| | Individual | Tony Kroskey | Brazos Electric Power Cooperative, Inc. | | | No - one or more definitions needs revision - see comments | For the ERCOT region/market the concept of ATC, AFC are not applicable. It is suggested that the definition of ATC have some consideration for whether there is a required "commercial activity" for it in a region. | Transmission Operator | | | | | | As commented in Question #1, Brazos Electric does not believe that the application of would serve any reliability need or commercial market purpose. Therefore an exclusion requirements based on whether a TO/TOP operates soley in a single control area region |
| | | | | | | | The NYISO has continuing concerns with two of the revised definitions: (i) "ATC Path;" and (ii) "ATC." ATC Path: The NYISO previously expressed concern with the SDT's use of a new defined term "ATC Path" instead of the term "Posted Path" that was used in earlier versions of MOD-001 and is more consistent with the terminology used in FERC's OASIS posting regulations. The NYISO continues to be concerned that the proposed definition of "ATC Path" set forth in the latest version of proposed MOD-001 could, absent revision or clarification, subject the NYISO to potential penalties that would be inappropriate given the nature of its financial reservation system and the inapplicability | | | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | of certain OASIS posting requirements to it. Specifically, as the NYISO has explained in previous comments, ATC serves a fundamentally different purpose and is calculated differently in New York, because there are no express physical transmission reservations and all desired uses of the grid are accommodated to the extent that customers are willing to pay congestion. FERC has expressly recognized that the NYISO's ATC postings are merely advisory projections that may be of some commercial benefit to customers but that they do not determine whether customers can obtain transmission service. The NYISO has also explained that there are no "Posted Paths" as that term is defined under FERC's OASIS regulations internal to the NYISO and that the NYISO is not required, both because of that fact, and because of FERC orders exempting the NYISO from certain OASIS regulations, to post ATC on its internal interfaces for periods further out than one day-ahead. The current draft of MOD-001 would define "ATC Path" as including both "Posted Paths" and "any other combination of Point of Receipt and Point of | | | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Delivery for which Available Transfer Capability is calculated." The NYISO remains concerned that without clarification this definition could be interpreted in a way that would require the NYISO to post ATC for time periods further out than one day ahead when it is not required by FERC's regulations to make such postings and where such postings would serve no reliability purpose (because they have nothing to do with scheduling or "over-scheduling" long-term transactions.) Given the nature of the NYISO's financial reservation system, and the central role that the output of its day-ahead and real-time market software plays in its ATC calculations (see below), the NYISO would not have any meaningful information to post for periods further out than one day-ahead in any case. The NYISO therefore respectfully requests that the SDT either: (i) remove the defined term "ATC Path" and return to the use of "Posted Path" as that term is defined in FERC's OASIS regulations; or (ii) revise the term "ATC Path" as follows: "ATC Path: Any Posted Path or any other combination of | | The NYISO continues to agree with the ISO/RTO Council that the MOD standards extend into areas that should be covered and addressed by NAESB Business Practices (as defined in MOD-001 Definitions). The frequency of postings and frequency of AFC/ATC calculations should be NAESB Business Practices, and not included in the NERC standards as reliability based requirements Nevertheless, to the extent that the SDT decides to keep such requirements in proposed MOD-001, the NYISO offers the following additional comments or R2, R8, and M2. R2 This requirement continues to reflect an assumption that all Transmission Service Providers are required under FERC's regulations to calculate and post ATC values for periods 48 hours, one month, and one year into the future. This is not true of the NYISO. Because of the nature of its financial reservation system, FERC has only required the NYISO to calculate and post ATCs for its internal interfaces for a period one day-ahead. The NYISO does not post and calculate, and given the nature of its system, cannot post and calculate, ATCs further out than one day ahead for those internal interfaces or for certain controllable lines that link the NYISO to neighboring Transmission Service Providers. Thus, as drafted, R2 would conflict with FERC orders and FERC approved tariff provisions excusing the NYISO from posting longer range ATCs. It would also require the NYISO to calculate and post ATCs that it cannot practically calculate given the nature of its system (under which ATC is determined primarily | | | | | |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Rick Gonzales | New York Independent System Operator | | | No - one or more definitions needs revision - see comments | Point of Receipt and Point of Delivery for which Available Transfer Capability is calculated, provided, however, that interfaces or paths for which a Transmission Service Provider is not required under FERC's regulations, or as a result of FERC orders, to calculate and post ATC for periods further out than one day-ahead shall not be considered to be ATC Paths" The NYISO's proposed revision would apply to few Transmission Service Providers, and thus would not undermine the proposed requirements or harm reliability. It would, however, be a very important accommodation to the NYISO that would prevent it from being subjected to inappropriate penalties under R1, R2, or R8. Available Transfer Capability ("ATC"): The proposed new definition of "ATC" does not appear to be flexible enough to accommodate the fundamentally different nature of ATC under the NYISO's FERC-approved financial reservation transmission model. As the NYISO has previously explained, a customer's ability to schedule transactions in the NYISO system is not limited by a pre-defined amount of ATC. In New York | Transmission Service Provider | by the output of the NYISO's day-ahead and real-time market software). If R2 is not modified, the NYISO would have to seek a modification (or waiver) from FERC to avoid being subject to penalties for non-compliance with a requirement that should not apply to it. The NYISO respectfully requests that the SDT address the problem by revising proposed R2 as follows: "Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the ATC methodology or methodologies selected by its Transmission Operator(s), except to the extent that the Transmission Service Provider is not required, under FERC's regulations, or as a result of FERC orders, to calculate and post ATC for periods further out than one day-ahead: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] R2.1. Hourly ATC values for at least the next 48 hours. R2.2. Daily ATC values for at least the next 31 calendar days. R2.3. Monthly ATC values for at least the next 12 months (months 2-13). In addition, the violation severity levels for these draft standards now have a graded implementation. Nevertheless, it may still be possible for multiple violations to result from a single unintended event. The NYISO requests that double counting of violations for a single event be eliminated by adding a new Item 6 to Section A of the proposed standard to establish this point. R8 The NYISO has previously asked the SDT to clarify or revise R8 so that Transmission Service Providers such as the NYISO that are not required to post monthly ATC values for internal interfaces (See the | Yes | | No | The NYISO agrees with the ISO/RTO Council comments on this issue. NERC states that a VSL defines the degree to which compliance with a requirement was not achieved. The violation severity levels for these draft standards now for the most part have a graded implementation, but the NYISO remains concerned regarding the possibility of multiple violations resulting from a single event. Therefore, the NYISO requests that double counting of violations for a single event be eliminated. A single event shall not result in multiple violations. |

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | ATC is not, in the SDT's words, "a measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses." Instead, ATC postings are really "advisory projections" calculated after the NYISO markets close, and transactions are scheduled, based on calculations performed by the NYISO's day-ahead and real-time market software. The fact that a posted ATC is zero does not mean that further commercial activity is precluded because the NYISO may redispatch its system to support additional transactions. A posted ATC value of zero simply indicates that there is congestion at a particular NYISO interface. FERC has granted the NYISO a number of waivers from its OASIS regulations that reflect these differences and has recognized that ATC is merely an "advisory projection" in New York. The NYISO therefore respectfully requests that the SDT accommodate the different nature of ATC under the NYISO's FERC-approved financial | NYISO's response to Question One, above) would not be subject to a requirement to recalculate such values on a weekly basis. Otherwise, R8 would effectively require the NYISO to conduct calculations that FERC has excused it from conducting and that would serve no reliability purpose under the NYISO's financial reservation transmission model. The NYISO therefore respectfully requests that the SDT revise R8 to to clearly establish that Transmission Service Providers need not recalculate ATC values that they are not required to calculate or post under FERC's regulations, or as a result of FERC orders M2 Consistent with the NYISO's comments on R2 and R8, and with past NYISO comments, NERC should revise M2 to clearly state that Transmission Service Providers need not provide evidence that they calculated ATCs that they are not required to calculate or post under FERC's regulations, or as a result of FERC orders | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | transmission model by either: (i) deleting the proposed definition of ATC; or (ii) specifying that each Transmission Service Provider must include its definition of ATC in its ATCID (and expressly allowing entities such as the NYISO to have definitions that vary from the standard definition); or (iii) revising the definition as follows: "Available Transfer Capability (ATC): A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows, except with respect to Transmission Service Providers that employ FERC-approved financial reservation transmission models in which ATC serves as an advisory projection of potential transmission congestion." Again, the NYISO's proposed revision would not apply to | | | | | | | |

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | many Transmission Service Providers, and thus would not undermine the proposed standard or harm reliability. It would, however, be a very important accommodation to the NYISO that would prevent it from being subjected to inappropriate penalties under R1, R2, R3.6, and R8. | | | | | | | |

# Standards Announcement

## Comment Period Opens
## April 16–May 15, 2008

**Now available at: http://www.nerc.com/~filez/standards/MOD-V0-Revision.html**

### Comment Period for Available Transfer Capability Standards (Project 2006-07) Posted for 30-day Comment Period April 16–May 15, 2008

The ATC Standard Drafting Team has posted the following five revised standards related to the determination of Available Transfer Capability (ATC) for a 30-day comment period through May 15, 2008. Each standard has its own implementation plan and has its own comment form.

MOD-001 — Available Transfer Capability — An "umbrella" standard that requires the selection of a methodology, the updating of values, and the sharing of procedures and data. Comment Form

MOD-008 — Transmission Reliability Margin — A standard that describes the calculation and use of TRM. Comment Form

MOD-028 — Area Interchange Methodology (Network Response ATC Methodology) — A standard that describes the calculation of TTC and ATC, as performed primarily in the Eastern Interconnection. Comment Form

MOD-029 — Rated System Path Methodology — A standard that describes the calculation of TTC and ATC, as performed primarily in the Western Interconnection. Comment Form

MOD-030 — Flowgate Methodology (Network Response Flowgate Methodology) — A standard that describes the calculation of TFC and AFC, as well as the conversion of those values to TTC and ATC. Comment Form

These standards have been revised based on stakeholder comments from the initial ballot conducted March 3–12, 2008. The drafting team's responses to the comments submitted with the ballots for these standards are posted for stakeholder review. The drafting team is still working on revisions to MOD-004-1 — Capacity Benefit Margin, and will post its consideration of the comments submitted with the initial ballot of MOD-004 and the revised standard and implementation plan for comment at a later time.

### Standards Development Process

The NERC posting and balloting procedures are described in the *Reliability Standards Development Procedure Manual*, which contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Maureen Long, Standards Process Manager, at maureen.long@nerc.net or at (813) 468-5998.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007
5. SDT posted second draft for comment from October 31–December 15, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–2, 2008

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Oder 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| **1.** Posting for 30-day industry comment. | May 23, 2008 |
| **2.** Respond to Comments. | August 25, 2008 |
| **3.** Posting for 30-day Pre-Ballot Review. | August 26, 2008 |
| **4.** Initial Ballot. | September 25, 2008 |
| **5.** Respond to comments. | October 31, 2008 |
| **6.** Recirculation ballot. | November 1, 2008 |
| **7.** 30-day posting before board adoption. | August 26, 2008 |
| **8.** Board adoption. | November 13, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Generation Capability Import Requirement (GCIR):** The amount of generation capability from external sources identified by a Load-Serving Entity (LSE) or Resource Planner (RP) to meet its generation reliability or resource adequacy requirements as an alternative to internal resources.

**Capacity Benefit Margin Implementation Document (CBMID):** A document that describes the implementation of a Capacity Benefit Margin methodology.

## A. Introduction

1. **Title:** **Capacity Benefit Margin**
2. **Number:** **MOD-004-1**
3. **Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Capacity Benefit Margin (CBM) to support analysis and system operations.
4. **Applicability:**
   - **4.1.** Load-Serving Entities.
   - **4.2.** Resource Planners.
   - **4.3.** Transmission Service Providers.
   - **4.4.** Balancing Authorities.
   - **4.5.** Transmission Planners, when their associated Transmission Service Provider has elected to maintain CBM.
5. **Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard become effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** The Transmission Service Provider that maintains CBM shall prepare and keep current a "Capacity Benefit Margin Implementation Document" (CBMID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning, Long-term Planning*]

**R1.1.** The process through which a Load-Serving Entity within a Balancing Authority Area associated with the Transmission Service Provider, or the Resource Planner associated with that Balancing Authority Area, may ensure that its need for Transmission capacity to be set aside as CBM will be reviewed and accommodated by the Transmission Service Provider to the extent Transmission capacity is available.

**R1.2.** The procedure and assumptions for establishing CBM for each Available Transfer Capability (ATC) Path or Flowgate.

**R1.3.** The procedure for a Load-Serving Entity or Balancing Authority to use Transmission capacity set aside as CBM.

**R2.** The Transmission Service Provider that maintains CBM shall make available its current CBMID to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, Resource Planners, and Planning Coordinators that are within or adjacent to the Transmission Service Provider's area, and notify those entities of any changes to the CBMID prior to the effective date of the change. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.** Each Load-Serving Entity determining the need for Transmission capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Using one of the following to determine the GCIR:

- Loss of Load Expectation (LOLE) studies
- Loss of Load Probability (LOLP) studies
- Deterministic risk-analysis studies
- Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

**R3.2.** Identifying expected import paths or source regions.

**R4.** Each Resource Planner determining the need for Transmission capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.1.** Using one of the following to determine the GCIR:

- Loss of Load Expectation (LOLE) studies
- Loss of Load Probability (LOLP) studies
- Deterministic risk-analysis studies
- Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

**R4.2.** Identifying expected import paths or source regions.

**R5.** At least every 13 months, the Transmission Service Provider that maintains CBM shall establish a CBM value for each ATC Path or Flowgate to be used for ATC or Available Flowgate Capability (AFC) calculations during the subsequent 13 months. This value shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** Reflect consideration of each of the following if available:

- Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Service Provider's area
- Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Service Provider's area
- Any reserve margin or resource adequacy requirements for loads within the Transmission Service Provider's area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

**R5.2.** Be allocated as follows:

- For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners
- For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Service Provider

**R6.** At least every 13 months, the Transmission Planner shall establish a CBM value for each ATC Path or Flowgate to be used for planning purposes during the subsequent years two through ten. This value shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** Reflect consideration of each of the following if available:

- Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Planner's area
- Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Planner's area
- Any reserve margin or resource adequacy requirements for loads within the Transmission Planner's area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

**R6.2.** Be allocated as follows:

- For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners
- For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Planner.

**R7.** Less than 31 calendar days after the establishment of CBM, the Transmission Service Provider that maintains CBM shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for CBM on the Transmission Service Provider's system of the amount of CBM set aside to meet their need. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R8.** Less than 31 calendar days after the establishment of CBM, the Transmission Planner shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for CBM on the system being planned by the Transmission Planner of the amount of CBM set aside to meet their need. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R9.** The Transmission Service Provider that maintains CBM and the Transmission Planner shall each provide copies of the supporting data, including any models, used for determining CBM or allocating CBM over each ATC Path or Flowgate to the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning, Long-term Planning*]

**R9.1.** Each of its associated Transmission Operators within 30 calendar days of their making a request for the data.

**R9.2.** To any Transmission Service Provider, Reliability Coordinator, Transmission Planner, Resource Planner, or Planning Coordinator within 30 calendar days of their making a request for the data.

**R10.** The Load-Serving Entity or Balancing Authority shall request to import energy over firm Transfer Capability set aside as CBM only when experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher. [*Violation Risk Factor: Lower*] [*Time Horizon: Same-day Operations*]

**R11.** When reviewing an Arranged Interchange using CBM, the Balancing Authority and Transmission Service Provider shall waive, within the bounds of reliable operation, any Real-time timing and ramping requirements. [*Violation Risk Factor: Medium*] [*Time Horizon: Same-day Operations*]

**R12.** The Transmission Service Provider that maintains CBM shall approve, within the bounds of reliable operation, any Arranged Interchange using CBM that is submitted by an Energy Deficient Entity[1] under an EEA 2 if: [*Violation Risk Factor: Medium*] [*Time Horizon: Same-day Operations*]

**R12.1.** The CBM is available

**R12.2.** The EEA 2 is declared within the Balancing Authority Area of the Load-Serving Entity, and

**R12.3.** The Balancing Authority with the EEA 2 is located within the Transmission Service Provider's area.

## C. Measures

**M1.** Each Transmission Service Provider that maintains CBM shall produce its CBMID evidencing inclusion of all information specified in R1. (R1)

**M2.** Each Transmission Service Provider that maintains CBM shall have evidence (such as dated logs and data, copies of dated electronic messages, or other equivalent evidence) to show that it made the current CBMID available to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, and Planning Coordinators specified in R2, and that prior to any change to the CBMID, it notified those entities of the change. (R2)

**M3.** Each Load-Serving Entity that determined a need for Transmission capacity to be set aside as CBM shall provide evidence (including studies and/or requirements) that it met the criteria in R3. (R3)

---

[1] See Attachment 1-EOP-002-0 for definition.

**M4.** Each Resource Planner that determined a need for Transmission capacity to be set aside as CBM shall provide evidence (including studies and/or requirements) that it met the criteria in R4. (R4)

**M5.** Each Transmission Service Provider that maintains CBM shall provide evidence (such as studies, requirements, and dated CBM values) that it established 13 months of CBM values consistent with the requirements in R5.1 and allocated the values consistent with the requirements in R5.2. (Note that CBM values may legitimately be zero.) (R5)

**M6.** Each Transmission Planner with an associated Transmission Service Provider that maintains CBM shall provide evidence (such as studies, requirements, and dated CBM values) that it established CBM values for years two through ten consistent with the requirements in R6.1 and allocated the values consistent with the requirements in R6.2. (Note that CBM values may legitimately be zero.) (R6)

**M7.** Each Transmission Service Provider that maintains CBM shall provide evidence (such as dated e-mail, data, or other records) that it notified the entities described in R7 of the amount of CBM set aside to meet their need. (R7)

**M8.** Each Transmission Planner with an associated Transmission Service Provider that maintains CBM shall provide evidence (such as e-mail, data, or other records) that it notified the entities described in R8 of the amount of CBM set aside to meet their need. (R8)

**M9.** Each Transmission Service Provider that maintains CBM and each Transmission Planner shall provide evidence including copies of dated requests for data supporting the calculation of CBM along with other evidences such as copies of electronic messages or other evidence to show that it provided the required entities with copies of the supporting data, including any models, used for allocating CBM as specified in R9. (R9)

**M10.** Each Load-Serving Entity and Balancing Authority shall provide evidence (such as logs, copies of tag data, or other data from its Reliability Coordinator) that at the time it requested to import energy using firm Transfer Capability set aside as CBM, they were in an EEA 2. (R10)

**M11.** Each Balancing Authority and Transmission Service Provider shall provide evidence (such as operating logs and tag data) that it waived Real-time timing and ramping requirements when approving an Arranged Interchange using CBM (R11)

**M12.** Each Transmission Service Provider that maintains CBM shall provide evidence including copies of CBM values along with other evidence (such as tags, reports, and supporting data) to show that it approved any Arranged Interchange meeting the criteria in R12. (R12)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority (CEA)

Regional Entity.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Data Retention**

- The Transmission Service Provider that maintains CBM shall maintain its current, in force CBMID and any prior versions of the CBMID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Service Provider that maintains CBM shall maintain evidence to show compliance with R2, R5, R7, R9, and R12 for the most recent three calendar years plus the current year.
- The Load-Serving Entity shall each maintain evidence to show compliance with R3 and R10 for the most recent three calendar years plus the current year.
- The Resource Planner shall each maintain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- The Transmission Planner shall maintain evidence to show compliance with R6, R8, and R9 for the most recent three calendar years plus the current year.
- The Balancing Authority shall maintain evidence to show compliance with R10 and R11 for the most recent three calendar years plus the current year.
- The Transmission Service Provider shall maintain evidence to show compliance with R11 for the most recent three calendar years plus the current year.
- If an entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

**None.**

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007
5. SDT posted second draft for comment from October 31–December 15, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008

### Description of Current Draft:

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes the modifications identified in the SAR with consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Oder 890, and Order 890-A.

### Future Development Plan:

| Anticipated Actions | Anticipated Date |
|---|---|
| **1.** Posting for 30-day industry comment. | May 22, 2008 |
| **2.** Respond to Comments. | August 25, 2008 |
| **3.** Posting for 30-day Pre-Ballot Review. | August 26, 2008 |
| **4.** Initial Ballot. | September 25, 2008 |
| **5.** Respond to comments. | October 31, 2008 |
| **6.** Recirculation ballot. | November 1, 2008 |
| **7.** 30-day posting before board adoption. | August 26, 2008 |
| **8.** Board adoption. | November 13, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Generation Capability Import Requirement (GCIR):** The amount of generation capability from external sources ~~requested~~ identified by a Load-Serving Entity (LSE) ~~(or group of LSEs with an aggregated need for Capacity Benefit Margin)~~ or Resource Planner (RP) to meet its generation reliability or resource adequacy requirements as an alternative to internal resources.

**Capacity Benefit Margin Implementation Document (CBMID):** A document that describes the implementation of a Capacity Benefit Margin methodology.

~~**Planned Resource Sharing Group (PRSG):** A group of Load-Serving Entities who have agreed to jointly meet their resource adequacy requirements.~~

## A. Introduction

**1. Title:** **Capacity Benefit Margin**

**2. Number:** **MOD-004-1**

**3. Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Capacity Benefit Margin (CBM) to support analysis and system operations.

**4. Applicability:**

~~**4.1.Functional Entity:**~~

**~~4.1.1~~4.1.** ~~Load Serving~~Load-Serving Entities~~y~~.

**4.2.** ~~Planned~~Resource ~~Sharing Group~~ Planners.

**4.3.** Transmission Service Providers. ~~that maintain CBM.~~

**~~4.1.4~~4.4.** Balancing Authorities.~~y.~~

**~~4.1.5~~4.5.** Transmission Planners, when their associated Transmission Service Provider has elected to maintain CBM.

~~**5.Facility Limitations/Specifications:**~~

~~5.1.None.~~

**~~6.~~5.** **Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard become effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** The Transmission Service Provider that maintains CBM shall prepare and keep current a "Capacity Benefit Margin Implementation Document" (CBMID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning, Long-term Planning*]

**R1.1.** ~~Its procedure for a Load-Serving Entity or Planned Resource Sharing Group within a Balancing Authority associated with the Transmission Service Provider to request the Generation Capability Import Requirement (GCIR) including the disposition and handling of deficient requests.~~ The process through which a ~~Load Serving~~Load-Serving Entity within a Balancing Authority Area associated with the Transmission Service Provider, or the Resource Planner associated with that Balancing Authority Area, may ensure that its need for ~~t~~Transmission capacity to be set aside as CBM will be reviewed and accommodated by the Transmission Service Provider to the extent ~~t~~Transmission capacity is available.

**R1.2.** ~~Its~~ The procedure and assumptions for ~~setting~~ establishing CBM for each Available Transfer Capability (ATC) Path or Flowgate ~~based on Load-Serving Entity or Planned Resource Sharing Group GCIR~~.

**R1.3.** ~~Its~~ The procedure for a ~~Load Serving~~Load-Serving Entity or Balancing Authority to ~~request the~~ use ~~of Transfer Capability~~~~t~~Transmission capacity set aside as CBM.

~~**R2.** A statement of whether the Transmission Service Provider allows ATC or AFC to be less than zero due to CBM.~~

~~**R3.**~~The Transmission Service Provider that maintains CBM shall make available its current CBMID ~~and any changes to the CBMID~~ to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, Resource Planners, and Planning Coordinators that are within or adjacent to the Transmission Service Provider's area, and notify those entities of any changes to the CBMID prior to the effective date of ~~a~~ the change. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

~~**R4.** A Load-Serving Entity or Planned Resource Sharing Group that wants Transfer Capability to be set aside in the form of CBM shall: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Long-term Planning]~~

~~**R5.** Submit an annual GCIR request to the Transmission Service Provider and Transmission Planner per the specifications in the CBMID that includes:~~

~~**R6.** The GCIR, specifying:~~

~~**R7.** A monthly GCIR value for each month for the next 24 months. If monthly values are not a requirement as per the applicable reserve margin and resource adequacy requirements documented in R3.1.2, a yearly GCIR value for the current and following year will be sufficient .~~

~~**R8.** An annual GCIR value for each subsequent year for each Balancing Authority or Posted Path not to exceed 10 years into the future.~~

~~**R9.** The location of the load served by the GCIR (e.g., Balancing Authority, zones, markets …).~~

~~**R10.** Assumed external resources (e.g., Balancing Authority(ies), specific generators, markets …) from which generation supporting each GCIR value of 3.1.1.1 and 3.1.1.2 will be supplied or the specific ATC Paths to be used for import of the generation supporting the GCIR.~~

~~**R11.** Identification of all applicable reserve margin and resource adequacy requirements, and the entity(ies) responsible for establishing them, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities.~~

~~**R12.** The process and periodicity of calculating or recalculating GCIR if the entities specified in R3.1.2 require calculating GCIR on a frequency different than specified in R3.1.1~~

~~**R13.** A summary of the results of resource studies performed to determine the amount of the request, not to include confidential information.~~

~~**R14.** All resource studies (and supporting information) performed to determine the amount of the request.~~

~~**R15.**Every thirty-one calendar days, each Load Serving Entity or Planned Resource Sharing Group shall adjust its GCIR request, if necessary per 3.1.1 or 3.1.2.1, to reflect any incremental increase or decrease in required GCIR by either simple adjustment or through recalculation. .~~

~~**R3.3.**~~**R2.** ~~Base the request provided per R3.1 on studies conducted in accordance with verifiable historical, state, regional transmission organization or regional entity criteria.~~

**R3.** Each ~~Load Serving~~Load-Serving Entity determining the need for Transmission ~~C~~capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Using one of the following to determine the GCIR:

- Loss of Load Expectation (LOLE) studies
- Loss of Load Probability (LOLP) studies
- Deterministic risk-analysis studies
- Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

**R3.2.** Identifying expected import paths or source regions.

**R4.** Each Resource Planner determining the need for Transmission ~~C~~capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.1.** Using one of the following to determine the GCIR:

- Loss of Load Expectation (LOLE) studies
- Loss of Load Probability (LOLP) studies
- Deterministic risk-analysis studies
- Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

**R4.2.** Identifying expected import paths or source regions.

~~**R4.**~~**R5.** At least every 13 months,~~Within fourteen calendar days of receiving a request or change to a GCIR request that meets the requirements defined in R3.1, the Transmission Service Provider shall set the CBM for the next 13 months requested as described in R3.1 as follows:~~ the Transmission Service Provider that maintains CBM shall establish a CBM value for each ATC Path or Flowgate to be used for ATC or Available Flowgate Capability (AFC) calculations during the subsequent 13 months. This value shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** Reflect consideration of each of the following if available:

- Any studies (as described in R3.1) performed by ~~Load Serving~~Load-Serving Entities for loads within the Transmission Service Provider's area
- Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Service Provider's area
- Any reserve margin or resource adequacy requirements for loads within the Transmission Service Provider's area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

**R5.2.** Be allocated as follows:

- For ATC Paths, based on the expected import paths or source regions provided by ~~Load Serving~~Load-Serving Entities or Resource Planners
- For Flowgates, based on the expected import paths or source regions provided by ~~Load Serving~~Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Service Provider

~~**R17.1.**~~At least every 13 months, t~~Determine the amount of CBM (for use in R4.2) for each request by using one of the following:~~

~~**R17.1.1.**For the Area Interchange Methodology and the Rated System Path Methodology, using the requested Generation Capability Import Requirement for the appropriate ATC Path(s)~~

~~**R17.1.2.**For the Flowgate Methodology, determining the significant impacts of each request on each Flowgate~~

~~17.1.2.1.Determine impacts of a request by multiplying the requested GCIR by the Distribution Factor for the import relative to the Flowgate or model the GCIR explicitly in the AFC model per R3.1.1.3 and R3.1.1.4.~~

~~**R17.2.**For the Area Interchange Methodology and the Rated System Path Methodology, set CBM for each ATC Path equal to the sum of all requests such that all requests can be met simultaneously or all firm ATC has been allocated to CBM as follows:~~

~~**R17.2.1.**If the situation exists where there is insufficient capability on the ATC Path to satisfy the sum of all GCIR requests and the Transmission Service Provider, per R1.4, does not allow ATC to be less than zero, then the Transmission Service Provider shall set the CBM such that the monthly ATCs equal zero~~

~~**R17.2.2.**If the situation exists where there is insufficient capability on the ATC Path to satisfy the sum of all GCIR requests and the Transmission Service Provider, per R1.4, allows the ATC to be less than zero, then the Transmission Service Provider shall set the CBM equal to the sum of the requested GCIR for that ATC Path.~~

~~**R17.3.**For the Flowgate Methodology set CBM for each Flowgate equal to the sum of all requests on that Flowgate such that all requests can be met simultaneously or all firm ATC has been allocated to CBM as follows:~~

~~**R17.3.1.**If the situation exists where there is insufficient Flowgate AFC to satisfy the sum of all GCIR requests and the Transmission Service Provider, per R1.4, does not allow the Flowgate AFC to be less than zero, then the Transmission Service Provider shall set the CBM such that the monthly Flowgate AFCs equal zero~~

~~**R17.3.2.**If the situation exists where there is insufficient Flowgate AFC to satisfy the sum of all GCIR requests and the Transmission Service Provider, per R1.4, allows the Flowgate AFC to be less than zero, then the Transmission Service Provider shall set the CBM equal to the sum of the requested GCIR for that Flowgate.~~

**~~R5.~~R6.** ~~Within sixty calendar days of receiving a request or change to a GCIR request that meets the requirements defined in R3.1, the Transmission Planner shall:~~he Transmission Planner shall establish a CBM value for each ATC Path or Flowgate to be used for planning purposes during the subsequent years ~~2~~two through ~~10~~ten. This value shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** Reflect consideration of each of the following if available:

- Any studies (as described in R3.1) performed by ~~Load Serving~~Load-Serving Entities for loads within the Transmission Planner's area
- Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Planner's area
- Any reserve margin or resource adequacy requirements for loads within the Transmission Planner's area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

**R6.2.** Be allocated as follows:

- For ATC Paths, based on the expected import paths or source regions provided by ~~Load Serving~~Load-Serving Entities or Resource Planners
- For Flowgates, based on the expected import paths or source regions provided by ~~Load Serving~~Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Planner.

**R7.** Less than 31 calendar days after the establishment of CBM, the Transmission Service Provider that maintains CBM shall notify all the ~~Load Serving~~Load-Serving Entities and Resource Planners that determined they had a need for CBM on the Transmission Service Provider's system of the amount of CBM set aside to meet their need. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R8.** Less than 31 calendar days after the establishment of CBM, the Transmission Planner shall notify all the ~~Load Serving~~Load-Serving Entities and Resource Planners that determined they had a need for CBM on the system being planned by the Transmission

Planner of the amount of CBM set aside to meet their need. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

~~R5.1.As per R3.1.1.3 and R3.1.1.4, model the GCIR explicitly in the ATC/AFC model or use the CBM calculated using requirements R4.1 through R4.3 for all years requested beyond 13 months not to exceed 10 years~~

~~R5.2.If so requested, provide the Transmission Service Provider with the following:~~

~~R5.2.1.The total amount of CBM for each ATC Path or Flowgate on the Transmission Service Provider's system in each of the years specified in the original CBM request not to exceed 10 years.~~

~~R5.2.2.If less than the sum of all requests was established as the CBM for any period, for each ATC Path or Flowgate, a list of the values of each GCIR used to set the CBM for each of the years specified in the original request not to exceed 10 years.~~

~~**R19.**Within seven calendar days of the determination of CBM as described in R4 or R5, the Transmission Service Provider shall provide each Load-Serving Entity or Planned Resource Sharing Group that requested CBM and the Balancing Authority hosting its (their) load with a report that includes: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]~~

~~**R19.1.**The total amount of CBM for each ATC Path or Flowgate on the Transmission Service Provider's system in each of the months or years specified in the original request.~~

~~**R19.2.**If less than the sum of all requests was established as the CBM for any period:~~

~~- For each ATC Path or Flowgate, a list of the values of each GCIR used to set the CBM for each of the months and years specified in the original request~~

~~- The option to pursue alternatives, including expansion, with the Transmission Service Provider.~~

**~~R7.~~R9.** The Transmission Service Provider that maintains CBM and the Transmission Planner shall each provide copies of the supporting data, including any models, used for determining CBM or allocating CBM over each ATC Path or Flowgate to the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning, Long-term Planning*]

**~~R7.1.~~R9.1.** Each of its associated Transmission Operators within ~~thirty~~ 30 calendar days of their making a request for the data.

**~~R7.2.~~R9.2.** To any Transmission Service Provider, Reliability Coordinator, Transmission Planner, Resource Planner, or Planning Coordinator within ~~thirty~~ 30 calendar days of their making a request for the data.

**~~R8.~~R10.** The Load-Serving Entity or Balancing Authority ~~that wants to schedule energy over firm Transfer Capability set aside as CBM shall submit an Arranged Interchange, and~~ shall ~~not~~ request to ~~schedule~~ import energy over firm Transfer Capability set aside as CBM only ~~unless~~ when experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher. [*Violation Risk Factor: Lower*] [*Time Horizon: Same-day Operations*]

**~~R9.~~R11.** When reviewing an Arranged Interchange using CBM, the Balancing Authority and Transmission Service Provider shall waive, within the bounds of reliable operation, any ~~real~~Real-time timing and ramping requirements. [*Violation Risk Factor: ~~Lower~~Medium*] [*Time Horizon: Same-day Operations*]

**~~R10.~~R12.** The Transmission Service Provider that maintains CBM shall approve, within the bounds of reliable operation, any Arranged Interchange using CBM that is submitted by an Energy Deficient Entity[1] under an EEA 2 if: [*Violation Risk Factor: Medium*] [*Time Horizon: Same-day Operations*]

**R12.1.** The CBM is available

**R12.2.** The EEA 2 is declared within the Balancing Authority Area of the ~~Load Serving~~Load-Serving Entity, and

**R12.3.** The Balancing Authority with the EEA 2 is located within the Transmission Service Provider's area.

**Measures~~the CBM is available. [Violation Risk Factor: Medium] [Time Horizon: Same-day Operations]~~**

[1] See Attachment 1-EOP-002-0 for definition.

## C. ~~Measures~~

**M1.** Each Transmission Service Provider that maintains CBM shall produce its CBMID evidencing inclusion of all information specified in R1. (R1)

**M2.** Each Transmission Service Provider that maintains CBM shall have evidence (such as dated logs and data, copies of dated electronic messages, or other equivalent evidence) to show that ~~prior to the effective date of a change to its CBMID,~~ it made the current CBMID available to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, and Planning Coordinators specified in R2, and that prior to any change to the CBMID, it notified those entities of the change. (R2)

**M3.** Each Load-Serving Entity ~~or Planned Resource Sharing Group that wants CBM shall provide a copy of its GCIR request with the supporting information specified in R3.1 to show that it is compliant with R3.1.~~that determined a need for Transmission ~~C~~capacity to be set aside as CBM shall provide evidence (including studies and/or requirements) that it met the criteria in R3. (R3)

**M4.** Each Resource Planner that determined a need for Transmission ~~C~~capacity to be set aside as CBM shall provide evidence (including studies and/or requirements) that it met the criteria in R4. (R4)

~~**M4.**Each Load-Serving Entity or Planned Resource Sharing Group that requests changes to its GCIR as per R3.2 shall provide dated copies of its updated GCIR along with studies or documentation of the changes that support its request; such as Transmission Service Requests, generator outage reports, and load-forecast changes that affect its resource adequacy requirements documented in R3.1.2. (R3).~~

~~**M5.**Each Load-Serving Entity or Planned Resource Sharing Group that wants CBM shall provide evidence (such as studies, historical data, copies of state or regional transmission organization reliability criteria, regional generation reliability criteria or other equivalent evidence) that it has based its GCIR request on verifiable historical, state, regional transmission organization, or regional generation reliability criteria in accordance with R3.3. (R3)~~

~~**M6.**~~**M5.** Each Transmission Service Provider that maintains CBM shall provide evidence ~~including copies of GCIR requests and requests for GCIR changes and other evidence such as copies of the actual computations to set CBM, or other equivalent evidence to show that CBM for the months requested as described in R3.1.1 has been established using the process described in R4.~~(such as studies, requirements, and dated CBM values) that it established 13 months of CBM values consistent with the requirements in R5.1 and allocated the values consistent with the requirements in R5.2. (Note that CBM values may legitimately be zero.) (~~R4~~R5)

**M6.** Each Transmission Planner with an associated Transmission Service Provider that maintains CBM shall provide evidence (such as studies, requirements, and dated CBM values) that it established CBM values for years ~~2~~two through ~~10~~ten consistent with the requirements in R6.1 and allocated the values consistent with the requirements in R6.2. (Note that CBM values may legitimately be zero.) (R6)

**M7.** Each Transmission Service Provider that maintains CBM shall provide evidence (such as dated e-mail, data, or other records) that it notified the entities described in R7 of the amount of CBM set aside to meet their need. (R7)

**M8.** Each Transmission Planner with an associated Transmission Service Provider that maintains CBM shall provide evidence (such as e-mail, data, or other records) that it notified the entities described in R8 of the amount of CBM set aside to meet their need. (R8)

~~**M7.**Each Transmission Planner shall provide evidence including copies of GCIR requests and requests for GCIR changes and other evidence (such as written documentation of studies and supporting study models that model base loadflow, copies of actual computations to set CBM, or other equivalent evidence) to show that the GCIR has been used to either model GCIR or calculate as per the process described in R5. (R5)~~

~~**M8.**Each Transmission Service Provider shall provide copies of the reports sent to Load-Serving Entities and Balancing Authorities along with other evidence (such as logs and data, copies of electronic messages, or other equivalent evidence) to show that within seven calendar days of the determination of CBM, a report meeting the requirements described in R6 was provided as specified. (R6).~~

**M9.** Each Transmission Service Provider that maintains CBM and each Transmission Planner shall ~~each~~ provide evidence including copies of dated requests for data supporting the calculation of CBM along with other evidences such as copies of electronic messages or other evidence to show that it provided the required entities with copies of the supporting data, including any models, used for allocating CBM as specified in ~~R7~~R9. (~~R7~~R9)

**M10.** Each Load-Serving Entity ~~or~~and Balancing Authority ~~that scheduled energy over firm Transfer Capability set aside as CBM~~ shall provide evidence (such as logs, copies of tag data, or other data from its Reliability Coordinator) that at the time ~~they~~ it requested ~~the~~ to import energy using~~schedule using~~ firm Transfer Capability set aside as CBM~~CBM~~, they were in an EEA 2. (~~R8~~R10)

**M11.** Each Balancing Authority and Transmission Service Provider shall provide evidence (such as operating logs and tag data) that it waived ~~real~~Real-time timing and ramping requirements when approving an Arranged Interchange using CBM (~~R9~~R11)

**M12.** Each Transmission Service Provider that maintains CBM shall provide evidence including copies of CBM values along with other evidence (such as tags, reports, and supporting data) to show that it approved any Arranged Interchange ~~using CBM for any Energy Deficient Entity[2] where the total CBM available was greater than the amount of CBM requested in the Arranged Interchange~~meeting the criteria in R12. (~~R10~~R12)

## D. Compliance

### 1. Compliance Monitoring Process

[2] See Attachment 1-EOP-002-0 for definition.

**1.1. Compliance Enforcement Authority (CEA)**

Regional Entity.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Data Retention**

- The Transmission Service Provider that maintains CBM shall maintain its current, in force CBMID and any prior versions of the CBMID that were in force since the last compliance audit to show compliance with R1~~1~~.
- The Transmission Service Provider that maintains CBM shall maintain evidence to show compliance with R2, ~~R2, R4, R6, R7~~R5, ~~and R10~~ R7, R9, and R12 for the most recent three calendar years plus the current year.
- The Load-Serving Entity ~~and Planned Resource Sharing Group~~ shall each maintain evidence to show compliance with R3~~,~~ and R~~8~~10 for the most recent three calendar years plus the current year.
- The Resource Planner shall each maintain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- The Transmission Planner shall maintain evidence to show compliance with ~~R5~~ R6, R8, and ~~R7~~ R9 for the most recent three calendar years plus the current year.
- The Balancing Authority shall maintain evidence to show compliance with ~~R9~~ R10 and R11 for the most recent three calendar years plus the current year.
- The Transmission Service Provider shall maintain evidence to show compliance with R11 for the most recent three calendar years plus the current year.
- If an entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

### 1.5. Additional Compliance Information

**None.**

## ~~2.~~Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |

# Standards Announcement

## Comment Period Opens
## May 23–June 23, 2008

**Now available at: http://www.nerc.com/~filez/standards/MOD-V0-Revision.html**

### Comment Period for MOD-004-1 — Capacity Benefit Margin (Project 2006-07) Posted for 30-day Comment Period

The ATC Standard Drafting Team has posted the fourth draft of MOD-004-1 – Capacity Benefit Margin, standard and associated implementation plan for a 30-day comment period through June 23, 2008.

This standard has been revised based on stakeholder comments submitted with the initial ballot conducted March 3-12, 2008. The drafting team's responses to the comments submitted with the ballots for this standard are posted for stakeholder review.

Please use this electronic comment form to submit comments on MOD-004 standard by June 23, 2008.

If you need an off-line, unofficial copy of the questions in the comment form, there is a copy of the comment form posted at the following site:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

Please use only the electronic form to submit comments by June 23, 2008. If you experience any difficulties in using the electronic form, please contact Barbara Bogenrief at 609-452-8060.

### Standards Development Process

The *Reliability Standards Development Procedure Manual* contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

*For more information or assistance, please contact Maureen Long,*
*Standards Process Manager, at maureen.long@nerc.net or at (813) 468-5998.*

# Implementation Plan for Standard MOD-004 — Capacity Benefit Margin (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-004 — Capacity Benefit Margin, which describes the reliability aspects of determining and maintaining a Capacity Benefit Margin and the conditions under which that margin may be used.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard supersedes MOD-004. The following standards have been incorporated into this standard, made irrelevant by this standard, or are being addressed by the North American Energy Standards Board, and should be retired.

- MOD-005 — Procedure for Verifying CBM Values
- MOD-006 — Procedures for the Use of Capacity Benefit Margin Values
- MOD-007 — Documentation of the Use of Capacity Benefit Margin

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Transmission Service Provider
- Load Serving Entity
- Resource Planner
- Transmission Planner
- Balancing Authority

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Implementation Plan for Standard MOD-004 – Capacity Benefit Margin (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-004 – Capacity Benefit Margin, which describes the reliability aspects of determining and maintaining a Capacity Benefit Margin and the conditions under which that margin may be used.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard supersedes MOD-004. The following standards ~~MOD-005, MOD-006, and MOD-007~~ have been incorporated into this standard, made irrelevant by this standard, or are being addressed by the North American Energy Standards Board, and should be retired.

- MOD-005 — Procedure for Verifying CBM Values
- MOD-006 — Procedures for the Use of Capacity Benefit Margin Values
- MOD-007 — Documentation of the Use of Capacity Benefit Margin

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Transmission Service Provider
- Load Serving Entity
- Resource Planner
- Transmission Planner
- Balancing Authority

| ~~Proposed Standard~~ | ~~Transmission Operator~~ | ~~Transmission Planner~~ | ~~Transmission Service Provider~~ | ~~Balancing Authorities~~ | ~~Purchasing Selling Entities~~ | ~~Load-Serving Entities~~ |
|---|---|---|---|---|---|---|
| ~~MOD-004~~ | | ~~■~~ | ~~■~~ | ~~■~~ | | ~~■~~ |

## Proposed Effective Date

**Implementation Plan for ~~Standards MOD-001,~~ MOD-004~~, MOD-008, MOD-028, MOD-029, and MOD-030; ATC/TTC/AFC and CBM/TRM Revisions~~ - Capacity Benefit Margin (Project 2006-07)**

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

Please use this form to submit comments on the current draft of MOD-004. Comments must be submitted by June 23, 2008. If you have questions please contact Andy Rodriquez at Andy.Rodriquez@nerc.net or by telephone at 202.393.3998.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007, FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

The drafting team has created the following proposed standard:

**MOD-004 — Capacity Benefit Margin.** A standard that describes the calculation and use of CBM.

The drafting team has also created five other standards (MOD-001, MOD-008, MOD-028, MOD-029, and MOD-030), for which comments are being sought through a different commenting period.

The drafting team also proposes the retirement of the following standards:

> **MOD-005 — Procedure for Verifying CBM Values.** Now addressed in compliance for MOD-004.
>
> **MOD-006 — Procedure for the Use of CBM.** Now addressed in MOD-004 R10, R11, and R12. Also to be addressed in future NAESB Business Practices.
>
> **MOD-007 — Documentation of the Use of CBM.** To be addressed in future NAESB Business Practices.

This standard was balloted March 3 to March 12, 2008. Many entities submitted negative ballots, and many submitted comments with their ballots. The drafting team has reviewed the comments submitted with ballots, and has made some changes to the standard to address these comments.

1. Based on industry comments, as well as those of the Functional Model Working Group, the Planned Resource Sharing Group (PRSG) has been eliminated. To address regional CBM processes, the Resource Planner was added as an applicable entity. Entities still may elect to register as a Joint Registration Organization (JRO), as well as delegate tasks.

2. The drafting team has modified the standard to be less prescriptive and allow for more flexibility in how the need for CBM and CBM itself is determined.

3. The requirement to waive timing and ramping requirements was modified to have a VRF of medium, as it has a direct impact on current-day operations and can result in the inadvertent denial of an interchange transaction needed to maintain reliability.

4. The requirement for a Transmission Service Provider to approve transactions using CBM if the CBM is available was modified to apply additional criteria to the evaluation for approval.

5. A more graded approach was applied to the VSLs where appropriate

The drafting team is now seeking comments on these changes.

You do not have to answer all questions.

1. The drafting team has modified the Violation Risk Factor for R11 and R12 of MOD-004 from Lower to Medium. NERC's VRF definitions are listed below:

   **High Risk Requirement:**

   (a) is a requirement that, if violated, could directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or
   (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk-Power System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

   **Medium Risk Requirement:**

   (a) is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System, but is unlikely to lead to Bulk-Power System instability, separation, or cascading failures; or
   (b) is a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System, but is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk-Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

   **Lower Risk Requirement: is administrative in nature and**

   (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or
   (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

   Are the current VRFs established correctly?

   ☐ Yes
   ☐ No
   ☐ No preference

   If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification. Comments:

2. The drafting team modified the applicable entities for the standard. Do you believe the applicable entities are correct?

☐ Yes

☐ No

☐ No preference

If "No," please identify entities should be applicable and what their roles should be. Comments:

3. The Drafting Team eliminated the detail regarding the request and response process for CBM. Do you believe this reduction in detail is appropriate?

   ☐ Yes

   ☐ No

   ☐ No preference

   If "No," please explain. Comments:

4. The drafting team has modified the Violation Severity Levels for MOD-004 to reflect industry concerns that they were too "pass/fail" oriented. Are the current VSLs established correctly?

   ☐ Yes

   ☐ No

   ☐ No preference

   If "No," please identify specific VSLs and suggest changes to the language. Comments:

5. The drafting team has modified the measures and compliance elements for MOD-004 based on industry comments. Do you believe these changes to the measures and compliance elements are appropriate?

   ☐ Yes

   ☐ No

   ☐ No preference

   If "No," please identify your concerns. Comments:

6. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-004. Comments:

| | Individual or group. | Name | Organization | Group Name | Lead Contact | Contact Organization | Question 1 | Question 1 Comments | Question 2 | Question 2 Comments | Question 3 | Question 3 Comments | Question 4 | Question 4 Comments | Question 5 | Question 5 Comments | Question 6 Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | NPCC | Guy Zito | NPCC | Yes | | Yes | | Yes | | Yes | | Yes | | |
| | Individual | Jack Cashin/Barry Green | EPSA | | | | No preference | | No preference | | No | . Some of the detail that has been eliminated was valuable and what is left resembles a fill-in-the-blank standard in some important aspects. For example, the previous draft required that CBM requirements be updated every 30 days. While the requirement for updates every 30 days may be excessive, it is important that the quantity withheld for CBM be reviewed regularly, as this transmission capability is not available for use by the market. We suggest a minimum of quarterly be required. The previous draft also specified the requirement for a TSP to make all CBM available to eligible parties requesting it (when in an EEA 2) even if some of those parties had needs that | No preference | | No preference | | In the following areas, EPSA believes that additional specificity in the standard would be beneficial. • The update frequency for specifying the quantities of CBM to be withheld (see question 3 above) • R3.1 specifies certain types of studies that are appropriate for the determination of CBM to be requested, for example LOLP studies. However, no guidance is provided on the appropriate target reliability. For example is 1 day in 10 years appropriate or 1 day in 100 years. • R3.2 requires the purchaser of CBM to specify the import paths or source region for the CBM. Is there any ability for the TSP to alter this request? If so, on what basis? On what frequency should |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | exceeded amounts requested in advance. While EPSA agreed that this was appropriate at the time of the emergency, there needed to be a reconciliation after the fact, and a possible finding of a violation, if the appropriate amounts of CBM were not being requested and paid for and therefore inappropriate amounts of transmission capability were being withheld from the market. In the current draft standard, it is not clear that any requirement would be violated under these circumstances. | | | | | this information be updated? • In R12 there is no indication of a priority level when CBM is requested by multiple LSEs in an EEA 2 and less than the full requested amount is available. Is the CBM granted to the LSE that had requested that it be set aside (R3)? Is it merely first come first served? Under this scenario, where a single contingency prompts a request for CBM from multiple LSEs, this suggests that it would be granted to the LSE that completes the paper work most quickly. |
| | Individual | Greg Rowland | Duke Energy Corporation | | | | Yes | | Yes | | Yes | | Yes | | No | Section 1.3 Data Retention, first bullet should identify a maximum retention period, such as the most recent three calendar years plus the current year. | In Requirements R7 and R8, and Measures M7 and M8 the phrase "to meet their need" should be struck. This phrase implies that the CBM set-aside would be assigned/allocated to specific LSEs and Resource Planners, which is not the case. |
| | Individual | Dennis Kimm | MidAmerican Energy | | | | Yes | | No preference | | No | The standard is a fill-in-blank standard, and although probably won't be approved by the industry unless it is a fill-in-the blank standard, I will be in the minority and not vote for | No preference | | No preference | | NERC needs to develop clear standards for how the CBM value shall be determined, allocated across transmission paths, and used. The current standard does not require that to happen. |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | this standard. | | | | | |
| | Individual | Danny Dees | MEAG Power | | | | No preference | | No preference | | No preference | | No preference | | No preference | | I wish to thank the SDT for its consideration of comments I submitted previously. Others at MEAG Power may choose to comment on other aspects of this standard; however, I comment solely to request that the SDT reconsider the wording of R12.3 in light of the fact that no Balancing Authority IS LOCATED WITHIN MEAG Power's service area. More specifically, MEAG Power's transmission system provides network service from network resources in Georgia to the loads of 48 cities and one county in Georgia. MEAG Power owns no transmission facilities outside of Georgia even though its system operates within the (multi-state) Southern Company Balancing Authority pursuant to a FERC-approved contract. Thus, MEAG Power is incapable of providing CBM to substantial amounts of load located within our host balancing authority (e.g., load located in Mississippi, Alabama and Florida). While it may not be typical for a TSP's service area to be a subset of its host balancing authority's footprint, I believe there are some others in this situation. Therefore, please consider if the |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | | following alternative wording would be suitable: R12.3 The energy deficient entity in the Balancing Authority with the EEA 2 has load located within the Transmission Service Provider's area. |
| | Individual | Chuck Falls | SRP | | | | Yes | | Yes | | Yes | | No | VSL for R2 - The VSL ties the number of days for notification to others using the phrase "after a change was made" in the CBMID. The requirement R2 refers instead to "the effective date of the change" which may be different from the date a change is made in the CBMID. We suggest the wording at all levels of VSL for this requirement be modified to refer to the effective date of the change. VSL for R5 - None of the VSL levels are identified if the TSP never re-establishes the CBM once first established. Suggest adding the following words to the Severe VSL description " OR The TSP never re-establishes the CBM after first established." Also, in both the Moderate & Severe VSL description the words "if available" | Yes | | No other comments to offer. |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | should be added following reference to R5.1 since none of the items in this section may be available which is acceptable per the first sentence in R5.1. VSL for R6 - Same comments apply as for R5 VSL. VSL for R7 - Change the "all" to "of" in the last sentence of the severe VSL. | | | |
| | | | | | | | | | | | | | | | | | R6: Can the SDT clarify the intent of "planning purposes during the subsequent years two through ten." Does this refer to transmission expansion planning or long term TSR planning? The Midwest ISO believes the intent is for transmission expansion planning. If this is true, then we believe that establishing/using a predetermined CBM value per path or flowgate should not be the only way to account for LOLE in the planning process. The Midwest ISO, through Module E of its Tariff, conducts Resource Adequacy studies to determine the total amount of generation available in its footprint and then derive the total amount of power remaining to satisfy its LOLE requirements. This remaining power can be accounted for by |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | John Harmon | Midwest ISO | | | | Yes | | Yes | | Yes | | Yes | | Yes | | building additional transmission in order to import or new generation can be built to meet the remaining power requirement. The Midwest ISO calculates CBM values for flowgates based on the remaining power requirement for short term (less than a year) ATC calculations. The Midwest ISO processes for Resource Adequacy and CBM Methodology have been through a Stakeholder process. We ask the SDT to consider the following language change: R6: The Transmission Planner shall establish a predetermined CBM value for each ATC Path or Flowgate or GCIR for each designated area to be used for future transmission planning during the subsequent years two through ten. R6.1 CBM and GCIR values shall reflect consideration of each of the following if available: •Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Planner's area •Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Planner's area •Any reserve margin or resource |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | | adequacy requirements for loads within the Transmission Planner's area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operations, Regional Reliability Organizations, or regional entities R6.2 Predetermined CBM values shall be allocated as follows: •For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners •For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Planner R6.3 Entities that do not utilize a predetermined CBM value in their respective planning process shall describe in their CBMID how the GCIR is calculated for each area and how the GCIR is used to calculate CBM values for ATC paths or Flowgates for selling transmission service. R8: The Midwest ISO believes this requirement will also need modification |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | | based on our comments and proposed revision to R6. Please consider the language below: R8. Less than 31 calendar days after the establishment of CBM or GCIR, the Transmission Planner shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for CBM on the system being planned by the Transmission Planner of the amount of CBM set aside or the GCIR required to meet their resource adequacy requirements. |
| | | | | | | | | | | | | | | | | | 1. We question how the TSP can "elect" to maintain CBM per R1. What if, per R3, the LSE determined they had a need to set aside transmission capacity as CBM but their TSP does not maintain CBM? Per FERC Orders 890 and 693, the LSE has the right to request CBM be set aside if it can prove that it is a critical need based on LOLE, deterministic studies, historical data, etc. as described in R3. We suggest revising the first part of the first sentence of R1 to state "The Transmission Service Provider that has been asked by its LSE or RP to maintain CBM...". 2. Per R3 and R4, it is not clear how GCIR is used in the CBM process. Is it merely equal to |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | FirstEnergy | Sam Ciccone | FirstEnergy Corp. | Yes | | No | Per our comments from Item 1 in Question 6 regarding the TSP electing to maintain CBM, we suggest changing "Transmission Planner, when their associated Transmission Service Provider has elected to maintain CBM" to simply "Transmission Planners". | Yes | We agree that the standard should be much less prescriptive as to how CBM is determined and utilized. | | | No | M6 - The phrase "(Note that CBM values may legitimately be zero)" should be removed from the measures and be integrated into the requirements. M10 - The end of the statement in the measure should say "EEA 2 or higher". | the CBM value or is it somehow used by the TSP to determine how much CBM is needed for each ATC Path or Flowgate? Either way, the standard should explain what is done with the GCIR once it has been established. 3. In R3.1 and R4.1, can the LSE and RP use different studies for different ATC Paths or Flowgates? If so, then R3.1 and R4.1 should be revised to state "Using one of the following for each ATC Path or Flowgate to determine the GCIR:". 4. With regard to R3 and the responsibilities of the LSE, currently many LSEs work with their TSP to determine the need for CBM because most LSEs do not have the capability to undertake these studies on their own. In addition, several LSEs participate within a Planned Resource Sharing Group that works with that sharing group's TSP to determine the need for CBM. We assume that these activities would be permitted to continue and that this standard will not preclude LSEs from working with their TSP to determine CBM needs. We ask the SDT to confirm our assumptions. |
| | | | | | | | | At present, ERCOT does not use the concept of CBM in its operating activities. Therefore, I | | I believe language should be added to make it very clear that only those | | | | At present, ERCOT does not use the concept of CBM in its operating activities. | | At present, ERCOT does not use the concept of CBM in its operating activities. Therefore, I | |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | H. Steven Myers | ERCOT | | | | No preference | do not feel it would be appropriate for me to comment upon the VRFs. I believe that ATC, TTC, AFC, CBM, and TRM are concepts that apply to the operation of a Transmission Service Market and do not have an associated reliability function if such a market is not in use. | No | entities that have ATC paths are applicable. I believe that the Requirements have been modified to indicate that only such entities that use the concept of CBM have a performance expected, but further clarifying the applicable entities language would help to make it even clearer. | Yes | | No preference | Therefore, I do not feel it would be appropriate for me to comment upon the VSLs. I believe that ATC, TTC, AFC, CBM, and TRM are concepts that apply to the operation of a Transmission Service Market and do not have an associated reliability function if such a market is not in use. | No preference | do not feel it would be appropriate for me to comment upon the measures and compliance elements. I believe that ATC, TTC, AFC, CBM, and TRM are concepts that apply to the operation of a Transmission Service Market and do not have an associated reliability function if such a market is not in use. | |
| | | | | | | | | | | The Applicability section of the | | | | VSL for R2: The VSL should be based on whether the TSP gave prior notice to changes in the CBMID before the changes took effect. Hence the requirement needs to be modified to specify how much "prior" is acceptable. We propose 30 days as appropriate. Hence the VSLs could be: Low = "... notification of less than 30 days but greater than 20 days of effective date." Medium = "... notification of 20 days or less but greater than 10 days of effective..." High = "... notification of 10 days or less but greater than 1 day of effective | | | Effective Date: We believe there is a fundamental issue related with effective dates, that is, the dates in which Reliability Standards become effective and enforceable. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in standards that |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Alessia Dawes | Hydro One Networks | | | | Yes | | No | standard reads as if maintaining a CBM is optional. We have concern with the following: Section 4.5 "Transmission Planners, when their associated Transmission Service Provider has elected to maintain CBM." This reads as though the TSP has the option of not maintaining a CBM and hence a TP has no responsibility as well. We suggest removing the "... when their associated TSP has elected to maintain CBM..." as it is manditory that CBM is established and maintained (even if it is zero). | Yes | | No | date..." Severe = "... gave 1 day or no notice of change prior to the effective date ..." As well, the VSLs for the second condition of R2 (the entities requiring CBMID) use the word "some" which is a loose term. We suggest rewording the "AND" part of the VSLs as follows: High = " ...made available the CBMID to less than 100% but greater than 50% of all entities listed in R2 who require it." Severe = "...made available the CBMIS to 50% or less of all entities listed in R2 who require it." VSLs for R7, R8 and R9 using this "some" loosely as well. We recommend the same wording recommended for R2 VSLs above. VSL for R6: The VSL ranges need to be modified to match the requirement range OR change the requirement to state the frequency at which they must maintain the subsequent 2 to 10 year CBM values. Also, requirement R6 induces | Yes | | have a clear reliability impact. In addition, it does not seem appropriate to have entities exposed to sanctions for non-compliance in some jurisdictions while not in others. The words inserted in the Effective Date of the Standards as well as in the Implementation Plan posted documents permit that these Standards are effective in some jurisdictions and not others. The Standard and the Implementation Plan should be modified to ensure that they become effective in all jurisdictions at the same time, including those where such regulatory approval in not required, that is, only when all regulatory approvals have been obtained. We suggest the same words used in MOD-001, 28, 29 and 30 be used: “All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by all applicable regulatory authorities.” R11 and R12: We think these requirements belong in the INT standards which deals with reliability assessment of Arranged Interchange. |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | the question "subsequent to what?" Do we assume subsequent to R5's 13 months? We may be interpreting the requirement wrong. If so, please rephrase the requirement. | | | |
| | Individual | Catherine Wesley | PJM | | | | Yes | | Yes | | Yes | | Yes | | Yes | | PJM submits the following comments for consideration. PJM proposes revising Requirement 6 as follows: R6 - At least every 13 months, the Transmission Planner shall establish a CBM value for each ATC Path or Flowgate to be used during the subsequent years 2 through 10. This value shall: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] PJM proposes the addition of a new Requirement 7 as follows: New R7 - At least every 13 months, the Transmission Planner shall establish a CBM value to be used for planning purposes during the subsequent years 2 through 10. This value shall: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] PJM agrees that Requirements 10, 11 and 12 are essential. PJM identifies these requirements as addressing emergency scenarios. PJM proposes that it is more appropriate to include these requirements in |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | | EOP-002, Attachment 1 which governs emergency operations. |
| | Group | | | ISO RTO Council/Standards Review Committee | Charles Yeung | Southwest Power Pool | Yes | | Yes | | Yes | | No | We agree with all VSLs except the following: R2: The structure of R2 is fine, but the identification of "late" notification of changes to CBMID needs to be based upon some specific time frame requirement in R2, which is absent in this draft standard. Please see our related comments under Q6. Further, the second condition for the HIGH VSL is loose. It assigns a HIGH to the TSP if it made available the CBMID to "some", but not all, of the entities specified in R2. "Some" needs to be more specific as otherwise, it will be a basis for argument in an audit process. Suggest to expand and grade the second condition VSLs by 1, 2, 3 and 4 or more for Low, Medium, High and Severe. R7: Same comment and suggestion for R2 on the assignment of HIGH based on "some" also applies here. R8: Same | Yes | | R2: It requires the TSP to notify those entities of any changes to the CBMID prior to the effective date of the change. There should be a time frame specified for the notification to tighten up the requirement and facilitate proper development of measures and VSLs. Given that the changes affect the CBMID, we'd think that a period of 7 to 30 days would be approriate. R9: It requires the TSP and TP to provide copies of the supporting data, including any models, used for determining CBM to a number of entities. It should be noted that some of these requesting entities may have commercial interests or affiliations. Further, in some established markets or jurisdictions, the TSPs and/or the TPs may not be able to provide such data, especially the model, to a third party. We suggest this requirement be qualified by adding "subject to confidentiality and security requirements" as in MOD-001, R8. R11 and R12: We think these 2 requirements |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | comment and suggestion for R2 on the assignment of HIGH based on "some" also applies here. R9: Same comment and suggestion for R2 on the assignment of HIGH based on "some" also applies here. In this case, the graded VSLs can be based on the percentage of total data requested. | | | should be moved to INT-006 which deals with reliability assessment of Arranged Interchange. The draft INT-006 being posted for comments deals specifically with emergency requests (and reliability adjustment requests). |
| | Individual | Ron Falsetti | Ontario IESO | | | | Yes | | Yes | | Yes | | No | We agree with all VSLs except the following: R2: The structure of R2 is fine, but the identification of "late" notification of changes to CBMID needs to be based upon some specific time frame requirement in R2, which is absent in this draft standard. | | | | | | | | | ATC supports the change to raise R11 and R12 from lower to medium. This is an example where clearly there is the potential for | | | | | | | | | 1. Due to the Midwest ISO methodology of calculating CBM in the short-term (1 year) and GCIR in the long-term, we believe that R6 should be changed to include: "GCIR for each designated area to be used for future transmission planning." and add the words "that maintains CBM" after "the Transmission Planner" 2. R6.1 should include "CBM and GCIR values shall reflect consideration of each of the following if available". 3. R6.3 should include |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Individual | Jason Shaver | American Transmission Company | | | | No | violations to "directly affect the electrical state or the capability of the Bulk-Power System" as described in the definition for the Medium Risk Requirement. In addition, ATC suggests that R10 be assigned as a "Medium" VRF as well. There is the potential for violations to "directly affect the electrical state or the capability of the Bulk-Power System" as described in the definition for the Medium Risk Requirement. | No preference | | Yes | ATC supports the proposed elimination of excess detail. In addition, ATC suggests that R9 be changed to "The Transmission Service Provider or Transmission Planner that maintains CBM shall provide copies of the applicable supporting data". | Yes | | Yes | | "Entities that do not utilize a predetermined CBM value in their respective planning process shall describe in their CBMID how the GCIR is calculated for each area and how the GCIR is used to calculate CBM values for ATC paths or Flowgates for selling transmission service." 4. R8 should include "Less than 31 calendar days after the establishment of CBM or GCIR, the Transmission Planner shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for GCIR on the system being planned by the Transmission Planner of the amount of CBM set aside or the GCIR required to meet their need." 5. Change the wording in 1.3 Data Retention to: "The Compliance Enforcement Authority shall keep the last audit records and all subsequent requested and submitted audit records." |
| | | | | | | | | | | | | | | | | | How would a generator in a neighboring Balancing Authority (or control area) provide the CBM due to a sudden generation outage in the host control area (or BA area) where the outage occurred? The CBM would be provided after the TRM and has been established as a reliability |

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Group | | | Bonneville Power Administration | Denise Koehn | Transmission Reliability Program | No preference | | No preference | | No | Why isn't the LSE among the entities listed in sec B.R.2, to which the TSP must make the current copy of the CBMID available to? | No preference | | No preference | | requirement by an LSE. The ATC DT should explain how this standard ensures that an LSE can replace the lost generation from a neighboring BA. New Section A.5. Effective date : On the third line, "become" should be "becomes" that is unless they intend to pluralize standard to be standards. CBM is a scheduled transmission reservation that is implemented following the expiration of the TRM. (TRM is unscheduled transmission capacity that can be used to implement emergency operations up to 59 minutes.) Would like to suggest that that the scope of Project 2009-09, a Resource Adequacy Assessments Standard, which is slated for development in 2009, be enlarged to include aspects of MOD-004 that relate to defining the four analyses upon which the GCIR determination is based in greater detail. Although we agree that any one of these analyses is appropriate in calculating GCIR, we believe that these analyses need to be defined in greater detail in order to achieve the stated purpose of the standard. The stated purpose of this standard is: "To promote the consistent and reliable calculation, verification, |

| | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | | | preservation, and use of Capacity Benefit Margin (CBM) to support analysis and system operations." The standard also states that the determination of Generation Capability Import Requirement (GCIR), which is the basis for the CBM request, can be calculated using any of the following analyses: (1) Loss of Load Expectation (LOLE) studies, (2) Loss of Load Probability (LOLP) studies, (3) Deterministic risk-analysis studies and (4) Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability. |

## Consideration of Comments on Draft Standard — MOD-001-4 — Project 2006-07

The ATC Standards Drafting Team thanks all commenters who submitted comments on the draft standard MOD-004-1. These standards were posted for a 30-day public comment period from May 23, 2008 through June 23, 2008. The stakeholders were asked to provide feedback on the standard through a special electronic Standard Comment Form. There were 15 sets of comments, including comments from 51 different people from approximately 30 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

There were many comments that led that drafting team to correct typographical errors, and to modify language to improve clarity, but none of the changes made by the drafting team changed the scope or intent of the requirements in the standard.

