order, but the order may not be technically correct, nor consistent with other OATT requirements. |

| WECC MIC MIS ATC TF | ☑ | | |
| Entergy | ☑ | | |
| PSC SC | ☑ | | |

8. Do you agree with the 3% specified in R16 for including third party impacts? If "No," please specify what percent or alternate approach should be used and explain why in the comment area below.

**Summary Consideration:** The drafting team only received one suggestion for a different threshold (5%); and elected to retain the 3% threshold. The 3% is consistent with the work of the Alliant West TLR Task Force, which performed statistical analyses to determine a more efficient threshold for identifying impacting transactions.

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| WECC MIC MIS ATC TF<br>BPA | | ☑ | The threshold of 3% appears to be an arbitrary level. This level may be rooted in Operational and Planning studies that consider impacts from outages on one TP's system that increase loading on an element of another TP's system by 3% or more. While this level may be a good indicator of impact, it may not provide an indicator of which party's ownership or allocation of facilities is being used. It does not assure TPs will be able to preserve their rights (i.e. by contractual allocation) with a fixed threshold of 3%. |
| **Response:** The 3% is consistent with the work of the Alliant West TLR Task Force, which performed statistical analyses to determine a more efficient threshold for identifying impacting transactions. | | | |
| Entergy | | ☑ | The threshold level of 3% for third party should not be included in this standard since there is no such threshold level for Transmission Service Provider's own data. |
| **Response:** We have modified the standard to clarify that providers may use a lower threshold if they wish – see the footnotes added to R7 in the revised standard. | | | |
| IESO<br>IRC | | ☑ | We assume the third party is a 1 tier or 2 tier Control Area adjacent to the Tariff footprint of the TSP. Some questions:<br>• Paragraph talks about impact transmission capability with 3%. Does this mean impact any flow gate within the Tariff footprint of the TSP with 3%. What about flow gates that are tie lines between Tariff footprint and 1tier and limiting element is in 1tier.<br>• What participation factors and generators should be used to determine if the GLDF of commonly dispatched units of 1tier Control Area is >3%. NERC IDC?<br>• Is the data listed in bullet point 2,3,4,5,6 of R16 going to be submitted by neighbor TSP. If so it is sufficient to specify that a TSP is getting the list of Reservations as specified in 2,3,4,5,6 of R16 from a neighboring TSP without having to know detail as specified in the bullet points. |
| **Response:** 1.) We have modified the standard such that the 3% applies to only 1st tier TSPs and those TSPS with which coordination agreements have been executed. We have also defined the criteria for how to select flowgates.<br>2.) The distribution factors should be based on calculating TSP's methodology for determining distribution factors.<br>3.) You will need to filter the data, since the data provided may include information relevant to one party but not another. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See IRC response. | | | |
| MEC Trading | | ☑ | If is this appropriate for MOD-30, it is appropriate for MOD-28. Why do you specifically spell out a |

| Question #8 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | requirement for MOD-30 but not MOD-28? |
| **Response:** The methodologies are different, and different approaches apply. We will look at making them more consistent in future versions. We have added a requirement to MOD-028 to consider third-party reservations. | | | |
| MEC | | ☑ | The impacts by more than 3% are consistent with post-contingent flowgates. It should be noted that pre-contingent flowgates are continuing to exist in the area. Such pre-contingent flowgates have physical conditions that would be improperly represented by post-contingent flowgates so the pre-contingent flowgates must remain in place. The pre-contingent flowgates in the area generally only consider significant those third-party impacts that are at 5% or more. Therefore, provisions should be made in R16 to allow the appropriate screen, 3% or 5%, for the appropriate type of flowgate, post-contingent or pre-contingent. |
| **Response:** The 3% is consistent with the work of the Alliant West TLR Task Force, which performed statistical analyses to determine a more efficient threshold for identifying impacting transactions. | | | |
| MRO | | ☑ | The impacts by more than 3% are consistent with post-contingent flowgates. It should be noted that pre-contingent flowgates are continuing to exist in the MRO area. Such pre-contingent flowgates have physical conditions that would be improperly represented by post-contingent flowgates so the pre-contingent flowgates must remain in place. The pre-contingent flowgates in the MRO generally only consider significant those third-party impacts that are at 5% or more. Therefore, provisions should be made in R16 to allow the appropriate screen, 3% or 5%, for the appropriate type of flowgate, post-contingent or pre-contingent. |
| **Response:** The 3% is consistent with the work of the Alliant West TLR Task Force, which performed statistical analyses to determine a more efficient threshold for identifying impacting transactions. | | | |
| Manitoba Hydro | | ☑ | During a TLR or redispatch, a 3% cutoff would require the third party to adjust their resources by up to 33 MW for every 1MW of relief. I believe that this is too much. I would recommend third party mitigation has to be a balance of impact and ability for relief and those 3% biases that balance. I would recommend that the 5% impact which still requires a potential 20 MW adjustment for every 1 MW of relief maintains the balance between impact and ability for relief. |
| **Response:** This requirement addresses what transactions that are included in TSP analyses, and is not directly related to curtailments. | | | |
| ITC | ☑ | | This is overdue in our estimation. Using 5%, as some have done, has resulted in unnecessary TLRs, particularly on lower voltage (138kV and below) systems. |
| **Response:** Thank you for your support. | | | |
| FirstEnergy | ☑ | | |
| PSC SC | ☑ | | |

9. Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please describe the conflict in the comments area.

**Summary Consideration:** Most stakeholders who responded to this comment indicated they were not aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement. The SDT suggests that ERCOT, and others who believe this standard should not apply to them, pursue a regional difference to address their concerns.

| **Question #9** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| ITC | | ☑ | There are 3 methods, pick the one that works. We have noted in our other comments that some entities, such as New England, have approved tariffs that don't require the sale of transmission service. They should not have to pick any method but should, as we have noted, be required to provide data to neighboring TSPs that do sell transmission service. |
| **Response:** The SDT agrees this is a concern – entities with this concern need to submit a request for a Regional Difference. | | | |
| FirstEnergy | | ☑ | |
| WECC MIC MIS ATC TF | | ☑ | |
| Entergy | | ☑ | |
| MEC | | ☑ | |
| Manitoba Hydro | | ☑ | |
| MRO | | ☑ | |
| PSC SC | | ☑ | |
| ERCOT | ☑ | | ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT Interconnection. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority Interconnection and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area and there has been no reservation of transmission capacity in ERCOT.<br><br>Available Transfer Capability is defined as the measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. |

| **Question #9** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| | | | It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin. The ERCOT Interconnection has already moved "beyond" ATC and into a Market design which resulted in the disappearance of an explicit transmission service product. In addition the DC Tie transfer capability is planned and coordinated by a TSP that is a member of both Regions and therfore both ERCOT and SPP are notified when the DC Tie capability is reduced.<br><br>Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. Currently ERCOT employs a zonal congestion management scheme that is flow-based, whereby the ERCOT transmission grid, including attached generation resources and load, are divided into a predetermined number of congestion zones. This congestion management scheme applies zonal shift factors, determined by ERCOT, to predict potential congestion under the known topology of the ERCOT System. This scheme is used in the Day Ahead and Adjustment Periods to evaluate potential congestion. During the operating period ERCOT uses zonal shift factors to determine zonal Redispatch deployments needed to maintain flows within zonal limits. The local congestion management scheme relies on a more detailed Operational Model to determine how each particular Resource or Load impacts the transmission system. This model uses the current known topology of the transmission system. Unit specific Redispatch instructions are then issued to manage local congestion.<br><br>In the future ERCOT will be transitioning from a Zonal Market to a full LMP market. This system is designed to manage congestion in the Day Ahead and Real-Time on a Resource specific basis. Under both of these market designs transmission facility limits are established in advance and updated based on coordinated exchange of information between transmission providers and ERCOT in planning and operating periods.<br><br>In the current and future ERCOT market design the method of calculating ATC, TTC and the use of CBM and TRM are not applicable to the ERCOT Region. ERCOT does not have a synchronous connection with any other Balancing Authority Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Control Areas and/or offer transmission reservations and schedules within the interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance. |
| **Response:** The SDT agrees this is a concern – ERCOT needs to submit a request for a Regional Difference. | | | |

| Question #9 | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| MEC Trading | ☑ | | This standard is not requiring consistenecy per the requirement of FERC Order 890. |
| **Response:** Please see the revised set of standards. The drafting team modified all of the standards to require greater consistency between standards. | | | |

10. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-030-1.

