A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

#### *Medium Risk Requirement*

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if

violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### *Lower Risk Requirement*

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

### **FERC Violation Risk Factor Guidelines**

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:<sup>1</sup>

#### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:<sup>2</sup>

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination

<sup>1</sup> North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

<sup>2</sup> Id. at footnote 15.

- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

#### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

#### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

#### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

#### **Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

#### **VRF Discussion**

The following discussion addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-

004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations.” The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a “fill-in-the-blank” standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity’s control or

would not improve BES reliability, it must explain this in a declaration why no further corrective actions will be taken.

In the last Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives, thus a Requirement-to-Requirement comparison of VRFs is not possible. In developing the new VRFs for the Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team’s VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

**NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance</p> <p>The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance.</p> <p>The performance or product measured still has significant value in meeting the</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.</p> <p>The performance or product has limited value in meeting the</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance.</p> <p>The performance measured does not meet the intent of the requirement or the product delivered</p>

	intent of the requirement.	intent of the requirement.	cannot be used in meeting the intent of the requirement.
--	----------------------------	----------------------------	--

**FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

***Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance***

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

***Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties***

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

***Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement***

VSLs should not expand on what is required in the requirement.

***Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations***

... unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

**VRF and VSL Justifications – PRC-004-3, R1**

<b>Proposed VRF</b>	<b>Medium</b>
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>Composite Protection System operations reviewed for proper operation by an owner is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>

**VRF and VSL Justifications – PRC-004-3, R1**

<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which both have a VRF of High. This Requirement R1, to “review” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p> <p>A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. The VRF assignment also comports with the currently effective standards PRC-016-0.1 and PRC-022-1.</p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p>

**VRF and VSL Justifications – PRC-004-3, R1**

	<p>Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
<p>FERC VRF G5 Discussion</p>	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

**Proposed VSL**

<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation.  OR The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.</p>

VRF and VSL Justifications – PRC-004-3, R1

<p>NERC VSL Guidelines</p>	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.</p>
<p>FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p>This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.</p>
<p>FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties  Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p>	<p>Guideline 2a: This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

VRF and VSL Justifications – PRC-004-3, R1

<p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	
<p>FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>
<p>FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

**VRF and VSL Justifications – PRC-004-3, R2**

<b>Proposed VRF</b>	<b>Medium</b>
<p>NERC VRF Discussion</p>	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify the other owner(s) of a Composite Protection System when the initiating owner determined its Protection System components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
<p>FERC VRF G1 Discussion</p>	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of the Composite Protection System component(s) when it determines that (or is unsure whether)its component(s) did not cause a Misoperation or when it is unable to rule out a Misoperation of the Composite Protection System owned by others. This ensures that all owners review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.</p>

**VRF and VSL Justifications – PRC-004-3, R2**

<p>FERC VRF G2 Discussion</p>	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which both have a VRF of High. This requirement and VRF of Medium is consistent with Reliability Standards FAC-008-3 – Facility Ratings, R7 (“...shall provide Facility Ratings (for its solely and jointly owned Facilities...)”), MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 (“...shall provide appropriate equipment characteristics and system data...”), and IRO-015-1 – NAME, R1.1 (“...shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.”) which all have a VRF of Medium.</p> <p>Other Protection Systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 (“...shall provide documentation...”), PRC-016-0.1 – Special Protection System Misoperations, R3 (“...that owns an SPS shall provide documentation of the misoperation analyses...”), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 (“...SPS shall provide documentation of the program...”) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.</p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p>

**VRF and VSL Justifications – PRC-004-3, R2**

	<p>Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
<p>FERC VRF G5 Discussion</p>	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

**VRF and VSL Justifications – PRC-004-3, R2**

**Proposed VSL**

<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation.</p> <p>OR</p> <p>The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.</p>
<p>NERC VSL Guidelines</p>	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.</p>		

**VRF and VSL Justifications – PRC-004-3, R2**

<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as Composite Protection Systems that are owned by multiple entities is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.</p>
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>

VRF and VSL Justifications – PRC-004-3, R2

Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

**VRF and VSL Justifications – PRC-004-3, R3**

<b>Proposed VRF</b>	<b>Medium</b>
<p>NERC VRF Discussion</p>	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
<p>FERC VRF G1 Discussion</p>	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. **Proposed VSL**

Lower	Moderate	High	Severe
<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late.</p> <p>OR</p> <p>The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.</p>
<p>NERC VSL Guidelines</p>	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.</p>		

**VRF and VSL Justifications – PRC-004-3, R3**

<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO &amp; TO) for the notified Protection System owner. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p>A VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.</p>
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>

VRF and VSL Justifications – PRC-004-3, R3

Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

**VRF and VSL Justifications – PRC-004-3, R4**

<b>Proposed VRF</b>	<b>Medium</b>
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation (if not determined in Requirements R1 or R3) could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>An Unidentified cause(s) of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>

**VRF and VSL Justifications – PRC-004-3, R4**

<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have a VRF of High. This Requirement R4, to perform at least one “investigative action” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p> <p>A VRF of Medium is not inadvertently lowering the current VRF of High in the former PRC-004-2.1a, Requirements R1 or R3, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.</p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>

**VRF and VSL Justifications – PRC-004-3, R4**

FERC VRF G5 Discussion	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>		
<b>Proposed VSL</b>			
<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
<p>The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.</p>	<p>The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.</p>	<p>The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.</p>	<p>The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late.</p> <p>OR</p> <p>The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.</p>
<b>NERC VSL Guidelines</b>			
NERC VSL Guidelines	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.</p>		

**VRF and VSL Justifications – PRC-004-3, R4**

<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.
NERC VSL Guidelines	Meets NERC’s VSL Guidelines—The VSLs cover aspects of this Requirement that are not equal in importance and performance.		
FERC VSL G1	<p>Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p>		

**VRF and VSL Justification – PRC-004-3, R6**

<p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based on the failure of updating the CAP when actions or timetables change which is administrative in nature.</p>
<p>FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties  Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent  Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a: This requirement is not binary; therefore, this criterion does not apply.  Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>

### VRF and VSL Justification – PRC-004-3, R6

FERC VSL G4

Violation Severity Level  
Assignment Should Be Based on  
A Single Violation, Not on A  
Cumulative Number of  
Violations

The VSL is based on a single violation and not cumulative violations.

# Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction  
Project 2010-05.1 – Protection System (Misoperations)

## Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 — Protection System Misoperations.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

### **NERC Criteria - Violation Risk Factors**

#### ***High Risk Requirement***

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

#### ***Medium Risk Requirement***

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### *Lower Risk Requirement*

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

### **FERC Violation Risk Factor Guidelines**

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:<sup>1</sup>

#### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:<sup>2</sup>

<sup>1</sup> North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

<sup>2</sup> Id. at footnote 15.

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

### **Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to

reflect the lower risk level associated with the less important objective of the Reliability Standard.

### VRF Discussion

The following discussion addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. " The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC-003-0 as a "fill-in-the-blank" standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1. First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another entity owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete requirement Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the

entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth ~~requirement~~Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity's control or would not improve BES reliability, ~~the entity it~~ must ~~make~~explain this in a declaration why ~~and that~~ no further corrective actions will be taken.

In the last ~~of the requirements~~, Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the ~~requirements~~Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new ~~requirements~~Requirements combine various reliability attributes of the legacy standards with precise reliability objectives, thus a ~~requirement~~Requirement-to-~~requirement~~Requirement comparison of VRFs is not possible. In developing the new VRFs for the ~~requirements~~Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations, (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation, (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation, (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team's VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

### **NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance</p> <p>The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance.</p> <p>The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.</p> <p>The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance.</p> <p>The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

***FERC Order on Violation Severity Levels***

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

***Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance***

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

***Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties***

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

***Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement***

VSLs should not expand on what is required in the requirement.

***Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations***

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1

Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p><u>Composite</u> Protection System operations reviewed for proper operation by <u>their</u> owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection <del>System</del><u>Systems</u> for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p>

VRF and VSL Justifications – PRC-004-3, R1

	<p><del>The</del><u>This</u> requirement <u>has a</u> single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which <u>both</u> have a VRF of High. This <del>proposed</del> Requirement R1, to “review” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p> <p><del>The proposed</del>A VRF of Medium <u>is does</u> not inadvertently <del>lowering lower</del> the <u>identified current</u> VRF of High in the former <u>PRC-004-2.1a</u>, Requirements R1 and R2, because <del>the proposed this</del> Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. <u>The VRF assignment also comports with the currently effective standards PRC-016-0.1 and PRC-022-1.</u></p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p>

VRF and VSL Justifications – PRC-004-3, R1

	<p>Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
FERC VRF G5 Discussion	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

VRF and VSL Justifications – PRC-004-3, R1

Proposed VSL

Lower	Moderate	High	Severe
<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation.  OR  The responsible entity failed to identify whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R1.</p>
<p>NERC VSL Guidelines</p>	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.</p>		

VRF and VSL Justifications – PRC-004-3, R1

<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p><del>The proposed</del><u>This</u> VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The <del>proposed</del> VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.</p>
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a: This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b: <del>The proposed</del><u>This</u> VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

VRF and VSL Justifications – PRC-004-3, R1

<p>FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p><del>The proposed</del><u>This</u> VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with <del>the requirement.</del><u>this Requirement.</u></p>
<p>FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

VRF and VSL Justifications – PRC-004-3, R2

Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify <del>a joint</del><u>the other</u> owner(s) of a <u>Composite</u> Protection System when the initiating owner determined its <u>Protection System</u> components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>Unresolved Misoperations of <del>jointly</del><u>Composite Protection Systems</u> owned <del>equipment or operations by</del><u>others</u> that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report:

## VRF and VSL Justifications – PRC-004-3, R2

	<p>This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of <u>the Composite</u> Protection System <del>components</del><u>component(s)</u> when it determines that (or is unsure whether) its <del>components</del><u>component(s)</u> did not cause a Misoperation or when it is unable to rule out a Misoperation of the <u>jointly owned Composite</u> Protection System- <u>owned by others</u>. This ensures that all <del>parties</del><u>owners</u> review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.</p>
<p>FERC VRF G2 Discussion</p>	<p>Guideline 2- Consistency within a Reliability Standard:  <del>The</del><u>This</u> requirement <u>has a</u> single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:          This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which <del>as both</del> <u>have</u> a VRF of High. <del>The</del><u>This</u> requirement and VRF of Medium is consistent with Reliability Standards FAC-008-3 – Facility Ratings, R7 (“...shall provide Facility Ratings (for its solely and jointly owned Facilities...”) <del>and ...</del>”), MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 (“...shall provide appropriate equipment characteristics and system data...”) <del>which both ...</del>), and IRO-015-1 – NAME, R1.1 (“...shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.”) <u>which all</u> have a VRF of Medium.</p>

VRF and VSL Justifications – PRC-004-3, R2

	<p>Other <del>protection systems</del><u>Protection Systems</u> based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 (“...shall provide documentation...”), PRC-016-0.1 – Special Protection System Misoperations, R3 (“...that owns an SPS shall provide documentation of the misoperation analyses...”), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 (“...SPS shall provide documentation of the program...”) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. <u>As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.</u></p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>Unresolved Misoperations of <u>jointly Composite Protection Systems</u> owned <del>equipment or operations by</del> <u>others</u> that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
<p>FERC VRF G5 Discussion</p>	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p>

**VRF and VSL Justifications – PRC-004-3, R2**

This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.

**Proposed VSL**

Lower	Moderate	High	Severe
<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation.</p> <p>OR</p> <p>The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.</p>
<p>NERC VSL Guidelines</p>	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.</p>		

VRF and VSL Justifications – PRC-004-3, R2

<p>FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as <del>joint ownership</del> <u>Composite Protection Systems that are owned by multiple entities</u> is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.</p>
<p>FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties  Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent  Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a: This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b: <del>The proposed</del> <u>This</u> VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p>	<p><del>The proposed</del> <u>This</u> VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with <del>the requirement.</del> <u>this Requirement.</u></p>

VRF and VSL Justifications – PRC-004-3, R2

Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R3

Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of <del>a joint</del><u>another</u> <u>Composite</u> Protection System owner to review its <del>components</del><u>component(s)</u> for Misoperation, upon <u>notification</u>, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate <del>for Misoperation upon notification</del> could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p><u>Composite</u> Protection System operations reviewed for proper operation by <u>the</u> other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection <del>System</del><u>Systems</u> for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.</p>

VRF and VSL Justifications – PRC-004-3, R3

<p>FERC VRF G2 Discussion</p>	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p><del>The</del><u>This</u> requirement <u>has a</u> single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which <u>as both have</u> a VRF of High. This <del>proposed</del> Requirement <u>R1, R3</u>, to “review” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p> <p><del>The proposed</del><u>A</u> VRF of Medium <u>is does</u> not inadvertently <u>lowering lower</u> the <u>identified current</u> VRF of High in the former <u>PRC-004-2.1a</u>, Requirements R1 and R2, because <del>the proposed</del><u>this</u> Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.</p>

VRF and VSL Justifications – PRC-004-3, R3

<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure of <del>a joint</del><u>another Composite</u> Protection System owner to review its <del>components</del><u>component(s) for Misoperation, upon notification</u>, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate <del>for Misoperation upon notification</del> could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p><u>Composite</u> Protection System operations reviewed for proper operation by <u>the</u> other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. VRF and VSL Justifications – PRC-004-3, R4

Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation <u>(if not determined in Requirements R1 or R3)</u> could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p><u>An</u> Unidentified <del>causes</del><u>cause(s)</u> of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p><del>The</del><u>This</u> requirement <u>has a</u> single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>

VRF and VSL Justifications – PRC-004-3, R4

<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which <del>as have</del> a VRF of High. This <del>proposed</del> Requirement R4, to perform at least one “investigative action” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p> <p><del>The proposed</del> VRF of Medium is not inadvertently lowering the <del>identified current</del> VRF of High in the former <del>Requirement PRC-004-2.1a, Requirements R1 or R3</del>, because <del>the proposed this</del> Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. <u>This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.</u></p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p>

**VRF and VSL Justifications – PRC-004-3, R4**

	<p>Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
<p>FERC VRF G5 Discussion</p>	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

**Proposed VSL**

Lower	Moderate	High	Severe
<p>The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.</p>	<p>The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.</p>	<p>The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.</p>	<p>The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late.  OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.</p>

VRF and VSL Justifications – PRC-004-3, R4

<p>NERC VSL Guidelines</p>	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.</p>
<p>FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p><del>The proposed</del><u>This</u> VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. <del>The proposed</del><u>This</u> VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.</p>
<p>FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties  Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p>	<p>Guideline 2a: This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b: <del>The proposed</del><u>This</u> VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

VRF and VSL Justifications – PRC-004-3, R4

<p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	
<p>FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p><del>The proposed</del><u>This</u> VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with <del>the requirement.</del><u>this Requirement.</u></p>
<p>FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

VRF and VSL Justifications – PRC-004-3, R5

Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p><del>The</del><u>This</u> requirement <u>has a</u> single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>

VRF and VSL Justifications – PRC-004-3, R5

<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have <del>varying VSLs.</del></p> <p><del>The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The former Requirement for the CAP was limited to a High VSL; however, the proposed Requirement R5 is now expanded to the Severe VSL. The lesser VSLs are based on tardiness and are practical and reasonable for the amount of time allotted for completion.</del> <u>a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“...shall take corrective actions to avoid future Misoperations”), PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan...”), FAC-003, R5 (“...Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management”) all three of which have a VRF of Medium.</u></p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>An unresolved cause of a Misoperation could contribute the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>

**VRF and VSL Justifications – PRC-004-3, R5**

FERC VRF G5 Discussion	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

<p>Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	
--	--

**VRF and VSL Justification – PRC-004-3, R6**

Proposed VRF	Medium
<p>NERC VRF Discussion</p>	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>An uncorrected cause of a Misoperation, <del>through</del> <u>as a result of</u> not implementing a Corrective Action Plan, could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>

## VRF and VSL Justification – PRC-004-3, R6

FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p><del>The</del><u>This</u> requirement <u>has a</u> single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
FERC VRF G3 Discussion	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-<del>2a</del><u>2.1a</u>, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which <del>as both</del> <u>have</u> a VRF of High. <del>The</del><u>This</u> requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“...shall take corrective actions to avoid future misoperations.”) and PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan...”) which both have a VRF of Medium.</p> <p>The proposed VRF of Medium <u>is does</u> not inadvertently <u>lowering lower</u> the <u>identified current</u> VRF of High in the former <del>Requirement</del><u>PRC-004-2.1a, Requirements R1 and R2</u>, because <del>the proposed this</del> Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.</p>

**VRF and VSL Justification – PRC-004-3, R6**

<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</p> <p>An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</p>
<p>FERC VRF G5 Discussion</p>	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

VRF and VSL Justification – PRC-004-3, R6

Proposed VSL

Lower	Moderate	High	Severe
<p>The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.</p>	<p>N/A</p>	<p>N/A</p>	<p>The responsible entity failed to implement a CAP in accordance with Requirement R6.</p>
<p>NERC VSL Guidelines</p>	<p>Meets NERC’s VSL Guidelines—The VSLs cover aspects of <del>the requirement</del><u>this Requirement</u> that are not equal in importance and performance.</p>		
<p>FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>Guideline 3- Consistency among Reliability Standards: This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.  The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based <u>on</u> the failure of updating the CAP when actions or timetables change which is administrative in nature.</p>		

VRF and VSL Justification – PRC-004-3, R6

<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p> <p>Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with <del>the requirement.</del> <u>this Requirement.</u></p>
<p>FERC VSL G4</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

## VRF and VSL Justification – PRC-004-3, R6

Violation Severity Level  
Assignment Should Be Based on  
A Single Violation, Not on A  
Cumulative Number of  
Violations

## Table of Issues and Directives

### Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Table of Issues and Directives Associated with PRC-003-1

Source	Issue or Directive Language (including Para. #)	Section and/or Requirement(s)	Consideration of Issue or Directive
FERC Order No. 693, P 1460.	For the reasons stated in the NOPR, the Commission will not approve or remand PRC-003-1.  (For reference) P 1458. In the NOPR, the Commission identified PRC-003-1 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-1 until the ERO submitted the additional information.	PRC-004-3	PRC-003-1 will be retired and replaced by PRC-004-3.
FERC Order No. 693, P 1461.	We agree with APPA that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No.	NERC Rules of Procedure, Section 1600 Request for	PRC-003-1 will be retired and replaced by PRC-004-3. The responsibility to address all aspects of a Protection System Misoperation is assigned to the

Table of Issues and Directives Associated with PRC-003-1

Source	Issue or Directive Language (including Para. #)	Section and/or Requirement(s)	Consideration of Issue or Directive
	<p>672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA’s suggestions in the Reliability Standards development process as it modifies PRC-003-1 to provide missing information needed for the Commission to act on this Reliability Standard</p> <p>(For reference)                      P 1459. APPA agrees with the Commission’s proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids and industry structures. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in completing this Reliability Standard.</p>	<p>Data or Information.</p>	<p>owner(s) of the Protection System(s) - the Transmission Owner, Generation Owner, and Distribution Provider.</p> <p>Additionally, further consistency has been achieved by specifying the data reporting requirements for periodic Misoperations reporting based on a continent-wide template. All reporting of Misoperations will be done through a data request according to the NERC Rules of Procedures, Section 1600, Request for Data or Information instead of having PRC-004-3 specify an administrative reporting requirement.</p>

Table of Issues and Directives Associated with PRC-004-2.1a

Source	Issues or Directive Language (including Para. #)	Section and/or Requirement(s)	Consideration of Issue or Directive
<p>FERC Order No. 693, P 1469 (first directive only)</p>	<p>We direct the ERO to consider ISO-NE’s suggestion that LSEs and transmission operators should be included in the applicability section, in the Reliability Standards development process as it modifies PRC-004-1.</p> <p>(For reference)                      P 1466. ISO-NE further requests the Commission to direct NERC to modify PRC-004-1 to include LSEs and transmission operators in the applicability section. It states that based on current practice in the ISO-NE balancing area, transmission operators, transmission owners, LSEs and distribution providers may individually or jointly own and operate a protection system. It therefore suggests that transmission operators and LSEs should also be included in the applicability section. ISO-NE provides the same suggestion with regard to PRC-005-1, PRC-008-0, PRC-011-0, PRC-015-0, PRC-016-0, PRC-017-0 and PRC-021-1.</p>	<p>PRC-004-3 all Requirements.</p>	<p>PRC-004-2.1a will be retired and replaced by PRC-004-3. The Transmission Owner, Generator Owner, and Distribution Provider own the BES Protection Systems. The owners of BES Protection Systems have been assigned responsibility for this standard.</p>

# Standards Announcement **Reminder**

## Project 2010-05.1 Protection System (Misoperations)

**Additional Ballot and Non-Binding Poll  
Now Open from June 20, 2014 through June 30, 2014**

### Now Available

An additional ballot and non-binding Poll for **PRC-004-3 – Protection System Misoperation Identification and Correction** is open from June 20, 2014 through June 30, 2014.

Background information for this project can be found on the [project page](#).

### **Instructions for Balloting**

Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking [here](#).

### **Next Steps**

The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a final ballot.

For more information on the **Standards Development Process**, please refer to the [Standard Processes Manual](#).

*For more information or assistance, please contact [Scott Barfield-McGinnis](#).*

## Standards Announcement

### Project 2010-05.1 Protection System (Misoperations) PRC-004-3

**A Formal Comment Period Now Open through June 30, 2014**

#### **Upcoming:**

Additional Ballot and Non-Binding Poll: June 20-30, 2014

#### **Now Available**

A 45-day formal comment period for **PRC-004-3 – Protection System Misoperation Identification and Correction** is open through **8 p.m. Eastern on Monday, June 30, 2014.**

#### **Instructions for Commenting**

Please use the [electronic form](#) to submit comments on the standard. If you experience any difficulties in using the electronic form, please contact [Wendy Muller](#). An off-line, unofficial copy of the comment form is posted on the [project page](#).