**Requirements**

- One entity suggested adding the Load Serving Entity to the list of entities to which the CBMID must be made available to in R2. The SDT incorporated the proposed language, and also added the Balancing Authority.
- One entity that supported the reduction in detail suggested that R9 be modified to require the provision of "applicable" supporting data. The SDT incorporated the proposed language.
- One entity suggested that the NERC standards were requiring CBM to be treated on a first-come, first served basis, As CBM is a margin, the SDT believes that the first entity that needs CBM should be allowed to use it. If a conflict arises due to competing needs, the SDT believes it is up to tariffs and/or business practices to determine the appropriate way to manage the conflict. The SDT has expanded R1.3 to require an explanation of how competing requests for use of CBM are handled.
- One entity requested that the phrase "to meet their need" be removed from R7, R8, M7 and M8, as that implied assignment of CBM like a reservation. The SDT removed the language.
- One entity identified a problem where TSP boundaries and BA boundaries were not consistent. The SDT modified the standard to address the commenter's concern by modifying R12.3 to read as follows: "The Load of the Energy Deficient Entity is located within the Transmission Service Provider's area."
- One entity pointed out that the standard indicated that only one study could be used to determine GCIR. The SDT modified the standard to allow use of multiple methods.
- One entity suggested that R9 include a provision that restricts data "subject to confidentiality and security requirements." The SDT incorporated the suggested language.

**Compliance**

- Several entities provided detailed comments with regard to Requirement 6. After careful review, the SDT determined that the providers' underlying concerns could be addressed with the current standard's language, provided that it was clear in the measure that the practices employed by those entities were acceptable. The SDT has modified measure M6 to address this concern by adding the following sentence: "Inclusion of GCIR based on R6.1 and R6.2 within the transmission base case meets this requirement."
- Four entities pointed out that the VSL for R2 referred generically to a "change" without specifying whether that change was in the CBMID or in the implementation. The SDT modified the standard to be clear that the VSL was based on the effective date of the change to the implementation. Some of those entities suggested changes to the timeframes for lateness, and recommended requiring a specific time ahead of a change for

notification. The SDT explained that that there are situations where rapid changes to the CBMID or its implementation could be required, and that limitations as suggested could delay entities from making those changes.

- One entity pointed out that the VSLs for R5 and R6 only referred to "re-establishment" of a value – but no initial establishment. The SDT corrected the oversight. The entity also pointed out that the VSLs for R5 and R6 did not allow for the requirement not to be met if information was not available; the SDT modified the language to be clear.
- Several entities felt the use of the phase "some, but not all" was ambiguous. The SDT modified the VSLs to refer instead to "at least one."
- One entity asked for limits to be placed on the data retention for R1; the SDT did so by adding the phrase "(but not more than the most recent three calendar years plus the current year)."
- One entity also pointed out that Measure 10 did not allow for the consideration of an EEA3; the SDT modified the language to allow for that consideration.

**Concepts**

- It was suggested that some of the requirements in the standard should be moved to either the EOP or INT families of standards. The SDT incorporated these requirements into this standard, as they are directly related to CBM. Additionally, the INT and EOP standards are outside the scope of this effort as defined by its SAR. Until such time as a SAR is submitted to move the requirements from this standard to another set of standards, the SDT believes it is more important to have the requirements approved and enforceable.

- It was suggested that Project 2009-09, a Resource Adequacy Assessments Standard, which is slated for development in 2009, be enlarged to include aspects of MOD-004 that relate to defining the four analyses upon which the GCIR determination is based in greater detail. SDT suggested that the commenter submit a suggestion for inclusion in the development of NERC's Work Plan. Suggestions may be submitted through the Reliability Standards Suggestions and Comment Form: http://www.nerc.com/files/Standards_Input_Form_Final_2008June30.doc

Based on the comments received, the drafting team is recommending that the Standards Committee authorize moving this standard forward to posting for pre-ballot consideration.

In this "Consideration of Comments" document stakeholder comments have been organized so that it is easier to see the responses associated with each question. All comments received on the standard can be viewed in their original format at:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Gerry Adamski, at 609-452-8060 or at gerry.adamski@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. The drafting team has modified the Violation Risk Factor for R11 and R12 of MOD-004 from Lower to Medium. Are the current VRFs established correctly? If "No," please identify which VRFs are incorrect, how they should be modified, and a justification for their modification.

**Summary Consideration:** Most entities supported this change.

One entity suggested raising the VRF for R10 as well. The SDT believes that a Lower VRF for R10 is correct. R10 requires that an entity use CBM only if in an EEA2. If not in an EEA2 and the CBM is requested to be used, there should be a minimal adverse impact to reliability. The SDT would expect that if such a request were made it would be denied; if it were inadvertently approved, it would subsequently be curtailed.

| Individual/Group | Question 1: | Question 1 Comments: |
|---|---|---|
| ERCOT | No preference | At present, ERCOT does not use the concept of CBM in its operating activities. Therefore, I do not feel it would be appropriate for me to comment upon the VRFs. I believe that ATC, TTC, AFC, CBM, and TRM are concepts that apply to the operation of a Transmission Service Market and do not have an associated reliability function if such a market is not in use. |
| Response: If ERCOT does not use the concept of CBM, this standard would not apply to ERCOT. | | |
| American Transmission Company | No | ATC supports the change to raise R11 and R12 from lower to medium. This is an example where clearly there is the potential for violations to "directly affect the electrical state or the capability of the Bulk-Power System" as described in the definition for the Medium Risk Requirement. In addition, ATC suggests that R10 be assigned as a "Medium" VRF as well. There is the potential for violations to "directly affect the electrical state or the capability of the Bulk-Power System" as described in the definition for the Medium Risk Requirement. |
| Response: The SDT believes that a Low VRF for R10 is correct. R10 requires that an entity use CBM only if in an EEA2. If not in an EEA2 and the CBM is requested to be used, there should be a minimal adverse impact to reliability. The SDT would expect that if such a request was made it would be denied; if it was inadvertently approved, it would subsequently be curtailed. | | |

2. The drafting team modified the applicable entities for the standard. Do you believe the applicable entities are correct? If "No," please identify entities should be applicable and what their roles should be.

**Summary Consideration:** Most entities agreed the applicable entities were correct.

Two entities suggested that the exclusion for Transmission Planners whose Transmission Service Provider did not maintain CBM was incorrect, and that all Transmission Service Providers (and therefore all Transmission Planners) had to follow the standard. Paragraph 82 of FERC Order 890-A states "The Commission clarifies in response to Duke that utilities do not need to make CBM available to LSEs on their system if the utilities do not reserve for themselves CBM or its equivalent." Accordingly, the SDT has written the requirements and applicability such that only entities who maintain a CBM are required to follow this standard. For Transmission Planners, this is addressed in the "Applicability" section of the standard; for Transmission Service Providers, however, some requirements apply to all Transmission Service Providers, while others apply only to those who maintain CBM – in this case, the applicability has been explicitly identified in the requirements themselves.

One entity suggested that this standard should not apply if an entity maintained CBM but did not use one of the three ATC methodologies. The SDT believes that the applicability is clear as written, and requires no modification.

| Individual/Group | Question 2: | Question 2 Comments: |
|---|---|---|
| FirstEnergy Corp. | No | Per our comments from Item 1 in Question 6 regarding the TSP electing to maintain CBM, we suggest changing "Transmission Planner, when their associated Transmission Service Provider has elected to maintain CBM" to simply "Transmission Planners". |
| Response: Paragraph 82 of FERC Order 890-A states "The Commission clarifies in response to Duke that utilities do not need to make CBM available to LSEs on their system if the utilities do not reserve for themselves CBM or its equivalent." Accordingly, the SDT has written the requirements and applicability such that only entities who maintain a CBM are required to follow this standard. For Transmission Planners, this is addressed in the "Applicability" section of the standard; for Transmission Service Providers, however, some requirements apply to all Transmission Service Providers, while others apply only to those who maintain CBM – in this case, the applicability has been explicitly identified in the requirements themselves. | | |
| ERCOT | No | I believe language should be added to make it very clear that only those entities that have ATC paths are applicable. I believe that the Requirements have been modified to indicate that only such entities that use the concept of CBM have a performance expected, but further clarifying the applicable entities language would help to make it even clearer. |
| Response: The SDT believes that the applicability is clear as written, and requires no modification. | | |
| Hydro One Networks | No | The Applicability section of the standard reads as if maintaining a CBM is optional. We have concern with the following: Section 4.5 "Transmission Planners, when their associated Transmission Service Provider has |

| Individual/Group | Question 2: | Question 2 Comments: |
|---|---|---|
| | | elected to maintain CBM." This reads as though the TSP has the option of not maintaining a CBM and hence a TP has no responsibility as well. We suggest removing the "…when their associated TSP has elected to maintain CBM?" as it is mandatory that CBM is established and maintained (even if it is zero). |
| Response: Paragraph 82 of FERC Order 890-A states "The Commission clarifies in response to Duke that utilities do not need to make CBM available to LSEs on their system if the utilities do not reserve for themselves CBM or its equivalent." Accordingly, the SDT has written the requirements and applicability such that only entities who maintain a CBM are required to follow this standard. For Transmission Planners, this is addressed in the "Applicability" section of the standard; for Transmission Service Providers, however, some requirements apply to all Transmission Service Providers, while others apply only to those who maintain CBM – in this case, the applicability has been explicitly identified in the requirements themselves. | | |

| Bonneville Power Administration | No preference | |

3. The Drafting Team eliminated the detail regarding the request and response process for CBM. Do you believe this reduction in detail is appropriate? If "No," please explain.

**Summary Consideration:** In general, entities were supportive of the reduction in detail. Three entities expressed concern with the reduction in detail.

One of those entities expressed concern that the standard was a "fill in the blank" standard. The SDT has attempted to draft the standard such that it is compatible with many other previously approved implementations of CBM. The SDT believe that this version of the standard is significantly more detailed than the existing standard, and although less prescriptive than some may desire, is not "fill in the blank."

One of those entities suggested that more frequent reviews of CBM should be undertaken, and that the standard should explain how to deal with equity and financial issues related to scarcity of CBM in real-time. Regarding the more frequent reviews, the SDT has identified through previous drafts and comment that the industry believes a less frequent review is appropriate. The SDT notes that only one entity expressed this concern. Regarding the question of equity and financial issues, the SDT does not believe that reconciliation of CBM and financial compensation is within the scope of this standards effort, and more properly belongs within tariffs, business practices, or other documents related to equity issues.

The last of those entities suggested that the Load Serving Entity be included in the list of entities to which the CBMID must be made available to. The SDT incorporated the proposed language, and also added the Balancing Authority.

One entity that supported the reduction in detail suggested that R9 be modified to require the provision of "applicable" supporting data. The SDT incorporated the proposed language.

| Individual/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| Electric Power Supply Association | No | Some of the detail that has been eliminated was valuable and what is left resembles a fill-in-the-blank standard in some important aspects. For example, the previous draft required that CBM requirements be updated every 30 days. While the requirement for updates every 30 days may be excessive, it is important that the quantity withheld for CBM be reviewed regularly, as this transmission capability is not available for use by the market. We suggest a minimum of quarterly be required.<br><br>Response: Through previous drafts and comments, the SDT has identified that the industry believes a less frequent review is appropriate.<br><br>The previous draft also specified the requirement for a TSP to make all CBM available to eligible parties requesting it (when in an EEA 2) even if some of those parties had needs that exceeded amounts requested in |

| Individual/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| | | advance. While EPSA agreed that this was appropriate at the time of the emergency, there needed to be a reconciliation after the fact, and a possible finding of a violation, if the appropriate amounts of CBM were not being requested and paid for and therefore inappropriate amounts of transmission capability were being withheld from the market. In the current draft standard, it is not clear that any requirement would be violated under these circumstances.<br><br>Response: The SDT does not believe that reconciliation of CBM and financial compensation is within the scope of this standards effort, and more properly belongs within tariffs, business practices, or other documents related to equity issues. |
| Response: Please see in-line responses. | | |
| MidAmerican Energy | No | The standard is a fill-in-blank standard, and although probably won't be approved by the industry unless it is a fill-in-the blank standard, I will be in the minority and not vote for this standard. |
| Response: The SDT has attempted to draft the standard such that it is compatible with many other previously approved implementations of CBM. The SDT believe that this version of the standard is significantly more detailed than the existing standard. | | |
| Bonneville Power Administration | No | Why isn't the LSE among the entities listed in sec B.R.2, to which the TSP must make the current copy of the CBMID available to? |
| Response: The SDT has modified the standard to incorporate the suggested change, as well as include Balancing Authorities. The new language reads as follows: "R2. The Transmission Service Provider that maintains CBM shall make available its current CBMID to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, Resource Planners, and Planning Coordinators that are within or adjacent to the Transmission Service Provider's area, and to the Load Serving Entities and Balancing Authorities within the Transmission Service Provider's area, and notify those entities of any changes to the CBMID prior to the effective date of the change." However, the SDT also notes that current draft NAESB business practices also require this information to be posted on the OASIS. | | |
| American Transmission Company | Yes | ATC supports the proposed elimination of excess detail. In addition, ATC suggests that R9 be changed to "The Transmission Service Provider or Transmission Planner that maintains CBM shall provide copies of the applicable supporting data". |
| Response: The SDT has made the requested change. The new language is, "R9. The Transmission Service Provider that maintains CBM and the Transmission Planner shall each provide (subject to confidentiality and security requirements) copies of the applicable supporting data, including any models, used for determining CBM or allocating CBM over each ATC Path or Flowgate to the following:" | | |
| FirstEnergy Corp. | Yes | We agree that the standard should be much less prescriptive as to how CBM is determined and utilized. |
| Response: Thank you for your supportive comment. | | |
| NPCC SRC | Yes | |
| Duke Energy Corporation | Yes | |
| Salt River Project | Yes | |
| Midwest ISO, Inc. | Yes | |

| Individual/Group | Question 3: | Question 3 Comments: |
|---|---|---|
| ERCOT | Yes | |
| Hydro One Networks | Yes | |
| PJM Interconnection, L.L.C. | Yes | |
| ISO/RTO Council | Yes | |
| Ontario IESO | Yes | |
| MEAG Power | No preference | |

4. The drafting team has modified the Violation Severity Levels for MOD-004 to reflect industry concerns that they were too “pass/fail” oriented. Are the current VSLs established correctly? If “No,” please identify specific VSLs and suggest changes to the language.

**Summary Consideration:** Four entities expressed concern with the VSLs.

Four entities pointed out that the VSL for R2 referred generically to a “change” without specifying whether that change was in the CBMID or in the implementation. The SDT modified the standard to be clear that the VSL was based on the effective date of the change to the implementation. Some of those entities suggested changes to the timeframes for lateness, and require a specific time ahead of a change for notification. The SDT explained that that there are situations where rapid changes to the CBMID or its implementation could be required, and that limitations as suggested could delay entities from making those changes.

One entity pointed out that the VSLs for R5 and R6 only referred to “re-establishment” of a value – but no initial establishment. The SDT corrected the oversight. The entity also pointed out that the VSLs for R5 and R6 did not allow for the requirement not to be met if information was not available; the SDT modified the language to be clear.

Several entities felt the use of the phase “some, but not all” was ambiguous. The SDT modified the VSLs to refer instead to “at least one.”

| Individual/Group | Question 4: | Question 4 Comments: |
|---|---|---|
| Salt River Project | No | VSL for R2 - The VSL ties the number of days for notification to others using the phrase "after a change was made" in the CBMID. The requirement R2 refers instead to "the effective date of the change" which may be different from the date a change is made in the CBMID. We suggest the wording at all levels of VSL for this requirement be modified to refer to the effective date of the change.<br><br>Response: The SDT has modified the VSL as suggested.<br><br>VSL for R5 - None of the VSL levels are identified if the TSP never re-establishes the CBM once first established. Suggest adding the following words to the Severe VSL description " OR The TSP never re-establishes the CBM after first established." Also, in both the Moderate & Severe VSL description the words "if available" should be added following reference to R5.1 since none of the items in this section may be available which is acceptable per the first sentence in R5.1.<br><br>Response: The SDT believe that the first issue is already addressed by requiring re-establishing the value after a previous establishment. However, the SDT has added a Severe VSL criteria for entities that maintain |

| Individual/Group | Question 4: | Question 4 Comments: |
|---|---|---|
| | | CBM but have not established an initial value. The SDT has modified the “Moderate” reference to R5.1 to address whether data was available; the “Severe” reference already included this language.<br><br>VSL for R6 - Same comments apply as for R5 VSL.<br>Response: The SDT believe that the first issue is already addressed by requiring re-establishing the value after a previous establishment. However, the SDT has added a Severe VSL criteria for entities that maintain CBM but have not established an initial value. The SDT has modified the “Moderate” reference to R6.1 to address whether data was available; the “Severe” reference already included this language.<br><br>VSL for R7 - Change the "all" to "of" in the last sentence of the severe VSL.<br>Response: The SDT has corrected this typographical error. |
| Response: Please see in-line responses. | | |
| Hydro One Networks | No | VSL for R2: The VSL should be based on whether the TSP gave prior notice to changes in the CBMID before the changes took effect. Hence the requirement needs to be modified to specify how much "prior" is acceptable. We propose 30 days as appropriate. Hence the VSLs could be:<br><br>Low = "…notification of less than 30 days but greater than 20 days of effective date."<br>Medium = "… notification of 20 days or less but greater than 10 days of effective…"<br>High = "…notification of 10 days or less but greater than 1 day of effective date…"<br>Severe = "… gave 1 day or no notice of change prior to the effective date …"<br><br>Response: The SDT believes that there are situations where rapid changes to the CBMID or its implementation could be required, and that limitations as suggested could delay entities from making those changes. Accordingly, the SDT did not elect to specify a minimum notice period for the requirement. Based on previous comments, the SDT has modified R2 to refer to the “effective date” rather than simply “the change.”<br><br>As well, the VSLs for the second condition of R2 (the entities requiring CBMID) use the word "some" which is a loose term. We suggest rewording the "AND" part of the VSLs as follows:<br><br>High = " …made available the CBMID to less than 100% but greater than 50% of all entities listed in R2 who require it."<br>Severe = "…made available the CBMIS to 50% or less of all entities listed in R2 who require it." |

| Individual/Group | Question 4: | Question 4 Comments: |
|---|---|---|
| | | VSLs for R7, R8 and R9 using this "some" loosely as well. We recommend the same wording recommended for R2 VSLs above.<br><br>Response: To be clearer, the SDT has replaced the word “some” with “at least one.”<br><br>VSL for R6: The VSL ranges need to be modified to match the requirement range OR change the requirement to state the frequency at which they must maintain the subsequent 2 to 10 year CBM values. Also, requirement R6 induces the question "subsequent to what?" Do we assume subsequent to R5's 13 months? We may be interpreting the requirement wrong. If so, please rephrase the requirement.<br><br>Response: The SDT has modified the VSLs to be clear that the duration referenced is related to the “lateness” of the determination, not the range to be calculated. In order to be clearer, the SDT has removed the word “subsequent” and redrafted the requirement as follows: “R6. At least every 13 months, the Transmission Planner shall establish a CBM value for each ATC Path or Flowgate to be used for planning purposes during each of the years two through ten following the current year.” |
| Response: Please see in-line responses. | | |
| ISO/RTO Council | No | We agree with all VSLs except the following:<br><br>R2: The structure of R2 is fine, but the identification of "late" notification of changes to CBMID needs to be based upon some specific time frame requirement in R2, which is absent in this draft standard. Please see our related comments under Q6. Further, the second condition for the HIGH VSL is loose. It assigns a HIGH to the TSP if it made available the CBMID to "some", but not all, of the entities specified in R2. "Some" needs to be more specific as otherwise, it will be a basis for argument in an audit process. Suggest to expand and grade the second condition VSLs by 1, 2, 3 and 4 or more for Low, Medium, High and Severe.<br><br>Response: The “late” criterion is not absent from the Requirement; the requirement states that notification must occur “before” the effective date of the change. Any notification that is not “before” that date is covered by the VSL and graded on “lateness.” To be clearer, the SDT has replaced the word “some” with “at least one.”<br><br>R7: Same comment and suggestion for R2 on the assignment of HIGH based on "some" also applies here.<br><br>Response: To be clearer, the SDT has replaced the word “some” with “at least one.” |

| Individual/Group | Question 4: | Question 4 Comments: |
|---|---|---|
| | | R8: Same comment and suggestion for R2 on the assignment of HIGH based on "some" also applies here. Response: To be clearer, the SDT has replaced the word "some" with "at least one." <br><br> R9: Same comment and suggestion for R2 on the assignment of HIGH based on "some" also applies here. In this case, the graded VSLs can be based on the percentage of total data requested. <br><br> Response: To be clearer, the SDT has replaced the word "some" with "at least one." The SDT believes that the "percentage of total data requested" would be somewhat difficult to measure. |
| Response: Please see in-line responses. | | |
| Ontario IESO | No | We agree with all VSLs except the following: <br><br> R2: The structure of R2 is fine, but the identification of "late" notification of changes to CBMID needs to be based upon some specific time frame requirement in R2, which is absent in this draft standard. Please see our related comments under Q6. Further, the second condition for the HIGH VSL is loose. It assigns a HIGH to the TSP if it made available the CBMID to "some", but not all, of the entities specified in R2. "Some" needs to be more specific as otherwise, it will be a basis for argument in an audit process. Suggest to expand and grade the second condition VSLs by 1, 2, 3 and 4 or more for Low, Medium, High and Severe. <br><br> Response: The "late" criterion is not absent from the Requirement; the requirement states that notification must occur "before" the effective date of the change. The SDT believes that |

| Individual/Group | Question 4: | Question 4 Comments: |
|---|---|---|
| | | the “percentage of total data requested” would be somewhat difficult to measure. |
| Response: Please see in-line responses. | | |
| NPCC SRC | Yes | |
| Duke Energy Corporation | Yes | |
| Midwest ISO, Inc. | Yes | |
| PJM Interconnection, L.L.C. | Yes | |
| American Transmission Company | Yes | |
| ERCOT | No preference | At present, ERCOT does not use the concept of CBM in its operating activities. Therefore, I do not feel it would be appropriate for me to comment upon the VSLs. I believe that ATC, TTC, AFC, CBM, and TRM are concepts that apply to the operation of a Transmission Service Market and do not have an associated reliability function if such a market is not in use. |
| Response: If ERCOT does not use the concept of CBM, this standard would not apply to ERCOT. | | |
| Electric Power Supply Association | No preference | |
| MidAmerican Energy | No preference | |
| MEAG Power | No preference | |
| Bonneville Power Administration | No preference | |

5. The drafting team has modified the measures and compliance elements for MOD-004 based on industry comments. Do you believe these changes to the measures and compliance elements are appropriate? If "No," please identify your concerns.

**Summary Consideration:** Most entities were supportive of the measures and compliance.

One entity asked for limits to be placed on the data retention for R1; the SDT did so by updating the data retention to" the most recent three calendar years plus the current year."

One entity suggested movement of some explanatory text relted to the use of zero values to form he measure to the requirement; the SDT believes the requirement already allows for zero values, and that this inclusion in the measure is intended to make it clear to an auditor when measuring compliance that the intent of the drafting team was to allow the use of zero values. That entity also pointed out that Measure 10 did not allow for the consideration of an EEA3; the SDT modified the language to allow for that consideration.

| Individual/Group | Question 5: | Question 5 Comments: |
|---|---|---|
| Duke Energy Corporation | No | Section 1.3 Data Retention, first bullet should identify a maximum retention period, such as the most recent three calendar years plus the current year. |
| Response: The SDT has revised the standard to state, "for the most recent three calendar years plus the current year" to address this concern. | | |
| FirstEnergy Corp. | No | M6 - The phrase "(Note that CBM values may legitimately be zero)" should be removed from the measures and be integrated into the requirements.<br><br>Response: The SDT believes the requirement already allows for zero values; this inclusion in the measure is intended to make it clear to an auditor when measuring compliance that the intent of the drafting team was to allow the use of zero values.<br><br>M10 - The end of the statement in the measure should say "EEA 2 or higher".<br><br>Response: The SDT has modified the language to incorporate the words "or higher." |
| Response: Please see in-line responses. | | |
| ERCOT | No preference | At present, ERCOT does not use the concept of CBM in its operating activities. Therefore, I do not feel it would be appropriate for me to comment upon the measures and compliance elements. I believe that ATC, TTC, AFC, CBM, and TRM are concepts that apply to the operation of a Transmission Service Market and do not have an associated reliability function if such a market is not in use. |
| Response: If ERCOT does not use the concept of CBM, this standard would not apply to ERCOT. | | |
| NPCC SRC | Yes | |
| Salt River Project | Yes | |

|---|---|---|
| Midwest ISO, Inc. | Yes | |
| PJM Interconnection, L.L.C. | Yes | |
| ISO/RTO Council | Yes | |
| Ontario IESO | Yes | |
| American Transmission Company | Yes | |
| Electric Power Supply Association | No preference | |
| MidAmerican Energy | No preference | |
| MEAG Power | No preference | |
| Hydro One Networks | Yes | |
| Bonneville Power Administration | No preference | |

6. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-004.

**Summary Consideration:**

One entity suggested that the NERC standards were requiring CBM to be treated on a first-come, first served basis. As CBM is a margin, the SDT believes that the first entity that needs CBM should be allowed to use it. If a conflict arises due to competing needs, the SDT believes it is up to tariffs and/or business practices to determine the appropriate way to manage the conflict. The SDT has expanded R1.3 to require an explanation of how competing requests for use of CBM are handled.

One entity requested that the phrase "to meet their need" be removed from R7, R8, M7 and M8, as this implied assignment of CBM like a reservation. The SDT removed the language.

One entity identified a problem where TSP boundaries and BA boundaries were not consistent. The SDT modified the standard to address the commenter's concern by modifying R12.3 to read as follows: "The Load of the Energy Deficient Entity is located within the Transmission Service Provider's area."

Several entities provided detailed questions with regard to Requirement 6. After careful review, the SDT determined that the providers' underlying concerns could be addressed with the current standards language, provided that it was clear in the measure that the practices employed by those entities were acceptable. The SDT has modified measure M6 to address this concern by adding the following sentence: "Inclusion of GCIR based on R6.1 and R6.2 within the transmission base case meets this requirement."

Two entities seemed to believe that CBM was required. The SDT directed those entities to the language in Order 890-A that indicated CBM was not required.

One entity pointed out that the standard indicated that only one study could be used to determine GCIR. The SDT modified R4.1 to allow for the use of multiple methods.

Several entities questioned the location of the requirements related to the use of CBM; some suggested they be moved to the INT standards, while other suggested they be moved to the EOP standards. The SDT has incorporated these requirements into this standard, as they are directly related to CBM. Additionally, the INT and EOP standards are outside the scope of this effort as defined by its SAR. Until such time as a SAR is submitted to move the requirements from this standard to another set of standards, we believe it is more important to have the requirements approved and enforceable.

Some entities suggested changes to the timeframes for lateness in R2, and requirement of a specific time ahead of a change for notification. The SDT explained that there are situations where rapid changes to the CBMID or its implementation could be required, and that limitations as suggested could delay entities from making those changes.

One entity suggested that R9 include a provision that restricts data "subject to confidentiality and security requirements." The SDT incorporated the suggested language.

| Individual/Group | Question 6 Comments: |
| --- | --- |
| Electric Power Supply Association | In the following areas, EPSA believes that additional specificity in the standard would be beneficial.<br><br>– The update frequency for specifying the quantities of CBM to be withheld (see question 3 above)<br><br>Response: Through previous drafts and comments, the SDT has identified that the industry believes a less frequent review is appropriate.<br><br>– R3.1 specifies certain types of studies that are appropriate for the determination of CBM to be requested, for example LOLP studies. However, no guidance is provided on the appropriate target reliability. For example is 1 day in 10 years appropriate or 1 day in 100 years.<br><br>Response: The SDT believes this is generally specified by regulatory authorities, and is outside the scope of the SAR.<br><br>– R3.2 requires the purchaser of CBM to specify the import paths or source region for the CBM. Is there any ability for the TSP to alter this request? If so, on what basis? On what frequency should this information be updated?<br><br>Response: Requirements 5.2 and 6.2 state that the Transmission Service Provider and Transmission Planner must utilize the import paths or source regions during it's CBM allocation. The SDT believes this does not allow changes to the CBM requests; in the case where a specific source or path did not have sufficient capacity to be set aside, the Transmission Service Provider and/or Transmission Planner would have to communicate this back to the requestor, and that requestor would need to identify an alternate source or path.<br><br>– In R12 there is no indication of a priority level when CBM is requested by multiple LSEs in an EEA 2 and less than the full requested amount is available. Is the CBM granted to the LSE that had requested that it be set aside (R3)? Is it merely first come first served? Under this scenario, where a single contingency prompts a request for CBM from multiple LSEs, this suggests that it would be granted to the LSE that completes the paper work most quickly. |

| Individual/Group | Question 6 Comments: |
|---|---|
| | Response: As CBM is a margin, the SDT believes that the first entity that needs CBM should be allowed to use it. If a conflict arises due to competing needs, the SDT believes it is up to tariffs and/or business practices to determine the appropriate way to manage the conflict. The SDT has expanded R1.3 to require an explanation of how competing request for use of CBM are handled. |
| Response: Please see in-line responses. | |
| Duke Energy Corporation | In Requirements R7 and R8, and Measures M7 and M8 the phrase "to meet their need" should be struck. This phrase implies that the CBM set-aside would be assigned/allocated to specific LSEs and Resource Planners, which is not the case. |
| Response: The SDT has eliminated the phrase as suggested. | |
| MidAmerican Energy | NERC needs to develop clear standards for how the CBM value shall be determined, allocated across transmission paths, and used. The current standard does not require that to happen. |
| Response: The SDT has attempted to draft the standard such that it is compatible with many other previously approved implementations of CBM. The SDT believes that the standard provides guidance regarding the attributes of the calculation without being overly prescriptive | |
| MEAG Power | I wish to thank the SDT for its consideration of comments I submitted previously. Others at MEAG Power may choose to comment on other aspects of this standard; however, I comment solely to request that the SDT reconsider the wording of R12.3 in light of the fact that no Balancing Authority IS LOCATED WITHIN MEAG Power's service area. More specifically, MEAG Power's transmission system provides network service from network resources in Georgia to the loads of 48 cities and one county in Georgia. MEAG Power owns no transmission facilities outside of Georgia even though its system operates within the (multi-state) Southern Company Balancing Authority pursuant to a FERC-approved contract. Thus, MEAG Power is incapable of providing CBM to substantial amounts of load located within our host balancing authority (e.g., load located in Mississippi, Alabama and Florida). While it may not be typical for a TSP's service area to be a subset of its host balancing authority's footprint, I believe there are some others in this situation. Therefore, please consider if the following alternative wording would be suitable: R12.3 The energy deficient entity in the Balancing Authority with the EEA 2 has load located within the Transmission Service Provider's area. |
| Response: The SDT has clarified the requirement to meet the intent of your suggestion. R12.3 now reads as follows: "The Load of the Energy Deficient Entity is located within the Transmission Service Provider's area." | |
| Salt River Project | No other comments to offer. |
| Midwest ISO, Inc. | R6: Can the SDT clarify the intent of "planning purposes during the subsequent years two through ten." Does this refer to transmission expansion planning or long term TSR planning? The Midwest ISO believes the intent is for transmission expansion planning. If this is true, then we believe that establishing/using a predetermined CBM value per path or flowgate should not be the only way to account for LOLE in the planning process. The Midwest ISO, through Module E of its Tariff, conducts Resource Adequacy studies to determine the total amount of generation available in its footprint and then derive the total amount of power remaining to satisfy its LOLE requirements. This remaining power can be accounted for by building additional transmission in order to |

| Individual/Group | Question 6 Comments: |
| --- | --- |
| | import or new generation can be built to meet the remaining power requirement. The Midwest ISO calculates CBM values for flowgates based on the remaining power requirement for short term (less than a year) ATC calculations. The Midwest ISO processes for Resource Adequacy and CBM Methodology have been through a Stakeholder process. We ask the SDT to consider the following language change:<br><br>R6: The Transmission Planner shall establish a predetermined CBM value for each ATC Path or Flowgate or GCIR for each designated area to be used for future transmission planning during the subsequent years two through ten.<br><br>R6.1 CBM and GCIR values shall reflect consideration of each of the following if available:<br>•Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Planner's area<br>•Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Planner's area<br>•Any reserve margin or resource adequacy requirements for loads within the Transmission Planner's area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operations, Regional Reliability Organizations, or regional entities<br><br>R6.2 Predetermined CBM values shall be allocated as follows:<br>•For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners<br>•For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Planner<br><br>R6.3 Entities that do not utilize a predetermined CBM value in their respective planning process shall describe in their CBMID how the GCIR is calculated for each area and how the GCIR is used to calculate CBM values for ATC paths or Flowgates for selling transmission service.<br><br>Response: The SDT has modified measure M6 to address this concern by adding the following sentence: "Inclusion of GCIR based on R6.1 and R6.2 within the transmission base case meets this requirement."<br><br>R8: The Midwest ISO believes this requirement will also need modification based on our comments and proposed revision to R6. Please consider the language below:<br><br>R8. Less than 31 calendar days after the establishment of CBM or GCIR, the Transmission Planner shall notify |

| Individual/Group | Question 6 Comments: |
|---|---|
| | all the Load-Serving Entities and Resource Planners that determined they had a need for CBM on the system being planned by the Transmission Planner of the amount of CBM set aside or the GCIR required to meet their resource adequacy requirements.<br>Response: the SDT believes that entities will need to convert GCIR into CBM. Accordingly, the SDT does not believe changes to the requirement are needed. |
| Response: Please see in-line responses. | |
| FirstEnergy Corp. | 1. We question how the TSP can "elect" to maintain CBM per R1. What if, per R3, the LSE determined they had a need to set aside transmission capacity as CBM but their TSP does not maintain CBM? Per FERC Orders 890 and 693, the LSE has the right to request CBM be set aside if it can prove that it is a critical need based on LOLE, deterministic studies, historical data, etc. as described in R3. We suggest revising the first part of the first sentence of R1 to state "The Transmission Service Provider that has been asked by its LSE or RP to maintain CBM?".<br><br>Response: Paragraph 82 of FERC Order 890-A states "The Commission clarifies in response to Duke that utilities do not need to make CBM available to LSEs on their system if the utilities do not reserve for themselves CBM or its equivalent." Accordingly, we have written the requirements and applicability such that only entities who maintain a CBM are required to follow this standard.<br><br>2. Per R3 and R4, it is not clear how GCIR is used in the CBM process. Is it merely equal to the CBM value or is it somehow used by the TSP to determine how much CBM is needed for each ATC Path or Flowgate? Either way, the standard should explain what is done with the GCIR once it has been established.<br><br>Response: The SDT chose not to be overly prescriptive regarding how GCIR would be used. GCIR may be used to determine the CBM, or may be used as the CBM, depending on the manner in which the entity implements CBM and the specific ATC methodology chosen.<br><br>3. In R3.1 and R4.1, can the LSE and RP use different studies for different ATC Paths or Flowgates? If so, then R3.1 and R4.1 should be revised to state "Using one of the following for each ATC Path or Flowgate to determine the GCIR:".<br><br>Response: The SDT has modified the language of the requirements to allow for the use of multiple approaches for determining GCIR.<br><br>4. With regard to R3 and the responsibilities of the LSE, currently many LSEs work with their TSP to determine the need for CBM because most LSEs do not have the capability to undertake these studies on their own. In addition, several LSEs participate within a Planned Resource Sharing Group that works with that sharing |

| Individual/Group | Question 6 Comments: |
|---|---|
| | group's TSP to determine the need for CBM. We assume that these activities would be permitted to continue and that this standard will not preclude LSEs from working with their TSP to determine CBM needs. We ask the SDT to confirm our assumptions.<br><br>Response: We believe that entities using a Planned Resource Sharing Group should be able to continue to do so by either 1.) working with their Resource Planner, or 2.) registering as a Joint Registration Organization. |
| Response: Please see in-line responses. | |
| Hydro One Networks | Effective Date:<br><br>We believe there is a fundamental issue related with effective dates, that is, the dates in which Reliability Standards become effective and enforceable. In principle, the effective date of standards must be the same for all jurisdictions in North America. It does not make sense that there is a period of time when a standard is effective only in some jurisdictions while not in others. This is particularly important in standards that have a clear reliability impact. In addition, it does not seem appropriate to have entities exposed to sanctions for non-compliance in some jurisdictions while not in others.<br><br>The words inserted in the Effective Date of the Standards as well as in the Implementation Plan posted documents permit that these Standards are effective in some jurisdictions and not others. The Standard and the Implementation Plan should be modified to ensure that they become effective in all jurisdictions at the same time, including those where such regulatory approval in not required, that is, only when all regulatory approvals have been obtained. We suggest the same words used in MOD-001, 28, 29 and 30 be used:<br><br>"All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by all applicable regulatory authorities."<br><br>Response: The SDT believes that in this case, it is not critical from a relativity perspective to implement this standard concurrently across North America. Note that there is already a CBM standard in place; until such time as this standard is approved, that standard will remain in effect.<br><br>R11 and R12: We think these requirements belong in the INT standards, which deals with reliability assessment of Arranged Interchange.<br><br>Response: The SDT has incorporated these requirements into this standard, as they are directly related to CBM. Additionally, the INT standards are outside the scope of this effort as defined by its SAR. Until such time as a SAR is submitted to move the requirements from this standard to another set of standards, we believe it is more important to have the requirements approved and enforceable. |

| American Transmission Company | 1. Due to the Midwest ISO methodology of calculating CBM in the short-term (1 year) and GCIR in the long-term, we believe that R6 should be changed to include: "GCIR for each designated area to be used for future transmission planning." and add the words "that maintains CBM" after "the Transmission Planner"<br><br>2. R6.1 should include "CBM and GCIR values shall reflect consideration of each of the following if available".<br><br>3. R6.3 should include "Entities that do not utilize a predetermined CBM value in their respective planning process shall describe in their CBMID how the GCIR is calculated for each area and how the GCIR is used to calculate CBM values for ATC paths or Flowgates for selling transmission service."<br><br>Response: The SDT interprets this comment to mean that ATC believes that planning may utilize a GCIR value rather than a specific path-based CBM. The SDT has modified measure M6 to address this concern by adding the following sentence: “Inclusion of GCIR based on R6.1 and R6.2 within the transmission base case meets this requirement.” Regarding the addition of the phrase “that maintains CBM,” the SDT has already included this language in the applicability section of the standard, so it is not required in R6.<br><br>4. R8 should include "Less than 31 calendar days after the establishment of CBM or GCIR, the Transmission Planner shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for GCIR on the system being planned by the Transmission Planner of the amount of CBM set aside or the GCIR required to meet their need."<br><br>Response: the SDT believes that entities will need to convert GCIR into CBM in order to communicate it back to entities that requested it. Accordingly, the SDT does not believe changes to the requirement are needed.<br><br>5. Change the wording in 1.3 Data Retention to: "The Compliance Enforcement Authority shall keep the last |

| Individual/Group | Question 6 Comments: |
|---|---|
| | audit records and all subsequent requested and submitted audit records."<br><br>Response: The SDT has modified the language to read as follows: "The Compliance Enforcement Authority shall keep the last audit records and all requested and subsequently submitted audit records." |
| Response: Please see in-line responses. | |
| Bonneville Power Administration | How would a generator in a neighboring Balancing Authority (or control area) provide the CBM due to a sudden generation outage in the host control area (or BA area) where the outage occurred? The CBM would be provided after the TRM and has been established as a reliability requirement by an LSE. The ATC DT should explain how this standard ensures that an LSE can replace the lost generation from a neighboring BA.<br><br>Response: This standard does not ensure that an LSE can replace the lost generation from a neighboring BA. It is intended to ensure that an LSE can import on its host system to replace that generation. All arrangements outside the host system should be managed by the entity needing the energy unless delegated to others.<br><br>New Section A.5. Effective date: On the third line, "become" should be "becomes" that is unless they intend to pluralize standard to be standards.<br><br>Response: The SDT has corrected the language as suggested.<br><br>CBM is a scheduled transmission reservation that is implemented following the expiration of the TRM. (TRM is unscheduled transmission capacity that can be used to implement emergency operations up to 59 minutes.)<br><br>Response: CBM is not a scheduled transmission reservation. CBM is a transmission margin set aside for potential future uses to import energy during an EEA2. The SDT does not agree that Reserves and the use of CBM are necessarily linked as the commenter seems to suggest.<br><br>Would like to suggest that that the scope of Project 2009-09, a Resource Adequacy Assessments Standard, which is slated for development in 2009, be enlarged to include aspects of MOD-004 that relate to defining the four analyses upon which the GCIR determination is based in greater detail. Although we agree that any one of these analyses is appropriate in calculating GCIR, we believe that these analyses need to be defined in greater detail in order to achieve the stated purpose of the standard. The stated purpose of this standard is: "To promote the consistent and reliable calculation, verification, preservation, and use of Capacity Benefit Margin (CBM) to support analysis and system operations." The standard also states that the determination of Generation Capability Import Requirement (GCIR), which is the basis for the CBM request, can be calculated using any of the following analyses: (1) Loss of Load Expectation (LOLE) studies, (2) Loss of Load Probability (LOLP) studies, (3) Deterministic risk-analysis studies and (4) Reserve margin or resource adequacy |

| Response: Please see in-line responses. | |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Flowgate:**

1.) A portion of the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.

**Total Flowgate Capability (TFC):** The maximum flow capability on a Flowgate, is not to exceed its thermal rating, or in the case of a flowgate used to represent a specific operating constraint (such as a voltage or stability limit), is not to exceed the associated System Operating Limit.

**Available Flowgate Capability (AFC):** A measure of the flow capability remaining on a Flowgate for further commercial activity over and above already committed uses. It is defined as TFC less Existing Transmission Commitments (ETC), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, and plus counterflows.

**Power Transfer Distribution Factor (PTDF):** In the pre-contingency configuration of a system under study, a measure of the responsiveness or change in electrical loadings on transmission system Facilities due to a change in electric power transfer from one area to another, expressed in percent (up to 100%) of the change in power transfer .

**Outage Transfer Distribution Factor (OTDF):** In the post-contingency configuration of a system under study, the electric Power Transfer Distribution Factor (PTDF) with one or more system Facilities removed from service (outaged).

**Flowgate Methodology:** The Flowgate methodology is characterized by identification of key Facilities as Flowgates. Total Flowgate Capabilities are determined based on Facility Ratings and voltage and stability limits. The impacts of Existing Transmission Commitments (ETCs) are determined by simulation. The impacts of ETC, Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) are subtracted from the Total Flowgate Capability, and Postbacks and counterflows are added, to determine the Available Flowgate Capability (AFC) value for that Flowgate. AFCs can be used to determine Available Transfer Capability (ATC).

## A. Introduction

1. **Title:** **Flowgate Methodology**

2. **Number:** **MOD-030-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.1** Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Flowgate Capabilities (AFCs)on Flowgates.

   **4.1.2** Each Transmission Service Provider that uses the Flowgate Methodology to calculate AFCs on Flowgates.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** The Transmission Service Provider shall include in its "Available Transfer Capability Implementation Document" (ATCID). [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.

**R1.2.** The following information on how source and sink for transmission service is accounted for in AFC calculations including:

**R1.2.1.** Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.

**R1.2.2.** Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.

**R1.2.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.2.4.** If the Transmission Service Provider's AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.

**R2.** The Transmission Operator shall perform the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Include Flowgates used in the AFC process based, at a minimum, on the following criteria:

**R2.1.1.** Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability such that at a minimum the first three limiting Elements and their worst associated

Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates.

2.1.1.1. Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.

2.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.2.** Results of a first Contingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

2.1.2.1. Use first Contingency criteria consistent with those first Contignency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.

2.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.3.** Any limiting Element/Contingency combination at least within the Transmission model identified in R3.4 and R3.5 that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology.

**R2.1.4.** Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

2.1.4.1. The coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or
- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.
- The Transmission Operator may utilize distribution factors less than 5% if desired.

2.1.4.2. The limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

**R2.2.** At a minimum, establish the list of Flowgates to create, modify, or delete internal Flowgates definitions at least once per calendar year.

**R2.3.** At a minimum, establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested as part of R2.1.4 within thirty calendar days from the request.

**R2.4.** Establish the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and Facilities161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence"

representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.

- If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

**R5.** When calculating AFCs, the Transmission Service Provider shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** Use the models provided by the Transmission Operator.

**R5.2.** Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the applicable period of the AFC calculation for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

**R5.3.** For external Flowgates, identified in R2.1.4, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

**R6.** When calculating the impact of ETC for firm commitments ($ETC_{Fi}$) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider's area, based on:

**R6.1.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.1.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage[1] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed based on:.

**R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.2.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider’s area.

**R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage[2] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider’s area.

**R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[3] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.7.** The impact of other firm services determined by the Transmission Service Provider.

**R7.** When calculating the impact of ETC for non-firm commitments ($ETC_{NFi}$) for all time periods for a Flowgate the Transmission Service Provider shall sum: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled for the Transmission Service Provider’s area.

**R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions

[1] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[2] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[3] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

using Transmission service from multiple Transmission Service Providers, that have a distribution factor equal to or greater than the percentage[4] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.3.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R7.4.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[5] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.5.** The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider's area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**R7.6.** The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage[6] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.7.** The impact of other non-firm services determined by the Transmission Service Provider.

**R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_F = TFC - ETC_{Fi} - CBM_i - TRM_i + Postbacks_{Fi} + counterflows_{Fi}$$

**Where:**

**$AFC_F$** is the firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$CBM_i$** is the impact of the Capacity Benefit Margin on the Flowgate during that period.

---

[4] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[5] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[6] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**$TRM_i$** is the impact of the Transmission Reliability Margin on the Flowgate during that period.

**$Postbacks_{Fi}$** are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{Fi}$** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC - ETC_{Fi} - ETC_{NFi} - CBM_{Si} - TRM_{Ui} + Postbacks_{NFi} + counterflows$$

**Where:**

**$AFC_{NF}$** is the non-firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$ETC_{NFi}$** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**$CBM_{Si}$** is the impact of any schedules during that period using Capacity Benefit Margin.

**$TRM_{Ui}$** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.2, R3.3, and R5, at a minimum on the following frequency, unless none of the calculated values identified in the AFC equation have changed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R10.1.** For hourly AFC, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the AFC equation.

**R10.2.** For daily AFC, once per day.

**R10.3.** For monthly AFC, once per week.

**R11.** When converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$TC = \min(P)$$

$$P = \{PTC_1, PTC_2, \ldots PTC_n\}$$

$$PTC_n = \frac{FC_n}{DF_{np}}$$

**Where:**

**TC** is the Transfer Capability (either ‘Available’ or ‘Total’).

**P** is the set of partial Transfer Capabilities (either available or total) for all “impacted” Flowgates honored by the Transmission Service Provider; a Flowgate is considered “impacted” by a path if the Distribution Factor for that path is greater than the percentage[7] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.

**$PTC_n$** is the partial Transfer Capability (either ‘Available’ or ‘Total’) for a path relative to a Flowgate *n*.

**$FC_n$** is the Flowgate Capability (‘Available’ or ‘Total’) of a Flowgate *n*.

**$DF_{np}$** is the distribution factor for Flowgate *n* relative to path *p*.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates and information on how sources and sinks are accounted for in AFC calculations. (R1)

**M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

**M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)

**M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)

**M5.** The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

**M6.** The Transmission Operator shall provide evidence (such as logs) that it established the TFCs for each Flowgate in accordance with the timing defined in R2.5. (R2.5)

**M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)

**M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

[7] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

**M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)

**M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)

**M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)

**M13.** The Transmission Service Provider shall demonstrate compliance with R6 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-030-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements defined in R6 to calculate its firm ETC. (R6)

**M14.** The Transmission Service Provider shall demonstrate compliance with R7 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in the standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements in R7 to calculate its non-firm ETC. (R7)

**M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

**M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)

**M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated AFC on the frequency defined in R10. (R10)

**M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, it follows the procedure described in R11. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to determine flowgates and TFC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R8, R9, R10, and R11 for the most recent calendar year plus current year.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R6 and R7 for the most recent 14 days; evidence to show compliance in calculating daily values required in R6 and R7 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R6 and R7 for the most recent sixty days.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits

- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider does not include in its ATCID one or two of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID three of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID the information described in R1.1.<br>**OR**<br>The Transmission Service Provider does not include in its ATCID the information described in R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). | The Transmission Service Provider does not include in its ATCID the information described in R1.1 and R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). |
| R2. | One or more of the following:<br>• The Transmission Operator established its list of internal Flowgates less frequently than once per calendar year, but not more than three months late as described in R2.2.<br>• The Transmission Operator established its list of external Flowgates more than thirty days, but not more than sixty days, following a request to create, modify or delete an external flowgate as described in R2.3.<br>• The Transmission Operator has not updated its Flowgate TFC when notified by the Transmission Owner in more | One or more of the following:<br>• The Transmission Operator did not include a Flowgate in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of internal Flowgates more than three months late, but not more than six months late as described in R2.2.<br>• The Transmission Operator established its list of external Flowgates more than sixty days, but not more than ninety days, following a request to create, modify or delete an external flowgate | One or more of the following:<br>• The Transmission Operator did not include two to five Flowgates in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of internal Flowgates more than six months late, but not more than nine months late as described in R2.2.<br>• The Transmission Operator established its list of external Flowgates more than ninety days, but not more than 120 days, following a request to create, modify or delete an external flowgate as | One or more of the following:<br>• The Transmission Operator did not include six or more Flowgates in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of internal Flowgates more than nine months late as described in R2.2.<br>• The Transmission Operator did not establish its list of internal Flowgates as described in R2.2.<br>• The Transmission Operator established its list of external Flowgates more than 120 days following a request to create, modify or delete an external flowgate as described in R2.3. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 3–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Flowgate:**

1.) A portion of the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.

**Total Flowgate Capability (TFC):** The maximum flow capability on a Flowgate, is not to exceed its thermal rating, or in the case of a flowgate used to represent a specific operating constraint (such as a voltage or stability limit), is not to exceed the associated System Operating Limit.

**Available Flowgate Capability (AFC):** A measure of the flow capability remaining on a Flowgate for further commercial activity over and above already committed uses. It is defined as TFC less Existing Transmission Commitments (ETC), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, and plus counterflows.

**Power Transfer Distribution Factor (PTDF):** In the pre-contingency configuration of a system under study, a measure of the responsiveness or change in electrical loadings on transmission system F~~f~~acilities due to a change in electric power transfer from one area to another, expressed in percent (up to 100%) of the change in power transfer .

**Outage Transfer Distribution Factor (OTDF):** In the post-contingency configuration of a system under study, the electric Power Transfer Distribution Factor (PTDF) with one or more system F~~f~~acilities removed from service (outaged).

**Flowgate Methodology:** The Flowgate methodology is characterized by identification of key Facilities as Flowgates. Total Flowgate Capabilities are determined based on Facility Ratings and voltage and stability limits. The impacts of Existing Transmission Commitments (ETCs) are determined by simulation. The impacts of ETC, Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) are subtracted from the Total Flowgate Capability, and Postbacks and counterflows are added, to determine the Available Flowgate Capability (AFC) value for that Flowgate. AFCs can be used to determine Available Transfer Capability (ATC).

## A. Introduction

1. **Title:** **Flowgate Methodology**

2. **Number:** **MOD-030-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.1** Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available ~~Transfer~~ Flowgate Capabilities (A~~T~~FCs)~~ for ATC Paths~~on Flowgates.

   **4.1.2** Each Transmission Service Provider that uses the Flowgate Methodology to calculate AFCs on Flowgates~~ATCs for ATC Paths~~.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** The Transmission Service Provider shall include in its "Available Transfer Capability Implementation Document" (ATCID). [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.

**R1.2.** The following information on how source and sink for transmission service is accounted for in AFC calculations including:

**R1.2.1.** Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.

**R1.2.2.** Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.

**R1.2.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.2.4.** If the Transmission Service Provider's AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.

**R2.** The Transmission Operator shall perform the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Include~~Identify~~ Flowgates used in the AFC process based, at a minimum, on the following criteria:

**R2.1.1.** Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates.

2.1.1.1. Use first Contingency ~~assumptions~~ criteria consistent with those first Contingenc~~ies~~y criteria used in planning of operations~~operations studies and planning studies~~ for the applicable time periods, including use of Special Protection Systems.

2.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.2.** Results of a first Contingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

2.1.2.1. Use first Contingency ~~assumptions~~ criteria consistent with those first Contignenc~~ies~~y criteria used in planning of operations~~operations studies and planning studies~~ for the applicable time periods, including use of Special Protection Systems.

2.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.3.** Any limiting Element/Contingency combination at least within the Transmission model identified in R3.4 and R3.5 that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology.

**R2.1.4.** Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

2.1.4.1. T~~If t~~he coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or
- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.

- The Transmission Operator may utilize distribution factors less than 5% if desired.

2.1.4.2. T~~If t~~he limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

**R2.2.** At a minimum, establish the list of Flowgates to create, modify, or delete internal Flowgates definitions at least once per calendar year.

**R2.3.** At a minimum, establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested as part of R2.1.4 within thirty calendar days from the request.

**R2.4.** Establish the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and F~~f~~acilities161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.

- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

**R5.** When calculating AFCs, the Transmission Service Provider shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** Use the models provided by the Transmission Operator.

**R5.2.** Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the ~~period calculated~~applicable period of the AFC calculation for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

**R5.3.** For external Flowgates, identified in R2.1.~~3~~4, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

**R6.** When calculating the impact of ETC for firm commitments ($ETC_{Fi}$) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider's area, based on:

**R6.1.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.1.2.** Unit commitment and ~~dispatch~~ Dispatch ~~order~~Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage[1] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed based on:.

**R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.2.2.** Unit commitment and ~~dispatch~~ Dispatch ~~order~~Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider's area.

**R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage[2] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[3] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.7.** The impact of other firm services determined by the Transmission Service Provider.

**R7.** When calculating the impact of ETC for non-firm commitments ($ETC_{NFi}$) for all time periods for a Flowgate the Transmission Service Provider shall sum: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

[1] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[2] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[3] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled for the Transmission Service Provider's area.

**R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, that have a distribution factor equal to or greater than the percentage[4] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.3.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R7.4.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[5] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers~~,~~ and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.5.** The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider's area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**R7.6.** The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage[6] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.7.** The impact of other non-firm services determined by the Transmission Service Provider.

**R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_F = TFC - ETC_{Fi} - CBM_i - TRM_i + Postbacks_{Fi} + counterflows_{Fi}$$

**Where:**

**$AFC_F$** is the firm Available Flowgate Capability for the Flowgate for that period.

[4] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[5] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[6] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$CBM_i$** is the impact of the Capacity Benefit Margin on the Flowgate during that period.

**$TRM_i$** is the impact of the Transmission Reliability Margin on the Flowgate during that period.

**$Postbacks_{Fi}$** are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{Fi}$** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC - ETC_{Fi} - ETC_{NFi} - CBM_{Si} - TRM_{Ui} + Postbacks_{NFi} + counterflows$$

**Where:**

**$AFC_{NF}$** is the non-firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$ETC_{NFi}$** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**$CBM_{Si}$** is the impact of any schedules during that period using Capacity Benefit Margin.

**$TRM_{Ui}$** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.~~3~~2, R3.~~4~~3, and R5, at a minimum on the following frequency, unless none of the calculated values identified in the AFC equation have changed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R10.1.** For hourly AFC, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the AFC equation.

**R10.2.** For daily AFC, once per day.

**R10.3.** For monthly AFC, once per week.

**R11.** When converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$TC = \min(P)$$

$$P = \{PTC_1, PTC_2, \ldots PTC_n\}$$

$$PTC_n = \frac{FC_n}{DF_{np}}$$

**Where:**

**TC** is the Transfer Capability (either 'Available' or 'Total').

**P** is the set of partial Transfer Capabilities (either available or total) for all "impacted" Flowgates honored by the Transmission Service Provider; a Flowgate is considered "impacted" by a path if the Distribution Factor for that path is greater than the percentage[7] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.

**$PTC_n$** is the partial Transfer Capability (either 'Available' or 'Total') for a path relative to a Flowgate *n.*

**$FC_n$** is the Flowgate Capability ('Available' or 'Total') of a Flowgate *n*.

**$DF_{np}$** is the distribution factor for Flowgate *n* relative to path *p*.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates and information on how sources and sinks are accounted for in ~~that are to be considered in~~ AFC calculations. (R1)

**M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

**M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)

**M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)

**M5.** The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

**M6.** The Transmission Operator shall provide evidence (such as logs) that it ~~updated~~ established the TFCs for each Flowgate in accordance with the timing defined in R2.5~~at least once per calendar year~~. (R2.5)

**M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)

[7] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

**M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

**M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)

**M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)

**M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)

**M13.** The Transmission Service Provider~~TSP~~ ~~must be capable of~~shall demonstrate~~ing~~ ~~that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can~~compliance with R6 by recalculating~~e~~ ~~the individual value of the~~ firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate ~~this~~ the specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in ~~the standard~~MOD-030-1 and the ATCID.~~,~~ To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is ~~and the audited value must be~~ within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements defined in R6 to calculate its firm ETC~~demonstrated result~~. (R6)

**M14.** The Transmission Service Provider~~TSP~~ ~~must be capable of~~shall demonstrate~~ing~~ ~~that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can~~compliance with R7 by recalculating~~e~~ ~~the individual value of the~~ non-firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate ~~this~~ the specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in the standard and the ATCID. ~~, and the audited value must be~~ To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements in R7 to calculate its non-firm ETC~~demonstrated result~~. (R7)

**M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

**M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)

**M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated ~~ATC~~ AFC on the frequency defined in R10. (R10)

**M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, it~~that the determination of Transfer Capabilities~~ follows the procedure described in R11. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

**1.1. Compliance Enforcement Authority**

Regional Entity.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Data Retention**

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to ~~to~~ determine flowgates and TFC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R8, R9, R10, and R11 for the most recent calendar year plus current year.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in ~~with~~ R6 and R7 for the most recent 14 days; evidence to show compliance in calculating daily values required in R6 and R7 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R6 and R7 for the most recent sixty days.

- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider does not include in its ATCID one or two of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID three of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID the information described in R1.1.<br>**OR**<br>The Transmission Service Provider does not include in its ATCID the information described in R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). | The Transmission Service Provider does not include in its ATCID the information described in R1.1 and R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). |

## Implementation Plan for Standard MOD-030 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-030 — Flowgate Methodology, which describes the Flowgate methodology (previously referred to as the Flowgate Network Response ATC methodology) for determining AFC.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Modified Standards

This standard incorporates the following requirements from FAC-012:

– R1 (Documentation of the Transfer Capability Methodology)

– R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).

R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board. As such, FAC-012 is no longer needed and is being retired.

This standard incorporates the following requirements from FAC-013:

– R1 (Calculation of the Transfer Capabilities)

– R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013 is no longer needed and is being retired.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-030 | ■ | | ■ | | | |

### Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001, MOD-028, MOD-029, and MOD-030) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to

implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Implementation Plan for Standard MOD-030 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-030 — Flowgate Methodology, which describes the Flowgate methodology (previously referred to as the Flowgate Network Response ATC methodology) for determining AFC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard incorporates the following requirements from FAC-012:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).

R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board. As such, FAC-012 is no longer needed and is being retired.

This standard incorporates the following requirements from FAC-013:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013 is no longer needed and is being retired.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-030 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001, MOD-028, MOD-029, and MOD-030) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to

implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

Committee shall set the proposed standard for ballot as soon as the work flow will accommodate.”