**Summary Consideration:** The SDT made changes in response to some of the comments below, including adding definitions and redrafting sections to be clearer. Note that NAESB will be addressing some of the more commercial areas of the subject matter, such as timing guidelines and posting requirements.

| **Question #10** | |
|---|---|
| **Commenter** | **Comment** |
| WECC MIC MIS ATC TF | A. R1.2 should be modified due to the fact that Facilities don't cause congestion, rather they experience congestion. The following change to the language would be more accurate:<br>"How the methodology identifies transmisison Facilities that are expected by the AFC calculator to experience congestion on the transmission system."<br>B. See comments on MOD-29.<br>In the "Applicability" section, the term "Available Transfer Capability Implementation Document" is used as a defined term. The term is used in MOD-01 R3. At minimum the ATCID either needs to be defined or a reference to the MOD-01 must be inserted for cross reference.<br>C. R.1 through R.3. appear to be a prohibited "fill-in-the-blank."<br>D. R22. Typo. Change "covert" to "convert." |
| **Response:** A. We have redrafted this language, and it is now included in R2.1. (See R2.1.3 in the revised standard.)<br>B. We have defined ATCID.<br>C. We have attempted to address this comment by requiring more detail and making explicit requirements where possible.<br>D. We have corrected this error (See R10 in the revised standard). | |
| BPA | The ATC MOD's (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) do not clearly distinguish the methodologies and their applications. Please provide descriptions of these methodologies.<br>The Applicability section 4.1. through 4.3. Should have the phrase "Available Transfer Capabilities for paths" replaced with "Available Flowgates Capabilities for Flowgates".<br>R1.2. should be modified due to the fact that Facilities don't cause congestion, rather they experience congestion. The following change to the language would be more accurate:<br>"How the methodology identifies transmisison Facilities that are expected by the AFC calculator to experience congestion on the transmission system."<br>R3. A Flowgate should not be defined as a thermal, voltage, or stability type due to the fact that Flowgates are limited by thermal, voltage, or stability problems that can vary depending on system conditions.<br>R4. through R8. should be combined into two requirements:<br>1) Each entity generating Flowgate limit values (note that it's not clear if this should be the Transmission |

| **Question #10** | |
|---|---|
| **Commenter** | **Comment** |
| | Owner, Transmission Planner, Planning Coordinator, and/or Reliability Coordinator) shall provide current Flowgate limit data to Transmission Service Providers (TSPs); and<br>2) TSPs shall use the lesser of the thermal, voltage, or stability limits that apply to the current system conditions.<br>R18.-sub-bullet 5, R23., and R24. should each have the "ATC"s replaced with "AFC"s, for the reasons explained in our response to the MOD-030-1 Comment Form's question 4.<br>R24. should have "path" replaced with "Flowgate", for the reasons explained in our response to the MOD-030-1 Comment Form's question 4. |
| **Response:** The SDT has included definitions of the methodologies for the glossary.<br>Regarding 4.1 through 4.5, we have modified the standard to use the phrase, 'for Posted Paths' and included a definition of 'Posted Path'.<br>R1.2 has been redrafted, and it is now included in R2.1 (See R2.1.3 in the revised standard.)<br>R3: We have changed the language in R3 to address this comment, and moved the language to 2.3.<br>Regarding R3 through R5, we have replaced this language with R2.3 and 2.5.<br>Regarding R24 Was deleted and is being addressed by NAESB along with the other requirements aimed at 'posting'. | |
| Duke | R1.1 does not create the same level of transmission service as created in MOD-028. MOD 028 R6.1 involves N-1 transmission contingency AND ramping/partial contingency of generation. MOD-030 R1.1 appears to only require N-1 transmission or generation contingency. This is not comparable service.<br>For R3. need to also include why the Flowgate is a limit |
| **Response:** MOD-028 as currently written allows for load adjustments instead of generation adjustments. Regarding R3, this will be addressed by NAESB, as will all other public posting requirements. | |
| ITC | We think this is a much better standard than MOD-028 and -029. It should provide for greater flexibility and reliability. We think all methods should be examined closely if there is any evidence of overselling (as evidenced byTLRs and market congestion) or underselling (as evidenced by denial of service without TLRs or market congestion). |
| **Response:** Thank you for your support. | |
| MEC Trading | This MOD should be combined with MOD-28 and everyone using a distribution factor based analysis should use the same methodology and the amount of consistency should be increased significantly. |
| **Response:** Most stakeholders supported the division of the various ATC calculation methods into separate standards. The SDT believes the differences between the two approaches merit two different standards | |
| MEC | 1. R1.1 implies that the only planning criteria that should be used in ATC calculations is Category B in Table 1 of the NERC Standards. That is incorrect, the methodology should describe how it meets the planning criteria that is appropriate for posted values including applicable NERC Standards, regional criteria, Transmission Owner criteria, etc. Therefore, R1.1 should state that "How methodology meets the planning criteria in NERC Standards, regional standards, Transmission Owner's planning criteria, Transmission Planner's planning criteria, and other applicable |

| **Question #10** | |
|---|---|
| **Commenter** | **Comment** |
| | planning criteria used by the Transmission Planner to plan the system.<br>2. R8 does not cover all the limitations that are possible for flowgates, for example, the limitation may be due to high transfers causing low voltage on the system after the next condition. This is not an example of a thermal rating or a voltage limit of the power transfer. I suggest that an additional bullet be added to R8 stating "Any other constraint to power transferred across the Flowgate, if applicable. For such constraints, the constraint should be defined, explained, and examples given in the methodology so as to ensure that the ATC methodology is transparent." As an alternative, a bullet should be added for "Steady-state voltage constraint."<br>3. The scheduling time horizon should be clarified.<br>4. The Standards Drafting Team indicated that they have decided not to define the term Existing Transmission Commitments, yet R13 uses that defined term with capital letters. The words Existing Transmission Commitments in R13 and elsewhere in the standard should not be capitalized so as not to indicate a defined term.<br>5. R22 change "covert" to "convert". |
| **Response:** 1.) R1.1 - We have changed the requirement to address this concern – the revised standard requires that contingencies used match those used in operations studies and planning studies for the applicable time periods.<br>2.) R8 – We believe the new language in R2.1.1 (R2.1.1. Any Facility within the Transmission Operator's area based on thermal, stability or voltage limits) addresses this concern.<br>3.) We have asked NAESB to address scheduling timelines and how they relate to the release of unscheduled reservations.<br>4.) We have defined ETC within the standards themselves.<br>5.) We have corrected this typographical error. | |
| MRO | 1. R1.1 implies that the only planning criteria that should be used in ATC calculations is Category B in Table 1 of the NERC Standards. That is incorrect, the methodology should describe how it meets the planning criteria that is appropriate for posted values including applicable NERC Standards, regional criteria, Transmission Owner criteria, etc. Therefore, R1.1 should state that "How methodology meets the planning criteria in NERC Standards, regional standards, Transmission Owner's planning criteria, Transmission Planner's planning criteria, and other applicable planning criteria used by the Transmission Planner to plan the system.<br>2. R8 does not cover all the limitations that are possible for flowgates, for example, the limitation may be due to high transfers causing low voltage on the system after the next condition. This is not an example of a thermal rating or a voltage limit of the power transfer. The MRO suggests that an additional bullet be added to R8 stating "Any other constraint to power transferred across the Flowgate, if applicable. For such constraints, the constraint should be defined, explained, and examples given in the methodology so as to ensure that the ATC methodology is transparent." As an alternative, the MRO recommends that a bullet be added for "Steady-state voltage constraint."<br>3. MRO believes the scheduling time horizon should be clarified.<br>4. The Standards Drafting Team indicated that they have decided not to define the term Existing Transmission Commitments, yet R13 uses that defined term with capital letters. The words Existing Transmission Commitments in R13 and elsewhere in the standard should not be capitalized so as not to indicate a defined term.<br>5. R22 change "covert" to "convert". |