#### **Next Steps**

An additional ballot and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **June 20-30, 2014.**

For information on the **Standards Development Process**, please refer to the [Standard Processes Manual](#).

*For more information or assistance, please contact [Wendy Muller](#) (via email),  
Standards Development Administrator, or at 404-446-2560.*

Individual Ballot Pool Results				
Segment	Organization	Member	Ballot	NERC Notes
1	Ameren Services	Kirit Shah	Affirmative	
1	American Electric Power	Paul B Johnson	Affirmative	
1	American Transmission Company, LLC	Andrew Z Pusztai	Affirmative	
1	Arizona Public Service Co.	Robert Smith	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Affirmative	
1	ATCO Electric	Glen Sutton	Affirmative	
1	Austin Energy	James Armke	Affirmative	
1	Avista Corp.	Scott J Kinney		
1	Balancing Authority of Northern California	Kevin Smith	Affirmative	
1	Baltimore Gas & Electric Company	Gregory S Miller	Affirmative	
1	BC Hydro and Power Authority	Patricia Robertson	Affirmative	
1	Beaches Energy Services	Joseph S Stonecipher		
1	Black Hills Corp	Eric Egge		
1	Bonneville Power Administration	Donald S. Watkins	Affirmative	
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey		
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Negative	COMMENT RECEIVED
1	Central Electric Power Cooperative	Michael B Bax	Affirmative	
1	Central Maine Power Company	Joseph Turano Jr.	Affirmative	
1	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Chang G Choi	Negative	SUPPORTS THIRD PARTY COMMENTS - (Chris Mattson)
1	City of Tallahassee	Daniel S Langston	Affirmative	
1	City Utilities of Springfield, Missouri	Jeff Knottek	Affirmative	
1	Clark Public Utilities	Jack Stamper	Affirmative	
1	Cleco Power LLC	Danny McDaniel	Negative	SUPPORTS THIRD PARTY COMMENTS - (Cleco)
1	Colorado Springs Utilities	Paul Morland	Affirmative	
1	Consolidated Edison Co. of New York	Christopher L de Graffenried	Affirmative	
1	Consumers Power Inc.	Stuart Sloan		
1	CPS Energy	Richard Castrejana	Affirmative	
1	Dairyland Power Coop.	Robert W. Roddy	Affirmative	
1	Dayton Power & Light Co.	Hertzel Shamash	Affirmative	
1	Dominion Virginia Power	Michael S Crowley	Affirmative	
1	Duke Energy Carolina	Doug E Hils	Affirmative	
1	El Paso Electric Company	Dennis Malone	Abstain	
1	Entergy Transmission	Oliver A Burke	Affirmative	
1	FirstEnergy Corp.	William J Smith	Affirmative	
1	Florida Keys Electric Cooperative Assoc.	Dennis Minton	Affirmative	
1	Florida Power & Light Co.	Mike O'Neil	Affirmative	
1	FortisBC	Curtis Klashinsky		
1	Gainesville Regional Utilities	Richard Bachmeier	Negative	SUPPORTS THIRD PARTY COMMENTS - (FMPA)
1	Georgia Transmission Corporation	Jason Snodgrass	Affirmative	
1	Grand River Dam Authority	James M Stafford		
1	Great River Energy	Gordon Pietsch	Affirmative	
1	Hoosier Energy Rural Electric Cooperative, Inc.	Bob Solomon		
1	Hydro One Networks, Inc.	Ajay Garg	Affirmative	
1	Hydro-Quebec TransEnergie	Bernard Pelletier		
1	Idaho Power Company	Molly Devine	Affirmative	

1	International Transmission Company Holdings Corp	Michael Moltane	Abstain	
1	JEA	Ted E Hobson	Negative	COMMENT RECEIVED
1	KAMO Electric Cooperative	Walter Kenyon	Affirmative	
1	Kansas City Power & Light Co.	Michael Gammon	Affirmative	
1	Lakeland Electric	Larry E Watt	Negative	SUPPORTS THIRD PARTY COMMENTS - (FMPA - Florida Municipal Power Agency)
1	Lee County Electric Cooperative	John W Delucca		
1	Lincoln Electric System	Doug Bantam	Affirmative	
1	Long Island Power Authority	Robert Ganley	Affirmative	
1	Lower Colorado River Authority	Martyn Turner	Affirmative	
1	M & A Electric Power Cooperative	William Price	Affirmative	
1	Manitoba Hydro	Joe D Petaski		
1	MEAG Power	Danny Dees	Affirmative	
1	MidAmerican Energy Co.	Terry Harbour	Affirmative	
1	Minnkota Power Coop. Inc.	Daniel L Inman	Affirmative	
1	Muscatine Power & Water	Andrew J Kurriger	Affirmative	
1	N.W. Electric Power Cooperative, Inc.	Mark Ramsey	Affirmative	
1	National Grid USA	Michael Jones	Affirmative	
1	Nebraska Public Power District	Cole C Brodine		
1	New York Power Authority	Bruce Metruck	Affirmative	
1	Northeast Missouri Electric Power Cooperative	Kevin White	Affirmative	
1	Northeast Utilities	David Boguslawski	Negative	COMMENT RECEIVED
1	Northern Indiana Public Service Co.	Kevin M Largura		
1	NorthWestern Energy	John Canavan	Abstain	
1	NStar Gas and Electric	John Robertson		
1	Ohio Valley Electric Corp.	Robert Matthey		
1	Oklahoma Gas and Electric Co.	Marvin E VanBebber	Affirmative	
1	Omaha Public Power District	Doug Peterchuck	Negative	SUPPORTS THIRD PARTY COMMENTS - (OPPD (Mahmood Safi))
1	Oncor Electric Delivery	Jen Fiegel	Negative	COMMENT RECEIVED
1	Otter Tail Power Company	Daryl Hanson	Affirmative	
1	Pacific Gas and Electric Company	Bangalore Vijayraghavan	Affirmative	
1	Platte River Power Authority	John C. Collins	Affirmative	
1	Portland General Electric Co.	John T Walker	Affirmative	
1	Potomac Electric Power Co.	David Thorne	Affirmative	
1	PowerSouth Energy Cooperative	Larry D Avery		
1	PPL Electric Utilities Corp.	Brenda L Truhe	Negative	SUPPORTS THIRD PARTY COMMENTS - (Refer to comments submitted on behalf of PPL NERC Registered Affiliates)
1	Public Service Company of New Mexico	Laurie Williams	Affirmative	
1	Public Service Electric and Gas Co.	Kenneth D. Brown	Negative	SUPPORTS THIRD PARTY COMMENTS - (Public Service Enterprise Group ("PSEG") comments)
1	Public Utility District No. 1 of Okanogan County	Dale Dunckel	Affirmative	
1	Public Utility District No. 2 of Grant County, Washington	Rod Noteboom		

1	Puget Sound Energy, Inc.	Denise M Lietz	Affirmative	
1	Rochester Gas and Electric Corp.	John C. Allen	Affirmative	
1	Sacramento Municipal Utility District	Tim Kelley	Affirmative	
1	Salt River Project	Robert Kondziolka	Affirmative	
1	Santee Cooper	Terry L Blackwell	Affirmative	
1	Seattle City Light	Pawel Krupa	Affirmative	
1	Sho-Me Power Electric Cooperative	Denise Stevens	Affirmative	
1	Snohomish County PUD No. 1	Long T Duong	Affirmative	
1	South Carolina Electric & Gas Co.	Tom Hanzlik	Affirmative	
1	Southern California Edison Company	Steven Mavis	Negative	SUPPORTS THIRD PARTY COMMENTS - (Patrick Farrell (SCE))
1	Southern Company Services, Inc.	Robert A. Schaffeld	Negative	SUPPORTS THIRD PARTY COMMENTS - (Southern Company)
1	Southern Illinois Power Coop.	William Hutchison	Negative	SUPPORTS THIRD PARTY COMMENTS - (ACES)

## Non-Binding Poll Results

### Project 2010-05.1 Protection Systems - Misoperations PRC-004-3

Non-Binding Poll Results	
<b>Non-Binding Poll Name:</b>	Project 2010-05.1 Non-binding Poll - Protection Systems -Misoperations
<b>Poll Period:</b>	6/20/2014 - 7/9/2014
<b>Total # Opinions:</b>	293
<b>Total Ballot Pool:</b>	388
<b>Summaray Results:</b>	75.52% of those who registered to participate provided an opinion or an abstention; 77.59% of those who provided an opinion indicated support for the VRFs and VSLs.

Individual Ballot Pool Results				
Segment	Organization	Member	Ballot	NERC Notes
1	Ameren Services	Kirit Shah	Abstain	
1	American Electric Power	Paul B Johnson	Abstain	
1	Arizona Public Service Co.	Robert Smith	Affirmative	
1	Associated Electric Cooperative, Inc.	John Bussman	Affirmative	
1	ATCO Electric	Glen Sutton	Affirmative	
1	Austin Energy	James Armke	Affirmative	
1	Avista Corp.	Scott J Kinney		
1	Balancing Authority of Northern California	Kevin Smith	Affirmative	
1	Baltimore Gas & Electric Company	Gregory S Miller	Affirmative	
1	BC Hydro and Power Authority	Patricia Robertson	Abstain	
1	Beaches Energy Services	Joseph S Stonecipher		
1	Black Hills Corp	Eric Egge		
1	Bonneville Power Administration	Donald S. Watkins	Affirmative	
1	Brazos Electric Power Cooperative, Inc.	Tony Kroskey		
1	Bryan Texas Utilities	John C Fontenot	Affirmative	
1	CenterPoint Energy Houston Electric, LLC	John Brockhan	Abstain	
1	Central Electric Power Cooperative	Michael B Bax	Affirmative	
1	Central Maine Power Company	Joseph Turano Jr.	Abstain	
1	City of Tacoma, Department of Public Utilities, Light Division, dba Tacoma Power	Chang G Choi	Negative	SUPPORTS THIRD PARTY COMMENTS - (Chris Mattson)
1	City of Tallahassee	Daniel S Langston	Affirmative	

1	City Utilities of Springfield, Missouri	Jeff Knottek	Affirmative

Group
Northeast Power Coordinating Council
Guy Zito
No
In the Composite Protection System definition "Backup protection provided to a remote Protection System is included." is not clear because it directs the focus from the local protected Element to a remote protection system. Suggest revising this sentence to read "Backup protection provided by a remote protection system by design is included."
No
The case where manual intervention is required to open a BES interrupting device, but the cause of the Misoperation is located on a Protection System component owned by another Transmission Owner is not addressed in R2. In R1 a special mention to manual intervention is included. Why isn't a process of notification included in R2 for manual intervention caused by Misoperation of another owner's protection system?
Regarding Section 5: Background (page 6), additional justification to explain the application of the standard would be beneficial. As indicated in our previous comments, we disagreed with the omission of UVLS while UFLS is included. The SDT's response indicates that UVLS has not been included in the proposed standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. This rationale is not sufficient to justify the inclusion of UFLS but exclusion of UVLS since both need to be assessed and treated the same. Note that the SAR for PRC-022-1 is being revised to include UFLS. We suggest the PRC-004 SDT coordinate with the PRC-022 SDT to apply a consistent approach to addressing Misoperations of UFLS and UVLS. Requirement R1 does not work for the case where manual intervention to operate the BES device was required. Parts 1.1 thru 1.3 are all ANDS. Part 1.3 requires the Interrupting Device to be operated by the Protection System. This conflicts with the idea in Part 1.1 of MANUAL intervention. If an operator manually opens a breaker because the Composite Protection System does not clear a fault then the Protection System could not have operated the interrupting device. Therefore the threshold R1 would not be met and no identification is required even though the Composite Protection System may have failed-to-trip. Suggest Part 1.3 be revised to read: The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation; or manual intervention was required to operate the BES interrupting device because its Protection System failed to operate. Requirement R1 can be rephrased to provide clarity to the relationship of Parts 1.1 thru 1.3 to R1. Present phrasing has the added phrase, under the following circumstances, following Misoperation where it can ambiguously modify Misoperation. Clearly the intent is to describe the circumstances that a BES device owner has to embark on a process to identify a Misoperation. There are two inputs prior to beginning the process of identification; first the operation of a BES interrupting device occurs and second that the attributes of Parts 1.1 thru 1.3 are met. It would be clearer to place the reference to

Parts 1.1 thru 1.3 prior to the word identify. Suggest Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated, and where such operation conforms to Parts 1.1 thru 1.3, shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation.

Chris Scanlon
Exelon Companies
Yes
Yes
Yes
Paraphrasing many commenters from draft 4, Exelon agrees emphasis on due dates from the time of an operation be reconsidered. There is a significant administrative burden imposed by the proposed approach not commensurate with gains in reliable operations. The drafting team can review previous comments to this effect as well as references to the use of "calendar" as used in the PRC-005 supplemental reference to preclude the need to have reviews done by a specific date. We disagree with the SDT response that timeframes as proposed are required to force entities to be diligent about identifying and correcting misoperations.

The most recent draft of the proposed standard added a definition for a composite protection system which satisfies our previous concerns.
Yes

We are in agreement that this revision eliminates the identified gap. However, we are still not in agreement that the owner of the interrupting device be responsible for demonstrating compliance with the requirements in the proposed standard, as has been previously stated. This is of particular interest at interface terminals with generator owners.

AEP recommends adding an example to the applications guideline to illustrate that a properly coordinated breaker failure operation does not equate to a "slow trip" type misoperation. AEP recommends adding a backup protection example to the application guidelines to illustrate how R2.2 would be applied. AEP recommends adding an example of a breaker failure misoperation to the application guidelines.

As currently written, R5 may be interpreted as requiring the entity to both develop a CAP and complete the evaluation of the CAP's applicability to other Protection Systems within 60 days. For large entities, or in cases where the evaluation requires equipment outages, completing the evaluation of applicability within 60 days could be impossible. R5 should be revised to clearly state that the entity is only required to develop a CAP within 60 days. There should be an option to include the evaluation within the CAP. This would enable entities to complete the evaluation as part of the CAP and within a time window that is tailored to the scope of the corrective action and quantity of potentially applicable Protection Systems. AEP supports the concept of evaluating a corrective action's applicability to other Protection Systems. However, the standard requirements provide no means of measuring what is an adequate evaluation. Without this, an auditor could question the adequacy of an entity's evaluation, decide that the entity's actions were not an evaluation and subsequently find the entity non-compliant with R5. We believe that the SDT's Application Guide examples were an effort to demonstrate what would be acceptable. However, the examples are not exhaustive and therefore do not eliminate the audit risk. AEP believes that subject matter experts are in the best position to determine evaluation scope and content. AEP recommends that in lieu of adding additional examples in the Application Guideline, the drafting team should consider the possibility of an auditor invalidating an evaluation. The requirement should be revised so that it places bounds on this scenario and provide entities with certainty in how R5 might be reviewed by an auditor. AEP supports the overall efforts of the drafting team in the fundamental approach taken in the proposed standard. AEP has chosen to vote in the affirmative despite our concerns regarding the CAP and evaluation within R5, and how their compliance would ultimately be determined by an auditor.

The 2nd sentence in the definition of Composite Protection System is "Backup protection provided to a remote Protection System is included." The meaning and intention of this phrase is not readily understood. We suggest that the phrase from previous Draft 4: "Backup protection provided by a remote Protection System is excluded", is clearer and should be re-instated.
Yes
Yes
Facilities, Section 4.2.1, should have an exclusion for individual dispersed generators, or have its applicability limited to the point where the generators are aggregated to greater than 75 MVA. It is critical for the PRC-004-3 SDT to coordinate with the SDT for Project 2014-01, Standards Applicability for Dispersed Generation Resources, to assure that the new standard will have appropriate applicability consistent with BES reliability.

We agree with the Slow Trip changes. However, the revised definition of Composite Protection System caused much discussion. In the end, we would accept it provided that "a remote" in the second sentence is changed to "another." With this change, the second sentence would read "Backup protection provided to another Protection System is included." The backup Protection System need not be "remote" physically; it could be located in the same substation. The phrase "a remote Protection System" would require that the backup Protection System be at a different physical location, which may not be the case as we have just described.
Yes
No

In comments for the prior posting, we addressed a "consistency" reporting issue. See our comments and the SDT's response in the Consideration of Comments document on pp 27-28 and the SDT's response which is incorporated into the standard in various places. See the Application Guideline change on p. 31 of the redline version, which included this addition: "The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation until the entity determines otherwise. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation." The SDT's language above still allows entities too much latitude in the classification of an operation as a correct Operation or a Misoperation. The classification of an operation as a correct operation or a Misoperation is step 1 in the process. Only if the operation is determined to be a Misoperation is the cause of the Misoperation investigated (step 2). We suggest this guidance: "If the available evidence IS INSUFFICIENT to classify the operation as a Misoperation PRIOR TO THE INVESTIGATION OF THE CAUSE OF A POSSIBLE MISOPERATION, DO NOT CLASSIFY THE OPERATION AS A MISOPERATION." • A Misoperation with "no cause found" is not equivalent to a correct operation, which is how an unreported Misoperation is interpreted. If an entity classifies an operation as a Misoperation and goes down that path to investigate the cause, it may well conclude that no Misoperation occurred; however, unless its original Misoperation classification is changed to reflect that result, the reported Misoperations will be overstated. Another entity with an identical operation may decide not to classify it as a Misoperation based upon the data available to it absent an investigation of the cause. For the sake of consistent reporting, the classification decision (correct operation or Misoperation) must be reached without a causal investigation, which only takes place if an operation is classified as a Misoperation.

See the Consideration of Comments document, pp. 76-77. We interpreted that the SDT agreed to our proposed changes to R3; however it was not reflected in this draft.

Requirements R1 and R2 place the burden on the owner of a BES interrupting device to initiating a review on the operation of the device. This responsibility should fall on the owner of the components of the Composite Protection System that initiated the BES interrupting device to operate. The owner of these components should be just as aware as the owner of the device regarding its operation. In addition, for those entities that are interconnected and who utilize the same BES interrupting device, those entities should have equal awareness of the BES interrupting device status. Therefore, Seminole recommends that the SDT revise Requirements R1 and R2 to require the entity whose components of the Composite Protection System initiated the BES interrupting device to activate.

Definitions for "Failure to Trip – During Fault" and "Failure to Trip – Other Than Fault" state that "The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct". However, requirement R1 asks to identify if "Protection System component(s) caused a Misoperation". These statements seem to contradict each other. Definition for "Unnecessary Trip – Other Than Fault" provides examples for what it is not. It should also provide examples for what it is, similarly with other definitions.
Yes
Yes
Second part of sub-requirement R1.1 "The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate" seems to contradict with sub-requirement R1.3 "The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation". R1.1 and R1.3 cannot be met at the same time. An entity which receives notification of the BES interrupting device(s) operation in requirement R3 is allotted between 60 and 120 calendar days. However, the BES interrupting device(s) owner(s) are allotted 120 calendar days. Receiving entity also should be allotted full 120 calendar days counting from the day it receives notification. Requirements R1, R2, and R3 are assuming that an entity will make an attempt to determine the cause(s) of a Misoperation. However, an entity can choose to make no effort until requirement R4 becomes applicable. It is suggested to expand requirements R1, R2, and R3 with the obligation for an entity to make an effort to determine the cause(s) of a Misoperation before requirement R4 takes place.

The purpose of the Standard shall be limited only to "Identify and correct the causes of Misoperations of Protection Systems affecting the reliability of the Bulk Electric System (BES)." The Bulk Electric System (BES) Elements or Protection System Misoperations that may affect the reliability of the Bulk Electric System (BES), shall be first identified by the PC or RC. Requirement R2 The owner of the interrupting device shall share any information he has, that could be used by the other owner of the protection system to determine the cause of the misoperation.
Individual
Don Schmit
Nebraska Public Power District
Yes
No
R2 2.2 states: For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided." Perhaps it would be clearer to state: For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's Element, notification of the operation shall be provided to the other Protection System owner(s) from the backup protection system owner(s) for which that backup protection was provided." A concern with the gap fix is that the backup protection system owner will not be tracking this as a misoperation because the owner of the interrupting device is the one who had the misoperation yet the backup protection owner must store this notification as part of a misoperation on another entities system which creates an odd and risky compliance tracking situation. It would be unfortunate to get fined for not tracking this even though a misoperation did not occur on your system. This is a difficult situation to address. For a backup protection system owner who operates in back up for a fault on a non BES or non-registered entities system is the notification not required?
No
See suggestion below in 4)
The 1.2 Evidence Retention section states 12 months is the required evidence retention period for the requirements. It also notes that "the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit." I would recommend that the evidence retention be longer since it will be difficult to reproduce audit period evidence if it has been discarded. Project 2014-01 Dispersed Generation has noted that PRC-004 needs to be reviewed and updated to direct the industry as to the appropriateness of the BES elements that require misoperation analysis and documentation related to dispersed generation. It is recommended to consider adding these changes rather than issuing multiple versions of this standard unless there is a serious reliability risk with the existing PRC-004 standard. The Draft 5 Application Guidelines states "The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP

and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5." There are concerns that some CAP evaluations including programs for other locations could be open for long periods of time creating significant audit tracking burdens. Is it acceptable in some cases if a CAP for correcting the issue with equipment that misoperated also has an evaluation to only identify other locations that have a similar issue and once other locations are identified the CAP is considered completed and no other audit tracking is required? If this is acceptable this may be beneficial for cases where there is an issue with a large number of similar breakers, relays, communication schemes, potential devices or current transformers that might be widespread on some systems requiring years to replace or update as part of a program or several programs. If the above is not acceptable as the standard is written consider adding a 3rd bullet to R5 to allow a CAP for the specific misoperations and a requirement to identify other locations or allow a declaration that can be used for creating a CAP for other locations that will be considered separately from PRC-004-3. There are still concerns with including manual intervention as part of R1 since most appear to agree it is rare. Can the SDT provide some thoughts on the best way to guarantee that a manual intervention is duly tracked and provided to the protection departments for review? Perhaps dispatch centers need to have a procedure or process that specifically states "any manual intervention for a failed protection system must be reported to the appropriate protection system owner". Would this be considered a reasonable process approach to satisfy the requirements of auditors that the proper misoperation procedures are in place? It may be that the manual intervention requirement is better suited to the SPS, UFSL, UVLS or plant shutdown schemes since those schemes are more likely to allow operators time to react rather than having manual intervention a part of all types of system operations as it is in R1. Perhaps there are cases where an operator has taken action for a transmission line fault or issue that did not clear with primary/secondary/breaker failure or backup remote clearing but I am not aware of any of these cases. It may be better to clarify the types of practical manual interventions that are intended to be covered by the standard or remove it and place it in another standard mentioned above with clarification for the most practical cases where this should be tracked to simplify the misoperation process documents utilities would likely need to have in place. There is concern that an auditor will have the latitude to ask how you guarantee that you are aware and tracked all manual interventions for protection system failures that have taken place on your system in the last audit period and this could be difficult to prove.