NERC’s Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008.  Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee’s Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards.  The Standards Committee’s Executive Committee directed NERC’s Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

## Reliability Standards

| Ballot Results | |
|---|---|
| **Ballot Name:** | ATC et al Standard - MOD-030_in |
| **Ballot Period:** | 7/21/2008 - 7/30/2008 |
| **Ballot Type:** | Initial |
| **Total # Votes:** | 218 |
| **Total Ballot Pool:** | 231 |
| **Quorum:** | **94.37 % The Quorum has been reached** |
| **Weighted Segment Vote:** | 56.56 % |
| **Ballot Results:** | **The standard will proceed to recirculation ballot.** |

**Summary of Ballot Results**

| Segment | Ballot Pool | Segment Weight | Affirmative # Votes | Affirmative Fraction | Negative # Votes | Negative Fraction | Abstain # Votes | No Vote |

|---|---|---|---|
| Ameren Services Company | 1 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-030-1. (1) AFC is a market parameter and as such is applicable to the Transmission Service Provider. (2) Definition of an adequate flowgate population is required to adequately constrain the sale of transmission service, as such this would appear to be a market not a reliability issue. (3) Under R2 the calculation of TFC is applicable to the Transmission Operator. This is not consistent with the current version of the Functional Model. The Transmission Planner is responsible for supporting the development of TTC (TFC). (3) Under R3 the Transmission Service Provider not the Transmission Operator should be responsible for the calculation of ATC/AFC and any modeling data. This is especially true when the Transmission Service Provider determines ATC for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO. (4) That said we are aware that the oversubscription of transmission service can lead to reliability problems. (5)AFC issues affect long term planning as well as planning in the Operating Time Horizon. |
| American Transmission Company, LLC | 1 | Negative | R2.1.3: Midwest ISO believes that this requirement is too onerous and leaves no allowance for an Interconnection-wide congestion management process to be enacted due to a forced outage or any other system condition unforeseen by forecasted system conditions. Also, the SDT did not respond to Midwest ISO comment concerning temporary flowgates in TLR. Midwest ISO questions the reliability benefit gained by calculating AFCs for a flowgate which was only created for a temporary system condition. Midwest ISO also believes that a flowgate referenced by R3.5 should be added by process established in R2.1.4. Otherwise, as the requirement is written, if a forced outage causes an Interconnection-wide congestion management procedure to be enacted in on a limiting element/contingency in PJM, then Midwest ISO would be required to add that facility as a flowgate despite the opinion of PJM or even if a transfer from Midwest ISO to PJM does not have an impact greater than the 5% threshold. R2.2: Midwest ISO continues to believe that the text of this requirement is not clear. Midwest ISO asks the drafting team to consider the following language. At a minimum, establish the list of internal flowgates to create, modify, or delete at least once per calendar year. R2.3: Midwest ISO continues to believe that the text of this requirement is not clear. Midwest ISO asks the drafting team to consider the following language. At a minimum, establish the list of external flowgates to create, modify, or delete that have been requested as part of R2.1.4 within thirty calendar days from the request. R2.4: Both sub bullets instruct the entity to use the SOL for the flowgate. If this were to be the case, then R2.4 could be revised to just require the use of the SOL of the flowgate. Otherwise, the requirement should be revised to precisely capture the intention of the SDT. R5.3: How can this requirement be enforceable for entities that are non-FERC jurisdictional? We are concerned of the situation where a non-FERC jurisdictional neighboring entity doesn't provide such data to the Midwest ISO. We request clarification. R6.2/R6.4/R6.6/R7.2/R7.4/R7.6: Midwest ISO is not convinced that similar seams coordination requirements exist for the other two standards, especially for MOD-029. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies. We request to remove these requirements from MOD-030 to achieve |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | more unbiased standards. R11: Midwest ISO continues to question the language of this requirement for three reasons. First, the response from the SDT to our previous round of comments indicates that the TTC would remain constant because the flowgate with the lowest TFC would generally remain constant relative to each path. However, the SDT ignored the fact that the distribution factor for that same flowgate changes due to system topology changes. Hence, the TTC value will almost always change each time the model is updated, which is currently once per day as stated in R3. Second, the TTC value back calculated for the Flowgate methodology is not as valuable as it is in the Rated System Path methodology or the Area Interchange Methodology. If a flowgate will never limit an ATC, why would anyone be interested to know a TTC calculated by this flowgate? As the requirement is written, the Transmission Service Provider will be expected to incur additional cost, with no benefit to either the reliability or transmission customers, to separately account for the flowgate with the smallest TFC value in order to back calculate a TTC value. Third, when you use the same flowgate for all value conversions, the formula “ATC=TTC-CBMpath-TRMpath-ETCpath” still holds if you simply divide everything in formula “AFC=TFC-CBMflowgate-TRMflowgate-ETCflowgate” by the flowgate distribution factor. However, using different flowgates would make the formula “ATC=TTC-CBM-TRM-ETC” invalid. This result eliminates the usefulness of the TTC value for the Flowgate methodology. Therefore, we request this requirement to be rewritten if the SDT believes a formula to calculate TTC must be included in the standard. |
| Avista Corp. | 1 | Negative | The standard needs some flexibility due to regional differences. Support comments submitted by the Bonneville Power Administration. |
| Bonneville Power Administration | 1 | Negative | BPA believes this forces undue complication for our utility that could, in fact, lessen attention to reliability by adding extensive additional work without any gain in reliability. Our comments: 1. R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the eastern interconnection with its commensurate characteristics. However, practices that are in place in BPA’s part of the western interconnection use flow based ATC determination consistent with the concepts of this proposed standard, but they are based on using a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. MOD-30 as written would require many new "flowgates" based on varying system conditions without providing any increased reliability benefit. This is because BPA determines their capacity based on WECC criteria which test for thermal restrictions, voltage stability, and transient stability where the specific characteristics of: load, generation, configuration of extensive special protection schemes (SPS), and WECC’s more stringent (greater than n-1) performance requirements determine which varying specific lines or equipment determine the capacity of the flowgate. While being made up of different named elements, BPA’s existing flowgates do not always include the first three limiting Elements and their worst associated Contingency combinations, yet they still protect the area of transmission constraint. An example of a basis for an ATC capacity that does not fit the proposed standard’s language is a two Palo Verde nuclear unit outage in Arizona which is often the critical contingency that causes voltage stability limitations on BPA’s North of Hanford Path in Washington over 1000 miles away from the Palo Verde units. While the proposed MOD-30 Flowgate Methodology may provide sufficient reliability for |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | (n-1) thermally limited constraints where the impact of an outage is on parallel transmission, the above example describes a limiting outage that is not in the area of the transmission constraint, thus it does not make sense to define it as part of a flowgate. In regards to capacity, BPA's existing flowgates can be dynamically changed to maximize capacity based on specific operating conditions. If the language in R2.1.1 and R2.1.2 of MOD-30 is adopted, it will require defining many additional "flowgates" with no added reliability or capacity compared to the method BPA has in place today. This would unnecessarily introduce significant workload and computation to BPA and many others in the western interconnection that could, in fact, complicate the understanding of operational constraints. For these reasons, BPA believes that implementation of R2.1.1-2.1.2.2 does not make sense within WECC and respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2 for WECC entities as a regional difference: RX. WECC: Results of transfer analyses, consistent with those studies required in FAC-010 and FAC-011, or their successors, for ATC Paths up to the path capability. RX.1. Only the most limiting element in a series configuration needs to be included in a Flowgate. If these "RX" requirements are added, to replace R2.1.1-2.1.2.2 for WECC entities, R2.4 would also require modification as follows ("red/underlined" language indicates additions): R2.4. Establish the TFC of each of the defined Flowgates as equal to: For thermal limits, the lowest System Operating Limit (SOL) included in the definition of the Flowgate. For voltage or stability limits, the flow that will respect the lowest SOL included in the definition of the Flowgate. 2. Additionally, there are typos at the following locations: Applicability 4.1.1, where a space is missing between "(AFCs)" and "on"; R1, where a colon is missing following the "(ATCID)"; R2.1.2, where "analyses" should not be plural; and "R"s appear to be missing from all "fourth-tier" requirements (2.1.1.1 for example). |
| Brazos Electric Power Cooperative, Inc. | 1 | Negative | A NEGATIVE vote is cast for this standard as written as it imposes obligations on entities in the ERCOT region that do not utilize ATC paths and calculation methodologies to manage congestion or for reliability operations. Our previous submitted comments suggested that applicability language be included in the requirements to recognize that such market difference exists. |
| Central Lincoln PUD | 1 | Negative | The Northwest uses a flow-based ATC determination consistent with the concepts of the proposed MOD-030 standard. Northwest flowgates, however, are defined with adequate granularity to identify varying sets of critical contingencies and impacted lines under changing system conditions. Seasonal operating nomograms are developed using varying temperatures, loads and ratings, generation dispatch, and contingency analysis (that meeting greater than n-1 performance requirements) to determine reliable operating capabilities. These operating nomograms allow the transmission provider or operator to maximize capacity based on specific operating conditions. In addition these seasonal operating nomograms are reviewed by the region and posted in advance of the operating season, addressing both transparency and coordinating requirements. This methodology accommodates and is tailored to the “Hub and Spoke” nature of the Western Interconnection system. Large generation resources are located long distances from large loads verses the tightly meshed systems in the Eastern Interconnection where load and generation are located very close together. Due to the remote nature of generation and load in the west, transient and voltage stability considerations must be taken into consideration. If the language in R2.1.1 and R2.1.2 of MOD-030 is adopted, it will require many |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | additional "flowgates" in the Northwest that will result in no added reliability benefits compared to the method our transmission provider has in place today. Adopting R2.1.1 and R2.1.2 of MOD-030 without further revision would unnecessarily introduce significant workload, cost, and complications that Public Power Council's members and other transmission customers will ultimately have to fund. Because the standard would unnecessarily impose these burdens without any incremental improvement in reliability, Central Lincoln PUD respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2. The current method used by the Bonneville Power Administration is ultimately more reliable, given the specific nature of the transmission and generation resources in the Western Interconnection. Central Lincoln PUD supports Bonneville's proposed approach and proposed revisions to R2.1 to address the needs of the Western Interconnection in this proposed standard. |
| City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power | 1 | Negative | The Northwest uses a flow-based ATC determination consistent with the concepts of the proposed MOD-030 standard. Northwest flowgates, however, are defined with adequate granularity to identify varying sets of critical contingencies and impacted lines under changing system conditions. Seasonal operating nomograms are developed using varying temperatures, loads and ratings, generation dispatch, and contingency analysis (that meeting greater than n-1 performance requirements) to determine reliable operating capabilities. These operating nomograms allow the transmission provider or operator to maximize capacity based on specific operating conditions. In addition these seasonal operating nomograms are reviewed by the region and posted in advance of the operating season, addressing both transparency and coordinating requirements. This methodology accommodates and is tailored to the "Hub and Spoke" nature of the Western Interconnection system. Large generation resources are located long distances from large loads verses the tightly meshed systems in the Eastern Interconnection where load and generation are located very close together. Due to the remote nature of generation and load in the west, transient and voltage stability considerations must be taken into consideration. If the language in R2.1.1 and R2.1.2 of MOD-030 is adopted, it will require many additional "flowgates" in the Northwest that will result in no added reliability benefits compared to the method our transmission provider has in place today. Adopting R2.1.1 and R2.1.2 of MOD-030 without further revision would unnecessarily introduce significant workload, cost, and complications that Tacoma Power and other transmission customers will ultimately have to fund. Because the standard would unnecessarily these burdens without any incremental improvement in reliability, Tacoma Power respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2. The current method used by the Bonneville Power Administration is ultimately more reliable, given the specific nature of the transmission and generation resources in the Western Interconnection. Tacoma Power supports Bonneville's proposed approach and proposed revisions to R2.1 to address the needs of the Western Interconnection in this proposed standard. |
| Exelon Energy | 1 | Affirmative | General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies for corresponding time periods. Exelon's comments reflect these deficiencies and |

| Entity | Segment | Vote | Comment |
| --- | --- | --- | --- |
| | | | Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890. Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-030-1 Flowgate Methodology Â· Requirement 2.1.1.1. and 2.1.2.1. need to be revised as follows:<br><br>Use first Contingency criteria consistent with those first Contingency used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems.<br><br>A requirement that the Available Transfer Capability Implementation Document specify the following: o PTDF and OTDF cutoff values used |
| FirstEnergy Energy Delivery | 1 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-030 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-030 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-030 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R2: Flowgate determination and calculation of TFC on flowgates. The variance would not be applicable to the TOP assignment in requirement R3, which requires the TOP to provide transmission modeling data to the TSP for the calculation of AFC. Additional Comments: In response to FE's most recent MOD-030 comments, the drafting team indicated that it felt the TOP is the appropriate entity for Requirement R2 since they are responsible for |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | keeping the system within its operating limits. While it is true that TOPs identify SOLs and are required to maintain SOLs, the use of flowgates is primarily a market function used in evaluating interchange transactions. Per FAC-014 requirement R5.2, TOPs are required to submit SOL information to TSPs and therefore the TSP would have the information available for the determination of Total Flow Capacity (TFC) for a given flowgate. Therefore, it is FE’s position that R2 is better assigned to the TSP, but if the SDT elects not to change the standard, the above request for a MISO variance will satisfy our needs. |
| Great River Energy | 1 | Negative | GRE is concerned with the Transmission Operator being the responsible entity for MOD-030_R2 and R3. GRE believes that the responsible entity for these requirements should be the Transmission Service Provider. It is GRE's opinion that a standard should not knowingly be written in a manner that requires delegation agreements to be created for a large number of responsible entities, doing so is an inefficient use of resources. |
| Manitoba Hydro | 1 | Negative | R2.1.3 - This requirement seems onerous. Having to calculate AFCs for a flowgate that was created for a temporary system configuration, once that system configuration has resolved, seems like work for little/no benefit. R2.2 - Manitoba Hydro agrees with MISO's proposed wording changes of: At a minimum, establish the list of internal flowgates to create, modify or delete at least once per calendar year. R2.3 - Manitoba Hydro agrees with MISO's proposed wording changes of: At a minimum, establish the list of external flowgates to create, modify or delete that have been requested as part of R2.1.4 within thirty calendar days from the request. R2.4 - It is unclear why the SDT differentiated between thermal and voltage/stability limits, when the instructions were to use the SOL regardless. R11 - Manitoba Hydro is not convinced that conversion from AFC to ATC can be easily calculated in a formula when different assumptions are used for calculating transmission capability. Manitoba Hydro also questions why is it only MOD 30 that requires a conversion formula? If standards are to be fair, shouldn't all three standards (MOD 28, MOD 29 and MOD 30) have as a requirement to convert transmission capability from one method to the other? Manitoba Hydro re-iterates that there shouldn't be 3 ways to calculate transmission capability. The standards should specify one methodology with consistent assumptions to preserve reliability. |
| PacifiCorp | 1 | Negative | PacifiCorp agrees with Bonneville Power's comments, listed below: 1. R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the Eastern interconnection with its commensurate characteristics. However, practices that are in place in BPA’s part of the western interconnection use flow based ATC determination consistent with the concepts of this proposed standard, but they are based on using a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. MOD-30 as written would require many new “flowgates” based on varying system conditions without providing any increased reliability benefit. This is because BPA determines their capacity based on WECC criteria which test for thermal restrictions, voltage stability, and transient stability where the specific characteristics of: â€¢ Load â€¢ Generation â€¢ Configuration of extensive special protection schemes (SPS) and â€¢ WECC’s more stringent (greater than n-1) performance requirements determine which varying specific lines or equipment determine the capacity of the flowgate. While being made up of different named elements, BPA’s existing flowgates do not always include the first three limiting Elements and their worst associated contingency combinations, |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | yet they still protect the area of transmission constraint. An example of a basis for an ATC capacity that does not fit the proposed standard's language is a two Palo Verde nuclear unit outage in Arizona which is often the critical contingency that causes voltage stability limitations on BPA's North of Hanford Path in Washington over 1000 miles away from the Palo Verde units. While the proposed MOD-30 Flowgate Methodology may provide sufficient reliability for (n-1) thermally limited constraints where the impact of an outage is on parallel transmission, the above example describes a limiting outage that is not in the area of the transmission constraint, thus it does not make sense to define it as part of a flowgate. In regards to capacity, BPA's existing flowgates can be dynamically changed to maximize capacity based on specific operating conditions. If the language in R2.1.1 and R2.1.2 of MOD-30 is adopted, it will require defining many additional "flowgates" with no added reliability or capacity compared to the method BPA has in place today. This would unnecessarily introduce significant workload and computation to BPA and many others in the western interconnection that could, in fact, complicate the understanding of operational constraints. For these reasons, BPA believes that implementation of R2.1.1-2.1.2.2 does not make sense within WECC and respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2 for WECC entities as a regional difference: RX. WECC: Results of transfer analyses, consistent with those studies required in FAC-010 and FAC-011, or their successors, for ATC Paths up to the path capability. RX.1. Only the most limiting element in a series configuration needs to be included in a Flowgate. If these "RX" requirements are added, to replace R2.1.1-2.1.2.2 for WECC entities, R2.4 would also require modification as follows ("red/underlined" language indicates additions): R2.4. Establish the TFC of each of the defined Flowgates as equal to: â€“ For thermal limits, the lowest System Operating Limit (SOL) included in the definition of the Flowgate. â€“ For voltage or stability limits, the flow that will respect the lowest SOL included in the definition of the Flowgate. |
| PP&L, Inc. | 1 | Negative | The R2.1.1 thru R2.1.2.2 requirements are inconsistent with western interconnection practices and may complicate the understanding of operational constraints which may negatively impact reliability. Therefore, PPL EU is in agreement with the comments posted by the Bonneville Power Administration, WECC and MISO and the recommendation to vote NO for this standard. |
| Seattle City Light | 1 | Abstain | The draft standard, in R2.1, proposes requirements for defining flowgates that appear to be inconsistent with approaches currently used in parts of the Western Interconnection to designate flowgate elements. The linear analysis method proposed will not sufficiently consider other System Operating Limits (SOLs) that may factor into flowgate designations. Specifically, the 5% Outage Transfer Distribution Factor (OTDF) threshold proposed for identifying flowgate elements does not reflect the methods currently used in WECC to designate flowgates. While application of OTDF methods is straight-forward, and provides a simple screening tool, it may be excessively burdensome to Transmission Operators to designate and redesignate flowgates using the proposed criteria. Furthermore, it may be impractical for Transmission Service Providers to manage requests for transmission services under pro forma OATT service provisions if the proposed criteria results in a large number of flowgates subject to simultaneous limits. SCL is in agreement with the apparent purpose of the R2.1 - establishing objective criteria with distinct metrics for flowgate designation. However, the |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | requirement R2.1 proposed in the draft should be replaced, perhaps using a WECC variance, to ensure that it results in a manageable number of flowgates that promote reliable operation of the Bulk Electric System. In standards FAC-010-1 and FAC-011-1 NERC has granted Regional Differences for establishing SOLs in the Western Interconnection. A similar Regional Difference should be developed and granted with respect to the establishment and designation of flowgates in the Western Interconnection. |
| Southwest Transmission Cooperative, Inc. | 1 | Abstain | SWTC does not use this methodology. |
| Western Area Power Administration | 1 | Negative | As written, complying with the standard would add substantial burden to "Flowgate" entities within the WECC while adding no additional reliability value. |
| California ISO | 2 | Negative | Implementation is incompatible with current operating practices in the Western Interconnection |
| Independent Electricity System Operator | 2 | Affirmative | R2.5 does not require a recalculation of TFC if the TOP becomes aware of a change to the transmission configuration such as an outage to a transmission facility. This should be required in addition to having to recalculating TFC upon being notified of a facility rating change. |
| Midwest ISO, Inc. | 2 | Abstain | R2.1.3: Midwest ISO believes that this requirement is too onerous and leaves no allowance for an Interconnection-wide congestion management process to be enacted due to a forced outage or any other system condition unforeseen by forecasted system conditions. Also, the SDT did not respond to Midwest ISO comment concerning temporary flowgates in TLR. Midwest ISO questions the reliability benefit gained by calculating AFCs for a flowgate which was only created for a temporary system condition. The response from the SDT to include limiting element/contingency combinations in R3.5 does not limit the potential list of flowgates to only adjacent Reliability Coordinator Areas as was originally intended. Language in R3.5 states “immediately adjacent and beyond Reliability Coordination Areas”, which implies the inclusion of Reliability Coordination Areas that are not adjacent. The Midwest ISO asks the SDT to clarify. Midwest ISO also believes that a flowgate referenced by R3.5 should be added by the process established in R2.1.4. Otherwise, as the requirement is written, if a forced outage causes an Interconnection-wide congestion management procedure to be enacted in on a limiting element/contingency in PJM, then Midwest ISO would be required to add that facility as a flowgate despite the opinion of PJM or even if a transfer from Midwest ISO to PJM does not have an impact greater than the 5% threshold. R2.2: Midwest ISO continues to believe that the text of this requirement is not clear. Midwest ISO asks the drafting team to consider the following language: R2.2: At a minimum, establish the list of internal flowgates to create, modify, or delete at least once per calendar year. R2.3: Midwest ISO continues to believe that the text of this requirement is not clear. Midwest ISO asks the drafting team to consider the following language: R2.3: At a minimum, establish the list of external flowgates to create, modify, or delete that have been requested as part of R2.1.4 within thirty calendar days from the request. R2.4: Both sub bullets instruct the entity to use the SOL for the flowgate. If this were to be the case, then R2.4 could be revised to just require the use of the SOL of the flowgate. Otherwise, the requirement should be revised to precisely capture the intention of |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | the SDT. R5.3: How can this requirement be enforceable for entities that are non-FERC jurisdictional? We are concerned of the situation where a non-FERC jurisdictional neighboring entity doesn't provide such data to the Midwest ISO. We request clarification. R6.2/R6.4/R6.6/R7.2/R7.4/R7.6 â€“ The Midwest ISO is not convinced that similar seams coordination requirements exist for the other two standards, especially for MOD-029. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies. We request to remove these requirements from MOD-030 to achieve more unbiased standards. R11: Midwest ISO continues to question the language of this requirement for three reasons. First, the response from the SDT to our previous round of comments indicates that the TTC would remain constant because the flowgate with the lowest TFC would generally remain constant relative to each path. However, the SDT ignored the fact that the distribution factor for that same flowgate changes due to system topology changes. Hence, the TTC value will almost always change each time the model is updated, which is currently once per day as stated in R3. Second, the TTC value back calculated for the Flowgate methodology is not as valuable as it is in the Rated System Path methodology or the Area Interchange Methodology. If a flowgate will never limit an ATC, why would anyone be interested to know a TTC calculated by this flowgate? As the requirement is written, the Transmission Service Provider will be expected to incur additional cost, with no benefit to either the reliability or transmission customers, to separately account for the flowgate with the smallest TFC value in order to back calculate a TTC value. Third, when you use the same flowgate for all value conversions, the formula "ATC=TTC-CBMpath-TRMpath-ETCpath"still holds if you simply divide everything in formula "AFC=TFC-CBMflowgate-TRMflowgate-ETCflowgate" by the flowgate distribution factor. However, using different flowgates would make the formula "ATC=TTC-CBM-TRM-ETC" invalid. This result eliminates the usefulness of the TTC value for the Flowgate methodology. Therefore, we request this requirement to be rewritten if the SDT believes a formula to calculate TTC must be included in the standard. The Midwest ISO acknowledges the fact that there can be three methodologies for calculating ATC values. The Midwest ISO continues to believe that a single standard that qualitatively judges the reliability of all three methodologies is the right form to ensure reliability of the interconnected bulk power systems rather than the current approach of having a separate standard for each methodology. The Midwest ISO believes that three different standards for three different methodologies have created requirements and measures to ensure that each entity is executing its methodology per the guidelines prescribed by the standards and do not necessarily ensure reliability of the interconnected system. For example, while the MOD-030 includes several requirements for Constraints (Flowgates) used in that methodology, the other standards do not include similar requirements with the premise that those methodologies do not use flowgates. For the system to be reliable, the constraints that impact an energy transfer should be the same irrespective of the methodology. The Midwest ISO sees these standards as guidelines to ensure documentation of the methodologies being executed as opposed to consistency amongst the methodologies to ensure system reliability. Midwest ISO also believes that the Flow based methodology is an advanced technique with a high level of detail and alignment with congestion management procedures such as the NERC IDC. The Midwest ISO continues to observe a significantly higher number of compliance |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | requirements under MOD-030 than entities using a methodology that is subject to either MOD-028 or MOD-029. The Midwest ISO believes that a single ATC standard and the termination of the three previously mentioned standards would eliminate any compliance concerns related to improperly aligned standards. Flow based methodology entities under MOD 030 are held to a higher degree of compliance for volunteering to use the Flow based methodology; when regardless of methodology the highest degree of compliance must required for all three methodologies. Therefore, the Midwest ISO believes it is imperative to draft a single ATC standard that would apply to all entities regardless of the methodology selected. |
| Ameren Services Company | 3 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-030-1. AFC is a market parameter and as such is applicable to the Transmission Service Provider. Definition of an adequate flowgate population is required to adequately constrain the sale of transmission service, as such this would appear to be a market not a reliability issue. Under R2 the calculation of TFC is applicable to the Transmission Operator. This is not consistent with the current version of the Functional Model. The Transmission Planner is responsible for supporting the development of TTC (TFC). Under R3 the Transmission Service Provider not the Transmission Operator should be responsible for the calculation of ATC/AFC and any modeling data. This is especially true when the Transmission Service Provider determines ATC for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO. That said we are aware that the oversubscription of transmission service can lead to reliability problems. AFC issues affect long term planning as well as planning in the Operating Time Horizon. |
| Avista Corp. | 3 | Negative | The standard needs some flexibility due to regional differences. Support comments submitted by the Bonneville Power Administration. |
| Blachly-Lane Electric Co-op | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| Bonneville Power Administration | 3 | Negative | 1. R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the eastern interconnection with its commensurate characteristics. However, practices that are in place in BPA's part of the western interconnection use flow based ATC determination consistent with the concepts of this proposed standard, but they are based on using a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. MOD-30 as written would require many new "flowgates" based on varying system conditions without providing any increased reliability benefit. This is because BPA determines their capacity based on WECC criteria which test for thermal restrictions, voltage stability, and transient stability where the specific characteristics of: load, generation, configuration of extensive special protection schemes (SPS), and WECC's more stringent (greater than n-1) performance requirements determine which varying specific lines or equipment determine the capacity of the flowgate. While being made up of different named elements, BPA's existing flowgates do not always include the first three limiting Elements and their worst associated Contingency combinations, yet they still protect the area of transmission constraint. An example of a basis for an ATC capacity that does not fit the proposed standard's language is a two |

|---|---|---|---|
| | | | Palo Verde nuclear unit outage in Arizona which is often the critical contingency that causes voltage stability limitations on BPA's North of Hanford Path in Washington over 1000 miles away from the Palo Verde units. While the proposed MOD-30 Flowgate Methodology may provide sufficient reliability for (n-1) thermally limited constraints where the impact of an outage is on parallel transmission, the above example describes a limiting outage that is not in the area of the transmission constraint, thus it does not make sense to define it as part of a flowgate. In regards to capacity, BPA's existing flowgates can be dynamically changed to maximize capacity based on specific operating conditions. If the language in R2.1.1 and R2.1.2 of MOD-30 is adopted, it will require defining many additional "flowgates" with no added reliability or capacity compared to the method BPA has in place today. This would unnecessarily introduce significant workload and computation to BPA and many others in the western interconnection that could, in fact, complicate the understanding of operational constraints. For these reasons, BPA believes that implementation of R2.1.1-2.1.2.2 does not make sense within WECC and respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2 for WECC entities as a regional difference: RX. WECC: Results of transfer analyses, consistent with those studies required in FAC-010 and FAC-011, or their successors, for ATC Paths up to the path capability. RX.1. Only the most limiting element in a series configuration needs to be included in a Flowgate. If these "RX" requirements are added, to replace R2.1.1-2.1.2.2 for WECC entities, R2.4 would also require modification as follows: R2.4. Establish the TFC of each of the defined Flowgates as equal to: For thermal limits, the lowest System Operating Limit (SOL) included in the definition of the Flowgate. For voltage or stability limits, the flow that will respect the lowest SOL included in the definition of the Flowgate. 2. Additionally, there are typos at the following locations: Applicability 4.1.1, where a space is missing between "(AFCs)" and "on"; R1, where a colon is missing following the "(ATCID)"; R2.1.2, where "analyses" should not be plural; and "R"s appear to be missing from all "fourth-tier" requirements (2.1.1.1 for example). |
| City of McMinnville | 3 | Negative | Inappropriate methodology for WECC specific entities |
| City Public Service of San Antonio | 3 | Negative | I cannot vote for this standard as written. It needs to acknowledge definitive alternatives to ATC for regions or markets such as ERCOT where transmission service markets are not used. |
| Clatskanie People's Utility District | 3 | Negative | The requirement of substantial additional flowgate analysis does not add reliability and instead offers the possibility of a lower standard of understanding of system operation. |
| Clearwater Power Co. | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| Coos-Curry Electric Cooperative, Inc | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| Cowlitz County PUD | 3 | Negative | Cowlitz County PUD No.1 (District) Comments on MOD-030-1 Adapted from PPC Recommendations 7/29/08 The Northwest uses a flow-based ATC determination consistent with the main concepts of the |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | proposed MOD-030 standard. However, Northwest flowgates are defined with adequate granularity to identify varying sets of critical contingencies and impacted lines under changing system conditions. Seasonal operating nomograms are developed using varying temperatures, loads and ratings, generation dispatch, and contingency analysis (that meeting greater than n-1 performance requirements) to determine reliable operating capabilities. These operating nomograms allow the transmission provider or operator to maximize capacity based on specific operating conditions. In addition, these seasonal operating nomograms are reviewed by the region and posted in advance of the operating season, addressing both transparency and coordinating requirements. This methodology is specifically designed to the “Hub and Spoke” nature of the Western Interconnection system. Large generation resources are located long distances from large loads verses the tightly meshed systems in the Eastern Interconnection where load and generation are located very close together. Due to the remote nature of generation and load in the west, transient and voltage stability considerations must be taken into consideration. The District disagrees with current language in R2.1.1 and R2.1.2 of MOD-030 which will require the creation of many additional “flowgates” in the Northwest with no added reliability benefits. The current proven methodology used by the Bonneville Power Administration is sufficient. Adopting R2.1.1 and R2.1.2 of MOD-030 as it now stands will unnecessarily increase workload and cost. The District is not willing to help fund complicated reliability measures where there is no benefit. The District respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2. The current methodology used by the Bonneville Power Administration is ultimately more reliable, given the specific nature of the transmission and generation resources in the Western Interconnection. The District supports Bonneville’s proposed changes to R2.1 of this proposed standard. |
| Duke Energy Carolina | 3 | Affirmative | While we support approval of this standard, bulk electric system facilities 161kV and below may have significant network response. Since these facilities may have significant impact on TTC/AFC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders. |
| FirstEnergy Solutions | 3 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-030 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-030 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO |

|---|---|---|---|
| MidAmerican Energy Co. | 3 | Negative | I am concerned that R2.1 requires the Transmission Operator to set up a certain number of flowgates at a minimum. With smaller Transmission Service Providers, I believe this will result unnecessarily in additional flow gates in the interconnection. I believe R2.1. should be greatly simplified, deleted, or else changes should be made to R2.1.3. Add at the end of R2.1.3 an exclusion from the requirement of adding flowgates for situations that resulted in congestion management "unless the need for Interconnection-wide congestion management was a result of unusual operating conditions that are not reasonably expected to frequently occur again (such as multiple prior outages of transmission facilities and/or critical generators)." |
| Northern Lights Inc. | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| Northern Wasco County People's Utility District (PUD) | 3 | Negative | The Northwest uses a flow-based ATC determination consistent with the concepts of the proposed MOD-030 standard. Northwest flowgates, however, are defined with adequate granularity to identify varying sets of critical contingencies and impacted lines under changing system conditions. Seasonal operating nomograms are developed using varying temperatures, loads and ratings, generation dispatch, and contingency analysis (that meeting greater than n-1 performance requirements) to determine reliable operating capabilities. These operating nomograms allow the transmission provider or operator to maximize capacity based on specific operating conditions. In addition these seasonal operating nomograms are reviewed by the region and posted in advance of the operating season, addressing both transparency and coordinating requirements. This methodology accommodates and is tailored to the “Hub and Spoke” nature of the Western Interconnection system. Large generation resources are located long distances from large loads verses the tightly meshed systems in the Eastern Interconnection where load and generation are located very close together. Due to the remote nature of generation and load in the west, transient and voltage stability considerations must be taken into consideration. If the language in R2.1.1 and R2.1.2 of MOD-030 is adopted, it will require many additional “flowgates” in the Northwest that will result in no added reliability benefits compared to the method our transmission provider has in place today. Adopting R2.1.1 and R2.1.2 of MOD-030 without further revision would unnecessarily introduce significant workload, cost, and complications that Northern Wasco County PUD and other transmission customers will ultimately have to fund. Because the standard would unnecessarily impose these burdens without any incremental improvement in reliability, Northern Wasco County PUD respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2. The current method used by the Bonneville Power Administration is ultimately more reliable, given the specific nature of the transmission and generation resources in the Western Interconnection. Northern Wasco County PUD supports Bonneville’s proposed approach and proposed revisions to R2.1 to address the needs of the Western Interconnection in this proposed standard. |
| Okanogan County Electric Cooperative, Inc. | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| Public Utility | 3 | Negative | The Northwest uses a flow-based ATC determination consistent with the concepts of the proposed |

| District No. 1 of Benton County | | | MOD-030 standard. Northwest flowgates, however, are defined with adequate granularity to identify varying sets of critical contingencies and impacted lines under changing system conditions. Seasonal operating nomograms are developed using varying temperatures, loads and ratings, generation dispatch, and contingency analysis (that meeting greater than n-1 performance requirements) to determine reliable operating capabilities. These operating nomograms allow the transmission provider or operator to maximize capacity based on specific operating conditions. In addition these seasonal operating nomograms are reviewed by the region and posted in advance of the operating season, addressing both transparency and coordinating requirements. This methodology accommodates and is tailored to the “Hub and Spoke” nature of the Western Interconnection system. Large generation resources are located long distances from large loads verses the tightly meshed systems in the Eastern Interconnection where load and generation are located very close together. Due to the remote nature of generation and load in the west, transient and voltage stability considerations must be taken into consideration. If the language in R2.1.1 and R2.1.2 of MOD-030 is adopted, it will require many additional “flowgates” in the Northwest that will result in no added reliability benefits compared to the method our transmission provider has in place today. Adopting R2.1.1 and R2.1.2 of MOD-030 without further revision would unnecessarily introduce significant workload, cost, and complications that Public Utility District No. 1 of Benton County (Benton PUD) and other transmission customers will ultimately have to fund. Because the standard would unnecessarily impose these burdens without any incremental improvement in reliability, Benton PUD respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2. The current method used by the Bonneville Power Administration is ultimately more reliable, given the specific nature of the transmission and generation resources in the Western Interconnection. Benton PUD supports Bonneville’s proposed approach and proposed revisions to R2.1 to address the needs of the Western Interconnection in this proposed standard. |
| Public Utility District No. 2 of Grant County | 3 | Negative | The additional requirements add no reliability to the system in the western interconnection. |
| Raft River Rural Electric Cooperative | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| Salmon River Electric Cooperative | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| Seattle City Light | 3 | Abstain | The draft standard, in R2.1, proposes requirements for defining flowgates that appear to be inconsistent with approaches currently used in parts of the Western Interconnection to designate flowgate elements. The linear analysis method proposed will not sufficiently consider other System Operating Limits (SOLs) that may factor into flowgate designations. Specifically, the 5% Outage Transfer Distribution Factor (OTDF) threshold proposed for identifying flowgate elements does not reflect the methods currently used in WECC to designate flowgates. While application of OTDF |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | methods is straight-forward, and provides a simple screening tool, it may be excessively burdensome to Transmission Operators to designate and redesignate flowgates using the proposed criteria. Furthermore, it may be impractical for Transmission Service Providers to manage requests for transmission services under pro forma OATT service provisions if the proposed criteria results in a large number of flowgates subject to simultaneous limits. SCL is in agreement with the apparent purpose of the R2.1 - establishing objective criteria with distinct metrics for flowgate designation. However, the requirement R2.1 proposed in the draft should be replaced, perhaps using a WECC variance, to ensure that it results in a manageable number of flowgates that promote reliable operation of the Bulk Electric System. In standards FAC-010-1 and FAC-011-1 NERC has granted Regional Differences for establishing SOLs in the Western Interconnection. A similar Regional Difference should be developed and granted with respect to the establishment and designation of flowgates in the Western Interconnection. |
| Umatilla Electric Cooperative | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| Wisconsin Public Service Corp. | 3 | Negative | R2 needs to be simplified. |
| Alliant Energy Corp. Services, Inc. | 4 | Negative | We believe that R2.1 requires the Transmission Operator to set up a certain number of flowgates. We believe this will require that many flowgates will be needlessly set up. |
| Eugene Water & Electric Board | 4 | Negative | The Northwest uses a flow-based ATC determination consistent with the concepts of the proposed MOD-030 standard. Northwest flowgates, however, are defined with adequate granularity to identify varying sets of critical contingencies and impacted lines under changing system conditions. A similar Regional Difference should be developed and granted with respect to the establishment and designation of flowgates in the Western Interconnection. |
| WPS Resources | 4 | Negative | R2.1 requires that the Transmission Operator shall set up a certain number of flowgates at a minimum. |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Corp. | | | This could result in a certain flowgates that are not needed on an on-going basis. This requirement should be simplified, deleted, and/or changed. R2.1.3. presently states that "Any limiting Element/Contingency combination at least within the Transmission model identified in R3.4 and R3.5 that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology." This requirement should provide another condition when the requirement is waived by adding the following words at the end of the requirement "or unless the need for Interconnection-wide congestion management was a result of unusual operating conditions that are not reasonably expected to frequently occur again (such as multiple prior outages of transmission facilities and/or critical generators)." Also, the Transmission Operator is the responsible entity for R2 through R3 for MOD-030. The responsible entity for these requirements should be the Transmission Service Provider. |
| Avista Corp. | 5 | Negative | This standard needs to incorporate the need for regional differences. We support the comments submitted by BPA. |
| Bonneville Power Administration | 5 | Negative | 1. R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the eastern interconnection. However, existing practices in BPA's part of the western interconnection use flow based ATC determination which, while consistent with the concepts of this proposed standard, use a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. MOD-30 as written would require many new "flowgates" based on varying system conditions without providing any increased reliability benefit. This is because BPA determines their capacity based on WECC criteria which test for thermal restrictions, voltage stability, and transient stability - where the specific characteristics of load, generation, configuration of extensive special protection schemes (SPS), and WECC's more stringent (greater than n-1) performance requirements - to determine which varying specific lines or equipment determine the capacity of the flowgate. While made up of different named elements, BPA's existing flowgates do not always include the first three limiting elements and their worst associated Contingency combinations, yet they still protect the area of transmission constraint. An example of a basis for an ATC capacity that does not fit the proposed standard's language is a two Palo Verde nuclear unit outage in Arizona which is often the critical contingency that causes voltage stability limitations on BPA's North of Hanford Path in Washington over 1000 miles away from the Palo Verde units. While the proposed MOD-30 Flowgate Methodology may provide sufficient reliability for (n-1) thermally limited constraints where the impact of an outage is on parallel transmission, the above example describes a limiting outage that is not in the area of the transmission constraint, thus it does not make sense to define it as part of a flowgate. In regards to capacity, BPA's existing flowgates can be dynamically changed to maximize capacity based on specific operating conditions. If the language in R2.1.1 and R2.1.2 of MOD-30 is adopted, it will require defining many additional "flowgates" with no added reliability or capacity compared to the method BPA has in place today. This would unnecessarily introduce significant workload and computation to BPA and many others in the western interconnection that could, in fact, complicate the understanding of operational constraints. For these reasons, BPA believes that implementation of R2.1.1-2.1.2.2 does not make sense within WECC and respectfully requests that alternate WECC- |

|---|---|---|---|
| | | | specific requirements be added to replace R2.1.1-2.1.2.2 for WECC entities as a regional difference: RX. WECC: Results of transfer analyses, consistent with those studies required in FAC-010 and FAC-011, or their successors, for ATC Paths up to the path capability. RX.1. Only the most limiting element in a series configuration needs to be included in a Flowgate. If these "RX" requirements are added, to replace R2.1.1-2.1.2.2 for WECC entities, R2.4 would also require modification as follows ("red/underlined" language indicates additions): R2.4. Establish the TFC of each of the defined Flowgates as equal to: For thermal limits, the lowest System Operating Limit (SOL) included in the definition of the Flowgate. For voltage or stability limits, the flow that will respect the lowest SOL included in the definition of the Flowgate. 2. Additionally, there are typos at the following locations: Applicability 4.1.1, where a space is missing between "(AFCs)" and "on"; R1, where a colon is missing following the "(ATCID)"; R2.1.2, where "analyses" should not be plural; and "R"s appear to be missing from all "fourth-tier" requirements (2.1.1.1 for example). |
| FirstEnergy Solutions | 5 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-030 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-030 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-030 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R2: Flowgate determination and calculation of TFC on flowgates. The variance would not be applicable to the TOP assignment in requirement R3, which requires the TOP to provide transmission modeling data to the TSP for the calculation of AFC. Additional Comments: In response to FE's most recent MOD-030 comments, the drafting team |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | indicated that it felt the TOP is the appropriate entity for Requirement R2 since they are responsible for keeping the system within its operating limits. While it is true that TOPs identify SOLs and are required to maintain SOLs, the use of flowgates is primarily a market function used in evaluating interchange transactions. Per FAC-014 requirement R5.2, TOPs are required to submit SOL information to TSPs and therefore the TSP would have the information available for the determination of Total Flow Capacity (TFC) for a given flowgate. Therefore, it is FE's position that R2 is better assigned to the TSP, but if the SDT elects not to change the standard, the above request for a MISO variance will satisfy our needs. |
| IBERDROLA RENEWABLES | 5 | Negative | R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the Eastern interconnection with its commensurate characteristics. However, practices that are in place in BPA's part of the western interconnection use flow based ATC determination consistent with the concepts of this proposed standard, but they are based on using a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. MOD-30 as written would require many new "flowgates" based on varying system conditions without providing any increased reliability benefit. | | | | specific requirements be added to replace R2.1.1-2.1.2.2 for WECC entities as a regional difference: RX. WECC: Results of transfer analyses, consistent with those studies required in FAC-010 and FAC-011, or their successors, for ATC Paths up to the path capability. RX.1. Only the most limiting element in a series configuration needs to be included in a Flowgate. If these "RX" requirements are added, to replace R2.1.1-2.1.2.2 for WECC entities, R2.4 would also require modification as follows ("red/underlined" language indicates additions): R2.4. Establish the TFC of each of the defined Flowgates as equal to:<br><br>– For thermal limits, the lowest System Operating Limit (SOL) included in the definition of the Flowgate.<br>– For voltage or stability limits, the flow that will respect the lowest SOL included in the definition of the Flowgate. 2. Additionally, there are typos at the following locations: Applicability 4.1.1, where a space is missing between"(AFCs)" and "on"; R1, where a colon is missing following the "(ATCID)"; R2.1.2, where "analyse" should not be plural; and "R"s appear to be missing from all "fourth-tier" requirements (2.1.1.1 for example). |
| Manitoba Hydro | 5 | Negative | R2.1.3 - This requirement seems onerous. Having to calculate AFCs for a flowgate that was created for a temporary system configuration, once that system configuration has resolved, seems like work for little/no benefit. R2.2 - Manitoba Hydro agrees with MISO's proposed wording changes of: At a minimum, establish the list of internal flowgates to create, modify or delete at least once per calendar year. R2.3 - Manitoba Hydro agrees with MISO's proposed wording changes of: At a minimum, establish the list of external flowgates to create, modify or delete that have been requested as part of R2.1.4 within thirty calendar days from the request. R2.4 - It is unclear why the SDT differentiated between thermal and voltage/stability limits, when the instructions were to use the SOL regardless. R11 - Manitoba Hydro is not convinced that conversion from AFC to ATC can be easily calculated in a formula when different assumption are used for calculating transmission capability. Manitoba Hydro also questions why is it only MOD 30 that requires a conversion formula? If standards are to be fair, shouldn't all three standards (MOD 28, MOD 29 and MOD 30) have as a requirement to convert transmission capability from one method to the other? Manitoba Hydro re-iterates that there shouldn't be 3 ways to calculate transmission capability. The standards should specify one methodology with consistent assumptions to preserve reliability. |
| PPL Generation LLC | 5 | Negative | We are respecting BPA's and MISO's position on this ballot in our decision to vote negative. |
| Bonneville Power Administration | 6 | Negative | 1. R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the eastern interconnection with its commensurate characteristics. However, practices that are in place in BPA's part of the western interconnection use flow based ATC determination consistent with the concepts of this proposed standard, but they are based on using a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-030 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R2: Flowgate determination and calculation of TFC on flowgates. The variance would not be applicable to the TOP assignment in requirement R3, which requires the TOP to provide transmission modeling data to the TSP for the calculation of AFC. Additional Comments: In response to FE's most recent MOD-030 comments, the drafting team indicated that it felt the TOP is the appropriate entity for Requirement R2 since they are responsible for keeping the system within its operating limits. While it is true that TOPs identify SOLs and are required to maintain SOLs, the use of flowgates is primarily a market function used in evaluating interchange transactions. Per FAC-014 requirement R5.2, TOPs are required to submit SOL information to TSPs and therefore the TSP would have the information available for the determination of Total Flow Capacity (TFC) for a given flowgate. Therefore, it is FE's position that R2 is better assigned to the TSP, but if the SDT elects not to change the standard, the above request for a MISO variance will satisfy our needs. |
| IBERDROLA RENEWABLES | 6 | Negative | R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the Eastern interconnection with its commensurate characteristics. However, practices that are in place in BPA's part of the western interconnection use flow based ATC determination consistent with the concepts of this proposed standard, but they are based on using a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. MOD-30 as written would require many new "flowgates" based on varying system conditions without providing any increased reliability benefit. This is because BPA determines their capacity based on WECC criteria which test for thermal restrictions, voltage stability, and transient stability where the specific characteristics of:<br><br>– Load – Generation<br>– Configuration of extensive special protection schemes (SPS) and<br>– WECC's more stringent (greater than n-1) performance requirements determine which varying |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | specific lines or equipment determine the capacity of the flowgate. While being made up of different named elements, BPA's existing flowgates do not always include the first three limiting Elements and their worst associated contingency combinations, yet they still protect the area of transmission constraint.<br>An example of a basis for an ATC capacity that does not fit the proposed standard's language is a two Palo Verde nuclear unit outage in Arizona which is often the critical contingency that causes voltage stability limitations on BPA's North of Hanford Path in Washington over 1000 miles away from the Palo Verde units. While the proposed MOD-30 Flowgate Methodology may provide sufficient reliability for (n-1) thermally limited constraints where the impact of an outage is on parallel transmission, the above example describes a limiting outage that is not in the area of the transmission constraint, thus it does not make sense to define it as part of a flowgate. In regards to capacity, BPA's existing flowgates can be dynamically changed to maximize capacity based on specific operating conditions. If the language in R2.1.1 and R2.1.2 of MOD-30 is adopted, it will require defining many additional "flowgates" with no added reliability or capacity compared to the method BPA has in place today. This would unnecessarily introduce significant workload and computation to BPA and many others in the western interconnection that could, in fact, complicate the understanding of operational constraints. For these reasons, BPA believes that implementation of R2.1.1-2.1.2.2 does not make sense within WECC and respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2 for WECC entities as a regional difference: RX. WECC: Results of transfer analyses, consistent with those studies required in FAC-010 and FAC-011, or their successors, for ATC Paths up to the path capability. RX.1. Only the most limiting element in a series configuration needs to be included in a Flowgate. If these "RX" requirements are added, to replace R2.1.1- 2.1.2.2 for WECC entities, R2.4 would also require modification as follows ("red/underline" language indicates additions): R2.4. Establish the TFC of each of the defined Flowgates as equal to:<br>For thermal limits, the lowest System Operating Limit (SOL) included in the definition of the Flowgate. For voltage or stability limits, the flow that will respect the lowest SOL included in the definition of the Flowgate. 2. Additionally, there are typos at the following locations: Applicability 4.1.1, where a space is missing between "(AFCs)" and "on"; R1, where a colon is missing following the "(ATCID)'; R2.1.2, where "analyses" should not be plural; and "R" appear to be missing from all "fourth-tier" requirements (2.1.1.1 for example). |
| Manitoba Hydro | 6 | Negative | R2.1.3 - This requirement seems onerous. Having to calculate AFCs for a flowgate that was created for a temporary system configuration, once that system configuration has resolved, seems like work for little/no benefit. R2.2 - Manitoba Hydro agrees with MISO's proposed wording changes of: At a minimum, establish the list of internal flowgates to create, modify or delete at least once per calendar year. R2.3 - Manitoba Hydro agrees with MISO's proposed wording changes of: At a minimum, establish the list of external flowgates to create, modify or delete that have been requested as part of R2.1.4 within thirty calendar days from the request. R2.4 - It is unclear why the SDT differentiated between thermal and voltage/stability limits, when the instructions were to use the SOL regardless. R11 - Manitoba Hydro is not convinced that conversion from AFC to ATC can be easily calculated in a |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | formula when different assumptions are used for calculating transmission capability. Manitoba Hydro also questions why is it only MOD 30 that requires a conversion formula? If standards are to be fair, shouldn't all three standards (MOD 28, MOD 29 and MOD 30) have as a requirement to convert transmission capability from one method to the other? Manitoba Hydro re-iterates that there shouldn't be 3 ways to calculate transmission capability. The standards should specify one methodology with consistent assumptions to preserve reliability. |
| Public Utility District No. 1 of Chelan County | 6 | Negative | Standard as written complicates transmission service from the Bonneville Power Authority without adding reliability. |
| Electric Reliability Council of Texas, Inc. | 10 | Abstain | Although stated in the Applicability Section, the Requirements and Measures contain no clear applicability only to those Transmission Operators and Transmission Service providers who utilize the Flowgate methodology in calculating Available Flowgate Capabilities. |
| Midwest Reliability Organization | 10 | Negative | The MRO is concerned with the R2.1 that requires that the Transmission Operator shall set up a certain number of flowgates at a minimum. The MRO is concerned that this will require a certain number of flowgates will be needlessly set up by smaller Transmission Service Providers as a result of this requirement. The MRO believes that this will result in a certain number of flowgates be needlessly set up. We believe that this requirement should be greatly simplified, deleted, and/or changes to R2.1.3 should be made. R2.1.3. presently states that "Any limiting Element/Contingency combination at least within the Transmission model identified in R3.4 and R3.5 that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology." We believe that this requirement should provide another condition when the requirement is waived by adding the following words at the end of the requirement "or unless the need for Interconnection-wide congestion management was a result of unusual operating conditions that are not reasonably expected to frequently occur again (such as multiple prior outages of transmission facilities and/or critical generators)." Also, the MRO is concerned with the Transmission Operator being the responsible entity for R2 through R3 for MOD-030. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |

## Consideration of Comments on Initial Ballot — MOD-030-1 — Flowgate Methodology

**Summary Consideration:** Some stakeholders identified typographical errors in the standard, and these have been corrected as noted below. The announcement for the recirculation ballot will include a notice of these corrections.

- Applicability 4.1.1, - added a space between "(AFCs)" and "on"
- R1 - replaced the "period" with a "colon" following "(ATCID)"
- R2.1.2 - changed "analyses" to "analysis"
- Added "R"s to all "fourth-tier" requirements (changing 2.1.1.1 to R2.1.1.1 for example)

While some stakeholders suggested modifications to the standard, the Drafting Team has decided to address these changes in the next version of the standard, which is currently under development and will be posted for comment at the same time as the recirculation ballot. The drafting team did not make any changes, other than correcting typographical errors, to the standard.

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Ameren Services Company | 1 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-030-1.<br>(1) AFC is a market parameter and as such is applicable to the Transmission Service Provider.<br>(2) Definition of an adequate flowgate population is required to adequately constrain the sale of transmission service, as such this would appear to be a market not a reliability issue.<br>(3) Under R2 the calculation of TFC is applicable to the Transmission Operator. This is not consistent with the current version of the Functional Model. The Transmission Planner is responsible for supporting the development of TTC (TFC).<br>(3) Under R3 the Transmission Service Provider not the Transmission Operator should be responsible for the calculation of ATC/AFC and any modeling data. This is especially true when the Transmission Service Provider determines ATC for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO.<br>(4) That said we are aware that the oversubscription of transmission service can lead to reliability problems.<br>(5)AFC issues affect long term planning as well as planning in the Operating Time Horizon. |
| **Response:** The SDT has assigned the portions of the flowgate methodology related to AFC to the Transmission Service Provider.<br><br>The SDT believes the determination of flowgate is a reliability consideration, and defines how the transmission system is to be analyzed for reliability reasons with regard to determining the impacts of forecast usage of that system. | | | |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| The Functional Model does not attribute the determination of TTC or TFC to any entity. As such, the SDT was required to interpret the model to determine the appropriate entity for determining TTC or TFC. Since the ratings of facilities are established by the Transmission Operator, the SDT felt it appropriate to assign the responsibility for TFC to the Transmission Operator.<br><br>Under R3, the Transmission Operator is not responsible for calculating AFC – only providing the Transmission Service Provider with a model to use in that calculation. While many entities may have delegated this task to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. NERC has attempted to address this through allowing the use of Joint Registration Organizations, where a MISO/Ameren collaboration would be sanctioned as a single entity, and then the JRO would be responsible for determining how to allocate those sanctions among participants in the JRO.<br><br>The SDT concurs that oversubscription can lead to reliability problems.<br><br>With regard to the Time Horizons used in compliance, the SDT believes the correct horizon is Operations Planning. | | | |
| American Transmission Company, LLC | 1 | Negative | R2.1.3: Midwest ISO believes that this requirement is too onerous and leaves no allowance for an Interconnection-wide congestion management process to be enacted due to a forced outage or any other system condition unforeseen by forecasted system conditions. Also, the SDT did not respond to Midwest ISO comment concerning temporary flowgates in TLR. Midwest ISO questions the reliability benefit gained by calculating AFCs for a flowgate which was only created for a temporary system condition. Midwest ISO also believes that a flowgate referenced by R3.5 should be added by process established in R2.1.4. Otherwise, as the requirement is written, if a forced outage causes an Interconnection-wide congestion management procedure to be enacted in on a limiting element/contingency in PJM, then Midwest ISO would be required to add that facility as a flowgate despite the opinion of PJM or even if a transfer from Midwest ISO to PJM does not have an impact greater than the 5% threshold.<br>**Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.2: Midwest ISO continues to believe that the text of this requirement is not clear. Midwest ISO asks the drafting team to consider the following language. At a minimum, establish the list of internal flowgates to create, modify, or delete at least once per calendar year. |

It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.4: Both sub bullets instruct the entity to use the SOL for the flowgate. If this were to be the case, then R2.4 could be revised to just require the use of the SOL of the flowgate. Otherwise, the requirement should be revised to precisely capture the intention of the SDT.<br>**Response:** The first bullet requires that for SOLs with a limit based on megawatts, that the megawatt value be used. However, for SOLs with limits based on MVARs or other units, the flowgate limit would need to be specified as a level of flow in megawatts that supports the SOL. This is the intent of bullet two.<br><br>R5.3: How can this requirement be enforceable for entities that are non-FERC jurisdictional? We are concerned of the situation where a non-FERC jurisdictional neighboring entity doesn't provide such data to the Midwest ISO. We request clarification.<br>**Response:** Entities are only required to use AFCs they have been provided; if the information has not been provided, entities are not expected to use it. All entities within the continental United States are subject to mandatory and enforceable standards developed by the ERO. Entities outside the United States may be responsible for providing this information based on the regulatory agencies under which they operate. |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | R6.2/R6.4/R6.6/R7.2/R7.4/R7.6: Midwest ISO is not convinced that similar seams coordination requirements exist for the other two standards, especially for MOD-029. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies. We request to remove these requirements from MOD-030 to achieve more unbiased standards.<br>**Response:** MOD-029 is not a simulation-based methodology. As such, it is inappropriate to require the same kind of coordination as is described in MOD-028 and MOD-030. The SDT reiterates that MOD-028 does require similar coordination in R3 (generation dispatch and load for neighboring areas) and R4.3 (firm reservations from neighboring areas).<br><br>R11: Midwest ISO continues to question the language of this requirement for three reasons.<br>First, the response from the SDT to our previous round of comments indicates that the TTC would remain constant because the flowgate with the lowest TFC would generally remain constant relative to each path. However, the SDT ignored the fact that the distribution factor for that same flowgate changes due to system topology changes. Hence, the TTC value will almost always change each time the model is updated, which is currently once per day as stated in R3.<br>Second, the TTC value back calculated for the Flowgate methodology is not as valuable as it is in the Rated System Path methodology or the Area Interchange Methodology. If a flowgate will never limit an ATC, why would anyone be interested to know a TTC calculated by this flowgate? As the requirement is written, the Transmission Service Provider will be expected to incur additional cost, with no benefit to either the reliability or transmission customers, to separately account for the flowgate with the smallest TFC value in order to back calculate a TTC value.<br>Third, when you use the same flowgate for all value conversions, the formula “ATC=TTC-CBMpath-TRMpath-ETCpath” still holds if you simply divide everything in formula “AFC=TFC-CBMflowgate-TRMflowgate-ETCflowgate” by the flowgate distribution factor. However, using different flowgates would make the formula “ATC=TTC-CBM-TRM-ETC” invalid. This result eliminates the usefulness of the TTC value for the Flowgate methodology. Therefore, we request this requirement to be rewritten if the SDT believes a formula to calculate TTC must be included in the standard.<br>**Response:** The SDT recognizes the commenter’s concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision |

| Exelon Energy | 1 | Affirmative | General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | for corresponding time periods. Exelon's comments reflect these deficiencies and Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890. Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-030-1 Flowgate Methodology Â· Requirement 2.1.1.1. and 2.1.2.1. need to be revised as follows:<br><br>Use first Contingency criteria consistent with those first Contingency used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems.<br><br>A requirement that the Available Transfer Capability Implementation Document specify the following: o PTDF and OTDF cutoff values used |
| **Response:** The SDT notes MOD-001 R6 and R7 are intended to address the contingency concerns described in Exelon's comments, as well as R2.1.2.1 of MOD-030. The SDT notes that the "planning of operations" language has intentionally been taken directly from Order 890 to ensure consistency with the Commission's intent.<br><br>The SDT notes that MOD-001 R3.1 already indirectly requires the PTDF and OTDF information suggested. | | | |
| FirstEnergy Energy Delivery | 1 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-030 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written.<br>In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-030 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC |

| | | | standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-030 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R2: Flowgate determination and calculation of TFC on flowgates. The variance would not be applicable to the TOP assignment in requirement R3, which requires the TOP to provide transmission modeling data to the TSP for the calculation of AFC.<br>Additional Comments: In response to FE's most recent MOD-030 comments, the drafting team indicated that it felt the TOP is the appropriate entity for Requirement R2 since they are responsible for keeping the system within its operating limits. While it is true that TOPs identify SOLs and are required to maintain SOLs, the use of flowgates is primarily a market function used in evaluating interchange transactions. Per FAC-014 requirement R5.2, TOPs are required to submit SOL information to TSPs and therefore the TSP would have the information available for the determination of Total Flow Capacity (TFC) for a given flowgate. Therefore, it is FE's position that R2 is better assigned to the TSP, but if the SDT elects not to change the standard, the above request for a MISO variance will satisfy our needs. |
| **Response**: The SDT believes that the assignment to the Transmission Operator is correct. However, if MISO or its members wish to pursue an entity variance, they may submit a SAR requesting such a variance as defined in the NERC Reliability Standards Development Procedure. | | | |
| Great River Energy | 1 | Negative | GRE is concerned with the Transmission Operator being the responsible entity for MOD-030_R2 and R3. GRE believes that the responsible entity for these requirements should be the Transmission Service Provider. It is GRE's opinion that a standard should not knowingly be written in a manner that requires delegation agreements to be created for a large number of responsible entities, doing so is an inefficient use of resources. |
| **Response:** The SDT acknowledges that some entities stated that their Transmission Service Provider performed the tasks associated with R2 and R3, and that it may be easier for a regional entity to perform these tasks, but no entity has provided support (through the Functional Model or any other means) for why the responsibility should be shifted to the Transmission Service Provider. The SDT also notes that in previous comments, some entities supported the assignment to the Transmission Operator. | | | |
| Manitoba Hydro | 1 | Negative | R2.1.3 - This requirement seems onerous. Having to calculate AFCs for a flowgate that was created for a temporary system configuration, once that system configuration has resolved, seems like work for little/no benefit.<br>**Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to |

| | | | MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.2 - Manitoba Hydro agrees with MISO's proposed wording changes of: At a minimum, establish the list of internal flowgates to create, modify or delete at least once per calendar year.<br>**Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.3 - Manitoba Hydro agrees with MISO's proposed wording changes of: At a minimum, establish the list of external flowgates to create, modify or delete that have been requested as part of R2.1.4 within thirty calendar days from the request.<br>**Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.4 - It is unclear why the SDT differentiated between thermal and voltage/stability limits, when the instructions were to use the SOL regardless.<br>**Response:** The first bullet requires that for SOLs with a limit based on megawatts, that the megawatt value be used. However, for SOLs with limits based on MVARs or other units, the flowgate limit would need to be specified as a level of flow in megawatts that supports the SOL. This is the intent of bullet two.<br><br>R11 - Manitoba Hydro is not convinced that conversion from AFC to ATC can be easily calculated in a formula when different assumptions are used for calculating transmission capability. Manitoba Hydro also questions why is it only MOD 30 that requires a conversion formula? If standards are to be fair, shouldn't all three standards (MOD 28, MOD 29 and MOD 30) have as a requirement to convert transmission |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | capability from one method to the other? Manitoba Hydro re-iterates that there shouldn't be 3 ways to calculate transmission capability. The standards should specify one methodology with consistent assumptions to preserve reliability.<br>**Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. |
| **Response:** Please see in-line responses. | | | |
| PacifiCorp | 1 | Negative | PacifiCorp agrees with Bonneville Power's comments, listed below:<br>1. R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the Eastern interconnection with its commensurate characteristics. However, practices that are in place in BPA's part of the western interconnection use flow based ATC determination consistent with the concepts of this proposed standard, but they are based on using a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. MOD-30 as written would require many new "flowgates" based on varying system conditions without providing any increased reliability benefit. This is because BPA determines their capacity based on WECC criteria which test for thermal restrictions, voltage stability, and transient stability where the specific characteristics of: â€¢ Load â€¢ Generation â€¢ Configuration of extensive special protection schemes (SPS) and â€¢ WECC's more stringent (greater than n-1) performance requirements determine which varying specific lines or equipment determine the capacity of the flowgate. While being made up of different named elements, BPA's existing flowgates do not always include the first three limiting Elements and their worst associated contingency combinations, yet they still protect the area of transmission constraint. An example of a basis for an ATC capacity that does not fit the proposed standard's language is a two Palo Verde nuclear unit outage in Arizona which is often the critical contingency that causes voltage stability limitations on BPA's North of Hanford Path in Washington over 1000 miles away from the Palo Verde units. While the proposed MOD-30 Flowgate Methodology may provide sufficient reliability for (n-1) thermally limited constraints where the impact of an outage is on parallel transmission, the above example describes a limiting outage that is not in the area of the transmission constraint, thus it does not make sense to define it as part of a flowgate. In regards to capacity, BPA's existing flowgates can be dynamically changed to maximize capacity based on specific operating conditions. If the language in R2.1.1 and R2.1.2 of MOD-30 is adopted, it will require defining many additional "flowgates" with no added reliability or capacity |

|---|---|---|---|
| | | | compared to the method BPA has in place today. This would unnecessarily introduce significant workload and computation to BPA and many others in the western interconnection that could, in fact, complicate the understanding of operational constraints. For these reasons, BPA believes that implementation of R2.1.1-2.1.2.2 does not make sense within WECC and respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2 for WECC entities as a regional difference:<br><br>RX. WECC: Results of transfer analyses, consistent with those studies required in FAC-010 and FAC-011, or their successors, for ATC Paths up to the path capability.<br><br>RX.1. Only the most limiting element in a series configuration needs to be included in a Flowgate.<br><br>If these "RX" requirements are added, to replace R2.1.1-2.1.2.2 for WECC entities, R2.4 would also require modification as follows ("red/underlined" language indicates additions):<br>R2.4. Establish the TFC of each of the defined Flowgates as equal to: â€" For thermal limits, the lowest System Operating Limit (SOL) included in the definition of the Flowgate. â€" For voltage or stability limits, the flow that will respect the lowest SOL included in the definition of the Flowgate. |
| **Response**: The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| PP&L, Inc. | 1 | Negative | The R2.1.1 thru R2.1.2.2 requirements are inconsistent with western interconnection practices and may complicate the understanding of operational constraints which may negatively impact reliability. Therefore, PPL EU is in agreement with the comments posted by the Bonneville Power Administration, WECC and MISO and the recommendation to vote NO for this standard. |
| **Response:** Please see responses to BPA, other WECC entities and MISO. | | | |
| Seattle City Light | 1 | Abstain | The draft standard, in R2.1, proposes requirements for defining flowgates that appear to be inconsistent with approaches currently used in parts of the Western Interconnection to designate flowgate elements. The linear analysis method proposed will not sufficiently consider other System Operating Limits (SOLs) that may factor into flowgate designations.<br>Specifically, the 5% Outage Transfer Distribution Factor (OTDF) threshold proposed for identifying flowgate elements does not reflect the methods currently used in WECC |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | to designate flowgates. While application of OTDF methods is straight-forward, and provides a simple screening tool, it may be excessively burdensome to Transmission Operators to designate and redesignate flowgates using the proposed criteria. Furthermore, it may be impractical for Transmission Service Providers to manage requests for transmission services under pro forma OATT service provisions if the proposed criteria results in a large number of flowgates subject to simultaneous limits. SCL is in agreement with the apparent purpose of the R2.1 - establishing objective criteria with distinct metrics for flowgate designation. However, the requirement R2.1 proposed in the draft should be replaced, perhaps using a WECC variance, to ensure that it results in a manageable number of flowgates that promote reliable operation of the Bulk Electric System. In standards FAC-010-1 and FAC-011-1 NERC has granted Regional Differences for establishing SOLs in the Western Interconnection. A similar Regional Difference should be developed and granted with respect to the establishment and designation of flowgates in the Western Interconnection. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| Southwest Transmission Cooperative, Inc. | 1 | Abstain | SWTC does not use this methodology. |
| **Response:** Thank you for your comment. | | | |
| Western Area Power Administration | 1 | Negative | As written, complying with the standard would add substantial burden to "Flowgate" entities within the WECC while adding no additional reliability value. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| California ISO | 2 | Negative | Implementation is incompatible with current operating practices in the Western Interconnection |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| Independent Electricity System Operator | 2 | Affirmative | R2.5 does not require a recalculation of TFC if the TOP becomes aware of a change to the transmission configuration such as an outage to a transmission facility. This should be required in addition to having to recalculating TFC upon being notified of a facility rating change. |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| **Response:** The SDT believes that the modeling and outage requirements contained in R3 would result in an update to the AFC, which would reflect the changing conditions described. | | | |
| Midwest ISO, Inc. | 2 | Abstain | R2.1.3: Midwest ISO believes that this requirement is too onerous and leaves no allowance for an Interconnection-wide congestion management process to be enacted due to a forced outage or any other system condition unforeseen by forecasted system conditions. Also, the SDT did not respond to Midwest ISO comment concerning temporary flowgates in TLR. Midwest ISO questions the reliability benefit gained by calculating AFCs for a flowgate which was only created for a temporary system condition. Midwest ISO also believes that a flowgate referenced by R3.5 should be added by process established in R2.1.4. Otherwise, as the requirement is written, if a forced outage causes an Interconnection-wide congestion management procedure to be enacted in on a limiting element/contingency in PJM, then Midwest ISO would be required to add that facility as a flowgate despite the opinion of PJM or even if a transfer from Midwest ISO to PJM does not have an impact greater than the 5% threshold.<br>**Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.2: Midwest ISO continues to believe that the text of this requirement is not clear. Midwest ISO asks the drafting team to consider the following language. At a minimum, establish the list of internal flowgates to create, modify, or delete at least once per calendar year.<br>**Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.3: Midwest ISO continues to believe that the text of this requirement is not clear. Midwest ISO asks the drafting team to consider the following language. At a minimum, establish the list of external flowgates to create, modify, or delete that have been requested as part of R2.1.4 within thirty calendar days from the request. |

|---|---|---|---|
| | | | **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.4: Both sub bullets instruct the entity to use the SOL for the flowgate. If this were to be the case, then R2.4 could be revised to just require the use of the SOL of the flowgate. Otherwise, the requirement should be revised to precisely capture the intention of the SDT.<br>**Response:** The first bullet requires that for SOLs with a limit based on megawatts, that the megawatt value be used. However, for SOLs with limits based on MVARs or other units, the flowgate limit would need to be specified as a level of flow in megawatts that supports the SOL. This is the intent of bullet two.<br><br>R5.3: How can this requirement be enforceable for entities that are non-FERC jurisdictional? We are concerned of the situation where a non-FERC jurisdictional neighboring entity doesn't provide such data to the Midwest ISO. We request clarification.<br>**Response:** Entities are only required to use AFCs they have been provided; if the information has not been provided, entities are not expected to use it. All entities within the continental United States are subject to mandatory and enforceable standards developed by the ERO. Entities outside the United States may be responsible for providing this information based on the regulatory agencies under which they operate.<br><br>R6.2/R6.4/R6.6/R7.2/R7.4/R7.6: Midwest ISO is not convinced that similar seams coordination requirements exist for the other two standards, especially for MOD-029. This continues to demonstrate that more stringent requirements are placed on MOD-030 than the other methodologies. We request to remove these requirements from MOD-030 to achieve more unbiased standards.<br>**Response:** MOD-029 is not a simulation-based methodology. As such, it is inappropriate to require the same kind of coordination as is described in MOD-028 and MOD-030. The SDT reiterates that MOD-028 does require similar coordination in R3 (generation dispatch and load for neighboring areas) and R4.3 (firm reservations from neighboring areas). |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | R11: Midwest ISO continues to question the language of this requirement for three reasons. First, the response from the SDT to our previous round of comments indicates that the TTC would remain constant because the flowgate with the lowest TFC would generally remain constant relative to each path. However, the SDT ignored the fact that the distribution factor for that same flowgate changes due to system topology changes. Hence, the TTC value will almost always change each time the model is updated, which is currently once per day as stated in R3.<br>Second, the TTC value back calculated for the Flowgate methodology is not as valuable as it is in the Rated System Path methodology or the Area Interchange Methodology. If a flowgate will never limit an ATC, why would anyone be interested to know a TTC calculated by this flowgate? As the requirement is written, the Transmission Service Provider will be expected to incur additional cost, with no benefit to either the reliability or transmission customers, to separately account for the flowgate with the smallest TFC value in order to back calculate a TTC value.<br>Third, when you use the same flowgate for all value conversions, the formula “ATC=TTC-CBMpath-TRMpath-ETCpath”still holds if you simply divide everything in formula ”AFC=TFC-CBMflowgate-TRMflowgate-ETCflowgate” by the flowgate distribution factor. However, using different flowgates would make the formula “ATC=TTC-CBM-TRM-ETC” invalid. This result eliminates the usefulness of the TTC value for the Flowgate methodology. Therefore, we request this requirement to be rewritten if the SDT believes a formula to calculate TTC must be included in the standard.<br>**Response:** The SDT recognizes the commenter’s concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>The Midwest ISO acknowledges the fact that there can be three methodologies for calculating ATC values. The Midwest ISO continues to believe that a single standard that qualitatively judges the reliability of all three methodologies is the right form to ensure reliability of the interconnected bulk power systems rather than the current approach of having a separate standard for each methodology. The Midwest ISO believes that three different standards for three different methodologies have created requirements and measures to ensure that each entity is executing its methodology per the guidelines prescribed by the standards and do not necessarily ensure reliability of the interconnected system. For example, while the MOD-030 includes several |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | requirements for Constraints (Flowgates) used in that methodology, the other standards do not include similar requirements with the premise that those methodologies do not use flowgates. For the system to be reliable, the constraints that impact an energy transfer should be the same irrespective of the methodology. The Midwest ISO sees these standards as guidelines to ensure documentation of the methodologies being executed as opposed to consistency amongst the methodologies to ensure system reliability. Midwest ISO also believes that the Flow based methodology is an advanced technique with a high level of detail and alignment with congestion management procedures such as the NERC IDC. The Midwest ISO continues to observe a significantly higher number of compliance requirements under MOD-030 than entities using a methodology that is subject to either MOD-028 or MOD-029. The Midwest ISO believes that a single ATC standard and the termination of the three previously mentioned standards would eliminate any compliance concerns related to improperly aligned standards. Flow based methodology entities under MOD 030 are held to a higher degree of compliance for volunteering to use the Flow based methodology; when regardless of methodology the highest degree of compliance must required for all three methodologies. Therefore, the Midwest ISO believes it is imperative to draft a single ATC standard that would apply to all entities regardless of the methodology selected.<br>**Response:** The SDT believes that the standards are an appropriate set of requirements that support reliability. While the SDT applauds the Midwest ISO's decision to implement an advanced technique with a high level of detail and alignment with congestion management procedures such as the NERC IDC, it notes that not all entities agree that this technique is appropriate for use by all entities. If the Midwest ISO is advocating a single methodology, the SDT suggests the Midwest ISO request this for inclusion in NERC's annual work plan. |
| **Response:** Please see in-line responses. | | | |
| Ameren Services Company | 3 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-030-1.<br>AFC is a market parameter and as such is applicable to the Transmission Service Provider.<br>Definition of an adequate flowgate population is required to adequately constrain the sale of transmission service, as such this would appear to be a market not a reliability issue.<br>Under R2 the calculation of TFC is applicable to the Transmission Operator. This is not consistent with the current version of the Functional Model. The Transmission Planner is responsible for supporting the development of TTC (TFC).<br>Under R3 the Transmission Service Provider not the Transmission Operator should be responsible for the calculation of ATC/AFC and any modeling data. This is especially |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | true when the Transmission Service Provider determines ATC for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO. That said we are aware that the oversubscription of transmission service can lead to reliability problems. AFC issues affect long term planning as well as planning in the Operating Time Horizon. |
| **Response:** The SDT has assigned the portions of the flowgate methodology related to AFC to the Transmission Service Provider.<br><br>The SDT believes the determination of flowgate is a reliability consideration, and defines how the transmission system is to be analyzed for reliability reasons with regard to determining the impacts of forecast usage of that system.<br><br>The Functional Model does not attribute the determination of TTC or TFC to any entity. As such, the SDT was required to interpret the model to determine the appropriate entity for determining TTC or TFC. Since the ratings of facilities are established by the Transmission Operator, the SDT felt it appropriate to assign the responsibility for TFC to the Transmission Operator.<br><br>Under R3, the Transmission Operator is not responsible for calculating AFC – only providing the Transmission Service Provider with a model to use in that calculation. While many entities may have delegated this task to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. NERC has attempted to address this through allowing the use of Joint Registration Organizations, where a MISO/Ameren collaboration would be sanctioned as a single entity, and then the JRO would be responsible for determining how to allocate those sanctions among participants in the JRO.<br><br>The SDT concurs that oversubscription can lead to reliability problems.<br><br>With regard to the Time Horizons used in compliance, the SDT believes the correct horizon is Operations Planning. | | | |
| Avista Corp. | 3 | Negative | The standard needs some flexibility due to regional differences. Support comments submitted by the Bonneville Power Administration. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| Blachly-Lane Electric Co-op | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. | | | | the "(ATCID)"; R2.1.2, where "analyses" should not be plural; and "R"s appear to be missing from all "fourth-tier" requirements (2.1.1.1 for example). |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br>The typographical errors have been corrected and an updated version of the standard has been posted for stakeholders to see – these corrections will be noted in the announcement for the recirculation ballot. | | | |
| City of McMinnville | 3 | Negative | Inappropriate methodology for WECC specific entities |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| City Public Service of San Antonio | 3 | Negative | I cannot vote for this standard as written. It needs to acknowledge definitive alternatives to ATC for regions or markets such as ERCOT where transmission service markets are not used. |
| **Response:** If ERCOT does not choose to implement this methodology, then this standard would not apply to ERCOT. If ERCOT does not have ATC Paths, or ERCOT has an associated variance, MOD-001 would not require them to select a methodology. | | | |
| Clatskanie People's Utility District | 3 | Negative | The requirement of substantial additional flowgate analysis does not add reliability and instead offers the possibility of a lower standard of understanding of system operation. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| Clearwater Power Co. | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| Coos-Curry Electric Cooperative, Inc | 3 | Negative | We suggest a rewrite of requirement 2 that will work for the Western Interconnection. |
| **Response:** The SDT recognizes the commenter's concerns. | Cowlitz County PUD | 3 | Negative | Cowlitz County PUD No.1 (District) Comments on MOD-030-1 Adapted from PPC Recommendations 7/29/08 The Northwest uses a flow-based ATC determination consistent with the main concepts of the proposed MOD-030 standard. However, Northwest flowgates are defined with adequate granularity to identify varying sets of critical contingencies and impacted lines under changing system conditions. Seasonal operating nomograms are developed using varying temperatures, loads and ratings, generation dispatch, and contingency analysis (that meeting greater than n-1 performance requirements) to determine reliable operating capabilities. These operating nomograms allow the transmission provider or operator to maximize capacity based on specific operating conditions. In addition, these seasonal operating nomograms are reviewed by the region and posted in advance of the operating season, addressing both transparency and coordinating requirements. This methodology is specifically designed to the "Hub and Spoke" nature of the Western Interconnection system. Large generation resources are located long distances from large loads verses the tightly meshed systems in the Eastern Interconnection where load and generation are located very close together. Due to the remote nature of generation and load in the west, transient and voltage stability considerations must be taken into consideration.<br>The District disagrees with current language in R2.1.1 and R2.1.2 of MOD-030 which will require the creation of many additional "flowgates" in the Northwest with no added reliability benefits. The current proven methodology used by the Bonneville Power Administration is sufficient. Adopting R2.1.1 and R2.1.2 of MOD-030 as it now stands will unnecessarily increase workload and cost. The District is not willing to help fund complicated reliability measures where there is no benefit.<br>The District respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2. The current methodology used by the Bonneville Power Administration is ultimately more reliable, given the specific nature of the transmission and generation resources in the Western Interconnection. The District supports Bonneville's proposed changes to R2.1 of this proposed standard. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| Duke Energy Carolina | 3 | Affirmative | While we support approval of this standard, bulk electric system facilities 161kV and below may have significant network response. Since these facilities may have significant impact on TTC/AFC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders. |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| **Response:** The standard does not require, but also does not forbid, such documentation. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent. | | | |
| FirstEnergy Solutions | 3 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-030 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-030 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-030 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R2: Flowgate determination and calculation of TFC on flowgates. The variance would not be applicable to the TOP assignment in requirement R3, which requires the TOP to provide transmission modeling data to the TSP for the calculation of AFC. Additional Comments: In response to FE's most recent MOD-030 comments, the drafting team indicated that it felt the TOP is the appropriate entity for Requirement R2 since they are responsible for keeping the system within its operating limits. While it is true that TOPs identify SOLs and are required to maintain SOLs, the use of flowgates is primarily a market function used in evaluating interchange transactions. Per FAC-014 requirement R5.2, TOPs are required to submit SOL information to TSPs and therefore |