| Question #10 | |
|---|---|
| **Commenter** | **Comment** |
| **Response:** 1.) R1.1 - We have changed the requirement to address this concern – the revised standard requires that contingencies used match those used in operations studies and planning studies for the applicable time periods.<br>2.) R8 – We believe the new language in R2.1.1 (R2.1.1. Any Facility within the Transmission Operator's area based on thermal, stability or voltage limits) addresses this concern.<br>3.) We have asked NAESB to address scheduling timelines and how they relate to the release of unscheduled reservations.<br>4.) We have defined ETC within the standards themselves.<br>5.) We have corrected this typographical error. | |
| SERC ATCWG | The updating of flowgates as specified in Requirement 2 should be annually rather than quarterly. |
| **Response:** Since no other stakeholders disagreed with the 'quarterly' update and since no justification has been provided to support the change, the drafting team left 'quarterly' in the requirement. | |
| SRP | The standard should describe how flowgates and reliability limits should be determined such as is done for the Network Response Methodology MOD028 in requirement R6 and is done for the Rated System Path Methodology MOD029 in requirement R6.<br>Requirements R1.1, R1.2 & R1.3 are fill-in-the-blank requirements and need to specify rather than ask the tsp to explain what they do.<br>R8 - The standard should specify how the thermal, voltage and stability limited are determined. For example, are these n-0 or n-1 limits and are they transient or post-transient? |
| **Response:** 1.) The SDT has modified the standard to address this comment. R2.1 in the revised standard is the process for identifying Flowgates.<br>2.) The SDT has modified the standard to address this comment. R1.1 was moved into R2.1.2 and states, more specifically, how to treat contingencies in the identification of Flowgates. R1.2 and R1.3 were moved into R2.1.3 and identifies, more specifically, how to treat congestion in the identification of Flowgates<br>3.) The SDT has specified in R2.3 that the TFCs must respect SOLs. In the revised standard, the Transmission Operator is assigned responsibility for determining transfer capabilities and, the Transmission Operator will already have the thermal voltage and stability limits through requirements in other standards. | |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a standard drafting team on March 17, 2006.

**Description of Current Draft:**

This is the first draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of applicable FERC directives from FERC Order 693 and Order 890.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to comments. | TBD |
| 2. Post revised standard for stakeholder comment. | TBD |
| 3. Respond to comments. | TBD |
| 4. Post for 30-day pre-ballot review. | TBD |
| 5. First ballot of standard. | TBD |
| 6. Respond to comments. | TBD |
| 7. Recirculation ballot. | TBD |
| 8. 30-day posting before board adoption. | TBD |
| 9. Board adoption. | TBD |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**None.**

## A. Introduction

1. **Title:** **Rated System Path Available Transfer Capability**

2. **Number:** MOD-029-1

3. **Purpose:** To promote the consistent and uniform application and documentation of Available Transfer Capability (ATC) calculations performed using the Rated System Path method for reliable system operations.

4. **Applicability:**

   **4.1.** Each Planning Coordinator that uses the Rated System Path method to calculate Transfer Capabilities for paths identified in an Available Transfer Capability Implementation Document.

   **4.2.** Each Reliability Coordinator that uses the Rated System Path method to calculate Transfer Capabilities for paths identified in an Available Transfer Capability Implementation Document.

   **4.3.** Each Transmission Service Provider that uses the Rated System Path method to calculate Transfer Capabilities for paths identified in an Available Transfer Capability Implementation Document.

5. **Proposed Effective Date:** To be determined.

## B. Requirements

**R1.** The Planning Coordinator shall provide to its Transmission Service Provider (in the report drafted for a TTC study) a description of the Contingencies and assumptions considered in the study.

**R2.** The Transmission Service Provider shall make publicly available the reports drafted for TTC studies supplied by its Planning Coordinator(s).

**R3.** The Planning Coordinator shall use a model to conduct its TTC studies that includes at least the entire Planning Coordinator Area, as well as critical modeling details from other Planning Coordinator Areas that would impact the Facility or Facilities under study.

**R4.** Each Planning Coordinator shall update the following components of the base case power flow model it uses to determine a TTC for the time horizon being studied:

**R4.1.** Anticipated transmission system configuration

**R4.2.** Facility Ratings

**R4.3.** Load forecast

**R4.4.** Transmission system Elements scheduled to be taken out of or returned to service

**R4.5.** Generation resources scheduled to be in service, to be taken out of service or to be returned to service

**R4.6.** Special Protection System models

**R5.** The Planning Coordinator shall use assumptions in its TTC calculation that are consistent with those it uses in its expansion planning analyses.

**R6.** For each path upon which Transmission Service has been requested, each Planning Coordinator shall:

**R6.1.** Determine the reliability limited TTC for a path by adjusting generation schedules and Load levels to extreme values (without introducing fictitious facilities into the model) to determine the maximum flow that can be simulated on the path while at the same time satisfying the planning criteria in TPL-001 and TPL-002 for the Contingencies in Table 1, Category B or the successor criteria.

- If it is not possible to simulate a flow sufficiently large to reach a reliability-limited TTC, the TTC of the path is equal to the maximum flow simulated and the path is said to be flow limited.
- If the TTC determined for a path in one direction is reliability limited and the TTC determined for the same path in the other direction is flow limited, the reliability limited TTC may be used for both directions.

**R6.2.** Determine if the TTC for a new or revised path adversely impacts the path ratings or TTC values of existing paths by modeling the flow on the new or revised path at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level, and if there is an adverse impact:

- Limit the TTC for the new or revised path to eliminate the adverse impacts, or
- Follow a local or regional procedure for resolving the impact with the affected parties.

**R6.3.** Ensure that for jointly owned paths, the sum of all owners' allocations is equal to the TTC of the path

**R6.4.** Draft a report to document the steps performed in determining the TTC for the path including the resulting TTC and the Contingencies and assumptions used to determine the resulting TTC.

**R7.** Each Planning Coordinator associated with a Transmission Service Provider shall ensure that TTC for all posted paths for that Transmission Service Provider are calculated and up to date for use within the transfer capability time horizons specified in MOD-001.

**R8.** Each Planning Coordinator associated with a Transmission Service Provider shall make available to the Transmission Service Provider the most current value for TTC for all the posted paths of that Transmission Service Provider and the reports on the TTC studies performed for each path.

**R9.** The Transmission Service Provider shall make publicly available the results, and associated study reports, of the calculations of TTC provided by the Planning Coordinator(s) upon their being made available to the Transmission Service Provider.

**R10.** The Transmission Service Provider shall calculate ATC for the time horizons specified in MOD-001 R2 according to the ATC calculation schedule specified in MOD-001 R5.

**R11.** The Transmission Service Provider shall calculate firm ATC by reducing the TTC by the sum of the impact of firm Existing Transmission Commitments (ETCs), the Capacity Benefit Margin (CBM), and the Transmission Reliability Margin (TRM) allocated to the path.

**R12.** The Transmission Service Provider shall determine the impact of firm ETCs based on the following inputs:

**R12.1.** The transmission capability utilized in serving Native Load commitments, to include Native Load growth, Load forecast error and losses not otherwise included in TRM or CBM.

**R12.2.** The impact of Firm Network Integration Transmission Service serving Load, to include Load forecast error and losses not otherwise included in TRM or CBM.

**R12.3.** The impact of grandfathered firm Transmission Service agreements and bundled contracts for energy and transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or Safe Harbor Tariff accepted by FERC.

**R12.4.** The impact of Firm Point to Point Transmission Service.

**R12.5.** The impact of maintaining roll-over rights for Firm Transmission Service contracts, five years or longer in duration, granting Transmission Customers the right of first refusal to take or continue to take Transmission Service from a Transmission Owner when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**R12.6.** The impact of any Ancillary Services not otherwise included in CBM or TRM,

**R12.7.** Post-backs of redirected or released Firm services.

**R12.8.** The impact of counter-flows not otherwise accounted for in the ATC calculation.

**R12.9.** The impact of any other services, contracts, or agreements not specified above using transmission that serves Native Load or Firm Network Integration Transmission Service

Re: R12.7 — Being discussed at NAESB - may need to be included. Maybe for temporary "undesignation" of a DNR

**R12.10.** The Transmission Service Provider shall calculate non-firm ATC by reducing the TTC by the sum of the firm ETCs, the non-firm ETCs, and the TRM allocated to the path.

**R13.** The Transmission Service Provider shall determine the impact of non-firm ETCs based on the following inputs:

**R14.** The impact of Non-Firm Network Integration Transmission Service serving Load to include Load forecast error and losses not otherwise included in TRM or CBM.