Individual

Michelle D'Antuono

Ingleside Cogeneration LP

Yes

Ingleside Cogeneration ("ICLP") agrees that the drafting team has made a change for the better in the definition of "Misoperation". The prior version would perhaps lead to more technically-accurate identifications of slow-trip incidents, but made too many assumptions around our capability as a GO to conduct a performance evaluation of the Composite Protection System. We simply do not have the tools or training to determine if high-speed performance is necessary to prevent voltage or dynamic instability. In fact, we may not be aware that a slow trip took place if a secondary or back-up Protection System acts in a manner that masks the condition. We believe that improper operation of a nearby Protection System may be an indication that a slow trip occurred. From that point on, an investigation can ensue that has a chance of success – as our investigative capabilities are designed to address such events. In addition, the bright-line definition leaves no room for a violation assessment based upon a CEA's interpretation that the GO should have deployed sophisticated recorders (DME) or situational analysis tools to prepare for a Misoperation of the type.

Yes

ICLP agrees that there are situations where a relay owned by an external entity may trip a circuit breaker protecting an Element owned by another entity. The interrupting device and relay owners will need to coordinate their investigations in order to resolve the issue – and R2 now ensures that the process will be initiated.

Yes

ICLP found the examples provided in the Applications Guidelines to be helpful. In addition, there is a sufficient diversity in scope that will act as a useful reference in the event that we suspect a Misoperation of one of our Composite Protection Systems may have taken place.

No
Protection Systems regularly provide backup to the next Element. These backup features are not intended to operate under normal conditions and would not be included as part of an Element's Composite Protection System as we interpret it. The phrase "intended to operate" in 2.2 should be modified to account for operations of another Element's Composite Protection System that could operate as backup to the normal Composite Protection System for an extreme event.
Yes
Group
Tennessee Valley Authority
Dennis Chastain
Currently, there is not a clear indication of regulatory relief for an entity following a major natural disaster. When recovering from major events such as Hurricane Sandy, the first priority is to get lights on and rebuild the system. Because a large natural event produces an influx of unique system configurations that may not have been planned for by system planners or relay setters, analyzing and investigating all the operations and misoperations that occur takes months and is not the top priority for a utility that endures such an event. We respectfully request that the standard drafting committee add wording that states something similar to the following. In the event that the reporting entity is the victim of a weather related Category 4 or 5 event, 90 days are added to each of the required deadlines for misoperations caused by the weather related event.

Chris Mattson
Tacoma Power
Yes
No
In the Application Guidelines for Unnecessary Trip – Other Than Fault, the following paragraph seems out of place: "If a coordination error was at the remote terminal (i.e., set too fast), then it was an 'Unnecessary Trip,' category of Misoperation at the remote terminal." This paragraph seems to focus on a scenario involving a fault. There is concern that, for a very small number of BES interrupting device operations, an entity could fail to identify (formally document) whether or not its Protection System component(s) caused a Misoperation. If this were to occur, it would likely be associated with apparently benign operations, so the likelihood that a misoperation would have occurred is low. Generally, misoperations garner a lot of attention within an entity, so they are generally hard to miss. Even if no misoperation occurred, an entity could be fined up to the maximum allowable for a Medium VRF and Severe VSL for failing to identify that its Protection System component(s) did not cause a Misoperation. The possibility for fines of this magnitude could drive potentially costly measures to ensure zero defects, even though BES reliability would not be impacted by failing to formally identify that an entity's Protection System component(s) did not cause a Misoperation. Tacoma Power agrees with the spirit of Requirement R1 but believes that compliance and enforcement should be assessed with failure (or tardiness in) identifying that its Protection System component(s) caused a Misoperation. Basically, if an entity does not determine whether or not a Misoperation occurred, they would be implicitly (by default) saying that a

Misoperation did not occur. During an audit, if a BES interrupting device operation caused by a Protection System is uncovered for which no formal (explicit) identification according to Requirement R1 was made, the entity should only be found non-compliant (or penalized) if the CEA believes that a Misoperation did indeed occur. The purpose of the standard is to "identify and correct the causes of Misoperations of Protection Systems..." Perhaps this issue could be addressed in the Application Guidelines. Even though Requirement R1, Part 1.1, stipulates that "the BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate," to what extent will entities be required to prove that BES interrupting device operations were not caused by a Protection System operation? The potential risk of failing to satisfy Requirement R1 seems high enough that entities may take costly measures to ensure zero defects, out of an abundance of caution, by excessively reviewing BES interrupting device operations. This additional cost could be better served in other areas to support BES reliability. Perhaps this issue could be addressed in the Application Guidelines. In the Application Guidelines for Requirement R1, change "For the case,..." to "For the case in which a..." Furthermore, should this paragraph be included under the Requirement R2 portion of the Application Guidelines? In the Application Guidelines for Requirements R1 and R3, change "The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion" to something like "The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred." The concern is that the CEA could require an entity to leverage all available data before determining that a Misoperation did not occur. Tacoma Power appreciates the following paragraph in the Application Guidelines for Requirement R2: "A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the GO and TO functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1." In the Application Guidelines for Requirement R4, Example R4a, was the scheduling activity on 03/24/2014 considered to be the first investigative action pursuant to Requirement R4, or did the first investigative action pursuant to Requirement R4 occur on 4/10/2014? Regarding Requirements R1, R3, and R4, is the date when an entity identifies that its Protection System component(s) caused a Misoperation the date that they officially make the identification? As long as an entity is compliant with Requirement R1 or R3, as applicable, are they afforded some discretion as to the identification date? It seems like the timeline for Requirement R4 should be based on 120 calendar days of the BES interrupting device operation, for Misoperations identified pursuant to Requirement R1, or the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, for Misoperations identified pursuant to Requirement R3. As written now, those entities who quickly identify Misoperations will have compliance obligations under Requirement R4 sooner. On the other hand, an entity that delays officially identifying a Misoperation could be looking for causes ahead of time such that they effectively bypass Requirement R4. Perhaps this issue could be addressed in the Application Guidelines. The objective here is not to make the standard more complicated but to avoid misunderstanding that might surface during an audit. Similarly, regarding Requirement R4 and R5, is the date when an entity determines the cause(s) of a Misoperation the date that they officially make the determination? Perhaps this issue could be addressed in the Application Guidelines. Again, the objective here is not to make the standard more complicated but to avoid misunderstanding that might surface during an audit. In the Application Guidelines for Requirement R6, change "...were postponed due resource..." to "...were postponed due to resource..." If manual intervention in response to a Protection System failure to operate is required, this could imply that both the primary Composite Protection System and remote backup Composite Protection System(s) failed to operate, assuming that remote backup could be configured reliably to detect the fault under the pre-fault power system conditions. Would this condition automatically mean that multiple Composite Protection Systems, potentially at multiple locations (both primary and remote backup), misoperated? Perhaps this issue could be addressed in the Application Guidelines.

Although the term is discussed in the Application Guidelines, consider formally defining the term "interrupting device." In Requirement R3, should "BES interrupting device(s)" be "BES interrupting

device"? In Requirement R4, should "the cause" be "the cause(s)"? In Requirement R5, should "a cause" be "the cause" or "the cause(s)"? In the Rationale for R6, change "tivities" to "activities."

We generally agree with the changes to the proposed definition of Misoperation, but do not agree with the proposed addition of the term Composite Protection System. In our previous comments, we expressed our disagreement with the need to create a defined term "Composite Protection System". By definition, a Protection System is already a composite system whose components need to function collectively to protect an Element. The proposed term is therefore redundant. In the comment report, the SDT's response indicates that the reason for proposing the newly defined term, "Composite Protection System," is found in the Application Guidelines under the heading "Definitions.", and therefore no change was made. In the Application Guideline, the rationale provided for introducing this new term is that: [The Composite Protection System definition is based on the principle that an Element's multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element's total complement of protection should be considered while evaluating an operation.] We find this rationale insufficient to justify the introduction of the new term since by having the defined term "Misoperation" which covers any failure a Protection System to operate as intended for protection purposes would suffice to include the effect of multiple levels of protection (e.g. redundant systems). In other words, if a Protection System failed to operate as intended or operated unnecessarily, then regardless of the level of protection and which component caused the Protection System to operate, the action/inaction of the Protection System – Composite or otherwise, would constitute a Misoperation. We therefore continue to disagree with the proposed addition of this new term, and suggest that it be removed.

Yes
No
We do not agree with the part on Composite Protection System, for the reasons indicated under Q1, above.
As indicated in our previous comments, we disagreed with the omission of UVLS while UFLS is included. The SDT's response indicates that UVLS has not been included in the proposed standard's Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. We do not find this rationale sufficient to justify the inclusion of UFLS but exclusion of UVLS since both need to be assessed and treated under the same light. Note that the SAR for Project PRC-022-1 is being revised to include UFLS. We suggest the PRC-004 SDT to coordinate with the PRC-022 SDT to apply a consistent approach to addressing Misoperations of UFLS and UVLS.

Gul Khan
Oncor Electric Delivery LLC
Yes
Yes
No
Since the last Standard draft, the SDT has added a new example on page 29 of the Application Guideline which states "Example 7d: A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush following a maintenance outage. Only the high-side breaker opens since the low-side breaker had not yet been closed. Since closing the breaker put the transformer bank into service, this is a Misoperation." Although this scenario would be an undesired trip, without the low side breaker closed the transformer will not feed load. With that said, tripping of the high side will not compromise reliability of the BES although it is undesirable. Oncor has not seen a perfect relay that will respond ideally during the reenergization of a transformer with magnetizing current. For the reason just described, the possibility of tripping a transformer unnecessarily during energization (with no load connected) is preferable to desensitizing the protection further such that it might not operate when necessary.
Oncor initially balloted affirmative; however, based on the changes in the Application Guide, Oncor's ballot position has changed. Oncor's comments have been provided for the SDT's consideration (response to Question #3) Oncor requests the SDT please consider the additional comment below: In "R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation." The circumstances mentioned in 1.1 and 1.3 cause confusion when you do not have a protection system component cause the BES interrupting device operation in the event a BES device is operated by manual intervention. Oncor recommends that 1.3 be written to state: The BES interrupting device owner identified that its Protection System component(s) were designed to cause the BES interrupting device(s) operation. The request below is an outstanding request from Oncor's previous comment period: The Extenuating Circumstances process, as outlined on page 30 of the Application Guidelines, relies too heavily on a subjective review by Enforcement to determine whether penalties will be imposed. In alignment with the Reliability Assurance Initiative Oncor recommends the evaluation of an Extenuating Circumstance be initially reviewed by Compliance Operations in accordance with the system-wide and regional risk framework, an entity's inherent risk assessment and controls to ensure extenuating circumstances are not evaluated as a

"one size fits all" and findings are determined in accordance with RAI versus an automatic Enforcement path. Furthermore, Oncor recommends the Registered Entity be allowed to request a formal "state of extenuating circumstance" and coordinate an extension to the 120 day deadline with the Regional Entity.

PPL NERC Registered Affiliates

Brent Ingebrigtsen

No

These comments are submitted on behalf of the following PPL NERC Registered Affiliates: LG&E and KU Energy, LLC; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP. It is helpful that the Definitions section on p.3 of the standard now says that a Slow Trip classification applies only if the Protection System of another Element was made to operate, but the term "slower than required" should be revised for clarity to read, "slower than the setting specified in the test/calibration instructions." That is, a Slow Trip should be declared only if the timer is found to be mis-adjusted. Otherwise there's no way of knowing whether the device at fault was slow or simply failed to function. Uncertainty on this subject is increased by Example 4 on p.25 having been left in its previous (draft 3) wording, "A failure of a generator's Composite Protection System to operate as quickly as intended for an overexcitation condition is a Misoperation." This puts us back in the situation of having to decide if a relay acted in, say, ten cycles when five cycles was intended. Having to make such determinations ranges from being unduly burdensome to (for electromechanical relays) impossible, and was the principal reason for our having voted against draft 3 of the standard. It would be better still to state that Slow Trips apply only for TOs, because the issues of concern for this category of Misoperation (e.g. system instability, sequence of tripping) do not apply for generation plants. The description on p.25 of the standard of, "...owner(s) reviewing each Protection System operation," to determine whether or not, "the speed and outcome...met their objective," is not typical or appropriate for GOs, and they should not be required to add monitoring systems and design-level personnel to perform a no-value-added function.

No

See our comments above for Example #4. The Application Guidelines should clarify Misoperation analysis scope and purpose differences between TOs (preserve stability and enforce orderly isolation of circuits on a still-live system) and GOs (trip the unit).

We continue to disagree that stating whether or not a Misoperation occurred (per R1) and (under some circumstances) what the cause was (per R3) should be due within 120 days even though identifying the cause may take much longer or may even prove impossible (per R4). That is, the SDT apparently prefers where uncertainty exists to classify events as Misoperations and retract the declaration if later findings show otherwise, while we prefer the present approach of not assuming a Misoperation if evidence to support such a conclusion is lacking. The difficulty foreseen regarding the SDT's approach is that dated evidence is required in M1 that an entity, "identified the Misoperation... within the allotted time period," and in M3 that it, "identified whether its protection System component(s) caused a Misoperation within the allotted time period," while all we may be able to say after 120 days is that we don't know why an event happened. R4 describes what to do in such a situation, but it does not retract the obligation to provide impossible-to-obtain evidence satisfying M1 and M3.

The composite protection definition involving backup to remote protection does not completely make sense when coupled with the "slow trip" definition. The "total compliment" description in the

Composite Protection System definition indicates that remote backup protection is included in the "total compliment". If the remote backup protection operates instead of the local, primary protection for an element, the "total compliment" collectively functioned to protect the element. Calling this situation a "misoperation of the Composite Protection System" is contradictory to stating that the total compliment collectively functioned as intended. Also, how does this make sense for the protection systems at generating facilities? What does 'backup protection provided by a remote protection system' mean for generating facilities? The slow trip definitions are still confusing. Are there multiple Composite Protection Systems that need to be considered when determining if a trip is a slow trip? The "its operating time" references are indefinite in the definition. Consider making the slow trip definition either one of the following or a combination of the following OR statements: "a composite protection system operation that is slower than required or slower than designed or slower than desired or slower than the intended design". There is a fundamental flaw in the definition of misoperation. A misoperation is recognizable any time any part of a protection system design fails to operate as intended by the design, regardless of the existence of a redundant, remote, or back up protection scheme. The fact that something did not operate properly should indicate that a misoperation has occurred. The addition of the adjective "reportable" simply classifies the types of misoperations that are to be reported. The comment above does not address a requirement governing the actual reporting.

No

There is a problem with R2.2. One entity does not necessarily know whether or not another entities' Element has an abnormal condition. This notification of other entities for an explained operation of my interrupting device and my protection system should not be required. It is acknowledged that this was an attempt to eliminate the gap described above, but it is contrary to the Composite Protection System collectively functioning as intended to protect an element.

Yes

Application Guidelines: Overall, this document is very good in addressing the process.

a) The multiple timing process periods are an added burden and still unclear in the standard. However, the application notes do provide some guidance { R3}; b) The wording in R3 of the Process Flow Chart on the last page of the draft standard should match that of the requirement R6 (change "greater" to "later" in the chart). There is no evidence that entities have not been doing due diligence in investigating and correcting misoperations, therefore, the addition of the various timelines serve only to generate additional paperwork.

Individual

Patrick Farrell

Southern California Edison Company

No

SCE disagrees with the explanation of and rationale for the "Composite Protection System" for the following reasons: 1. If an interrupting device is tripped due to misoperation of another device not owned by the owner of the interrupting device, then the owner of the interrupting device will be unaware of this issue until the formal notification of the event to all the owners of the composite protection system is made. One of the reasons for the misoperation of the other device could be a failure to trip. 2. In the case above, the owner of the interrupting device would not be able to validate Requirement 1.3: "The BES interrupting device owner identified that its Protection System Component caused the BES interrupting device(s) operation." Therefore the owner would not be able to and may not be required to notify other entities owning the composite protection system. The root cause would either not be analyzed or the analysis would be delayed.

No

In the case where a non-performing protection system has caused a tripping device to operate, the non-tripping device could be ignored, resulting in the problem not being mitigated and eventually posing a greater risk to the composite protection system. Assuming that the owner of the system notifies the other entities owning the composite protection system, the time window of 120 days to notify would be too long in order to promote effective and efficient resolution of the problem. Notification should be within a week of the occurrence of event in order to allow the other impacted entities to review, analyze, and communicate with each other in order to perform a root cause analysis and determine a corrective action plan.

Yes
With respect to Requirement 5 on the Corrective Action Plan requirements, we are concerned that an entity's declaration that no corrective action will be taken without supporting evidence, could leave a system problem unresolved. The decision that a Corrective Action Plan is unnecessary, or the development of a Corrective Action Plan, are both complex actions that should be done jointly by respective owners of the composite protection system in a consensus-building manner. The failure to reach consensus on Correction Action Plans can leave the problem unresolved.
Group
ACES Standards Collaborators
Jason Marshall
Yes
We agree with the changes.
No
(1) We continue to believe that this standard has been overly complicated by including administrative elements such as reporting information to third parties. The reporting does little to nothing to support reliability. The real value is in analyzing the Protection System operations and correcting any errors. Is there any indication that registered entities are not communicating to co-owners of the Composite Protection System that a potential misoperation occurred? If not, (and we have seen no such evidence) why does this administrative requirement that clearly meets multiple P81 criteria (administrative and reporting) rise to level of needing to be enforced with financial penalties? Barring such evidence, we simply do not see how we can support such a requirement. Clearly, the application guidelines spell out what is necessary. We recommend that the drafting team perform a study to determine if there is a true reliability need for communicating with co-owners of Composite Protection Systems. If the drafting team cannot provide data or statistics indicating a gap in reliability, then we recommend striking the administrative tasks from the requirement. (2) The existing standard was fairly simple and coupled with the new definition of Misoperation largely addresses the scope of the SAR. All that is really is needed for this standard is a requirement to evaluate Protection System operations, identify if the Protection System operation was a misoperation and then to develop a Corrective Action Plan to prevent future misoperations. Six requirements create more complication than what is necessary.
Yes
(1) We agree that the Application Guidelines include improved examples and did clarify the intent of the drafting team. Furthermore, we support the intent in the application guidelines. However, in some cases, the intent of the drafting team and the language of the requirements simply do not align. For example, language was inserted into the Requirement R3 discussion on page 31 to clarify that a registered entity is "to classify an operation as Misoperation if the available information leads to that conclusion" and "allows an entity to classify an operation as a Misoperation if an entity is not sure." Neither Requirement R3 nor Requirement R1 language provide this flexibility and is thus inconsistent with the language in the application guidelines. R1 and R3 are both very clear that the responsible entity has 120 days (for R3 or the later of 60 days after notification) to identify whether its Protection System operations were a Misoperation. This language is definitive. We do not see how this language allows an entity to classify an operation as Misoperation if it is not sure. Again, the requirement language states clearly that the responsible entity has to identify whether its Protection System components result in a Misoperation. There is no room in the language of the requirement for uncertainty. This further leads to a problem with R4 because R4 would require R1 and R3 to be violated since both require determination of whether a Misoperation occurred and R4 identifies a situation that can only occur after a violation of R1 or R3. Even the last Severe VSL for both R1 and R3 supports our argument. Failure to identify a whether or not a Protection System operation is a Misoperation is a Severe VSL. We suggest the drafting further refine Requirements R1, R3, and R4 collectively to match the intent demonstrated in the application guidelines.
(1) Example 3 on page 25 should be updated. The first sentence is inconsistent with the proposed definition of Misoperation. A failure of a line's Composite Protection System to operate as quickly as intended is only a Misoperation if another Element's Composite Protection System operation. Please append the following clause to the first sentence: "if another Element's Composite Protection System operated." (2) The VSLs for R3 rely only on the 120 day portion of the language in the requirement.