<table>
<tr><th>Entity</th><th>Segment</th><th>Vote</th><th>Comment</th></tr>
<tr><td></td><td></td><td></td><td>the TSP would have the information available for the determination of Total Flow Capacity (TFC) for a given flowgate. Therefore, it is FE's position that R2 is better assigned to the TSP, but if the SDT elects not to change the standard, the above request for a MISO variance will satisfy our needs.</td></tr>
<tr><td colspan="4">Response: The SDT believes that the assignment to the Transmission Operator is correct. However, if MISO or its members wish to pursue an entity variance, they may submit a SAR requesting such a variance as defined in the NERC Reliability Standards Development procedure.</td></tr>
<tr><td>Lost River Electric Cooperative</td><td>3</td><td>Negative</td><td>We suggest a rewrite of requirement 2 that will work for the Western Interconnection.</td></tr>

It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.4 - It is unclear why the SDT differentiated between thermal and voltage/stability limits, when the instructions were to use the SOL regardless.<br>**Response:** The first bullet requires that for SOLs with a limit based on megawatts, that the megawatt value be used. However, for SOLs with limits based on MVARs or other units, the flowgate limit would need to be specified as a level of flow in megawatts that supports the SOL. This is the intent of bullet two.<br><br>R11 - Manitoba Hydro is not convinced that conversion from AFC to ATC can be easily calculated in a formula when different assumptions are used for calculating transmission capability. Manitoba Hydro also questions why is it only MOD 30 that requires a conversion formula? If standards are to be fair, shouldn't all three standards (MOD 28, MOD 29 and MOD 30) have as a requirement to convert transmission capability from one method to the other? Manitoba Hydro re-iterates that there shouldn't be 3 ways to calculate transmission capability. The standards should specify one methodology with consistent assumptions to preserve reliability.<br>**Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. | **Response:** Please see in-line responses. | | | |
| MidAmerican Energy Co. | 3 | Negative | I am concerned that R2.1 requires the Transmission Operator to set up a certain number of flowgates at a minimum. With smaller Transmission Service Providers, I believe this will result unnecessarily in additional flow gates in the interconnection. I believe R2.1. should be greatly simplified, deleted, or else changes should be made to R2.1.3. Add at the end of R2.1.3 an exclusion from the requirement of adding flowgates for situations that resulted in congestion management "unless the need for Interconnection-wide congestion management was a result of unusual operating conditions that are not reasonably expected to frequently occur again (such as multiple prior outages of transmission facilities and/or critical generators)." |

| Seattle City Light | 3 | Abstain | The draft standard, in R2.1, proposes requirements for defining flowgates that appear to be inconsistent with approaches currently used in parts of the Western Interconnection to designate flowgate elements. The linear analysis method proposed will not sufficiently consider other System Operating Limits (SOLs) that may factor into flowgate designations. Specifically, the 5% Outage Transfer Distribution Factor (OTDF) threshold proposed for identifying flowgate elements does not reflect the methods currently used in WECC to designate flowgates. While application of OTDF methods is straight-forward, and provides a simple screening tool, it may be excessively burdensome to Transmission Operators to designate and redesignate flowgates using the proposed criteria. Furthermore, it may be impractical for Transmission Service Providers to manage requests for transmission services under pro forma OATT service provisions if the proposed criteria results in a large number of flowgates subject to simultaneous limits. SCL is in agreement with the apparent purpose of the R2.1 - establishing objective criteria with distinct metrics for flowgate designation. However, |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | the requirement R2.1 proposed in the draft should be replaced, perhaps using a WECC variance, to ensure that it results in a manageable number of flowgates that promote reliable operation of the Bulk Electric System. In standards FAC-010-1 and FAC-011-1 NERC has granted Regional Differences for establishing SOLs in the Western Interconnection. A similar Regional Difference should be developed and granted with respect to the establishment and designation of flowgates in the Western Interconnection. |

However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| Public Power Council | 4 | Negative | The Northwest uses a flow-based ATC determination consistent with the concepts of the proposed MOD-030 standard. Northwest flowgates, however, are defined with adequate granularity to identify varying sets of critical contingencies and impacted lines under changing system conditions. Seasonal operating nomograms are developed using varying temperatures, loads and ratings, generation dispatch, and contingency analysis (that meeting greater than n-1 performance requirements) to determine reliable operating capabilities. These operating nomograms allow the transmission provider or operator to maximize capacity based on specific operating conditions. In addition these seasonal operating nomograms are reviewed by the region and posted in advance of the operating season, addressing both transparency and coordinating requirements. This methodology accommodates and is tailored to the “Hub and Spoke” |

|---|---|---|---|
| | | | nature of the Western Interconnection system. Large generation resources are located long distances from large loads verses the tightly meshed systems in the Eastern Interconnection where load and generation are located very close together. Due to the remote nature of generation and load in the west, transient and voltage stability considerations must be taken into consideration. If the language in R2.1.1 and R2.1.2 of MOD-030 is adopted, it will require many additional "flowgates" in the Northwest that will result in no added reliability benefits compared to the method our transmission provider has in place today. Adopting R2.1.1 and R2.1.2 of MOD-030 without further revision would unnecessarily introduce significant workload, cost, and complications that Public Power Council's members and other transmission customers will ultimately have to fund. Because the standard would unnecessarily impose these burdens without any incremental improvement in reliability, Public Power Council respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2. The current method used by the Bonneville Power Administration is ultimately more reliable, given the specific nature of the transmission and generation resources in the Western Interconnection. Public Power Council supports Bonneville's proposed approach and proposed revisions to R2.1 to address the needs of the Western Interconnection in this proposed standard. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| Public Utility District No. 1 of Douglas County | 4 | Negative | We have not had sufficient time to adequately review and coordinate the issue within our region. |
| **Response:** The SDT believes that significant time has been allowed for entities to review and comment on the standard. | | | |
| Public Utility District No. 1 of Snohomish County | 4 | Negative | The District Intends To Vote As Follows: MOD-001: votes Abstain, with no comments MOD-030 comments: The Northwest uses a flow-based ATC determination consistent with the concepts of the proposed MOD-030 standard. However northwest flowgates are defined to provide adequate granularity needed to identify varying sets of critical contingencies and impacted lines under changing system conditions. Seasonal operating nomograms are developed using varying temperatures/loads/rating, generation dispatch, and contingency analysis (that meeting greater than n-1 performance requirements) to determine reliable operating capabilities. | Seattle City Light | 4 | Abstain | The draft standard, in R2.1, proposes requirements for defining flowgates that appear to be inconsistent with approaches currently used in parts of the Western Interconnection to designate flowgate elements. The linear analysis method proposed will not sufficiently consider other System Operating Limits (SOLs) that may factor into flowgate designations. Specifically, the 5% Outage Transfer Distribution Factor (OTDF) threshold proposed for identifying flowgate elements does not reflect the methods currently used in WECC to designate flowgates. While application of OTDF methods is straight-forward, and provides a simple screening tool, it may be excessively burdensome to Transmission Operators to designate and redesignate flowgates using the proposed criteria. Furthermore, it may be impractical for Transmission Service Providers to manage requests for transmission services under pro forma OATT service provisions if the proposed criteria results in a large number of flowgates subject to simultaneous limits. SCL is in agreement with the apparent purpose of the R2.1 - establishing objective criteria with distinct metrics for flowgate designation. However, the requirement R2.1 proposed in the draft should be replaced, perhaps using a WECC variance, to ensure that it results in a manageable number of flowgates that promote |

| WPS Resources Corp. | 4 | Negative | R2.1 requires that the Transmission Operator shall set up a certain number of flowgates at a minimum. This could result in a certain flowgates that are not needed on an on-going basis. This requirement should be simplified, deleted, and/or changed.<br>R2.1.3. presently states that "Any limiting Element/Contingency combination at least within the Transmission model identified in R3.4 and R3.5 that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology." This requirement should provide another condition when the requirement is waived by adding the following words at the end of the requirement "or unless the need for Interconnection-wide congestion management was a result of unusual operating conditions that are not reasonably expected to frequently occur again (such as multiple prior outages of transmission facilities and/or critical generators)."<br>Also, the Transmission Operator is the responsible entity for R2 through R3 for MOD-030. The responsible entity for these requirements should be the Transmission Service Provider. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>Regarding the assignment of R2 and R3 to the Transmission Operator, the Functional Model does not attribute the determination of TTC or TFC to any entity. As such, the SDT was required to interpret the model to determine the appropriate entity for determining TTC or TFC. Since the ratings of facilities are established by the Transmission Operator, the SDT felt it appropriate to assign the responsibility for TFC to the Transmission Operator. | | | |
| Avista Corp. | 5 | Negative | This standard needs to incorporate the need for regional differences. We support the comments submitted by BPA. |

| Bonneville Power Administration | 5 | Negative | 1. R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the eastern interconnection. However, existing practices in BPA's part of the western interconnection use flow based ATC determination which, while consistent with the concepts of this proposed standard, use a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. MOD-30 as written would require many new "flowgates" based on varying system conditions without providing any increased reliability benefit. This is because BPA determines their capacity based on WECC criteria which test for thermal restrictions, voltage stability, and transient stability - where the specific characteristics of load, generation, configuration of extensive special protection schemes (SPS), and WECC's more stringent (greater than n-1) performance requirements - to determine which varying specific lines or equipment determine the capacity of the flowgate. While made up of different named elements, BPA's existing flowgates do not always include the first three limiting elements and their worst associated Contingency combinations, yet they still protect the area of transmission constraint. An example of a basis for an ATC capacity that does not fit the proposed standard's language is a two Palo Verde nuclear unit outage in Arizona which is often the critical contingency that causes voltage stability limitations on BPA's North of Hanford Path in Washington over 1000 miles away from the Palo Verde units. While the proposed MOD-30 Flowgate Methodology may provide sufficient reliability for (n-1) thermally limited constraints where the impact of an outage is on parallel transmission, the above example describes a limiting outage that is not in the area of the transmission constraint, thus it does not make sense to define it as part of a flowgate. In regards to capacity, BPA's existing flowgates can be dynamically changed to maximize capacity based on specific operating conditions. If the language in R2.1.1 and R2.1.2 of MOD-30 is adopted, it will require defining many additional "flowgates" with no added reliability or capacity compared to the method BPA has in place today. This would unnecessarily introduce significant workload and computation to BPA and many others in the western interconnection that could, in fact, complicate the understanding of operational constraints. For these reasons, BPA believes that implementation of R2.1.1-2.1.2.2 does not make sense within WECC and respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2 for WECC entities as a regional difference: RX. WECC: Results of transfer analyses, consistent with those studies required in FAC-010 and FAC-011, or their successors, for ATC Paths up to the path capability. RX.1. Only the most limiting element in a series configuration needs to be included in a Flowgate. If these "RX" requirements are added, to replace R2.1.1-2.1.2.2 for WECC entities, R2.4 would also require modification as follows ("red/underlined" language indicates additions): R2.4. Establish the TFC of each of the |

It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br>The typographical errors have been corrected and an updated version of the standard has been posted for stakeholders to see – these corrections will be noted in the announcement for the recirculation ballot. | | | |
| FirstEnergy Solutions | 5 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-030 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-030 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-030 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R2: Flowgate determination and calculation of TFC on flowgates. The variance would not be applicable to the TOP assignment in requirement R3, which requires the TOP to provide transmission modeling data to the TSP for the calculation of AFC. Additional Comments: In response to FE's most recent MOD-030 comments, the drafting team indicated that it felt the TOP is the appropriate entity for Requirement R2 since they are responsible for keeping the system within its operating limits. While it is true that TOPs identify SOLs and are required to maintain SOLs, the use of flowgates is primarily a market function used in evaluating interchange transactions. Per FAC-014 requirement R5.2, TOPs are required to submit SOL information to TSPs and therefore the TSP would have the information available for the determination of Total Flow Capacity (TFC) for a given flowgate. Therefore, it is FE's position that R2 is better assigned to the TSP, but if the SDT elects not to change the standard, the above request for a MISO variance will satisfy our needs. |
| **Response:** The SDT believes that the assignment to the Transmission Operator is correct. However, if MISO or its members wish to pursue an entity variance, they may submit a SAR requesting such a variance as defined in the NERC Reliability Standards Development procedure. | | | |
| IBERDROLA RENEWABLES | 5 | Negative | R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the Eastern interconnection with its commensurate characteristics. However, practices that are in place in BPA's part of the western interconnection use flow based ATC determination consistent with the concepts of this proposed standard, but they are based on using a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-030 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R2: Flowgate determination and calculation of TFC on flowgates. The variance would not be applicable to the TOP assignment in requirement R3, which requires the TOP to provide transmission modeling data to the TSP for the calculation of AFC. Additional Comments: In response to FE's most recent MOD-030 comments, the drafting team indicated that it felt the TOP is the appropriate entity for Requirement R2 since they are responsible for keeping the system within its operating limits. While it is true that TOPs identify SOLs and are required to maintain SOLs, the use of flowgates is primarily a market function used in evaluating interchange transactions. Per FAC-014 requirement R5.2, TOPs are required to submit SOL information to TSPs and therefore the TSP would have the information available for the determination of Total Flow Capacity (TFC) for a given flowgate. Therefore, it is FE's position that R2 is better assigned to the TSP, but if the SDT elects not to change the standard, the above request for a MISO variance will satisfy our needs. |
| **Response:** The SDT believes that the assignment to the Transmission Operator is correct. However, if MISO or its members wish to pursue an entity variance, they may submit a SAR requesting such a variance as defined in the NERC Reliability Standards Development procedure**.** | | | |
| IBERDROLA | 6 | Negative | R2.1.1 thru R2.1.2.2 appear to well reflect existing practices in the Eastern |

| RENEWABLES | | | interconnection with its commensurate characteristics. However, practices that are in place in BPA's part of the western interconnection use flow based ATC determination consistent with the concepts of this proposed standard, but they are based on using a set of designated flowgates that could have a varying set of critical contingencies and impacted lines depending on the system conditions. MOD-30 as written would require many new "flowgates" based on varying system conditions without providing any increased reliability benefit. This is because BPA determines their capacity based on WECC criteria which test for thermal restrictions, voltage stability, and transient stability where the specific characteristics of:<br><br>– Load – Generation<br>– Configuration of extensive special protection schemes (SPS) and<br>– WECC's more stringent (greater than n-1) performance requirements determine which varying specific lines or equipment determine the capacity of the flowgate. While being made up of different named elements, BPA's existing flowgates do not always include the first three limiting Elements and their worst associated contingency combinations, yet they still protect the area of transmission constraint.<br>An example of a basis for an ATC capacity that does not fit the proposed standard's language is a two Palo Verde nuclear unit outage in Arizona which is often the critical contingency that causes voltage stability limitations on BPA's North of Hanford Path in Washington over 1000 miles away from the Palo Verde units. While the proposed MOD-30 Flowgate Methodology may provide sufficient reliability for (n-1) thermally limited constraints where the impact of an outage is on parallel transmission, the above example describes a limiting outage that is not in the area of the transmission constraint, thus it does not make sense to define it as part of a flowgate. In regards to capacity, BPA's existing flowgates can be dynamically changed to maximize capacity based on specific operating conditions. If the language in R2.1.1 and R2.1.2 of MOD-30 is adopted, it will require defining many additional "flowgates" with no added reliability or capacity compared to the method BPA has in place today. This would unnecessarily introduce significant workload and computation to BPA and many others in the western interconnection that could, in fact, complicate the understanding of operational constraints. For these reasons, BPA believes that implementation of R2.1.1-2.1.2.2 does not make sense within WECC and respectfully requests that alternate WECC-specific requirements be added to replace R2.1.1-2.1.2.2 for WECC entities as a regional difference: RX. WECC: Results of transfer analyses, consistent with those studies required in FAC-010 and FAC-011, or their successors, for ATC Paths up to the path capability. RX.1. Only the most limiting element in a series configuration needs to be included in a Flowgate. If these "RX" requirements are |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | added, to replace R2.1.1- 2.1.2.2 for WECC entities, R2.4 would also require modification as follows (“red/underline” language indicates additions): R2.4. Establish the TFC of each of the defined Flowgates as equal to:<br>For thermal limits, the lowest System Operating Limit (SOL) included in the definition of the Flowgate.<br>For voltage or stability limits, the flow that will respect the lowest SOL included in the definition of the Flowgate.<br>**Response:** The SDT recognizes the commenter’s concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>2. Additionally, there are typos at the following locations: Applicability 4.1.1, where a space is missing between “(AFCs)” and “on”; R1, where a colon is missing following the “(ATCID)’; R2.1.2, where “analyses” should not be plural; and “R” appear to be missing from all “fourth-tier” requirements (2.1.1.1 for example).<br>**Response:** The typographical errors have been corrected and an updated version of the standard has been posted for stakeholders to see – these corrections will be noted in the announcement for the recirculation ballot. |
| **Response:** Please see in-line responses. | | | |
| Manitoba Hydro | 6 | Negative | R2.1.3 - This requirement seems onerous. Having to calculate AFCs for a flowgate that was created for a temporary system configuration, once that system configuration has resolved, seems like work for little/no benefit.<br>**Response:** The SDT recognizes the commenter’s concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.3 - Manitoba Hydro agrees with MISO's proposed wording changes of: At a minimum, establish the list of external flowgates to create, modify or delete that have been requested as part of R2.1.4 within thirty calendar days from the request.<br>**Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version.<br><br>R2.4 - It is unclear why the SDT differentiated between thermal and voltage/stability limits, when the instructions were to use the SOL regardless.<br>**Response:** The first bullet requires that for SOLs with a limit based on megawatts, that the megawatt value be used. However, for SOLs with limits based on MVARs or other units, the flowgate limit would need to be specified as a level of flow in megawatts that supports the SOL. This is the intent of bullet two.<br><br>R11 - Manitoba Hydro is not convinced that conversion from AFC to ATC can be easily calculated in a formula when different assumptions are used for calculating transmission capability. Manitoba Hydro also questions why is it only MOD 30 that requires a conversion formula? If standards are to be fair, shouldn't all three standards (MOD 28, MOD 29 and MOD 30) have as a requirement to convert transmission capability from one method to the other? Manitoba Hydro re-iterates that there shouldn't be 3 ways to calculate transmission capability. The standards should specify one methodology with consistent assumptions to preserve reliability.<br>**Response:** The SDT is not commenting on whether or not a TTC value has usefulness within the Flowgate methodology, and is not requiring in this standard that the TTC be calculated. However, if TTC is to be calculated, the SDT believes that this is a standardized way to do so that will result in a number that can be presented as a valid TTC. Other entities have not been requested to convert their ATCs or TTCs to AFCs or TFCs because to do so would require information that would only be available if the entities had implemented the Flowgate methodology. If Manitoba Hydro is advocating |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | a single methodology, the SDT suggests the Manitoba Hydro request this for inclusion in NERC's annual work plan. |
| **Response:** Please see in-line responses. | | | |
| Public Utility District No. 1 of Chelan County | 6 | Negative | Standard as written complicates transmission service from the Bonneville Power Authority without adding reliability. |
| **Response:** The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline, the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |
| Electric Reliability Council of Texas, Inc. | 10 | Abstain | Although stated in the Applicability Section, the Requirements and Measures contain no clear applicability only to those Transmission Operators and Transmission Service providers who utilize the Flowgate methodology in calculating Available Flowgate Capabilities. |
| **Response:** The entire standard applies only to those entities who utilize the Flowgate methodology in calculating TFC and AFC. | | | |
| Midwest Reliability Organization | 10 | Negative | The MRO is concerned with the R2.1 that requires that the Transmission Operator shall set up a certain number of flowgates at a minimum. The MRO is concerned that this will require a certain number of flowgates will be needlessly set up by smaller Transmission Service Providers as a result of this requirement. The MRO believes that this will result in a certain number of flowgates be needlessly set up. We believe that this requirement should be greatly simplified, deleted, and/or changes to R2.1.3 should be made. R2.1.3. presently states that "Any limiting Element/Contingency combination at least within the Transmission model identified in R3.4 and R3.5 that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology." We believe that this requirement should provide another condition when the requirement is waived by adding the following words at the end of the requirement "or unless the need for Interconnection-wide congestion management was a result of unusual operating conditions that are not reasonably expected to frequently occur again (such as multiple prior outages of transmission facilities and/or critical generators)." Also, the MRO is concerned with the Transmission Operator being the responsible entity for R2 through R3 for MOD-030. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| **Response: The SDT recognizes the commenter's concerns. In order to be responsive to FERC Order 890 within the established filing deadline,** the SDT is not making changes to the standard at this time. However, the SDT has developed a revision to MOD-030 to address this concern (MOD-030 Version 2) and has posted that revision for a 45-day comment period. It is the intention of the SDT to pursue the approval of MOD-030 Version 2 prior to the effective date of MOD-030 Version 1, such that the new version supersedes the older version. | | | |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Regarding the assignment of R2 and R3 to the Transmission Operator, the Functional Model does not attribute the determination of TTC or TFC to any entity. As such, the SDT was required to interpret the model to determine the appropriate entity for determining TTC or TFC. Since the ratings of facilities are established by the Transmission Operator, the SDT felt it appropriate to assign the responsibility for TFC to the Transmission Operator. | | | |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30 Day posting before board adoption. | June 21 ,2008 |
| 8. Board adopts MOD-001-1. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Rated System Path Methodology:** The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC, and Postbacks and counterflows are added as applicable, to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities.

## A. Introduction

1. **Title:** **Rated System Path Methodology**

2. **Number:** **MOD-029-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Rated System Path Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

   **4.2.** Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** When calculating TTCs for ATC Paths, the Transmission Operator shall use a Transmission model which satisfies the following requirements: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The model utilizes data and assumptions consistent with the time period being studied and that meets the following criteria:

**R1.1.1.** Includes at least:

R1.1.1.1. The Transmission Operator area. Equivalent representation of radial lines and facilities 161kV or below is allowed.

R1.1.1.2. All Transmission Operator areas contiguous with its own Transmission Operator area. (Equivalent representation is allowed.)

R1.1.1.3. Any other Transmission Operator area linked to the Transmission Operator's area by joint operating agreement. (Equivalent representation is allowed.)

**R1.1.2.** Models all system Elements as in-service for the assumed initial conditions.

**R1.1.3.** Models all generation (may be either a single generator or multiple generators) that is greater than 20 MVA at the point of interconnection in the studied area.

**R1.1.4.** Models phase shifters in non-regulating mode, unless otherwise specified in the Available Transfer Capability Implementation Document (ATCID).

**R1.1.5.** Uses Load forecast by Balancing Authority.

**R1.1.6.** Uses Transmission Facility additions and retirements.

**R1.1.7.** Uses Generation Facility additions and retirements.

**R1.1.8.** Uses Special Protection System (SPS) models where currently existing or projected for implementation within the studied time horizon.

**R1.1.9.** Models series compensation for each line at the expected operating level unless specified otherwise in the ATCID.

**R1.1.10.** Includes any other modeling requirements or criteria specified in the ATCID.

**R1.2.** Uses Facility Ratings as provided by the Transmission Owner and Generator Owner

**R2.** The Transmission Operator shall use the following process to determine TTC: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Except where otherwise specified within MOD-029-1, adjust base case generation and Load levels within the updated power flow model to determine the TTC (maximum flow or reliability limit) that can be simulated on the ATC Path while at the same time satisfying all planning criteria contingencies as follows:

**R2.1.1.** When modeling normal conditions, all Transmission Elements will be modeled at or below 100% of their continuous rating.

**R2.1.2.** When modeling contingencies the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its Emergency Rating.

**R2.1.3.** Uncontrolled separation shall not occur.

**R2.2.** Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependant on a Special Protection System (SPS), set the TTC for the non-prevailing flow direction equal to the greater of the maximum flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a SPS.

**R2.3.** For an ATC Path whose capacity is limited by contract, set TTC on the ATC Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R2.1.

**R2.4.** For an ATC Path whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.

**R2.5.** The Transmission Operator shall identify when the TTC for the ATC Path being studied has an adverse impact on the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1. The Transmission Operator shall include the resolution of this adverse impact in its study report for the ATC Path.

**R2.6.** Where multiple ownership of Transmission rights exists on an ATC Path, allocate TTC of that ATC Path in accordance with the contractual agreement made by the multiple owners of that ATC Path.

**R2.7.** For ATC Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and no action has been taken to have the path rated using a different method, set the TTC at that previously established amount.

**R2.8.** Create a study report that describes the steps above that were undertaken (R2.1 – R2.7), including the contingencies and assumptions used, when determining the TTC and the results of the study. Where three phase fault damping is used to determine stability limits, that report shall also identify the percent used and include justification for use unless specified otherwise in the ATCID.

**R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.** Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** When calculating ETC for firm Existing Transmission Commitments ($ETC_F$) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

$\mathbf{NL_F}$ is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{NITS_F}$ is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{GF_F}$ is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "safe harbor tariff."

$\mathbf{PTP_F}$ is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

$\mathbf{ROR_F}$ is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

$\mathbf{OS_F}$ is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments ($ETC_{NF}$) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

$\mathbf{NITS_{NF}}$ is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{GF_{NF}}$ is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "safe harbor tariff."

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

**R7.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + counterflows_F$$

**Where**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_F$** are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.

**R8.** When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and specified in its ATCID.

## C. Measures

**M1.** Each Transmission Operator that uses the Rated System Path Methodology shall produce any Transmission model it used to calculate TTC for purposes of calculating ATC for each ATC Path, as required in R1, for the time horizon(s) to be examined. (R1)

**M1.1.** Production shall be in the same form and format used by the Transmission Operator to calculate the TTC, as required in R1. (R1)

**M1.2.** The Transmission model produced must include the areas listed in R1.1.1 (or an equivalent representation, as described in the requirement) (R1.1)

**M1.3.** The Transmission model produced must show the use of the modeling parameters stated in R1.1.2 through R1.1.10; except that, no evidence shall be required to prove: 1) utilization of a Special Protection System where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred. (R1.1.2 through R1.1.10)

**M1.4.** The Transmission Operator must provide evidence that the models used to determine TTC included Facility Ratings as provided by the Transmission Owner and Generator Owner. (R1.2)

**M2.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (R1.1.4, R.1.1.9, and R1.1.10).

**M3.** Each Transmission Operator that uses the Rated System Path Methodology with paths with ratings established prior to January 1, 1994 shall provide evidence the path and its rating were established prior to January 1, 1994. (R2.7)

**M4.** Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)

**M5.** Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7and R8 for each ATC Path. (R3)

**M6.** Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R4)

**M7.** The Transmission Service Provider shall demonstrate compliance with R5 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R5 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-029-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R5 to calculate its firm ETC. (R5)

**M8.** The Transmission Service Provider shall demonstrate compliance with R5 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R6 and with data used to calculate this specified value for the designated time period. The data used must meet the requirements specified in the MOD-029 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15

MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R6 to calculate its non-firm ETC. (R6)

**M9.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R7. Such documentation must show that only the variables allowed in R7 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R7)

**M10.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall have its latest models used to determine TTC for R1. (M1)
- The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)
- The Transmission Operator shall retain evidence of any path and its rating that was established prior to January 1, 1994. (M3)
- The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M4)
- The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R3 and R4. (M5 and M6)
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R5 and R6 for the most recent 14 days; evidence to show compliance in calculating daily values required in R5 and R6 for the most recent 30

days; and evidence to show compliance in calculating daily values required in R5 and R6 for the most recent sixty days. (M7 and M8)

- The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R7 and R8. (M9 and M10)
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

| R7. | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |
| R8. | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30 Day posting before board adoption. | June 21 ,2008 |
| 8. Board adopts MOD-001-1. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Rated System Path Methodology:** The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC, and Postbacks and counterflows are added as applicable, to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities.

## A. Introduction

1. **Title:** **Rated System Path Methodology**

2. **Number:** **MOD-029-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Rated System Path Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

   **4.2.** Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** When calculating TTCs for ATC Paths, the Transmission Operator shall use a Transmission model which satisfies the following requirements: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The model utilizes data and assumptions consistent with the time period being studied and that meets the following criteria:

**R1.1.1.** Includes at least:

1.1.1.1. The Transmission Operator area. Equivalent representation of radial lines and facilities 161kV or below is allowed.

1.1.1.2. All Transmission Operator areas contiguous with its own Transmission Operator area. (~~e~~Equivalent representation is allowed.)~~.~~

1.1.1.3. Any other Transmission Operator area linked to the Transmission Operator's area by joint operating agreement. (~~e~~Equivalent representation is allowed.)~~.~~

**R1.1.2.** Models all system Elements as in-service for the assumed initial conditions.

**R1.1.3.** Models all generation (may be either a single generator or multiple generators)~~Facilities~~ ~~larger~~ that is greater than 20 MVA at the point of interconnection in the studied area.

**R1.1.4.** Models phase shifters in non-regulating mode, unless otherwise specified in the Available Transfer Capability Implementation Document (ATCID).

**R1.1.5.** Uses Load forecast by Balancing Authority.

**R1.1.6.** Uses Transmission Facility additions and retirements.

**R1.1.7.** Uses Generation Facility additions and retirements.

**R1.1.8.** Uses Special Protection System (SPS) models where currently existing or projected for implementation within the studied time horizon.

**R1.1.9.** Models series compensation for each line at the expected operating level unless specified otherwise in the ATCID.

**R1.1.10.** Includes any other modeling requirements or criteria specified in the ATCID.

**R1.2.** Uses Facility Ratings as provided by the Transmission Owner and Generator Owner

**R2.** The Transmission Operator shall use the following process to determine TTC: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Except where otherwise specified within MOD-029-1, adjust base case generation and Load levels within the updated power flow model to determine the TTC (maximum flow or reliability limit) that can be simulated on the ATC Path while at the same time satisfying all planning criteria contingencies as follows:

**R2.1.1.** When modeling normal conditions, ~~do not model any~~all Transmission Elements will be modeled at or ~~above~~ below 100% of ~~its~~ their continuous rating.

**R2.1.2.** When modeling contingencies the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its Emergency Rating.

**R2.1.3.** Uncontrolled separation shall not occur.

**R2.2.** Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependant on a Special Protection System (SPS), set the TTC for the non-prevailing flow direction equal to the greater of the maximum flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a SPS.

**R2.3.** For an ATC Path whose capacity is limited by contract, set TTC on the ATC Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R2.1.

**R2.4.** For an ATC Path whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.

**R2.5.** The Transmission Operator shall identify when~~Verify that~~ the TTC for the ATC Path being studied ~~does not~~has an adverse~~ly~~ impact on the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1. ~~.~~ The Transmission Operator shall include the resolution of this adverse impact in ~~the~~its study report for the ATC Path.

**R2.6.** Where multiple ownership of Transmission rights exists on an ATC Path, allocate TTC of that ATC Path in accordance with the contractual agreement made by the multiple owners of that ATC Path.

**R2.7.** For ATC Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and no action has been taken to have the path rated using a different method, set the TTC at that previously established amount.

**R2.8.** Create a study report that describes the steps above that were undertaken (R2.1 – R2.7), including the contingencies and assumptions used, when determining the TTC and the results of the study. Where three phase fault damping is used to determine stability limits, that report shall also identify the percent used and include justification for use unless specified otherwise in the ATCID.

**R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.** Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** When calculating ETC for firm Existing Transmission Commitments ($ETC_F$) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

$\mathbf{NL_F}$ is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{NITS_F}$ is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{GF_F}$ is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "s~~S~~afe h~~H~~arbor t~~T~~ariff." ~~accepted by FERC.~~

$\mathbf{PTP_F}$ is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

$\mathbf{ROR_F}$ is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

$\mathbf{OS_F}$ is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments ($ETC_{NF}$) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**$NITS_{NF}$** is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**$GF_{NF}$** is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "s~~S~~afe h~~H~~arbor t~~T~~ariff." ~~accepted by FERC.~~

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

**R7.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + counterflows_F$$

**Where**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_F$** are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.

**R8.** When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**Postbacks**$_{NF}$ are changes to non-firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**counterflows**$_{NF}$ are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and specified in its ATCID.

## C. Measures

**M1.** Each Transmission Operator that uses the Rated System Path Methodology shall produce any Transmission model it used to calculate TTC for purposes of calculating ATC for each ATC Path, as required in R1, for the time horizon(s) to be examined. (R1)

**M1.1.** Production shall be in the same form and format used by the Transmission Operator to calculate the TTC, ~~used in its ATC calculations,~~ as required in R1. (R1)

**M1.2.** The Transmission model produced must include the areas listed in R1.1.1 ~~1~~ (or an equivalent representation, as described in the requirement) (R1.1)

**M1.3.** The Transmission model produced must show the use of the modeling parameters stated in R1.1.2 through R1.1.10; except that, no evidence shall be required to prove: 1) utilization of a Special Protection System where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred. (R1.1.2 through R1.1.10)

**M1.4.** The Transmission Operator must provide evidence that the models used to determine TTC included Facility Ratings as provided by the Transmission Owner and Generator Owner. (R1.2)

**M2.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (R1.1.4, R.1.1.9, and R1.1.10).

**M3.** Each Transmission Operator that uses the Rated System Path Methodology with paths with ratings established prior to January 1, 1994 shall provide evidence the path and its rating were established prior to January 1, 1994. (R2.7)

**M4.** Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)

**M5.** Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7and R8 for each ATC Path. (R3)

**M6.** Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R4)

**M7.** The Transmission Service Provider ~~must be capable of~~shall ~~demonstrating~~ demonstrate compliance with R5 by ~~that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate~~ recalculating ~~the individual value of the~~ firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R5 and with data used to calculate ~~this~~ the specified value for the designated ~~hour.~~time period. The data used must meet the requirements specified in ~~the standard~~MOD-029-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is ~~, and the audited value must be~~ within +/- 15% or 15 MW, whichever is greater, of the

~~demonstrated~~ originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R5 to calculate its firm ETC~~result~~. (R5)

**M8.** The Tranasmission Service Provider ~~must be capable of demonstrating~~shall demonstrate compliance with R5 by ~~that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can~~ recalculatinge ~~the individual value of the~~ non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R6 and with data used to calculate this specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in the ~~standard~~ MOD-029 and the ATCID.~~,~~ To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is ~~and the audited value must be~~ within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R6 to calculate its non-firm ETC~~demonstrated result~~. (R6)

**M9.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R7. Such documentation must show that only the variables allowed in R7 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R7)

**M10.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall have its latest models used to determine TTC for R1. (M1)
- The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)

- The Transmission Operator shall retain evidence of any path and its rating that was established prior to January 1, 1994. (M3)
- The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M4)
- The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R3 and R4. (M5 and M6)
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R5 and R6 for the most recent 14 days; evidence to show compliance in calculating daily values required in R5 and R6 for the most recent 30 days; and evidence to show compliance in calculating daily values required in R5 and R6 for the most recent sixty days. ~~to show compliance with R5 and R6.~~ (M7 and M8)
- The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R7 and R8. (M9 and M10)
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

~~-~~The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|

## Implementation Plan for Standard MOD-029-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-029-1 – Rated System Path Methodology, which describes the Rated System Path methodology for determining ATC.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Retired Standards

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-029-1 incorporates the following requirements from FAC-012-1:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-029-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-029-1 incorporates the following requirements from FAC-013-1:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-029-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-029-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

Committee shall set the proposed standard for ballot as soon as the work flow will accommodate."

NERC's Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008. Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee's Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards. The Standards Committee's Executive Committee directed NERC's Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

116-390 Village Boulevard, Princeton, New Jersey 08540-5721

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Brazos Electric Power Cooperative, Inc. | 1 | Negative | A NEGATIVE vote is cast for this standard as written as it imposes obligations on entities in the ERCOT region that do not utilize ATC paths and calculation methodologies to manage congestion or for reliability operations. Our previous submitted comments suggested that applicability language be included in the requirements to recognize that such market difference exists. |
| Exelon Energy | 1 | Affirmative | General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies for corresponding time periods. Exelon's comments reflect these deficiencies and Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890. Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-028-1 Area Interchange Methodology, MOD-029-1 Rated System Path Methodology Â· Both standards need the following requirement added: Use first contingency criteria consistent with those first contingency used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems. |
| Southwest Transmission Cooperative, Inc. | 1 | Affirmative | SWTC supports all elements of MOD-29; however, there is a minority opinion that the VSLs as redrafted to accommodate the industry comments have blurred the lines of severity and grant additional discretion to the enforcement entity. |
| New York Independent System Operator | 2 | Abstain | The NYISO abstains from voting on this proposed standard. The NYISO appreciates recent feedback from the Standards Drafting Team on several rounds of comments requesting that revisions be made to the language of this proposed standard in order to: (i) expressly accommodate the NYISO's FERC-approved market design and financial reservation based open access transmission system; and (ii) eliminate any possible question as to whether the NYISO's existing approach to calculating ATC satisfies the requirements of the proposed standards. The Standards Drafting Team has indicated that it believes that the NYISO's existing procedures are compliant with the proposed standard. Nevertheless, the NYISO is abstaining in order to preserve its rights to seek a formal confirmation of its compliance from FERC or NERC. |
| City Public Service of San Antonio | 3 | Negative | I cannot vote for this standard as written. It needs to acknowledge definitive alternatives to ATC for regions or markets such as ERCOT where transmission service markets are not used. |
| Duke Energy Carolina | 3 | Affirmative | While we support approval of this standard, bulk electric system facilities 161kV and below may have significant network response. Since these facilities may have significant impact on TTC/AFC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders. |
| Wisconsin Public Service Corp. | 3 | Abstain | This is the rated system path methodology that is used in WECC. |
| Public Utility District | 4 | Negative | We have not had sufficient time to review the effects of this change and coordinate it with others in our |

| Entity | Segment | Vote | Comment |

| No. 1 of Douglas County | | | region. |
| Electric Reliability Council of Texas, Inc. | 10 | Abstain | Although stated in the Applicability Section, the Requirements and Measures contain no clear applicability only to those Transmission Operators and Transmission Service providers who utilize the Rated System Path methodology in calculating TTC and ATC. |
| Midwest Reliability Organization | 10 | Abstain | This is the rated system path methodology that is used in WECC. |

NERC

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

## Consideration of Comments on Initial Ballot — MOD-029-1 — Rated System Path Methodology

**Summary Consideration:** While some stakeholders suggested modifications to the standard, most stakeholders agreed with the standard as proposed and the drafting team did not make any changes to the standard.

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Brazos Electric Power Cooperative, Inc. | 1 | Negative | A NEGATIVE vote is cast for this standard as written as it imposes obligations on entities in the ERCOT region that do not utilize ATC paths and calculation methodologies to manage congestion or for reliability operations. Our previous submitted comments suggested that applicability language be included in the requirements to recognize that such market difference exists. |
| **Response:** If ERCOT does not choose to implement this methodology, then this standard would not apply to ERCOT. If ERCOT does not have ATC Paths, or ERCOT has an associated variance, MOD-001 would not require them to select a methodology. | | | |
| Exelon Energy | 1 | Affirmative | General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies for corresponding time periods. Exelon's comments reflect these deficiencies and Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890. Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-028-1 Area Interchange Methodology, MOD-029-1 Rated System Path Methodology Â· Both standards need the following requirement added: Use first contingency criteria consistent with those first contingency used in operations studies and planning studies for the applicable time periods, including use of Special Protection Systems. |
| **Response:** The SDT believes the intent of this suggestion is addressed in MOD-001 R6 and R7. | | | |
| Southwest Transmission Cooperative, Inc. | 1 | Affirmative | SWTC supports all elements of MOD-29; however, there is a minority opinion that the VSLs as redrafted to accommodate the industry comments have blurred the lines of severity and grant additional discretion to the enforcement entity. |
| **Response:** The SDT reviewed the VSLs and concludes that they appropriately minimize the discretion of the enforcement entity. If in future comments on standards you could be more specific, that would aid the team in addressing your concerns. | | | |
| New York Independent System Operator | 2 | Abstain | The NYISO abstains from voting on this proposed standard. The NYISO appreciates recent feedback from the Standards Drafting Team on several rounds of comments requesting that revisions be made to the language of this proposed standard in order to: (i) expressly |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | accommodate the NYISO's FERC-approved market design and financial reservation based open access transmission system; and (ii) eliminate any possible question as to whether the NYISO's existing approach to calculating ATC satisfies the requirements of the proposed standards. The Standards Drafting Team has indicated that it believes that the NYISO's existing procedures are compliant with the proposed standard. Nevertheless, the NYISO is abstaining in order to preserve its rights to seek a formal confirmation of its compliance from FERC or NERC. |
| **Response:** The SDT cannot provide such formal confirmation, but thanks you for your supportive comment. | | | |
| City Public Service of San Antonio | 3 | Negative | I cannot vote for this standard as written. It needs to acknowledge definitive alternatives to ATC for regions or markets such as ERCOT where transmission service markets are not used. |
| **Response:** If ERCOT does not choose to implement this methodology, then this standard would not apply to ERCOT. If ERCOT does not have ATC Paths, or ERCOT has an associated variance, MOD-001 would not require them to select a methodology. | | | |
| Duke Energy Carolina | 3 | Affirmative | While we support approval of this standard, bulk electric system facilities 161kV and below may have significant network response. Since these facilities may have significant impact on TTC/AFC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders. |
| **Response:** The standard does not require, but also does not forbid, such documentation. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent. | | | |
| Wisconsin Public Service Corp. | 3 | Abstain | This is the rated system path methodology that is used in WECC. |
| **Response:** The SDT concurs. | | | |
| Public Utility District No. 1 of Douglas County | 4 | Negative | We have not had sufficient time to review the effects of this change and coordinate it with others in our region. |
| **Response:** The SDT believes that significant time has been allowed for entities to review and comment on the standard. | | | |
| Electric Reliability Council of Texas, Inc. | 10 | Abstain | Although stated in the Applicability Section, the Requirements and Measures contain no clear applicability only to those Transmission Operators and Transmission Service providers who utilize the Rated System Path methodology in calculating TTC and ATC. |
| **Response:** The entire standard applies only to those entities who utilize the Rated System Path methodology in calculating TTC and ATC. | | | |
| Midwest Reliability Organization | 10 | Abstain | This is the rated system path methodology that is used in WECC. |
| **Response:** The SDT concurs. | | | |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Area Interchange Methodology:** The Area Interchange methodology is characterized by determination of incremental transfer capability via simulation, from which Total Transfer Capability (TTC) can be mathematically derived. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Area Interchange Methodology, TTC results are generally reported on an area to area basis.

## A. Introduction

1. **Title: Area Interchange Methodology**

2. **Number: MOD-028-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of Transfer Capability calculations for short-term use performed by entities using the Area Interchange Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Area Interchange Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

   **4.2.** Each Transmission Service Provider that uses the Area Interchange Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Service Provider shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining Total Transfer Capability (TTC): *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- **R1.1.** Information describing how the selected methodology has been implemented, in such detail that, given the same information used by the Transmission Operator, the results of the TTC calculations can be validated.
- **R1.2.** A description of the manner in which the Transmission Operator will account for Interchange Schedules in the calculation of TTC.
- **R1.3.** Any contractual obligations for allocation of TTC.
- **R1.4.** A description of the manner in which Contingencies are identified for use in the TTC process.
- **R1.5.** The following information on how source and sink for transmission service is accounted for in ATC calculations including:
  - **R1.5.1.** Define if the source used for Available Transfer Capability (ATC) calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation
  - **R1.5.2.** Define if the sink used for ATC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation
  - **R1.5.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.5.4.** If the Transmission Service Provider's ATC calculation process involves a grouping of generation, the ATCID must identify how these generators participate in the group.

**R2.** When calculating TTC for ATC Paths, the Transmission Operator shall use a Transmission model that contains all of the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R2.1.** Modeling data and topology of its Reliability Coordinator's area of responsibility. Equivalent representation of radial lines and facilities 161 kV or below is allowed.

**R2.2.** Modeling data and topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination areas.

**R2.3.** Facility Ratings specified by the Generator Owners and Transmission Owners.

**R3.** When calculating TTCs for ATC Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's area. The Transmission Operator shall also include the following data associated with Facilities that are explicitly represented in the Transmission model, as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** For on-peak and off-peak intra-day and next-day TTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):

**R3.1.1.** Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.

**R3.1.2.** Load forecast for the applicable period being calculated.

**R3.1.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R3.2.** For days two through 31 TTCs and for months two through 13 TTCs, use the following (as well as any other values and internal parameters as specified in the ATCID):

**R3.2.1.** Expected generation and Transmission outages, additions, and Retirements, included as specified in the ATCID.

**R3.2.2.** Daily load forecast for the days two through 31 TTCs being calculated and monthly forecast for months two through 13 months TTCs being calculated.

**R3.2.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R4.** When calculating TTCs for ATC Paths, the Transmission Operator shall meet all of the following conditions: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** Use all Contingencies meeting the criteria described in the ATCID.

**R4.2.** Respect any contractual allocations of TTC.

**R4.3.** Include, for each time period, the Firm Transmission Service expected to be scheduled as specified in the ATCID (filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers) for the Transmission Service Provider, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed modeling the source and sink as follows:

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point shall as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can not be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent

Balancing Authority associated with the Transmission Service Provider to which the power is to be delivered as the sink.

- If the sink, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider to which the power is being delivered as the sink.

**R5.** Each Transmission Operator shall establish TTC for each ATC Path as defined below: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.1.** At least once within the seven calendar days prior to the specified period for TTCs used in hourly and daily ATC calculations.

**R5.2.** At least once per calendar month for TTCs used in monthly ATC calculations.

**R5.3.** Within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a transformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage, provided such outage is expected to last 24 hours or longer.

**R6.** Each Transmission Operator shall establish TTC for each ATC Path using the following process: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.1.** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either:

- A System Operating Limit is reached on the Transmission Service Provider's system, or
- A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater[1].

**R6.2.** If the limit in step R6.1 can not be reached by adjusting any combination of load or generation, then set the incremental Transfer Capability by the results of the case where the maximum adjustments were applied.

**R6.3.** Use (as the TTC) the lesser of:

- The sum of the incremental Transfer Capability and the impacts of Firm Transmission Services, as specified in the Transmission Service Provider's ATCID, that were included in the study model, or
- The sum of Facility Ratings of all ties comprising the ATC Path.

**R6.4.** For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Service Provider so the TTC does not exceed each Transmission Service Provider's contractual rights.

[1] The Transmission operator may honor distribution factors less than 5% if desired.

**R7.** The Transmission Operator shall provide the Transmission Service Provider of that ATC Path with the most current value for TTC for that ATC Path no more than: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.1.** One calendar day after its determination for TTCs used in hourly and daily ATC calculations.

**R7.2.** Seven calendar days after its determination for TTCs used in monthly ATC calculations.

**R8.** When calculating Existing Transmission Commitments (ETCs) for firm commitments ($ETC_F$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

**$NITS_F$** is the firm capacity set aside for Network Integration Transmission Service (including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources) on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_F$** is the firm capacity set aside for Grandfathered Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or safe harbor tariff on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_F$** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$ROR_F$** is the capacity reserved for roll-over rights for Firm Transmission Service contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**$OS_F$** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R9.** When calculating ETC for non-firm commitments ($ETC_{NF}$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**$NITS_{NF}$** is the non-firm capacity set aside for Network Integration Transmission Service (i.e., secondary service , including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources)

reserved on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_{NF}$** is the non-firm capacity reserved for Grandfathered Non-Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or safe harbor tariff on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R10.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall utilize the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_F = TTC – ETC_F – CBM – TRM + Postbacks_F + counterflows_F$$

**Where:**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_F$** are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

**R11.** When calculating non-firm ATC for a ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_{NF} = TTC – ETC_F - ETC_{NF} – CBM_S – TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm Transmission commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled without a separate reservation during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its current ATCID that has the information described in R1 to show compliance with R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including the model used to calculate TTC as well as other evidence (such as Facility Ratings provided by facility owners, written documentation, logs, and data) to show that the modeling requirements in R2 were met. (R2)

**M3.** Each Transmission Operator shall provide evidence, including scheduled outages, facility additions and retirements, (such as written documentation, logs, and data) that the data described in R3 and R4 were included in the determination of TTC as specified in the ATCID. (R3)

**M4.** Each Transmission Operator shall provide the contingencies used in determining TTC and the ATCID as evidence to show that the contingencies described in the ATCID were included in the determination of TTC. (R4)

**M5.** Each Transmission Operator shall provide copies of contracts that contain requirements to allocate TTCs and TTC values to show that any contractual allocations of TTC were respected as required in R4.2. (R4)

**M6.** Each Transmission Operator shall provide evidence (such as copies of coordination agreements, reservations, interchange transactions, or other documentation) to show that firm reservations were used to estimate scheduled interchange, the modeling of scheduled interchange was based on the rules described in R4.3, and that estimated scheduled interchange was included in the determination of TTC. (R4)

**M7.** Each Transmission Operator shall provide evidence (such as logs and data and dated copies of requests from the Transmission Service Provider to establish TTCs at specific intervals) that TTCs have been established at least once in the calendar week prior to the specified period for TTCs used in hourly and daily ATC calculations, at least once per calendar month for TTCs used in monthly ATC calculations, and within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a autotransformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated

duration of the outage; provided such outage is expected to last 24 hours or longer in duration per the specifications in R5.(R5)

**M8.** Each Transmission Operator shall provide evidence (such as written documentation) that TTCs have been calculated using the process described in R6. (R6)

**M9.** Each Transmission Operator shall have evidence including a copy of the latest calculated TTC values along with a dated copy of email notices or other equivalent evidence to show that it provided its Transmission Service Provider with the most current values for TTC in accordance with R7. (R7)

**M10.** The Transmission Service Provider shall demonstrate compliance with R8 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R8 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-028-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its firm ETC. (R8)

**M11.** The Transmission Service Provider shall demonstrate compliance with R9 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R9 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-028-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its non-firm ETC. (R9)

**M12.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R10. Such documentation must show that only the variables allowed in R10 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R10)

**M13.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R11. Such documentation must show that only the variables allowed in R11 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R11)

## D. Compliance

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

Regional Entity.

**1.2. Compliance Monitoring Period and Reset**

Not applicable.

**1.3. Data Retention**

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2.
- The Transmission Operator shall retain evidence to show compliance with R3 for the most recent 12 months or until the model used to calculate TTC is updated, whichever is longer.
- The Transmission Operator shall retain evidence to show compliance with R4, R5, R6 and R7 for the most recent 12 months.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R8 and R9 for the most recent 14 days; evidence to show compliance in calculating daily values required in R8 and R9 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R8 and R9 for the most recent 60 days.
- The Transmission Service Provider shall retain evidence to show compliance with R10 and R11 for the most recent 12 months.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider has an ATCID but it is missing one of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements) | The Transmission Service Provider has an ATCID but it is missing two of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements) | The Transmission Service Provider has an ATCID but it is missing three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements) | The Transmission Service Provider has an ATCID but it is missing more than three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements) |
| R2. | The Transmission Operator used one to ten Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model. | The Transmission Operator used eleven to twenty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model. | One or both of the following:<br>• The Transmission Operator used twenty-one to thirty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>• The Transmission Operator did not use a Transmission model that includes modeling data and topology (or equivalent representation) for one adjacent Reliability Coordinator Area. | One or more of the following:<br>• The Transmission Operator used more than thirty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>• The Transmission Operator's model includes equivalent representation of non-radial facilities greater than 161 kV for its own Reliability Coordinator Area.<br>• The Transmission Operator did not use a Transmission model that includes modeling data and topology (or equivalent representation) for two or more adjacent Reliability Coordinator |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | | | | Areas. |
| R3. | The Transmission Operator did not include in the TTC process one to ten expected generation and Transmission outages, additions or retirements as specified in the ATCID. | The Transmission Operator did not include in the TTC process eleven to twenty-five expected generation and Transmission outages, additions or retirements as specified in the ATCID. | The Transmission Operator did not include in the TTC process twenty-six to fifty expected generation and Transmission outages, additions or retirements as specified in the ATCID. | One or more of the following:<br>• The Transmission Operator did not include in the TTC process more than fifty expected generation and Transmission outages, additions or retirements as specified in the ATCID.<br>• The Transmission Operator did not include the Load forecast or unit commitment in its TTC calculation as described in R3. |
| R4. | The Transmission Operator did not model reservations' sources or sinks as described in R5.3 for more than zero reservations, but not more than 5% of all reservations; or 1 reservation, whichever is greater. | The Transmission Operator did not model reservations' sources or sinks as described in R5.3 for more than 5%, but not more than 10% of all reservations; or 2 reservations, whichever is greater. | The Transmission Operator did not model reservations' sources or sinks as described in R5.3 for more than 10%, but not more than 15% of all reservations; or 3 reservations, whichever is greater. | One or more of the following:<br>• The Transmission Operator did not include in the TTC calculation the contingencies that met the criteria described in the ATCID.<br>• The Transmission Operator did not respect contractual allocations of TTC.<br>• The Transmission Service Provider did not model reservations' sources or sinks as described in R4.3 for more than 15% of all reservations; or more than 3 reservations, whichever is greater.<br>• The Transmission Operator did not use firm reservations to estimate interchange or did not |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | | | | utilize that estimate in the TTC calculation as described in R4.3. |
| R5. | One or more of the following:<br>• The Transmission Operator did not establish TTCs for use in hourly or daily ATCs within 7 calendar days but did establish the values within 10 calendar days<br>• The Transmission Operator did not establish TTCs for use in monthly ATCs during a calendar month but did establish the values within the next consecutive calendar month | One or more of the following:<br>• The Transmission Operator did not establish TTCs for use in hourly or daily ATCs in 10 calendar days but did establish the values within 13 calendar days<br>• The Transmission Operator did not establish TTCs for use in monthly ATCs during a two consecutive calendar month period but did establish the values within the third consecutive calendar month | One or more of the following:<br>• The Transmission Operator did not establish TTCs for used in hourly or daily ATCs in 13 calendar days but did establish the values within 16 calendar days<br>• The Transmission Operator did not establish TTCs for use in monthly ATCs during a three consecutive calendar month period but did establish the values within the fourth consecutive calendar month | One or more of the following:<br>• The Transmission Operator did not establish TTCs for used in hourly or daily ATCs in 16 calendar days<br>• The Transmission Operator did not establish TTCs for use in monthly ATCs during a four or more consecutive calendar month period<br>• The Transmission Operator did not establish TTCs within 24 hrs of the triggers defined in R5.3 |
| R6. | N/A | N/A | N/A | The Transmission Operator did not calculate TTCs per the process specified in R6. |
| R7. | One or more of the following:<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in hourly or daily ATC calculations more than one calendar day after their determination, but not been more than two calendar days after their determination.<br>• The Transmission Operator | One or more of the following:<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in hourly or daily ATC calculations more than two calendar days after their determination, but not been more than three calendar days after their determination.<br>• The Transmission Operator | One or more of the following:<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in hourly or daily ATC calculations more than three calendar days after their determination, but not been more than four calendar days after their determination.<br>• The Transmission Operator | One or more of the following:<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in hourly or daily ATC calculations more than four calendar days after their determination.<br>• The Transmission Operator did not provide its Transmission Service Provider with its ATC Path TTCs used in hourly or |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | has not provided its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations more than seven calendar days after their determination, but not more than 14 calendar days since their determination. | has not provided its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations more than 14 calendar days after their determination, but not been more than 21 calendar days after their determination. | has not provided its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations more than 21 calendar days after their determination, but not been more than 28 calendar days after their determination. | daily ATC calculations.<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations more than 28 calendar days after their determination.<br>• The Transmission Operator did not provide its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations. |
| R8. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M10 for the same period, and the absolute value difference was more than 15% of the value calculated in the measure or 15MW, whichever is greater, but not more than 25% of the value calculated in the measure or 25MW, whichever is greater. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M10 for the same period, and the absolute value difference was more than 25% of the value calculated in the measure or 25MW, whichever is greater, but not more than 35% of the value calculated in the measure or 35MW, whichever is greater. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M10 for the same period, and the absolute value difference was more than 35% of the value calculated in the measure or 35MW, whichever is greater, but not more than 45% of the value calculated in the measure or 45MW, whichever is greater. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M10 for the same period, and the absolute value difference was more than 45% of the value calculated in the measure or 45MW, whichever is greater. |
| R9. | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M11 for the same period, and the absolute value difference was more than 15% of the value calculated in the measure or 15MW, whichever is greater, but not | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M11 for the same period, and the absolute value difference was more than 25% of the value calculated in the measure or 25MW, whichever is greater, but not | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M11 for the same period, and the absolute value difference was more than 35% of the value calculated in the measure or 35MW, whichever is greater, but not | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M11 for the same period, and the absolute value difference was more than 45% of the value calculated in the measure or 45MW, whichever is greater. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | more than 25% of the value calculated in the measure or 25MW, whichever is greater. | more than 35% of the value calculated in the measure or 35MW, whichever is greater... | more than 45% of the value calculated in the measure or 45MW, whichever is greater. | |
| R10. | The Transmission Service Provider did not use all the elements defined in R10 when determining firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R10 when determining firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R10 when determining firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R10 when determining firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |
| R11. | The Transmission Service Provider did not use all the elements defined in R11 when determining non-firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R11 when determining non-firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R11 when determining non-firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R11 when determining non-firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Area Interchange Methodology:** The Area Interchange methodology is characterized by determination of incremental transfer capability via simulation, from which Total Transfer Capability (TTC) can be mathematically derived. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Area Interchange Methodology, TTC results are generally reported on an area to area basis.

## A. Introduction

1. **Title: Area Interchange Methodology**

2. **Number: MOD-028-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of Transfer Capability calculations for short-term use performed by entities using the Area Interchange Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Area Interchange Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

   **4.2.** Each Transmission Service Provider that uses the Area Interchange Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Service Provider shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining Total Transfer Capability (TTC): *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R1.1.** Information describing how the selected methodology has been implemented, in such detail that, given the same information used by the Transmission Operator, the results of the TTC calculations can be validated.

**R1.2.** A description of the manner in which the Transmission Operator will account for Interchange Schedules in the calculation of TTC.

**R1.3.** Any contractual obligations for allocation of TTC.

**R1.4.** A description of the manner in which Contingencies are identified for use in the TTC process.

**R1.5.** The following information on how source and sink for transmission service is accounted for in ATC calculations including:

**R1.5.1.** Define if the source used for Available Transfer Capability (ATC) calculations is obtained from the source field or the Point ~~O~~of Receipt (POR) field of the transmission reservation

**R1.5.2.** Define if the sink used for ATC calculations is obtained from the sink field or the Point ~~O~~of Delivery (POD) field of the transmission reservation

**R1.5.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.5.4.** If the Transmission Service Provider's ATC calculation process involves a grouping of generation, the ATCID must identify how these generators participate in the group.

**R2.** When calculating TTC for ATC Paths, the Transmission Operator shall use a Transmission model that contains all of the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R2.1.** Modeling data and topology of its Reliability Coordinator's area of responsibility. Equivalent representation of radial lines and facilities 161 kV or below is allowed.

**R2.2.** Modeling data and topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination areas.

**R2.3.** Facility Ratings specified by the Generator Owners and Transmission Owners.

**R3.** When calculating TTCs for ATC Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's area. The Transmission Operator shall also include the following data associated with Facilities that are explicitly represented in the Transmission model, as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** For on-peak and off-peak intra-day and next-day TTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):

**R3.1.1.** Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.

**R3.1.2.** Load forecast for the applicable period being calculated.

**R3.1.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R3.2.** For days two through 31 TTCs and for months two through 13 TTCs, use the following (as well as any other values and internal parameters as specified in the ATCID):

**R3.2.1.** Expected generation and Transmission outages, additions, and Retirements, included as specified in the ATCID.

**R3.2.2.** Daily load forecast for the days two through 31 TTCs being calculated and monthly forecast for months two through 13 months TTCs being calculated.

**R3.2.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R4.** When calculating TTCs for ATC Paths, the Transmission Operator shall meet all of the following conditions: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** Use all Contingencies meeting the criteria described in ~~its~~ the ATCID.

**R4.2.** Respect any contractual allocations of TTC.

**R4.3.** Include, for each time period, the Firm Transmission Service expected to be scheduled as specified in the ATCID (filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers) for the Transmission Service Provider, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed modeling the source and sink as follows:

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point shall as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can not be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent

Balancing Authority associated with the Transmission Service Provider to which the power is to be delivered as the sink.

- If the sink, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider to which the power is being delivered as the sink.

**R5.** Each Transmission Operator shall establish TTC for each ATC Path as defined below: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.1.** At least once within the seven calendar days ~~in the calendar week~~ prior to the specified period for TTCs used in hourly and daily ATC calculations.

**R5.2.** At least once per calendar month for TTCs used in monthly ATC calculations.

**R5.3.** Within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a transformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage, provided such outage is expected to last 24 hours or longer.

**R6.** Each Transmission Operator shall establish TTC for each ATC Path using the following process: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.1.** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either:

- A System Operating Limit is reached on the Transmission Service Provider's system, or
- A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater[1].

**R6.2.** If the limit in step R6.1 can not be reached by adjusting any combination of load or generation, then set the incremental Transfer Capability by the results of the case where the maximum adjustments were applied.

**R6.3.** Use (as the TTC) the lesser of:

– The sum of the incremental Transfer Capability and the impacts of Firm Transmission Services, as specified in the Transmission Service Provider's ATCID, that were included in the study model, or

– The sum of Facility Ratings of all ties comprising the ATC Path.

**R6.4.** For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission ~~Operator~~ Service Provider so the TTC does not exceed ~~that Transmission Operator's~~ each Transmission Service Provider's contractual rights.

[1] The Transmission operator may honor distribution factors less than 5% if desired.

**R7.** The Transmission Operator shall provide the Transmission Service Provider of that ATC Path with the most current value for TTC for that ATC Path no more than: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.1.** One calendar day after its determination for TTCs used in hourly and daily ATC calculations.

**R7.2.** Seven calendar days after its determination for TTCs used in monthly ATC calculations.

**R8.** When calculating Existing Transmission Commitments (ETCs) for firm commitments ($ETC_F$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

$\mathbf{NITS_F}$ is the firm capacity set aside for Network Integration Transmission Service (including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources) on ATC Paths that serve as interfaces with other Balancing Authorities.

$\mathbf{GF_F}$ is the firm capacity set aside for Grandfathered Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or ~~"S~~safe ~~Harbor~~ harbor ~~Tariff~~tariff~~"~~ ~~accepted by FERC~~ on ATC Paths that serve as interfaces with other Balancing Authorities.