**R14.1.** The impact of grandfathered Non-Firm Transmission Service agreements and bundled contracts for energy and transmission, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or Safe Harbor Tariff accepted by FERC.

**R14.2.** The impact of Non-firm Point to Point Transmission Service.

**R14.3.** The impact of counter-flows not otherwise accounted for in the ATC calculation.

**R14.4.** Capacity utilized for TRM that the Transmission Service Provider has elected to be released for as non-firm ATC.

**R14.5.** Post-backs due to the reinstating of Firm from a "Firm-to-Non-Firm" redirect.

**R15.** The Transmission Service Provider shall increase non-firm ATC by the amount of capacity associated with unscheduled Transmission Service accounted for within firm and non-firm ETC, to the extent allowable by the agreement associated with the service, in accordance with established business practices.

**R16.** The Transmission Service Provider shall make publicly available the ATC for each path.

## C. Compliance

To be added with next posting.

## D. Measures

To be added with next posting.

## E. Regional Differences

None.

## F. Associated Documents

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☐ Yes

   ☐ No

   Comments:

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☐ No

   Comments:

5. Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

   ☐ Yes

   ☐ No

   Comments:

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**7.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☐ No

Comments:

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☒ No

   Comments: This is the very reason why it is necessary for the TSP to go the TP, PC , RC or TOP (depending on the time horizon of the ATC calculation) which have determined the TTC for reliable operational and planning reasons. Whatever, method the reliability functions have used will be communicated to the TSP and they will post the values and backup information for the calculations.

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☒ No

   Comments: See my comments on MOD-028

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☐ Yes

   ☐ No

   Comments: R6 and its Sub-requirements are study methodologies that should not be included in any standard. Requirements of this nature could be interpreted to mean that an entities' future plan that included a resource 6 years from now would be fictitious if in the next planning cycle they determined to remove it. These Standards are written in a Policy format.

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: This is a business practice, not reliability.

**5.** Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

☐ Yes

☒ No

Comments: This should be removed, the rules for using CBM should stay in the CBM standards.

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: These are confusing and should be removed. R14 is written in a manner it is impossible to determine which Reliability function is responsible to meet the standard. In addition, any reference to non-firm ATC should be in MOD-001, not spread out through several standards.

**7.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: See Comments on MOD-029

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☐ Yes

☒ No

Comments: The Federal Energy Regulatory Commission (FERC) has requested Standards that determine the requirements to calculate TTC will be handled in the FAC Standards. Order 693 States the following: 1050. We adopt the NOPR proposal and require that TTC be addressed under the Reliability Standard that deals with transfer capability such as FAC-012-1, rather than MOD-001-0. The FAC series of standards contain the Reliability Standards that form the technical and procedural basis for calculating transfer capabilities. FAC-008-1 provides the basis for determining the thermal ratings of facilities while FAC-009-1 provides the basis for communicating those ratings. FAC-010-1 and FAC-011-1 provide the system operating limits methodologies for the planning and operational horizon respectively and FAC-014 provides for the communication of those ratings.
FERC has correctly recognized that FAC-012 and FAC-013, while associated with modeling is highly dependent on the previous FAC Standards as noted by FERC.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments: See question 8 above

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments: The Standard is written much like a Policy and it cannot be determined who is responsible for the different calculations of the components of the ATC. The Standard does not provide the Compliance Monitor or the TSP who calculates the Hourly. Daily, and Monthly ATCs with the necessary requirements to know what is necessary to be compliant.

Please use this form to submit comments on the 1st draft of standard MOD-029-1 Rated System Path ATC Methodology. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: The use of artificial input data to increase a TTC limit for scenarios analysis and evaluating the impacts of a proposed generator (which is a fictitious until it has been constructed) would not diminish the liabilty of the system.

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☐ No

   Comments:

5. Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

   ☐ Yes

☐ No

Comments:

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**7.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: ATC related standards should be applicable only to entities who have the obligation to provide non-discrimintory transmission service, that is the Transmission Service Providers.

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments:

Requirements R3, R4, R5, and R6 are similar to what we are required to do under FAC-010-1. Similarity is good, but in this case there are areas of duplication and inconsistency. For example:

1. FAC-010-1 requires Planning Authorities to have an SOL Methodology that reflects the requirements similar to R3 and R4. Is NERC proposing that they will audit on having an SOL Methodology consistent with FAC-010 and then audit on determining TTCs consistent with MOD-029. What happens if our SOL Methodology differs from MOD-029? It seems that the TTC standard should only require to determine TTCs based on SOLs, which is what FAC-012 requires.

2. Requirement R5 requires the use of assumptions consistent with expansion planning analysis. It is unclear what this means or how this would be audited, except by looking at SOL Methodology, unless we are also required to document our assumptions for MOD-029. This would be duplicative of our SOL Methodology.

3. Requirement R6 is not acceptable because it limits what we can consider in determining TTCs. R6.1, which references TPL-001 and TPL-002, is somewhat consistent with FAC-010. However, the reference should be to FAC-010, System Operating Limits, not the transmission planning standards. TPL-001 and TPL-002 do not have Western Interconnection differences, and TTCs need to allow for consideration of regional differences. Furthermore, we have to ask what is the purpose of BCTC having an SOL Methodology (FAC-010) and determining SOLs according to this Methodology (FAC-014), if MOD-029 provides criteria for determining TTCs. This is setting us up for a reliablity vs. commercial capacity conflict.

4. The second bullet under R6.1 is not acceptable. If a path is flow limited to less than "the reliability limit", how can we provide TTC up to the reliability limit. Firstly, we cannot calculate a reliability limit for anything higher than what will flow on the path (without using fictitious devices). Secondly, how can a customer use it?

Our suggestion to NERC would be to follow the structure layed out in the FAC series. Transmission Owners determine Facility Ratings according to FAC-008 and 009. Based on these Facility Ratings and other factors, Planning Coordinators, Reliability Coordinators, Transmission Planners determine SOLs according to FAC-010, 011,and -014. Based on these SOLs, PCs, RCs, and TSPs determine TTC, etc. according to the applicable NERC standard.

The above comments are also applicable to MOD-28-1 and MOD 30-1

Please use this form to submit comments on the 1st draft of standard MOD-029-1 Rated System Path ATC Methodology. Comments must be submitted by **June 24, 2007**. **You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☒ No

   Comments: The impact of load growth for Network Integration Transmission Service should be included in R12.2.
   The "five years or longer in duration" language should be removed from R12.5. due to the fact that this element of Order 890 is only to be implemented by a Transmission Service Provider (TSP) once the FERC has approved the TSP's Attachment K -- this may not occur for some TSPs until after the standards are to be implemented. Additionally, regardless of whether a TSP's Attachment K is approved, there will be a transition period (to be developed by each TSP) from the old 1-year/60-day roll-over paradigm to the 5-year/1-year -- the standard should not preclude a TSP from encumbering capacity for those existing Customers who have not yet been required to commit to five years of service to retain their roll-over rights.

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☒ Yes

   ☐ No

   Comments: Allowing the use of artificial input data to increase a TTC limit does not represent the most relevent system conditions to establish a reliabilty limit.

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☐ No

Comments:

**5.** Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

☐ Yes

☐ No

Comments:

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**7.** Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: "Planning Coordinator" is not defined in the NERC Glossary of Terms Used in Reliability Standards. Please clarify what the Planning Coordinator is or replace "Planning Coordinator" with Planning Authority.

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission’s (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC’s directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If “No,” please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments: The ATC MODs (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) do not clearly distinguish the methodologies and their applications. Please provide narrative descriptions of these methodologies.

The Applicability section 4.1. through 4.3. and R1., R4. through R11., R15., and R16. should be clarified that ATC need only be calculated and posted for Posted Paths, where "Posted Path" is defined consistent with NAESB R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.

R2. and R9. -- Making TTC study reports publicly available would present system security concerns due to the fact that such studies will identify the most limiting contingencies. Identifying the most critical contingencies publicly could make them a target and thus reduce system reliability. This information should only be shared with those entities demonstrably impacted by such limiting contingencies.

R12.7. and R14.5. -- Please define the term "Post-back".

The current "R14." should be numbered as "R13.1." and this will have an impact on all subsequent requirements.

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☒ Yes

   ☐ No

   Comments: Each Transmission Service Provider should calculated TTC for all posted using the same method for consistency.