They do not include the “later of” language relying on 60 days if more than 60 days has passed since the original Protection System Operation. We suggest the VSLs should be updated accordingly reflect the requirement in totality. (3) To avoid requiring a registered entity from providing all BES interrupting device operations, the Compliance Assessment Approach for R1 in the RSAW needs to be modified to be consistent with the requirement and the evidence request section. The auditor should only sample BES interrupting device operations that meet the criteria Requirement R1 Part 1.1 through 1.3 and is provided as evidence in the evidence requested section. Please add “that meet criteria Requirement R1 Part 1.1 through 1.3” after “interrupting device operations” in the first and second rows of the RSAW’s Compliance Assessment Approach for R1. (4) Please update the RSAW’s Note to Auditor section to review the Application Guidelines section for Requirement R2 for small entities as well as vertically integrated utilities. The Application Guidelines make clear that small entities with a single protection engineer are not expected to provide notification requirements between the GO, TO and DP because they would already be aware since they evaluate all Protection System operations including transmission and generation. (5) Thank you for the opportunity to comment.

Individual

Mahmood Safi

Omaha Public Power District

Yes

Yes

Yes

The Omaha Public Power District (OPPD) is still concern with the 60-day requirement to develop a Corrective Action Plan (CAP) for an identified misoperation. This timing is not practical, and depending on the time of the year, budget cycle, scope of work, 60 days is not sufficient to obtain funding for CAPs. Also, the first bullet under R5 would require evaluation of the applicability of all CAPs to all BES locations which, depending on the CAP, could be overly burdensome. As worded, a wiring or setting error would require that all wiring and all settings at all BES locations be checked. The evaluation should be limited to CAPs related to scheme logic or relay design deficiencies. OPPD proposes that 180 days (6 months) is a sufficient timeframe to practically develop a CAP addressing both operational and budgetary coordination.

Florida Municipal Power Agency

Carol Chinn

Yes

FMPA’s primary concern with the previous version of this definition centered around the ability to accurately classify the events and show evidence as appropriate. FMPA agrees the revised versions of “Slow Trip – During Fault” and “Slow Trip – Other than Fault” are more specific and thus easier to consistently apply. However, we do not believe the revised versions are going to result in events being classified the way the SDT desires. We are voting yes for this item because our primary concern is addressed. The SDT should reconsider these revisions, though, in light of the following – the revised versions have nothing to do with the designed, set, or normal operating time as specified by the relay manufacturer/settings. We believe the intent of these two categorizations is to identify relay misoperations for which a relay, interrupting device, or relay setting which was intended to operate at a particular speed, instead operated at a slower speed / in a longer time. Just because a relay from a different Element’s Composite Protection System operates does not necessarily mean this event was undesired, unnecessary, or unintended. As stated in our last comments we refer back to the core issue that the protection system performance should be measured against a company’s relay setting philosophy. We also note that the Application Guide still refers to this event in “Example 3” as “A failure of a line’s Composite Protection System to operate as quickly as intended...”. The application guide also still includes language regarding “slower than previously identified as being necessary to prevent voltage or dynamic instability”.

1. FMPA does not feel our previous comment regarding notification to affected entities was properly understood. This comment was offered to R2 in the previous round of comments. We understand the way the document is intended to flow, but our main concern is the relay event records are preserved by all entities indefinitely – for many Utilities a special trip must be made to the substation to download the event records. What prevents the Owner of a BES interrupting device that operated from taking the full 120 days to conduct their review without saying anything to the other affected owners, only to find upon request of further evaluation that those entities no longer have the relay event records necessary for the evaluation? At minimum the entity Owning the BES interrupting device should advise the other affected Protection System owners that the investigation is under way at the earliest time they determine those entities are affected, to allow the entities to be prepared with data should they be notified in accord with R2. FMPA does not see how the gap regarding a case where an interrupting device did not operate has been addressed. Reading R1 and R2 again, it still appears that all triggers for activity are based on interrupting device operation, and we see no mention of a case where an interrupting device did not operate. While we can see that requiring actions in the standard based on relay targets, for example, would be challenging to enforce, we would have expected at least a statement, something to the effect of “Or if the entity otherwise becomes aware that a Composite Protection System it owns operated without an associated interrupting device action”.

Yes

FMPA appreciates the changes to the Application Guide and does feel the additional specificity was beneficial. We do, however, feel some sections are inconsistent with the revised Requirements and definitions in the standard. See our comments on the definition of “Misoperation” above. There may be some additional changes that are needed to the Application Guide to ensure it fully supports the revised Standard.

2. FMPA does not feel our previous comment regarding the inherent problems with the concept of comparing Protection System performance to a single set of generic categories as tied to compliance was addressed. We feel many of the issues and challenges in this revised standard would easily be addressed by allowing entities to compare the performance of their relays with their Protection System Design Philosophy. In the absence of a mandatory electric reliability standard, this is how Utilities would determine “mis-operations” – did the Protection System/component perform according to the intended design? 3. In the Facilities section – what is the reason PRC-004-3 cannot use the same description of “Protection System” as PRC-005-2? Would these two standards not inherently be designed to cover the very same Facilities? 4. FMPA accepts the SDT’s revised definition of Composite Protection system which no longer singles out step-distance/intentional remote backup schemes. However, we in general do not agree with the use of Composite Protection System in the standard. This term is being used to reduce what is considered a “Misoperation”. While FMPA supports more relaxed Requirements for mitigating/remediating a Misoperation when another part of the Composite Protection System successfully prevents any negative impact to the BES, a Misoperation is still a Misoperation. If the goal is to keep statistics on how we are doing as an industry, we need to tie those statistics to basic characteristics that are less subject to interpretation and change. Misoperation should still be tied to the failure of equipment. The fact that a different part of the Composite system properly functioned is additional information. Again, we support the idea that a properly designed Composite Protection system should mean an entity does not necessarily need to make changes, but the Misoperation should still be tracked. 5. What is the reason the defined Glossary term “Fault” has been replaced with “fault” throughout the document?

Cleco

Yes

Yes

Yes

Cleco will continue to vote "Negative" as long as the SDT continues to support in R1 and R2 the deadline of 120 days to determine if an operation is a misoperation. There should be exceptions built into the standard when there are circumstances that create numerous outages such as ice storms or hurricanes. For example; In FAC-003, a footnote allows for circumstances that are beyond the control of the Registered Entity. Also, the standard should apply to all protection systems and the SDT should not exclude SPS or RAS.

Individual

Karin Schweitzer

Texas Reliability Entity

Yes

No comments

No comments.

Texas Reliability Entity is voting Negative on this standard due to the concern that the reliable operation of the BES is not ensured by this standard (as written) because the allowable time periods for investigating and correcting are too long and investigative actions are not required before R4. Please consider the following comments and recommendations. 1) Recommend changing the allowable time for identification of a Misoperation to 60 days for R1 and R2. The 120 identification period (in R1 and R2) coupled with the additional allowance in R3 of 60 days means a Misoperation may not be determined up to 179 days after the interrupting device operation. The risk to the BES is still undetermined during this time period and actions should be taken to identify if a Misoperation occurred more expeditiously. 2) Suggest revising language in Requirements 1 and 3 to include investigative actions: [each entity] "shall perform investigative actions to identify whether its Protection System component(s) caused a Misoperation" The proposed language would clarify the expectation that investigations are on-going prior to R4. As written, the standard conceivably allows for a period of up to 120 days before investigative actions are performed. Although the application guidelines for R4 states that an entity "is expected to use due diligence in taking investigative action(s) to determine the cause(s)..." and that R4 "provides the entity a mechanism to continue its investigative work..." the standard does not require an entity to do investigative work before R4. 3) Recommend changing the performance of investigative actions to at least once every calendar quarter in R4. If a Misoperation is confirmed (through steps taken in R1 – R3) then the risk to the BES continues until such time as a cause is found and can be corrected. The application guidelines state that periodic investigative action minimizes compliance burden and focuses the entity's efforts on determining cause, Texas Reliability Entity asserts that the time period of at least one investigative action every two full calendar quarters (180 days) is not adequate to protect reliability. 4) In order for R4 to be measurable there should be a stated time horizon (per NERC's Acceptance of a Reliability Standard, Item 7, first bullet). The investigation may end either by identification of the cause of the Misoperation or a declaration that no cause was found. Suggest adding requirement to either determine the cause or make the no cause found declaration within 365 days after interrupting device operation. 5) The investigation and CAP timelines (as written) exceed 12 months so the evidence retention period of 12 months is insufficient. Evidence of investigative actions may be disposed of before corrective action is completed; meaning that a full record of an interrupting device operation may not be available for review by the CEA. In addition, the 12 month evidence retention schedules for R5 and R6 mean that an entity may not have any evidence to prove compliance to a CEA during an audit (which can be several years after a Misoperation).

Individual

Bill Temple

Northeast Utilities

No

The part of the Composite Protection System definition "Backup protection provided to a remote protection is included" is not clear because it switches focus from the local protected element to a remote protection system. We suggest revising this part to say "Backup protection of the element provided by a remote protection by design is included."

Yes

Yes

The examples provided in the application guideline should be clarified when talking about unnecessary trips. It should be made clear that if any portion of a Composite Protection System designed to protect one Element operates for a problem on another Element is considered a Misoperation.

The Unnecessary Trip definitions as written are unclear and seem to indicate that the total compliment of the Composite Protection System. Suggest the following clarifications; Unnecessary Trip – During Fault – An unnecessary operation of any Protection System of a Composite Protection System for a Fault condition on another Element. Unnecessary Trip – Other Than Fault – An unnecessary operation of any Protection System of a Composite Protection System for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

Individual

John Brockhan

CenterPoint Energy

No

CenterPoint Energy recommends adding wording to the definition to address the direct interrelationships between Misoperation categories, especially the "Slow Trip – During Fault" and the "Unnecessary Trip – During Fault" categories. For these two categories, an operation of an unfaulted Element's Composite Protection System occurs. This interrelationship is detailed in the Application Guidelines which states the following for the "Slow Trip – During Fault" category: "In analyzing the Protection System for Misoperation, the entity must also consider the "Unnecessary Trip – During Fault" category to determine if an "unnecessary trip" applies to the Protection System operation of an Element other than the faulted Element. If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip – During Fault" category of Misoperation at the local terminal." In addition, the Application Guidelines states the following for the Unnecessary Trip – During Fault: "If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal." CenterPoint Energy suggests adding clarifying wording at the end of the "Slow Trip – During Fault" and the "Unnecessary Trip – During Fault" categories: 3. Slow Trip – During Fault – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System, providing it is not determined to be an Unnecessary Trip – During Fault. 5. Unnecessary Trip – During Fault – An unnecessary Composite Protection System operation for a Fault condition on another Element, providing it is not determined to be a Slow Trip – During Fault.

CenterPoint Energy recommends deleting the proposed Requirement R2.2. Based upon the changes made to the Composite Protection System definition and the proposed wording of Requirement R2.1, CenterPoint Energy believes the proposed wording of Requirement R2.2 related to backup protection is unnecessary. The Composite Protection System definition now states that "Backup protection provided to a remote Protection System is included." This, along with Requirement R2.1 stating "notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances" and Requirement R2.1.2 stating "The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation", provides for the notification intended by Requirement R2.2.

No

CenterPoint Energy recommends adding additional examples to help provide consistent reporting of Misoperations. Examples for Breaker failure events (stuck breaker) and additional examples of the more common "Unnecessary Trip – During Fault" category would be helpful. Additional examples would help clarify the interrelationship between the "Slow Trip – During Fault" and the "Unnecessary Trip – During Fault" categories. The following comments and additional examples are provided for consideration: Example 1e: The Composite Protection System for a bus does not operate during a bus fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one "Failure to Trip – During

Fault" Misoperation of the bus Composite Protection System. Example 3b: A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical fault clearing time for a line fault in conjunction with a breaker failure (stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element's Composite Protection System. If a generating unit's Composite Protection System operates due to instability caused by failure of a breaker's Composite Protection System, it is not an "Unnecessary Trip – During Fault" Misoperation of the generating unit's Composite Protection System. This event would be a "Slow Trip – During Fault" Misoperation of the breaker's Composite Protection System. Example 3c: A line connected to a generation interconnection station is protected with two independent high-speed pilot systems due to dynamic stability reasons. The Composite Protection Scheme for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a fault on this line, the two pilot systems fail to operate; and, the time-overcurrent scheme operates clearing the fault with no generating units or other Elements tripping (no over-trips). This event is not a Misoperation. Example 3d: A line connected to a switching station is protected with two independent high-speed pilot systems for reasons other than voltage or dynamic stability (e.g., short line length or to reduce backup clearing times for service reliability). The Composite Protection Scheme for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. The step distance and time-overcurrent schemes and Protection Systems of other line terminals are intentionally not coordinated with the step distance and time-overcurrent schemes of this line because high-speed tripping is expected on the line with the two independent high-speed pilot systems. During a fault on the line with the two independent high-speed pilot systems, the two pilot systems fail to operate; however, the time-overcurrent scheme operates clearing the fault however, another line in the system trips (over-trips). The trip of the other line in the system is not an "Unnecessary Trip – During Fault" Misoperation as miscoordination was expected for the conditions that occurred. The event on the line with the two pilot systems is a "Slow Trip – During Fault" Misoperation, although the analysis and Corrective Action Plan would address the two pilot schemes failure to trip. Example 5b: An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared fault on a different line is a Misoperation. The fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip of the line protection; therefore, the non-faulted line Protection System operation is an "Unnecessary Trip – During Fault" Misoperation. Example 5c: A line connected to a switching station is protected with two independent high-speed pilot systems for reasons other than voltage or dynamic stability (e.g., short line length or to reduce backup clearing times for service reliability). The Composite Protection Scheme also includes step distance and time-overcurrent schemes in addition to the two pilot systems. The step distance and time-overcurrent schemes and Protection Systems of other line terminals are intentionally not coordinated with the step distance and time-overcurrent schemes of this line because high-speed tripping is expected on the line with two independent high-speed pilot systems. During a fault on the line with two independent high-speed pilot systems, the two pilot systems fail to operate; however, the time-overcurrent scheme operates clearing the fault and, in conjunction, another line in the system trips (over-trips). The trip of the other line is not an "Unnecessary Trip – During Fault" Misoperation as miscoordination was expected for the conditions that occurred. The event on the line with the two pilot systems is a "Slow Trip – During Fault" Misoperation, although the analysis and Corrective Action Plan would address the schemes failure to trip. Additionally, in the Application Guidelines, it appears the following paragraph at the end of the "Unnecessary Trip – Other Than Fault" examples is misplaced and could be deleted: "If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip," category of Misoperation at the remote terminal." CenterPoint Energy recommends adding the following wording as the last two paragraphs at the end of the examples for "Unnecessary Trip – During Fault" examples to parallel the wording for the "Slow Trip – During Fault" category: In analyzing the Protection System for Misoperation, the entity must also consider the "Slow Trip – During Fault" category to determine if an "slow trip" applies to the Protection System operation of an Element other than the faulted Element. If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

<p>(a) In the Application Guidelines, CenterPoint Energy recommends changes to account for high-speed tripping for internal transformer faults by other types of protection systems (e.g., sudden pressure) that are not specifically included in the proposed definition of Composite Protection System. The following additional wording at the end of Examples 1a and 1b is suggested: Example 1a: A failure of a transformer's Composite Protection System to operate for a transformer fault is a Misoperation unless other protection schemes (e.g., sudden pressure) operated. Example 1b: A failure of a "primary" transformer relay (or any other component) to operate for a transformer fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System or other protection schemes (e.g., sudden pressure) operated. (b) The proposed Requirement R4 wording currently includes the following: "...shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes...". CenterPoint Energy understands this wording is to provide a mechanism to continue investigative work to determine the cause of a Misoperation when the cause cannot be determined during the allotted time periods in Requirements R1 or R3. CenterPoint Energy recommends additional wording to allow the investigation to be completed in the quarter that the misoperation occurs ("partial quarter") for cases where the investigation and tests, including any needed outages&lt; can be completed in the partial quarter and suggests the following wording: "...shall perform investigative action(s) to determine the cause of the Misoperation at least once during the partial quarter when the misoperation occurs or every two full calendar quarters after the Misoperation was first identified, until one of the following completes...".</p>

Tri-State remains concerned with situations where individual components are jointly owned. The SDT's response "While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results" appears to require all entities to report the operation giving double jeopardy to each misoperation on jointly-owned Composite Protection System components, unless a contract speaks to the designated "Compliance Entity". Typically compliance contracts take some time to come to fruition. Is it the drafting team's intent that misoperations be reported by multiple entities in this situation until a contract is finalized?
Yes
In response to Tri-State's previous concern to the review and reporting of operations of jointly-owned Composite Protection System components as opposed to multiple entities owning separate components. The SDT stated "While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results" appears to require all entities to report the operation giving double jeopardy to each misoperation on jointly-owned Composite Protection System components, unless a contract speaks to the designated "Compliance Entity". Typically compliance contracts take some time to come to fruition. Is it the drafting team's intent that misoperations be reported by multiple entities in this situation until a contract is finalized?

Yes

Yes

Formatting in recent standards has tended toward using bullets in lieu of subparts. The drafting team is encouraged to follow this practice in Requirement R2. Note that there are bullets in Requirement R5. Delete the 2nd 'when' in the 6th line (clean copy) of the Rationale Box for Requirement R2.

No

We note that the drafting team included several additional examples in this version of the standard and we certainly appreciate that. We would however suggest that the following examples would provide further clarification: 1) an example which illustrates that a properly coordinated breaker failure operation does not equate to a slow-trip operation, 2) a backup protection example to provide clarity on how Requirement 2, Part 2.2 would be applied and 3) an example of a breaker failure Misoperation. We noted that the drafting team reverted to the non-capitalized 'fault' throughout most of the Application Guidelines. Yet in the listing of items that characterize a Misoperation on Page 23 (clean copy), the drafting team maintained the capitalization from the previous draft. Can the drafting team provided clarification on the proper use of the term? In the 1st line under Unnecessary Trip – Other Than Fault on Page 26 (clean copy), delete the comma between 'to' and 'power'. Hyphenate 'out-of-service' in the paragraph following Example 7a on Page 27 (clean copy). Hyphenate 'high-side' in the 3rd line of Example 7b on Page 27 (clean copy). Replace 'voltampere-reactive' with 'VAR' in the 3rd line of the paragraph under Non-Protective Functions on Page 27 (clean copy). We appreciate the explanation provided in the Extenuating Circumstances section. However, we believe that the standard should go beyond what is provided in the Sanction Guidelines. Why should an entity be held in violation in the event of multiple operations on its system during a natural disaster? There may not be an actual Misoperation but because an entity simply doesn't meet the purely administrative requirement of getting the evaluation done within a prescribed number of days, a violation has occurred. Recognition should be given in the standard for such events which withhold declaration of any potential violation until the entity has had sufficient time to 1) deal with the crisis at hand of rebuilding its system and 2) then performing the evaluations to determine if Misoperations occurred. This flies in the face of being innocent until proven guilty. In the 2nd paragraph below Example R1a, insert 'where a' such that the 1st line reads: 'For the case, where a BES interrupting device...' In the 4th paragraph below Example R1a, insert 'the' in the 7th line between 'if' and 'entity'. In the 1st paragraph below Requirement R3, break the two sentences in the 7th-9th lines (clean copy) into two separate sentences such that it reads: 'The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation and continue its investigation under Requirement R4.' Bracket the 's' in 'CAP(s)' in the 4th line of the 2nd paragraph below Requirement R5 on Page 33 (clean copy). Insert a 'to' between 'due' and 'resource' in the 4th line of the 2nd paragraph of Example R6c. Regardless of the outcome of the capitalization of 'fault', it should be capitalized in the 1st sentence of Example R6d just like the 1st words of all the other examples given.

UFLS is mentioned in 4.2.2 of the Applicability Section but there is no mention of UVLS. Should it be included here? We would suggest that the drafting team consider incorporating the evaluation of the CAP's applicability mentioned in the first bullet under Requirement R5 into the CAP itself. This falls in line with the second bullet in the Requirement which is included in the CAP and gets the burden of making the evaluation concurrently with the development of the CAP out of the way. The evaluation could delay the completion of the CAP. References to days should be calendar days and they should be hyphenated; for example 30-, 45-, 60-, or 120-calendar days. Similarly, references to months should be treated in the same manner; for example 12-calendar months.

Individual

Cheryl Moseley

Electric Reliability Council of Texas, Inc.

Yes

Yes

ERCOT is concerned about Requirement 1 that allows entities 120 days to identify a misoperation. ERCOT believes this might negatively impact the reliability of the grid. Currently, entities have the responsibility to analyze disturbances to identify misoperations. A misoperation could indicate a greater threat to reliability and that threat could exist, unknown, for several months while entities make determinations if operations are truly a misoperation. The responsible entity under the new Standard will track misoperations and develop Corrective Action Plans (CAPs). There is no responsibility for the entity to share that information with Reliability Coordinators who have the responsibility for the wide area view of their Reliability Coordinator area. ERCOT is also concerned that while the responsible entity may develop CAPs, there is no responsibility of coordination of the CAP with other potentially affected entities. ERCOT is therefore recommending the following: R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 24 hours, identify whether its Protection System component(s) caused a Misoperation on an element that is part of an Interconnection Reliability Operating Limit under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 2 business days, identify whether its Protection System component(s) caused a Misoperation on an element at 200 kV or more under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 2.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 2.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 2.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. R3. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 5 business days, identify whether its Protection System component(s) caused a Misoperation on an element that is a BES element under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning] 3.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and 3.2 The BES interrupting device owner owns all or part of the Composite Protection System; and 3.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation. R7. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide the CAP developed in R5, to the Reliability Coordinator with the expected date of completion, how the Composite Protection System will operate until the CAP is completed and detailed information of how the entity will coordinate the CAP with other affected entities if applicable.