$\mathbf{PTP_F}$ is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

$\mathbf{ROR_F}$ is the capacity reserved for roll-over rights for Firm Transmission Service contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

$\mathbf{OS_F}$ is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R9.** When calculating ETC for non-firm commitments ($ETC_{NF}$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

$\mathbf{NITS_{NF}}$ is the non-firm capacity set aside for Network Integration Transmission Service (i.e., secondary service , including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources)

reserved on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_{NF}$** is the non-firm capacity reserved for Grandfathered Non-Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or ~~"~~s~~S~~afe ~~Harbor~~ harbor ~~Tariff~~tariff~~"~~ ~~accepted by FERC~~ on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R10.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall utilize the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + counterflows_F$$

**Where:**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_F$** are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

**R11.** When calculating non-firm ATC for a ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm Transmission commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled without a separate reservation during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its current ATCID that has the information described in R1 to show compliance with R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including the model used to calculate TTC as well as other evidence (such as Facility Ratings provided by facility owners, written documentation, logs, and data) to show that the modeling requirements in R2 were met. (R2)

**M3.** Each Transmission Operator shall provide evidence, including scheduled outages, facility additions and retirements, (such as written documentation, logs, and data) that the data described in R3 and R4 were included in the determination of TTC as specified in the ATCID. (R3)

**M4.** Each Transmission Operator shall provide the contingencies used in determining TTC and ~~its~~ the ATCID as evidence to show that the contingencies described in the ATCID were included in the determination of TTC. (R4)

**M5.** Each Transmission Operator shall provide copies of contracts that contain requirements to allocate TTCs and TTC values to show that any contractual allocations of TTC were respected as required in R4.2. (R4)

**M6.** Each Transmission Operator shall provide evidence (such as copies of coordination agreements, reservations, interchange transactions, or other documentation) to show that firm reservations were used to estimate scheduled interchange, the modeling of scheduled interchange was based on the rules described in R4.3, and that estimated scheduled interchange was included in the determination of TTC. (R4)

**M7.** Each Transmission Operator shall provide evidence (such as logs and data and dated copies of requests from the Transmission Service Provider to establish TTCs at specific intervals) that TTCs have been established at least once in the calendar week prior to the specified period for TTCs used in hourly and daily ATC calculations, at least once per calendar month for TTCs used in monthly ATC calculations, and within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a autotransformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated

duration of the outage; provided such outage is expected to last 24 hours or longer in duration per the specifications in R5.(R5)

**M8.** Each Transmission Operator shall provide evidence (such as written documentation) that TTCs have been calculated using the process described in R6. (R6)

**M9.** Each Transmission Operator shall have evidence including a copy of the latest calculated TTC values along with a dated copy of email notices or other equivalent evidence to show that it provided its Transmission Service Provider with the most current values for TTC in accordance with R7. (R7)

**M10.** The ~~T~~Transmission Service Provider ~~must be capable of demonstrating~~shall demonstrate compliance with R8 by ~~that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the firm ETC for~~ recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R8 and with data used to calculate ~~this~~ the specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in ~~the standard~~MOD-028-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated ~~, and the audited~~ value ~~must~~ that is~~be~~ within +/- 15% or 15 MW, whichever is greater, of the ~~demonstrated result~~originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its firm ETC. (R8)

~~**M10.**~~ ~~(R8)~~

**M11.** The Transmission Service Provider ~~must be capable of demonstrating~~shall demonstrate compliance with R9 by ~~that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can~~ recalculateing ~~the individual value of the~~ non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R9 and with data used to calculate ~~this~~ the specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in ~~the standard~~MOD-028-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is ~~, and the audited value must be~~ within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its non-firm ETC~~demonstrated result~~. (R9)

**M12.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R10. Such documentation must show that only the variables allowed in R10 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R10)

**M13.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R11. Such documentation must show that only the variables allowed in R11 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2.
- The Transmission Operator shall retain evidence to show compliance with R3 for the most recent 12 months or until the model used to calculate TTC is updated, whichever is longer.
- The Transmission Operator shall retain evidence to show compliance with R4, R5, R6 and R7 for the most recent 12 months.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in ~~with~~ R8 and R9 for the most recent ~~sixty~~ 14 days; evidence to show compliance in calculating daily values required in R8 and R9 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R8 and R9 for the most recent 60 days.
- The Transmission Service Provider shall retain evidence to show compliance with R10 and R11 for the most recent 12 months.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider has an ATCID but it is missing one of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements)<br>~~The Transmission Service Provider has an ATCID that meets the intent of Requirement 1 but the ATCID is missing some minor information.~~ | The Transmission Service Provider has an ATCID but it is missing two of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements)<br>~~The Transmission Service Provider has an ATCID but it is missing one of the four required elements in R1.~~ | The Transmission Service Provider has an ATCID but it is missing three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements)<br>~~The Transmission Service Provider has an ATCID but it is missing two of the four required elements in R1.~~ | The Transmission Service Provider has an ATCID but it is missing more than three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements)<br>~~The Transmission Service Provider has an ATCID but it is missing three or more of the four required elements in R1.~~ |
| R2. | The Transmission Operator ~~utilized~~ used one to ten Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>~~Note: A modeling error (a violation of the criteria in R2) is a single violation, regardless how many times that error has been modeled~~used. | The Transmission Operator ~~utilized~~ used eleven to twenty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>~~Note: A modeling error (a violation of the criteria in R2) is a single violation, regardless how many times that error has been modeled~~used. | One or both of the following:<br>• The Transmission Operator ~~utilized~~ used twenty-one to thirty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>~~OR~~<br>• The Transmission Operator did not use a Transmission model that includes modeling data and topology (or equivalent representation) | One or more of the following:<br>• The Transmission Operator ~~utilized~~ used more than thirty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>~~OR~~<br>• The Transmission Operator's model includes equivalent representation of non-radial facilities greater than 161 kV for its own Reliability |

| R # | Lower VSL | Moderate ~~VSL~~ | High VSL | Severe VSL |
|---|---|---|---|---|
| | | | for one adjacent Reliability Coordinator ~~area~~Area.<br>~~Note: A modeling error (a violation of the criteria in R2) is a single violation, regardless how many times that error has been modeled~~used~~.~~ | Coordinator ~~area~~Area.<br>~~OR~~<br>• The Transmission Operator did not use a Transmission model that includes modeling data and topology (or equivalent representation) for two or more adjacent Reliability Coordinator ~~areas~~Areas.<br>~~Note: A modeling error (a violation of the criteria in R2) is a single violation, regardless how many times that error has been modeled~~used~~.~~ |
| R3. | The Transmission Operator did not include in the TTC process one to ten expected generation and Transmission outages, additions or retirements as specified in the ATCID. | The Transmission Operator did not include in the TTC process eleven to twenty-five expected generation and Transmission outages, additions or retirements as specified in the ATCID. | The Transmission Operator did not include in the TTC process twenty-six to fifty expected generation and Transmission outages, additions or retirements as specified in the ATCID. | One or more ~~violations below constitutes a single violation of R3~~of the following:~~:~~<br>• The Transmission Operator did not include in the TTC process more than fifty expected generation and Transmission outages, additions or retirements as specified in the ATCID.<br>~~OR~~<br>• The Transmission Operator did not include the Load forecast or unit commitment in its TTC calculation as described in R3. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R4. | The Transmission ~~Service Provider~~Operator did not model reservations' sources or sinks as described in R5.3 for more than zero reservations, but not more than 5% of all reservations; or 1 reservation, whichever is greater~~.~~. | The Transmission ~~Service Provider~~Operator did not model reservations' sources or sinks as described in R5.3 for more than 5%, but not more than 10% of all reservations; or 2 reservations, whichever is greater~~.~~. | The Transmission ~~Service Provider~~Operator did not model reservations' sources or sinks as described in R5.3 for more than 10%, but not more than 15% of all reservations; or 3 reservations, whichever is greater~~.~~. | One or more of the following:<br>• The Transmission Operator did not include in the TTC calculation the contingencies that met the criteria described in the ATCID.<br>~~OR~~<br>• The Transmission Operator did not respect contractual allocations of TTC.<br>~~OR~~<br>• The Transmission ~~Service Provider~~Operator did not model reservations' sources or sinks as described in ~~R5~~R4.3 for more than 15% of all reservations; or more than 3 reservations, whichever is greater.<br>~~OR~~<br>• The Transmission Operator did not use firm reservations to estimate interchange or did not utilize that estimate in the TTC calculation as described in R4.3. |
| R5. | One or more of the following:<br>• The Transmission Operator did not establish TTCs for use in hourly or daily ATCs within 7 calendar days but did establish the values within 10 calendar days | One or more of the following:<br>• The Transmission Operator did not establish TTCs for use in hourly or daily ATCs in 10 calendar days but did establish the values within 13 calendar days | One or more of the following:<br>• The Transmission Operator did not establish TTCs for used in hourly or daily ATCs in 13 calendar days but did establish the values within 16 calendar days | One or more of the following:<br>• The Transmission Operator did not establish TTCs for used in hourly or daily ATCs in 16 calendar days<br>• The Transmission Operator did not establish TTCs for |

## Implementation Plan for Standard MOD-028-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-028-1 – Area Interchange Methodology, which describes the Area Interchange methodology (previously referred to as the Network Response ATC methodology) for determining ATC.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Retired Standards

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-028-1 incorporates the following requirements from FAC-012-1:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-028-1 incorporates the following requirements from FAC-013-1:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-028-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

## Implementation Plan for Standard MOD-028-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-028-1 – Area Interchange Methodology, which describes the Area Interchange methodology (previously referred to as the Network Response ATC methodology) for determining ATC.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Retired Standards

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-028-1 incorporates the following requirements from FAC-012-1:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-028-1 incorporates the following requirements from FAC-013-1:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-028-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

> Committee shall set the proposed standard for ballot as soon as the work flow will accommodate."

NERC's Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008. Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee's Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards. The Standards Committee's Executive Committee directed NERC's Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

116-390 Village Boulevard, Princeton, New Jersey 08540-5721

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Brazos Electric Power Cooperative, Inc. | 1 | Negative | A NEGATIVE vote is cast for this standard as written as it imposes obligations on entities in the ERCOT region that do not utilize ATC paths and calculation methodologies to manage congestion or for reliability operations. Our previous submitted comments suggested that applicability language be included in the requirements to recognize that such market difference exists. |
| Exelon Energy | 1 | Affirmative | General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies for corresponding time periods. Exelon's comments reflect these deficiencies and Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890. Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-028-1 Area Interchange Methodology, MOD-029-1 Rated System Path Methodology and MOD-030-1 Flowgate Methodology In the “Purpose” section, all three standards state, “To increase consistency and reliability in the development and documentation of Transfer Capability calculations for “short-term use”. Short-term is an undefined term and it applies that these standards do not apply to ATC calculations beyond the “short-term” period. In is recommended that the phrase for “short-term use” be removed from the purpose. |
| Great River Energy | 1 | Negative | GRE is concerned with the Transmission Operator being the responsible entity for MOD-028_R2-R7. GRE believes that the responsible entity for these requirements should be the Transmission Service Provider. It is GRE's opinion that a standard should not knowingly be written in a manner that requires delegation agreements to be created for a large number of responsible entities, doing so is an inefficient use of resources. |
| Sierra Pacific Power Co. | 1 | Affirmative | Affirmative vote with comment: The severity levels surrounding R1 still appear to imply that all of the sub-items of R1.1 are expected to be used in the TRMID. It must be clear that it does not constitute a violation if various of these sub-items are not applicable to the TRMID used by the entity. Clarify that this is "as applicable" or "as determined by the entity". |
| Southwest Transmission Cooperative, Inc. | 1 | Abstain | No WECC entity that has definitely elected to use MOD-28; therefore, we recommend no action. |
| New York Independent System Operator | 2 | Abstain | The NYISO abstains from voting on this proposed standard. The NYISO appreciates recent feedback from the Standards Drafting Team on several rounds of comments requesting that revisions be made to the language of this proposed standard in order to: (i) expressly accommodate the NYISO’s FERC-approved market design and financial reservation based open access transmission system; and (ii) eliminate any possible question as to whether the NYISO’s existing approach to calculating ATC satisfies the requirements of the proposed standards. The Standards Drafting Team has indicated that it believes that the NYISO’s existing procedures are compliant with the proposed standard. Nevertheless, the NYISO is |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | abstaining in order to preserve its rights to seek a formal confirmation of its compliance from FERC or NERC. |
| City Public Service of San Antonio | 3 | Negative | I cannot vote for this standard as written. It needs to acknowledge definitive alternatives to ATC for regions or markets such as ERCOT where transmission service markets are not used. |
| Duke Energy Carolina | 3 | Affirmative | While we support approval of this standard, bulk electric system facilities 161kV and below may have significant network response. Since these facilities may have significant impact on TTC/AFC, documentation should be required by the standard for those facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders. |
| Lincoln Electric System | 3 | Negative | LES is concerned with the Transmission Operator being the responsible entity for R2 through R7 for MOD-028. We believe that the responsible entity for these requirements should be the Transmission Service Provider |
| Wisconsin Public Service Corp. | 3 | Negative | The Transmission Service Provider should be the responsible entity for R2 through R7 for MOD-028, not the Transmission Operator. |
| Alliant Energy Corp. Services, Inc. | 4 | Negative | We believe the responsible entity for R2 thru R7 should be the Transmission Service Provider, not the Transmission Operator. |
| Public Utility District No. 1 of Douglas County | 4 | Negative | We have not had sufficient time to review the effects of this change and coordinate it with others in our region. |
| WPS Resources Corp. | 4 | Negative | Requirements R2 through R7 list the responsible entity as the Transmission Owner. The Transmission Service Provider should be the responsible entity. |
| Lincoln Electric System | 5 | Negative | LES is concerned with the Transmission Operator being the responsible entity for R2 through R7 for MOD-028. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| Lincoln Electric System | 6 | Negative | LES is concerned with the Transmission Operator being the responsible entity for R2 through R7 for MOD-028. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| Electric Reliability Council of Texas, Inc. | 10 | Abstain | Although stated in the Applicability Section of the Standard, the Requirements and Measures contain no clear applicability only to those Transmission Operators and Transmission Service Providers who utilize AIM in calculating ATC and TTC for their transmission system and market operations. |
| Midwest Reliability Organization | 10 | Negative | The MRO is concerned with the Transmission Operator being the responsible entity for R2 through R7 for MOD-028. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |

RELIABILITY CORPORATION

# Consideration of Comments on Initial Ballot — MOD-028-1 — Area Interchange Methodology

**Summary Consideration:** While some stakeholders suggested modifications to the standard, most stakeholders agreed with the standard as proposed and the drafting team did not make any changes to the standard.

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Brazos Electric Power Cooperative, Inc. | 1 | Negative | A NEGATIVE vote is cast for this standard as written as it imposes obligations on entities in the ERCOT region that do not utilize ATC paths and calculation methodologies to manage congestion or for reliability operations. Our previous submitted comments suggested that applicability language be included in the requirements to recognize that such market difference exists. |
| **Response**: If ERCOT does not choose to implement this methodology, then this standard would not apply to ERCOT. If ERCOT does not have ATC Paths, or ERCOT has an associated variance, MOD-001 would not require them to select a methodology. | | | |
| Exelon Energy | 1 | Affirmative | General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies for corresponding time periods. Exelon's comments reflect these deficiencies and Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890.<br><br>Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-028-1 Area Interchange Methodology, MOD-029-1 Rated System Path Methodology and MOD-030-1 Flowgate Methodology In the “Purpose” section, all three standards state, “To increase consistency and reliability in the development and documentation of Transfer Capability calculations for “short-term use”. Short-term is an undefined term and it applies that these standards do not apply to ATC calculations beyond the “short-term” period. In is recommended that the phrase for “short-term use” be removed from the purpose. |
| **Response**: The SDT does not believe the term used in the Purpose statement of the standard is confusing. The requirements themselves specify all time periods for which entities will be expected to comply. | | | |
| Great River Energy | 1 | Negative | GRE is concerned with the Transmission Operator being the responsible entity for MOD- |

|---|---|---|---|
| | | | 028_R2-R7. GRE believes that the responsible entity for these requirements should be the Transmission Service Provider. It is GRE's opinion that a standard should not knowingly be written in a manner that requires delegation agreements to be created for a large number of responsible entities, doing so is an inefficient use of resources. |
| **Response**: The SDT believes the Functional Model indicates these requirements should apply to the Transmission Operator. While many entities may have delegated these tasks to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Note that given the lack of consistency in how the industry performs these functions, a change to the Transmission Operator could require other entities to enter into similar delegation agreements to address that situation. If an entity does not want delegation agreements, then an entity variance or the use of a Joint Registration Organization may be appropriate. | | | |
| Sierra Pacific Power Co. | 1 | Affirmative | Affirmative vote with comment: The severity levels surrounding R1 still appear to imply that all of the sub-items of R1.1 are expected to be used in the TRMID. It must be clear that it does not constitute a violation if various of these sub-items are not applicable to the TRMID used by the entity. Clarify that this is "as applicable" or "as determined by the entity". |
| **Response**: This comment has been addressed with the MOD-008 standard. | | | |
| Southwest Transmission Cooperative, Inc. | 1 | Abstain | No WECC entity that has definitely elected to use MOD-28; therefore, we recommend no action. |
| **Response**: The SDT concurs. | | | |
| New York Independent System Operator | 2 | Abstain | The NYISO abstains from voting on this proposed standard. The NYISO appreciates recent feedback from the Standards Drafting Team on several rounds of comments requesting that revisions be made to the language of this proposed standard in order to: (i) expressly accommodate the NYISO's FERC-approved market design and financial reservation based open access transmission system; and (ii) eliminate any possible question as to whether the NYISO's existing approach to calculating ATC satisfies the requirements of the proposed standards. The Standards Drafting Team has indicated that it believes that the NYISO's existing procedures are compliant with the proposed standard. Nevertheless, the NYISO is abstaining in order to preserve its rights to seek a formal confirmation of its compliance from FERC or NERC. |
| **Response**: The SDT cannot provide such formal confirmation, but thanks you for your supportive comment. | | | |
| City Public Service of San Antonio | 3 | Negative | I cannot vote for this standard as written. It needs to acknowledge definitive alternatives to ATC for regions or markets such as ERCOT where transmission service markets are not used. |
| **Response**: If ERCOT does not choose to implement this methodology, then this standard would not apply to ERCOT. If ERCOT does not have ATC Paths, or ERCOT has an associated variance, MOD-001 would not require them to select a methodology. | | | |

| | | | facilities 161kV and below which are equivalized. This will provide transparency for impacted stakeholders. |
| **Response**: The standard does not require, but also does not forbid, such documentation. If a region believes that facilities 161 kV and below should not be equivalenced or more transparency is required, then that region can write a regional standard that is more stringent. | | | |
| Lincoln Electric System | 3 | Negative | LES is concerned with the Transmission Operator being the responsible entity for R2 through R7 for MOD-028. We believe that the responsible entity for these requirements should be the Transmission Service Provider |
| **Response**: The SDT does not find a clear rationale for selecting the Transmission Service Provider as the entity responsible for calculating TTC. The Functional Model requires the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining TTC. The Transmission Service Provider is responsible for providing service within the constraints established by the Transmission Operator, not actually establishing those constraints.<br><br>If an entity believes the TSP to be the appropriate entity, then options for delegation of this task exist. The Transmission Service Provider and their Transmission Operators can register as a Joint Registration Organization, with the Transmission Service Provider agreeing to take on responsibility for this requirement through written contract. If an entity does not want delegation agreements, then an entity variance or the use of a Joint Registration Organization may be appropriate. | | | |
| Wisconsin Public Service Corp. | 3 | Negative | The Transmission Service Provider should be the responsible entity for R2 through R7 for MOD-028, not the Transmission Operator. |
| **Response**: The SDT does not find a clear rationale for selecting the Transmission Service Provider as the entity responsible for calculating TTC. The Functional Model requires the Transmission Operator to determine SOLs (Defines System Operating Limits based on facility information provided by the Transmission Owners and Generator Owners and assistance from Reliability Coordinator), which we believe ties them to determining TTC. The Transmission Service Provider is responsible for providing service within the constraints established by the Transmission Operator, not actually establishing those constraints.<br><br>If an entity believes the TSP to be the appropriate entity, then options for delegation of this task exist. The Transmission Service Provider and their Transmission Operators can register as a Joint Registration Organization, with the Transmission Service Provider agreeing to take on responsibility for this requirement through written contract. ## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.
7. SDT posted third draft for comment from April 16–May 15, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to Comments. | June 20, 2008 |
| 2. Posting for 30-day Pre-Ballot Review. | June 20, 2008 |
| 3. Initial Ballot. | July 21, 2008 |
| 4. Respond to comments. | August 20, 2008 |
| 5. Recirculation ballot. | August 21, 2008 |
| 6. 30 Day posting before board adoption. | June 21, 2008 |
| 7. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Transmission Reliability Margin Implementation Document (TRMID):** A document that describes the implementation of a Transmission Reliability Margin methodology, and provides information related to a Transmission Operator's calculation of TRM.

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**

2. **Number:** **MOD-008-1**

3. **Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to support analysis and system operations.

4. **Applicability:**

   **4.1.** Transmission Operators that maintain TRM.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** Identification of (on each of its respective ATC Paths or Flowgates) each of the following components of uncertainty if used in establishing TRM, and a description of how that component is used to establish a TRM value:

- Aggregate Load forecast.
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including, but not limited to, forced or unplanned outages and maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including, but not limited to, forced or unplanned outages, maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions ).
- Reserve sharing requirements.
- Inertial response and frequency bias.

**R1.2.** The description of the method used to allocate TRM across ATC Paths or Flowgates.

**R1.3.** The identification of the TRM calculation used for the following time periods:

**R1.3.1.** Same day and real-time.

**R1.3.2.** Day-ahead and pre-schedule.

**R1.3.3.** Beyond day-ahead and pre-schedule, up to thirteen months ahead.

**R2.** Each Transmission Operator shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.** Each Transmission Operator shall make available its TRMID, and if requested, underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request no more than 30 calendar days after receiving the request. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- Transmission Service Providers
- Reliability Coordinators
- Planning Coordinators
- Transmission Planner
- Transmission Operators

**R4.** Each Transmission Operator that maintains TRM shall establish TRM values in accordance with the TRMID at least once every 13 months. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** The Transmission Operator that maintains TRM shall provide the TRM values to its Transmission Service Provider(s) and Transmission Planner(s) no more than seven calendar days after a TRM value is initially established or subsequently changed. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

## C. Measures

**M1.** Each Transmission Operator shall produce its TRMID evidencing inclusion of all specified information in R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, or other evidence, (such as written documentation, study reports, documentation of its CBM process, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

**M3.** Each Transmission Operator shall provide a dated copy of any request from an entity described in R3. The Transmission Operator shall also provide evidence (such as copies of emails or postal receipts that show the recipient, date and contents) that the requested documentation (such as work papers and load flow cases) was made available within the specified timeframe to the requestor. (R3)

**M4.** Each Transmission Operator shall provide evidence (such as logs, study report, review notes, or data) that it established TRM values at least once every thirteen months for each of the TRM time periods. (R4)

**M5.** Each Transmission Operator shall provide evidence (such as logs, email, website postings) that it provided their Transmission Service Provider(s) and Transmission Planner(s) with the updated TRM value as described in R5. (R5)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.
- The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes

Any of the following may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

#### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator has a TRMID that does not incorporate changes made up to three months ago. | The Transmission Operator has a TRMID that does not incorporate changes that have been made three or more months ago but less than six months ago.<br>**OR**<br>The Transmission Operator's TRMID does not address one of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3 | The Transmission Operator has a TRMID that does not incorporate changes that have been made six or more months ago but less than one year ago.<br>**OR**<br>The Transmission Operator's TRMID does not address two of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3 | The Transmission Operator has a TRMID that does not incorporate changes that have been made one year ago or more.<br>**OR**<br>The Transmission Operator does not have a TRMID.<br>**OR**<br>The Transmission Operator's TRMID does not address three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3 |
| R2. | N/A | N/A | N/A | One or both of the following:<br>▪ The Transmission Operator included elements of uncertainty not defined in R1 in their establishment of TRM.<br>▪ The Transmission Operator included components of CBM in TRM. |
| R3. | The Transmission Operator made the TRMID available to a requesting entity specified in R3 but provided TRMID in more than 30 days but less than 45 days. | The Transmission Operator made the TRMID available to a requesting entity specified in R3 but provided TRMID in 45 days or more but less than 60 days. | The Transmission Operator made the TRMID available to a requesting entity specified in R3 but provided TRMID in 60 days or more but less than 90 days. | The Transmission Operator did not make the TRMID available for 90 days or more. |

| | | | | |
|---|---|---|---|---|
| R4 | The Transmission Operator established TRM values on schedule BUT the values were incomplete or incorrect. Not more than 5% or 1 value (whichever is greater) were incorrect or missing. | The Transmission Operator did not establish TRM within thirteen months of the previous determination, and the last determination was not more than 15 months ago<br>OR<br>The Transmission Operator established TRM values on schedule BUT the values were incomplete. More than 5%, or 1 value (which ever is greater) were incorrect or missing, but not more than 10% or 2 values (whichever is greater). | The Transmission Operator did not establish TRM within 15 months of the previous determination, and the last determination was not more than 18 months ago.<br>OR<br>The Transmission Operator established TRM values on schedule BUT the values were incomplete or incorrect. More than 10% or 2 values (which ever is greater) were incorrect or missing, but not more than 15% or 3 values. | The Transmission Operator did not establish TRM<br>OR<br>The last determination of TRM was more than 18 months ago.<br>OR<br>The Transmission Operator established TRM values on schedule BUT the values were incomplete or incorrect. More than 15% or 3 values (which ever is greater) were incorrect or missing. |
| R5 | The Transmission Operator did provide the TRM values to all entities specified in more then 7 days but less than 14 days.<br>OR<br>The Transmission Operator did provide TRM values on schedule BUT the values were incomplete or did not match those determined in R4. Not more than 5% or 1 value (which ever is greater) were incorrect or missing. | The Transmission Operator did provide the TRM values to all entities specified in 14 days or more, but less than 30 days.<br>OR<br>The Transmission Operator did provide TRM values on schedule BUT the values were incomplete or did not match those determined in R4. More than 5% or 1 value (which ever is greater) were incorrect or missing, but not more than 10% or 2 values (whichever is greater). | The Transmission Operator did provide the TRM values to all entities specified in 30 days or more, but less than 60 days.<br>OR<br>The Transmission Operator did provide TRM values on schedule BUT the values were incomplete or did not match those determined in R4. More than 15% or 3 values (which ever is greater) were incorrect or missing. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.
7. SDT posted third draft for comment from April 16–May 15, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to Comments. | June 20, 2008 |
| 2. Posting for 30-day Pre-Ballot Review. | June 20, 2008 |
| 3. Initial Ballot. | July 21, 2008 |
| 4. Respond to comments. | August 20, 2008 |
| 5. Recirculation ballot. | August 21, 2008 |
| 6. 30 Day posting before board adoption. | June 21, 2008 |
| 7. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Transmission Reliability Margin Implementation Document (TRMID):** A document that describes the implementation of a Transmission Reliability Margin methodology, and provides information related to a Transmission Operator's calculation of TRM.

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**
2. **Number:** **MOD-008-1**
3. **Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to support analysis and system operations.
4. **Applicability:**

   **4.1.** Transmission Operators that maintain TRM.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** Identification of (on each of its respective ATC Paths or Flowgates) each of the following components of uncertainty if used in establishing TRM, and a description of how that component is used to establish a TRM value:

- Aggregate Load forecast.
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including, but not limited to, forced or unplanned outages and maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including, but not limited to, forced or unplanned outages, maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions ~~not exceeding a 59-minute window~~).
- Reserve sharing requirements.
- Inertial response and frequency bias.

**R1.2.** The description of the method used to allocate TRM across ATC Paths or Flowgates.

**R1.3.** The identification of the TRM calculation used for the following time periods:

**R1.3.1.** Same day and real-time.

**R1.3.2.** Day-ahead and pre-schedule.

**R1.3.3.** Beyond day-ahead and pre-schedule, up to thirteen months ahead.

**R2.** Each Transmission Operator shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.** Each Transmission Operator shall make available its TRMID, and if requested, underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request no more than 30 calendar days after receiving the request. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- Transmission Service Providers
- Reliability Coordinators
- Planning Coordinators
- Transmission Planner
- Transmission Operators

**R4.** Each Transmission Operator ~~using~~ that maintains TRM shall establish TRM values in accordance with the TRMID at least once every 13 months. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** The Transmission Operator ~~using~~ that maintains TRM shall provide the TRM values to its Transmission Service Provider(s) and Transmission Planner(s) no more than seven calendar days after a TRM value is initially established or subsequently changed. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

## C. Measures

**M1.** Each Transmission Operator shall produce its TRMID evidencing inclusion of all specified information in R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, ~~and CBMID ,~~ or other evidence, (such as written documentation, study reports, documentation of its CBM process, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

**M3.** Each Transmission Operator shall provide a dated copy of any request from an entity described in R3. The Transmission Operator shall also provide evidence (such as copies of emails or postal receipts that show the recipient, date and contents) that the requested documentation (such as work papers and load flow cases) was made available within the specified timeframe to the requestor. (R3)

**M4.** Each Transmission Operator shall provide evidence (such as logs, study report, review notes, or data) that it established TRM values at least once every thirteen months for each of the TRM time periods. (R4)

**M5.** Each Transmission Operator shall provide evidence (such as logs, email, website postings) that it provided their Transmission Service Provider(s) and Transmission Planner(s) with the updated TRM value as described in R5. (R5)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.
- The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes

Any of the following may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

#### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator has a TRMID that does not incorporate changes made up to three months ago. | The Transmission Operator has a TRMID that does not incorporate changes that have been made three or more months ago but less than six months ago.<br>**OR**<br>The Transmission Operator's TRMID does not address one of the ~~sub requirements~~following:<br>▪ ~~(~~R1.1~~,~~<br>▪ R1.2~~,~~<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3~~).~~<br>~~Any violation or violations of the sub-requirements of R1.3 shall be considered a single violation of R1.3.~~ | The Transmission Operator has a TRMID that does not incorporate changes that have been made six or more months ago but less than one year ago.<br>**OR**<br>The Transmission Operator's TRMID does not address two of the ~~sub requirements (R1.1, R1.2, R1.3).~~ following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3<br>~~Any violation or violations of the sub-requirements of R1.3 shall be considered a single violation of R1.3.~~ | The Transmission Operator has a TRMID that does not incorporate changes that have been made one year ago or more.<br>**OR**<br>The Transmission Operator does not have a TRMID~~;~~.<br>**OR**<br>The Transmission Operator's TRMID does not address three of the ~~sub requirements (R1.1, R1.2, R1.3).~~following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3~~Any violation or violations of the sub-requirements of R1.3 shall be considered a single violation of R1.3.~~ |

# Implementation Plan for Standard MOD-008-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-008-1 – Transmission Reliability Margin which describes the reliability aspects of determining and maintaining a Transmission Reliability Margin and what components of uncertainty may be considered when making that determination.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard supersedes MOD-008-0. MOD-009-0 – Procedure for Verifying Transmission Reliability Margin Values, has been incorporated into this standard, made irrelevant by this standard, or is being addressed by the North American Energy Standards Board, and should be retired when MOD-008-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-008-1 | ■ | | | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Implementation Plan for Standard MOD-008-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-008-1 – Transmission Reliability Margin which describes the reliability aspects of determining and maintaining a Transmission Reliability Margin and what components of uncertainty may be considered when making that determination.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard supersedes MOD-008-0. MOD-009-0 – Procedure for Verifying Transmission Reliability Margin Values, has been incorporated into this standard, made irrelevant by this standard, or is being addressed by the North American Energy Standards Board, and should be retired when MOD-008-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-008-1 | ■ | | | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

Committee shall set the proposed standard for ballot as soon as the work flow will accommodate."

NERC's Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008. Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee's Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards. The Standards Committee's Executive Committee directed NERC's Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Ameren Services Company | 1 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-008-1. (1) Applicability: The Transmission Service Provider not the Transmission Operator should be responsible for TRM methodology. This is especially true when the Transmission Service Provider determines TRM for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO. (2) Is TRM a reliability parameter or a market parameter? While the concepts of uncertainty and sensitivity analysis are inherent in reliability planning TRM as a metric has not been previously defined in the planning process. TRM has been applied in sale of open access transmission system to limit exposure to oversubscription of transmission service. As such TRM should be the responsibility of the Transmission Service Provider. (3) That said we are aware that the oversubscription of transmission service can lead to reliability problems. (4) The Transmission Service Provider, Transmission Operator, Planning Coordinator, and Transmission Planner should coordinate and cooperate in developing the TRM methodology. (5)TRM is applicable in the Operating Time Horizon and the one-year and beyond horizon. |
| American Electric Power | 1 | Affirmative | AEP votes affirmative, but we have a concern that the standard appears to have an internal ambiguity. The applicability states “Transmission Operators that maintain TRM" however, R1 requires that “Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) ...." In the context of R1, it unclear what requirements are placed upon Transmission Operators that DOES NOT maintain TRM. In addition, the Purpose statement implies that TRM is used as a real-time operation value. It is not. Despite these reservations, the proposed standard is benign, and AEP does vote affirmative. |
| Brazos Electric Power Cooperative, Inc. | 1 | Negative | A NEGATIVE vote is cast for this standard as written as it imposes obligations on entities in the ERCOT region that do not utilize ATC paths and calculation methodologies to manage congestion or for reliability operations. Our previous submitted comments suggested that applicability language be included in the requirements to recognize that such market difference exists. |
| Exelon Energy | 1 | Affirmative | General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies for corresponding time periods. Exelon's comments reflect these deficiencies and Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890. Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-008-1 TRM Calculation Methodology Standard lacks a requirement that components of TRM be consistent with those used in operating and planning studies for the same time period being studied |
| FirstEnergy Energy Delivery | 1 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-008 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-008 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-008 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - All Requirements (R1 through R5) Additional Comments: Applicability Section - The applicability states "Transmission Operators that maintain TRM" and all requirements of the standard are applicable to the TOP in regards to preparing and maintaining a TRM Implementation Document (TRMID), distributing the TRMID to other interested parties, calculating TRM consistent with the TRMID, etc. It is unclear to FE what requirements are placed upon a Transmission Operator that DOES NOT maintain TRM. A TOP who does not maintain TRM could be interpreted one of two ways: 1) For a given TOP footprint TRM is not withheld in calculating ATC 2) TRM is withheld for the TOP footprint, but the TOP does not determine or calculate the TRM value withheld. If the appropriate interpretation is as described in item 1) above, it begs the question if this is a needed reliability standard. If TRM is truly a reliability need, it can not be optional for any TOP service area. If the latter, item 2 and FE's understanding, is the correct interpretation, then FE's position on responsibility remains that that the applicability of this standard should rest with the entity performing the calculation of TRM which in many areas of the country is the TSP organization. Since the SDT has elected to not make a change in this regard we are requesting the aforementioned variance for the MISO RTO area. |
| Great River Energy | 1 | Negative | GRE is concerned with the Transmission Operator being the responsible entity for MOD-008. GRE believes that the responsible entity for these requirements should be the Transmission Service Provider. If the Transmission Operator does not perform this function then a delegation agreement must be created between it and the entity performing the function. It is GRE's opinion that a standard should not knowingly be written in a manner that requires delegation agreements for a large number of responsible entities, doing so is an inefficient use of resources. |
| Sierra Pacific Power Co. | 1 | Affirmative | Affirmative vote with comment: The severity levels surrounding R1 still appear to imply that all of the sub-items of R1.1 are expected to be used in the TRMID. It must be clear that it does not constitute a violation if |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | various of these sub-items are not applicable to the TRMID used by the entity. Clarify that this is "as applicable" or "as determined by the entity". |
| Southwest Transmission Cooperative, Inc. | 1 | Affirmative | SWTC supports all elements of MOD-08; however, the VSLs as redrafted to accommodate the industry comments have blurred the lines of severity and grant additional discretion to the enforcement entity. Further, the Applicable entity should be clarified throughout the standard to clearly identify whether the standard applies only to TOs that maintain TRM or to all TOs. |
| Tucson Electric Power Co. | 1 | Affirmative | TEP supports proposed WECC Team remedial language clarifying VSL severity level. |
| Ameren Services Company | 3 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-008-1. Applicability: The Transmission Service Provider not the Transmission Operator should be responsible for TRM methodology. This is especially true when the Transmission Service Provider determines TRM for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO. Is TRM a reliability parameter or a market parameter? While the concepts of uncertainty and sensitivity analysis are inherent in reliability planning TRM as a metric has not been previously defined in the planning process. TRM has been applied in sale of open access transmission system to limit exposure to oversubscription of transmission service. As such TRM should be the responsibility of the Transmission Service Provider. That said we are aware that the oversubscription of transmission service can lead to reliability problems. The Transmission Service Provider, Transmission Operator, Planning Coordinator, and Transmission Planner should coordinate and cooperate in developing the TRM methodology. TRM is applicable in the Operating Time Horizon and the one-year and beyond horizon |
| City Public Service of San Antonio | 3 | Negative | I cannot vote for this standard as written. It needs to acknowledge definitive alternatives to ATC for regions or markets such as ERCOT where transmission service markets are not used. |
| Constellation Energy | 3 | Affirmative | Greater standardization in the determination of TRM and monitoring of the on-going appropriateness of the amount set aside for TRM is required. |
| FirstEnergy Solutions | 3 | Affirmative | FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-008-1 and ask that the SDT consider our enclosed comments. Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General “The Violation Risk Factors should be added to the text of all of the standards. IRO-004 - VSL table shows “R7” instead of “R1” IRO-005 - Several Measures reference the incorrect requirement numbers TOP-003 - R4 — There is no measure associated with this requirement - Measures do not include evidence of “planning” of scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements |
| Lincoln Electric System | 3 | Negative | LES is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| Wisconsin Public Service Corp. | 3 | Negative | The Transmission Service Provider should be the responsible entity for MOD-008, not the Transmission Operator. |
| Alliant Energy Corp. Services, | 4 | Negative | We believe the Transmission Service Provider should be the responsible entity. |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Inc. | | | |
| Public Utility District No. 1 of Douglas County | 4 | Negative | We have not had sufficient time to review the effects of this change and coordinate it with others in our region. |
| WPS Resources Corp. | 4 | Negative | Requirement R3. The TRMID document should be made available to all users, owners, and operators. That is, the TRMID should be publicly available. |
| Constellation Generation Group | 5 | Negative | Greater standardization in the determination of TRM and monitoring of the on-going appropriateness of the amount set aside for TRM is required then this standard provides. TRM seems to be applied only at certain times by certain TPs. For example, one large TP in the South applies TRM only when an entity is looking for long term transmission service outside an 18 month window. That is, if the transmission service is for a year but the year begins and ends within the next 18 months, TRM isn't applied. This causes a very significant difference in study results. Others apply it differently. This type of item should be standardized. |
| Electric Power Supply Association | 5 | Negative | Greater standardization is required with the standard as drafted. Determination of TRM and monitoring of the associated with the ongoing appropriateness of the amounts set aside for TRM is required to achieve the needed standardization. |
| FirstEnergy Solutions | 5 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-008 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-008 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-008 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - All Requirements (R1 through R5) Additional Comments: Applicability Section - The applicability states "Transmission Operators that maintain TRM" and all requirements of the standard are applicable to the TOP in regards to preparing |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | and maintaining a TRM Implementation Document (TRMID), distributing the TRMID to other interested parties, calculating TRM consistent with the TRMID, etc. It is unclear to FE what requirements are placed upon a Transmission Operator that DOES NOT maintain TRM. A TOP who does not maintain TRM could be interpreted one of two ways: 1) For a given TOP footprint TRM is not withheld in calculating ATC 2) TRM is withheld for the TOP footprint, but the TOP does not determine or calculate the TRM value withheld. If the appropriate interpretation is as described in item 1) above, it begs the question if this is a needed reliability standard. If TRM is truly a reliability need, it can not be optional for any TOP service area. If the latter, item 2 and FE's understanding, is the correct interpretation, then FE's position on responsibility remains that that the applicability of this standard should rest with the entity performing the calculation of TRM which in many areas of the country is the TSP organization. Since the SDT has elected to not make a change in this regard we are requesting the aforementioned variance for the MISO RTO area. |
| Lincoln Electric System | 5 | Negative | LES is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| AEP Marketing | 6 | Affirmative | AEP has a concern because the standard appears to have an internal ambiguity. The applicability states "Transmission Operators that maintain TRM" however, R1 requires that "Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) ...." In the context of R1, it unclear what requirements are placed upon Transmission Operators that DOES NOT maintain TRM. In addition, the Purpose statement implies that TRM is used as a real-time operation value. It is not. |
| Barry Green Consulting Inc. | 6 | Negative | Greater standardization in the determination of TRM and monitoring of the on-going appropriateness of the amount set aside for TRM is required. |
| Constellation Energy Commodities Group | 6 | Negative | Greater standardization in the determination of TRM and monitoring of the ongoing appropriateness of the amount set aside for TRM is required. |
| FirstEnergy Solutions | 6 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-008 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. | | | | development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, “Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance.” FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-008 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - All Requirements (R1 through R5) Additional Comments: Applicability Section - The applicability states “Transmission Operators that maintain TRM” and all requirements of the standard are applicable to the TOP in regards to preparing and maintaining a TRM Implementation Document (TRMID), distributing the TRMID to other interested parties, calculating TRM consistent with the TRMID, etc. It is unclear to FE what requirements are placed upon a Transmission Operator that DOES NOT maintain TRM. A TOP who does not maintain TRM could be interpreted one of two ways: 1) For a given TOP footprint TRM is not withheld in calculating ATC 2) TRM is withheld for the TOP footprint, but the TOP does not determine or calculate the TRM value withheld. If the appropriate interpretation is as described in item 1) above, it begs the question if this is a needed reliability standard. If TRM is truly a reliability need, it can not be optional for any TOP service area. If the latter, item 2 and FE’s understanding, is the correct interpretation, then FE’s position on responsibility remains that that the applicability of this standard should rest with the entity performing the calculation of TRM which in many areas of the country is the TSP organization. Since the SDT has elected to not make a change in this regard we are requesting the aforementioned variance for the MISO RTO area. |
| Lincoln Electric System | 6 | Negative | LES is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| Volkmann Consulting | 8 | Negative | This standard does not show the applicability to the Transmission Service Provider. In RTOs the TSP is responsible for calculating and maintaining TRM. Delegation agreements can cover this. However, with the larger portion of the Eastern Interconnection covered by regional tariffs and TSP operation, this standard should speak directly to the TSP responsibilities |
| Electric Reliability Council of Texas, Inc. | 10 | Abstain | Although the Applicability Section is clear, some Requirements and Measures contain no clear applicability only to those Transmission Operators that maintain TRM in their transmission system and market operations. |
| Midwest Reliability Organization | 10 | Negative | The MRO is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |

# Consideration of Comments on Initial Ballot — MOD-008-1 — Transmission Reliability Margin Calculation Methodology

**Summary Consideration:** While some stakeholders suggested modifications to the standard, most stakeholders agreed with the standard as proposed and the drafting team did not make any changes to the standard.

| Entity | Segment | Vote | Comment |

<table>
<tr><th>Entity</th><th>Segment</th><th>Vote</th><th>Comment</th></tr>
<tr><td colspan="4">The SDT concurs that oversubscription can lead to reliability problems.<br><br>Developing requirements that require collaboration are difficult, as it can be challenging to discover who is not complying. For example, if MISO and Ameren were unable to come to agreement on development of a TRM methodology, should both entities be sanctioned for not meeting the TRM requirements? NERC has attempted to address this through allowing the use of Joint Registration Organizations, where a MISO/Ameren collaboration would be sanctioned as a single entity, and then the JRO would be responsible for determining how to allocate those sanctions among participants in the JRO.<br><br>With regard to the Time Horizons used in compliance (which are generally used to indicate how much time is available for mitigating a violation to the requirements), the SDT believes the correct horizon is Operations Planning.</td></tr>
<tr><td>American Electric Power</td><td>1</td><td>Affirmative</td><td>AEP votes affirmative, but we have a concern that the standard appears to have an internal ambiguity. The applicability states “Transmission Operators that maintain TRM" however, R1 requires that “Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) ...." In the context of R1, it unclear what requirements are placed upon Transmission Operators that DOES NOT maintain TRM. In addition, the Purpose statement implies that TRM is used as a real-time operation value. It is not. Despite these reservations, the proposed standard is benign, and AEP does vote affirmative.</td></tr>
<tr><td colspan="4">Response: The entire standard only applies to those Transmission Operators that maintain TRM and because this is specified in the applicability, the standard did not reiterate this in the requirements. With regard to the use of TRM as a real-time operation value, the SDT believes that while the TRM may not be explicitly scheduled, the capacity withheld as a margin may be used in real-time (e.g., if load forecast is higher than expected, then some of the margin may be used to support the additional internal generation needed to serve that load).</td></tr>
<tr><td>Brazos Electric Power Cooperative, Inc.</td><td>1</td><td>Negative</td><td>A NEGATIVE vote is cast for this standard as written as it imposes obligations on entities in the ERCOT region that do not utilize ATC paths and calculation methodologies to manage congestion or for reliability operations. Our previous submitted comments suggested that applicability language be included in the requirements to recognize that such market difference exists.</td></tr>
<tr><td colspan="4">Response: If ERCOT does not utilize TRM, then this standard does not apply.</td></tr>
<tr><td>Exelon Energy</td><td>1</td><td>Affirmative</td><td>General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies for corresponding time periods. Exelon's comments reflect these deficiencies and Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890. Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-008-1 TRM Calculation Methodology Standard lacks a requirement that</td></tr>

|---|---|---|---|
| | | | components of TRM be consistent with those used in operating and planning studies for the same time period being studied |
| **Response**: The SDT considered adding the requirement described in previous discussions. However, to do so would negate the value of TRM, as TRM is specifically intended to be based on situations other than those expected. For example, the system might be expected to operate with a load of 10,000 MW. TRM is intended to be used to create a margin such that if load is 11,000 MW, transmission capacity is available to support the serving of that load. In this example, the operations studies performed might include an 11,000 MW case, but would not necessarily include an explicit TRM. The SDT does not believe this to be inconsistent with the intent of Order 890. | | | |
| FirstEnergy Energy Delivery | 1 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-008 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-008 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-008 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - All Requirements (R1 through R5) Additional Comments: Applicability Section - The applicability states "Transmission Operators that maintain TRM" and all requirements of the standard are applicable to the TOP in regards to preparing and maintaining a TRM Implementation Document (TRMID), distributing the TRMID to other interested parties, calculating TRM |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | consistent with the TRMID, etc. It is unclear to FE what requirements are placed upon a Transmission Operator that DOES NOT maintain TRM. A TOP who does not maintain TRM could be interpreted one of two ways: 1) For a given TOP footprint TRM is not withheld in calculating ATC 2) TRM is withheld for the TOP footprint, but the TOP does not determine or calculate the TRM value withheld. If the appropriate interpretation is as described in item 1) above, it begs the question if this is a needed reliability standard. If TRM is truly a reliability need, it can not be optional for any TOP service area. If the latter, item 2 and FE's understanding, is the correct interpretation, then FE's position on responsibility remains that that the applicability of this standard should rest with the entity performing the calculation of TRM which in many areas of the country is the TSP organization. Since the SDT has elected to not make a change in this regard we are requesting the aforementioned variance for the MISO RTO area. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. The SDT believes the transfer of responsibility described within the MISO Transmission Owners Agreement would be an effective way to delegate this task to a Transmission Service Provider through the registration of a Joint Registration Organization. To the extent an entity variance is desired, First Energy and/or MISO would need to submit a SAR to request the variance. The commenter is correct that ideally a variance would be considered in the SAR process and throughout the standard development process; however, no one has yet requested a variance through a SAR (or incorporated the request into one of the existing SARs during their development), and at this time the drafting team can not add a variance and still meet the deadline established by NERC and FERC for this revision of the standard.<br><br>Regarding the applicability of the standard, the entire standard only applies to those Transmission Operators that operate their system with the assumption that some transmission capacity margin has been withheld from commercial use to address the reliability threats listed in R1. The SDT does not believe that TRM is required for all entities; entities that have reviewed the risks listed in R1 and determined that they can manage those risks through other means (e.g., demand **Response**, operating guides, etc...) are not required to maintain TRM. | | | |
| Great River Energy | 1 | Negative | GRE is concerned with the Transmission Operator being the responsible entity for MOD-008. GRE believes that the responsible entity for these requirements should be the Transmission Service Provider. If the Transmission Operator does not perform this function then a delegation agreement must be created between it and the entity performing the function. It is GRE's opinion that a standard should not knowingly be written in a manner that requires delegation agreements for a large number of responsible entities, doing so is an inefficient use of resources. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; | | | |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| however, we are required to pick a single entity as responsible for this task. | | | |
| Sierra Pacific Power Co. | 1 | Affirmative | Affirmative vote with comment: The severity levels surrounding R1 still appear to imply that all of the sub-items of R1.1 are expected to be used in the TRMID. It must be clear that it does not constitute a violation if various of these sub-items are not applicable to the TRMID used by the entity. Clarify that this is "as applicable" or "as determined by the entity". |
| **Response**: The VSL indicates that entities must comply with R1.1. R1.1 requires the "Identification of… each of the following components of uncertainty *if used in establishing TRM*" (emphasis added). If the entity does not use a specific element in determining TRM, then its absence would not result in a violation. | | | |
| Southwest Transmission Cooperative, Inc. | 1 | Affirmative | SWTC supports all elements of MOD-08; however, the VSLs as redrafted to accommodate the industry comments have blurred the lines of severity and grant additional discretion to the enforcement entity. Further, the Applicable entity should be clarified throughout the standard to clearly identify whether the standard applies only to TOs that maintain TRM or to all TOs. |
| **Response**: The SDT reviewed the VSLs and concludes that they appropriately minimize the discretion of the enforcement entity. If in future comments on standards you could be more specific, that would aid the team in addressing your concerns.<br><br>The entire standard only applies to those Transmission Operators that maintain TRM and because this is specified in the applicability, the standard did not reiterate this in the requirements. | | | |
| Tucson Electric Power Co. | 1 | Affirmative | TEP supports proposed WECC Team remedial language clarifying VSL severity level. |
| **Response**: The SDT does not have the WECC team remedial language, and therefore cannot comment on it. | | | |
| Ameren Services Company | 3 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-008-1.<br>Applicability: The Transmission Service Provider not the Transmission Operator should be responsible for TRM methodology. | Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | TRM seems to be applied only at certain times by certain TPs. For example, one large TP in the South applies TRM only when an entity is looking for long term transmission service outside an 18 month window. That is, if the transmission service is for a year but the year begins and ends within the next 18 months, TRM isn't applied. This causes a very significant difference in study results. Others apply it differently. This type of item should be standardized. |
| **Response**: The SDT did not believe that it could, at this time, define a single methodology for TRM without arbitrarily affecting either reliability, market access or both. The SDT encourages entities to submit requests for future work to be considered as part of NERC's annual planning process. The MOD standards do require that TRM and other factors of TTC/TFC be applied consistently by an entity so that all users of their system are treated equally. | | | |
| Electric Power Supply Association | 5 | Negative | Greater standardization is required with the standard as drafted. Determination of TRM and monitoring of the associated with the ongoing appropriateness of the amounts set aside for TRM is required to achieve the needed standardization. |
| **Response**: The SDT did not believe that it could, at this time, define a single methodology for TRM without arbitrarily affecting either reliability, market access or both. The SDT encourages entities to submit requests for future work to be considered as part of NERC's annual planning process. | | | |
| FirstEnergy Solutions | 5 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-008 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-008 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-008 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - All Requirements (R1 through R5) Additional Comments: Applicability Section - The applicability states "Transmission Operators that maintain TRM" and all requirements of the standard are applicable to the TOP in regards to preparing and maintaining a TRM Implementation Document (TRMID), distributing the TRMID to other interested parties, calculating TRM consistent with the TRMID, etc. It is unclear to FE what requirements are placed upon a Transmission Operator that DOES NOT maintain TRM. A TOP who does not maintain TRM could be interpreted one of two ways: 1) For a given TOP footprint TRM is not withheld in calculating ATC 2) TRM is withheld for the TOP footprint, but the TOP does not determine or calculate the TRM value withheld. If the appropriate interpretation is as described in item 1) above, it begs the question if this is a needed reliability standard. If TRM is truly a reliability need, it can not be optional for any TOP service area. If the latter, item 2 and FE's understanding, is the correct interpretation, then FE's position on responsibility remains that that the applicability of this standard should rest with the entity performing the calculation of TRM which in many areas of the country is the TSP organization. Since the SDT has elected to not make a change in this regard we are requesting the aforementioned variance for the MISO RTO area. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. The SDT believes the transfer of responsibility described within the MISO Transmission Owners Agreement would be an effective way to delegate this task to a Transmission Service Provider through the registration of a Joint Registration Organization. To the extent an entity variance is desired, First Energy and/or MISO would need to submit a SAR to request the variance. The commenter is correct that ideally a variance would be considered in the SAR process and throughout the standard development process; however, no one has yet requested a variance through a SAR (or incorporated the request into one of the existing SARs during their development), and at this time the drafting team can not add a variance and still meet the deadline established by NERC and FERC for this revision of the standard.<br><br>Regarding the applicability of the standard, the entire standard only applies to those Transmission Operators that operate their system with the assumption that some transmission capacity margin has been withheld from commercial use to address the reliability threats listed in R1. The SDT does not believe that TRM is required for all entities; entities that have reviewed the risks listed in R1 and determined that they can manage those risks through other means (e.g., demand response, operating guides, etc…) are not required to maintain TRM. | | | |
| Lincoln Electric System | 5 | Negative | LES is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission |

|---|---|---|---|
| | | | Service Provider. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; however, we are required to pick a single entity as responsible for this task. | | | |
| AEP Marketing | 6 | Affirmative | AEP has a concern because the standard appears to have an internal ambiguity. The applicability states “Transmission Operators that maintain TRM" however, R1 requires that “Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) ...." In the context of R1, it unclear what requirements are placed upon Transmission Operators that DOES NOT maintain TRM. In addition, the Purpose statement implies that TRM is used as a real-time operation value. It is not. |
| **Response**: The entire standard only applies to those Transmission Operators that maintain TRM and because this is specified in the applicability, the standard did not reiterate this in the requirements. With regard to the use of TRM as a real-time operation value, the SDT believes that while the TRM may not be explicitly scheduled, the capacity withheld as a margin may be used in real-time (e.g., if load forecast is higher than expected, then some of the margin may be used to support the additional internal generation needed to serve that load). | | | |
| Barry Green Consulting Inc. | 6 | Negative | Greater standardization in the determination of TRM and monitoring of the on-going appropriateness of the amount set aside for TRM is required. |
| **Response**: The SDT did not believe that it could, at this time, define a single methodology for TRM without arbitrarily affecting either reliability, market access or both. The SDT encourages entities to submit requests for future work to be considered as part of NERC's annual planning process. | | | |
| Constellation Energy Commodities Group | 6 | Negative | Greater standardization in the determination of TRM and monitoring of the ongoing appropriateness of the amount set aside for TRM is required. |
| **Response**: The SDT did not believe that it could, at this time, define a single methodology for TRM without arbitrarily affecting either reliability, market access or both. The SDT encourages entities to submit requests for future work to be considered as part of NERC's annual planning process. | | | |

| Lincoln Electric System | 6 | Negative | LES is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. | | | |
| Volkmann Consulting | 8 | Negative | This standard does not show the applicability to the Transmission Service Provider. In RTOs the TSP is responsible for calculating and maintaining TRM. Delegation agreements can cover this. However, with the larger portion of the Eastern Interconnection covered by regional tariffs and TSP operation, this standard should speak directly to the TSP responsibilities |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; however, we are required to pick a single entity as responsible for this task. | | | |
| Electric Reliability Council of Texas, Inc. | 10 | Abstain | Although the Applicability Section is clear, some Requirements and Measures contain no clear applicability only to those Transmission Operators that maintain TRM in their transmission system and market operations. |
| **Response**: The entire standard only applies to those Transmission Operators that maintain TRM and because this is specified in the applicability, the standard did not reiterate this in the requirements. | | | |
| Midwest Reliability Organization | 10 | Negative | The MRO is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; however, we are required to pick a single entity as responsible for this task. | | | |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR Development June 20 2005.
2. SAC Authorized the SAR to be developed as a standard on February 14 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from February 15–March 16, 2007.
5. SDT posted second draft for comment from May 25–June 25, 2007.
6. SDT posted third draft for comment from October 31–December 15, 2007.
7. SC conducted an Initial Ballot of the standard from March 3–12, 2008.
8. SDT posted fourth draft for comment form April 16–May 15, 2008.

**Description of Current Draft:**

This is the fifth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to Comments. | June 20, 2008 |
| 2. Posting for 30-day Pre-Ballot Review. | June 20, 2008 |
| 3. Initial Ballot. | July 21, 2008 |
| 4. Respond to comments. | August 20, 2008 |
| 5. Recirculation ballot. | August 21, 2008 |
| 6. 30-day posting before board adoption. | June 21, 2008 |
| 7. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**ATC Path:** Any combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path[1].

**Available Transfer Capability (ATC):** A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less Existing Transmission Commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows.

**Available Transfer Capability Implementation Document (ATCID):** A document that describes the implementation of a methodology for calculating ATC or AFC, and provides information related to a Transmission Service Provider's calculation of ATC or AFC.

**Transmission Operator Area:** The collection of Transmission assets over which the Transmission Operator is responsible for operating.

**Existing Transmission Commitments (ETC):** Committed uses of a Transmission Service Provider's Transmission system considered when determining ATC or AFC.

**Planning Coordinator:** See Planning Authority.

**Postback:** Positive adjustments to ATC or AFC as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.

**Business Practices:** Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization or regional entity business practices; or NAESB Business Practices**.**

**Block Dispatch:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).

**Dispatch Order:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.

**Participation Factors:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.

---

[1] See 18 CFR 37.6(b)(1)

## A. Introduction

1. **Title:** **Available Transmission System Capability**
2. **Number:** **MOD-001-1**
3. **Purpose:** To ensure that calculations are performed by Transmission Service Providers to maintain awareness of available transmission system capability and future flows on their own systems as well as those of their neighbors
4. **Applicability:**
   - **4.1.** Transmission Service Provider.
   - **4.2.** Transmission Operator.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Operator shall select one of the methodologies[2] listed below for calculating Available Transfer Capability (ATC) or Available Flowgate Capability (AFC) for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- The Area Interchange Methodology, as described in MOD-028
- The Rated System Path Methodology, as described in MOD-029
- The Flowgate Methodology, as described in MOD-030

**R2.** Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s): [*Violation Risk Factor: Lower* [*Time Horizon: Operations Planning*]

**R2.1.** Hourly values for at least the next 48 hours.

**R2.2.** Daily values for at least the next 31 calendar days.

**R2.3.** Monthly values for at least the next 12 months (months 2-13).

**R3.** Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC or AFC calculations can be validated.

**R3.2.** A description of the manner in which the Transmission Service Provider will account for counterflows including:

**R3.2.1.** How confirmed Transmission reservations, expected Interchange and internal counterflow are addressed in firm and non-firm ATC or AFC calculations.

---

[2] All ATC Paths do not have to use the same methodology and no particular ATC Path must use the same methodology for all time periods.

**R3.2.2.** A rationale for that accounting specified in R3.2.

**R3.3.** The identity of the Transmission Operators and Transmission Service Providers from which the Transmission Service Provider receives data for use in calculating ATC or AFC.

**R3.4.** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer or Flowgate capability.

**R3.5.** A description of the allocation processes listed below that are applicable to the Transmission Service Provider:

- Processes used to allocate transfer or Flowgate capability among multiple lines or sub-paths within a larger ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities among multiple owners or users of an ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities between Transmission Service Providers to address issues such as forward looking congestion management and seams coordination.

**R3.6.** A description of how generation and transmission outages are considered in transfer or Flowgate capability calculations, including:

**R3.6.1.** The criteria used to determine when an outage that is in effect part of a day impacts a daily calculation.

**R3.6.2.** The criteria used to determine when an outage that is in effect part of a month impacts a monthly calculation.

**R3.6.3.** How outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed.

**R4.** The Transmission Service Provider shall notify the following entities before implementing a new or revised ATCID: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.1.** Each Planning Coordinator associated with the Transmission Service Provider's area.

**R4.2.** Each Reliability Coordinator associated with the Transmission Service Provider's area.

**R4.3.** Each Transmission Operator associated with the Transmission Service Provider's area.

**R4.4.** Each Planning Coordinator adjacent to the Transmission Service Provider's area.

**R4.5.** Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

**R4.6.** Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

**R5.** The Transmission Service Provider shall make available the current ATCID to all of the entities specified in R4. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.** When calculating Total Transfer Capability (TTC) or Total Flowgate Capability (TFC) the Transmission Operator shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.** When calculating ATC or AFC the Transmission Service Provider shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R8.** Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**R8.1.** Hourly values, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the ATC equation.

**R8.2.** Daily values, once per day.

**R8.3.** Monthly values, once per week.

**R9.** Within thirty calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below solely for use in the requestor's ATC or AFC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R9.1 and R9.2: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

> Note that the North American Energy Standards Board (NAESB) is developing the companion standards that address the posting of ATC information, including supporting information such as that described in R9.

- Expected generation and Transmission outages, additions, and retirements.
- Load forecasts.
- Unit commitments and order of dispatch, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:
  - Dispatch Order
  - Participation Factors
  - Block Dispatch
- Aggregated firm capacity set-aside for Network Integration Transmission Service and aggregated non-firm capacity set aside for Network Integration Transmission Service (i.e. Secondary Service).
- Firm and non-firm Transmission reservations.
- Aggregated capacity set-aside for Grandfathered obligations
- Firm roll-over rights.
- Any firm and non-firm adjustments applied by the Transmission Service Provider to reflect parallel path impacts.
- Power flow models and underlying assumptions.

- Contingencies, provided in one or more of the following formats:
  - A list of Elements
  - A list of Flowgates
  - A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider
- Facility Ratings.
- Any other services that impact Existing Transmission Commitments (ETCs).
- Values of Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) for all ATC Paths or Flowgates.
- Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider receiving the request when selling Transmission service.
- Values of TTC and ATC for all ATC Paths for those Transmission Service Providers receiving the request that do not consider Flowgates when selling Transmission Service.
- Source and sink identification and mapping to the model.

**R9.1.** The Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months into the future (subject to confidentiality and security requirements).

**R9.1.1.** If the Transmission Service Provider uses the data requested in its transfer or Flowgate capability calculations, it shall make the data used available

**R9.1.2.** If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, but maintains that data, it shall make that data available

**R9.1.3.** If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, and does not maintain that data, it shall not be required to make that data available

**R9.2.** This data shall be made available by the Transmission Provider on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider).

## C. Measures

**M1.** The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one of the specified methodologies per time period in R2 for use in determining Transfer Capabilities of those Facilities for each ATC Path within the Transmission Operator's operating area. (R1).

**M2.** The Transmission Service Provider shall provide ATC or AFC values and identification of the selected methodologies along with other evidence (such as written documentation, processes, or data) to show it calculated ATC or AFC for the following using the selected methodology or methodologies chosen as part of R1 (R2):

- There has been at least 48 hours of hourly values calculated at all times. (R2.1)
- There has been at least 31 consecutive calendar days of daily values calculated at all times. (R2.2)

- There has been at least the next 12 months of monthly values calculated at all times (Months 2-13). (R2.3)

**M3.** The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

**M4.** The Transmission Service Provider shall provide evidence (such as dated electronic mail messages, mail receipts, or voice recordings) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)

**M5.** The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in R4, as required by R5. (R5)

**M6.** The Transmission Operator shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides or data sources for load forecast and facility outages) used to calculate TTC or TFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining TTC or TFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Operator may demonstrate that the same load flow cases are used for both TTC or TFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R6)

**M7.** The Transmission Service Provider shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides or data sources for load forecast and facility outages) used to calculate ATC or AFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining ATC or AFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Service Provider may demonstrate that the same load flow cases are used for both AFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R7)

**M8.** The Transmission Service Provider calculating ATC shall provide evidence (such as logs or data) that it has calculated the hourly, daily, and monthly values on at least the minimum frequencies specified in R8 or provide evidence (such as data, procedures, or software documentation) that the calculated values identified in the ATC equation have not changed. (R8)

**M9.** The Transmission Service Provider shall provide a copy of the dated request, if any, for ATC or AFC data as well as evidence to show it responded to that request (such as logs or data) within thirty calendar days of receiving the request, and the requested data items were made available in accordance with R9. (R9)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

**1.3. Data Retention**

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall maintain its current selected method(s) for calculating ATC or AFC and any methods in force since last compliance audit period to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7, and R8 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.
- The Transmission Service Provider shall maintain evidence to show compliance with R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | N/A | N/A | N/A | The Transmission Operator did not select one of the specified methodologies for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area. |
| R2. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 30 hours but less than the next 48 hours.<br>▪ Has calculated daily ATC or AFC values for more than the next 21 calendar days but less than the next 31 calendar days.<br>▪ Has calculated monthly ATC or AFC values for more than the next 9 months but less than the next 12 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 20 hours but less than the next 31 hours.<br>▪ Has calculated daily ATC or AFC values for more than the next 14 calendar days but less than the next 22 calendar days.<br>▪ Has calculated monthly ATC or AFC values for more than the next 6 months but less than the next 10 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 10 hours but less than the next 21 hours.<br>▪ Has calculated daily ATC or AFC values for more than the next 7 calendar days but less than the next 15 calendar days.<br>▪ Has calculated monthly ATC or AFC values for more than the next 3 months but less than the next 7 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for less than the next 11 hours.<br>▪ Has calculated daily ATC or AFC values for less than the next 8 calendar days.<br>▪ Has calculated monthly ATC or AFC values for less than the next 4 months.<br>▪ Did not use the selected methodology(ies) to calculate ATC. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made up to three months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than three months but not more than six months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than six months but not more than one year ago.<br>**OR**<br>The Transmission Service Provider has an ATCID, but it does not include one or two of the information items described in R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made a year or more ago.<br>**OR**<br>The Transmission Service Provider does not have an ATCID, or its ATCID does not include three or more of the information items described in R3. |
| R4. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID after, but not more than 30 calendar days after, its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 30, but not more than 60, calendar days after its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 60, but not more than 90, calendar days after its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 90 calendar days after its implementation.<br>**OR**<br>The Transmission Service Provider did not notify one or more of the parties specified in R4 of a new or modified ATCID for more than 90 calendar days after its implementation. |
| R5. | N/A | N/A | N/A | The Transmission Service Provider did not make the ATCID available to the parties described in R4. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R6. | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than zero ATC Paths or Flowgates, but not more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater), but not more than 10% of all ATC Paths or Flowgates or 2 ATC Paths or Flowgates (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 10% of all ATC Paths or Flowgates or 2 ATC Path or Flowgate (whichever is greater), but not more than 15% of all ATC Paths or Flowgates or 3 ATC Paths or Flowgates (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 15% of all ATC Paths or Flowgates or more than 3 ATC Paths or Flowgates (whichever is greater). |
| R7 | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than zero ATC Paths or Flowgates, but not more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater), but not more than 10% of all ATC Paths or Flowgates or 2 ATC Paths or Flowgates (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 10%, of all ATC Paths or Flowgates or 2 ATC Path or Flowgate (whichever is greater), but not more than 15% of all ATC Paths or Flowgates or 3 ATC Paths or Flowgates (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 15% of all ATC Paths or Flowgates or more than 3 ATC Paths or Flowgates (whichever is greater). |
| R8. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for one or more hours but not more than 15 hours, and was in excess of the 175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 15 hours but not more than 20 hours, and was in excess of the 175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 20 hours but not more than 25 hours, and was in excess of the 175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 25 hours, and was in excess of the 175-hour per year requirement.<br>▪ For Daily, the values |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | ▪ For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for one or more calendar days but not more than 3 calendar days.<br>▪ For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for seven or more calendar days, but less than 14 calendar days. | ▪ For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 3 calendar days but not more than 4 calendar days.<br>▪ For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 14 or more calendar days, but less than 21 calendar days. | For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 4 calendar days but not more than 5 calendar days.<br>▪ For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 21 or more calendar days, but less than 28 calendar days. | described in the ATC equation changed and the Transmission Service provider did not calculate for more than 5 calendar days.<br>▪ For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 28 or more calendar days. |
| R9 | N/A | The Transmission Service Provider made the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available more than 30 calendar days but less than 45 calendar days after receiving a request. | The Transmission Service Provider made the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available 45 calendar days or more but less than 60 calendar days after receiving a request. | The Transmission Service Provider did not make the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available for 60 calendar days or more after receiving a request. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR Development June 20 2005.
2. SAC Authorized the SAR to be developed as a standard on February 14 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from February 15–March 16, 2007.
5. SDT posted second draft for comment from May 25–June 25, 2007.
6. SDT posted third draft for comment from October 31–December 15, 2007.
7. SC conducted an Initial Ballot of the standard from March 3–12, 2008.
8. SDT posted fourth draft for comment form April 16–May 15, 2008.