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☒ No

   Comments: We suggest that R12.10 should be a stand alone requirement rather than a sub requirement. R 13 should be a lead requirement with R14 and R 14.1 - R14.5 as sub requirements under R13 requirements. R15 is similar to post back, therefore, it should also be made as a subrequirement under R13.

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: Realistically TTC should be calculated using any controls that can impact flow on the path. By not using all controls such as phase shifting transformers, TTC values are lower than what they can practically be, therefore, potential of underutilizing the transmission system.

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: Sale of service should not be in scope of this standard, only how TTCs and ATCs are calculated should be included. Accounting for Non-Firm Transmission already sold multiple times should be included in this standard so that accurate ATCs can be calculated and offered for sale to the market place. Sale of Non-Firm Transmission multiple times is a commercial issue and should be addressed by NAESB Business Practice Standard.

**5.** Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

☒ Yes

☐ No

Comments: For consistency with other methods, excluding CBM from Non-Firm ETC should be included in this standard..

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: Please see comments to Question 2 above.

**7.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☒ Yes

☐ No

Comments:

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☒ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments: R1- it is not clear which "report drafted for a TTC study" is referred to and what study is conducted. R3 - "critical modeling details" is vague and should be explained. R3 and R4 - it appears that only one model is used for calculation of TTC for all paths and time horizons, if yes, it appears unrealistic, if no, model should be made plural. R4 - are Long Term Firm Transmission Service Reservations included in base cases? If so, these should be included as subrequirement under R4. R4 - R4 should include planned and unplanned outages, if included in the base case. R6.2 refers to path rating - is it same as TTC of that path, if so, only TTC based on path rating should be used. R6.2, it is not clear what is "revised path". R6.2 second bullet - are local or regional procedures approved by any entity? These should be included in the data to be made publicly available and included in R9. R8 - it appears like each Planning Coordinator determine TTC for all posted path of Transmission Service Provider. "value" should be made plural. It is not clear how frequently TTC values are calculated or updated.

Please use this form to submit comments on the 1st draft of standard MOD-029-1 Rated System Path ATC Methodology. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

☒ Yes

☒ No

Comments: See IRC comments submitted by Charles Yeung.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☒ Yes

☐ No

Comments: ERCOT is a separate Interconnection and Region connected to the Eastern Interconnection through DC ties. Texas Senate Bill 7 effective on 9/1/99 amended the Texas utilities code to provide for the restructuring of the electric utility industry within the ERCOT Interconnection. The act deregulated the electricity generation market to allow for competition in the retail sale of electricity. As of July 2001 the ERCOT interconnection began operation as a single Balancing Authority Interconnection and implemented a market in accordance with the Texas Public Utility commission ruling. Since the implementation of this Act, all of ERCOT has been a single Balancing Authority Area and there has been no reservation of transmission capacity in ERCOT.

Available Transfer Capability is defined as the measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin. The ERCOT Interconnection has already moved "beyond" ATC and into a Market design which resulted in the disappearance of an explicit transmission service product. In addition the DC Tie transfer capability is planned and coordinated by a TSP that is a member of both Regions and therfore both ERCOT and SPP are notified when the DC Tie capability is reduced.

Under ERCOT market rules, Transmission Service allows all eligible transmission service customers to deliver energy from resources to serve load obligations, using the transmission facilities of all of the Transmission Service Providers in ERCOT. Currently ERCOT employs a zonal congestion management scheme that is flow-based, whereby the ERCOT transmission grid, including attached generation resources and load, are divided into a predetermined number of congestion zones. This congestion management scheme applies zonal shift factors, determined by ERCOT, to predict potential congestion under the known topology of the ERCOT System. This scheme is used in the Day Ahead and Adjustment Periods to evaluate potential congestion. During the operating period ERCOT uses zonal shift factors to determine zonal Redispatch deployments needed to maintain flows within zonal limits. The local congestion management scheme relies on a more detailed Operational Model to determine how each particular Resource or Load impacts the transmission system. This model uses the current known topology of the transmission system. Unit specific Redispatch instructions are then issued to manage local congestion.

In the future ERCOT will be transitioning from a Zonal Market to a full LMP market. This system is designed to manage congestion in the Day Ahead and Real-Time on a Resource specific basis. Under both of these market designs transmission facility limits are established in advance and updated based on coordinated exchange of information between transmission providers and ERCOT in planning and operating periods.

In the current and future ERCOT market design the method of calculating ATC, TTC and the use of CBM and TRM are not applicable to the ERCOT Interconnection. ERCOT does not have a synchronous connection with any other Balancing Authority Area, and does not use the transmission reservation and scheduling practices addressed by these standards. ERCOT requests the drafting team consider revising the wording so that Responsible Entitles required to conform to the standards are those that are synchronously connected with other Balancing Authority Areas and/or offer transmission reservations and schedules within the interconnection. We also recommend that the standard allow for ERCOT exception or exemption from calculation and posting of ATC, TTC, CBM, and TRM without the need for a Regional variance.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☒ No

   Comments:

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: Permitting the arbitrary introduction of fictitious devices potentially encourages producing the limitation wanted rather than determining the actual limitation. First bullet in R6.1 says the path will be said to be "flow limited", which is a misleading characterization. It really would be "extreme value limited" and should be identified as such. The second bullet in R6.1 seems to be very arbitrary and should be deleted to result in a limit that more accurately reflects the actual ability of the system to transfer power.

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: This is better covered by NAESB as a business practice issue. However, the requirements for loading and unloading the interchange schedules associated with this practice should be included in the NERC Standards to ensure that reliability is not jeopardized.

**5.** Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

☐ Yes

☒ No

Comments: MOD-004 should contain all the rules related to CBM. However, R13 and R14 should be renumbered to reflect the appropriate formatting.

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: They should be combined to strengthen the reader's understanding of the material.

**7.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☒ Yes

☐ No

Comments: MOD-001, 028, 029, and 030 should be combined into one standard to eliminate the need to reference several standards at once, eliminate duplication, and simplify the applicability sections of MOD-028, 029, and 030

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☒ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments: R6.2 demonstrates the essential difference with Network Response ATC calculations.

R11 should be revised to eliminate the subtraction of a portion of TRM from TTC to calculate ATC since this has already occurred in R6.2 where parallel path impacts are covered.

Please use this form to submit comments on the 1st draft of standard MOD-029-1 Rated System Path ATC Methodology. Comments must be submitted by **June 24, 2007**. 1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments: .

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☒ Yes

   ☐ No

   Comments: R12.10 should be renumbered R13, R13 should be renumbered R14, R14 should be renumbered R14.1, R14.1 should be renumbered R14.2 (etc.)

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☒ Yes

   ☒ No

   Comments: Real-time system reliability would not be diminished since the actual power transfer is less than the reliability limit. However, long-term reliabilty could be diminished because posted TTC would be higher than the actual maximum flow. Transmission users could overestimate the path capacity and consequently overesimate the amount of power that can be delivered on this specific path. A path might be voltage limited, not flow limited, and the introduction of a fictitious generator might hide the reliability rating if it supports the voltage on the path in the simulation, but not in "real life".

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

Comments: As requested in R12.10, non-firm ATC is calculated by reducing TTC by non-firm-ETCs. Depending on time horizon, unscheduled transmission service could be sold multiple-times This is a business issue that should be addressed by NAESB.

**5.** Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

☐ Yes

☒ No

Comments: This is a business issue to be addressed by NAESB.

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: R14 is for planning and operating horizons and R15 is only for operating horizon

**7.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☒ Yes

☒ No

Comments: MOD-029 includes applicability to Reliability Coordinator, but there is no reference in the details of the standard to the RC. A role should be defined, or RC should be removed from the Applicability section. All MOD standards should be consisent in their description of the roles for providing input and calculating ATC.

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments: We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the requirements defined in these standards do not apply to entities that do not sell transmission service in advance of the physical flow of energy. For example, many or all items associated with firm and non-firm ETC would be zero for these markets.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments: for clarification

R6.1 Regional criteria (NPCC) are not all included in TPL-001 and TPL002 for contingencies in Table 1, category B…There should be acknowledgement that there can be regional differences in the application of planning criteria that may extend beyond Category B contingencies in determination of TTC.

R.12.10 (re-numbered to R13) : Note that the TRM allocated to the path for non-firm ATC may be less than the TRM for firm ATC.

R12.10 (renumbered to R13): As it is not specified , we understand that the TSP is free to calculate the ATC by reducing the TTC by reserved or by scheduled transmission services depending on the time horizon.