BPA believes that there is one other gap that has not been identified. This is the case where a TO, GO, or DP owns a BES interrupting device that operates, but does not own any of the Composite Protection System. This is a real scenario. In this situation, the owner of the BES interrupting device is not subject to R1 because R1.2 is not true, i.e. the owner of the BES interrupting device does not own all or part of the Composite Protection System. Likewise, the owner of the BES interrupting device is not subject to R2 because R2.1.1 is not true, i.e. the owner of the BES interrupting device does not share ownership of the Composite Protection System -- they don't have any ownership of the Composite Protection System. With the owner of the BES interrupting device not subject to R1 or

R2, the operation of the BES interrupting device would not be investigated. BPA suggests that this problem could be remedied with a slight change in language to R2.1.1 as follows: "The BES interrupting device owner does not own any of the Composite Protection System or shares the Composite Protection System ownership with any other owner." This change would require an owner of a BES interrupting device that does not own any of the Composite Protection System to provide notification of the operation to the owners of the Composite Protection System within 120 days per R2.1 so that they could then investigate the operation.

Group

Operational Compliance

Dianne Gordon

No

A. The Application Guidelines provide some clarity on the difference between "Slow Trip - During Fault" and "Unnecessary Trip - During Fault". However, these definitions may still not be entirely clear. B. Quoting Requirement R1...p.31 of Application Guidelines "When Elements are isolated from the BES and undergoing maintenance.....not subject to the standard....provided they do not result in the operation of...part of the BES." This statement and Example 6e (#6 of Misoperation definition), p.28 (at first glance anyways) may be at odds.

No

Generally do not like the phrase "composite", would prefer that Protection System just have a solid definition. I appreciate that is the dilemma here and my specific suggestion be to delete the word composite throughout.

No

The way the M2 is written is overly prescriptive and limiting on what might be acceptable way to show the coordination between entities. The measure seems to written like a requirements. Prefer the previous language.

Yes

still have trouble with how the word composite is being used, but do agree that the guidelines provide clarity on the drafting teams intent, unsure the compliance impact on the requirements

Generally feel that the requirements should be the sole place where the actual compliance requirements appear. Lot of information in measures, application guidelines, definitional changes that are not technically requirements but may be treated as such depending upon the audience.

Individual

Michelle Clements

Wolverine Power Supply Cooperative, Inc.

Yes

Yes

Yes

Wolverine's position is that the PRC-005 standard sufficiently covers the maintenance and testing requirements for protection systems. Because of this maintenance performed, it is not necessary to perform a detailed engineering analysis of every BES protection system operation. Wolverine's position is to only perform an engineering review of protection system operations if there is an apparent misoperation, for example, an over reach condition, failure to trip, etc. These are easily identified by transmission operators if only the correct facility cleared. To use a protection system operation to verify if a primary and backup protection system work properly seems to conflict with the requirement in PRC-005, which is written to ensure protection systems are maintained so they work properly.

# Consideration of Comments

## Project 2010-05.1 Protection System (Misoperations)

The Project 2010-05.1 standard drafting team (“SDT” or “drafting team”) thanks all commenters who submitted comments on the draft 5 of PRC-004-3 Reliability Standard. This draft Reliability Standard was posted for a 45-day public comment period from June 20, 2014 through July 9, 2014. Stakeholders were asked to provide feedback on the draft Reliability Standard and associated documents through a special electronic comment form. There were 47 sets of comments, including comments from approximately 136 different people from approximately 101 companies representing all 10 industry segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the NERC Standard’s [project page](#).

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Director of Standards, Valerie Agnew, at 404-446-2566 or at [valerie.agnew@nerc.net](mailto:valerie.agnew@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

### Summary of Changes

The drafting team determined certain non-substantive changes should be made in response to comments. The summary below provides an overview of the clarifications made to the draft PRC-004-3 Reliability Standard.

### Definitions

The second sentence of the definition of “Composite Protection System” was clarified by changing the wording from an “inclusionary” to an “exclusionary” statement.

“The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element’s Protection System(s) is excluded.”

The drafting team contends that this change is non-substantive because it is a clarifying rewording of the intent of the definition that was requested by commenters. The phrase for backup protection provided “to a remote Protection System” - “is included” is better described “by a different Element’s Protection System” - “is excluded”. Backup protection that is a part of the Protection System under study is “included.” however, it is not intended that the “backup protection provided by a different

<sup>1</sup> The appeals process is in the Standard Processes Manual: [http://www.nerc.com/comm/SC/Documents/Appendix\\_3A\\_StandardsProcessesManual.pdf](http://www.nerc.com/comm/SC/Documents/Appendix_3A_StandardsProcessesManual.pdf)

Element's Protection System(s) to be" included. If this were the case, by definition, there would be very few identified Misoperations.

## Requirements

### *Requirement R1*

Requirement R1 was clarified based on comments. The drafting team moved the clause "under the following circumstances" (referring to Parts 1.1, 1.2, and 1.3) and added the clause with the clarifying reference to the Parts "under the circumstances in Parts 1.1 through 1.3" before the "shall" statement. The reason for moving the clause is based on comments noting that with the placement at the end of the requirement grammatically modified "Misoperation" and not the "BES interrupting device." The drafting team agreed that moving the text would grammatically modify "BES interrupting device" without changing the meaning of the Requirement.

Requirement R1, Part 1.3 was clarified based on a comment revealing an unintentional omission in the circumstances in which an entity is required to review a BES interrupting device operation. The Requirement has three conditions for which the applicable entities must initiate a review of its Protection System to identify whether its Protection System component(s) caused a Misoperation. Part 1.1 has two conditions:

1. A BES interrupting device operation caused by a Protection System; or
2. A BES interrupting device operation caused by "manual intervention" in response to a Protection System failure to operate.

The comment revealed that in Part 1.3 that there was no circumstance for "manual intervention" that is included in Part 1.1. This unintentionally means that all three Parts (i.e., 1.1-1.3) could not be properly satisfied for the "manual intervention" circumstance ("was true") in Part 1.1. Because of this, an applicable entity could reason that the "manual intervention" circumstance was not caused by an actual Protection System component per se. Since the BES interrupting device operation did not satisfy all the circumstances ("were true") of the three Parts, the entity could reasonably justify that the operation does not need to be reviewed because Part 1.3 would not be true. The drafting team did not intend for Part 1.3 to create this circumstance. The drafting team agreed that this circumstance omission technically created an unintended condition in Requirement R1 where it is obvious that Part 1.3 should have included the "manual intervention" circumstance. Therefore, the drafting team inserted the phrase "or was caused by manual intervention in response to its Protection System failure to operate" to accurately account for the "manual intervention" condition specified in Requirement R1, Part 1.1 to make the intention clear to industry.

### *Requirement R2*

Requirement R2, Part 2.1 received the same clarification to include "manual intervention" as Requirement R1, Part 1.3 based on comments. The intention is to notify other Protection System

owners when either the BES interrupting device operation is caused by a Composite Protection System or “by manual intervention in response to a Protection System failure to operate.”

Additionally, the drafting team inserted the term “BES” in Requirement R2, Part 2.2 before “Element” to clarify that backup protection was provided for a condition on another entity’s “BES Element” and not on another entity’s non-BES Element. This is consistent with the objectives listed in Section 5, Background of the draft PRC-004-3 Reliability Standard.

### ***Requirement R3***

No changes were made to Requirement R3.

### ***Requirement R4***

Requirement R4 was clarified by adding a parenthetical “(s)” to the second occurrence of “cause” for consistency with a previous occurrence in the Requirement.

### ***Requirements R5 and R6***

No changes were made to Requirements R5 and R6.

### ***Measures M1 through M6***

No changes were made to Measures M1 through M6.

### ***Compliance***

The clause “a minimum of” was added to the paragraphs pertaining to Requirements R1 through R6 to clarify that the evidence retention periods stated in the Compliance section are minimum retention periods. The drafting team made another clarification based on a comment about how the evidence retention period is applied to Requirements R1, R2, R3, and R4. To clarify that the minimum retention period applies to each Requirement, the drafting team added the clause “following the completion of each Requirement.” Last, the drafting team clarified that evidence from R1 through R4 must be retained with the Corrective Action Plan.

### ***Violation Risk Factors and Violation Severity Levels***

There were no changes to Violation Risk Factors. The drafting team deleted “or not” from each of the Requirement R1 Violation Severity Levels. Requirement R1 does not mandate that an entity make a determination of whether “or not” an operation is a Misoperation. The reliability activity in Requirement R1 is to “identify whether its Protection System component(s) caused a Misoperation.” The VSL could be construed as an expansion of the standard; therefore, the drafting team deleted “or not” based on a comment.

### ***Guidelines and Technical Basis***

The drafting team made grammatical corrections to text in the Rationale boxes associated with several Requirements. Rationale boxes will be moved to the end of the Guidelines upon adoption. The drafting team added a number of examples requested throughout comments. Also, the drafting team reconsidered the lowercase use of the term “fault” throughout the Guidelines and Technical Basis. The

team changed a number of instances back to the *Glossary of Terms Used in NERC Reliability Standards* capitalized term “Fault” for increased clarity. The use of the term throughout the Guidelines and Technical Basis does not change any meanings and is only intended to provide the reader a more specific understanding of the guidance. Some instances were not changed because they are lowercase (e.g., use of “fault” in the current definition of “Misoperation”).

Due to continued questions about the time periods in each of the Requirements, the drafting team consolidated text about time periods into its own section, “Requirement Time Periods.” This section explains what other sections already addressed in one concise location for all Requirements. Last, minor corrections were made to the flowchart text to more closely align with the text in the Requirements based on a comment.

### ***Implementation Plan***

The drafting team corrected the Implementation Plan to align the definition of “Misoperation,” category 2 and Applicability section concerning Facilities with the draft PRC-004-3 Reliability Standard. These revisions occurred in the previous posting and were not aligned with the text presented in the draft 5 of the PRC-004-3 Reliability Standard.

1. **Based on stakeholder input, the drafting team revised the proposed definition of “Misoperation.” Concerning the two categories of “Slow Trip.” The drafting team also clarified the proposed definition of “Composite Protection System.” Do you agree the revisions provided clarity? If not, please provide specific suggestions for improvement..... 14**

2. **Based on stakeholder input, the drafting team revised Requirement R2 to clarify responsibilities when local protection is responsible for the interrupting device operation and when backup protection is responsible. This also addresses the notifications that must occur to eliminate a gap in the previous draft. The gap was a condition where an entity’s BES interrupting device did not operate because of a failed Protection System; therefore, would not have been applicable to the standard. Do you agree that the gap has been eliminated with the change to Requirement R2? If not, please provide specific suggestions for improvement..... 30**

3. **The drafting team modified the Application Guidelines to improve examples and clarify the team’s intent on various topics. Do you agree the Application Guidelines provide sufficient examples and clarity? If not, please provide specific suggestions for improvement..... 44**

4. **If you have any other comments on this Standard that were not provided in response to the previous questions, please provide them here:..... 69**

**The Industry Segments are:**

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities

If you support the comments submitted by another entity and would like to indicate you agree with their comments, please select "agree" below and enter the entity's name in the comment section (please provide the name of the organization, trade association, group, or committee, rather than the name of the individual submitter).

**Summary Consideration:** The drafting team appreciates the entities below supporting the comments of others. Having single sets of comments with documented support greatly improves the efficiency of the drafting team in responding to comments. This format also ensures the drafting team has a clearer picture of the number of stakeholders supporting the same concerns or suggestions as the case may be.

Organization	Agree	Supporting Comments of "Entity Name"
Ameren	Agree	Ameren supports and adopts by reference the SERC PCS comments.
Beaches Energy Services	Agree	FMPA - Florida Municipal Power Agency
Occidental Chemical Corporation	Agree	Ingleside Cogeneration LP

1. Based on stakeholder input, the drafting team revised the proposed definition of “Misoperation.” Concerning the two categories of “Slow Trip.” The drafting team also clarified the proposed definition of “Composite Protection System.” Do you agree the revisions provided clarity? If not, please provide specific suggestions for improvement

**Summary Consideration:** The numerical values are approximate and are intended to provide a gauge of the concerns raised by industry stakeholders. The number of comments noted is analogous to the number of entities (e.g., five comments means five entities provided a comment). More than 60 percent of individual stakeholders that commented in support of the drafting team’s revised the proposed definition of “Misoperation,” the two categories of “Slow Trip,” and clarifications to the proposed definition of “Composite Protection System.” There were 12 comments by 49 individuals that were not supportive of the revisions and there were 29 entities represented by 80 individuals that did not comment and only provided a “yes” response to the question in support of the drafting team’s revisions.

There was one common issue raised in this section that resulted in a clarifying revision to the proposed definition of “Composite Protection System.” Six comments by 34 individuals requested the drafting team to clarify the intent of the definition of “Composite Protection System” to eliminate the confusion of whether “remote” was local or away from the initiating Protection System. To clarify, the drafting team changed the last sentence from an “inclusionary” statement to an “exclusionary” statement. The phrase “[b]ackup protection provided to a remote Protection System is included” was clarified to “[b]ackup protection provided by a different Element’s Protection System(s) is excluded.”

There were three common issues that were raised by commenters that did not result in revisions. Three comments by 18 individuals requested changes to the definitions of “Composite Protection System” and “Misoperation.” Another three comments by individuals noted a lack of clarity on the differences in either the categories of the definition of “Misoperation,” the cited examples in the Guidelines, and/or the case where backup protection was provided for a failed Protection System of another owner. Two comments note that the definition of “Composite Protection System” is unnecessary and should not include, for example, redundant systems because in their opinion any failure in the Protection System should be identified as a Misoperation. The drafting team concluded that the suggested changes did not provide additional clarity.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	<p>In the Composite Protection System definition “Backup protection provided to a remote Protection System is included.” is not clear because it directs the focus from the local protected Element to a remote protection system. Suggest revising this sentence to read “Backup protection provided by a remote protection system by design is included.”</p> <p><b>Response:</b> The drafting team clarified the intent of the definition of “Composite Protection System” to eliminate the confusion of whether “remote” was local or away from the initiating Protection System. The phrase “a remote Protection System” was clarified to “a different Element’s Protection System.” Change made.</p>
National Grid	No	<p>Definitions for “Failure to Trip - During Fault” and “Failure to Trip - Other Than Fault” state that “The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct”. However, requirement R1 asks to identify if “Protection System component(s) caused a Misoperation”. These statements seem to contradict each other.</p> <p><b>Response:</b> The drafting team asserts that every Protection System Misoperation will include the failure of a component to act properly for an identified Misoperation. If the Composite Protection System operates as intended, it is not a Misoperation. No change made.</p> <p>Definition for “Unnecessary Trip - Other Than Fault” provides examples for what it is not. It should also provide examples for what it is, similarly with other definitions.</p> <p><b>Response:</b> The current draft includes what “is a Misoperation” (Examples 6a-6d) and what “is not a Misoperation” (Example 6e). No change made.</p>

Organization	Yes or No	Question 1 Comment
PPL NERC Registered Affiliates	No	<p>These comments are submitted on behalf of the following PPL NERC Registered Affiliates: LG&amp;E and KU Energy, LLC; PPL Electric Utilities Corporation, PPL EnergyPlus, LLC; PPL Generation, LLC; PPL Susquehanna, LLC; and PPL Montana, LLC. The PPL NERC Registered Affiliates are registered in six regions (MRO, NPCC, RFC, SERC, SPP, and WECC) for one or more of the following NERC functions: BA, DP, GO, GOP, IA, LSE, PA, PSE, RP, TO, TOP, TP, and TSP.</p> <p>It is helpful that the Definitions section on p.3 of the standard now says that a Slow Trip classification applies only if the Protection System of another Element was made to operate, but the term “slower than required” should be revised for clarity to read, “slower than the setting specified in the test/calibration instructions.” That is, a Slow Trip should be declared only if the timer is found to be mis-adjusted. Otherwise there’s no way of knowing whether the device at fault was slow or simply failed to function. Uncertainty on this subject is increased by Example 4 on p.25 having been left in its previous (draft 3) wording, “A failure of a generator's Composite Protection System to operate as quickly as intended for an overexcitation condition is a Misoperation.” This puts us back in the situation of having to decide if a relay acted in, say, ten cycles when five cycles was intended. Having to make such determinations ranges from being unduly burdensome to (for electromechanical relays) impossible, and was the principal reason for our having voted against draft 3 of the standard.</p> <p>It would be better still to state that Slow Trips apply only for TOs, because the issues of concern for this category of Misoperation (e.g. system instability, sequence of tripping) do not apply for generation plants. The description on p.25 of the standard of, “...owner(s) reviewing each Protection System operation,” to determine whether or not, “the speed and</p>

Organization	Yes or No	Question 1 Comment
		<p>outcome...met their objective,” is not typical or appropriate for GOs, and they should not be required to add monitoring systems and design-level personnel to perform a no-value-added function.</p> <p><b>Response:</b> The modifications to the category of “Slow Trip” were previously made to simplify the identification and improve the measurability. The identification is based on the reliability impact. It is appropriate to include Generator Owners in the standard’s Applicability. No change made.</p>
<p>Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing</p>	<p>No</p>	<p>The composite protection definition involving backup to remote protection does not completely make sense when coupled with the "slow trip" definition. The "total compliment" description in the Composite Protection System definition indicates that remote backup protection is included in the "total compliment". If the remote backup protection operates instead of the local, primary protection for an element, the "total compliment" collectively functioned to protect the element. Calling this situation a "misoperation of the Composite Protection System" is contradictory to stating that the total compliment collectively functioned as intended. Also, how does this make sense for the protection systems at generating facilities? What does 'backup protection provided by a remote protection system' mean for generating facilities?</p> <p><b>Response:</b> The definition of “Composite Protection System,” has been clarified to address the intent of backup protection. Clarification made.</p> <p>The slow trip definitions are still confusing. Are there multiple Composite Protection Systems that need to be considered when determining if a trip is a slow trip?</p>

Organization	Yes or No	Question 1 Comment
		<p>The "its operating time" references are indefinite in the definition. Consider making the slow trip definition either one of the following or a combination of the following OR statements: "a composite protection system operation that is slower than required or slower than designed or slower than desired or slower than the intended design".</p> <p><b>Response:</b> The modifications to the category of “Slow Trip” were previously made to simplify the identification and improve the measurability. The identification is based on the reliability impact. No change made.</p> <p>There is a fundamental flaw in the definition of misoperation. A misoperation is recognizable any time any part of a protection system design fails to operate as intended by the design, regardless of the existence of a redundant, remote, or back up protection scheme. The fact that something did not operate properly should indicate that a misoperation has occurred. The addition of the adjective “reportable” simply classifies the types of misoperations that are to be reported. The comment above does not address a requirement governing the actual reporting.</p> <p><b>Response:</b> The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This new definition has been introduced in this draft PRC-004-3 Reliability Standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation. No change made.</p>

Organization	Yes or No	Question 1 Comment
Operational Compliance	No	<p>A. The Application Guidelines provide some clarity on the difference between "Slow Trip - During Fault" and "Unnecessary Trip - During Fault". However, these definitions may still not be entirely clear.</p> <p><b>Response:</b> The drafting team asserts that the Guidelines and Technical Basis is the appropriate place for clarification rather than the definition of "Misoperation." No change made.</p> <p>B. Quoting Requirement R1...p.31 of Application Guidelines "When Elements are isolated from the BES and undergoing maintenance.....not subject to the standard....provided they do not result in the operation of...part of the BES." This statement and Example 6e (#6 of Misoperation definition), p.28 (at first glance anyways) may be at odds.</p> <p><b>Response:</b> The text referenced on page 31 has been removed because maintenance cannot change the applicability of the standard. Example 6e is not a Misoperation of an in-service Element because of the maintenance exclusion; however, the owner of the BES interrupting device that operates will review the operation when the operation meets the circumstances in Requirement R1, Parts 1.1 through 1.3. Clarification made.</p>
Wisconsin Electric Power Company	No	<p>The 2nd sentence in the definition of Composite Protection System is "Backup protection provided to a remote Protection System is included." The meaning and intention of this phrase is not readily understood. We suggest that the phrase from previous Draft 4: "Backup protection provided by a remote Protection System is excluded", is clearer and should be re-instated.</p> <p><b>Response:</b> The definition of "Composite Protection System," has been clarified to address the intent of backup protection by providing an</p>

Organization	Yes or No	Question 1 Comment
		<p>“exclusionary” condition rather than an “inclusionary” condition. Clarification made.</p>
Public Service Enterprise Group	No	<p>We agree with the Slow Trip changes. However, the revised definition of Composite Protection System caused much discussion. In the end, we would accept it provided that “a remote” in the second sentence is changed to “another.” With this change, the second sentence would read “Backup protection provided to another Protection System is included.” The backup Protection System need not be “remote” physically; it could be located in the same substation. The phrase “a remote Protection System” would require that the backup Protection System be at a different physical location, which may not be the case as we have just described.</p> <p><b>Response:</b> The drafting team clarified the intent of the definition of “Composite Protection System” to eliminate the confusion of whether “remote” was local or away from the initiating Protection System. The phrase “a remote Protection System” was clarified to “a different Element’s Protection System.” Clarification made.</p>
Independent Electricity System Operator	No	<p>We generally agree with the changes to the proposed definition of Misoperation, but do not agree with the proposed addition of the term Composite Protection System.</p> <p>In our previous comments, we expressed our disagreement with the need to create a defined term “Composite Protection System”. By definition, a Protection System is already a composite system whose components need to function collectively to protect an Element. The proposed term is therefore redundant. In the comment report, the SDT’s response indicates that the reason for proposing the newly defined term, “Composite Protection</p>

Organization	Yes or No	Question 1 Comment
		<p>System,” is found in the Application Guidelines under the heading “Definitions.”, and therefore no change was made.</p> <p>In the Application Guideline, the rationale provided for introducing this new term is that: [The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation.]We find this rationale insufficient to justify the introduction of the new term since by having the defined term “Misoperation” which covers any failure a Protection System to operate as intended for protection purposes would suffice to include the effect of multiple levels of protection (e.g. redundant systems). In other words, if a Protection System failed to operate as intended or operated unnecessarily, then regardless of the level of protection and which component caused the Protection System to operate, the action/inaction of the Protection System - Composite or otherwise, would constitute a Misoperation. We therefore continue to disagree with the proposed addition of this new term, and suggest that it be removed.</p> <p><b>Response:</b> Not all entities consider a Protection System to include all associated components to protect an Element. The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This new definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation. Also, the new definition supports consistent</p>