**Description of Current Draft:**

This is the fifth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to Comments. | June 20, 2008 |
| 2. Posting for 30-day Pre-Ballot Review. | June 20, 2008 |
| 3. Initial Ballot. | July 21, 2008 |
| 4. Respond to comments. | August 20, 2008 |
| 5. Recirculation ballot. | August 21, 2008 |
| 6. 30-day posting before board adoption. | June 21, 2008 |
| 7. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**ATC Path:** ~~Any Posted Path or~~ Aany ~~other~~ combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path[1].

**Available Transfer Capability (ATC):** A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less Eexisting Ttransmission Ccommitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows.

**Available Transfer Capability Implementation Document (ATCID):** A document that describes the implementation of a methodology for calculating ATC or AFC, and provides information related to a Transmission Service Provider's calculation of ATC or AFC.

**Transmission Operator Area:** The collection of Transmission assets over which the Transmission Operator is responsible for operating.

**Existing Transmission Commitments (ETC):** Committed uses of a Transmission Service Provider's Transmission system considered when determining ATC or AFC.

**Planning Coordinator:** See Planning Authority.

**Postback:** Positive adjustments to ATC or AFC as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.

**Business Practices:** Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization or regional entity business practices; or NAESB Business Practices**.**

**Block Dispatch:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).

**Dispatch Order:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.

**Participation Factors:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.

[1] See 18 CFR 37.6(b)(1)

## A. Introduction

1. **Title:** **Available Transmission System Capability**

2. **Number:** **MOD-001-1**

3. **Purpose:** To ensure that calculations are performed by Transmission Service Providers to maintain awareness of available transmission system capability and future flows on their own systems as well as those of their neighbors

4. **Applicability:**

   **4.1.** Transmission Service Provider.

   **4.2.** Transmission Operator.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Operator shall select one of the ~~ATC~~ methodolog~~y~~ies[2] listed below for calculating Available Transfer Capability (ATC) ~~ATC (Area Interchange methodology, Rated System Path methodology)~~ or -Available Flowgate Capability (AFC) ~~AFC (Flowgate methodology)~~ for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area~~.~~: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- The Area Interchange Methodology, as described in MOD-028
- The Rated System Path Methodology, as described in MOD-029
- The Flowgate Methodology, as described in MOD-030

**R2.** Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s): [*Violation Risk Factor: Lower* [*Time Horizon: Operations Planning*]

**R2.1.** Hourly values for at least the next 48 hours.

**R2.2.** Daily values for at least the next 31 calendar days.

**R2.3.** Monthly values for at least the next 12 months (months 2-13).

**R3.** Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC or AFC calculations can be validated.

**R3.2.** A description of the manner in which the Transmission Service Provider will account for counterflows including:

---

[2] All ATC Paths do not have to use the same methodology and no particular ATC Path must use the same methodology for all time periods.

**R3.2.1.** How confirmed Transmission reservations, expected Interchange and internal counterflow are addressed in firm and non-firm ATC or AFC calculations.

**R3.2.2.** A rationale for th~~e defined~~ at accounting specified in R3.2. ~~.~~

**R3.3.** The identity of the Transmission Operators and Transmission Service Providers from which the Transmission Service Provider receives data for use in calculating ATC ~~transfer of Flowgate capability~~or AFC.

**R3.4.** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer or Flowgate capability.

**R3.5.** A description of the allocation processes listed below that are applicable to the Transmission Service Provider:

- Processes used to allocate transfer or Flowgate capability among multiple lines or sub-paths within a larger ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities among multiple owners or users of an ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities between Transmission Service Providers to address issues such as forward looking congestion management and seams coordination.

**R3.6.** A description of how generation and transmission outages are considered in ~~ATC~~ transfer or Flowgate capability calculations, including:

**R3.6.1.** The criteria used to determine when an outage that is in effect part of a day impacts a daily ~~ATC or AFC~~ calculation.

**R3.6.2.** The criteria used to determine when an outage that is in effect part of a month impacts a monthly ~~ATC or AFC~~ calculation.

**R3.6.3.** How outages from other Transmission Service Providers ~~(including those outages from other Transmission Service Providers that are unrecognized)~~that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are ~~processed~~addressed~~,~~.

**R4.** The Transmission Service Provider shall notify the following entities ~~(via electronic mail)~~ before implementing a new or revised ATCID: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.1.** Each Planning Coordinator associated with the Transmission Service Provider's area.

**R4.2.** Each Reliability Coordinator associated with the Transmission Service Provider's area.

**R4.3.** Each Transmission Operator associated with the Transmission Service Provider's area.

**R4.4.** Each Planning Coordinator adjacent to the Transmission Service Provider's area.

**R4.5.** Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

**R4.6.** Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

**R5.** The Transmission Service Provider shall make available the current ATCID to all of the entities specified in R4. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.** When calculating Total ~~t~~Transfer Capability (TTC) or Total Flowgate Capability (TFC) the Transmission Operator shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.** When calculating ATC or AFC the Transmission Service Provider shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R8.** Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**R8.1.** Hourly values, once per hour. Transmission Service Providers are allowed up to ~~80~~ 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the ATC equation.

**R8.2.** Daily values, once per day.

**R8.3.** Monthly values, once per week.

**R9.** Within thirty calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below solely for use in the requestor's ATC or AFC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R9.1 and R9.2: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Expected generation and Transmission outages, additions, and retirements.
- Load forecasts.
- Unit commitments and order of dispatch, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:
  - Dispatch Order
  - Participation Factors
  - Block Dispatch
- Aggregated firm capacity set-aside for Network Integration Transmission Service and aggregated non-firm capacity set aside for Network Integration Transmission Service (i.e. Secondary Service).
- Firm and non-firm Transmission reservations.
- Aggregated capacity set-aside for Grandfathered obligations

Note that the North American Energy Standards Board (NAESB) is developing the companion standards that address the posting of ATC information, including supporting information such as that described in R9.

- Firm roll-over rights.
- Any firm and non-firm adjustments applied by the Transmission Service Provider to reflect parallel path impacts.
- Power flow models and underlying assumptions.
- Contingencies, provided in one or more of the following formats:
  - A list of Elements
  - A list of Flowgates
  - A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider
- Facility Ratings.
- Any other services that impact Existing Transmission Commitments (ETCs).
- Values of Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM)~~, and TTC~~ for all ATC Paths or Flowgates.
- Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider receiving the request when selling Transmission service.
- Values of TTC and ATC for all ATC Paths for those Transmission Service Providers receiving the request that do not consider Flowgates when selling Transmission Service.
- Source and sink identification and mapping to the model.

**R9.1.** The Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months into the future (subject to confidentiality and security requirements).

**R9.1.1.** If the Transmission Service Provider uses the data requested in its transfer or Flowgate capability calculations, it shall make the data used available

**R9.1.2.** If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, but maintains that data, it shall make that data available

**R9.1.3.** If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, and does not maintain that data, it shall not be required to make that data available

**R9.2.** This data shall be made available by the Transmission Provider on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider).

## C. Measures

**M1.** The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one of the specified methodologies per time period in R2 for use in determining Transfer Capabilities of those Facilities for each ATC Path within the Transmission Operator's operating area. (R1).

**M2.** The Transmission Service Provider shall provide ATC or AFC values and identification of the selected methodologies along with other evidence (such as written documentation, processes, or data) to show it calculated ATC or AFC for the following using the selected methodology or methodologies chosen as part of R1 (R2):

- There has been at least 48 hours of hourly values calculated at all times. (R2.1)
- There has been at least 31 consecutive calendar days of daily values calculated at all times. (R2.2)
- There has been at least the next 12 months of monthly values calculated at all times (Months 2-13). (R2.3)

**M3.** The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

**M4.** The Transmission Service Provider shall provide evidence (such as dated electronic mail messages, mail receipts, or voice recordings) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)

**M5.** The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in R4, as required by R5. (R5)

**M6.** The Transmission Operator shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides~~, load shedding~~ or data sources for load forecast and facility outages) used to calculate TTC or TFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining TTC or TFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Operator may demonstrate that the same load flow cases are used for both TTC or TFC ~~-~~and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R6)

**M7.** The Transmission Service Provider shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides~~, load shedding~~ or data sources for load forecast and facility outages) used to calculate ATC or AFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining ATC or AFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Service Provider may demonstrate that the same load flow cases are used for both AFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R7)

**M8.** The Transmission Service Provider calculating ATC shall provide evidence (such as logs or data) that it has calculated the hourly, daily, and monthly values on at least the minimum frequencies specified in R8 or provide evidence (such as data, procedures, or software documentation) that the calculated values identified in the ATC equation have not changed. (R8)

**M9.** The Transmission Service Provider shall provide a copy of the dated request, if any, for ATC or AFC data as well as evidence to show it responded to that request (such as logs or data) within thirty calendar days of receiving the request, and the requested data items were made available in accordance with R9. (R9)

## D. Compliance

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

Regional Entity.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Data Retention**

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall maintain its current selected method(s) for calculating ATC or AFC and any methods in force since last compliance audit period to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7, and R8 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.
- The Transmission Service Provider shall maintain evidence to show compliance with R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

-The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | N/A | N/A | N/A | The Transmission Operator did not select one of the specified methodologies for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area. |
| R2. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 30 hours but less than the next 48 hours.<br>~~OR~~<br>▪ Has calculated daily ATC or AFC values for more than the next 21 calendar days but less than the next 31 calendar days.<br>~~OR~~<br>▪ Has calculated monthly ATC or AFC values for more than the next 9 months but less than the next 12 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 20 hours but less than the next 31 hours.<br>~~OR~~<br>▪ Has calculated daily ATC or AFC values for more than the next 14 calendar days but less than the next 22 calendar days.<br>~~OR~~<br>▪ Has calculated monthly ATC or AFC values for more than the next 6 months but less than the next 10 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 10 hours but less than the next 21 hours.<br>~~OR~~<br>▪ Has calculated daily ATC or AFC values for more than the next 7 calendar days but less than the next 15 calendar days.<br>~~OR~~<br>▪ Has calculated monthly ATC or AFC values for more than the next 3 months but less than the next 7 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated ~~less than 11~~ hourly ATC or AFC values for less than the next 11 hours.<br>~~OR~~<br>▪ Has c~~C~~alculated ~~less than 8~~ daily ATC or AFC values for less than the next 8 calendar days.<br>~~OR~~<br>▪ Has c~~C~~alculated ~~less than4~~ monthly ATC or AFC values for less than the next 4 months.<br>~~OR~~<br>▪ Did not use the selected methodology(ies) to calculate ATC. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made up to three months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than three months but not more than six months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than six months but not more than one year ago.<br>**OR**<br>The Transmission Service Provider has an ATCID, but it does not include one or two ~~or more~~ of the information items described in R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made a year or more ago.<br>**OR**<br>The Transmission Service Provider does not have an ATCID, or its ATCID does not include ~~any~~ three or more of the information items described in R3. |
| R4. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID after, but not more than 30 calendar days after, its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 30, but not more than 60, calendar days after its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 60, but not more than 90, calendar days after its implementation. | The Transmission Service Provider ~~did not notify~~notified one or more of the parties specified in R4 of a new or modified ATCID ~~for~~ more than 90 calendar days after its implementation.<br>**OR**<br>The Transmission Service Provider did not notify one or more of the parties specified in R4 of a new or modified ATCID for more than 90 calendar days after its implementation. |
| R5. | N/A | N/A | N/A | The Transmission Service Provider did not make the ATCID available to the parties described in R4. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R6. | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than zero ATC Paths or Flowgates, but not more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater), but not more than 10% of all ATC Paths or Flowgates or 2 ATC Paths or Flowgates (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 10% of all ATC Paths or Flowgates or 2 ATC Path or Flowgate (whichever is greater), but not more than 15% of all ATC Paths or Flowgates or 3 ATC Paths or Flowgates (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 15% of all ATC Paths or Flowgates or more than 3 ATC Paths or Flowgates (whichever is greater). |
| R7 | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than zero ATC Paths or Flowgates, but not more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater), but not more than 10% of all ATC Paths or Flowgates or 2 ATC Paths or Flowgates (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 10%, of all ATC Paths or Flowgates or 2 ATC Path or Flowgate (whichever is greater), but not more than 15% of all ATC Paths or Flowgates or 3 ATC Paths or Flowgates (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 15% of all ATC Paths or Flowgates or more than 3 ATC Paths or Flowgates (whichever is greater). |
| R8. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for one or more hours but not more than 15 hours, and was in excess of the ~~80~~175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 15 hours but not more than 20 hours, and was in excess of the ~~80~~175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 20 hours but not more than 25 hours, and was in excess of the ~~80~~175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 25 hours, and was in excess of the ~~80~~175-hour per year requirement. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | ~~OR~~<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for one or more calendar days but not more than 3 calendar days.<br>~~OR~~<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for seven or more calendar days, but less than 14 calendar days. | ~~OR~~<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 3 calendar days but not more than 4 calendar days.<br>~~OR~~<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 14 or more calendar days, but less than 21 calendar days. | ~~OR~~<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 4 calendar days but not more than 5 calendar days.<br>~~OR~~<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 21 or more calendar days, but less than 28 calendar days. | ~~OR~~<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 5 calendar days.<br>~~OR~~<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 28 or more calendar days. |
| R9 | N/A | The Transmission Service Provider made the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available more than 30 calendar days but less than 45 calendar days after receiving a request. | The Transmission Service Provider made the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available 45 calendar days or more but less than 60 calendar days after receiving a request. | The Transmission Service Provider did not make the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available for 60 calendar days or more after receiving a request. |

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

## Implementation Plan for Standard MOD-001-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-001-1 – Available Transfer Capability which requires the selection of an ATC methodology and describes the parts of the ATC process that apply to all entities, regardless of methodology chosen.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Retired Standards

This standard supersedes the current MOD-001-0.

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-001-1 incorporates the requirements from FAC-012-1 as follows:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-001-1 incorporates the two requirements from FAC-013-1 as follows:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-001-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Implementation Plan for Standard MOD-001-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-001-1 – Available Transfer Capability which requires the selection of an ATC methodology and describes the parts of the ATC process that apply to all entities, regardless of methodology chosen.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Retired Standards

This standard supersedes the current MOD-001-0.

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-001-1 incorporates the requirements from FAC-012-1 as follows:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-001-1 incorporates the two requirements from FAC-013-1 as follows:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-001-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

> Committee shall set the proposed standard for ballot as soon as the work flow will accommodate."

NERC's Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008. Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee's Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards. The Standards Committee's Executive Committee directed NERC's Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

|---|---|---|---|
| Ameren Services Company | 1 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-001-1. Under R1, the Transmission Service Provider not the Transmission Operator should be responsible for selection of the ATC/AFC methodology. This is especially true when the Transmission Service Provider determines ATC for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO. R5 suggests that the Transmission Operator is responsible to calculate TTC or TFC. This is not supported by the current version of the Functional Model. Determining TTC (TFC) is a planning function supported by the Transmission Planner. The majority of requirements are limited to the Operations Planning Time Horizon. TTC (TFC) and ATC (TFC) are also parameters which are relevant in the plus one year. |
| American Electric Power | 1 | Negative | AEP would have voted affirmatively for this standard had seemingly minor clarifications been included. This negative vote is for the following reasons: This standard, as written, has largely divorced itself from the previous references of ATC and its connection to 'selling' unused transmission 'capacity'. And, as such, the Purpose section in this proposed standard presupposes that these calculations are to be (or is being) done and are necessary for reliability. The purpose clearly states "To ensure calculations are performed ..... to maintain awareness of available transmission capability and future flows...." This is simply not the case for a large portion of the bulk electric system. As an example, ERCOT does not have any "ATC paths" internal to ERCOT and therefore does not calculate ATC for the transmission system internal to ERCOT. However, the proposed revision to MOD 001 does not clearly state where (which paths) ATC must be calculated or where it should not (or need not) be calculated. Although one could assume that ATC is not intended to require ATC calculations for "internal Paths" -- the standard is less than clear in this regard. However this proposed Standard requires that each Transmission Operator (per R1) select a method a method of calculation "for each ATC path ...... for those Facilities within its Transmission operating area" , strongly implies or at least allows a far more reaching, unnecessary and burdensome interpretation. In addition, the definition of ATC Path states ..."any combination of POR and POD for which ATC is calculated and any Posted Path." And the definition of ATC states — measure of transfer capability remaining in the physical transmission network for further commercial activity..." It is unclear how to interpret "further commercial activity" in a market such as ERCOT's. (ERCOT does not 'sell' transmission service). This alone could cause unwarranted concern, or needless ambiguity during implementation of this standard or some future audit -- and/or necessitates creation of a regional standard. The standard is also internally inconsistent. The Purpose presupposes that the calculation is being (or needs to be) performed. R1 requires that "Each Transmission Provider" must select a methodology. The standard does not define for which PRO/POD pairings (ATC Paths) ATC must be calculated. However, for existing tariff and other reasons, ATC is not currently be calculated for a large portion of the bulk electric system. It is unclear if this standard will now require ATC to be calculated where it is currently not being and not needed to be calculated. Much of the dismay of this proposed standard could have been mitigated by adding the clarification — that this standard (or the calculation of ATC) does NOT pertain to any POR/POD pairings internal to a particular Transmission Service Provider (or Balancing Authority) but rather between two or more synchronously |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | connected 'neighbors'. Without this clarification, we believe that there is a high risk of unintended consequences, and therefore, must vote against |
| Brazos Electric Power Cooperative, Inc. | 1 | Negative | Brazos votes NEGATIVE for this standard as written as it imposes obligations on entities in the ERCOT region that do not utilize ATC paths and calculation methodologies to manage congestion or for reliability operations. Our previous submitted comments suggested that applicability language be included in requirement R1 to recognize that such market difference exists. |
| CenterPoint Energy | 1 | Negative | CenterPoint Energy has previously commented to the ballot pool that we do not support this standard until the standard is clarified. In the interest of brevity, CenterPoint Energy will not repeat its earlier comments. |
| Exelon Energy | 1 | Affirmative | General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies for corresponding time periods. Exelon's comments reflect these deficiencies and Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890. Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-001-1 Available Transmission System Capability The purpose of the standard does align with the requirements specified. There are no requirements that would “ensure that calculations are performed by Transmission Service Providers to maintain awareness of available transmission system capability and future flows on their own systems as well as those of their neighbors”. The following wording is suggested for the purpose: To ensure that Available Transmission System Capability calculations performed by Transmission Service Providers are documented and performed using one of the three methodologies specified in this standard. R6 and R7 need to be revised to reflect consistency with both planning and operating studies for corresponding time periods studied. The term “planning of operations” is not a defined term and one that is not commonly used by all electric utility entities. The following wording is suggested for R6 and R7: R6. When calculating Total Transfer Capability (TTC) or Total Flowgate Capability (TFC) the Transmission Operator shall use assumptions no more limiting than those used in operating studies and planning studies for the corresponding time period studied. R7. When calculating ATC or AFC the Transmission Service Provider shall use assumptions no more limiting than those used in operating studies and planning studies for the corresponding time period studied. In R3 add requirements to specify the following: PTDF and OTDF cutoff values used Source and sink point determination and use |
| FirstEnergy Energy Delivery | 1 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-001 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-001 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-001 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R1: Selection the ATC or AFC methodology - R6: Calculation of TTC or TFC. Additional Comments: R1 â€" Selection of ATC or AFC Methodology(ies): We appreciate the effort taken by the SDT during the last comment period in seeking industry feedback regarding which responsible entity, the Transmission Service Provider (TSP) or Transmission Operator (TOP), should be responsible for selecting the ATC or AFC methodology used to calculate ATC or AFC. In the SDT team's response to industry comments it was indicated that 13 out of 35 responders felt the TSP is the appropriate responsible entity and it was the SDT's opinion that this did not show consensus from the industry to change the SDT's proposed assignment of the requirement to the TOP. However, the SDT failed to recognize that only 7 favored the TOP and that 15 respondents were indifferent to the TSP or TOP being assigned. The SDT's action to keep the TOP as the responsible entity assumes the team was correct in its initial assignment. In reality, the review of data from industry should have been 7 for TOP and 13 for TSP. This is nearly a 2 to 1 response in favor of the TSP selecting the methodology. Therefore, FE believes the SDT failed to make the appropriate adjustment and that the TSP is the appropriate responsible entity for this requirement. |
| Great River Energy | 1 | Negative | Great River Energy (GRE) thanks the NERC ATC/CBM/TRM standard drafting team for all of their efforts in the creation of this standard. However, GRE is concerned with the Transmission Operator being assigned as the responsible entity for R1 and R6 in MOD-001. It is GRE's opinion that the responsible entity for R1 and R6 should be the Transmission Service Provider. |
| Oncor Electric Delivery | 1 | Negative | Oncor votes NO on this standard due to continuing objection to applicability. This standard imposes obligations on Transmission Operators and Transmission Service Providers to take actions involving ATC paths and calculation methodologies in physical markets where those methodologies are not used to reliably manage congestion nor are they needed to maintain reliability. For example R1 requires Transmission Operators to select one of three methodologies to calculate something that has no need to be calculated in the ERCOT market and perhaps in other areas as well. This concern has been expressed to the drafting team and they continue to say that the variance process is the way to deal with this concern. |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | In our opinion that is inappropriate behavior for a drafting team. If they know that there is not a reliability need to impose an obligation on certain market participants then the drafting team should do the work to correct that within the standard itself rather than passing the buck to the market participant to do variance work. The drafting team is knowingly imposing a construct that is used in the Eastern Interconnection as the only way to do something when they full well know that there are other methodologies used in other interconnections that are effective at meeting the underlying reliability needs. |
| Sierra Pacific Power Co. | 1 | Affirmative | Affirmative vote; however, I would like to point out a disagreement with R9 of the Standard MOD-001-1. It doesn't appear to me that a Planning Coordinator or Reliability Coordinator would have a plausible need for the data requested in the sub-items of R9, as they are to be used "solely for the requestor's ATC calculations". In R7, I believe that the Requirement should be revised to allow for differences between operational planning and the calculation of ATC values, as this is necessary in a dynamic environment. |
| Tucson Electric Power Co. | 1 | Affirmative | TEP supports WECC Team remedial language clarifying VSL severity level. |
| Independent Electricity System Operator | 2 | Affirmative | The revised R3.6.3 may lead to confusion. The term “outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability” is subject to interpretation, which needs clarifying. Specific to R6 and R7 - The wording “no more limiting than” as opposed to using something like “consistent with” may give rise to the use of less limiting assumptions. The qualifying phrase appended to these requirements “providing such planning of operations has been performed for that time period” does not provide any value, nor does it address the issue brought up above. |
| Midwest ISO, Inc. | 2 | Abstain | R3.5: Various Joint Operating Agreements (JOA) and other stand alone documents that describe the flowgate allocation processes for Midwest ISO and its neighboring entities are already posted on public websites. Midwest ISO does not believe it is reasonable to include the identical content in the ATCID that is in another stand alone document, whose contents could contain considerable length. Instead, Midwest ISO believes referencing appropriate documents via links included in the ATCID is an acceptable alternative that will prevent updating multiple documents due to a revision in a JOA. Thus, Midwest ISO submits the following revision to R3: R3: Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information or links to posted documents that contain the following information: R6: Midwest ISO continues to believe that the phrase “no more limiting” is not clear for all specific assumptions used when calculating TTC or TFC. This seems to leave it up to the individual auditor to make a decision to decide which assumption is more limiting. We believe that the essence of a standard is to remove subjectivity from the determination of compliance. R7: Midwest ISO continues to believe that the phrase “no more limiting” is not clear for all specific assumptions used when calculating TTC or TFC. This seems to leave it up to the individual auditor to make a decision to decide which assumption is more limiting. We believe that the essence of a standard is to remove subjectivity from the determination of compliance. |
| New York Independent | 2 | Abstain | The NYISO abstains from voting on this proposed standard. The NYISO appreciates recent feedback from the Standards Drafting Team on several rounds of comments requesting that revisions be made to the |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| System Operator | | | language of this proposed standard in order to: (i) expressly accommodate the NYISO's FERC-approved market design and financial reservation based open access transmission system; and (ii) eliminate any possible question as to whether the NYISO's existing approach to calculating ATC satisfies the requirements of the proposed standards. The Standards Drafting Team has indicated that it believes that the NYISO's existing procedures are compliant with the proposed standard. Nevertheless, the NYISO is abstaining in order to preserve its rights to seek a formal confirmation of its compliance from FERC or NERC. |
| Ameren Services Company | 3 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-001-1. Under R1, the Transmission Service Provider not the Transmission Operator should be responsible for selection of the ATC/AFC methodology. This is especially true when the Transmission Service Provider determines ATC for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO. R5 suggests that the Transmission Operator is responsible to calculate TTC or TFC. This is not supported by the current version of the Functional Model. Determining TTC (TFC) is a planning function supported by the Transmission Planner. The majority of requirements are limited to the Operations Planning Time Horizon. TTC (TFC) and ATC (TFC) are also parameters which are relevant in the plus one year. |
| City Public Service of San Antonio | 3 | Negative | I cannot vote for this standard as written. It needs to acknowledge definitive alternatives to ATC for regions or markets such as ERCOT where transmission service markets are not used. |
| Constellation Energy | 3 | Affirmative | Greater standardization in the use of counterflows is required. |
| FirstEnergy Solutions | 3 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-001 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-001 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-001 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R1: Selection the ATC or AFC methodology - R6: Calculation of TTC or TFC. Additional Comments: R1 â€“ Selection of ATC or AFC Methodology(ies): We appreciate the effort taken by the SDT during the last comment period in seeking industry feedback regarding which responsible entity, the Transmission Service Provider (TSP) or Transmission Operator (TOP), should be responsible for selecting the ATC or AFC methodology used to calculate ATC or AFC. In the SDT team's response to industry comments it was indicated that 13 out of 35 responders felt the TSP is the appropriate responsible entity and it was the SDT's opinion that this did not show consensus from the industry to change the SDT's proposed assignment of the requirement to the TOP. However, the SDT failed to recognize that only 7 favored the TOP and that 15 respondents were indifferent to the TSP or TOP being assigned. The SDT's action to keep the TOP as the responsible entity assumes the team was correct in its initial assignment. In reality, the review of data from industry should have been 7 for TOP and 13 for TSP. This is nearly a 2 to 1 response in favor of the TSP selecting the methodology. Therefore, FE believes the SDT failed to make the appropriate adjustment and that the TSP is the appropriate responsible entity for this requirement. |
| MidAmerican Energy Co. | 3 | Negative | I am concerned with R7 and M7. I do not see how technically models can be created day to day to use in operational planning that incorporate transmission service requests that change instantaneously each and every day. Also, I believe TRM should not be used in operational planning. I recommend that R7 and M7 be revised to specifically allow differences between operational planning and ATC and AFC for transmission service requests and TRM. |
| Wisconsin Public Service Corp. | 3 | Negative | R7 and M7 of MOD-001-1 should be revised to specifically allow differences between operational planning and calculating ATC and AFC for transmission service requests and for TRM. Incorporating transmission service requests, which change frequently, into operational planning models is problematic. Also, TRM can be used to calculate ATC and AFC and that TRM should not be used in operational planning. The Transmission Operator should not be the responsible entity for R1 and R6 in MOD-001, it should be the Transmission Service Provider. |
| Alliant Energy Corp. Services, Inc. | 4 | Negative | We are concerned with R7 and M7. We do not see how it is feasible technically to create models day to day for use in operational planning that incorporate transmission service requests that change instantaneously day to day. We also believe TRM can be used to calculate ATC and AFC and that TRM should not be used in operational planning. We beleve the responsible entity in R1 and R6 should be the Transmission Service Provider. |
| Public Utility District No. 1 of Douglas County | 4 | Negative | We have not had sufficient time to review the effects of this change and coordinate it with others in our region. |
| WPS Resources | 4 | Negative | Requirement R5. The ATCID should be made available to all users, owners, and operators. That is, the document should be publicly available. R1 and R6 should be the responsibility of the Transmission Service |

| Entity | Segment | Vote | Comment |

The SDT's action to keep the TOP as the responsible entity assumes the team was correct in its initial assignment. In reality, the review of data from industry should have been 7 for TOP and 13 for TSP. This is nearly a 2 to 1 response in favor of the TSP selecting the methodology. Therefore, FE believes the SDT failed to make the appropriate adjustment and that the TSP is the appropriate responsible entity for this requirement. |
| Reliant Energy Services | 5 | Negative | Reliant Energy, Inc. is concerned the proposed MOD-001-1 would include the ERCOT Region (TOP, TSP) in the NERC requirements to calculate ATC. ERCOT uses the CSC methodology that differs from the ATC methodology used in the eastern interconnection. This change would serve no reliability purpose in ERCOT, which operates as a single control area. As such, the standard should contain exclusionary language added for ERCOT so as not to apply to the ERCOT Region. |
| Barry Green Consulting Inc. | 6 | Negative | Greater standardization in the use of counterflows is required |
| Constellation Energy Commodities Group | 6 | Negative | Greater standardization in the use of counterflows is required. |
| FirstEnergy Solutions | 6 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-001 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-001 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-001 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - R1: Selection the ATC or AFC methodology - R6: Calculation of TTC or TFC. Additional Comments: R1 â€" Selection of ATC or AFC Methodology(ies): We appreciate the effort taken by the SDT during the last comment period in seeking industry feedback regarding which responsible entity, the Transmission Service Provider (TSP) or Transmission Operator (TOP), should be responsible for selecting the ATC or AFC methodology used to calculate ATC or AFC. In the SDT team's response to industry comments it was indicated that 13 out of 35 responders felt the TSP is the appropriate responsible entity and it was the SDT's opinion that this did not show consensus from the industry to change the SDT's proposed assignment of the requirement to the TOP. However, the SDT failed to recognize that only 7 favored the TOP and that 15 respondents were indifferent to the TSP or TOP being assigned. The SDT's action to keep the TOP as the responsible entity assumes the team was correct in its initial assignment. In reality, the review of data from industry should have been 7 for TOP and 13 for TSP. This is nearly a 2 to 1 response in favor of the TSP selecting the methodology. Therefore, FE believes the SDT failed to make the appropriate adjustment and that the TSP is the appropriate responsible entity for this requirement. |
| Reliant Energy Services | 6 | Negative | Reliant Energy, Inc. is concerned the proposed MOD-001-1 would include the ERCOT Region (TOP, TSP) in the NERC requirements to calculate ATC. ERCOT uses the CSC methodology that differs from the ATC methodology used in the eastern interconnection. This change would serve no reliability purpose in ERCOT, which operates as a single control area. As such, the standard should contain exclusionary language added for ERCOT so as not to apply to the ERCOT Region. |
| Electric Reliability Council of Texas, Inc. | 10 | Negative | The standard as proposed contains no clear applicability only to those Transmission Operators or Transmission Service providers who utilize ATC in their transmission system and market operations. |
| Midwest Reliability Organization | 10 | Negative | The MRO is concerned with R7 and M7. We do not see how technically models can be created day to day for use in operational planning that incorporate transmission service requests that change instantaneously each and every day. Also, we believe TRM can be used to calculate ATC and AFC and that TRM should not be used in operational planning. We believe that R7 and M7 of MOD-001-1 should be revised to specifically allow differences between operational planning and ATC and AFC for transmission service requests and for TRM. |

# Consideration of Comments on Initial Ballot — MOD-008-1 — Transmission Reliability Margin Calculation Methodology

**Summary Consideration:** While some stakeholders suggested modifications to the standard, most stakeholders agreed with the standard as proposed and the drafting team did not make any changes to the standard.

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| Ameren Services Company | 1 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-008-1.<br><br>(1) Applicability: The Transmission Service Provider not the Transmission Operator should be responsible for TRM methodology. This is especially true when the Transmission Service Provider determines TRM for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO.<br><br>(2) Is TRM a reliability parameter or a market parameter? While the concepts of uncertainty and sensitivity analysis are inherent in reliability planning TRM as a metric has not been previously defined in the planning process. TRM has been applied in sale of open access transmission system to limit exposure to oversubscription of transmission service. As such TRM should be the responsibility of the Transmission Service Provider.<br><br>(3) That said we are aware that the oversubscription of transmission service can lead to reliability problems.<br><br>(4) The Transmission Service Provider, Transmission Operator, Planning Coordinator, and Transmission Planner should coordinate and cooperate in developing the TRM methodology.<br>(5)TRM is applicable in the Operating Time Horizon and the one-year and beyond horizon. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structure; however, we are required to pick a single entity as responsible for this task.<br><br>The SDT believes TRM is a reliability parameter, as the Transmission Operator may expect it to be available as one of its tools to manage the reliability of the system and respond to situations outside expected conditions. | | | |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| The SDT concurs that oversubscription can lead to reliability problems.<br><br>Developing requirements that require collaboration are difficult, as it can be challenging to discover who is not complying. For example, if MISO and Ameren were unable to come to agreement on development of a TRM methodology, should both entities be sanctioned for not meeting the TRM requirements? NERC has attempted to address this through allowing the use of Joint Registration Organizations, where a MISO/Ameren collaboration would be sanctioned as a single entity, and then the JRO would be responsible for determining how to allocate those sanctions among participants in the JRO.<br><br>With regard to the Time Horizons used in compliance (which are generally used to indicate how much time is available for mitigating a violation to the requirements), the SDT believes the correct horizon is Operations Planning. | | | |
| American Electric Power | 1 | Affirmative | AEP votes affirmative, but we have a concern that the standard appears to have an internal ambiguity. The applicability states “Transmission Operators that maintain TRM" however, R1 requires that “Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) ...." In the context of R1, it unclear what requirements are placed upon Transmission Operators that DOES NOT maintain TRM. In addition, the Purpose statement implies that TRM is used as a real-time operation value. It is not. Despite these reservations, the proposed standard is benign, and AEP does vote affirmative. |
| **Response**: The entire standard only applies to those Transmission Operators that maintain TRM and because this is specified in the applicability, the standard did not reiterate this in the requirements. With regard to the use of TRM as a real-time operation value, the SDT believes that while the TRM may not be explicitly scheduled, the capacity withheld as a margin may be used in real-time (e.g., if load forecast is higher than expected, then some of the margin may be used to support the additional internal generation needed to serve that load). | | | |
| Brazos Electric Power Cooperative, Inc. | 1 | Negative | A NEGATIVE vote is cast for this standard as written as it imposes obligations on entities in the ERCOT region that do not utilize ATC paths and calculation methodologies to manage congestion or for reliability operations. Our previous submitted comments suggested that applicability language be included in the requirements to recognize that such market difference exists. |
| **Response**: If ERCOT does not utilize TRM, then this standard does not apply. | | | |
| Exelon Energy | 1 | Affirmative | General comment These standards bring the industry closer to a unified ATC calculation methodology by requiring that one of three calculation methodologies be utilized and documented. This is an improvement from where the industry is today but falls short of FERC Order No. 890. The standards still lack a requirement for ATC or AFC calculations to be consistent with criteria used in operating and planning studies for corresponding time periods. Exelon's comments reflect these deficiencies and Exelon will be making these same points to FERC if these standards are approved, requesting that the FERC direct NERC to approve the standards but modify the standards to be consistent with Order No. 890. Suggested modifications to the standards to achieve this consistency are included in our comments. MOD-008-1 TRM Calculation Methodology Standard lacks a requirement that |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | components of TRM be consistent with those used in operating and planning studies for the same time period being studied |
| **Response**: The SDT considered adding the requirement described in previous discussions. However, to do so would negate the value of TRM, as TRM is specifically intended to be based on situations other than those expected. For example, the system might be expected to operate with a load of 10,000 MW. TRM is intended to be used to create a margin such that if load is 11,000 MW, transmission capacity is available to support the serving of that load. In this example, the operations studies performed might include an 11,000 MW case, but would not necessarily include an explicit TRM. The SDT does not believe this to be inconsistent with the intent of Order 890. | | | |
| FirstEnergy Energy Delivery | 1 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-008 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-008 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-008 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - All Requirements (R1 through R5) Additional Comments: Applicability Section - The applicability states "Transmission Operators that maintain TRM" and all requirements of the standard are applicable to the TOP in regards to preparing and maintaining a TRM Implementation Document (TRMID), distributing the TRMID to other interested parties, calculating TRM |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | consistent with the TRMID, etc. It is unclear to FE what requirements are placed upon a Transmission Operator that DOES NOT maintain TRM. A TOP who does not maintain TRM could be interpreted one of two ways: 1) For a given TOP footprint TRM is not withheld in calculating ATC 2) TRM is withheld for the TOP footprint, but the TOP does not determine or calculate the TRM value withheld. If the appropriate interpretation is as described in item 1) above, it begs the question if this is a needed reliability standard. If TRM is truly a reliability need, it can not be optional for any TOP service area. If the latter, item 2 and FE's understanding, is the correct interpretation, then FE's position on responsibility remains that that the applicability of this standard should rest with the entity performing the calculation of TRM which in many areas of the country is the TSP organization. Since the SDT has elected to not make a change in this regard we are requesting the aforementioned variance for the MISO RTO area. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. The SDT believes the transfer of responsibility described within the MISO Transmission Owners Agreement would be an effective way to delegate this task to a Transmission Service Provider through the registration of a Joint Registration Organization. To the extent an entity variance is desired, First Energy and/or MISO would need to submit a SAR to request the variance. The commenter is correct that ideally a variance would be considered in the SAR process and throughout the standard development process; however, no one has yet requested a variance through a SAR (or incorporated the request into one of the existing SARs during their development), and at this time the drafting team can not add a variance and still meet the deadline established by NERC and FERC for this revision of the standard.<br><br>Regarding the applicability of the standard, the entire standard only applies to those Transmission Operators that operate their system with the assumption that some transmission capacity margin has been withheld from commercial use to address the reliability threats listed in R1. The SDT does not believe that TRM is required for all entities; entities that have reviewed the risks listed in R1 and determined that they can manage those risks through other means (e.g., demand **Response**, operating guides, etc…) are not required to maintain TRM. | | | |
| Great River Energy | 1 | Negative | GRE is concerned with the Transmission Operator being the responsible entity for MOD-008. GRE believes that the responsible entity for these requirements should be the Transmission Service Provider. If the Transmission Operator does not perform this function then a delegation agreement must be created between it and the entity performing the function. It is GRE's opinion that a standard should not knowingly be written in a manner that requires delegation agreements for a large number of responsible entities, doing so is an inefficient use of resources. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; | | | |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| however, we are required to pick a single entity as responsible for this task. | | | |
| Sierra Pacific Power Co. | 1 | Affirmative | Affirmative vote with comment: The severity levels surrounding R1 still appear to imply that all of the sub-items of R1.1 are expected to be used in the TRMID. It must be clear that it does not constitute a violation if various of these sub-items are not applicable to the TRMID used by the entity. Clarify that this is "as applicable" or "as determined by the entity". |
| **Response**: The VSL indicates that entities must comply with R1.1. R1.1 requires the "Identification of… each of the following components of uncertainty *if used in establishing TRM*" (emphasis added). If the entity does not use a specific element in determining TRM, then its absence would not result in a violation. | | | |
| Southwest Transmission Cooperative, Inc. | 1 | Affirmative | SWTC supports all elements of MOD-08; however, the VSLs as redrafted to accommodate the industry comments have blurred the lines of severity and grant additional discretion to the enforcement entity. Further, the Applicable entity should be clarified throughout the standard to clearly identify whether the standard applies only to TOs that maintain TRM or to all TOs. |
| **Response**: The SDT reviewed the VSLs and concludes that they appropriately minimize the discretion of the enforcement entity. If in future comments on standards you could be more specific, that would aid the team in addressing your concerns.<br><br>The entire standard only applies to those Transmission Operators that maintain TRM and because this is specified in the applicability, the standard did not reiterate this in the requirements. | | | |
| Tucson Electric Power Co. | 1 | Affirmative | TEP supports proposed WECC Team remedial language clarifying VSL severity level. |
| **Response**: The SDT does not have the WECC team remedial language, and therefore cannot comment on it. | | | |
| Ameren Services Company | 3 | Negative | Ameren would like to thank the SDT for the considerable effort invested in drafting this standard. However, Ameren cannot support this version of MOD-008-1.<br>Applicability: The Transmission Service Provider not the Transmission Operator should be responsible for TRM methodology. This is especially true when the Transmission Service Provider determines TRM for the transmission systems of several Transmission Operators as would occur in an RTO/ISO such as the MISO.<br><br>Is TRM a reliability parameter or a market parameter? While the concepts of uncertainty and sensitivity analysis are inherent in reliability planning TRM as a metric has not been previously defined in the planning process. TRM has been applied in sale of open access transmission system to limit exposure to oversubscription of transmission service. As such TRM should be the responsibility of the Transmission Service Provider. That said we are aware that the oversubscription of transmission service can lead to reliability problems.<br><br>The Transmission Service Provider, Transmission Operator, Planning Coordinator, and Transmission Planner should coordinate and cooperate in developing the TRM methodology. |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | TRM is applicable in the Operating Time Horizon and the one-year and beyond horizon |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structure; however, we are required to pick a single entity as responsible for this task.<br><br>The SDT believes TRM is a reliability parameter, as the Transmission Operator may expect it to be available as one of his or her tools to manage the reliability of the system and respond to situations outside expected conditions.<br><br>The SDT concurs that oversubscription can lead to reliability problems.<br><br>Developing requirements that require collaboration are difficult, as it can be challenging to discover who is not complying. For example, if MISO and Ameren were unable to come to agreement on development of a TRM methodology, should both entities be sanctioned for not meeting the TRM requirements? NERC has attempted to address this through allowing the use of Joint Registration Organizations, where a MISO/Ameren collaboration would be sanctioned as a single entity, and then the JRO would be responsible for determining how to allocate those sanctions among participants in the JRO.<br><br>With regard to the Time Horizons used in compliance (which are generally used to indicate how much time is available for mitigating a violation to the requirements), the SDT believes the correct horizon is Operations Planning. | | | |
| City Public Service of San Antonio | 3 | Negative | I cannot vote for this standard as written. It needs to acknowledge definitive alternatives to ATC for regions or markets such as ERCOT where transmission service markets are not used. |
| **Response**: If ERCOT does not utilize TRM, then this standard does not apply. | | | |
| Constellation Energy | 3 | Affirmative | Greater standardization in the determination of TRM and monitoring of the on-going appropriateness of the amount set aside for TRM is required. |
| **Response**: The SDT did not believe that it could, at this time, define a single methodology for TRM without arbitrarily affecting either reliability, market access or both. The SDT encourages entities to submit requests for future work to be considered as part of NERC's annual standards planning process. | | | |
| FirstEnergy Solutions | 3 | Affirmative | FirstEnergy Corp. appreciates the hard work of the Standard Drafting Team on the challenging task of reorganizing and enhancing the verbiage of the IROL requirements. We vote AFFIRMATIVE to standard IRO-008-1 and ask that the SDT consider our enclosed comments. Comments on EOP-001, IRO-002, IRO-004, IRO-005, TOP-003, TOP-005, and TOP-006: General "The Violation Risk Factors should be added to the text of all of the standards. IRO-004 - VSL table shows "R7" instead of "R1" IRO-005 - Several Measures reference the incorrect requirement numbers TOP-003 - R4 — There is no measure associated with this requirement - Measures do not include evidence of "planning" of |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | scheduled outages per the requirements - VSL for R3 and R4 are incorrect and reference the wrong entity per the requirements |
| **Response**: The SDT does not believe these comments are related to MOD-008. | | | |
| Lincoln Electric System | 3 | Negative | LES is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; however, we are required to pick a single entity as responsible for this task. | | | |
| Wisconsin Public Service Corp. | 3 | Negative | The Transmission Service Provider should be the responsible entity for MOD-008, not the Transmission Operator. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; however, we are required to pick a single entity as responsible for this task. | | | |
| Alliant Energy Corp. Services, Inc. | 4 | Negative | We believe the Transmission Service Provider should be the responsible entity. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; however, we are required to pick a single entity as responsible for this task. | | | |
| Public Utility District No. 1 of Douglas County | 4 | Negative | We have not had sufficient time to review the effects of this change and coordinate it with others in our region. |
| **Response**: The SDT believes that significant time has been allowed for entities to review and comment on the standard. | | | |
| WPS Resources Corp. | 4 | Negative | Requirement R3. The TRMID document should be made available to all users, owners, and operators. That is, the TRMID should be publicly available. |
| **Response**: The North American Energy Standards Board (NAESB) is responsible for developing business practices related to public availability of information to support commercial needs. The SDT believes it is NAESB intention to require the disclosure of the TRMID on the OASIS. The NERC standard is related only to reliability, and there is no reliability need for public posting. | | | |
| Constellation Generation Group | 5 | Negative | Greater standardization in the determination of TRM and monitoring of the on-going appropriateness of the amount set aside for TRM is required then this standard provides. |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | TRM seems to be applied only at certain times by certain TPs. For example, one large TP in the South applies TRM only when an entity is looking for long term transmission service outside an 18 month window. That is, if the transmission service is for a year but the year begins and ends within the next 18 months, TRM isn't applied. This causes a very significant difference in study results. Others apply it differently. This type of item should be standardized. |
| **Response**: The SDT did not believe that it could, at this time, define a single methodology for TRM without arbitrarily affecting either reliability, market access or both. The SDT encourages entities to submit requests for future work to be considered as part of NERC's annual planning process. The MOD standards do require that TRM and other factors of TTC/TFC be applied consistently by an entity so that all users of their system are treated equally. | | | |
| Electric Power Supply Association | 5 | Negative | Greater standardization is required with the standard as drafted. Determination of TRM and monitoring of the associated with the ongoing appropriateness of the amounts set aside for TRM is required to achieve the needed standardization. |
| **Response**: The SDT did not believe that it could, at this time, define a single methodology for TRM without arbitrarily affecting either reliability, market access or both. The SDT encourages entities to submit requests for future work to be considered as part of NERC's annual planning process. | | | |
| FirstEnergy Solutions | 5 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-008 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-008 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-008 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - All Requirements (R1 through R5) Additional Comments: Applicability Section - The applicability states "Transmission Operators that maintain TRM" and all requirements of the standard are applicable to the TOP in regards to preparing and maintaining a TRM Implementation Document (TRMID), distributing the TRMID to other interested parties, calculating TRM consistent with the TRMID, etc. It is unclear to FE what requirements are placed upon a Transmission Operator that DOES NOT maintain TRM. A TOP who does not maintain TRM could be interpreted one of two ways: 1) For a given TOP footprint TRM is not withheld in calculating ATC 2) TRM is withheld for the TOP footprint, but the TOP does not determine or calculate the TRM value withheld. If the appropriate interpretation is as described in item 1) above, it begs the question if this is a needed reliability standard. If TRM is truly a reliability need, it can not be optional for any TOP service area. If the latter, item 2 and FE's understanding, is the correct interpretation, then FE's position on responsibility remains that that the applicability of this standard should rest with the entity performing the calculation of TRM which in many areas of the country is the TSP organization. Since the SDT has elected to not make a change in this regard we are requesting the aforementioned variance for the MISO RTO area. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. The SDT believes the transfer of responsibility described within the MISO Transmission Owners Agreement would be an effective way to delegate this task to a Transmission Service Provider through the registration of a Joint Registration Organization. To the extent an entity variance is desired, First Energy and/or MISO would need to submit a SAR to request the variance. The commenter is correct that ideally a variance would be considered in the SAR process and throughout the standard development process; however, no one has yet requested a variance through a SAR (or incorporated the request into one of the existing SARs during their development), and at this time the drafting team can not add a variance and still meet the deadline established by NERC and FERC for this revision of the standard.<br><br>Regarding the applicability of the standard, the entire standard only applies to those Transmission Operators that operate their system with the assumption that some transmission capacity margin has been withheld from commercial use to address the reliability threats listed in R1. | AEP Marketing | 6 | Affirmative | AEP has a concern because the standard appears to have an internal ambiguity. The applicability states “Transmission Operators that maintain TRM" however, R1 requires that “Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) ...." In the context of R1, it unclear what requirements are placed upon Transmission Operators that DOES NOT maintain TRM. In addition, the Purpose statement implies that TRM is used as a real-time operation value. It is not. |
| **Response**: The entire standard only applies to those Transmission Operators that maintain TRM and because this is specified in the applicability, the standard did not reiterate this in the requirements. With regard to the use of TRM as a real-time operation value, the SDT believes that while the TRM may not be explicitly scheduled, the capacity withheld as a margin may be used in real-time (e.g., if load forecast is higher than expected, then some of the margin may be used to support the additional internal generation needed to serve that load). | | | |
| Barry Green Consulting Inc. | 6 | Negative | Greater standardization in the determination of TRM and monitoring of the on-going appropriateness of the amount set aside for TRM is required. |
| **Response**: The SDT did not believe that it could, at this time, define a single methodology for TRM without arbitrarily affecting either reliability, market access or both. The SDT encourages entities to submit requests for future work to be considered as part of NERC’s annual planning process. | | | |
| Constellation Energy Commodities Group | 6 | Negative | Greater standardization in the determination of TRM and monitoring of the ongoing appropriateness of the amount set aside for TRM is required. |
| **Response**: The SDT did not believe that it could, at this time, define a single methodology for TRM without arbitrarily affecting either reliability, market access or both. The SDT encourages entities to submit requests for future work to be considered as part of NERC’s annual planning process. | | | |
| FirstEnergy Solutions | 6 | Negative | FirstEnergy Corp. (FE) appreciates the hard work put forth by the NERC ATC/CBM/TRM standard drafting team (SDT). However, based on difficulties of efficiently and effectively implementing the proposed MOD-008 standard within the Midwest ISO (MISO) footprint, FE is voting NEGATIVE to the standard as written. In prior comment periods, FE has indicated its concerns with requirements assigned to NERC registered entity classifications that apply to FE, but in actuality are performed by the MISO. The SDT has not changed its position and has indicated that FE could delegate responsibility to MISO. However, as previously stated, FE believes a standard should not be written in a way that would knowingly require delegation agreements for a large number of responsible entities. Therefore, in order for FE |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| | | | to support this standard, we request that the SDT work with MISO and its member companies to complete a regional variance for the MISO regional transmission organization and include it within the standard as a Regional Difference. A variance is needed to explain the MOD-008 requirements that describe tasks which have been transferred by the MISO member transmission companies to the MISO organization. This transfer of responsibility is described in the MISO Transmission Owners Agreement and Attachment C of the MISO Open Access Transmission and Energy Market Tariff. It is FE's opinion that an Entity Variance as described in the NERC Reliability Standards Development Procedure is the appropriate mitigation measure and that including the variance with the initial development of the standard is appropriate per the NERC standard development procedure. As described in the procedure, "Variances should be identified and considered when a SAR is posted for comment. Variances should also be considered in the drafting of a standard, with the intent to make any necessary variances a part of the initial development of a standard. The public posting allows for all impacted parties to identify the requirements of a NERC reliability standard that might require a variance." FE believes it is important to complete and include the MISO variance in conjunction with the drafting of the MOD-008 standard. FE requests the variance to cover TOP tasks as described in the following requirements: - All Requirements (R1 through R5) Additional Comments: Applicability Section - The applicability states "Transmission Operators that maintain TRM" and all requirements of the standard are applicable to the TOP in regards to preparing and maintaining a TRM Implementation Document (TRMID), distributing the TRMID to other interested parties, calculating TRM consistent with the TRMID, etc. It is unclear to FE what requirements are placed upon a Transmission Operator that DOES NOT maintain TRM. A TOP who does not maintain TRM could be interpreted one of two ways: 1) For a given TOP footprint TRM is not withheld in calculating ATC 2) TRM is withheld for the TOP footprint, but the TOP does not determine or calculate the TRM value withheld. If the appropriate interpretation is as described in item 1) above, it begs the question if this is a needed reliability standard. If TRM is truly a reliability need, it can not be optional for any TOP service area. If the latter, item 2 and FE's understanding, is the correct interpretation, then FE's position on responsibility remains that that the applicability of this standard should rest with the entity performing the calculation of TRM which in many areas of the country is the TSP organization. Since the SDT has elected to not make a change in this regard we are requesting the aforementioned variance for the MISO RTO area. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. The SDT believes the transfer of responsibility described within the MISO Transmission Owners Agreement would be an effective way to delegate this task to a Transmission Service Provider through the | | | |

| Entity | Segment | Vote | Comment |
|---|---|---|---|
| registration of a Joint Registration Organization. To the extent an entity variance is desired, First Energy and/or MISO would need to submit a SAR to request the variance. The commenter is correct that ideally a variance would be considered in the SAR process and throughout the standard development process; however, no one has yet requested a variance through a SAR (or incorporated the request into one of the existing SARs during their development), and at this time the drafting team can not add a variance and still meet the deadline established by NERC and FERC for this revision of the standard.<br><br>Regarding the applicability of the standard, the entire standard only applies to those Transmission Operators that operate their system with the assumption that some transmission capacity margin has been withheld from commercial use to address the reliability threats listed in R1. The SDT does not believe that TRM is required for all entities; entities that have reviewed the risks listed in R1 and determined that they can manage those risks through other means (e.g., demand response, operating guides, etc…) are not required to maintain TRM. | | | |
| Lincoln Electric System | 6 | Negative | LES is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. | | | |
| Volkmann Consulting | 8 | Negative | This standard does not show the applicability to the Transmission Service Provider. In RTOs the TSP is responsible for calculating and maintaining TRM. Delegation agreements can cover this. However, with the larger portion of the Eastern Interconnection covered by regional tariffs and TSP operation, this standard should speak directly to the TSP responsibilities |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; however, we are required to pick a single entity as responsible for this task. | | | |
| Electric Reliability Council of Texas, Inc. | 10 | Abstain | Although the Applicability Section is clear, some Requirements and Measures contain no clear applicability only to those Transmission Operators that maintain TRM in their transmission system and market operations. |
| **Response**: The entire standard only applies to those Transmission Operators that maintain TRM and because this is specified in the applicability, the standard did not reiterate this in the requirements. | | | |
| Midwest Reliability Organization | 10 | Negative | The MRO is concerned with the Transmission Operator being the responsible entity for MOD-008. We believe that the responsible entity for these requirements should be the Transmission Service Provider. |
| **Response**: The SDT believes the Functional Model indicates that TRM should be established by the Transmission Operator. While many entities may have delegated this responsibility to Transmission Service Providers through implementation of regional transmission service, the SDT does not believe this alone changes the responsibilities established. Based on the most recent comment period, the majority of the commenters supported the Transmission Operator as the appropriate entity. The SDT realized this may not be a perfect fit for all structures; however, we are required to pick a single entity as responsible for this task. | | | |

# Standards Announcement

## Ballot Pools and Pre-ballot Windows Open
## June 20–July 21, 2008

**Now available at: https://standards.nerc.net/BallotPool.aspx**

### Ballot Pools and Pre-ballot Windows for IRO-008-1, IRO-009-1, and IRO-010-1

The following Interconnection Reliability Operating Limit (IROL) standards, implementation plan, and a report identifying how the drafting team addressed relevant directives from FERC Order 693 are posted for a 30-day, pre-ballot review starting **June 20, 2008**:

- IRO-008-1 — Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009-1 — Reliability Coordinator Actions to Operate within IROLs
- IRO-010-1 — Reliability Coordinator Data Specification and Collection

These standards require the Reliability Coordinator to take actions to keep the bulk electric system operating within IROLs.

There are three separate ballot pools for this set of IROL standards — and any member of the Registered Ballot Body may join as many or as few of the ballot pools as desired — a member wanting to ballot all three of the IROL standards must join all three of the ballot pools. The ballot for each of the IROL standards includes the retirement or revision of associated requirements from some already approved standards as identified in the table below. The IROL implementation plan contains the justification for the recommended retirements and revisions.

| Three Ballots for IROL Standards | | |
|---|---|---|
| Ballot Pool (List Server) | Ballot for New Standard | Includes Modifications to Associated Approved Standards |
| IROL Standard — IRO-008_in<br>bp-IRO-008_in@nerc.com | IRO-008 | IRO-004-1 — RC – Operations Planning<br>▪ Retire R1 and R2 |
| IROL Standard — IRO-009_in<br>bp-IRO-009_in@nerc.com | IRO-009 | EOP-001-0 — Emergency Operations Planning<br>▪ Retire R2 |
| | | IRO-004-1 — RC – Operations Planning<br>▪ Retire R3 and R6 |
| | | IRO-005-2 — RC – Current Day Operations<br>▪ Retire R3, R5, R16, R17;<br>▪ Modify R9, R13 and R14 |
| IROL Standard — IRO-010_in<br>bp-IRO-010_in@nerc.com | IRO-010 | IRO-002-1 — RC – Facilities<br>▪ Retire R2 |
| | | IRO-004-1 — RC – Operations Planning<br>▪ Retire R4, R5 |
| | | IRO-005-2 — RC – Current Day Operations<br>▪ Retire R2 |

| | | |
|---|---|---|
| | | TOP-003-0 — Planned Outage Coordination<br>▪ Modify R1.2 |
| | | TOP-005-1 — Operational Reliability Information<br>▪ Retire R1, R1.1 |
| | | TOP-006-1 — Monitoring System Conditions<br>▪ Modify R4 |

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server.[1]" (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The ballot pools will remain open up until **8 a.m. (EDT), Monday, July 21, 2008**.

[1]For assistance in using a list server, contact Barbara Bogenrief at 609-452-8060.

### Now available at: https://standards.nerc.net/BallotPool.aspx

### Five Pre-ballot Windows and Ballot Pools for Project 2006-07 — ATC/TTC and CBM/TRM

The following standards related to the determination of Available Transfer Capability (ATC), Total Transfer Capability (TTC), and Transmission Reliability Margin (TRM) and associated implementation plans, are posted for a 30-day, pre-ballot review beginning **June 20, 2008**:

- MOD-001 — Available Transfer Capability
- MOD-008 — Transmission Reliability Margin
- MOD-028 — Area Interchange Methodology
- MOD-029 — Rated System Path Methodology
- MOD-030 — Flowgate Methodology

This set of ATC-related standards requires consistency in the calculation and documentation of TRM, TTC, AFC, and ATC.

Note that there is another standard in this set, MOD-004-1 — Capacity Benefit Margin (CBM), that is still undergoing revisions and is not ready for ballot. The Standards Committee considered whether to wait until the revisions to MOD-004-1 were complete before moving the entire set of six standards forward to ballot. The committee concluded that the interests of NERC and its stakeholders are best served by proceeding with the ballot for the five standards that are ready. Since there are approved standards in place that address CBM, the five new ATC-related standards can be implemented effectively without the new MOD-004-1.

There are five separate ballot pools for this set of ATC standards — and any member of the Registered Ballot Body may join as many or as few of the ballot pools as desired — a member wanting to ballot all five of the ATC-related standards must join all five of the ballot pools. (Note: these are **new ballot pools** — the ballot pools used to conduct the ATC-related ballots that took place earlier this year have been retired.)

The ballot for each of the standards includes the retirement of associated approved standards as identified in the table below. The implementation plans contain the justification for the recommended retirements.

| Five Ballots for ATC Standards | | |
|---|---|---|
| Standard | Ballot Pool<br>(List Server) | Ballot Includes Retirement of Associated Approved Standards |
| MOD-001-1<br>Available Transfer Capability | ATC et al Standards — MOD-001<br>bp-MOD-001_R1_in@nerc.com | MOD-001-0<br>FAC-012-1, FAC-013-1 |

| | | |
|---|---|---|
| MOD-008-1<br>Transmission Reliability Margin | ATC et al Standard — MOD-008<br>bp-MOD-008_R1_in@nerc.com | MOD-008-0, MOD-009-0 |
| MOD-028-1<br>Area Interchange Methodology | ATC et al Standard — MOD-028<br>bp-MOD-028_R1_in@nerc.com | FAC-012-1, FAC-013-1 |
| MOD-029-1<br>Rated System Path Methodology | ATC et al Standard — MOD-029<br>bp-MOD-029_R1_in@nerc.com | FAC-012-1, FAC-013-1 |
| MOD-030<br>Flowgate Methodology | ATC et al Standard — MOD-030<br>bp-MOD-030_R1_in@nerc.com | FAC-012-1, FAC-013-1 |

During the 30-day, pre-ballot window, members of a ballot pool may communicate with one another by using their "ballot pool list server.[1]" (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The ballot pools will remain open up until **8 a.m. (EDT), Monday, July 21, 2008**.

# Standard Authorization Request Form

| | |
|---|---|
| Title of Proposed Standard | Flowgate Methodology |
| Request Date | August 8, 2008 |

| **SAR Requester Information** | | **SAR Type** (*Check a box for each one that applies.*) | |
|---|---|---|---|
| Name | Duke Energy | ☐ | New Standard |
| Primary Contact | Laura Lee | ☒ | Revision to existing Standard |
| Telephone<br>Fax | 704-382-3625 | ☐ | Withdrawal of existing Standard |
| E-mail | llee@duke-energy.com | ☐ | Urgent Action |

**Purpose**

To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.

**Industry Need**

Entities have proposed methods through which flowgates can be analyzed in a reliable manner other than those included in MOD-030-01. This SAR proposes modifications to the standard such that those methods can be accommodated within the standard.

**Brief Description**

Requirements 2 and 11 of MOD-030-01 will be modified.

**Detailed Description**

Modify R2.1 to make it clear that if any limiting elements or Contingencies are already protected by another Flowgate, then no new Flowgates need to be established for such limiting elements or Contingencies. Modify 2.1 such that limits are placed around flowgates added because of the exercise of an Interconnection-wide Congestion Management procedure. Modify the R2.1 so that it is clear that temporary flowgates are not required to be incorporated into the list of flowgates for which AFC is determined.

Modify R11 to remove references to TFC and TTC, since there are multiple ways to determine TTC from TFC and FERC has not mandated the creation of a single method.

Make conforming changes to the Measures and Compliance elements of the standard to support the above requirements.

Make any other changes as necessary to support the above requirements.

***Reliability Functions***

| The Standard will Apply to the Following Functions *(Check box for each one that applies.)* | | |
|---|---|---|
| ☐ | Regional Reliability Organization | Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions. |
| ☐ | Reliability Coordinator | Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view. |
| ☐ | Balancing Authority | Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time. |
| ☐ | Interchange Authority | Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas. |
| ☐ | Planning Coordinator | Assesses the longer-term reliability of its Planning Coordinator Area. |
| ☐ | Resource Planner | Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area. |
| ☐ | Transmission Planner | Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area. |
| ☒ | Transmission Service Provider | Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff). |
| ☐ | Transmission Owner | Owns and maintains transmission facilities. |
| ☒ | Transmission Operator | Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area. |
| ☐ | Distribution Provider | Delivers electrical energy to the End-use customer. |
| ☐ | Generator Owner | Owns and maintains generation facilities. |
| ☐ | Generator Operator | Operates generation unit(s) to provide real and reactive power. |
| ☐ | Purchasing-Selling Entity | Purchases or sells energy, capacity, and necessary reliability-related services as required. |
| ☐ | Market Operator | Interface point for reliability functions with commercial functions. |
| ☐ | Load-Serving Entity | Secures energy and transmission service (and reliability-related services) to serve the End-use Customer. |

***Reliability and Market Interface Principles***

| **Applicable Reliability Principles** *(Check box for all that apply.)* | |
|---|---|
| ☒ | 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards. |
| ☐ | 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand. |
| ☒ | 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably. |
| ☐ | 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented. |
| ☐ | 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems. |
| ☐ | 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions. |
| ☒ | 7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis. |
| ☐ | 8. Bulk power systems shall be protected from malicious physical or cyber attacks. |

| **Does the proposed Standard comply with all of the following Market Interface Principles?** *(Select 'yes' or 'no' from the drop-down box.)* |
|---|
| 1. A reliability standard shall not give any market participant an unfair competitive advantage. Yes |
| 2. A reliability standard shall neither mandate nor prohibit any specific market structure. Yes |
| 3. A reliability standard shall not preclude market solutions to achieving compliance with that standard. Yes |
| 4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes |

***Related Standards***

| Standard No. | Explanation |
|---|---|
| MOD-001-01 | Parent standard to this standard |
| MOD-030-01 | Earlier version of the standard. |
| | |
| | |

***Related SARs***

| SAR ID | Explanation |
|---|---|
| | Parent SAR to this SAR |
| | Supplemental SAR to the above SAR |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SC authorized posting the concurrent posting of the SAR and proposed standard on August 8, 2008.
2. SDT posted SAR and first draft of MOD-030-2 for a 45-day comment period from August 12, 2008 through September 24, 2008.

**Description of Current Draft:**

This is the first draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments from the initial ballot of MOD-030-1 and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to Comments. | To be determined |
| 2. Posting for 30-day Pre-Ballot Review. | To be determined |
| 3. Initial Ballot. | To be determined |
| 4. Respond to comments. | To be determined |
| 5. Recirculation ballot. | To be determined |
| 6. Board adoption. | To be determined |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**None.**

## A. Introduction

1. **Title:** **Flowgate Methodology**

2. **Number:** **MOD-030-02**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.1** Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Flowgate Capabilities (AFCs) on Flowgates.

   **4.1.2** Each Transmission Service Provider that uses the Flowgate Methodology to calculate AFCs on Flowgates.

5. **Proposed Effective Date:** The date upon which MOD-030-01 is currently scheduled to become effective.

## B. Requirements

**R1.** The Transmission Service Provider shall include in its "Available Transfer Capability Implementation Document" (ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.

**R1.2.** The following information on how source and sink for transmission service is accounted for in AFC calculations including:

**R1.2.1.** Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.

**R1.2.2.** Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.

**R1.2.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.2.4.** If the Transmission Service Provider's AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.

**R2.** The Transmission Operator shall perform the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Include Flowgates used in the AFC process based, at a minimum, on the following criteria:

**R2.1.1.** Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability such that at a minimum the first three limiting Elements and their worst associated

Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates.

R2.1.1.1. Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.

R2.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

R2.1.1.3. If any limiting elements or Contingencies are already protected by another Flowgate, then no new Flowgates need to be established for such limiting elements or Contingencies.

**R2.1.2.** Results of a first Contingency transfer analysis from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

R2.1.2.1. Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.

R2.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

R2.1.2.3. If any limiting elements or Contingencies are already protected by another Flowgate, then no new Flowgates need to be established for such limiting elements or Contingencies.

**R2.1.3.** With the exception of flowgates created to address temporary operating conditions, any limiting Element/Contingency combination at least within its Reliability Coordinator's Area that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology.

**R2.1.4.** Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

R2.1.4.1. The coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or

- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.
- The Transmission Operator may utilize distribution factors less than 5% if desired.

R2.1.4.2. The limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

**R2.2.** At a minimum, establish a list of Flowgates by creating, modifying, or deleting Flowgate definitions at least once per calendar year.

**R2.3.** At a minimum, establish a list of Flowgates by creating, modifying, or deleting Flowgates that have been requested as part of R2.1.4 within thirty calendar days from the request.

**R2.4.** Establish the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and Facilities161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.

- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an “equivalence” or “aggregate” representation in the Transmission Service Provider’s Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an “equivalence” representation in the Transmission Service Provider’s Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider’s Transmission model, use the discretely modeled point as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an “equivalence” or “aggregate” representation in the Transmission Service Provider’s Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an “equivalence” representation in the Transmission Service Provider’s Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

**R5.** When calculating AFCs, the Transmission Service Provider shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** Use the models provided by the Transmission Operator.

**R5.2.** Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the applicable period of the AFC calculation for the Transmission Service Provider’s area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

**R5.3.** For external Flowgates, identified in R2.1.4, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

**R6.** When calculating the impact of ETC for firm commitments ($ETC_{Fi}$) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider’s area, based on:

**R6.1.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.1.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage[1] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed based on:.

**R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.2.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider's area.

**R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage[2] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[3] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.7.** The impact of other firm services determined by the Transmission Service Provider.