R11: Use of the word "impact" in the formula for ATC introduces confusion. Can R11 be written in formula format like the Version Zero standards?

R11.4 Use of the word "impact" is redundant.

Please use this form to submit comments on the 1st draft of standard MOD-029-1 Rated System Path ATC Methodology. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments: No Comments.

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☒ No

   Comments: We feel that R12.1, R12.2, R12.6 and R14 leave room for double counting for components that shold have been taken care of by TRM and CBM. Further, details to be included for non-firm ATC calculation are missing in R13.

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: Reliability would not be diminished by incorporating fictitious devices into power flow simulations. This practice is not uncommon in the determination of operating limits and TTCs when available resources are insufficient to stress an interface or transfer level to the "edge" or for other practical modeling reasons. However, entities which use such fictitious devices must ensure that its modeling assumptions are shared with other possible affected entities.

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: This seems to be a business practice issue. Similar issues are selling non-firm services out of TRMs and/or CBMs which may be recalled when these latter components need to be used for capacity needs or transmission reliability needs.

**5.** Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

☒ Yes

☐ No

Comments: It needs to be, but then again it may be a business practice issue. Along this vein, MOD-028 is silent on this and also has no mention of the CBM quantity in the calculation of non-firm ATC.

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: R14 and R15 could be combined. However, in R15, we do not understand what would be the items that are "the amount of capacity associated with unscheduled Transmission Service accounted for within firm and non-firm ETC,.."

**7.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: Unlike the other MOD standards, this standard more appropriately reflect the role of the PC and RC in the determination of transfer capabilities, not ATC. However, the applicability section gives rise to unclear responsibilities between TSP and the PC/RC in that both calculate transfer capabilities of the "paths". We feel that the PC and RC are responsible for calculating the total path capability, whereas the TSP is responsible for calculating the available path capability. This distinction needs to applied to all the MOD standards.

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☒ Yes

☒ No

Comments: It appears that the SDT has addressd all of the FERC directives. However, in view of the many comments provided to this and the other related MOD standards, and hence substantive changes are expected, we see the need to revisit this subject again when revised standards are posted.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments: No, but please note that some markets do not offer physical transmission services and hence some of the requirements in this standard do not apply to these entities.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments: Please see our comments on the supplementary SAR.

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☐ Yes

   ☐ No

   Comments:

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☐ No

   Comments:

5. Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

   ☐ Yes

   ☐ No

   Comments:

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**7.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☐ No

Comments:

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☐ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments: Our footprint does not include facilities in the WECC, therefore, I do not answer all the questions on the MOD-029-1 but provides the following comments: 1. The purpose of each of the standards should be revised to be more in-line with each other, that is some refer to "transparent" and others do not. The purpose in MOD-028-1 be revised to replace "uniform" with "transparent"

2. The Functional Entity as provided in A.4. should not be qualified, for example, A.4. should just list Planning Coordinator, Reliability Coordinator, and Transmission Service Provider. 3. For R1, R3, R4, R5, R6, R7, and R8, the responsible entities described are incorrectly based upon the assumption that all NERC members are members of an RTO. These requirements should be revised in this regard to provide that "the Transmission Service Provider, the Reliability Coordinator, and/or the Planning Coordinator, as appropriate", do these requirements in the standard. 4. R6.1 refers to only certain NERC planning criteria, when the TTC must be based upon the appropriate planning criteria whatever that is. The references to planning criteria should be expanded to include all applicable planning criteria, including NERC, regional, subregional, Transmission Owner, etc. 5. R2, R9, R16 and other requirements that indicate that the results are to be made available publicly should indicate that these results should be made available

publicly "on the OASIS" so that this information is not made publicly without registration. 6. R12 should be revised to indicate that "The Transmission Service Provider shall determine the impact of firm ETCs based on "an appropriate level of " the following inputs. 7. R14 should be renumbered R13.1 and R14.1 through R14.5 should be renumbered R13.2 through R13.6. R15 and R16 should be renumber R14 and R15. 8. Existing transmission commitments should be listed without capital letters or else it needs to be defined for the NERC Glossary.

Please use this form to submit comments on the 1st draft of standard MOD-029-1 Rated System Path ATC Methodology. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line. If you have questions please contact **Andy Rodriquez** at Andy.Rodriquez@nerc.net or by telephone at 609-947-3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? ## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments: .

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☒ Yes

   ☐ No

   Comments: R12.10 should be renumbered R13, R13 should be renumbered R14, R14 should be renumbered R14.1, R14.1 should be renumbered R14.2 (etc.)

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☒ Yes

   ☒ No

   Comments: Real-time system reliability would not be diminished since the actual power transfer is less than the reliability limit. However, long-term reliabilty could be diminished because posted TTC would be higher than the actual maximum flow. Transmission users could overestimate the path capacity and consequently overesimate the amount of power that can be delivered on this specific path. A path might be voltage limited, not flow limited, and the introduction of a fictitious generator might hide the reliability rating if it supports the voltage on the path in the simulation, but not in "real life".

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

Comments: As requested in R12.10, non-firm ATC is calculated by reducing TTC by non-firm-ETCs. Depending on time horizon, unscheduled transmission service could be sold multiple-times This is a business issue that should be addressed by NAESB.

**5.** Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

☐ Yes

☒ No

Comments: This is a business issue to be addressed by NAESB.

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: R14 is for planning and operating horizons and R15 is only for operating horizon

**7.** Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities to whom you believe the standard should apply and why.

☒ Yes

☒ No

Comments: MOD-029 includes applicability to Reliability Coordinator, but there is no reference in the details of the standard to the RC. A role should be defined, or RC should be removed from the Applicability section. All MOD standards should be consisent in their description of the roles for providing input and calculating ATC.

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission’s (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC’s directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If “No,” please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If “Yes,” please identify the conflict in the comments area.

☐ Yes

☐ No

Comments: We are not aware of any conflicts. However, we want to ensure that NERC recognizes that many of the requirements defined in these standards do not apply to entities that do not sell transmission service in advance of the physical flow of energy. For example, many or all items associated with firm and non-firm ETC would be zero for these markets.

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments: for clarification

R6.1 Regional criteria (NPCC) are not all included in TPL-001 and TPL002 for contingencies in Table 1, category B…There should be acknowledgement that there can be regional differences in the application of planning criteria that may extend beyond Category B contingencies in determination of TTC.

R.12.10 (re-numbered to R13) : Note that the TRM allocated to the path for non-firm ATC may be less than the TRM for firm ATC.

R12.10 (renumbered to R13): As it is not specified , we understand that the TSP is free to calculate the ATC by reducing the TTC by reserved or by scheduled transmission services depending on the time horizon.

R11: Use of the word "impact" in the formula for ATC introduces confusion. Can R11 be written in formula format like the Version Zero standards?

R11.4 Use of the word "impact" is redundant.

### Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☒ No

   Comments:

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☒ Yes

   ☐ No

   Comments:

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☐ Yes

   ☐ No

   Comments: Our comments are from a regulatory perspective. This is strictly a technical issue.

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

   ☐ Yes

   ☐ No

   Comments: Our comments are from a regulatory perspective. This is strictly a technical issue.

5. Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

   ☐ Yes

   ☐ No

   Comments: Our comments are from a regulatory perspective. This is strictly a technical issue.

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments: Our comments are from a regulatory perspective. This is strictly a technical issue.

**7.** Do you agree with the functional entities identified in the "Applicability" section of the draft standard? If "No," please identify the functional entities to whom you believe the standard should apply and why.

☒ Yes

☐ No

Comments:

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☒ Yes

☐ No

Comments:

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. You may submit the completed form by e-mail to sarcomm@nerc.net with "RSP ATC Standard" in the subject line.

**You do not have to answer all questions. Enter All Comments in Simple Text Format.**

*Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.*

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☒ Yes

   ☐ No

   Comments: SRP supports the comments on this subject submitted by the WECC contingent. Additionally we suggest that the drafting team provide for a "phasing-in" period to allow time for the TSP's who use the Rated System Path Methodology to re-study the TTC for their Posted Paths. This is needed because of the large number of Posted Paths in the west whose TTC was not established by the rigorous methodology stipulated in the R6 of the new standard. If a "phasing-in" period is not appropriately addressed in the standard itself it needs to be provided for somewhere. We suggest an Implementation Plan similar to the CIP Standards. One that requires the Responsible Entities to become Substantially Compliant, Compliant, and then Audibly Compliant within a defined schedule.

2. Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

   ☐ Yes

   ☐ No

   Comments:

3. Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

   ☐ Yes

   ☒ No

   Comments: The system should be reliable if the TTC in both directions of all paths is reliability limited even if one or more of the reliability limits was found using fictitious devices for stressing the system in order to determine the reliability limit. The flow limit does not represent the capability of the transmission system to reliably transfer power. It does represent the limit of the capability of the system to stress the system which doesn't imply the limit beyond which reliability is in jeopardy.

4. Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**5.** Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

☐ Yes

☐ No

**Background Information**

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires that specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The standard drafting team was charged with revising the set of modeling standards related to ATC to comply with the FERC directives and stakeholder recommendations.

The standard drafting team posted Draft 1 of standard MOD-001-1, ATC and AFC Calculation Methodologies, for a 30-day comment period beginning February 15, 2007. As stated in the comment form at that time, MOD-001-1 outlined the requirements for calculation of ATC and AFC, but did not provide requirements for the calculation of TFC or TTC. The drafting team identified two standardized methods of calculating TTC and from those values ATC, and one standardized method of calculating TFC and from that value AFC and a conversion to ATC. These methods are presented in the drafts being posted of three new standards: MOD-028 Network Response Available Transfer Capability, MOD-029 Rated System Path Available Transfer Capability and MOD-030 Flowgate Network Response Available Transfer Capability.

The standard drafting team would like to receive industry comments on the proposed requirements and structure of MOD-029-1 Rated System Path ATC. Once there is consensus on the requirements, the drafting team will add measures and compliance elements. Please review the 'White Paper' and MOD-029-1 before answering the questions on the following pages. Comments must be submitted by **June 24, 2007**. 1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flowbase). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

   ☒ Yes

   ☐ No

   Comments:

   The TTC determinative process for the Rated System Path methodology accurately resides in the MOD-29. The WECC Team suggests that these determinants be fully vetted through the augmented expertise of those being added to the team via the most recent ATC SAR.

   The WECC Team does not believe it is FERC's intent to require a posting of TTC for each and every path and each and every possible permutation of paths or POR/PODs within a utility's system. It is estimated that this could result in a million plus postings for some utilities; most of these posting would be on paths for which no service has been requested.

   Rather, FERC has already made it clear that as to posting of ATC and TTC, FERC's intent was stated in its approved definition of "Posted Path." It is the "Posted Path" that requires a posting of ATC and TTC. The WECC Team has the below positive suggestions that will remedy many concerns for MOD-29.

   Suggested Remedy:

   18 CFR 37.6, Order 889/RM95-9-000, P. 58-60 and NAEBS R-4005 all utilize "Posted Path" as the delineated paths for which ATC and TTC must be posted.

   At 18 CFR 37.6, the defintion for Posted Path states: (control area has been replaced with Balancing Authority to bring the defintion in line with the Functional Model)

   Posted Path means: 1) any Balancing Authority to Balancing Authority interconnection; 2) any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months; 3) and any path for which a customer requests to have ATC or TTC posted. For purposes of this definition, an hour includes any part of an hour during which service was denied, curtailed or interrupted. (Plagiarized from NAESBE R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60. See also: 18 CFR 37.6; http://a257.g.akamaitech.net/7/257/2422/12feb20041500/edocket.access.gpo.gov/cfr_2004/aprqtr/pdf/18cfr37.5.pdf

   First, in refining this draft the term "Posted Path" must be adopted in accordance with FERC's intent.

   The WECC MIC MIS ATC TF Team suggests the following rewrite of R6:

– R6. For each Posted Path, each Planning Coordinator shall determine TTC using the applicable method below:

–

– R6.1. For Posted Paths whose capacity is limited by thermal, voltage or stability limits, TTC shall be the lesser of the thermal, voltage or stability limits as determined by adjusting generation dispatch, area interchange schedules, and Load levels to maximum values (without introducing fictitious facilities or unrealistic values into the system model) to determine the maximum flow that can be simulated on the path while at the same time satisfying the planning criteria in TPL-001 and TPL-002 for the Contingencies in Table 1, Category B or the successor criteria.

–

– • If it is not possible to simulate a flow sufficiently large to reach a reliability-limited TTC, the TTC of the path is equal to the maximum flow simulated and the path is said to be flow limited.

–

– • If the TTC determined for a path in one direction is reliability limited and the TTC determined for the same path in the other direction is flow limited, the reliability limited TTC may be used for both directions.

–

– R6.2. For Posted Paths whose capacity is limited by contract, TTC shall be set on the Posted Path at the maximum allowable contract capacity, not to exceed the thermal, voltage or stability limits of that Posted Path.

–

– R6.3 For Posted Paths whose capacity is jointly owned, TTC shall be set for each separate owner of the Posted Path at the maximum capacity owned by each separate owner.

~ R6.3.1. The Transmission Service Provider shall ensure that for jointly owned paths, the sum of all owners' allocations is equal to the TTC of the path

–

– R6.4. For Posted Paths whose capacity has been established for ten years or more (subject to contingency and seasonal adjustment), and that are known to have operated reliably at that established capacity rating, TTC shall be set on the Posted Path at the established, reliable level at which that Posted Path has been operating for at least the previous ten years.

–

– R6.5. For new or revised Posted Paths, the Planning Coordinator shall determine if the TTC adversely impacts the path rating or TTC values of existing paths by modeling the flow on the new or revised Posted Path at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level, and if there is an adverse impact:

–

– • Limit the TTC for the new or revised path to eliminate the adverse impacts, or

–

– • Follow a local or regional procedure for resolving the impact with the affected parties.

–

–

R6.6. Draft a report to document the steps performed in determining the TTC for the Posted Path.

**2.** Do you believe that all elements of ETC relevant to the RSP Methodology have been adequately captured in Requirements twelve and fourteen (R12 and R14)? If "No" please explain how you believe it should be addressed in the comments area.

☐ Yes

☒ No

Comments:

The impact of load growth for Network Integration Transmission Service should be included in R12.2.

**3.** Would the reliability of the system be diminished if the flow limited TTC requirement in this standard (R6.1) was relaxed such that fictitious devices (e.g. fictitious generators or load or phase shifting transformers) could be modeled in the simulation in order to raise the flow on a flow limited path to a reliability limit and then allow the reliability limited rating to take precedence over the flow limited rating? Please explain your answer in the comments area.

☐ Yes

☐ No

Comments:

**4.** Does this standard need to address the practice of selling the same Non-Firm Transmission multiple times? Please explain your answer in the comments area.

☐ Yes

☒ No

Comments: The incremental sells of the same non-firm transmission to multiple customers represents a prioritization issue that would best be addressed in a NAESB Busines Practice.

**5.** Does R13 or R14 need to be reworded to explicitly clarify that CBM must be offered for sale as Non-Firm transmission? Please explain your answer in the comment area.

☒ Yes

☐ No

Comments: As drafted the standard is unclear. This team suggests language that better reflects the following: Order 890, P. 351. "The Commission also required transmission providers to make any transfer capability set aside for CBM available on a non-firm basis and to post this availability on OASIS."

For clarity, this statement needs to be reconciled with MOD-04-1, R.3.4 stating, "The Transmission Service Provider shall use "zero" as the value for all unscheduled CBM for all non-firm ATC calcualtions for all methodlogies. Order 890. P. 262.

**6.** Should R14 and R15 be combined to clarify the calculation for non-firm ATC? Please explain your answer in the comments area.

☒ Yes

☐ No

Comments: Merely combining these may not be sufficient to make clear what the TSP is supposed to do. R14 should, at minimum, be a subset of R13, lest there be no responsible party. Adding R15 as a subset of R13 would be appropriate.

Some in WECC assert that all "non-firm" is a business practice to be determined by NAESB. Others believe "non-firm" shoud be addressed in MOD-01 - not here.

**7.** Do you agree with the functional entities identified in the “Applicability” section of the draft standard? If “No,” please identify the functional entities to whom you believe the standard should apply and why.

☐ Yes

☒ No

Comments: Although the "Applicability" section states it is applicatable to Relaibility Coordinators, there is nothing in the draft that applies to an RC.