Organization	Yes or No	Question 1 Comment
		reporting of Misoperations under the Section 1600 data request because all entities, under the new definition, will be evaluating its Composite Protection Systems in the same manner. No change made.
Southern California Edison Company	No	<p>SCE disagrees with the explanation of and rationale for the "Composite Protection System" for the following reasons:</p> <ol style="list-style-type: none"> <li>1. If an interrupting device is tripped due to misoperation of another device not owned by the owner of the interrupting device, then the owner of the interrupting device will be unaware of this issue until the formal notification of the event to all the owners of the composite protection system is made. One of the reasons for the misoperation of the other device could be a failure to trip.</li> </ol> <p><b>Response:</b> The drafting team contends that this concern is addressed by Requirement R2. The new definition of "Composite Protection System," has been clarified to address the intent of backup protection. Clarification made.</p> <ol style="list-style-type: none"> <li>2. In the case above, the owner of the interrupting device would not be able to validate Requirement 1.3: "The BES interrupting device owner identified that its Protection System Component caused the BES interrupting device(s) operation." Therefore the owner would not be able to and may not be required to notify other entities owning the composite protection system. The root cause would either not be analyzed or the analysis would be delayed.</li> </ol> <p><b>Response:</b> Requirement R1 is for the BES interrupting device owner to initiate the review for identifying any Misoperations caused by its components. Requirement R2 addresses the circumstances in which the initiating BES interrupting device owner in Requirement R1 must make</p>

Organization	Yes or No	Question 1 Comment
		notification to other owners. The notified Protection System component owner(s) in R3 must review its portion of the Composite Protection System for any Misoperation. No change made.
Northeast Utilities	No	<p>The part of the Composite Protection System definition “Backup protection provided to a remote protection is included” is not clear because it switches focus from the local protected element to a remote protection system. We suggest revising this part to say “Backup protection of the element provided by a remote protection by design is included.”</p> <p><b>Response:</b> The drafting team clarified the intent of the definition of “Composite Protection System” to eliminate the confusion of whether “remote” was local or away from the initiating Protection System. The phrase “a remote Protection System” was clarified to “a different Element’s Protection System.” Clarification made.</p>
CenterPoint Energy	No	<p>CenterPoint Energy recommends adding wording to the definition to address the direct interrelationships between Misoperation categories, especially the “Slow Trip - During Fault” and the “Unnecessary Trip - During Fault” categories. For these two categories, an operation of an un-faulted Element’s Composite Protection System occurs. This interrelationship is detailed in the Application Guidelines which states the following for the “Slow Trip - During Fault” category: “In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip - During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element. If a coordination error was at the local terminal (i.e., set too slow), then it was a “Slow Trip - During Fault” category of Misoperation at the local terminal.” In addition, the Application Guidelines states the following for the Unnecessary Trip - During</p>

Organization	Yes or No	Question 1 Comment
		<p>Fault: "If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip - During Fault" category of Misoperation at the remote terminal."</p> <p>CenterPoint Energy suggests adding clarifying wording at the end of the "Slow Trip - During Fault" and the "Unnecessary Trip - During Fault" categories:</p> <p>3. Slow Trip - During Fault - A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System, providing it is not determined to be an Unnecessary Trip - During Fault.</p> <p>5. Unnecessary Trip - During Fault - An unnecessary Composite Protection System operation for a Fault condition on another Element, providing it is not determined to be a Slow Trip - During Fault.</p> <p><b>Response:</b> The drafting team asserts that the Guidelines and Technical Basis is the appropriate place for additional explanation rather than within the definition of "Misoperation." No change made.</p>
Flathead Electric Cooperative, Inc.	No	<p>Generally do not like the phrase "composite", would prefer that Protection System just have a solid definition. I appreciate that is the dilemma here and my specific suggestion be to delete the word composite throughout.</p> <p><b>Response:</b> The drafting team contends that modifying the Protection System definition in the <i>Glossary of Terms Used in NERC Reliability Standards</i> impacts all Reliability Standards using the term. No change made.</p>

SERC Protection and Controls Subcommittee	Yes	
ACES Standards Collaborators	Yes	<p>We agree with the changes.</p> <p><b>Response:</b> Thank you for your comment.</p>
Florida Municipal Power Agency	Yes	<p>FMPA’s primary concern with the previous version of this definition centered around the ability to accurately classify the events and show evidence as appropriate. FMPA agrees the revised versions of “Slow Trip - During Fault” and “Slow Trip - Other than Fault” are more specific and thus easier to consistently apply. However, we do not believe the revised versions are going to result in events being classified the way the SDT desires.</p> <p>We are voting yes for this item because our primary concern is addressed. The SDT should reconsider these revisions, though, in light of the following - the revised versions have nothing to do with the designed, set, or normal operating time as specified by the relay manufacturer/settings. We believe the intent of these two categorizations is to identify relay misoperations for which a relay, interrupting device, or relay setting which was intended to operate at a particular speed, instead operated at a slower speed / in a</p>

Organization	Yes or No	Question 1 Comment
		<p>longer time. Just because a relay from a different Element’s Composite Protection System operates does not necessarily mean this event was undesired, unnecessary, or unintended. As stated in our last comments we refer back to the core issue that the protection system performance should be measured against a company’s relay setting philosophy. We also note that the Application Guide still refers to this event in “Example 3” as “A failure of a line’s Composite Protection System to operate as quickly as intended...”.</p> <p><b>Response:</b> The modifications to the category of “Slow Trip” were previously made to simplify the identification and improve the measurability. The identification is based on the reliability impact. Example 3 in the Guidelines and Technical Basis have been clarified to remove the “quickly” wording.</p> <p>The drafting team contends that design philosophies inherently include the principles of dependability and security. Each entity using its particular design philosophy would lead to less consistent classification of Misoperations. No change made.</p> <p>The application guide also still includes language regarding “slower than previously identified as being necessary to prevent voltage or dynamic instability”.</p> <p><b>Response:</b> The Guidelines and Technical Basis have been updated to remove this reference. Correction made.</p>

2. Based on stakeholder input, the drafting team revised Requirement R2 to clarify responsibilities when local protection is responsible for the interrupting device operation and when backup protection is responsible. This also addresses the notifications that must occur to eliminate a gap in the previous draft. The gap was a condition where an entity's BES interrupting device did not operate because of a failed Protection System; therefore, would not have been applicable to the standard. Do you agree that the gap has been eliminated with the change to Requirement R2? If not, please provide specific suggestions for improvement.

**Summary Consideration:** The numerical values are approximate and are intended to provide a gauge of the concerns raised by industry stakeholders. The number of comments noted is analogous to the number of entities (e.g., five comments means five entities provided a comment). More than 62 percent of individual stakeholders agreed with the approach used by the drafting team in Requirement R2 to clarify responsibilities when local protection is responsible for the interrupting device operation and when backup protection is responsible. This also addresses the notifications that must occur to eliminate a gap in the previous draft 5.

There were two common comment themes that required a clarification in the standard. First, a single comment by 23 individuals raised concern that the drafting team failed to make it obvious that an entity should also have to notify other owner(s) of Protection Systems under the same circumstances in Requirement R1 for a BES interrupting device operation by manual intervention in response to a Protection System failure. The drafting team agreed with the lack of clarity and inserted the appropriate phrase to highlight that this circumstance is intended to be covered by Requirement R2. Second, two comments by individuals disagreed with the way Requirement R2, Part 2.2 was constructed when compared with the definition of "Composite Protection System." The drafting team did not make a change to Part 2.2 based on the comment, but provided additional explanation in the response how the clarification to the definition of "Composite Protection System" should address the concern.

There were six varying comment themes that did not require the drafting team to clarify the standard. Of those, two comments by nine individuals believed that requirements for providing notifications overly complicate the standard. The drafting team contends that requiring notifications is important to ensuring all Protection System owners become aware of when they need to review their Protection Systems, and when notified, that they have a responsibility to perform the necessary requirements. A single comment expressed concern about the entity that provided remote backup protection having to track operations. The drafting team noted that a BES interrupting device operation meeting the circumstances in Requirement R1 dictate that a review of the operation be performed. Requirement R2, Part 2.2 requires that entity to notify the other owner(s) for which backup protection was provided. Two comments by 12 individuals were concerned that 120 calendar days is too long of a period and would not promote effective and efficient resolution of the problem. The drafting team contends that most Protection System reviews would occur soon after a

BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load.

The last three comments were provided by an individual commenter. One comment raised concern that Measure M2 limited an entity’s ways to demonstrate coordination of evidence. The drafting team contended that Measure M2 specifically notes that evidence “may include, but is not limited to.” A second comment disagreed that the BES interrupting device owner should be responsible for demonstrating compliance with the requirements in the proposed standard. The drafting team contends that the trip coil(s) of a BES interrupting device are, by definition, included in what is considered a Protection System. Last, one comment pointed out that the entity did not see how the gap regarding a case where an interrupting device did not operate has been addressed. The drafting team is confident that a BES interrupting device will operate, somewhere in the system to clear the abnormal condition, thus the entity that owns the BES interrupting device that clears the abnormal condition will notify the other owner(s).

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	<p>The case where manual intervention is required to open a BES interrupting device, but the cause of the Misoperation is located on a Protection System component owned by another Transmission Owner is not addressed in R2.</p> <p>In R1 a special mention to manual intervention is included. Why isn’t a process of notification included in R2 for manual intervention caused by Misoperation of another owner’s protection system?</p> <p><b>Response:</b> The drafting team intended in Requirement R2 that a BES interrupting device operation due to a Protection System operation or by manual intervention in response to a Protection System failure would be considered in whether or not notifications to other owners would be required. The drafting team added the appropriate clarification for “by manual intervention in response to a Protection System failure to operate.” Clarification made.</p>
Southern Company: Southern Company Services, Inc.;	No	There is a problem with R2.2. One entity does not necessarily know whether or not another entities' Element has an abnormal condition. This notification of other entities

Organization	Yes or No	Question 2 Comment
<p>Alabama Power Company;                      Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation;                      Southern Company Generation and Energy Marketing</p>		<p>for an explained operation of my interrupting device and my protection system should not be required. It is acknowledged that this was an attempt to eliminate the gap described above, but it is contrary to the Composite Protection System collectively functioning as intended to protect an element.</p> <p><b>Response:</b> Requirement R2 provides the circumstances where the initiating entity either determines that the operation was not caused by its Composite Protection System components or the initiating entity is unable to rule out a Misoperation. The drafting team contends that the initiating entity will be in the position to determine its Protection System operated correctly. If not, Requirement R2 requires notification to other owners if the initiating entity is unable to rule out a Misoperation. No change made.</p> <p>Also, the drafting team clarified the intent of the definition of “Composite Protection System” to eliminate the confusion of whether “remote” was local or away from the initiating Protection System. The phrase “a remote Protection System” was clarified to “a different Element’s Protection System.” Clarification made.</p>
<p>ACES Standards Collaborators</p>	<p>No</p>	<p>(1) We continue to believe that this standard has been overly complicated by including administrative elements such as reporting information to third parties. The reporting does little to nothing to support reliability. The real value is in analyzing the Protection System operations and correcting any errors. Is there any indication that registered entities are not communicating to co-owners of the Composite Protection System that a potential misoperation occurred? If not, (and we have seen no such evidence) why does this administrative requirement that clearly meets multiple P81 criteria (administrative and reporting) rise to level of needing to be enforced with financial penalties? Barring such evidence, we simply do not see how we can support such a requirement. Clearly, the application guidelines spell out what is necessary. We recommend that the drafting team perform a study to determine if there is a true</p>

Organization	Yes or No	Question 2 Comment
		<p>reliability need for communicating with co-owners of Composite Protection Systems. If the drafting team cannot provide data or statistics indicating a gap in reliability, then we recommend striking the administrative tasks from the requirement.</p> <p><b>Response:</b> Requirement R2 requires notification to other owners of the Composite Protection System who have a reliability role in identifying Misoperations, but were not accounted for within Requirement R1. Requirement R2, under the circumstances in Part 2.1 and Part 2.2 determine when the notification to other owners must occur. No change made.</p> <p>(2) The existing standard was fairly simple and coupled with the new definition of Misoperation largely addresses the scope of the SAR. All that is really is needed for this standard is a requirement to evaluate Protection System operations, identify if the Protection System operation was a misoperation and then to develop a Corrective Action Plan to prevent future misoperations. Six requirements create more complication than what is necessary.</p> <p><b>Response:</b> The Requirements provide additional clarity over the current version two PRC-004-2.1a Reliability Standard that has three activities in a Requirement. This draft version three PRC-004-3 Reliability Standard has one reliability activity per Requirement and those Requirements provide the essential actions to ensure each and all entities are informed. No change made.</p>
Seminole Electric Cooperative, Inc.	No	<p>Requirements R1 and R2 place the burden on the owner of a BES interrupting device to initiating a review on the operation of the device. This responsibility should fall on the owner of the components of the Composite Protection System that initiated the BES interrupting device to operate. The owner of these components should be just as aware as the owner of the device regarding its operation. In addition, for those entities that are interconnected and who utilize the same BES interrupting device, those entities should have equal awareness of the BES interrupting device status.</p>

Organization	Yes or No	Question 2 Comment
		<p>Therefore, Seminole recommends that the SDT revise Requirements R1 and R2 to require the entity whose components of the Composite Protection System initiated the BES interrupting device to activate.</p> <p><b>Response:</b> According to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). The BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. In the case where the relays or other Protection System component(s) are owned by another entity, that owner may not know of the operation until it receives notification from the BES interrupting device owner. No change made.</p>
Nebraska Public Power District	No	<p>R2 2.2 states:</p> <p style="padding-left: 40px;">“For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity’s Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.”</p> <p>Perhaps it would be clearer to state:</p> <p style="padding-left: 40px;">“For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity’s Element, notification of the operation shall be provided to the other Protection System owner(s) from the backup protection system owner(s) for which that backup protection was provided.”</p> <p><b>Response:</b> The drafting team disagrees that the suggestion provides additional clarity. No change made.</p>

Organization	Yes or No	Question 2 Comment
		<p>A concern with the gap fix is that the backup protection system owner will not be tracking this as a misoperation because the owner of the interrupting device is the one who had the misoperation yet the backup protection owner must store this notification as part of a misoperation on another entities system which creates an odd and risky compliance tracking situation. It would be unfortunate to get fined for not tracking this even though a misoperation did not occur on your system. This is a difficult situation to address.</p> <p><b>Response:</b> Regardless of fixing the gap (i.e., R2, Part 2.2), the entity that experienced a BES interrupting device operation is required to review the operation according to the circumstances in Requirement R1. For example, if the operation was “correct” it would not be identified as a “Misoperation;” however, Requirement R2, Part 2.2 requires that the entity provide notification to the other Protection System owner(s) if the operation was a result of providing backup protection for a condition on another entity’s Element. No change made.</p> <p>For a backup protection system owner who operates in back up for a fault on a non BES or non-registered entities system is the notification not required?</p> <p><b>Response:</b> Requirement R2, Part 2.2 has been clarified that the “other entity’s Element” is a “BES Element.” The Guidelines and Technical Basis have been supplemented for this condition. Clarification made.</p>
Idaho Power	No	<p>Protection Systems regularly provide backup to the next Element. These backup features are not intended to operate under normal conditions and would not be included as part of an Element's Composite Protection System as we interpret it. The phrase “intended to operate” in 2.2 should be modified to account for operations of another Element’s Composite Protection System that could operate as backup to the normal Composite Protection System for an extreme event.</p>

Organization	Yes or No	Question 2 Comment
		<p><b>Response:</b> The drafting team clarified the definition of “Composite Protection System.” Back up protection provided by a different Element’s Protection System(s) is excluded. The intent of Requirement R2, Part 2.2 is for the condition where an entity provides backup protection for a different Element’s Protection System, such as, the case of a failed protection system of another BES Element. Part 2.2 requires that the entity that provided the backup protection (i.e., a correct operation) is required to notify the other Protection System owners to close the reliability gap for a BES interrupting device that did not operate. A clarification was made to the definition of “Composite Protection System.”</p>
Southern California Edison Company	No	<p>In the case where a non-performing protection system has caused a tripping device to operate, the non-tripping device could be ignored, resulting in the problem not being mitigated and eventually posing a greater risk to the composite protection system. Assuming that the owner of the system notifies the other entities owning the composite protection system, the time window of 120 days to notify would be too long in order to promote effective and efficient resolution of the problem. Notification should be within a week of the occurrence of event in order to allow the other impacted entities to review, analyze, and communicate with each other in order to perform a root cause analysis and determine a corrective action plan.</p> <p><b>Response:</b> The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load. Also, requiring automatic notifications to other owners of the Composite Protection System would create an unnecessary compliance burden on entities (i.e., Requirement R3) if the initiating entity did not perform a cursory review of the Protection System operation first. No change made.</p>

Organization	Yes or No	Question 2 Comment
		Requirement R2 provides the circumstances where the initiating entity either determines that the operation was not caused by its Composite Protection System components or the initiating entity is unable to rule out a Misoperation. No change made.
Tri-State Generation and Transmission Association, Inc.	No	<p>Tri-State remains concerned with situations where individual components are jointly owned. The SDT’s response</p> <p>“While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results” appears to require all entities to report the operation giving double jeopardy to each misoperation on jointly-owned Composite Protection System components, unless a contract speaks to the designated “Compliance Entity”.</p> <p>Typically compliance contracts take some time to come to fruition. Is it the drafting team’s intent that misoperations be reported by multiple entities in this situation until a contract is finalized?</p> <p><b>Response:</b> The reporting of Misoperations is outside the scope of the draft PRC-004-3 Reliability Standard and is being addressed by the NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., “data request”). Absent an agreement, all owners of a Protection System will have a compliance responsibility. No change made.</p>
Flathead Electric Cooperative, Inc.	No	The way the M2 is written is overly prescriptive and limiting on what might be acceptable way to show the coordination between entities. The measure seems to written like a requirements. Prefer the previous language.

Organization	Yes or No	Question 2 Comment
		<p><b>Response:</b> The drafting team notes the Measure is worded “may include, but is not limited to,” thus allowing other forms of evidence. The wording of the Measure follows NERC guidance. No change made.</p>
Arizona Public Service Company	Yes	
MRO NERC Standards Review Forum	Yes	
National Grid	Yes	
Dominion	Yes	
Duke Energy	Yes	
SERC Protection and Controls Subcommittee	Yes	
SPP Standards Review Group	Yes	<p>Formatting in recent standards has tended toward using bullets in lieu of subparts. The drafting team is encouraged to follow this practice in Requirement R2. Note that there are bullets in Requirement R5.</p> <p><b>Response:</b> The drafting team followed the NERC convention for numbering and bulleting. Numbered items mean “and” which requires all of the items to be considered or performed. Bullets mean “or” and generally mean one or more are required depending on the Requirement text. No change made.</p>

Organization	Yes or No	Question 2 Comment
		<p>Delete the 2nd ‘when’ in the 6th line (clean copy) of the Rationale Box for Requirement R2.</p> <p><b>Response:</b> The drafting team removed the second occurrence of “when.” Change made.</p>
Bonneville Power Administration	Yes	
Operational Compliance	Yes	
Exelon Companies	Yes	
Manitoba Hydro	Yes	
Pepco Holdings Inc	Yes	<p>We are in agreement that this revision eliminates the identified gap. However, we are still not in agreement that the owner of the interrupting device be responsible for demonstrating compliance with the requirements in the proposed standard, as has been previously stated. This is of particular interest at interface terminals with generator owners.</p> <p><b>Response:</b> The drafting team thanks you for your comment. The drafting team contends that the BES interrupting device owner is in the best position to be aware of the operation and to initiate the identification of any Misoperation. No change made.</p>

Florida Municipal Power Agency		<p>1. FMMPA does not feel our previous comment regarding notification to affected entities was properly understood. This comment was offered to R2 in the previous round of comments. We understand the way the document is intended to flow, but our main concern is the relay event records are preserved by all entities indefinitely - for many Utilities a special trip must be made to the substation to download the event records. What prevents the Owner of a BES interrupting device that operated from taking the full 120 days to conduct their review without saying anything to the other affected owners, only to find upon request of further evaluation that those entities no longer have the relay event records necessary for the evaluation? At minimum the entity Owning the BES interrupting device should advise the other affected Protection System owners that the investigation is under way at the earliest time they determine those entities are affected, to allow the entities to be prepared with data should they be notified in accord with R2.</p> <p><b>Response:</b> The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work</p>

Organization	Yes or No	Question 2 Comment
		<p>load. Also, requiring automatic notifications to other owners of the Composite Protection System would create an unnecessary compliance burden on entities (i.e., Requirement R3) if the initiating entity did not perform a cursory review of the Protection System operation first. No change made.</p> <p>FMPA does not see how the gap regarding a case where an interrupting device did not operate has been addressed. Reading R1 and R2 again, it still appears that all triggers for activity are based on interrupting device operation, and we see no mention of a case where an interrupting device did not operate. While we can see that requiring actions in the standard based on relay targets, for example, would be challenging to enforce, we would have expected at least a statement, something to the effect of “Or if the entity otherwise becomes aware that a Composite Protection System it owns operated without an associated interrupting device action”.</p> <p><b>Response:</b> The drafting team is confident that a BES interrupting device will operate, somewhere in the system to clear the abnormal condition. The draft PRC-004-3 Reliability Standard is initiated on the operation of a BES interrupting device. Requirement R2 addresses this perceived gap for a device not operating because an entity that provided backup protection is required to notify the entity for which it provided backup protection. The other entity is then required under Requirement R3 to review its Protection System for Misoperation. No change made.</p>
Texas Reliability Entity		No comments
CenterPoint Energy		CenterPoint Energy recommends deleting the proposed Requirement R2.2. Based upon the changes made to the Composite Protection System definition and the proposed wording of Requirement R2.1, CenterPoint Energy believes the proposed wording of Requirement R2.2 related to backup protection is unnecessary. The Composite Protection System definition now states that “Backup protection provided

Organization	Yes or No	Question 2 Comment
		<p>to a remote Protection System is included.” This, along with Requirement R2.1 stating “notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances” and Requirement R2.1.2 stating “The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation”, provides for the notification intended by Requirement R2.2.</p> <p><b>Response:</b> The drafting team clarified the definition of “Composite Protection System.” Back up protection provided by a different Element’s Protection System(s) is excluded. The intent of Requirement R2, Part 2.2 is for the condition where an entity provides backup protection for a different Element’s Protection System, such as, the case of a failed protection system of another Element. Part 2.2 requires that the entity that provided the backup protection (i.e., a correct operation) is required to notify the other Protection System owners to close the reliability gap for a BES interrupting device that did not operate. A clarification was made to the definition of “Composite Protection System.”</p>

**3. The drafting team modified the Application Guidelines to improve examples and clarify the team’s intent on various topics. Do you agree the Application Guidelines provide sufficient examples and clarity? If not, please provide specific suggestions for improvement.**

**Summary Consideration:** The numerical values are approximate and are intended to provide a gauge of the concerns raised by industry stakeholders. The number of comments noted is analogous to the number of entities (e.g., five comments means five entities provided a comment). More than 70 percent of individual stakeholders agreed that the Guidelines and Technical Basis was improved by the numerous examples and that it clarified the team’s intent on various topics.