---

[1] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[2] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[3] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**R7.** When calculating the impact of ETC for non-firm commitments ($ETC_{NFi}$) for all time periods for a Flowgate the Transmission Service Provider shall sum: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled for the Transmission Service Provider's area.

**R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, that have a distribution factor equal to or greater than the percentage[4] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.3.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R7.4.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[5] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.5.** The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider's area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**R7.6.** The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage[6] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.7.** The impact of other non-firm services determined by the Transmission Service Provider.

**R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_F = TFC - ETC_{Fi} - CBM_i - TRM_i + Postbacks_{Fi} + counterflows_{Fi}$$

[4] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[5] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[6] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**Where:**

**$AFC_F$** is the firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$CBM_i$** is the impact of the Capacity Benefit Margin on the Flowgate during that period.

**$TRM_i$** is the impact of the Transmission Reliability Margin on the Flowgate during that period.

**$Postbacks_{Fi}$** are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{Fi}$** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC - ETC_{Fi} - ETC_{NFi} - CBM_{Si} - TRM_{Ui} + Postbacks_{NFi} + counterflows$$

**Where:**

**$AFC_{NF}$** is the non-firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$ETC_{NFi}$** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**$CBM_{Si}$** is the impact of any schedules during that period using Capacity Benefit Margin.

**$TRM_{Ui}$** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.2, R3.3, and R5, at a minimum on the following frequency, unless none of the calculated values identified in the AFC equation have changed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R10.1.** For hourly AFC, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the AFC equation.

**R10.2.** For daily AFC, once per day.

**R10.3.** For monthly AFC, once per week.

**R11.** When converting Flowgate AFCs to ATCs for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC = \min(P)$$

$$P = \{PATC_1, PATC_2, \ldots PATC_n\}$$

$$PATC_n = \frac{AFC_n}{DF_{np}}$$

**Where:**

**ATC** is the Available Transfer Capability.

**P** is the set of partial Available Transfer Capabilities for all "impacted" Flowgates honored by the Transmission Service Provider; a Flowgate is considered "impacted" by a path if the Distribution Factor for that path is greater than the percentage[7] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.

**$PATC_n$** is the partial Available Transfer Capability for a path relative to a Flowgate *n*.

**$AFC_n$** is the Available Flowgate Capability of a Flowgate *n*.

**$DF_{np}$** is the distribution factor for Flowgate *n* relative to path *p*.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates and information on how sources and sinks are accounted for in AFC calculations. (R1)

**M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

**M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)

**M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)

**M5.** The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

**M6.** The Transmission Operator shall provide evidence (such as logs) that it established the TFCs for each Flowgate in accordance with the timing defined in R2.5. (R2.5)

**M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)

[7] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

**M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

**M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)

**M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)

**M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)

**M13.** The Transmission Service Provider shall demonstrate compliance with R6 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-030-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements defined in R6 to calculate its firm ETC. (R6)

**M14.** The Transmission Service Provider shall demonstrate compliance with R7 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in the standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements in R7 to calculate its non-firm ETC. (R7)

**M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

**M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)

**M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated AFC on the frequency defined in R10. (R10)

**M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs for ATC Paths, it follows the procedure described in R11. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to determine flowgates and TFC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R8, R9, R10, and R11 for the most recent calendar year plus current year.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R6 and R7 for the most recent 14 days; evidence to show compliance in calculating daily values required in R6 and R7 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R6 and R7 for the most recent sixty days.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider does not include in its ATCID one or two of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID three of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID the information described in R1.1.<br>**OR**<br>The Transmission Service Provider does not include in its ATCID the information described in R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). | The Transmission Service Provider does not include in its ATCID the information described in R1.1 and R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). |
| R2. | One or more of the following:<br>• The Transmission Operator established its list of Flowgates less frequently than once per calendar year, but not more than three months late as described in R2.2.<br>• The Transmission Operator established its list of Flowgates more than thirty days, but not more than sixty days, following a request to create, modify or delete a flowgate as described in R2.3.<br>• The Transmission Operator has not updated its Flowgate TFC when notified by the Transmission Owner in more | One or more of the following:<br>• The Transmission Operator did not include a Flowgate in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of Flowgates more than three months late, but not more than six months late as described in R2.2.<br>• The Transmission Operator established its list of Flowgates more than sixty days, but not more than ninety days, following a request to create, modify or delete a flowgate as | One or more of the following:<br>• The Transmission Operator did not include two to five Flowgates in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of Flowgates more than six months late, but not more than nine months late as described in R2.2.<br>• The Transmission Operator established its list of Flowgates more than ninety days, but not more than 120 days, following a request to create, modify or delete a flowgate as described in | One or more of the following:<br>• The Transmission Operator did not include six or more Flowgates in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of Flowgates more than nine months late as described in R2.2.<br>• The Transmission Operator did not establish its list of internal Flowgates as described in R2.2.<br>• The Transmission Operator established its list of Flowgates more than 120 days following a request to create, modify or delete a flowgate as described in R2.3. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SC authorized posting the concurrent posting of the SAR and proposed standard on August 8, 2008.
2. SDT posted SAR and first draft of MOD-030-2 for a 45-day comment period from August 11, 2008 through September 24, 2008.

**Description of Current Draft:**

This is the first draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments from the initial ballot of MOD-030-1 and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to Comments. | To be determined |
| 2. Posting for 30-day Pre-Ballot Review. | To be determined |
| 3. Initial Ballot. | To be determined |
| 4. Respond to comments. | To be determined |
| 5. Recirculation ballot. | To be determined |
| 6. Board adoption. | To be determined |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**None.**

## A. Introduction

1. **Title:** **Flowgate Methodology**

2. **Number:** **MOD-030-2**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.1** Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Flowgate Capabilities (AFCs) on Flowgates.

   **4.1.2** Each Transmission Service Provider that uses the Flowgate Methodology to calculate AFCs on Flowgates.

5. **Proposed Effective Date:** The date upon which MOD-030-01 is currently scheduled to become effective.

## B. Requirements

**R1.** The Transmission Service Provider shall include in its "Available Transfer Capability Implementation Document" (ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.

**R1.2.** The following information on how source and sink for transmission service is accounted for in AFC calculations including:

**R1.2.1.** Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.

**R1.2.2.** Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.

**R1.2.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.2.4.** If the Transmission Service Provider's AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.

**R2.** The Transmission Operator shall perform the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Include Flowgates used in the AFC process based, at a minimum, on the following criteria:

**R2.1.1.** Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability such that at a minimum the first three limiting Elements and their worst associated

Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates.

R2.1.1.1. Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.

R2.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

R2.1.1.3. If any limiting elements or Contingencies are already protected by another Flowgate, then no new Flowgates need to be established for such limiting elements or Contingencies.

**R2.1.2.** Results of a first Contingency transfer analysis from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

R2.1.2.1. Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.

R2.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

R2.1.2.3. If any limiting elements or Contingencies are already protected by another Flowgate, then no new Flowgates need to be established for such limiting elements or Contingencies.

**R2.1.3.** With the exception of flowgates created to address temporary operating conditions, ~~A~~any limiting Element/Contingency combination at least within its Reliability Coordinator's Area ~~the Transmission model identified in R3.4 and R3.5~~ that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology~~[1]~~.

**R2.1.4.** Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

R2.1.4.1. The coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or
- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.
- The Transmission Operator may utilize distribution factors less than 5% if desired.

R2.1.4.2. The limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

**R2.2.** At a minimum, establish ~~the~~ a list of Flowgates ~~to~~ by creatinge, modifying, or deletinge ~~internal~~ Flowgates definitions ~~-~~at least once per calendar year.

**R2.3.** At a minimum, establish ~~the~~ a list of Flowgates ~~to~~ by creatinge, modifying, or deletinge ~~external~~ Flowgates that have been requested as part of R2.1.4 within thirty calendar days from the request.

**R2.4.** Establish the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and Facilities161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

**R5.** When calculating AFCs, the Transmission Service Provider shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** Use the models provided by the Transmission Operator.

**R5.2.** Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the applicable period of the AFC calculation for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

**R5.3.** For external Flowgates, identified in R2.1.4, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

**R6.** When calculating the impact of ETC for firm commitments ($ETC_{Fi}$) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider's area, based on:

**R6.1.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.1.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage[2] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed based on:.

**R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.2.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider's area.

**R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage[3] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the

---

[2] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[3] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

percentage[4] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.7.** The impact of other firm services determined by the Transmission Service Provider.

**R7.** When calculating the impact of ETC for non-firm commitments ($ETC_{NFi}$) for all time periods for a Flowgate the Transmission Service Provider shall sum: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled for the Transmission Service Provider's area.

**R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, that have a distribution factor equal to or greater than the percentage[5] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.3.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R7.4.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[6] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.5.** The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider's area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**R7.6.** The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage[7] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

---

[4] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[5] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[6] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[7] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**R7.7.** The impact of other non-firm services determined by the Transmission Service Provider.

**R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_F = TFC – ETC_{Fi} – CBM_i – TRM_i + Postbacks_{Fi} + counterflows_{Fi}$$

**Where:**

**$AFC_F$** is the firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$CBM_i$** is the impact of the Capacity Benefit Margin on the Flowgate during that period.

**$TRM_i$** is the impact of the Transmission Reliability Margin on the Flowgate during that period.

**$Postbacks_{Fi}$** are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{Fi}$** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC – ETC_{Fi} – ETC_{NFi} – CBM_{Si} – TRM_{Ui} + Postbacks_{NFi} + counterflows$$

**Where:**

**$AFC_{NF}$** is the non-firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$ETC_{NFi}$** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**$CBM_{Si}$** is the impact of any schedules during that period using Capacity Benefit Margin.

**$TRM_{Ui}$** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.2, R3.3, and R5, at a minimum on the following frequency, unless none of the calculated values identified in the AFC equation have changed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R10.1.** For hourly AFC, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the AFC equation.

**R10.2.** For daily AFC, once per day.

**R10.3.** For monthly AFC, once per week.

**R11.** When converting Flowgate AFCs to ATCs ~~(and TFCs to TTCs)~~ for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC = \min(P)$$

$$P = \{PATC_1, PATC_2, \ldots PATC_n\}$$

$$PATC_n = \frac{AFC_n}{DF_{np}}$$

**Where:**

**ATC** is the Available Transfer Capability ~~(either 'Available' or 'Total')~~.

**P** is the set of partial Available Transfer Capabilities ~~(either available or total)~~ for all "impacted" Flowgates honored by the Transmission Service Provider; a Flowgate is considered "impacted" by a path if the Distribution Factor for that path is greater than the percentage[8] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.

**$PATC_n$** is the partial Available Transfer Capability ~~(either 'Available' or 'Total')~~ for a path relative to a Flowgate *n.*

**$AFC_n$** is the Available Flowgate Capability ~~('Available' or 'Total')~~ of a Flowgate *n*.

**$DF_{np}$** is the distribution factor for Flowgate *n* relative to path *p*.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates and information on how sources and sinks are accounted for in AFC calculations. (R1)

**M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

**M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)

[8] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)

**M5.** The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

**M6.** The Transmission Operator shall provide evidence (such as logs) that it established the TFCs for each Flowgate in accordance with the timing defined in R2.5. (R2.5)

**M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)

**M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

**M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

**M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)

**M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)

**M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)

**M13.** The Transmission Service Provider shall demonstrate compliance with R6 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-030-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements defined in R6 to calculate its firm ETC. (R6)

**M14.** The Transmission Service Provider shall demonstrate compliance with R7 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in the standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements in R7 to calculate its non-firm ETC. (R7)

**M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

**M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)

**M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated AFC on the frequency defined in R10. (R10)

**M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs ~~(and TFCs to TTCs)~~ for ATC Paths, it follows the procedure described in R11. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to determine flowgates and TFC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R8, R9, R10, and R11 for the most recent calendar year plus current year.

- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R6 and R7 for the most recent 14 days; evidence to show compliance in calculating daily values required in R6 and R7 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R6 and R7 for the most recent sixty days.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider does not include in its ATCID one or two of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID three of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID the information described in R1.1.<br>**OR**<br>The Transmission Service Provider does not include in its ATCID the information described in R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). | The Transmission Service Provider does not include in its ATCID the information described in R1.1 and R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). |
| R2. | One or more of the following:<br>• The Transmission Operator established its list of ~~internal~~ Flowgates less frequently than once per calendar year, but not more than three months late as described in R2.2.<br>• The Transmission Operator established its list of ~~external~~ Flowgates more than thirty days, but not more than sixty days, following a request to create, modify or delete a~~n~~ ~~external~~ flowgate as described in R2.3.<br>• The Transmission Operator has not updated its Flowgate TFC when notified by the Transmission Owner in more | One or more of the following:<br>• The Transmission Operator did not include a Flowgate in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of ~~internal~~ Flowgates more than three months late, but not more than six months late as described in R2.2.<br>• The Transmission Operator established its list of ~~external~~ Flowgates more than sixty days, but not more than ninety days, following a request to create, modify or delete a~~n~~ ~~external~~ flowgate | One or more of the following:<br>• The Transmission Operator did not include two to five Flowgates in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of ~~internal~~ Flowgates more than six months late, but not more than nine months late as described in R2.2.<br>• The Transmission Operator established its list of ~~external~~ Flowgates more than ninety days, but not more than 120 days, following a request to create, modify or delete a~~n~~ ~~external~~ flowgate as | One or more of the following:<br>• The Transmission Operator did not include six or more Flowgates in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of ~~internal~~ Flowgates more than nine months late as described in R2.2.<br>• The Transmission Operator did not establish its list of internal Flowgates as described in R2.2.<br>• The Transmission Operator established its list of ~~external~~ Flowgates more than 120 days following a request to create, modify or delete a~~n~~ ~~external~~ flowgate as described in R2.3. |

## Two Comment Periods Open
## August 12, 2008

### Comment Period for SAR and MOD-030-2 — Flowgate Methodology (Project 2006-07) Posted for 45-day Comment Period August 12–September 24, 2008

The "ATC" Standard Drafting Team has posted a new SAR, a new proposed version of MOD-030-2 – Flowgate Methodology, and an implementation plan for a 45-day comment period through **September 24, 2008**.

This new version of the standard was developed based on stakeholder comments submitted with the initial ballot of MOD-030-1 conducted July 21–30, 2008. The drafting team's responses to the comments submitted with the ballots for this standard are posted for stakeholder review. MOD-030-1 will continue through the recirculation ballot process at the same time this new version of the standard goes through the standards development process. As envisioned, the new version of MOD-030-2 will be approved by its ballot pool and filed for regulatory approval before MOD-030-1 becomes effective.

Please use this electronic form to submit comments on the SAR, standard and the associated implementation plan.

If you need an off-line, unofficial copy of the questions in the comment form, there is a copy of the comment form posted at the following site:

http://www.nerc.com/~filez/standards/MOD-V0-Revision.html

Please use only the electronic form to submit comments by **September 24, 2008**. If you experience any difficulties in using the electronic form, please contact Barbara Bogenrief at 609-452-8060.

### Comment Period for SAR for Credible Multiple Contingencies (Project 2008-05) Posted for 30-day Comment Period August 12–September 10, 2008

Draft 2 of the SAR for Credible Multiple Contingencies is posted for a 30-day comment period through **September 10, 2008**. The revised SAR proposes modifying FAC-011-2 — System Operating Limit Methodology for the Operations Horizon to require:

- The consideration of common mode Contingencies that result in loss of two or more (multiple) elements that are associated with potential IROL conditions, and
- That the System Operating Limit (SOL) methodology addresses the SOLs received from the Planning Authority.

To aid in understanding the revised scope of modifications, the SAR drafting team has posted a red line version of FAC-011-2 with the proposed changes.

Please use this electronic form to submit comments on the SAR.

If you need an off-line, unofficial copy of the questions in the comment form, there is a copy of the comment form posted at the following site:

http://www.nerc.com/filez/standards/Facility_Ratings_Project_2008-05.html

Please use only the electronic form to submit comments by **September 10, 2008**. If you experience any difficulties in using the electronic form, please contact Barbara Bogenrief at 609-452-8060.

*For more information or assistance, please contact Maureen Long, Standards Process Manager, at maureen.long@nerc.net or at (813) 468-5998.*

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-030-02, which describes the Flowgate methodology (previously referred to as the Flowgate Network Response ATC methodology) for determining AFC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard completely replaces MOD-030-01.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-030 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the date upon which MOD-030-01 is currently scheduled to become effective.

Comments must be submitted by **September 24, 2008.** If you have questions please contact **Andy Rodriquez** at [Andy.Rodriquez@nerc.net](mailto:Andy.Rodriquez@nerc.net) or by telephone at 609.947.3885.

## Background Information

Project 2006-07 was initiated in 2006 to revise the then existing NERC reliability modeling standards to ensure the consistent and transparent calculation, verification, preservation, and use of Total Transfer Capability (TTC)/Available Transfer Capability (ATC)/Available Flowgate Capability (AFC). Project 2006-07 requires specific reliability practices be incorporated into the TTC/ATC/AFC calculation and coordination methodologies and adds requirements for documentation of the methodologies used to coordinate TTC/ATC/AFC. Such changes will enhance the reliable use of the bulk power transmission system without arbitrarily limiting commercial activity.

On February 17, 2007 FERC issued Order 890 which directed, among other things, a number of reforms in the determination of ATC by requiring consistency in how TTC/ATC/AFC is evaluated, as well as providing greater transparency about how a transmission provider calculates and allocates TTC/ATC/AFC. Then on March 16, 2007 FERC issued Order 693 which provided directives on modifying the NERC standards, including those related to modeling.

During the initial ballot for MOD-030-1, several balloters proposed the following modifications and they are reflected in the SAR and in the modifications to the standard:

- Modify R2.1 to make it clear that if any limiting elements or Contingencies are already protected by another Flowgate, then no new Flowgates need to be established for such limiting elements or Contingencies.
- Modify 2.1 such that limits are placed around flowgates added because of the exercise of an Interconnection-wide Congestion Management procedure.
- Modify the R2.1 so that it is clear that temporary flowgates are not required to be incorporated into the list of flowgates for which AFC is determined.
- Modify R11 to remove references to TFC and TTC, since there are multiple ways to determine TTC from TFC and FERC has not mandated the creation of a single method.
- Make conforming changes to the Measures and Compliance elements of the standard to support the above requirements.

In response to suggestions for these improvements, the drafting team has created the following proposed standard:

**MOD-030-02 – Flowgate Methodology**

Please review the SAR and the proposed standard and then answer the following questions.

**You do not have to answer all questions.**

*Insert a “check” mark in the appropriate boxes by double-clicking the gray areas.*

**1.** Do you agree with the SAR’s purpose, scope and applicability?

☐ Yes

☐ No

Comments:

**2.** The drafting team has modified R2.1, R2.2, R2.3, and R11. Do you agree with the proposed changes?

☐ Yes

☐ No

☐ No preference

If “No,” please identify the modifications with which you are concerned and suggest changes to the language. Comments:

**3.** Are you aware of any conflicts between the proposed MOD-030-2 and any regulatory function, rule/order, tariff, rate schedule, legislative requirement or agreement?

☐ Yes

☐ No

☐ No preference

If “Yes,” please explain why in the comment area below and provide supporting information. Comments:

**4.** Please provide any other comments (that you have not already provided in response to the questions above) that you have on the proposed MOD-030-2.

Comments:

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Flowgate:**

1.) A portion of the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.

**Total Flowgate Capability (TFC):** The maximum flow capability on a Flowgate, is not to exceed its thermal rating, or in the case of a flowgate used to represent a specific operating constraint (such as a voltage or stability limit), is not to exceed the associated System Operating Limit.

**Available Flowgate Capability (AFC):** A measure of the flow capability remaining on a Flowgate for further commercial activity over and above already committed uses. It is defined as TFC less Existing Transmission Commitments (ETC), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, and plus counterflows.

**Power Transfer Distribution Factor (PTDF):** In the pre-contingency configuration of a system under study, a measure of the responsiveness or change in electrical loadings on transmission system Facilities due to a change in electric power transfer from one area to another, expressed in percent (up to 100%) of the change in power transfer .

**Outage Transfer Distribution Factor (OTDF):** In the post-contingency configuration of a system under study, the electric Power Transfer Distribution Factor (PTDF) with one or more system Facilities removed from service (outaged).

**Flowgate Methodology:** The Flowgate methodology is characterized by identification of key Facilities as Flowgates. Total Flowgate Capabilities are determined based on Facility Ratings and voltage and stability limits. The impacts of Existing Transmission Commitments (ETCs) are determined by simulation. The impacts of ETC, Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) are subtracted from the Total Flowgate Capability, and Postbacks and counterflows are added, to determine the Available Flowgate Capability (AFC) value for that Flowgate. AFCs can be used to determine Available Transfer Capability (ATC).

## A. Introduction

1. **Title:** **Flowgate Methodology**
2. **Number:** **MOD-030-1**
3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.
4. **Applicability:**
   - **4.1.1** Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Flowgate Capabilities (AFCs)on Flowgates.
   - **4.1.2** Each Transmission Service Provider that uses the Flowgate Methodology to calculate AFCs on Flowgates.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** The Transmission Service Provider shall include in its "Available Transfer Capability Implementation Document" (ATCID). [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.

**R1.2.** The following information on how source and sink for transmission service is accounted for in AFC calculations including:

**R1.2.1.** Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.

**R1.2.2.** Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.

**R1.2.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.2.4.** If the Transmission Service Provider's AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.

**R2.** The Transmission Operator shall perform the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Include Flowgates used in the AFC process based, at a minimum, on the following criteria:

**R2.1.1.** Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator's system up to the path capability such that at a minimum the first three limiting Elements and their worst associated

Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates.

2.1.1.1. Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.

2.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.2.** Results of a first Contingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

2.1.2.1. Use first Contingency criteria consistent with those first Contignency criteria used in planning of operations for the applicable time periods, including use of Special Protection Systems.

2.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.3.** Any limiting Element/Contingency combination at least within the Transmission model identified in R3.4 and R3.5 that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology.

**R2.1.4.** Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

2.1.4.1. The coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or
- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.
- The Transmission Operator may utilize distribution factors less than 5% if desired.

2.1.4.2. The limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

**R2.2.** At a minimum, establish the list of Flowgates to create, modify, or delete internal Flowgates definitions at least once per calendar year.

**R2.3.** At a minimum, establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested as part of R2.1.4 within thirty calendar days from the request.

**R2.4.** Establish the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and Facilities161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence"

representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.

- If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

**R5.** When calculating AFCs, the Transmission Service Provider shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** Use the models provided by the Transmission Operator.

**R5.2.** Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the applicable period of the AFC calculation for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

**R5.3.** For external Flowgates, identified in R2.1.4, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

**R6.** When calculating the impact of ETC for firm commitments ($ETC_{Fi}$) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider's area, based on:

**R6.1.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.1.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage[1] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed based on:.

**R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.2.2.** Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider’s area.

**R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage[2] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider’s area.

**R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[3] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.7.** The impact of other firm services determined by the Transmission Service Provider.

**R7.** When calculating the impact of ETC for non-firm commitments ($ETC_{NFi}$) for all time periods for a Flowgate the Transmission Service Provider shall sum: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled for the Transmission Service Provider’s area.

**R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions

[1] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[2] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[3] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

using Transmission service from multiple Transmission Service Providers, that have a distribution factor equal to or greater than the percentage[4] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.3.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R7.4.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[5] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.5.** The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider's area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**R7.6.** The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage[6] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.7.** The impact of other non-firm services determined by the Transmission Service Provider.

**R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_F = TFC - ETC_{Fi} - CBM_i - TRM_i + Postbacks_{Fi} + counterflows_{Fi}$$

**Where:**

**$AFC_F$** is the firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$CBM_i$** is the impact of the Capacity Benefit Margin on the Flowgate during that period.

---

[4] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[5] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[6] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**$TRM_i$** is the impact of the Transmission Reliability Margin on the Flowgate during that period.

**$Postbacks_{Fi}$** are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{Fi}$** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC – ETC_{Fi} – ETC_{NFi} – CBM_{Si} – TRM_{Ui} + Postbacks_{NFi} + counterflows$$

**Where:**

**$AFC_{NF}$** is the non-firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$ETC_{NFi}$** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**$CBM_{Si}$** is the impact of any schedules during that period using Capacity Benefit Margin.

**$TRM_{Ui}$** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.2, R3.3, and R5, at a minimum on the following frequency, unless none of the calculated values identified in the AFC equation have changed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R10.1.** For hourly AFC, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the AFC equation.

**R10.2.** For daily AFC, once per day.

**R10.3.** For monthly AFC, once per week.

**R11.** When converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$TC = \min(P)$$

$$P = \{PTC_1, PTC_2, \ldots PTC_n\}$$

$$\mathrm{PTC_n} = \frac{FC_n}{DF_{np}}$$

**Where:**

**TC** is the Transfer Capability (either 'Available' or 'Total').

**P** is the set of partial Transfer Capabilities (either available or total) for all "impacted" Flowgates honored by the Transmission Service Provider; a Flowgate is considered "impacted" by a path if the Distribution Factor for that path is greater than the percentage[7] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.

**$PTC_n$** is the partial Transfer Capability (either 'Available' or 'Total') for a path relative to a Flowgate *n.*

**$FC_n$** is the Flowgate Capability ('Available' or 'Total') of a Flowgate *n*.

**$DF_{np}$** is the distribution factor for Flowgate *n* relative to path *p*.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates and information on how sources and sinks are accounted for in AFC calculations. (R1)

**M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

**M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)

**M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)

**M5.** The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

**M6.** The Transmission Operator shall provide evidence (such as logs) that it established the TFCs for each Flowgate in accordance with the timing defined in R2.5. (R2.5)

**M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)

**M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

---

[7] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

**M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)

**M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)

**M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)

**M13.** The Transmission Service Provider shall demonstrate compliance with R6 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-030-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements defined in R6 to calculate its firm ETC. (R6)

**M14.** The Transmission Service Provider shall demonstrate compliance with R7 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in the standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements in R7 to calculate its non-firm ETC. (R7)

**M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

**M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)

**M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated AFC on the frequency defined in R10. (R10)

**M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, it follows the procedure described in R11. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to determine flowgates and TFC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R8, R9, R10, and R11 for the most recent calendar year plus current year.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R6 and R7 for the most recent 14 days; evidence to show compliance in calculating daily values required in R6 and R7 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R6 and R7 for the most recent sixty days.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits

- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider does not include in its ATCID one or two of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID three of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID the information described in R1.1.<br>**OR**<br>The Transmission Service Provider does not include in its ATCID the information described in R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). | The Transmission Service Provider does not include in its ATCID the information described in R1.1 and R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). |
| R2. | One or more of the following:<br>• The Transmission Operator established its list of internal Flowgates less frequently than once per calendar year, but not more than three months late as described in R2.2.<br>• The Transmission Operator established its list of external Flowgates more than thirty days, but not more than sixty days, following a request to create, modify or delete an external flowgate as described in R2.3.<br>• The Transmission Operator has not updated its Flowgate TFC when notified by the Transmission Owner in more | One or more of the following:<br>• The Transmission Operator did not include a Flowgate in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of internal Flowgates more than three months late, but not more than six months late as described in R2.2.<br>• The Transmission Operator established its list of external Flowgates more than sixty days, but not more than ninety days, following a request to create, modify or delete an external flowgate | One or more of the following:<br>• The Transmission Operator did not include two to five Flowgates in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of internal Flowgates more than six months late, but not more than nine months late as described in R2.2.<br>• The Transmission Operator established its list of external Flowgates more than ninety days, but not more than 120 days, following a request to create, modify or delete an external flowgate as | One or more of the following:<br>• The Transmission Operator did not include six or more Flowgates in their AFC calculations that met the criteria described in R2.1.<br>• The Transmission Operator established its list of internal Flowgates more than nine months late as described in R2.2.<br>• The Transmission Operator did not establish its list of internal Flowgates as described in R2.2.<br>• The Transmission Operator established its list of external Flowgates more than 120 days following a request to create, modify or delete an external flowgate as described in R2.3. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 3–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Flowgate:**

1.) A portion of the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.

**Total Flowgate Capability (TFC):** The maximum flow capability on a Flowgate, is not to exceed its thermal rating, or in the case of a flowgate used to represent a specific operating constraint (such as a voltage or stability limit), is not to exceed the associated System Operating Limit.

**Available Flowgate Capability (AFC):** A measure of the flow capability remaining on a Flowgate for further commercial activity over and above already committed uses. It is defined as TFC less Existing Transmission Commitments (ETC), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, and plus counterflows.

**Power Transfer Distribution Factor (PTDF):** In the pre-contingency configuration of a system under study, a measure of the responsiveness or change in electrical loadings on transmission system F~~f~~acilities due to a change in electric power transfer from one area to another, expressed in percent (up to 100%) of the change in power transfer .

**Outage Transfer Distribution Factor (OTDF):** In the post-contingency configuration of a system under study, the electric Power Transfer Distribution Factor (PTDF) with one or more system F~~f~~acilities removed from service (outaged).

**Flowgate Methodology:** The Flowgate methodology is characterized by identification of key Facilities as Flowgates. Total Flowgate Capabilities are determined based on Facility Ratings and voltage and stability limits. The impacts of Existing Transmission Commitments (ETCs) are determined by simulation. The impacts of ETC, Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) are subtracted from the Total Flowgate Capability, and Postbacks and counterflows are added, to determine the Available Flowgate Capability (AFC) value for that Flowgate. AFCs can be used to determine Available Transfer Capability (ATC).

## A. Introduction

1. **Title:** **Flowgate Methodology**

2. **Number:** **MOD-030-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.1** Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available ~~Transfer~~ Flowgate Capabilities (A~~T~~FCs) ~~for ATC Paths~~on Flowgates.

   **4.1.2** Each Transmission Service Provider that uses the Flowgate Methodology to calculate AFCs on Flowgates~~ATCs for ATC Paths~~.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** The Transmission Service Provider shall include in its “Available Transfer Capability Implementation Document” (ATCID). [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.

**R1.2.** The following information on how source and sink for transmission service is accounted for in AFC calculations including:

**R1.2.1.** Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.

**R1.2.2.** Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.

**R1.2.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.2.4.** If the Transmission Service Provider’s AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.

**R2.** The Transmission Operator shall perform the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Include~~Identify~~ Flowgates used in the AFC process based, at a minimum, on the following criteria:

**R2.1.1.** Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator’s system up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an OTDF of at least 5% and within the Transmission Operator's system are included as Flowgates.

2.1.1.1. Use first Contingency ~~assumptions~~ criteria consistent with those first Contingenc~~ies~~y criteria used in planning of operations~~operations studies and planning studies~~ for the applicable time periods, including use of Special Protection Systems.

2.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.2.** Results of a first Contingency transfer analyses from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator's system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

2.1.2.1. Use first Contingency ~~assumptions~~ criteria consistent with those first Contignenc~~ies~~y criteria used in planning of operations~~operations studies and planning studies~~ for the applicable time periods, including use of Special Protection Systems.

2.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

**R2.1.3.** Any limiting Element/Contingency combination at least within the Transmission model identified in R3.4 and R3.5 that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology.

**R2.1.4.** Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

2.1.4.1. T~~If t~~he coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider's area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or
- A transfer from any Balancing Area within the Transmission Service Provider's area to a Balancing Area adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.

- The Transmission Operator may utilize distribution factors less than 5% if desired.

2.1.4.2. T~~If t~~he limiting Element/Contingency combination is included in the requesting Transmission Service Provider's methodology.

**R2.2.** At a minimum, establish the list of Flowgates to create, modify, or delete internal Flowgates definitions at least once per calendar year.

**R2.3.** At a minimum, establish the list of Flowgates to create, modify, or delete external Flowgates that have been requested as part of R2.1.4 within thirty calendar days from the request.

**R2.4.** Establish the TFC of each of the defined Flowgates as equal to:

- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator's Area. Equivalent representation of radial lines and F~~f~~acilities161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.

- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate" representation in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an "equivalence" representation in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.
- If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

**R5.** When calculating AFCs, the Transmission Service Provider shall: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.1.** Use the models provided by the Transmission Operator.

**R5.2.** Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the ~~period calculated~~applicable period of the AFC calculation for the Transmission Service Provider's area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

**R5.3.** For external Flowgates, identified in R2.1.~~3~~4, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

**R6.** When calculating the impact of ETC for firm commitments ($ETC_{Fi}$) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R6.1.** The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider's area, based on:

**R6.1.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.1.2.** Unit commitment and ~~dispatch~~ Dispatch ~~order~~Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.2.** The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage[1] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed based on:.

**R6.2.1.** Load forecast for the time period being calculated, including Native Load and Network Service load

**R6.2.2.** Unit commitment and ~~dispatch~~ Dispatch ~~order~~Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

**R6.3.** The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider's area.

**R6.4.** The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage[2] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.5.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R6.6.** The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[3] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R6.7.** The impact of other firm services determined by the Transmission Service Provider.

**R7.** When calculating the impact of ETC for non-firm commitments ($ETC_{NFi}$) for all time periods for a Flowgate the Transmission Service Provider shall sum: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

[1] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[2] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[3] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**R7.1.** The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled for the Transmission Service Provider's area.

**R7.2.** The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, that have a distribution factor equal to or greater than the percentage[4] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.3.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider's area.

**R7.4.** The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage[5] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers~~,~~ and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.5.** The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider's area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**R7.6.** The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage[6] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

**R7.7.** The impact of other non-firm services determined by the Transmission Service Provider.

**R8.** When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_F = TFC – ETC_{Fi} – CBM_i – TRM_i + Postbacks_{Fi} + counterflows_{Fi}$$

**Where:**

**$AFC_F$** is the firm Available Flowgate Capability for the Flowgate for that period.

---

[4] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[5] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

[6] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$CBM_i$** is the impact of the Capacity Benefit Margin on the Flowgate during that period.

**$TRM_i$** is the impact of the Transmission Reliability Margin on the Flowgate during that period.

**$Postbacks_{Fi}$** are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{Fi}$** are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R9.** When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$AFC_{NF} = TFC – ETC_{Fi} – ETC_{NFi} – CBM_{Si} – TRM_{Ui} + Postbacks_{NFi} + counterflows$$

**Where:**

**$AFC_{NF}$** is the non-firm Available Flowgate Capability for the Flowgate for that period.

**TFC** is the Total Flowgate Capability of the Flowgate.

**$ETC_{Fi}$** is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

**$ETC_{NFi}$** is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

**$CBM_{Si}$** is the impact of any schedules during that period using Capacity Benefit Margin.

**$TRM_{Ui}$** is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

**R10.** Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.~~3~~2, R3.~~4~~3, and R5, at a minimum on the following frequency, unless none of the calculated values identified in the AFC equation have changed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R10.1.** For hourly AFC, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the AFC equation.

**R10.2.** For daily AFC, once per day.

**R10.3.** For monthly AFC, once per week.

**R11.** When converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$TC = \min(P)$$

$$P = \{PTC_1, PTC_2, \ldots PTC_n\}$$

$$PTC_n = \frac{FC_n}{DF_{np}}$$

**Where:**

**TC** is the Transfer Capability (either 'Available' or 'Total').

**P** is the set of partial Transfer Capabilities (either available or total) for all "impacted" Flowgates honored by the Transmission Service Provider; a Flowgate is considered "impacted" by a path if the Distribution Factor for that path is greater than the percentage[7] used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.

**$PTC_n$** is the partial Transfer Capability (either 'Available' or 'Total') for a path relative to a Flowgate *n.*

**$FC_n$** is the Flowgate Capability ('Available' or 'Total') of a Flowgate *n*.

**$DF_{np}$** is the distribution factor for Flowgate *n* relative to path *p*.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates and information on how sources and sinks are accounted for in ~~that are to be considered in~~ AFC calculations. (R1)

**M2.** The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

**M3.** The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)

**M4.** The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)

**M5.** The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

**M6.** The Transmission Operator shall provide evidence (such as logs) that it ~~updated~~ established the TFCs for each Flowgate in accordance with the timing defined in R2.5~~at least once per calendar year~~. (R2.5)

**M7.** The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)

[7] A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

**M8.** The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

**M9.** The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

**M10.** The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator's models in calculating AFC. (R5.1)

**M11.** The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)

**M12.** The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)

**M13.** The Transmission Service Provider~~TSP~~ ~~must be capable of~~shall demonstrate~~ing~~ ~~that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can~~compliance with R6 by recalculating~~e~~ ~~the individual value of the~~ firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate ~~this~~ the specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in ~~the standard~~MOD-030-1 and the ATCID.~~,~~ To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is ~~and the audited value must be~~ within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements defined in R6 to calculate its firm ETC~~demonstrated result~~. (R6)

**M14.** The Transmission Service Provider~~TSP~~ ~~must be capable of~~shall demonstrate~~ing~~ ~~that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can~~compliance with R7 by recalculating~~e~~ ~~the individual value of the~~ non-firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate ~~this~~ the specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in the standard and the ATCID. ~~, and the audited value must be~~ To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements in R7 to calculate its non-firm ETC~~demonstrated result~~. (R7)

**M15.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

**M16.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R9)

**M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated logs, and data) that it calculated ~~ATC~~ AFC on the frequency defined in R10. (R10)

**M18.** The Transmission Service Provider shall provide evidence (such as documentation and data) when converting Flowgate AFCs to ATCs (and TFCs to TTCs) for ATC Paths, it~~that the determination of Transfer Capabilities~~ follows the procedure described in R11. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to ~~to~~ determine flowgates and TFC and evidence of the previous version to show compliance with R2 and R3.
- The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for the most recent 12 months.
- The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4 and R2.5 for the most recent three calendar years plus current year.
- The Transmission Service Provider shall retain evidence to show compliance with R4 for 12 months or until the model used to calculate AFC is updated, whichever is longer.
- The Transmission Service Provider shall retain evidence to show compliance with R5, R8, R9, R10, and R11 for the most recent calendar year plus current year.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in ~~with~~ R6 and R7 for the most recent 14 days; evidence to show compliance in calculating daily values required in R6 and R7 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R6 and R7 for the most recent sixty days.

- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider does not include in its ATCID one or two of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID three of the sub-requirements listed under R1.2, or the sub-requirement is incomplete. | The Transmission Service Provider does not include in its ATCID the information described in R1.1.<br>**OR**<br>The Transmission Service Provider does not include in its ATCID the information described in R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). | The Transmission Service Provider does not include in its ATCID the information described in R1.1 and R1.2 (1.2.1, 1.2.2., 1.2.3, and 1.2.4 are missing). |

RELIABILITY CORPORATION

# Implementation Plan for Standard MOD-030 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-030 — Flowgate Methodology, which describes the Flowgate methodology (previously referred to as the Flowgate Network Response ATC methodology) for determining AFC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard incorporates the following requirements from FAC-012:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).

R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board. As such, FAC-012 is no longer needed and is being retired.

This standard incorporates the following requirements from FAC-013:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013 is no longer needed and is being retired.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-030 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001, MOD-028, MOD-029, and MOD-030) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to

implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Implementation Plan for Standard MOD-030 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-030 — Flowgate Methodology, which describes the Flowgate methodology (previously referred to as the Flowgate Network Response ATC methodology) for determining AFC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard incorporates the following requirements from FAC-012:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).

R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board. As such, FAC-012 is no longer needed and is being retired.

This standard incorporates the following requirements from FAC-013:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013 is no longer needed and is being retired.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-030 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001, MOD-028, MOD-029, and MOD-030) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to

implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

> Committee shall set the proposed standard for ballot as soon as the work flow will accommodate."

NERC's Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008. Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee's Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards. The Standards Committee's Executive Committee directed NERC's Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30 Day posting before board adoption. | June 21 ,2008 |
| 8. Board adopts MOD-001-1. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Rated System Path Methodology:** The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC, and Postbacks and counterflows are added as applicable, to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities.

## A. Introduction

1. **Title:** **Rated System Path Methodology**
2. **Number:** **MOD-029-1**
3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Rated System Path Methodology to support analysis and system operations.
4. **Applicability:**
   - **4.1.** Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.
   - **4.2.** Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** When calculating TTCs for ATC Paths, the Transmission Operator shall use a Transmission model which satisfies the following requirements: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The model utilizes data and assumptions consistent with the time period being studied and that meets the following criteria:

**R1.1.1.** Includes at least:

R1.1.1.1. The Transmission Operator area. Equivalent representation of radial lines and facilities 161kV or below is allowed.

R1.1.1.2. All Transmission Operator areas contiguous with its own Transmission Operator area. (Equivalent representation is allowed.)

R1.1.1.3. Any other Transmission Operator area linked to the Transmission Operator's area by joint operating agreement. (Equivalent representation is allowed.)

**R1.1.2.** Models all system Elements as in-service for the assumed initial conditions.

**R1.1.3.** Models all generation (may be either a single generator or multiple generators) that is greater than 20 MVA at the point of interconnection in the studied area.

**R1.1.4.** Models phase shifters in non-regulating mode, unless otherwise specified in the Available Transfer Capability Implementation Document (ATCID).

**R1.1.5.** Uses Load forecast by Balancing Authority.

**R1.1.6.** Uses Transmission Facility additions and retirements.

**R1.1.7.** Uses Generation Facility additions and retirements.

**R1.1.8.** Uses Special Protection System (SPS) models where currently existing or projected for implementation within the studied time horizon.

**R1.1.9.** Models series compensation for each line at the expected operating level unless specified otherwise in the ATCID.

**R1.1.10.** Includes any other modeling requirements or criteria specified in the ATCID.

**R1.2.** Uses Facility Ratings as provided by the Transmission Owner and Generator Owner

**R2.** The Transmission Operator shall use the following process to determine TTC: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Except where otherwise specified within MOD-029-1, adjust base case generation and Load levels within the updated power flow model to determine the TTC (maximum flow or reliability limit) that can be simulated on the ATC Path while at the same time satisfying all planning criteria contingencies as follows:

**R2.1.1.** When modeling normal conditions, all Transmission Elements will be modeled at or below 100% of their continuous rating.

**R2.1.2.** When modeling contingencies the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its Emergency Rating.

**R2.1.3.** Uncontrolled separation shall not occur.

**R2.2.** Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependant on a Special Protection System (SPS), set the TTC for the non-prevailing flow direction equal to the greater of the maximum flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a SPS.

**R2.3.** For an ATC Path whose capacity is limited by contract, set TTC on the ATC Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R2.1.

**R2.4.** For an ATC Path whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.

**R2.5.** The Transmission Operator shall identify when the TTC for the ATC Path being studied has an adverse impact on the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1. The Transmission Operator shall include the resolution of this adverse impact in its study report for the ATC Path.

**R2.6.** Where multiple ownership of Transmission rights exists on an ATC Path, allocate TTC of that ATC Path in accordance with the contractual agreement made by the multiple owners of that ATC Path.

**R2.7.** For ATC Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and no action has been taken to have the path rated using a different method, set the TTC at that previously established amount.

**R2.8.** Create a study report that describes the steps above that were undertaken (R2.1 – R2.7), including the contingencies and assumptions used, when determining the TTC and the results of the study. Where three phase fault damping is used to determine stability limits, that report shall also identify the percent used and include justification for use unless specified otherwise in the ATCID.

**R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.** Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** When calculating ETC for firm Existing Transmission Commitments ($ETC_F$) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

$\mathbf{NL_F}$ is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{NITS_F}$ is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{GF_F}$ is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "safe harbor tariff."

$\mathbf{PTP_F}$ is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

$\mathbf{ROR_F}$ is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

$\mathbf{OS_F}$ is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments ($ETC_{NF}$) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

$\mathbf{NITS_{NF}}$ is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{GF_{NF}}$ is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "safe harbor tariff."

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

**R7.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + counterflows_F$$

**Where**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_F$** are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.

**R8.** When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and specified in its ATCID.

## C. Measures

**M1.** Each Transmission Operator that uses the Rated System Path Methodology shall produce any Transmission model it used to calculate TTC for purposes of calculating ATC for each ATC Path, as required in R1, for the time horizon(s) to be examined. (R1)

**M1.1.** Production shall be in the same form and format used by the Transmission Operator to calculate the TTC, as required in R1. (R1)

**M1.2.** The Transmission model produced must include the areas listed in R1.1.1 (or an equivalent representation, as described in the requirement) (R1.1)

**M1.3.** The Transmission model produced must show the use of the modeling parameters stated in R1.1.2 through R1.1.10; except that, no evidence shall be required to prove: 1) utilization of a Special Protection System where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred. (R1.1.2 through R1.1.10)

**M1.4.** The Transmission Operator must provide evidence that the models used to determine TTC included Facility Ratings as provided by the Transmission Owner and Generator Owner. (R1.2)

**M2.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (R1.1.4, R.1.1.9, and R1.1.10).

**M3.** Each Transmission Operator that uses the Rated System Path Methodology with paths with ratings established prior to January 1, 1994 shall provide evidence the path and its rating were established prior to January 1, 1994. (R2.7)

**M4.** Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)

**M5.** Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7and R8 for each ATC Path. (R3)

**M6.** Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R4)

**M7.** The Transmission Service Provider shall demonstrate compliance with R5 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R5 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-029-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R5 to calculate its firm ETC. (R5)

**M8.** The Transmission Service Provider shall demonstrate compliance with R5 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R6 and with data used to calculate this specified value for the designated time period. The data used must meet the requirements specified in the MOD-029 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15

MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R6 to calculate its non-firm ETC. (R6)

**M9.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R7. Such documentation must show that only the variables allowed in R7 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R7)

**M10.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall have its latest models used to determine TTC for R1. (M1)
- The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)
- The Transmission Operator shall retain evidence of any path and its rating that was established prior to January 1, 1994. (M3)
- The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M4)
- The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R3 and R4. (M5 and M6)
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R5 and R6 for the most recent 14 days; evidence to show compliance in calculating daily values required in R5 and R6 for the most recent 30

days; and evidence to show compliance in calculating daily values required in R5 and R6 for the most recent sixty days. (M7 and M8)

- The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R7 and R8. (M9 and M10)
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

| | value difference was more than 15% of the value calculated in the measure or 15MW, whichever is greater, but not more than 25% of the value calculated in the measure or 25MW, whichever is greater. | value difference was more than 25% of the value calculated in the measure or 25MW, whichever is greater, but not more than 35% of the value calculated in the measure or 35MW, whichever is greater. | value difference was more than 35% of the value calculated in the measure or 35MW, whichever is greater, but not more than 45% of the value calculated in the measure or 45MW, whichever is greater. | absolute value difference was more than 45% of the value calculated in the measure or 45MW, whichever is greater. |
| R7. | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R7 when determining firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |
| R8. | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R8 when determining non-firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC Conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30 Day posting before board adoption. | June 21 ,2008 |
| 8. Board adopts MOD-001-1. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Rated System Path Methodology:** The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC, and Postbacks and counterflows are added as applicable, to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities.

## A. Introduction

1. **Title:** **Rated System Path Methodology**

2. **Number:** **MOD-029-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Rated System Path Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

   **4.2.** Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** When calculating TTCs for ATC Paths, the Transmission Operator shall use a Transmission model which satisfies the following requirements: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** The model utilizes data and assumptions consistent with the time period being studied and that meets the following criteria:

**R1.1.1.** Includes at least:

1.1.1.1. The Transmission Operator area. Equivalent representation of radial lines and facilities 161kV or below is allowed.

1.1.1.2. All Transmission Operator areas contiguous with its own Transmission Operator area. (~~e~~Equivalent representation is allowed.)~~.~~

1.1.1.3. Any other Transmission Operator area linked to the Transmission Operator's area by joint operating agreement. (~~e~~Equivalent representation is allowed.)~~.~~

**R1.1.2.** Models all system Elements as in-service for the assumed initial conditions.

**R1.1.3.** Models all generation (may be either a single generator or multiple generators)~~Facilities~~ ~~larger~~ that is greater than 20 MVA at the point of interconnection in the studied area.

**R1.1.4.** Models phase shifters in non-regulating mode, unless otherwise specified in the Available Transfer Capability Implementation Document (ATCID).

**R1.1.5.** Uses Load forecast by Balancing Authority.

**R1.1.6.** Uses Transmission Facility additions and retirements.

**R1.1.7.** Uses Generation Facility additions and retirements.

**R1.1.8.** Uses Special Protection System (SPS) models where currently existing or projected for implementation within the studied time horizon.

**R1.1.9.** Models series compensation for each line at the expected operating level unless specified otherwise in the ATCID.

**R1.1.10.** Includes any other modeling requirements or criteria specified in the ATCID.

**R1.2.** Uses Facility Ratings as provided by the Transmission Owner and Generator Owner

**R2.** The Transmission Operator shall use the following process to determine TTC: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R2.1.** Except where otherwise specified within MOD-029-1, adjust base case generation and Load levels within the updated power flow model to determine the TTC (maximum flow or reliability limit) that can be simulated on the ATC Path while at the same time satisfying all planning criteria contingencies as follows:

**R2.1.1.** When modeling normal conditions, ~~do not model any~~all Transmission Elements will be modeled at or ~~above~~ below 100% of ~~its~~ their continuous rating.

**R2.1.2.** When modeling contingencies the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its Emergency Rating.

**R2.1.3.** Uncontrolled separation shall not occur.

**R2.2.** Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependant on a Special Protection System (SPS), set the TTC for the non-prevailing flow direction equal to the greater of the maximum flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a SPS.

**R2.3.** For an ATC Path whose capacity is limited by contract, set TTC on the ATC Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R2.1.

**R2.4.** For an ATC Path whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.

**R2.5.** The Transmission Operator shall identify when~~Verify that~~ the TTC for the ATC Path being studied ~~does not~~has an adverse~~ly~~ impact on the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1. ~~.~~ The Transmission Operator shall include the resolution of this adverse impact in ~~the~~its study report for the ATC Path.

**R2.6.** Where multiple ownership of Transmission rights exists on an ATC Path, allocate TTC of that ATC Path in accordance with the contractual agreement made by the multiple owners of that ATC Path.

**R2.7.** For ATC Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and no action has been taken to have the path rated using a different method, set the TTC at that previously established amount.

**R2.8.** Create a study report that describes the steps above that were undertaken (R2.1 – R2.7), including the contingencies and assumptions used, when determining the TTC and the results of the study. Where three phase fault damping is used to determine stability limits, that report shall also identify the percent used and include justification for use unless specified otherwise in the ATCID.

**R3.** Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.** Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** When calculating ETC for firm Existing Transmission Commitments ($ETC_F$) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

$\mathbf{NL_F}$ is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{NITS_F}$ is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

$\mathbf{GF_F}$ is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "s~~S~~afe h~~H~~arbor t~~T~~ariff." ~~accepted by FERC.~~

$\mathbf{PTP_F}$ is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

$\mathbf{ROR_F}$ is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

$\mathbf{OS_F}$ is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments ($ETC_{NF}$) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**$NITS_{NF}$** is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

**$GF_{NF}$** is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or "s~~S~~afe h~~H~~arbor t~~T~~ariff." ~~accepted by FERC.~~

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

**R7.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + counterflows_F$$

**Where**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_F$** are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.

**R8.** When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**Postbacks$_{NF}$** are changes to non-firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**counterflows$_{NF}$** are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and specified in its ATCID.

## C. Measures

**M1.** Each Transmission Operator that uses the Rated System Path Methodology shall produce any Transmission model it used to calculate TTC for purposes of calculating ATC for each ATC Path, as required in R1, for the time horizon(s) to be examined. (R1)

**M1.1.** Production shall be in the same form and format used by the Transmission Operator to calculate the TTC, ~~used in its ATC calculations,~~ as required in R1. (R1)

**M1.2.** The Transmission model produced must include the areas listed in R1.1.1 ~~1~~ (or an equivalent representation, as described in the requirement) (R1.1)

**M1.3.** The Transmission model produced must show the use of the modeling parameters stated in R1.1.2 through R1.1.10; except that, no evidence shall be required to prove: 1) utilization of a Special Protection System where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred. (R1.1.2 through R1.1.10)

**M1.4.** The Transmission Operator must provide evidence that the models used to determine TTC included Facility Ratings as provided by the Transmission Owner and Generator Owner. (R1.2)

**M2.** Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (R1.1.4, R.1.1.9, and R1.1.10).

**M3.** Each Transmission Operator that uses the Rated System Path Methodology with paths with ratings established prior to January 1, 1994 shall provide evidence the path and its rating were established prior to January 1, 1994. (R2.7)

**M4.** Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)

**M5.** Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7and R8 for each ATC Path. (R3)

**M6.** Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R4)

**M7.** The Transmission Service Provider ~~must be capable of~~shall ~~demonstrating~~ demonstrate compliance with R5 by ~~that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate~~ recalculating ~~the individual value of the~~ firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R5 and with data used to calculate ~~this~~ the specified value for the designated ~~hour.~~time period. The data used must meet the requirements specified in ~~the standard~~MOD-029-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is ~~, and the audited value must be~~ within +/- 15% or 15 MW, whichever is greater, of the

~~demonstrated~~ originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R5 to calculate its firm ETC~~result~~. (R5)

**M8.** The Tran~~a~~smission Service Provider ~~must be capable of demonstrating~~shall demonstrate compliance with R5 by ~~that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can~~ recalculatinge ~~the individual value of the~~ non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R6 and with data used to calculate this specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in the ~~standard~~ MOD-029 and the ATCID.~~,~~ To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is ~~and the audited value must be~~ within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R6 to calculate its non-firm ETC~~demonstrated result~~. (R6)

**M9.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R7. Such documentation must show that only the variables allowed in R7 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R7)

**M10.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall have its latest models used to determine TTC for R1. (M1)
- The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)

- The Transmission Operator shall retain evidence of any path and its rating that was established prior to January 1, 1994. (M3)
- The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M4)
- The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R3 and R4. (M5 and M6)
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R5 and R6 for the most recent 14 days; evidence to show compliance in calculating daily values required in R5 and R6 for the most recent 30 days; and evidence to show compliance in calculating daily values required in R5 and R6 for the most recent sixty days. ~~to show compliance with R5 and R6.~~ (M7 and M8)
- The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R7 and R8. (M9 and M10)
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

~~-~~The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator used a model that met all but one of the modeling requirements specified in R1.1.<br>**OR**<br>The Transmission Operator utilized one to ten Facility Ratings that were different from those specified by a Transmission Owner or Generation Owner in their Transmission model. (R1.2)<br>~~Note: A modeling error (a violation of the criteria in R1) is a single violation, regardless how many times that error has been modeled.~~ | The Transmission Operator used a model that met all but two of the modeling requirements specified in R1.1.<br>**OR**<br>The Transmission Operator utilized eleven to twenty Facility Ratings that were different from those specified by a Transmission Owner or Generation Owner in their Transmission model. # Implementation Plan for Standard MOD-029-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-029-1 – Rated System Path Methodology, which describes the Rated System Path methodology for determining ATC.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Retired Standards

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-029-1 incorporates the following requirements from FAC-012-1:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-029-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-029-1 incorporates the following requirements from FAC-013-1:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-029-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-029-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-029-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-029-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

> Committee shall set the proposed standard for ballot as soon as the work flow will accommodate."

NERC's Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008. Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee's Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards. The Standards Committee's Executive Committee directed NERC's Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Area Interchange Methodology:** The Area Interchange methodology is characterized by determination of incremental transfer capability via simulation, from which Total Transfer Capability (TTC) can be mathematically derived. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Area Interchange Methodology, TTC results are generally reported on an area to area basis.

## A. Introduction

1. **Title: Area Interchange Methodology**

2. **Number: MOD-028-1**

3. **Purpose:** To increase consistency and reliability in the development and documentation of Transfer Capability calculations for short-term use performed by entities using the Area Interchange Methodology to support analysis and system operations.

4. **Applicability:**

   **4.1.** Each Transmission Operator that uses the Area Interchange Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.

   **4.2.** Each Transmission Service Provider that uses the Area Interchange Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Service Provider shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining Total Transfer Capability (TTC): *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R1.1.** Information describing how the selected methodology has been implemented, in such detail that, given the same information used by the Transmission Operator, the results of the TTC calculations can be validated.

**R1.2.** A description of the manner in which the Transmission Operator will account for Interchange Schedules in the calculation of TTC.

**R1.3.** Any contractual obligations for allocation of TTC.

**R1.4.** A description of the manner in which Contingencies are identified for use in the TTC process.

**R1.5.** The following information on how source and sink for transmission service is accounted for in ATC calculations including:

**R1.5.1.** Define if the source used for Available Transfer Capability (ATC) calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation

**R1.5.2.** Define if the sink used for ATC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation

**R1.5.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.5.4.** If the Transmission Service Provider's ATC calculation process involves a grouping of generation, the ATCID must identify how these generators participate in the group.

**R2.** When calculating TTC for ATC Paths, the Transmission Operator shall use a Transmission model that contains all of the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R2.1.** Modeling data and topology of its Reliability Coordinator's area of responsibility. Equivalent representation of radial lines and facilities 161 kV or below is allowed.

**R2.2.** Modeling data and topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination areas.

**R2.3.** Facility Ratings specified by the Generator Owners and Transmission Owners.

**R3.** When calculating TTCs for ATC Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's area. The Transmission Operator shall also include the following data associated with Facilities that are explicitly represented in the Transmission model, as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** For on-peak and off-peak intra-day and next-day TTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):

**R3.1.1.** Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.

**R3.1.2.** Load forecast for the applicable period being calculated.

**R3.1.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R3.2.** For days two through 31 TTCs and for months two through 13 TTCs, use the following (as well as any other values and internal parameters as specified in the ATCID):

**R3.2.1.** Expected generation and Transmission outages, additions, and Retirements, included as specified in the ATCID.

**R3.2.2.** Daily load forecast for the days two through 31 TTCs being calculated and monthly forecast for months two through 13 months TTCs being calculated.

**R3.2.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R4.** When calculating TTCs for ATC Paths, the Transmission Operator shall meet all of the following conditions: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** Use all Contingencies meeting the criteria described in the ATCID.

**R4.2.** Respect any contractual allocations of TTC.

**R4.3.** Include, for each time period, the Firm Transmission Service expected to be scheduled as specified in the ATCID (filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers) for the Transmission Service Provider, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed modeling the source and sink as follows:

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point shall as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can not be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent

Balancing Authority associated with the Transmission Service Provider to which the power is to be delivered as the sink.

- If the sink, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider to which the power is being delivered as the sink.

**R5.** Each Transmission Operator shall establish TTC for each ATC Path as defined below: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.1.** At least once within the seven calendar days prior to the specified period for TTCs used in hourly and daily ATC calculations.

**R5.2.** At least once per calendar month for TTCs used in monthly ATC calculations.

**R5.3.** Within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a transformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage, provided such outage is expected to last 24 hours or longer.

**R6.** Each Transmission Operator shall establish TTC for each ATC Path using the following process: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.1.** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either:

- A System Operating Limit is reached on the Transmission Service Provider's system, or
- A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater[1].

**R6.2.** If the limit in step R6.1 can not be reached by adjusting any combination of load or generation, then set the incremental Transfer Capability by the results of the case where the maximum adjustments were applied.

**R6.3.** Use (as the TTC) the lesser of:

– The sum of the incremental Transfer Capability and the impacts of Firm Transmission Services, as specified in the Transmission Service Provider's ATCID, that were included in the study model, or

– The sum of Facility Ratings of all ties comprising the ATC Path.

**R6.4.** For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Service Provider so the TTC does not exceed each Transmission Service Provider's contractual rights.

[1] The Transmission operator may honor distribution factors less than 5% if desired.

**R7.** The Transmission Operator shall provide the Transmission Service Provider of that ATC Path with the most current value for TTC for that ATC Path no more than: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.1.** One calendar day after its determination for TTCs used in hourly and daily ATC calculations.

**R7.2.** Seven calendar days after its determination for TTCs used in monthly ATC calculations.

**R8.** When calculating Existing Transmission Commitments (ETCs) for firm commitments ($ETC_F$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

**$NITS_F$** is the firm capacity set aside for Network Integration Transmission Service (including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources) on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_F$** is the firm capacity set aside for Grandfathered Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or safe harbor tariff on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_F$** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$ROR_F$** is the capacity reserved for roll-over rights for Firm Transmission Service contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**$OS_F$** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R9.** When calculating ETC for non-firm commitments ($ETC_{NF}$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**$NITS_{NF}$** is the non-firm capacity set aside for Network Integration Transmission Service (i.e., secondary service , including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources)

reserved on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_{NF}$** is the non-firm capacity reserved for Grandfathered Non-Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or safe harbor tariff on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R10.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall utilize the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_F = TTC - ETC_F - CBM - TRM + Postbacks_F + counterflows_F$$

**Where:**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_F$** are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

**R11.** When calculating non-firm ATC for a ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_{NF} = TTC - ETC_F - ETC_{NF} - CBM_S - TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**ETC$_{NF}$** is the sum of existing non-firm Transmission commitments for the ATC Path during that period.

**CBM$_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled without a separate reservation during that period.

**TRM$_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**Postbacks$_{NF}$** are changes to non-firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**counterflows$_{NF}$** are adjustments to non-firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its current ATCID that has the information described in R1 to show compliance with R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including the model used to calculate TTC as well as other evidence (such as Facility Ratings provided by facility owners, written documentation, logs, and data) to show that the modeling requirements in R2 were met. (R2)

**M3.** Each Transmission Operator shall provide evidence, including scheduled outages, facility additions and retirements, (such as written documentation, logs, and data) that the data described in R3 and R4 were included in the determination of TTC as specified in the ATCID. (R3)

**M4.** Each Transmission Operator shall provide the contingencies used in determining TTC and the ATCID as evidence to show that the contingencies described in the ATCID were included in the determination of TTC. (R4)

**M5.** Each Transmission Operator shall provide copies of contracts that contain requirements to allocate TTCs and TTC values to show that any contractual allocations of TTC were respected as required in R4.2. (R4)

**M6.** Each Transmission Operator shall provide evidence (such as copies of coordination agreements, reservations, interchange transactions, or other documentation) to show that firm reservations were used to estimate scheduled interchange, the modeling of scheduled interchange was based on the rules described in R4.3, and that estimated scheduled interchange was included in the determination of TTC. (R4)

**M7.** Each Transmission Operator shall provide evidence (such as logs and data and dated copies of requests from the Transmission Service Provider to establish TTCs at specific intervals) that TTCs have been established at least once in the calendar week prior to the specified period for TTCs used in hourly and daily ATC calculations, at least once per calendar month for TTCs used in monthly ATC calculations, and within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a autotransformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated

duration of the outage; provided such outage is expected to last 24 hours or longer in duration per the specifications in R5.(R5)

**M8.** Each Transmission Operator shall provide evidence (such as written documentation) that TTCs have been calculated using the process described in R6. (R6)

**M9.** Each Transmission Operator shall have evidence including a copy of the latest calculated TTC values along with a dated copy of email notices or other equivalent evidence to show that it provided its Transmission Service Provider with the most current values for TTC in accordance with R7. (R7)

**M10.** The Transmission Service Provider shall demonstrate compliance with R8 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R8 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-028-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its firm ETC. (R8)

**M11.** The Transmission Service Provider shall demonstrate compliance with R9 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R9 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-028-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its non-firm ETC. (R9)

**M12.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R10. Such documentation must show that only the variables allowed in R10 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R10)

**M13.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R11. Such documentation must show that only the variables allowed in R11 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R11)

## D. Compliance

## 1. Compliance Monitoring Process

### 1.1. Compliance Enforcement Authority

Regional Entity.

### 1.2. Compliance Monitoring Period and Reset

Not applicable.

### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2.
- The Transmission Operator shall retain evidence to show compliance with R3 for the most recent 12 months or until the model used to calculate TTC is updated, whichever is longer.
- The Transmission Operator shall retain evidence to show compliance with R4, R5, R6 and R7 for the most recent 12 months.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R8 and R9 for the most recent 14 days; evidence to show compliance in calculating daily values required in R8 and R9 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R8 and R9 for the most recent 60 days.
- The Transmission Service Provider shall retain evidence to show compliance with R10 and R11 for the most recent 12 months.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider has an ATCID but it is missing one of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements) | The Transmission Service Provider has an ATCID but it is missing two of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements) | The Transmission Service Provider has an ATCID but it is missing three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements) | The Transmission Service Provider has an ATCID but it is missing more than three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements) |
| R2. | The Transmission Operator used one to ten Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model. | The Transmission Operator used eleven to twenty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model. | One or both of the following:<br>• The Transmission Operator used twenty-one to thirty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>• The Transmission Operator did not use a Transmission model that includes modeling data and topology (or equivalent representation) for one adjacent Reliability Coordinator Area. | One or more of the following:<br>• The Transmission Operator used more than thirty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>• The Transmission Operator's model includes equivalent representation of non-radial facilities greater than 161 kV for its own Reliability Coordinator Area.<br>• The Transmission Operator did not use a Transmission model that includes modeling data and topology (or equivalent representation) for two or more adjacent Reliability Coordinator |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | | | | Areas. |
| R3. | The Transmission Operator did not include in the TTC process one to ten expected generation and Transmission outages, additions or retirements as specified in the ATCID. | The Transmission Operator did not include in the TTC process eleven to twenty-five expected generation and Transmission outages, additions or retirements as specified in the ATCID. | The Transmission Operator did not include in the TTC process twenty-six to fifty expected generation and Transmission outages, additions or retirements as specified in the ATCID. | One or more of the following:<br>• The Transmission Operator did not include in the TTC process more than fifty expected generation and Transmission outages, additions or retirements as specified in the ATCID.<br>• The Transmission Operator did not include the Load forecast or unit commitment in its TTC calculation as described in R3. |
| R4. | The Transmission Operator did not model reservations' sources or sinks as described in R5.3 for more than zero reservations, but not more than 5% of all reservations; or 1 reservation, whichever is greater. | The Transmission Operator did not model reservations' sources or sinks as described in R5.3 for more than 5%, but not more than 10% of all reservations; or 2 reservations, whichever is greater. | The Transmission Operator did not model reservations' sources or sinks as described in R5.3 for more than 10%, but not more than 15% of all reservations; or 3 reservations, whichever is greater. | One or more of the following:<br>• The Transmission Operator did not include in the TTC calculation the contingencies that met the criteria described in the ATCID.<br>• The Transmission Operator did not respect contractual allocations of TTC.<br>• The Transmission Service Provider did not model reservations' sources or sinks as described in R4.3 for more than 15% of all reservations; or more than 3 reservations, whichever is greater.<br>• The Transmission Operator did not use firm reservations to estimate interchange or did not |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | | | | utilize that estimate in the TTC calculation as described in R4.3. |
| R5. | One or more of the following:<br>• The Transmission Operator did not establish TTCs for use in hourly or daily ATCs within 7 calendar days but did establish the values within 10 calendar days<br>• The Transmission Operator did not establish TTCs for use in monthly ATCs during a calendar month but did establish the values within the next consecutive calendar month | One or more of the following:<br>• The Transmission Operator did not establish TTCs for use in hourly or daily ATCs in 10 calendar days but did establish the values within 13 calendar days<br>• The Transmission Operator did not establish TTCs for use in monthly ATCs during a two consecutive calendar month period but did establish the values within the third consecutive calendar month | One or more of the following:<br>• The Transmission Operator did not establish TTCs for used in hourly or daily ATCs in 13 calendar days but did establish the values within 16 calendar days<br>• The Transmission Operator did not establish TTCs for use in monthly ATCs during a three consecutive calendar month period but did establish the values within the fourth consecutive calendar month | One or more of the following:<br>• The Transmission Operator did not establish TTCs for used in hourly or daily ATCs in 16 calendar days<br>• The Transmission Operator did not establish TTCs for use in monthly ATCs during a four or more consecutive calendar month period<br>• The Transmission Operator did not establish TTCs within 24 hrs of the triggers defined in R5.3 |
| R6. | N/A | N/A | N/A | The Transmission Operator did not calculate TTCs per the process specified in R6. |
| R7. | One or more of the following:<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in hourly or daily ATC calculations more than one calendar day after their determination, but not been more than two calendar days after their determination.<br>• The Transmission Operator | One or more of the following:<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in hourly or daily ATC calculations more than two calendar days after their determination, but not been more than three calendar days after their determination.<br>• The Transmission Operator | One or more of the following:<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in hourly or daily ATC calculations more than three calendar days after their determination, but not been more than four calendar days after their determination.<br>• The Transmission Operator | One or more of the following:<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in hourly or daily ATC calculations more than four calendar days after their determination.<br>• The Transmission Operator did not provide its Transmission Service Provider with its ATC Path TTCs used in hourly or |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | has not provided its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations more than seven calendar days after their determination, but not more than 14 calendar days since their determination. | has not provided its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations more than 14 calendar days after their determination, but not been more than 21 calendar days after their determination. | has not provided its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations more than 21 calendar days after their determination, but not been more than 28 calendar days after their determination. | daily ATC calculations.<br>• The Transmission Operator provided its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations more than 28 calendar days after their determination.<br>• The Transmission Operator did not provide its Transmission Service Provider with its ATC Path TTCs used in monthly ATC calculations. |
| R8. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M10 for the same period, and the absolute value difference was more than 15% of the value calculated in the measure or 15MW, whichever is greater, but not more than 25% of the value calculated in the measure or 25MW, whichever is greater. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M10 for the same period, and the absolute value difference was more than 25% of the value calculated in the measure or 25MW, whichever is greater, but not more than 35% of the value calculated in the measure or 35MW, whichever is greater. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M10 for the same period, and the absolute value difference was more than 35% of the value calculated in the measure or 35MW, whichever is greater, but not more than 45% of the value calculated in the measure or 45MW, whichever is greater. | For a specified period, the Transmission Service Provider calculated a firm ETC with an absolute value different than that calculated in M10 for the same period, and the absolute value difference was more than 45% of the value calculated in the measure or 45MW, whichever is greater. |
| R9. | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M11 for the same period, and the absolute value difference was more than 15% of the value calculated in the measure or 15MW, whichever is greater, but not | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M11 for the same period, and the absolute value difference was more than 25% of the value calculated in the measure or 25MW, whichever is greater, but not | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M11 for the same period, and the absolute value difference was more than 35% of the value calculated in the measure or 35MW, whichever is greater, but not | For a specified period, the Transmission Service Provider calculated a non-firm ETC with an absolute value different than that calculated in M11 for the same period, and the absolute value difference was more than 45% of the value calculated in the measure or 45MW, whichever is greater. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | more than 25% of the value calculated in the measure or 25MW, whichever is greater. | more than 35% of the value calculated in the measure or 35MW, whichever is greater... | more than 45% of the value calculated in the measure or 45MW, whichever is greater. | |
| R10. | The Transmission Service Provider did not use all the elements defined in R10 when determining firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R10 when determining firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R10 when determining firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R10 when determining firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |
| R11. | The Transmission Service Provider did not use all the elements defined in R11 when determining non-firm ATC, or used additional elements, for more than zero ATC Paths, but not more than 5% of all ATC Paths or 1 ATC Path (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R11 when determining non-firm ATC, or used additional elements, for more than 5% of all ATC Paths or 1 ATC Path (whichever is greater), but not more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R11 when determining non-firm ATC, or used additional elements, for more than 10% of all ATC Paths or 2 ATC Paths (whichever is greater), but not more than 15% of all ATC Paths or 3 ATC Paths (whichever is greater). | The Transmission Service Provider did not use all the elements defined in R11 when determining non-firm ATC, or used additional elements, for more than 15% of all ATC Paths or more than 3 ATC Paths (whichever is greater). |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be developed as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Posting for 30-day industry comment. | April 16, 2008 |
| 2. Respond to Comments. | June 20, 2008 |
| 3. Posting for 30-day Pre-Ballot Review. | June 21, 2008 |
| 4. Initial Ballot. | July 21, 2008 |
| 5. Respond to comments. | August 20, 2008 |
| 6. Recirculation ballot. | August 21, 2008 |
| 7. 30-day posting before board adoption. | June 21, 2008 |
| 8. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Area Interchange Methodology:** The Area Interchange methodology is characterized by determination of incremental transfer capability via simulation, from which Total Transfer Capability (TTC) can be mathematically derived. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Area Interchange Methodology, TTC results are generally reported on an area to area basis.

## A. Introduction

1. **Title: Area Interchange Methodology**
2. **Number: MOD-028-1**
3. **Purpose:** To increase consistency and reliability in the development and documentation of Transfer Capability calculations for short-term use performed by entities using the Area Interchange Methodology to support analysis and system operations.
4. **Applicability:**
   - **4.1.** Each Transmission Operator that uses the Area Interchange Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.
   - **4.2.** Each Transmission Service Provider that uses the Area Interchange Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Service Provider shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining Total Transfer Capability (TTC): *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- **R1.1.** Information describing how the selected methodology has been implemented, in such detail that, given the same information used by the Transmission Operator, the results of the TTC calculations can be validated.
- **R1.2.** A description of the manner in which the Transmission Operator will account for Interchange Schedules in the calculation of TTC.
- **R1.3.** Any contractual obligations for allocation of TTC.
- **R1.4.** A description of the manner in which Contingencies are identified for use in the TTC process.
- **R1.5.** The following information on how source and sink for transmission service is accounted for in ATC calculations including:
  - **R1.5.1.** Define if the source used for Available Transfer Capability (ATC) calculations is obtained from the source field or the Point ~~O~~of Receipt (POR) field of the transmission reservation
  - **R1.5.2.** Define if the sink used for ATC calculations is obtained from the sink field or the Point ~~O~~of Delivery (POD) field of the transmission reservation
  - **R1.5.3.** The source/sink or POR/POD identification and mapping to the model.

**R1.5.4.** If the Transmission Service Provider's ATC calculation process involves a grouping of generation, the ATCID must identify how these generators participate in the group.

**R2.** When calculating TTC for ATC Paths, the Transmission Operator shall use a Transmission model that contains all of the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R2.1.** Modeling data and topology of its Reliability Coordinator's area of responsibility. Equivalent representation of radial lines and facilities 161 kV or below is allowed.

**R2.2.** Modeling data and topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination areas.

**R2.3.** Facility Ratings specified by the Generator Owners and Transmission Owners.

**R3.** When calculating TTCs for ATC Paths, the Transmission Operator shall include the following data for the Transmission Service Provider's area. The Transmission Operator shall also include the following data associated with Facilities that are explicitly represented in the Transmission model, as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** For on-peak and off-peak intra-day and next-day TTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):

**R3.1.1.** Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.

**R3.1.2.** Load forecast for the applicable period being calculated.

**R3.1.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R3.2.** For days two through 31 TTCs and for months two through 13 TTCs, use the following (as well as any other values and internal parameters as specified in the ATCID):

**R3.2.1.** Expected generation and Transmission outages, additions, and Retirements, included as specified in the ATCID.

**R3.2.2.** Daily load forecast for the days two through 31 TTCs being calculated and monthly forecast for months two through 13 months TTCs being calculated.

**R3.2.3.** Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

**R4.** When calculating TTCs for ATC Paths, the Transmission Operator shall meet all of the following conditions: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R4.1.** Use all Contingencies meeting the criteria described in ~~its~~ the ATCID.

**R4.2.** Respect any contractual allocations of TTC.

**R4.3.** Include, for each time period, the Firm Transmission Service expected to be scheduled as specified in the ATCID (filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers) for the Transmission Service Provider, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed modeling the source and sink as follows:

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the source, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.
- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider's Transmission model, use the discretely modeled point shall as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an "equivalence" or "aggregate representation" in the Transmission Service Provider's Transmission model, use the modeled equivalence or aggregate as the sink.
- If the sink, as specified in the ATCID, has been identified in the reservation and the point can not be mapped to a discretely modeled point, an "equivalence," or an "aggregate representation" in the Transmission Service Provider's Transmission model, use the immediately adjacent

Balancing Authority associated with the Transmission Service Provider to which the power is to be delivered as the sink.

- If the sink, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider to which the power is being delivered as the sink.

**R5.** Each Transmission Operator shall establish TTC for each ATC Path as defined below: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R5.1.** At least once within the seven calendar days ~~in the calendar week~~ prior to the specified period for TTCs used in hourly and daily ATC calculations.

**R5.2.** At least once per calendar month for TTCs used in monthly ATC calculations.

**R5.3.** Within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a transformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage, provided such outage is expected to last 24 hours or longer.

**R6.** Each Transmission Operator shall establish TTC for each ATC Path using the following process: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.1.** Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either:

- A System Operating Limit is reached on the Transmission Service Provider's system, or
- A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater[1].

**R6.2.** If the limit in step R6.1 can not be reached by adjusting any combination of load or generation, then set the incremental Transfer Capability by the results of the case where the maximum adjustments were applied.

**R6.3.** Use (as the TTC) the lesser of:

– The sum of the incremental Transfer Capability and the impacts of Firm Transmission Services, as specified in the Transmission Service Provider's ATCID, that were included in the study model, or

– The sum of Facility Ratings of all ties comprising the ATC Path.

**R6.4.** For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission ~~Operator~~ Service Provider so the TTC does not exceed ~~that Transmission Operator's~~ each Transmission Service Provider's contractual rights.

[1] The Transmission operator may honor distribution factors less than 5% if desired.

**R7.** The Transmission Operator shall provide the Transmission Service Provider of that ATC Path with the most current value for TTC for that ATC Path no more than: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.1.** One calendar day after its determination for TTCs used in hourly and daily ATC calculations.

**R7.2.** Seven calendar days after its determination for TTCs used in monthly ATC calculations.

**R8.** When calculating Existing Transmission Commitments (ETCs) for firm commitments ($ETC_F$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F$$

**Where:**

**$NITS_F$** is the firm capacity set aside for Network Integration Transmission Service (including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources) on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_F$** is the firm capacity set aside for Grandfathered Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or ~~"S~~safe ~~Harbor~~ harbor ~~Tariff~~tariff~~"~~ ~~accepted by FERC~~ on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_F$** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$ROR_F$** is the capacity reserved for roll-over rights for Firm Transmission Service contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer's Transmission Service contract expires or is eligible for renewal.

**$OS_F$** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R9.** When calculating ETC for non-firm commitments ($ETC_{NF}$) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

$$ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}$$

**Where:**

**$NITS_{NF}$** is the non-firm capacity set aside for Network Integration Transmission Service (i.e., secondary service , including the capacity used to serve bundled load within the Transmission Service Provider's area with external sources)

reserved on ATC Paths that serve as interfaces with other Balancing Authorities.

**$GF_{NF}$** is the non-firm capacity reserved for Grandfathered Non-Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider's Open Access Transmission Tariff or ~~"~~s~~S~~afe ~~Harbor~~ harbor ~~Tariff~~tariff~~"~~ ~~accepted by FERC~~ on ATC Paths that serve as interfaces with other Balancing Authorities.

**$PTP_{NF}$** is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

**$OS_{NF}$** is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R10.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall utilize the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_F = TTC – ETC_F – CBM – TRM + Postbacks_F + counterflows_F$$

**Where:**

**$ATC_F$** is the firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**CBM** is the Capacity Benefit Margin for the ATC Path during that period.

**TRM** is the Transmission Reliability Margin for the ATC Path during that period.

**$Postbacks_F$** are changes to firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_F$** are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

**R11.** When calculating non-firm ATC for a ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

$$ATC_{NF} = TTC – ETC_F - ETC_{NF} – CBM_S – TRM_U + Postbacks_{NF} + counterflows_{NF}$$

**Where:**

**$ATC_{NF}$** is the non-firm Available Transfer Capability for the ATC Path for that period.

**TTC** is the Total Transfer Capability of the ATC Path for that period.

**$ETC_F$** is the sum of existing firm Transmission commitments for the ATC Path during that period.

**$ETC_{NF}$** is the sum of existing non-firm Transmission commitments for the ATC Path during that period.

**$CBM_S$** is the Capacity Benefit Margin for the ATC Path that has been scheduled without a separate reservation during that period.

**$TRM_U$** is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

**$Postbacks_{NF}$** are changes to non-firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

**$counterflows_{NF}$** are adjustments to non-firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

## C. Measures

**M1.** Each Transmission Service Provider shall provide its current ATCID that has the information described in R1 to show compliance with R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including the model used to calculate TTC as well as other evidence (such as Facility Ratings provided by facility owners, written documentation, logs, and data) to show that the modeling requirements in R2 were met. (R2)

**M3.** Each Transmission Operator shall provide evidence, including scheduled outages, facility additions and retirements, (such as written documentation, logs, and data) that the data described in R3 and R4 were included in the determination of TTC as specified in the ATCID. (R3)

**M4.** Each Transmission Operator shall provide the contingencies used in determining TTC and ~~its~~ the ATCID as evidence to show that the contingencies described in the ATCID were included in the determination of TTC. (R4)

**M5.** Each Transmission Operator shall provide copies of contracts that contain requirements to allocate TTCs and TTC values to show that any contractual allocations of TTC were respected as required in R4.2. (R4)

**M6.** Each Transmission Operator shall provide evidence (such as copies of coordination agreements, reservations, interchange transactions, or other documentation) to show that firm reservations were used to estimate scheduled interchange, the modeling of scheduled interchange was based on the rules described in R4.3, and that estimated scheduled interchange was included in the determination of TTC. (R4)

**M7.** Each Transmission Operator shall provide evidence (such as logs and data and dated copies of requests from the Transmission Service Provider to establish TTCs at specific intervals) that TTCs have been established at least once in the calendar week prior to the specified period for TTCs used in hourly and daily ATC calculations, at least once per calendar month for TTCs used in monthly ATC calculations, and within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a autotransformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated

duration of the outage; provided such outage is expected to last 24 hours or longer in duration per the specifications in R5.(R5)

**M8.** Each Transmission Operator shall provide evidence (such as written documentation) that TTCs have been calculated using the process described in R6. (R6)

**M9.** Each Transmission Operator shall have evidence including a copy of the latest calculated TTC values along with a dated copy of email notices or other equivalent evidence to show that it provided its Transmission Service Provider with the most current values for TTC in accordance with R7. (R7)

**M10.** The ~~T~~Transmission Service Provider ~~must be capable of demonstrating~~shall demonstrate compliance with R8 by ~~that for any calculation of firm ETC made in the previous sixty days, the Transmission Service Provider can recalculate the individual value of the firm ETC for~~ recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R8 and with data used to calculate ~~this~~ the specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in ~~the standard~~MOD-028-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated ~~, and the audited~~ value ~~must~~ that is~~be~~ within +/- 15% or 15 MW, whichever is greater, of the ~~demonstrated result~~originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its firm ETC. (R8)

~~**M10.** (R8)~~

**M11.** The Transmission Service Provider ~~must be capable of demonstrating~~shall demonstrate compliance with R9 by ~~that for any calculation of non-firm ETC made in the previous sixty days, the Transmission Service Provider can~~ recalculat~~e~~ing ~~the individual value of the~~ non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R9 and with data used to calculate ~~this~~ the specified value for the designated ~~hour~~time period. The data used must meet the requirements specified in ~~the standard~~MOD-028-1 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is ~~, and the audited value must be~~ within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its non-firm ETC~~demonstrated result~~. (R9)

**M12.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R10. Such documentation must show that only the variables allowed in R10 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R10)

**M13.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R11. Such documentation must show that only the variables allowed in R11 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R11)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset

Not applicable.

#### 1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2.
- The Transmission Operator shall retain evidence to show compliance with R3 for the most recent 12 months or until the model used to calculate TTC is updated, whichever is longer.
- The Transmission Operator shall retain evidence to show compliance with R4, R5, R6 and R7 for the most recent 12 months.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in ~~with~~ R8 and R9 for the most recent ~~sixty~~ 14 days; evidence to show compliance in calculating daily values required in R8 and R9 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R8 and R9 for the most recent 60 days.
- The Transmission Service Provider shall retain evidence to show compliance with R10 and R11 for the most recent 12 months.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Service Provider has an ATCID but it is missing one of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements)<br>~~The Transmission Service Provider has an ATCID that meets the intent of Requirement 1 but the ATCID is missing some minor information.~~ | The Transmission Service Provider has an ATCID but it is missing two of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements)<br>~~The Transmission Service Provider has an ATCID but it is missing one of the four required elements in R1.~~ | The Transmission Service Provider has an ATCID but it is missing three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements)<br>~~The Transmission Service Provider has an ATCID but it is missing two of the four required elements in R1.~~ | The Transmission Service Provider has an ATCID but it is missing more than three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ R1.3<br>▪ R1.4<br>▪ R1.5 (any one or more of its sub-subrequirements)<br>~~The Transmission Service Provider has an ATCID but it is missing three or more of the four required elements in R1.~~ |
| R2. | The Transmission Operator ~~utilized~~ used one to ten Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>~~Note: A modeling error (a violation of the criteria in R2) is a single violation, regardless how many times that error has been modeled~~used. | The Transmission Operator ~~utilized~~ used eleven to twenty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>~~Note: A modeling error (a violation of the criteria in R2) is a single violation, regardless how many times that error has been modeled~~used. | One or both of the following:<br>• The Transmission Operator ~~utilized~~ used twenty-one to thirty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>~~OR~~<br>• The Transmission Operator did not use a Transmission model that includes modeling data and topology (or equivalent representation) | One or more of the following:<br>• The Transmission Operator ~~utilized~~ used more than thirty Facility Ratings that were different from those specified by a Transmission or Generator Owner in their Transmission model.<br>~~OR~~<br>• The Transmission Operator's model includes equivalent representation of non-radial facilities greater than 161 kV for its own Reliability |

### Implementation Plan for Standard MOD-028-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-028-1 – Area Interchange Methodology, which describes the Area Interchange methodology (previously referred to as the Network Response ATC methodology) for determining ATC.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Retired Standards

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-028-1 incorporates the following requirements from FAC-012-1:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-028-1 incorporates the following requirements from FAC-013-1:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-028-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

> Committee shall set the proposed standard for ballot as soon as the work flow will accommodate."

NERC's Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008. Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee's Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards. The Standards Committee's Executive Committee directed NERC's Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.
7. SDT posted third draft for comment from April 16–May 15, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to Comments. | June 20, 2008 |
| 2. Posting for 30-day Pre-Ballot Review. | June 20, 2008 |
| 3. Initial Ballot. | July 21, 2008 |
| 4. Respond to comments. | August 20, 2008 |
| 5. Recirculation ballot. | August 21, 2008 |
| 6. 30 Day posting before board adoption. | June 21, 2008 |
| 7. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Transmission Reliability Margin Implementation Document (TRMID):** A document that describes the implementation of a Transmission Reliability Margin methodology, and provides information related to a Transmission Operator's calculation of TRM.

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**

2. **Number:** **MOD-008-1**

3. **Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to support analysis and system operations.

4. **Applicability:**

   **4.1.** Transmission Operators that maintain TRM.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** Identification of (on each of its respective ATC Paths or Flowgates) each of the following components of uncertainty if used in establishing TRM, and a description of how that component is used to establish a TRM value:

- Aggregate Load forecast.
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including, but not limited to, forced or unplanned outages and maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including, but not limited to, forced or unplanned outages, maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions ).
- Reserve sharing requirements.
- Inertial response and frequency bias.

**R1.2.** The description of the method used to allocate TRM across ATC Paths or Flowgates.

**R1.3.** The identification of the TRM calculation used for the following time periods:

**R1.3.1.** Same day and real-time.

**R1.3.2.** Day-ahead and pre-schedule.

**R1.3.3.** Beyond day-ahead and pre-schedule, up to thirteen months ahead.

**R2.** Each Transmission Operator shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.** Each Transmission Operator shall make available its TRMID, and if requested, underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request no more than 30 calendar days after receiving the request. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- Transmission Service Providers
- Reliability Coordinators
- Planning Coordinators
- Transmission Planner
- Transmission Operators

**R4.** Each Transmission Operator that maintains TRM shall establish TRM values in accordance with the TRMID at least once every 13 months. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** The Transmission Operator that maintains TRM shall provide the TRM values to its Transmission Service Provider(s) and Transmission Planner(s) no more than seven calendar days after a TRM value is initially established or subsequently changed. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

## C. Measures

**M1.** Each Transmission Operator shall produce its TRMID evidencing inclusion of all specified information in R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, or other evidence, (such as written documentation, study reports, documentation of its CBM process, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

**M3.** Each Transmission Operator shall provide a dated copy of any request from an entity described in R3. The Transmission Operator shall also provide evidence (such as copies of emails or postal receipts that show the recipient, date and contents) that the requested documentation (such as work papers and load flow cases) was made available within the specified timeframe to the requestor. (R3)

**M4.** Each Transmission Operator shall provide evidence (such as logs, study report, review notes, or data) that it established TRM values at least once every thirteen months for each of the TRM time periods. (R4)

**M5.** Each Transmission Operator shall provide evidence (such as logs, email, website postings) that it provided their Transmission Service Provider(s) and Transmission Planner(s) with the updated TRM value as described in R5. (R5)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

#### 1.3. Data Retention

The Transmission Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.
- The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### 1.4. Compliance Monitoring and Enforcement Processes

Any of the following may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

#### 1.5. Additional Compliance Information

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator has a TRMID that does not incorporate changes made up to three months ago. | The Transmission Operator has a TRMID that does not incorporate changes that have been made three or more months ago but less than six months ago.<br>**OR**<br>The Transmission Operator's TRMID does not address one of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3 | The Transmission Operator has a TRMID that does not incorporate changes that have been made six or more months ago but less than one year ago.<br>**OR**<br>The Transmission Operator's TRMID does not address two of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3 | The Transmission Operator has a TRMID that does not incorporate changes that have been made one year ago or more.<br>**OR**<br>The Transmission Operator does not have a TRMID.<br>**OR**<br>The Transmission Operator's TRMID does not address three of the following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3 |

More than 15% or 3 values (which ever is greater) were incorrect or missing. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC authorized posting TTC/ATC/AFC SAR development June 20, 2005.
2. SAC authorized the SAR to be development as a standard on February 14, 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from May 25–June 25, 2007.
5. SDT posted second draft for comment from October 31–December 14, 2007.
6. SC conducted an Initial Ballot of the standard from March 3–12, 2008.
7. SDT posted third draft for comment from April 16–May 15, 2008.

**Description of Current Draft:**

This is the fourth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| **Anticipated Actions** | **Anticipated Date** |
|---|---|
| 1. Respond to Comments. | June 20, 2008 |
| 2. Posting for 30-day Pre-Ballot Review. | June 20, 2008 |
| 3. Initial Ballot. | July 21, 2008 |
| 4. Respond to comments. | August 20, 2008 |
| 5. Recirculation ballot. | August 21, 2008 |
| 6. 30 Day posting before board adoption. | June 21, 2008 |
| 7. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**Transmission Reliability Margin Implementation Document (TRMID):** A document that describes the implementation of a Transmission Reliability Margin methodology, and provides information related to a Transmission Operator's calculation of TRM.

## A. Introduction

1. **Title:** **Transmission Reliability Margin Calculation Methodology**
2. **Number:** **MOD-008-1**
3. **Purpose:** To promote the consistent and reliable calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to support analysis and system operations.
4. **Applicability:**
   **4.1.** Transmission Operators that maintain TRM.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

## B. Requirements

**R1.** Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R1.1.** Identification of (on each of its respective ATC Paths or Flowgates) each of the following components of uncertainty if used in establishing TRM, and a description of how that component is used to establish a TRM value:

- Aggregate Load forecast.
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including, but not limited to, forced or unplanned outages and maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including, but not limited to, forced or unplanned outages, maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions ~~not exceeding a 59-minute window~~).
- Reserve sharing requirements.
- Inertial response and frequency bias.

**R1.2.** The description of the method used to allocate TRM across ATC Paths or Flowgates.

**R1.3.** The identification of the TRM calculation used for the following time periods:

**R1.3.1.** Same day and real-time.

**R1.3.2.** Day-ahead and pre-schedule.

**R1.3.3.** Beyond day-ahead and pre-schedule, up to thirteen months ahead.

**R2.** Each Transmission Operator shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.** Each Transmission Operator shall make available its TRMID, and if requested, underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request no more than 30 calendar days after receiving the request. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- Transmission Service Providers
- Reliability Coordinators
- Planning Coordinators
- Transmission Planner
- Transmission Operators

**R4.** Each Transmission Operator ~~using~~ that maintains TRM shall establish TRM values in accordance with the TRMID at least once every 13 months. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R5.** The Transmission Operator ~~using~~ that maintains TRM shall provide the TRM values to its Transmission Service Provider(s) and Transmission Planner(s) no more than seven calendar days after a TRM value is initially established or subsequently changed. [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

## C. Measures

**M1.** Each Transmission Operator shall produce its TRMID evidencing inclusion of all specified information in R1. (R1)

**M2.** Each Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, ~~and CBMID ,~~ or other evidence, (such as written documentation, study reports, documentation of its CBM process, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

**M3.** Each Transmission Operator shall provide a dated copy of any request from an entity described in R3. The Transmission Operator shall also provide evidence (such as copies of emails or postal receipts that show the recipient, date and contents) that the requested documentation (such as work papers and load flow cases) was made available within the specified timeframe to the requestor. (R3)

**M4.** Each Transmission Operator shall provide evidence (such as logs, study report, review notes, or data) that it established TRM values at least once every thirteen months for each of the TRM time periods. (R4)

**M5.** Each Transmission Operator shall provide evidence (such as logs, email, website postings) that it provided their Transmission Service Provider(s) and Transmission Planner(s) with the updated TRM value as described in R5. (R5)

## D. Compliance

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

Regional Entity.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Data Retention**

The Transmission Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.
- The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes**

Any of the following may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | The Transmission Operator has a TRMID that does not incorporate changes made up to three months ago. | The Transmission Operator has a TRMID that does not incorporate changes that have been made three or more months ago but less than six months ago.<br>**OR**<br>The Transmission Operator's TRMID does not address one of the ~~sub requirements~~following:<br>▪ ~~(~~R1.1~~,~~<br>▪ R1.2~~,~~<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3~~).~~<br>~~Any violation or violations of the sub-requirements of R1.3 shall be considered a single violation of R1.3.~~ | The Transmission Operator has a TRMID that does not incorporate changes that have been made six or more months ago but less than one year ago.<br>**OR**<br>The Transmission Operator's TRMID does not address two of the ~~sub requirements (R1.1, R1.2, R1.3).~~ following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3<br>~~Any violation or violations of the sub-requirements of R1.3 shall be considered a single violation of R1.3.~~ | The Transmission Operator has a TRMID that does not incorporate changes that have been made one year ago or more.<br>**OR**<br>The Transmission Operator does not have a TRMID~~;~~.<br>**OR**<br>The Transmission Operator's TRMID does not address three of the ~~sub requirements (R1.1, R1.2, R1.3).~~following:<br>▪ R1.1<br>▪ R1.2<br>▪ Any one or more of the following:<br>o R1.3.1, R1.3.2 or R1.3.3~~Any violation or violations of the sub-requirements of R1.3 shall be considered a single violation of R1.3.~~ |

## Implementation Plan for Standard MOD-028-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-028-1 – Area Interchange Methodology, which describes the Area Interchange methodology (previously referred to as the Network Response ATC methodology) for determining ATC.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Retired Standards

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-028-1 incorporates the following requirements from FAC-012-1:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-028-1 incorporates the following requirements from FAC-013-1:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-028-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-028-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Implementation Plan for Standard MOD-008-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-008-1 – Transmission Reliability Margin which describes the reliability aspects of determining and maintaining a Transmission Reliability Margin and what components of uncertainty may be considered when making that determination.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Modified Standards

This standard supersedes MOD-008-0. MOD-009-0 – Procedure for Verifying Transmission Reliability Margin Values, has been incorporated into this standard, made irrelevant by this standard, or is being addressed by the North American Energy Standards Board, and should be retired when MOD-008-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-008-1 | ■ | | | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the Reliability Standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date the standard is approved by the NERC Board of Trustees. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

> Committee shall set the proposed standard for ballot as soon as the work flow will accommodate."

NERC's Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008. Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee's Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards. The Standards Committee's Executive Committee directed NERC's Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR Development June 20 2005.
2. SAC Authorized the SAR to be developed as a standard on February 14 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from February 15–March 16, 2007.
5. SDT posted second draft for comment from May 25–June 25, 2007.
6. SDT posted third draft for comment from October 31–December 15, 2007.
7. SC conducted an Initial Ballot of the standard from March 3–12, 2008.
8. SDT posted fourth draft for comment form April 16–May 15, 2008.

**Description of Current Draft:**

This is the fifth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to Comments. | June 20, 2008 |
| 2. Posting for 30-day Pre-Ballot Review. | June 20, 2008 |
| 3. Initial Ballot. | July 21, 2008 |
| 4. Respond to comments. | August 20, 2008 |
| 5. Recirculation ballot. | August 21, 2008 |
| 6. 30-day posting before board adoption. | June 21, 2008 |
| 7. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**ATC Path:** Any combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path[1].

**Available Transfer Capability (ATC):** A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less Existing Transmission Commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows.

**Available Transfer Capability Implementation Document (ATCID):** A document that describes the implementation of a methodology for calculating ATC or AFC, and provides information related to a Transmission Service Provider's calculation of ATC or AFC.

**Transmission Operator Area:** The collection of Transmission assets over which the Transmission Operator is responsible for operating.

**Existing Transmission Commitments (ETC):** Committed uses of a Transmission Service Provider's Transmission system considered when determining ATC or AFC.

**Planning Coordinator:** See Planning Authority.

**Postback:** Positive adjustments to ATC or AFC as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.

**Business Practices:** Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization or regional entity business practices; or NAESB Business Practices**.**

**Block Dispatch:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).

**Dispatch Order:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.

**Participation Factors:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.

---

[1] See 18 CFR 37.6(b)(1)

## A. Introduction

1. **Title:** **Available Transmission System Capability**

2. **Number:** **MOD-001-1**

3. **Purpose:** To ensure that calculations are performed by Transmission Service Providers to maintain awareness of available transmission system capability and future flows on their own systems as well as those of their neighbors

4. **Applicability:**

   **4.1.** Transmission Service Provider.

   **4.2.** Transmission Operator.

5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Operator shall select one of the methodologies[2] listed below for calculating Available Transfer Capability (ATC) or Available Flowgate Capability (AFC) for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- The Area Interchange Methodology, as described in MOD-028
- The Rated System Path Methodology, as described in MOD-029
- The Flowgate Methodology, as described in MOD-030

**R2.** Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s): [*Violation Risk Factor: Lower* [*Time Horizon: Operations Planning*]

**R2.1.** Hourly values for at least the next 48 hours.

**R2.2.** Daily values for at least the next 31 calendar days.

**R2.3.** Monthly values for at least the next 12 months (months 2-13).

**R3.** Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC or AFC calculations can be validated.

**R3.2.** A description of the manner in which the Transmission Service Provider will account for counterflows including:

**R3.2.1.** How confirmed Transmission reservations, expected Interchange and internal counterflow are addressed in firm and non-firm ATC or AFC calculations.

---

[2] All ATC Paths do not have to use the same methodology and no particular ATC Path must use the same methodology for all time periods.

**R3.2.2.** A rationale for that accounting specified in R3.2.

**R3.3.** The identity of the Transmission Operators and Transmission Service Providers from which the Transmission Service Provider receives data for use in calculating ATC or AFC.

**R3.4.** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer or Flowgate capability.

**R3.5.** A description of the allocation processes listed below that are applicable to the Transmission Service Provider:

- Processes used to allocate transfer or Flowgate capability among multiple lines or sub-paths within a larger ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities among multiple owners or users of an ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities between Transmission Service Providers to address issues such as forward looking congestion management and seams coordination.

**R3.6.** A description of how generation and transmission outages are considered in transfer or Flowgate capability calculations, including:

**R3.6.1.** The criteria used to determine when an outage that is in effect part of a day impacts a daily calculation.

**R3.6.2.** The criteria used to determine when an outage that is in effect part of a month impacts a monthly calculation.

**R3.6.3.** How outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed.

**R4.** The Transmission Service Provider shall notify the following entities before implementing a new or revised ATCID: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.1.** Each Planning Coordinator associated with the Transmission Service Provider's area.

**R4.2.** Each Reliability Coordinator associated with the Transmission Service Provider's area.

**R4.3.** Each Transmission Operator associated with the Transmission Service Provider's area.

**R4.4.** Each Planning Coordinator adjacent to the Transmission Service Provider's area.

**R4.5.** Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

**R4.6.** Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

**R5.** The Transmission Service Provider shall make available the current ATCID to all of the entities specified in R4. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.** When calculating Total Transfer Capability (TTC) or Total Flowgate Capability (TFC) the Transmission Operator shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.** When calculating ATC or AFC the Transmission Service Provider shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R8.** Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**R8.1.** Hourly values, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the ATC equation.

**R8.2.** Daily values, once per day.

**R8.3.** Monthly values, once per week.

**R9.** Within thirty calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below solely for use in the requestor's ATC or AFC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R9.1 and R9.2: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Expected generation and Transmission outages, additions, and retirements.
- Load forecasts.
- Unit commitments and order of dispatch, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:
  - Dispatch Order
  - Participation Factors
  - Block Dispatch
- Aggregated firm capacity set-aside for Network Integration Transmission Service and aggregated non-firm capacity set aside for Network Integration Transmission Service (i.e. Secondary Service).
- Firm and non-firm Transmission reservations.
- Aggregated capacity set-aside for Grandfathered obligations
- Firm roll-over rights.
- Any firm and non-firm adjustments applied by the Transmission Service Provider to reflect parallel path impacts.
- Power flow models and underlying assumptions.

> Note that the North American Energy Standards Board (NAESB) is developing the companion standards that address the posting of ATC information, including supporting information such as that described in R9.

- Contingencies, provided in one or more of the following formats:
  - A list of Elements
  - A list of Flowgates
  - A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider
- Facility Ratings.
- Any other services that impact Existing Transmission Commitments (ETCs).
- Values of Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) for all ATC Paths or Flowgates.
- Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider receiving the request when selling Transmission service.
- Values of TTC and ATC for all ATC Paths for those Transmission Service Providers receiving the request that do not consider Flowgates when selling Transmission Service.
- Source and sink identification and mapping to the model.

**R9.1.** The Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months into the future (subject to confidentiality and security requirements).

**R9.1.1.** If the Transmission Service Provider uses the data requested in its transfer or Flowgate capability calculations, it shall make the data used available

**R9.1.2.** If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, but maintains that data, it shall make that data available

**R9.1.3.** If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, and does not maintain that data, it shall not be required to make that data available

**R9.2.** This data shall be made available by the Transmission Provider on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider).

## C. Measures

**M1.** The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one of the specified methodologies per time period in R2 for use in determining Transfer Capabilities of those Facilities for each ATC Path within the Transmission Operator's operating area. (R1).

**M2.** The Transmission Service Provider shall provide ATC or AFC values and identification of the selected methodologies along with other evidence (such as written documentation, processes, or data) to show it calculated ATC or AFC for the following using the selected methodology or methodologies chosen as part of R1 (R2):

- There has been at least 48 hours of hourly values calculated at all times. (R2.1)
- There has been at least 31 consecutive calendar days of daily values calculated at all times. (R2.2)

- There has been at least the next 12 months of monthly values calculated at all times (Months 2-13). (R2.3)

**M3.** The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

**M4.** The Transmission Service Provider shall provide evidence (such as dated electronic mail messages, mail receipts, or voice recordings) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)

**M5.** The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in R4, as required by R5. (R5)

**M6.** The Transmission Operator shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides or data sources for load forecast and facility outages) used to calculate TTC or TFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining TTC or TFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Operator may demonstrate that the same load flow cases are used for both TTC or TFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R6)

**M7.** The Transmission Service Provider shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides or data sources for load forecast and facility outages) used to calculate ATC or AFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining ATC or AFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Service Provider may demonstrate that the same load flow cases are used for both AFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R7)

**M8.** The Transmission Service Provider calculating ATC shall provide evidence (such as logs or data) that it has calculated the hourly, daily, and monthly values on at least the minimum frequencies specified in R8 or provide evidence (such as data, procedures, or software documentation) that the calculated values identified in the ATC equation have not changed. (R8)

**M9.** The Transmission Service Provider shall provide a copy of the dated request, if any, for ATC or AFC data as well as evidence to show it responded to that request (such as logs or data) within thirty calendar days of receiving the request, and the requested data items were made available in accordance with R9. (R9)

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

Regional Entity.

#### 1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

**1.3. Data Retention**

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall maintain its current selected method(s) for calculating ATC or AFC and any methods in force since last compliance audit period to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7, and R8 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.
- The Transmission Service Provider shall maintain evidence to show compliance with R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | N/A | N/A | N/A | The Transmission Operator did not select one of the specified methodologies for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area. |
| R2. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 30 hours but less than the next 48 hours.<br>▪ Has calculated daily ATC or AFC values for more than the next 21 calendar days but less than the next 31 calendar days.<br>▪ Has calculated monthly ATC or AFC values for more than the next 9 months but less than the next 12 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 20 hours but less than the next 31 hours.<br>▪ Has calculated daily ATC or AFC values for more than the next 14 calendar days but less than the next 22 calendar days.<br>▪ Has calculated monthly ATC or AFC values for more than the next 6 months but less than the next 10 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 10 hours but less than the next 21 hours.<br>▪ Has calculated daily ATC or AFC values for more than the next 7 calendar days but less than the next 15 calendar days.<br>▪ Has calculated monthly ATC or AFC values for more than the next 3 months but less than the next 7 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for less than the next 11 hours.<br>▪ Has calculated daily ATC or AFC values for less than the next 8 calendar days.<br>▪ Has calculated monthly ATC or AFC values for less than the next 4 months.<br>▪ Did not use the selected methodology(ies) to calculate ATC. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made up to three months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than three months but not more than six months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than six months but not more than one year ago.<br>**OR**<br>The Transmission Service Provider has an ATCID, but it does not include one or two of the information items described in R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made a year or more ago.<br>**OR**<br>The Transmission Service Provider does not have an ATCID, or its ATCID does not include three or more of the information items described in R3. |
| R4. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID after, but not more than 30 calendar days after, its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 30, but not more than 60, calendar days after its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 60, but not more than 90, calendar days after its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 90 calendar days after its implementation.<br>**OR**<br>The Transmission Service Provider did not notify one or more of the parties specified in R4 of a new or modified ATCID for more than 90 calendar days after its implementation. |
| R5. | N/A | N/A | N/A | The Transmission Service Provider did not make the ATCID available to the parties described in R4. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R6. | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than zero ATC Paths or Flowgates, but not more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater), but not more than 10% of all ATC Paths or Flowgates or 2 ATC Paths or Flowgates (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 10% of all ATC Paths or Flowgates or 2 ATC Path or Flowgate (whichever is greater), but not more than 15% of all ATC Paths or Flowgates or 3 ATC Paths or Flowgates (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 15% of all ATC Paths or Flowgates or more than 3 ATC Paths or Flowgates (whichever is greater). |
| R7 | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than zero ATC Paths or Flowgates, but not more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater), but not more than 10% of all ATC Paths or Flowgates or 2 ATC Paths or Flowgates (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 10%, of all ATC Paths or Flowgates or 2 ATC Path or Flowgate (whichever is greater), but not more than 15% of all ATC Paths or Flowgates or 3 ATC Paths or Flowgates (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 15% of all ATC Paths or Flowgates or more than 3 ATC Paths or Flowgates (whichever is greater). |
| R8. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for one or more hours but not more than 15 hours, and was in excess of the 175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 15 hours but not more than 20 hours, and was in excess of the 175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 20 hours but not more than 25 hours, and was in excess of the 175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 25 hours, and was in excess of the 175-hour per year requirement.<br>▪ For Daily, the values |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | ▪ For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for one or more calendar days but not more than 3 calendar days.<br>▪ For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for seven or more calendar days, but less than 14 calendar days. | ▪ For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 3 calendar days but not more than 4 calendar days.<br>▪ For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 14 or more calendar days, but less than 21 calendar days. | For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 4 calendar days but not more than 5 calendar days.<br>▪ For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 21 or more calendar days, but less than 28 calendar days. | described in the ATC equation changed and the Transmission Service provider did not calculate for more than 5 calendar days.<br>▪ For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 28 or more calendar days. |
| R9 | N/A | The Transmission Service Provider made the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available more than 30 calendar days but less than 45 calendar days after receiving a request. | The Transmission Service Provider made the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available 45 calendar days or more but less than 60 calendar days after receiving a request. | The Transmission Service Provider did not make the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available for 60 calendar days or more after receiving a request. |

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

**Development Steps Completed:**

1. SAC Authorized posting TTC/ATC/AFC SAR Development June 20 2005.
2. SAC Authorized the SAR to be developed as a standard on February 14 2006.
3. SC appointed a Standard Drafting Team on March 17, 2006.
4. SDT posted first draft for comment from February 15–March 16, 2007.
5. SDT posted second draft for comment from May 25–June 25, 2007.
6. SDT posted third draft for comment from October 31–December 15, 2007.
7. SC conducted an Initial Ballot of the standard from March 3–12, 2008.
8. SDT posted fourth draft for comment form April 16–May 15, 2008.

**Description of Current Draft:**

This is the fifth draft of the proposed standard posted for stakeholder comments. This draft includes consideration of stakeholder comments and applicable FERC directives from FERC Order 693, Order 890, and Order 890-A.

**Future Development Plan:**

| Anticipated Actions | Anticipated Date |
|---|---|
| 1. Respond to Comments. | June 20, 2008 |
| 2. Posting for 30-day Pre-Ballot Review. | June 20, 2008 |
| 3. Initial Ballot. | July 21, 2008 |
| 4. Respond to comments. | August 20, 2008 |
| 5. Recirculation ballot. | August 21, 2008 |
| 6. 30-day posting before board adoption. | June 21, 2008 |
| 7. Board adoption. | September 1, 2008 |

## Definitions of Terms Used in Standard

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

**ATC Path:** ~~Any Posted Path or~~ Aany ~~other~~ combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path[1].

**Available Transfer Capability (ATC):** A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less Eexisting Ttransmission Ccommitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows.

**Available Transfer Capability Implementation Document (ATCID):** A document that describes the implementation of a methodology for calculating ATC or AFC, and provides information related to a Transmission Service Provider's calculation of ATC or AFC.

**Transmission Operator Area:** The collection of Transmission assets over which the Transmission Operator is responsible for operating.

**Existing Transmission Commitments (ETC):** Committed uses of a Transmission Service Provider's Transmission system considered when determining ATC or AFC.

**Planning Coordinator:** See Planning Authority.

**Postback:** Positive adjustments to ATC or AFC as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.

**Business Practices:** Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization or regional entity business practices; or NAESB Business Practices**.**

**Block Dispatch:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).

**Dispatch Order:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.

**Participation Factors:** A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.

---

[1] See 18 CFR 37.6(b)(1)

## A. Introduction

1. **Title:** **Available Transmission System Capability**
2. **Number:** **MOD-001-1**
3. **Purpose:** To ensure that calculations are performed by Transmission Service Providers to maintain awareness of available transmission system capability and future flows on their own systems as well as those of their neighbors
4. **Applicability:**
   - **4.1.** Transmission Service Provider.
   - **4.2.** Transmission Operator.
5. **Proposed Effective Date:** First day of the first calendar quarter that is twelve months beyond the date that all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities.

## B. Requirements

**R1.** Each Transmission Operator shall select one of the ~~ATC~~ methodolog~~y~~ies[2] listed below for calculating Available Transfer Capability (ATC) ~~ATC (Area Interchange methodology, Rated System Path methodology)~~ or Available Flowgate Capability (AFC) ~~AFC (Flowgate methodology)~~ for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area~~.~~: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

- The Area Interchange Methodology, as described in MOD-028
- The Rated System Path Methodology, as described in MOD-029
- The Flowgate Methodology, as described in MOD-030

**R2.** Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s): [*Violation Risk Factor: Lower* [*Time Horizon: Operations Planning*]

**R2.1.** Hourly values for at least the next 48 hours.

**R2.2.** Daily values for at least the next 31 calendar days.

**R2.3.** Monthly values for at least the next 12 months (months 2-13).

**R3.** Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R3.1.** Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC or AFC calculations can be validated.

**R3.2.** A description of the manner in which the Transmission Service Provider will account for counterflows including:

---

[2] All ATC Paths do not have to use the same methodology and no particular ATC Path must use the same methodology for all time periods.

**R3.2.1.** How confirmed Transmission reservations, expected Interchange and internal counterflow are addressed in firm and non-firm ATC or AFC calculations.

**R3.2.2.** A rationale for th~~e defined~~ at accounting specified in R3.2. ~~.~~

**R3.3.** The identity of the Transmission Operators and Transmission Service Providers from which the Transmission Service Provider receives data for use in calculating ATC ~~transfer of Flowgate capability~~or AFC.

**R3.4.** The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer or Flowgate capability.

**R3.5.** A description of the allocation processes listed below that are applicable to the Transmission Service Provider:

- Processes used to allocate transfer or Flowgate capability among multiple lines or sub-paths within a larger ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities among multiple owners or users of an ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities between Transmission Service Providers to address issues such as forward looking congestion management and seams coordination.

**R3.6.** A description of how generation and transmission outages are considered in ~~ATC~~ transfer or Flowgate capability calculations, including:

**R3.6.1.** The criteria used to determine when an outage that is in effect part of a day impacts a daily ~~ATC or AFC~~ calculation.

**R3.6.2.** The criteria used to determine when an outage that is in effect part of a month impacts a monthly ~~ATC or AFC~~ calculation.

**R3.6.3.** How outages from other Transmission Service Providers ~~(including those outages from other Transmission Service Providers that are unrecognized)~~that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are ~~processed~~addressed~~,~~.

**R4.** The Transmission Service Provider shall notify the following entities ~~(via electronic mail)~~ before implementing a new or revised ATCID: [*Violation Risk Factor: Lower*] [*Time Horizon: Operations Planning*]

**R4.1.** Each Planning Coordinator associated with the Transmission Service Provider's area.

**R4.2.** Each Reliability Coordinator associated with the Transmission Service Provider's area.

**R4.3.** Each Transmission Operator associated with the Transmission Service Provider's area.

**R4.4.** Each Planning Coordinator adjacent to the Transmission Service Provider's area.

**R4.5.** Each Reliability Coordinator adjacent to the Transmission Service Provider's area.

**R4.6.** Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider's area.

**R5.** The Transmission Service Provider shall make available the current ATCID to all of the entities specified in R4. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R6.** When calculating Total ~~t~~Transfer Capability (TTC) or Total Flowgate Capability (TFC) the Transmission Operator shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R7.** When calculating ATC or AFC the Transmission Service Provider shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

**R8.** Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**R8.1.** Hourly values, once per hour. Transmission Service Providers are allowed up to ~~80~~ 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the ATC equation.

**R8.2.** Daily values, once per day.

**R8.3.** Monthly values, once per week.

**R9.** Within thirty calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below solely for use in the requestor's ATC or AFC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R9.1 and R9.2: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Expected generation and Transmission outages, additions, and retirements.
- Load forecasts.
- Unit commitments and order of dispatch, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:
  - Dispatch Order
  - Participation Factors
  - Block Dispatch
- Aggregated firm capacity set-aside for Network Integration Transmission Service and aggregated non-firm capacity set aside for Network Integration Transmission Service (i.e. Secondary Service).
- Firm and non-firm Transmission reservations.
- Aggregated capacity set-aside for Grandfathered obligations

Note that the North American Energy Standards Board (NAESB) is developing the companion standards that address the posting of ATC information, including supporting information such as that described in R9.

- Firm roll-over rights.
- Any firm and non-firm adjustments applied by the Transmission Service Provider to reflect parallel path impacts.
- Power flow models and underlying assumptions.
- Contingencies, provided in one or more of the following formats:
  - A list of Elements
  - A list of Flowgates
  - A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider
- Facility Ratings.
- Any other services that impact Existing Transmission Commitments (ETCs).
- Values of Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM)~~, and TTC~~ for all ATC Paths or Flowgates.
- Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider receiving the request when selling Transmission service.
- Values of TTC and ATC for all ATC Paths for those Transmission Service Providers receiving the request that do not consider Flowgates when selling Transmission Service.
- Source and sink identification and mapping to the model.

**R9.1.** The Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months into the future (subject to confidentiality and security requirements).

**R9.1.1.** If the Transmission Service Provider uses the data requested in its transfer or Flowgate capability calculations, it shall make the data used available

**R9.1.2.** If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, but maintains that data, it shall make that data available

**R9.1.3.** If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, and does not maintain that data, it shall not be required to make that data available

**R9.2.** This data shall be made available by the Transmission Provider on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider).

## C. Measures

**M1.** The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one of the specified methodologies per time period in R2 for use in determining Transfer Capabilities of those Facilities for each ATC Path within the Transmission Operator's operating area. (R1).

**M2.** The Transmission Service Provider shall provide ATC or AFC values and identification of the selected methodologies along with other evidence (such as written documentation, processes, or data) to show it calculated ATC or AFC for the following using the selected methodology or methodologies chosen as part of R1 (R2):

- There has been at least 48 hours of hourly values calculated at all times. (R2.1)
- There has been at least 31 consecutive calendar days of daily values calculated at all times. (R2.2)
- There has been at least the next 12 months of monthly values calculated at all times (Months 2-13). (R2.3)

**M3.** The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

**M4.** The Transmission Service Provider shall provide evidence (such as dated electronic mail messages, mail receipts, or voice recordings) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)

**M5.** The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in R4, as required by R5. (R5)

**M6.** The Transmission Operator shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides~~, load shedding~~ or data sources for load forecast and facility outages) used to calculate TTC or TFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining TTC or TFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Operator may demonstrate that the same load flow cases are used for both TTC or TFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R6)

**M7.** The Transmission Service Provider shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides~~, load shedding~~ or data sources for load forecast and facility outages) used to calculate ATC or AFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining ATC or AFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Service Provider may demonstrate that the same load flow cases are used for both AFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R7)

**M8.** The Transmission Service Provider calculating ATC shall provide evidence (such as logs or data) that it has calculated the hourly, daily, and monthly values on at least the minimum frequencies specified in R8 or provide evidence (such as data, procedures, or software documentation) that the calculated values identified in the ATC equation have not changed. (R8)

**M9.** The Transmission Service Provider shall provide a copy of the dated request, if any, for ATC or AFC data as well as evidence to show it responded to that request (such as logs or data) within thirty calendar days of receiving the request, and the requested data items were made available in accordance with R9. (R9)

## D. Compliance

**1. Compliance Monitoring Process**

**1.1. Compliance Enforcement Authority**

Regional Entity.

**1.2. Compliance Monitoring Period and Reset Time Frame**

Not applicable.

**1.3. Data Retention**

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall maintain its current selected method(s) for calculating ATC or AFC and any methods in force since last compliance audit period to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7, and R8 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.
- The Transmission Service Provider shall maintain evidence to show compliance with R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

-The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

**1.4. Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

**1.5. Additional Compliance Information**

None.

## 2. Violation Severity Levels

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R1. | N/A | N/A | N/A | The Transmission Operator did not select one of the specified methodologies for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area. |
| R2. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 30 hours but less than the next 48 hours.<br>~~OR~~<br>▪ Has calculated daily ATC or AFC values for more than the next 21 calendar days but less than the next 31 calendar days.<br>~~OR~~<br>▪ Has calculated monthly ATC or AFC values for more than the next 9 months but less than the next 12 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 20 hours but less than the next 31 hours.<br>~~OR~~<br>▪ Has calculated daily ATC or AFC values for more than the next 14 calendar days but less than the next 22 calendar days.<br>~~OR~~<br>▪ Has calculated monthly ATC or AFC values for more than the next 6 months but less than the next 10 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated hourly ATC or AFC values for more than the next 10 hours but less than the next 21 hours.<br>~~OR~~<br>▪ Has calculated daily ATC or AFC values for more than the next 7 calendar days but less than the next 15 calendar days.<br>~~OR~~<br>▪ Has calculated monthly ATC or AFC values for more than the next 3 months but less than the next 7 months. | One or more of the following:<br>▪ The Transmission Service Provider has calculated ~~less than 11~~ hourly ATC or AFC values for less than the next 11 hours.<br>~~OR~~<br>▪ Has c~~C~~alculated ~~less than 8~~ daily ATC or AFC values for less than the next 8 calendar days.<br>~~OR~~<br>▪ Has c~~C~~alculated ~~less than4~~ monthly ATC or AFC values for less than the next 4 months.<br>~~OR~~<br>▪ Did not use the selected methodology(ies) to calculate ATC. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made up to three months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than three months but not more than six months ago. | The Transmission Service Provider has an ATCID that does not incorporate changes made more than six months but not more than one year ago.<br>**OR**<br>The Transmission Service Provider has an ATCID, but it does not include one or two ~~or more~~ of the information items described in R3. | The Transmission Service Provider has an ATCID that does not incorporate changes made a year or more ago.<br>**OR**<br>The Transmission Service Provider does not have an ATCID, or its ATCID does not include ~~any~~ three or more of the information items described in R3. |
| R4. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID after, but not more than 30 calendar days after, its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 30, but not more than 60, calendar days after its implementation. | The Transmission Service Provider notified one or more of the parties specified in R4 of a new or modified ATCID more than 60, but not more than 90, calendar days after its implementation. | The Transmission Service Provider ~~did not notify~~notified one or more of the parties specified in R4 of a new or modified ATCID ~~for~~ more than 90 calendar days after its implementation.<br>**OR**<br>The Transmission Service Provider did not notify one or more of the parties specified in R4 of a new or modified ATCID for more than 90 calendar days after its implementation. |
| R5. | N/A | N/A | N/A | The Transmission Service Provider did not make the ATCID available to the parties described in R4. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| R6. | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than zero ATC Paths or Flowgates, but not more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater), but not more than 10% of all ATC Paths or Flowgates or 2 ATC Paths or Flowgates (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 10% of all ATC Paths or Flowgates or 2 ATC Path or Flowgate (whichever is greater), but not more than 15% of all ATC Paths or Flowgates or 3 ATC Paths or Flowgates (whichever is greater). | The Transmission Operator determined TTC or TFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 15% of all ATC Paths or Flowgates or more than 3 ATC Paths or Flowgates (whichever is greater). |
| R7 | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than zero ATC Paths or Flowgates, but not more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 5% of all ATC Paths or Flowgates or 1 ATC Path or Flowgate (whichever is greater), but not more than 10% of all ATC Paths or Flowgates or 2 ATC Paths or Flowgates (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 10%, of all ATC Paths or Flowgates or 2 ATC Path or Flowgate (whichever is greater), but not more than 15% of all ATC Paths or Flowgates or 3 ATC Paths or Flowgates (whichever is greater). | The Transmission Service Provider determined ATC or AFC using assumptions more limiting than those used in planning of operations for the studied time period for more than 15% of all ATC Paths or Flowgates or more than 3 ATC Paths or Flowgates (whichever is greater). |
| R8. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for one or more hours but not more than 15 hours, and was in excess of the ~~80~~175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 15 hours but not more than 20 hours, and was in excess of the ~~80~~175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 20 hours but not more than 25 hours, and was in excess of the ~~80~~175-hour per year requirement. | One or more of the following:<br>▪ For Hourly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 25 hours, and was in excess of the ~~80~~175-hour per year requirement. |

| R # | Lower VSL | Moderate VSL | High VSL | Severe VSL |
|---|---|---|---|---|
| | ~~OR~~<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for one or more calendar days but not more than 3 calendar days.<br>~~OR~~<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for seven or more calendar days, but less than 14 calendar days. | ~~OR~~<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 3 calendar days but not more than 4 calendar days.<br>~~OR~~<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 14 or more calendar days, but less than 21 calendar days. | ~~OR~~<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 4 calendar days but not more than 5 calendar days.<br>~~OR~~<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 21 or more calendar days, but less than 28 calendar days. | ~~OR~~<br>For Daily, the values described in the ATC equation changed and the Transmission Service provider did not calculate for more than 5 calendar days.<br>~~OR~~<br>For Monthly, the values described in the ATC equation changed and the Transmission Service provider did not calculate for 28 or more calendar days. |
| R9 | N/A | The Transmission Service Provider made the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available more than 30 calendar days but less than 45 calendar days after receiving a request. | The Transmission Service Provider made the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available 45 calendar days or more but less than 60 calendar days after receiving a request. | The Transmission Service Provider did not make the requested data items specified in R9 available to the requesting entities specified within the requirement, per the schedule specified in the request, subject to the limitations specified in R9, available for 60 calendar days or more after receiving a request. |

# Implementation Plan for Standard MOD-001-1 (Project 2006-07)

## Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-001-1 – Available Transfer Capability which requires the selection of an ATC methodology and describes the parts of the ATC process that apply to all entities, regardless of methodology chosen.

## Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

## Retired Standards

This standard supersedes the current MOD-001-0.

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-001-1 incorporates the requirements from FAC-012-1 as follows:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-001-1 incorporates the two requirements from FAC-013-1 as follows:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

## Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-001-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

## Implementation Plan for Standard MOD-001-1 (Project 2006-07)

### Summary

As part of compliance with FERC Order 890, the NERC ATC, TTC, CBM, & TRM Standards Drafting Team has prepared the following standard:

- MOD-001-1 – Available Transfer Capability which requires the selection of an ATC methodology and describes the parts of the ATC process that apply to all entities, regardless of methodology chosen.

### Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), approved, that must be implemented before this standard can be implemented.

### Retired Standards

This standard supersedes the current MOD-001-0.

FAC-012-1 – Transfer Capability Methodology includes four requirements. MOD-001-1 incorporates the requirements from FAC-012-1 as follows:

- R1 (Documentation of the Transfer Capability Methodology)
- R2, R3 (Communication of the Transfer Capability Methodology to appropriate entities).
- R4 (responding to comments by interested parties regarding the Transfer Capability Methodology) is being addressed by the North American Energy Standards Board.

As such, FAC-012-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

FAC-013-1 – Establish and Communicate Transfer Capabilities, includes two requirements. MOD-001-1 incorporates the two requirements from FAC-013-1 as follows:

- R1 (Calculation of the Transfer Capabilities)
- R2 (Communication of the Transfer Capabilities to appropriate entities).

As such, FAC-013-1 is no longer needed and is being retired when MOD-001-1 becomes effective.

### Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

| Proposed Standard | Transmission Operator | Transmission Planner | Transmission Service Provider | Balancing Authorities | Purchasing Selling Entities | Load-Serving Entities |
|---|---|---|---|---|---|---|
| MOD-001-1 | ■ | | ■ | | | |

## Proposed Effective Date

All requirements in the standard should become effective on the first day of the first calendar quarter that is twelve months beyond the date all four standards (MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1) are approved by all applicable regulatory authorities. This 12-month time period is to allow entities to implement the standard (including the procurement of any new hardware or software required) and to test those implementations thoroughly.

# Summary of Process Steps Taken Following Posting of the Standards for 30-day Comment

The ATC Standard Drafting Team is developing the ATC-related standards, in part, as a response to FERC Order 890. Order 890 provided specific guidance on the timeliness of this standards development effort. The drafting team has been working to a strict time line to ensure it can file these standards in compliance with the Commission's directives, while also adhering to the NERC Reliability Standards Development Procedure.

As described in Step 8 of NERC's Reliability Standards Development Procedure,

> "Based on the comments received and field testing, the standard drafting team may include revisions that are not substantive. Substantive changes to a draft standard shall not be permitted between the last posting for stakeholder comment and submittal for ballot. A substantive change is one that directly and materially affects the effect or use of the standard."

When reviewing the comments received and considering changes to the standards, the drafting team also considered that any substantive changes to the requirements would require an additional 30-day comment and response period, which would eliminate the possibility of meeting the FERC's submission deadlines. The drafting team carefully weighed the reliability benefit of any changes to the standard, and attempted to limit its modifications to those that clarify or explain, rather than create new requirements or change intent. The changes to the standards made by the drafting team fall into one or more of the following categories:

- Corrections
- Redrafting of language that does not change intent
- Clarifications that better explain intent
- Modifications that change minor details, but not intent
- Modifications to ensure consistency and reduce ambiguity

The drafting team does not believe that any of the changes made to the requirements following the last comment period directly or materially affect the effect or use of the standards, but instead make the standards more clear.

The NERC Standards Committee is a stakeholder group responsible for the oversight of standards development, including evaluation of the responses to comments and any changes to the standards. As described in Step 8 of NERC's Reliability Standards Development Procedure:

> "When the Standards Committee receives a draft standard that is recommended for ballot, the Standards Committee will review the standard and recommendations of the standards process manager to ensure that the proposed standard is consistent with the scope of the SAR; addresses all of the objectives and requirements cited in Steps 1 to 8, as applicable; has an implementation plan; and is compatible with other existing standards. If the proposed standard does not pass this review, the Standards Committee shall remand the proposed standard to the standard drafting team to address the deficiencies. If the proposed standard passes the review, the Standards

Committee shall set the proposed standard for ballot as soon as the work flow will accommodate."

NERC's Standards Process Manager presented the changes described above to the Executive Committee of the NERC Standards Committee on June 19, 2008. Following review of the revisions made to the standards, comment responses, and implementation plans, the Standards Committee's Executive Committee determined that the standards had passed the review, and the changes made do not directly or materially affect the effect or use of the standards. The Standards Committee's Executive Committee directed NERC's Standards Process Manager to post the standards for 30-day pre-ballot review and to begin assembling the ballot pools necessary for balloting.

# Standards Announcement

## Eight Recirculation Ballot Windows Open August 12, 2008

**Now available at:** https://standards.nerc.net/CurrentBallots.aspx

### Recirculation Ballot Windows for IRO-008-1, IRO-009-1 and IRO-010-1 Open August 12, 2008

The recirculation ballots for the following Interconnection Reliability Operating Limit (IROL) standards and their associated implementation plan open at 8 a.m. (EDT) on Tuesday, August 12, 2008:

- IRO-008-1— Reliability Coordinator Operational Analyses and Real-time Assessments
- IRO-009-1— Reliability Coordinator Actions to Operate within IROLs
- IRO-010-1— Reliability Coordinator Data Specification and Collection

These standards require the Reliability Coordinator (RC) to take actions to keep the bulk electric system operating within IROLs.

The ballot for each standard includes the retirement or revision of associated requirements from some already approved standards as identified in the table below. The IROL implementation plan contains the justification for the recommended retirements and revisions.

Note that during the initial ballot window, balloters identified some typographical errors in IRO-004 and IRO-005 and these have been corrected. A redline version of IRO-004 and IRO-005 has been posted to identify, with yellow highlighting, the corrections made. The corrections include the following:

- IRO-004 – changed the reference from “R7” to “R1” for the identification of the first set of VSLs
- IRO-005 – corrected the measures to reference the new requirement numbers

| Three Ballots for IROL Standards | |
|---|---|
| Ballot for New Standard | Includes Modifications to Associated Approved Standards |
| IRO-008 — RC Operational Analyses and Real-time Assessments | IRO-004-1 — RC – Operations Planning<br>▪ Retire R1 and R2 |
| IRO-009 — RC Actions to Operate within IROLs | EOP-001-0 — Emergency Operations Planning<br>▪ Retire R2 |
| | IRO-004-1 — RC – Operations Planning<br>▪ Retire R3 and R6 |
| | IRO-005-2 — RC – Current Day Operations<br>▪ Retire R3, R5, R16, R17;<br>▪ Modify R9, R13 and R14 |

| | |
|---|---|
| IRO-010 — RC Data Specification and Collection | IRO-002-1 — RC – Facilities<br>▪ Retire R2 |
| | IRO-004-1 — RC – Operations Planning<br>▪ Retire R4, R5 |
| | IRO-005-2 — RC – Current Day Operations<br>▪ Retire R2 |
| | TOP-003-0 — Planned Outage Coordination<br>▪ Modify R1.2 |
| | TOP-005-1 — Operational Reliability Information<br>▪ Retire R1, R1.1 |
| | TOP-006-1 — Monitoring System Conditions<br>▪ Modify R4 |

The recirculation ballot for each of the above standards will **close** at 8 p.m. (EDT) on Thursday, **August 21, 2008**.

**Five Recirculation Ballot Windows for Project 2006-07 — ATC/TTC and CBM/TRM Open August 12, 2008**

The recirculation ballots for the following ATC-related standards and their associated implementation plans open at 8 a.m. (EDT) on Tuesday, August 12, 2008:

- MOD-001-1 — Available Transfer Capability
- MOD-008-1 — Transmission Reliability Margin
- MOD-028-1 — Area Interchange Methodology
- MOD-029-1 — Rated System Path Methodology
- MOD-030-1 — Flowgate Methodology

This set of standards requires consistency in the calculation and documentation of Transmission Reliability Margin (TRM), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), and Available Transfer Capability (ATC). (Note that the ATC-related standard for Capacity Benefit Margin is not included in this set of ballots).

The ballot for each standard includes the retirement of associated approved standards as identified in the table below. The implementation plans contain the justification for the recommended retirements.

Note that during the initial ballot window, balloters identified some typographical errors in MOD-030 and these have been corrected. The errors include the following:

- Applicability 4.1.1 - added a space between "(AFCs)" and "on"
- R1 - replaced the “period” with a “colon” following "(ATCID)"
- R2.1.2 - changed "analyses" to “analysis”
- Added "R"s to all "fourth-tier" requirements (e.g., changed “2.1.1.1” to “R2.1.1.1”)

A redline version of MOD-030 has been posted to identify, with yellow highlighting, the corrections made. In addition, all of the ATC-related standards were missing the “Regional Variances” and “Version History” sections of the standard and these have been added to all five of the standards.

During the initial ballot window, several balloters provided suggestions for additional improvements to MOD-030-1. (The suggested improvements are aimed at allowing additional methods of achieving the same reliability objective – the suggested improvements are not aimed at correcting any errors in MOD-030-1.) Under the existing standards development process, if the drafting team makes these changes to MOD-030-1, then the standard must be posted for an additional comment period, and then the balloting must begin again. This delay would mean that the standard would not be ready to file with FERC before its due date.

To remedy this problem, the drafting team has submitted a SAR to initiate modifications to MOD-030-1, and has received Standards Committee authorization to post the SAR and a proposed version of MOD-030-2 that reflects consideration of comments submitted with the initial ballot of MOD-030-1. The SAR and proposed MOD-030-2 are currently posted for stakeholder review and comment. As envisioned, MOD-030-2 will move through the standards development process and will be filed with governmental authorities before MOD-030-1 becomes effective.

| Five Ballots for ATC-related Standards | |
|---|---|
| Ballot for New Standard | Includes Retirement of Associated Approved Standards |
| MOD-001-1 — Available Transfer Capability | MOD-001-0 — Documentation of TTC and ATC Calculation Methodologies<br>FAC-012-1 — TC Methodology<br>FAC-013-1 — Establish and Communicate TCs |
| MOD-008-1 — Transmission Reliability Margin | MOD-008-0 — Documentation and Content of Each Regional TRM Methodology<br>MOD-009-0 — Procedure for Verifying TRM Values |
| MOD-028-1 — Area Interchange Methodology | FAC-012-1 — TC Methodology<br>FAC-013-1 — Establish and Communicate TCs |
| MOD-029-1 — Rated System Path Methodology | FAC-012-1 — TC Methodology<br>FAC-013-1 — Establish and Communicate TCs |
| MOD-030-1 — Flowgate Methodology | FAC-012-1 — TC Methodology<br>FAC-013-1 — Establish and Communicate TCs |

The recirculation ballot for each of the above standards will **close** at 8 p.m. (EDT) on Thursday, **August 21, 2008**.