**8.** The drafting team attempted to address all of the directives identified in the Federal Energy Regulatory Commission's (FERC) Orders 890 and 693 related to RSP. Do you agree that the drafting team has adequately responded to all of FERC's directives in FERC Orders 890 and 693 related to the RSP methodology in this draft of MOD-029-1? If "No," please explain your answer in the comments area.

☐ Yes

☐ No

Comments: No comment.

**9.** Are you aware of any conflicts between the proposed standard and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement? If "Yes," please identify the conflict in the comments area.

☐ Yes

☒ No

Comments:

**10.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard MOD-029-1.

Comments:

A.

The current "R14." should be numbered as "R13.1." and this will have an impact on all subsequent requirements.

B.

In the "Applicability" section, the term "Available Transfer Capability Implementation Document" is used as a defined term. The term is used in MOD-01 R3. At minimum the ATCID either needs to be defined or a reference to the MOD-01 must be inserted for cross reference into each Standard in which it appears.

C.

R1. Change the determinant from "the" to "a" in the parenthetical.

D.

In the "Applicability" section, either "Planning Coordinator" needs to be defined and imported into the NERC Glossary or a more appropriate entity such as "Planning Authority" may be in order.

E.

R6. The term "extreme" is overly vague. This Team suggests replacement with the words "maximum or minimum".

F.

R7-R8. Change "posted path" to "Posted Path".

As with MOD-08, Posted Path should be defined as:

Posted Path

Posted Path means: 1) any Balancing Authority to Balancing Authority interconnection; 2) any path for which service is denied, curtailed or interrupted for more than 24 hours in the past 12 months; 3) and any path for which a customer requests to have ATC or TTC posted. For purposes of this definition, an hour includes any part of an hour during which service was denied, curtailed or interrupted. (Plagiarized from NAESBE R-4005 and Order 889, RM95-9-000, April 24, 1996, P. 58-60.

G.

The term "postbacks" appeared in Order 890, P. 212. "Therefore, we direct public utilities, working through NERC, to modify related ATC standards by implementing the following principles for firm and non-firm ATC calculations: (1) for firm ATC calculations, the transmission provider shall account only for firm commitments; and (2) for non-firm ATC calculations, the transmission provider shall account for both firm and non-firm commitments, postbacks of redirected services, unscheduled service, and counterflows." Since the term is not defined and whereas FERC did not specify exactly what it is, the NERC Team should clarify what FERC meant by the term before inserting it into the calculation process.

H. R6. Everytime the word "path" is used it should be replaced with "POSTED PATH."

I. To assist the industry in determining which of the three methodologies is best suited for the TSP's needs, it is suggested that a statement be inserted into the "Purpose" section of MOD-28 / 29 / 30 stating its intended use.

E.g.

MOD-28 was modeled on the ATC process of much of the Eastern Interconnect.

MOD-29 was modeled on the ATC process of much of the WECC Interconnet.

I.

R12.5 Delete "five years or longer in duration."

NERC
NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

# Consideration of Comments — 2nd Draft of Standard MOD-029-1 — Rated System Path ATC (Project 2006-07)

The ATC Standard Drafting Team requesters thank all commenters who submitted comments on the first draft of standard MOD-029-1, Rated System Path ATC (Project 2006-07). This standard was posted for a 30-day public comment period from May 25 through June 24, 2007. The requesters asked stakeholders to provide feedback on the standard through a special standard Comment Form. There were 15 sets of comments, including comments from 72 different people from more than 40 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

Based on the comments received from stakeholders, comments from the cooperative effort with NAESB in developing associated business practices, and comments received from FERC staff, the drafting team has significantly redrafted the standard. The changes have been so extensive that the revised standard bears very little resemblance to the last posted draft.

Major changes include:

- Title shortened to 'Rated System Path Methodology'
- Purpose statement revised to clarify that the purpose is to increase consistency and transparency in the development of transfer capability calculations rather than to promote consistent and uniform application and documentation of ATC calculations
- Applicability modified so that the requirement are assigned to the Transmission Operator and Transmission Service Provider – the Planning Coordinator and Reliability Coordinator are not assigned any requirements in the revised standard
- Eliminated R2, R9, and R16, requirements associated with making information 'publicly available' – NAESB business practices will address all posting requirements
- Rearranged the order of the requirements so that the sequence follows a more logical order. R1 (requires the documentation associated with the determination of TTC be organized in a report) was moved into R2 as the last step in the process of determining TTC.
- Put all the modeling requirements (R2 and R4) into a single requirement – R1.
- Deleted R5, the requirement to use assumptions consistent with those used in expansion planning, because the revised MOD-001 — Available Transfer Capability includes a requirement that addresses the same topic but is more comprehensive.
- R6 is the requirement that includes the steps in the process of determining TTC and this requirement was modified based on stakeholder comments to include consideration of Posted Paths limited by contract and to require the development of a nomogram under specific conditions. The step in the process that addressed situations where the TTC for a path is reliability-limited in one direction and flow-limited in the other direction.
- R7 and was a requirement for the Planning Coordinator to ensure TTCs were calculated and this has been deleted. In the revised standard the requirement to calculate TTCs is assigned to the Transmission Operator and is addressed in R2.

- R8 was a requirement for the Planning Coordinator to distribute its TTCs and the supporting information and this requirement has been deleted. In the revised standard the Transmission Operator is required to distribute the TTCs it has developed and this is addressed in R3.
- R10 was a requirement to calculate ATC at specified intervals and this requirement has been deleted. The revised MOD-001 — Available Transfer Capability includes the requirement to calculate ATC at specified intervals.
- R11 described how to calculate firm ATC and in the revised standard the descriptive language has been converted into an algorithm with each of the elements in the algorithm clearly defined. See R7 in the revised standard.
- R12 was a requirement to determine the impact of firm ETCs and this has been converted into an algorithm with each of the elements in the algorithm clearly defined. See R 5 in the revised standard.
- R13 and R14 were requirements to determine the impact of non-firm ETCs and these have been converted into an algorithm with each of the elements in the algorithm clearly defined. See R 6 in the revised standard. (Note that the posted version of the standard had a typographical error that separated R13 into two requirements and this had not been intended.)
- R15 was a requirement related to non-firm ATC and this deleted as a separate requirement – the revised standard includes a specific algorithm for the determination of non-firm ATC that includes the intent of R15 in the definition of 'postbacks.'
- Added measures and compliance elements.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standards can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 – Regional Reliability Organizations, Regional Entities

## Index to Questions, Comments, and Responses

1. FERC has ordered that the TTC for all posted paths be calculated by using one of three methodologies (1 Rated System Path, 2 Network Response & 3 Flow base). The Rated System Path (RSP) Standard (MOD-029-1) is modeled after the WECC Path Rating Methodology which does not require that all posted paths be rated using the WECC Methodology. There are many posted paths within WECC whose ratings were not calculated using the WECC Path Rating process and would need to be re-rated to conform to the RSP Standard. Should the RSP Standard address this issue? If "Yes" please explain how you believe it should be addressed in the comments area.

**Summary Consideration:** The SDT has opted to adopt the FERC / NAESB approach to "Posted Path" to define the universe of paths addressed in this standard. Further, the SDT has adopted comments suggesting a high level methodology for calculating TTC accompanied by additional delimiters to address a large universe of unique and peripheral circumstances that accompany this approach. Finally, the SDT will adopt a phased in approach when formulating the implementation schedule for this standard to account for the potentially large number of Posted Paths which must be studied or re-studied in order to conform to the new requirements imposed by this standard.

| **Question #1** | | | |
|---|---|---|---|
| **Commenter** | **Yes** | **No** | **Comment** |
| APPA | | ☑ | This is the very reason why it is necessary for the TSP to go the TP, PC, RC or TOP (depending on the time horizon of the ATC calculation) which has determined the TTC for reliable operational and planning reasons. Whatever, method the reliability functions have used will be communicated to the TSP and they will post the values and backup information for the calculations. |
| **Response:** This is what is intended. | | | |
| IRC | | ☑ | We do not believe the RSP Standard needs to specifically address WECC Path ratings which were not rated using the WECC Path Rating process. |
| **Response:** The SDT has opted to adopt the existing FERC / NAESB approach of "Posted Path" to define the universe of paths affected by this standard. | | | |
| ERCOT | | ☑ | See IRC comments submitted by Charles Yeung. |
| **Response:** See response to IRC / Charles Yeung. | | | |