There were three themes in the comments that resulted in revisions to the standard’s Guidelines. Five comments by 16 individuals requested additional examples in the Guidelines. Among the requests, examples included breaker failure, “Failure to Trip – During Fault,” “Slow Trip – During Fault,” “Slow Trip – Other Than Fault,” “Unnecessary Trip – During Fault,” and Requirements R1 and R2. The drafting team supplemented the Guidelines with most of the examples suggested by stakeholders. Four comments by 14 individuals suggested minor word clarifications, punctuation improvements, and grammar corrections needed in the Guidelines. The drafting team concurred with many of the suggestions and implemented the clarifications, improvements, and corrections. A single comment by 11 individuals noted minor issues with wording in the Guidelines that was not updated during previous revisions of the definitions. The drafting team addressed these issues.

The following five comments did not result in revisions or clarifications in the draft PRC-004-3 Reliability Standard or related documents. First, four comments by 21 individuals remained concerned with the “Slow Trip” category of the Misoperation definition. The drafting team noted that it may take a detailed investigation to distinguish between a “Slow Trip” and “Failure to Trip” category of Misoperation. However, making a distinction is not relevant to the Requirements because the entity is required to identify whether a Misoperation of its Protection System components occurred. Second, one comment by 11 individuals expressed concern that an entity does not have any flexibility in the timeframes of the Requirements for extenuating circumstances if the entity did not meet the timeframes due to an event such as a natural disaster. The drafting team responded that NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (i.e., “timeframes”) of a Reliability Standard in unique extenuating circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances allow the Compliance Enforcement Authority this flexibility based on the entity’s unique circumstances. Third, a single commenter believed that Bulk Electric System (BES) Elements or Protection System Misoperations that may affect the reliability of the Bulk Electric System (BES) should be first identified by the Planning Coordinator or Reliability Coordinator. The drafting team noted that the current version of the draft Reliability Standard (PRC-004-2.1a) applies to

all BES Protection Systems; therefore, the Planning Coordinator or Reliability Coordinator do not need to identify specific BES Elements that affect reliability, only the owners of Protection Systems. Fourth, an individual commenter suggested adding a Requirement to require the BES interrupting device owner to share any information it has regarding the operation of the Composite Protection System. The drafting team finds such a requirement to be administrative and a compliance burden when information is already being communicated. Last, a single commenter questioned about how the timeframes relate between the Requirements. The drafting team appended a new section, "Requirement Time Periods" to the Guidelines to provide clarity regarding timeframes.

Organization	Yes or No	Question 3 Comment
PPL NERC Registered Affiliates	No	<p>See our comments above for Example #4. The Application Guidelines should clarify Misoperation analysis scope and purpose differences between TOs (preserve stability and enforce orderly isolation of circuits on a still-live system) and GOs (trip the unit).</p> <p><b>The following text was provided to the drafting team by the group’s submitter after the drafting team requested clarification to the above comment:</b></p> <p><i>The following response was developed by a PPL SME. Please contact me if you have additional questions.</i></p> <p><i>The issue has to do with our objections regarding slow trips. Previous versions of the standard could be interpreted as requiring us to identify the time delay associated with every relay action, to see if the device functioned as quickly as intended. We (and probably most GOs) don’t have equipment allowing such a determination. The SDT sought to address this concern by revising the definitions to state that a slow trip occurs only if another, backup relay was made to operate.</i></p> <p><i>Two shortcomings remain, however. One doesn’t know whether the primary device that didn’t get the job done was slow or it was utterly non-functional. The classification of a slow trip should then apply only if the timer was found to be mis-programmed.</i></p>

Organization	Yes or No	Question 3 Comment
		<p><b>Response:</b> Since the symptoms are similar, it may take a detailed investigation to distinguish between a “Slow Trip” and “Failure to Trip” category of Misoperation. However, this is not relevant to the Requirements. The entity is required to identify, within 120 days, whether a Misoperation occurred. The definition’s wording change simplifies the identification process by allowing entities to use an operational evaluation to identify whether a Misoperation occurred. In the cited example, it should become clear during subsequent investigation whether a “Slow Trip” or “Failure to Trip” type Misoperation occurred. No change made.</p> <p>Secondly, the SDT forgot to revise the wording for Example 4 on p.25 of the Application Guidelines. It still talks about, “A failure of a generator's Composite Protection System to operate as quickly as intended,” contradicting the revised definition.</p> <p><b>Response:</b> Example 4 has been updated.</p>
SPP Standards Review Group	No	<p>We note that the drafting team included several additional examples in this version of the standard and we certainly appreciate that. We would however suggest that the following examples would provide further clarification:</p> <p>1) an example which illustrates that a properly coordinated breaker failure operation does not equate to a slow-trip operation,</p> <p><b>Response:</b> The drafting team has provided an example in the Guidelines and Technical Basis under “Composite Protection System – Breaker Failure Example” section, second bullet. Clarification made.</p> <p>2) a backup protection example to provide clarity on how Requirement 2, Part 2.2 would be applied and</p>

Organization	Yes or No	Question 3 Comment
		<p><b>Response:</b> The drafting team has provided Example 1e in the Guidelines and Technical Basis. Clarification made.</p> <p>3) an example of a breaker failure Misoperation.</p> <p><b>Response:</b> The drafting team has provided an example in the Guidelines and Technical Basis under “Composite Protection System – Breaker Failure Example” section, third bullet. Clarification made.</p> <p>We noted that the drafting team reverted to the non-capitalized ‘fault’ throughout most of the Application Guidelines. Yet in the listing of items that characterize a Misoperation on Page 23 (clean copy), the drafting team maintained the capitalization from the previous draft. Can the drafting team provided clarification on the proper use of the term?</p> <p><b>Response:</b> The drafting team re-evaluated the general use of “fault” and the <i>Glossary of Terms Used in NERC Reliability Standards</i> definition of “Fault.” The evaluation resulted in reverting certain occurrences that should refer to the glossary definition. Clarification made.</p> <p>In the 1st line under Unnecessary Trip - Other Than Fault on Page 26 (clean copy), delete the comma between ‘to’ and ‘power’.</p> <p><b>Response:</b> Punctuation correction made.</p> <p>Hyphenate ‘out-of-service’ in the paragraph following Example 7a on Page 27 (clean copy).</p> <p><b>Response:</b> Punctuation correction made.</p> <p>Hyphenate ‘high-side’ in the 3rd line of Example 7b on Page 27 (clean copy).</p> <p><b>Response:</b> Punctuation correction made.</p>

Organization	Yes or No	Question 3 Comment
		<p>Replace ‘voltampere-reactive’ with ‘VAr’ in the 3rd line of the paragraph under Non-Protective Functions on Page 27 (clean copy).</p> <p><b>Response:</b> The usage of “static voltampere-reactive compensator” is consistent with the NERC style guide and IEEE usage for an SVC. No change made.</p> <p>We appreciate the explanation provided in the Extenuating Circumstances section. However, we believe that the standard should go beyond what is provided in the Sanction Guidelines. Why should an entity be held in violation in the event of multiple operations on its system during a natural disaster? There may not be an actual Misoperation but because an entity simply doesn’t meet the purely administrative requirement of getting the evaluation done within a prescribed number of days, a violation has occurred. Recognition should be given in the standard for such events which withhold declaration of any potential violation until the entity has had sufficient time to 1) deal with the crisis at hand of rebuilding its system and 2) then performing the evaluations to determine if Misoperations occurred. This flies in the face of being innocent until proven guilty.</p> <p><b>Response:</b> NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (timeframes) of a Reliability Standard in unique extenuating circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: “In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties.” While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. No change made.</p>

American Electric Power	No	AEP recommends adding an example to the applications guideline to illustrate that a properly coordinated breaker failure operation does not equate to a “slow trip” type misoperation.

Organization	Yes or No	Question 3 Comment
		<p><b>Response:</b> The drafting team notes this is described in the first paragraph of the Guidelines and Technical Basis under the heading “Composite Protection System – Breaker Failure Example.” No change made.</p> <p>AEP recommends adding a backup protection example to the application guidelines to illustrate how R2.2 would be applied.</p> <p><b>Response:</b> The drafting team has provided an example(s) in the Guidelines and Technical Basis under the heading “Composite Protection System – Breaker Failure Example.” Clarification made.</p> <p>AEP recommends adding an example of a breaker failure misoperation to the application guidelines.</p> <p><b>Response:</b> The drafting team has provided an example(s) in the Guidelines and Technical Basis under the heading “Composite Protection System – Breaker Failure Example.” Clarification made.</p>
Public Service Enterprise Group	No	<p>In comments for the prior posting, we addressed a “consistency” reporting issue. See our comments and the SDT’s response in the Consideration of Comments document on pp 27-28 and the SDT’s response which is incorporated into the standard in various places. See the Application Guideline change on p. 31 of the redline version, which included this addition:</p> <p>“The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure, it may decide to identify the operation as a Misoperation and continue its investigation until the entity determines otherwise. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.”</p>

Organization	Yes or No	Question 3 Comment
		<p>The SDT’s language above still allows entities too much latitude in the classification of an operation as a correct Operation or a Misoperation. The classification of an operation as a correct operation or a Misoperation is step 1 in the process. Only if the operation is determined to be a Misoperation is the cause of the Misoperation investigated (step 2). We suggest this guidance:</p> <p style="padding-left: 40px;">“If the available evidence IS INSUFFICIENT to classify the operation as a Misoperation PRIOR TO THE INVESTIGATION OF THE CAUSE OF A POSSIBLE MISOPERATION, DO NOT CLASSIFY THE OPERATION AS A MISOPERATION.”</p> <p>A Misoperation with “no cause found” is not equivalent to a correct operation, which is how an unreported Misoperation is interpreted. If an entity classifies an operation as a Misoperation and goes down that path to investigate the cause, it may well conclude that no Misoperation occurred; however, unless its original Misoperation classification is changed to reflect that result, the reported Misoperations will be overstated. Another entity with an identical operation may decide not to classify it as a Misoperation based upon the data available to it absent an investigation of the cause. For the sake of consistent reporting, the classification decision (correct operation or Misoperation) must be reached without a causal investigation, which only takes place if an operation is classified as a Misoperation.</p> <p><b>Response:</b> The performance under Requirement R1 is that the entity identify Protection System operations that are Misoperations. The requirement does not preclude the entity from using judgment in the classification of the operation if the available evidence is inconclusive. No change made.</p>
Hydro-Québec	No	<p>The purpose of the Standard shall be limited only to "Identify and correct the causes of Misoperations of Protection Systems affecting the reliability of the Bulk Electric System (BES)." The Bulk Electric System (BES) Elements or Protection System</p>

Organization	Yes or No	Question 3 Comment
		<p>Misoperations that may affect the reliability of the Bulk Electric System (BES), shall be first identified by the PC or RC.</p> <p><b>Response:</b> The scope of the current PRC-004-2.1a Reliability Standard applied to all BES Protection Systems; therefore, the Planning Coordinator or Reliability Coordinator do not need to identify specific BES Elements that affect reliability. No change made.</p> <p>Requirement R2</p> <p>The owner of the interrupting device shall share any information he has, that could be used by the other owner of the protection system to determine the cause of the misoperation.</p> <p><b>Response:</b> The drafting team contends that Requirement R2 only needs to require notification to the other owner(s) of the Composite Protection System. Creating Requirements for sharing information does little to improve reliability where information is already being communicated because the Requirements would have to prescribe what is shared and within what timeframes. No change made.</p>
Nebraska Public Power District	No	<p>See suggestion below in 4)</p> <p><b>Response:</b> Please see response in Question #4.</p>
Tacoma Power	No	<p>In the Application Guidelines for Unnecessary Trip – Other Than Fault, the following paragraph seems out of place: “If a coordination error was at the remote terminal (i.e., set too fast), then it was an ‘Unnecessary Trip,’ category of Misoperation at the remote terminal.” This paragraph seems to focus on a scenario involving a fault.</p> <p><b>Response:</b> The text was moved to “Unnecessary Trip – During Fault.” Correction made.</p>

Organization	Yes or No	Question 3 Comment
		<p>There is concern that, for a very small number of BES interrupting device operations, an entity could fail to identify (formally document) whether or not its Protection System component(s) caused a Misoperation. If this were to occur, it would likely be associated with apparently benign operations, so the likelihood that a misoperation would have occurred is low. Generally, misoperations garner a lot of attention within an entity, so they are generally hard to miss. Even if no misoperation occurred, an entity could be fined up to the maximum allowable for a Medium VRF and Severe VSL for failing to identify that its Protection System component(s) did not cause a Misoperation. The possibility for fines of this magnitude could drive potentially costly measures to ensure zero defects, even though BES reliability would not be impacted by failing to formally identify that an entity’s Protection System component(s) did not cause a Misoperation. Tacoma Power agrees with the spirit of Requirement R1 but believes that compliance and enforcement should be assessed with failure (or tardiness in) identifying that its Protection System component(s) caused a Misoperation. Basically, if an entity does not determine whether or not a Misoperation occurred, they would be implicitly (by default) saying that a Misoperation did not occur. During an audit, if a BES interrupting device operation caused by a Protection System is uncovered for which no formal (explicit) identification according to Requirement R1 was made, the entity should only be found non-compliant (or penalized) if the CEA believes that a Misoperation did indeed occur. The purpose of the standard is to “identify and correct the causes of Misoperations of Protection Systems...” Perhaps this issue could be addressed in the Application Guidelines.</p> <p><b>Response:</b> The performance under Requirement R1 is that the entity identify Protection System operations that are Misoperations. The requirement does not preclude the entity from using judgment in the classification of the operation if the</p>

Organization	Yes or No	Question 3 Comment
		<p>available evidence is inconclusive. The phrases “or not” have been removed from the VSLs to align with the Requirement.</p> <p>Even though Requirement R1, Part 1.1, stipulates that “the BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate,” to what extent will entities be required to prove that BES interrupting device operations were not caused by a Protection System operation? The potential risk of failing to satisfy Requirement R1 seems high enough that entities may take costly measures to ensure zero defects, out of an abundance of caution, by excessively reviewing BES interrupting device operations. This additional cost could be better served in other areas to support BES reliability. Perhaps this issue could be addressed in the Application Guidelines.</p> <p><b>Response:</b> The Requirement is written so that only Protection System operations that occur “under the circumstances Parts 1.1 through 1.3” be evaluated for Misoperation. No change made.</p> <p>In the Application Guidelines for Requirement R1, change “For the case,…” to “For the case in which a…” Furthermore, should this paragraph be included under the Requirement R2 portion of the Application Guidelines?</p> <p><b>Response:</b> The drafting team provided an alternative clarification “For the case where a BES interrupting device…” Clarification made. The drafting team disagrees that this text needs to be included in the Guidelines and Technical Basis under Requirement R2.</p> <p>In the Application Guidelines for Requirements R1 and R3, change</p> <p style="padding-left: 40px;">“The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion”</p> <p>to something like</p>

Organization	Yes or No	Question 3 Comment
		<p>“The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred.”</p> <p>The concern is that the CEA could require an entity to leverage all available data before determining that a Misoperation did not occur.</p> <p><b>Response:</b> The drafting team added the clarification “In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred.” Clarification made.</p> <p>Tacoma Power appreciates the following paragraph in the Application Guidelines for Requirement R2:</p> <p>“A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the GO and TO functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.”</p> <p><b>Response:</b> Thank you for your comment.</p> <p>In the Application Guidelines for Requirement R4, Example R4a, was the scheduling activity on 03/24/2014 considered to be the first investigative action pursuant to Requirement R4, or did the first investigative action pursuant to Requirement R4 occur on 4/10/2014?</p>

Organization	Yes or No	Question 3 Comment
		<p><b>Response:</b> The drafting team added a clarification “as the first investigative” action to Examples R4b and R4b.</p> <p>Regarding Requirements R1, R3, and R4, is the date when an entity identifies that its Protection System component(s) caused a Misoperation the date that they officially make the identification?</p> <p><b>Response:</b> Yes.</p> <p>As long as an entity is compliant with Requirement R1 or R3, as applicable, are they afforded some discretion as to the identification date?</p> <p><b>Response:</b> The date a Misoperation is identified by the owner of the Protection System component(s) that caused a Misoperation would become the “official date” from which the Compliance Enforcement Authority would measure compliance with Requirement R1 (or R3 for the notified entity). Note that if the “cause” of an identified Misoperation was not identified in Requirements R1 (or R3 for the notified entity), the entity is obligated under Requirement R4 to perform at least one investigative action at least once every two full calendar quarters after the Misoperation was first identified. No change made.</p> <p>It seems like the timeline for Requirement R4 should be based on 120 calendar days of the BES interrupting device operation, for Misoperations identified pursuant to Requirement R1, or the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, for Misoperations identified pursuant to Requirement R3. As written now, those entities who quickly identify Misoperations will have compliance obligations under Requirement R4 sooner. On the other hand, an entity that delays officially identifying a Misoperation could be looking for causes ahead of time such that they effectively bypass Requirement R4. Perhaps this issue could be addressed in the Application Guidelines. The objective here is not to make</p>

Organization	Yes or No	Question 3 Comment
		<p>the standard more complicated but to avoid misunderstanding that might surface during an audit.</p> <p><b>Response:</b> Each of the time periods in the Requirements is discreet. Once a Misoperation is identified, the entity must either go to Requirement R4 (Misoperation without a cause) or Requirement R5 (develop a CAP because the cause is known). The drafting team added the “Requirement Time Periods” section to the Guidelines to provide additional clarity.</p> <p>Similarly, regarding Requirement R4 and R5, is the date when an entity determines the cause(s) of a Misoperation the date that they officially make the determination?</p> <p><b>Response:</b> Yes.</p> <p>Perhaps this issue could be addressed in the Application Guidelines. Again, the objective here is not to make the standard more complicated but to avoid misunderstanding that might surface during an audit.</p> <p><b>Response:</b> The drafting team provided clarification in the Guidelines and Technical Basis under the heading “Requirement Time Periods.” Clarification made.</p> <p>In the Application Guidelines for Requirement R6, change “...were postponed due resource...” to “...were postponed due to resource...”</p> <p><b>Response:</b> The drafting team corrected the grammar.</p> <p>If manual intervention in response to a Protection System failure to operate is required, this could imply that both the primary Composite Protection System and remote backup Composite Protection System(s) failed to operate, assuming that remote backup could be configured reliably to detect the fault under the pre-fault power system conditions. Would this condition automatically mean that multiple Composite Protection Systems, potentially at multiple locations (both primary and</p>

Organization	Yes or No	Question 3 Comment
		<p>remote backup), misoperated? Perhaps this issue could be addressed in the Application Guidelines.</p> <p><b>Response:</b> Under the scenario described above, multiple “Failure to Trip” Misoperations and would be likely to have occurred. No change made.</p>
Independent Electricity System Operator	No	<p>We do not agree with the part on Composite Protection System, for the reasons indicated under Q1, above.</p> <p><b>Response:</b> Please see the response under Question #1.</p>
Oncor Electric Delivery LLC	No	<p>Since the last Standard draft, the SDT has added a new example on page 29 of the Application Guideline which states</p> <p style="padding-left: 40px;">“Example 7d: A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush following a maintenance outage. Only the high-side breaker opens since the low-side breaker had not yet been closed. Since closing the breaker put the transformer bank into service, this is a Misoperation.”</p> <p>Although this scenario would be an undesired trip, without the low side breaker closed the transformer will not feed load. With that said, tripping of the high side will not compromise reliability of the BES although it is undesirable. Oncor has not seen a perfect relay that will respond ideally during the reenergization of a transformer with magnetizing current. For the reason just described, the possibility of tripping a transformer unnecessarily during energization (with no load connected) is preferable to desensitizing the protection further such that it might not operate when necessary.</p> <p><b>Response:</b> The drafting team recognizes this situation; however, the scenario should be classified as a Misoperation. If so, the entity may address not making any changes to the Protection System under Requirement R5 by making a declaration why</p>

Organization	Yes or No	Question 3 Comment
		corrective actions are beyond the entity’s control or would not improve BES reliability, and that no further corrective actions will be taken. No change made.
CenterPoint Energy	No	<p>CenterPoint Energy recommends adding additional examples to help provide consistent reporting of Misoperations. Examples for Breaker failure events (stuck breaker) and additional examples of the more common “Unnecessary Trip – During Fault” category would be helpful. Additional examples would help clarify the interrelationship between the “Slow Trip – During Fault” and the “Unnecessary Trip – During Fault” categories. The following comments and additional examples are provided for consideration:</p> <p><b>Response:</b> The drafting team has provided examples (see Examples 3b, 5b, and the 3<sup>rd</sup> bullet under the section “Composite Protection System – Breaker Failure Example”) in the Guidelines and Technical Basis. Clarification made.</p> <p>Example 1e: The Composite Protection System for a bus does not operate during a bus fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one “Failure to Trip – During Fault” Misoperation of the bus Composite Protection System.</p> <p><b>Response:</b> The drafting team has provided an Example 1e in the Guidelines and Technical Basis. Clarification made.</p> <p>Example 3b: A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical fault clearing time for a line fault in conjunction with a breaker failure (stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element’s Composite Protection System. If</p>

Organization	Yes or No	Question 3 Comment
		<p>a generating unit’s Composite Protection System operates due to instability caused by failure of a breaker’s Composite Protection System, it is not an “Unnecessary Trip – During Fault” Misoperation of the generating unit’s Composite Protection System. This event would be a “Slow Trip – During Fault” Misoperation of the breaker’s Composite Protection System.</p> <p><b>Response:</b> The drafting team has provided this Example 3b, almost verbatim, in the Guidelines and Technical Basis. Clarification made.</p> <p>Example 3c: A line connected to a generation interconnection station is protected with two independent high-speed pilot systems due to dynamic stability reasons. The Composite Protection Scheme for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a fault on this line, the two pilot systems fail to operate; and, the time-overcurrent scheme operates clearing the fault with no generating units or other Elements tripping (no over-trips). This event is not a Misoperation.</p> <p><b>Response:</b> The drafting team has provided an Example 3c in the Guidelines and Technical Basis. Clarification made.</p> <p>Example 3d: A line connected to a switching station is protected with two independent high-speed pilot systems for reasons other than voltage or dynamic stability (e.g., short line length or to reduce backup clearing times for service reliability). The Composite Protection Scheme for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. The step distance and time-overcurrent schemes and Protection Systems of other line terminals are intentionally not coordinated with the step distance and time-overcurrent schemes of this line because high-speed tripping is expected on the line with the two independent high-speed pilot systems. During a fault on the line with the two independent high-speed pilot systems, the two pilot systems fail to operate; however, the time-</p>

Organization	Yes or No	Question 3 Comment
		<p>overcurrent scheme operates clearing the fault however, another line in the system trips (over-trips). The trip of the other line in the system is not an “Unnecessary Trip – During Fault” Misoperation as miscoordination was expected for the conditions that occurred. The event on the line with the two pilot systems is a “Slow Trip – During Fault” Misoperation, although the analysis and Corrective Action Plan would address the two pilot schemes failure to trip.</p> <p><b>Response:</b> The drafting team notes this example is unnecessary due to its complexity therefore it has not been included in the Guidelines and Technical Basis. No change made.</p> <p>Example 5b: An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared fault on a different line is a Misoperation. The fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip of the line protection; therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.</p> <p><b>Response:</b> The drafting team has provided an Example 5b in the Guidelines and Technical Basis. Clarification made.</p> <p>Example 5c: A line connected to a switching station is protected with two independent high-speed pilot systems for reasons other than voltage or dynamic stability (e.g., short line length or to reduce backup clearing times for service reliability). The Composite Protection Scheme also includes step distance and time-overcurrent schemes in addition to the two pilot systems. The step distance and time-overcurrent schemes and Protection Systems of other line terminals are intentionally not</p>

Organization	Yes or No	Question 3 Comment
		<p>coordinated with the step distance and time-overcurrent schemes of this line because high-speed tripping is expected on the line with two independent high-speed pilot systems. During a fault on the line with two independent high-speed pilot systems, the two pilot systems fail to operate; however, the time-overcurrent scheme operates clearing the fault and, in conjunction, another line in the system trips (over-trips). The trip of the other line is not an “Unnecessary Trip – During Fault” Misoperation as miscoordination was expected for the conditions that occurred. The event on the line with the two pilot systems is a “Slow Trip – During Fault” Misoperation, although the analysis and Corrective Action Plan would address the schemes failure to trip.</p> <p><b>Response:</b> The drafting team notes this example is unnecessary due to its complexity therefore it has not been included in the Guidelines and Technical Basis. No change made.</p> <p>Additionally, in the Application Guidelines, it appears the following paragraph at the end of the “Unnecessary Trip – Other Than Fault” examples is misplaced and could be deleted: “If a coordination error was at the remote terminal (i.e., set too fast), then it was an “Unnecessary Trip,” category of Misoperation at the remote terminal.”</p> <p><b>Response:</b> The drafting team has relocated the text in the Guidelines and Technical Basis. Clarification made.</p> <p>CenterPoint Energy recommends adding the following wording as the last two paragraphs at the end of the examples for “Unnecessary Trip – During Fault” examples to parallel the wording for the “Slow Trip – During Fault” category:</p> <p>In analyzing the Protection System for Misoperation, the entity must also consider the “Slow Trip – During Fault” category to determine if an “slow trip” applies to the Protection System operation of an Element other than the faulted Element.</p>

Organization	Yes or No	Question 3 Comment
		<p><b>Response:</b> The drafting team disagrees that the suggestion “In analyzing...” provides additional clarity. No change made.</p> <p>If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.</p> <p><b>Response:</b> The drafting team has provided an Example 5c in the Guidelines and Technical Basis. Clarification made.</p>
Arizona Public Service Company	Yes	
MRO NERC Standards Review Forum	Yes	<p>The clarifications and additions to the Application Guide are helpful to the understanding of the standard. We recommend these type of guides be with all proposed Standards in the future.</p> <p><b>Response:</b> Thank you for your comment. Organization	Yes or No	Question 3 Comment
		<p>application guidelines. However, in some cases, the intent of the drafting team and the language of the requirements simply do not align.</p> <p>For example, language was inserted into the Requirement R3 discussion on page 31 to clarify that a registered entity is “to classify an operation as Misoperation if the available information leads to that conclusion” and “allows an entity to classify an operation as a Misoperation if an entity is not sure.” Neither Requirement R3 nor Requirement R1 language provide this flexibility and is thus inconsistent with the language in the application guidelines. R1 and R3 are both very clear that the responsible entity has 120 days (for R3 or the later of 60 days after notification) to identify whether its Protection System operations were a Misoperation. This language is definitive. We do not see how this language allows an entity to classify an operation as Misoperation if it is not sure.</p> <p>Again, the requirement language states clearly that the responsible entity has to identify whether its Protection System components result in a Misoperation. There is no room in the language of the requirement for uncertainty. This further leads to a problem with R4 because R4 would require R1 and R3 to be violated since both require determination of whether a Misoperation occurred and R4 identifies a situation that can only occur after a violation of R1 or R3. Even the last Severe VSL for both R1 and R3 supports our argument. Failure to identify a whether or not a Protection System operation is a Misoperation is a Severe VSL. We suggest the drafting further refine Requirements R1, R3, and R4 collectively to match the intent demonstrated in the application guidelines.</p> <p><b>Response:</b> The performance under Requirement R1 is that the entity identify Protection System operations that are Misoperations. The requirement does not preclude the entity from using judgment in the classification of the operation if the available evidence is inconclusive. The drafting team contends that the language in the</p>

		<p>Protection System designed to protect one Element operates for a problem on another Element is considered a Misoperation.</p> <p><b>Response:</b> The drafting team added a number of examples to clarify “unnecessary trips” in the Guidelines and Technical Basis. A Composite Protection System designed to protect one Element that operates for a problem on another Element is not necessarily a Misoperation. It could be a correct operation for a “Failure to Trip” elsewhere. Clarifications made to the Guidelines and Technical Basis.</p>
Tri-State Generation and Transmission Association, Inc.	Yes	
Flathead Electric Cooperative, Inc.	Yes	<p>still have trouble with how the word composite is being used, but do agree that the guidelines provide clarity on the drafting teams intent, unsure the compliance impact on the requirements</p> <p><b>Response:</b> Thank you for your comment.</p>
Wolverine Power Supply Cooperative, Inc.	Yes	
Texas Reliability Entity		No comments.

**4. If you have any other comments on this Standard that were not provided in response to the previous questions, please provide them here:**

**Summary Consideration:** The numerical values are approximate and are intended to provide a gauge of the concerns raised by industry stakeholders. The number of comments noted is analogous to the number of entities (e.g., five comments means five entities provided a comment). The following summary does not include items addressed in the previous summaries.

This section contained two individual comments that were different from previous summaries above. The comment suggested updating the flowchart wording based on clarifications made to the standard. The drafting team updated the draft PRC-004-3 Reliability Standard, its flowchart, and other related project documents for alignment such as the Implementation Plan which earlier posting revisions to the Misoperation definition failed to include.

Second, an entity pointed out that Evidence Retention section states 12 months is the required evidence retention period for the Requirements. The commenter also noted that the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The drafting team clarified the evidence retention periods are “a minimum of” time an entity is required to retain specific evidence to demonstrate compliance. The drafting team used NERC guidance in determining the appropriate minimum evidence retention periods.

The following multiple minority comments did not result in a clarification or revision to the draft PRC-004-3 Reliability Standard or other related project documents. Five comments by 15 individual presented general questions to the drafting team. The drafting team provided responses to these questions; for example, responses included as to whether the scenario was a Misoperation, not a Misoperation, or other response applicable to the rationale of certain Requirements. Three comments by 35 individuals requested either information on why topics like undervoltage load shedding (UVLS), and dispersed generation resources (DGR) concerning the new BES definition implementation, were not addressed in this version. The drafting team noted that it cannot base criteria or applicability in the proposed draft PRC-004-3 Reliability Standard based on projects that are in active development. Completing this version three will enable other drafting teams to address UVLS and DGR topics. Two comments represented by four individuals were concerned about the amount of time to develop a Corrective Action Plan (CAP) in Requirement R5. The drafting team contends that 60 calendar days is an adequate amount of time to develop a high level evaluation and plan. Timeframes associated with any actions taken as a part of the evaluation of other Protection Systems are outside the scope of the standard. Two individual comments suggested significant changes to the standard. The drafting team contends that the draft PRC-004-3 Reliability Standard as written

achieves the stated Purpose and therefore declines to make wholesale modifications to the Requirements. For example, there is no requirement to provide a CAP to the Reliability Coordinator in the current version PRC-004-2.1a Reliability Standard, although Regional procedures may have dictated the entity to do so.

The following are comments from single entities and individuals. There was a comment concerning the review and reporting of operations of jointly-owned Composite Protection System components as opposed to multiple entities owning separate components. The drafting team contends that the reporting of Misoperations is outside the scope of the draft PRC-004-3 Reliability Standard and is being addressed by the NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., “data request”). Absent an agreement, all owners of a Protection System will have a compliance responsibility. Also, one comment asked when is a change to a CAP considered failure to implement. The drafting team noted that modifying a CAP does not constitute a failure to implement a CAP. According to Requirement R6, the audit approach to determining a failure to implement a CAP is addressed by the previously posted draft Reliability Standard Audit Worksheet (RSAW). As the entity completes the actions within a CAP, the entity will update the CAP periodically, thus the CAP will demonstrate implementation.

Another single entity commented that an entity in Requirement R3 should be afforded a full 120 calendar days to review its Protection System similar to entities that initiate reviews under Requirement R1. The drafting team responded that when an entity receives notification of a Protection System operation by the BES interrupting device owner, the Protection System owner is allotted a minimum of 60 calendar days to identify whether it was a Misoperation and could be as much a 120 calendar days from the date the BES interrupting device operated depending on when notification occurs. A minimum time period that is less than 120 calendar days is provided on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

Another entity commented that an entity could forego performing Requirement R1 or R3 and conduct its review under Requirement R4. The drafting team contends that Requirements R1 and R3 do not preclude an entity from determining the cause of an identified Misoperation (Note: Requirement R2 is for notification to others.); however, Requirement R4 becomes applicable only after a Protection System operation is “identified as a Misoperation” under Requirement R1 or R3 and does not have an identified cause. Requirement R4 is an exception-based Requirement and is only performed when the entity did not identify the cause(s) of the Misoperation in its performance in either Requirement R1 or R3.

Last, a single commenter suggested shortening the performance time periods in Requirement R4 for performing investigative action. The drafting team contends that the periodic action balances the compliance burdens and focuses the entity’s effort on determining the cause(s) of the Misoperation while providing measurable evidence. In addition, certain planned investigative actions may require

months or years to schedule and complete due to outages and other factors. Additionally, the drafting team contends that listing a defined time limit to complete the Requirement would actually decrease reliability. Shortening time limits would have the unintended consequence of causing an entity to discontinue its investigation. The Requirement allows the entity to either determine the cause or conclude its investigation when it is confident that a cause cannot be determined.

Organization	Question 4 Comment
<p>Southern Company: Southern Company Services, Inc.; Alabama Power Company; Georgia Power Company; Gulf Power Company; Mississippi Power Company; Southern Company Generation; Southern Company Generation and Energy Marketing</p>	<p>a) The multiple timing process periods are an added burden and still unclear in the standard. However, the application notes do provide some guidance {R3};</p> <p><b>Response:</b> The drafting team provided clarification in the Guidelines and Technical Basis under the heading "Requirement Time Periods." Clarification made.</p> <p>b) The wording in R3 of the Process Flow Chart on the last page of the draft standard should match that of the requirement R6 (change "greater" to "later" in the chart). There is no evidence that entities have not been doing due diligence in investigating and correcting misoperations, therefore, the addition of the various timelines serve only to generate additional paperwork.</p> <p><b>Response:</b> The drafting team has corrected the wording in the flowchart. Correction made.</p>
<p>ACES Standards Collaborators</p>	<p>(1) Example 3 on page 25 should be updated. The first sentence is inconsistent with the proposed definition of Misoperation. A failure of a line's Composite Protection System to operate as quickly as intended is only a Misoperation if another Element's Composite Protection System operation. Please append the following clause to the first sentence: "if another Element's Composite Protection System operated."</p> <p><b>Response:</b> Clarification made.</p> <p>(2) The VSLs for R3 rely only on the 120 day portion of the language in the requirement. They do not include the "later of" language relying on 60 days if more than 60 days has passed since the original Protection System Operation. We suggest the VSLs should be updated accordingly reflect the requirement in totality.</p>

Organization	Question 4 Comment
	<p><b>Response:</b> The VSL is based on tardiness regardless of whether the entity is afforded 120 calendar days from the operation of the BES interrupting device or 60 calendar days of notification by the initiating entity pursuant to Requirement R2. No change made.</p> <p>(3) To avoid requiring a registered entity from providing all BES interrupting device operations, the Compliance Assessment Approach for R1 in the RSAW needs to be modified to be consistent with the requirement and the evidence request section. The auditor should only sample BES interrupting device operations that meet the criteria Requirement R1 Part 1.1 through 1.3 and is provided as evidence in the evidence requested section. Please add “that meet criteria Requirement R1 Part 1.1 through 1.3” after “interrupting device operations” in the first and second rows of the RSAW’s Compliance Assessment Approach for R1.</p> <p><b>Response:</b> The drafting team has provided the RSAW comment to NERC Compliance for consideration and modification.</p> <p>(4) Please update the RSAW’s Note to Auditor section to review the Application Guidelines section for Requirement R2 for small entities as well as vertically integrated utilities. The Application Guidelines make clear that small entities with a single protection engineer are not expected to provide notification requirements between the GO, TO and DP because they would already be aware since they evaluate all Protection System operations including transmission and generation.</p> <p><b>Response:</b> This concern is addressed in the paragraph following Example R2b in the Guidelines and Technical Basis under the heading “Requirement R2.” The drafting team has provided the RSAW comment to NERC Compliance for consideration and modification.</p> <p>(5) Thank you for the opportunity to comment.</p>
CenterPoint Energy	<p>(a) In the Application Guidelines, CenterPoint Energy recommends changes to account for high-speed tripping for internal transformer faults by other types of protection systems (e.g., sudden pressure) that are not specifically included in the proposed definition of Composite Protection System. The following additional wording at the end of Examples 1a and 1b is suggested:</p>

Organization	Question 4 Comment
	<p>Example 1a: A failure of a transformer's Composite Protection System to operate for a transformer fault is a Misoperation unless other protection schemes (e.g., sudden pressure) operated.</p> <p>Example 1b: A failure of a "primary" transformer relay (or any other component) to operate for a transformer fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System or other protection schemes (e.g., sudden pressure) operated.</p> <p><b>Response:</b> The drafting team contends that the scenario that is described does not meet the definition of "Misoperation." For a high impedance transformer Fault, the non-operation of a differential relay due to low Fault current levels is not a failure to operate as intended for protection purposes. A similar example (R1b) has been added to the Guidelines and Technical Basis. Clarification made.</p> <p>(b) The proposed Requirement R4 wording currently includes the following:</p> <p style="padding-left: 40px;">"...shall perform investigative action(s) to determine the cause of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes..."</p> <p>CenterPoint Energy understands this wording is to provide a mechanism to continue investigative work to determine the cause of a Misoperation when the cause cannot be determined during the allotted time periods in Requirements R1 or R3. CenterPoint Energy recommends additional wording to allow the investigation to be completed in the quarter that the misoperation occurs ("partial quarter") for cases where the investigation and tests, including any needed outages&lt; can be completed in the partial quarter and suggests the following wording:</p> <p style="padding-left: 40px;">"...shall perform investigative action(s) to determine the cause of the Misoperation at least once during the partial quarter when the misoperation occurs or every two full calendar quarters after the Misoperation was first identified, until one of the following completes..."</p>

Organization	Question 4 Comment
	<p><b>Response:</b> The drafting team contends that the suggestion does not provide any additional benefit over the current wording and may have the unintended consequence of shortening the time period for performance and being in compliance. See Example R4a in the Guidelines and Technical Basis for additional detail. No change made.</p>
<p>Florida Municipal Power Agency</p>	<p>2. FMPA does not feel our previous comment regarding the inherent problems with the concept of comparing Protection System performance to a single set of generic categories as tied to compliance was addressed. We feel many of the issues and challenges in this revised standard would easily be addressed by allowing entities to compare the performance of their relays with their Protection System Design Philosophy. In the absence of a mandatory electric reliability standard, this is how Utilities would determine “mis-operations” – did the Protection System/component perform according to the intended design?</p> <p><b>Response:</b> The drafting team contends that design philosophies inherently include the principles of dependability and security. Each entity using its particular design philosophy would lead to less consistent classification of Misoperations. No change made.</p> <p>3. In the Facilities section – what is the reason PRC-004-3 cannot use the same description of “Protection System” as PRC-005-2? Would these two standards not inherently be designed to cover the very same Facilities?</p> <p><b>Response:</b> The draft PRC-004-3 Reliability Standard uses the defined term in the <i>Glossary of Terms Used in NERC Reliability Standards</i> without the additional level of specificity provided in PRC-005-2. The reasoning was to avoid a subsequent change to the draft PRC-004-3 Reliability Standard if additional equipment changed in the future. No change made.</p> <p>4. FMPA accepts the SDT’s revised definition of Composite Protection system which no longer singles out step-distance/intentional remote backup schemes. However, we in general do not agree with the use of Composite Protection System in the standard. This term is being used to reduce what is considered a “Misoperation”. While FMPA supports more relaxed Requirements for</p>

Organization	Question 4 Comment
	<p>mitigating/remediating a Misoperation when another part of the Composite Protection System successfully prevents any negative impact to the BES, a Misoperation is still a Misoperation. If the goal is to keep statistics on how we are doing as an industry, we need to tie those statistics to basic characteristics that are less subject to interpretation and change. Misoperation should still be tied to the failure of equipment. The fact that a different part of the Composite system properly functioned is additional information. Again, we support the idea that a properly designed Composite Protection system should mean an entity does not necessarily need to make changes, but the Misoperation should still be tracked.</p> <p><b>Response:</b> The drafting team contends that “Composite Protection System” should be based on the principle that an Element’s multiple layers of protection are intended to function collectively. Also, the new definition supports consistent reporting of Misoperations under the Section 1600 data request because all entities, under the new definition, will be evaluating their Composite Protection Systems in the same manner. No change made.</p> <p>5. What is the reason the defined Glossary term “Fault” has been replaced with “fault” throughout the document?</p> <p><b>Response:</b> The drafting team re-evaluated the general use of “fault” and the <i>Glossary of Terms Used in NERC Reliability Standards</i> definition of “Fault.” The evaluation resulted in reverting certain occurrences that should refer to the glossary definition. Clarification made.</p>
Tacoma Power	<p>Although the term is discussed in the Application Guidelines, consider formally defining the term “interrupting device.”</p> <p><b>Response:</b> The drafting team asserts that the phrase “BES interrupting device” is widely understood by industry and is described in the Guidelines and Technical Basis under the heading “Definitions.” No change made.</p> <p>In Requirement R3, should “BES interrupting device(s)” be “BES interrupting device”?</p>

Organization	Question 4 Comment
	<p><b>Response:</b> The parenthetical “s” is added here because the Protection System may have tripped more than one BES interrupting device. No change made.</p> <p>In Requirement R4, should “the cause” be “the cause(s)”?</p> <p><b>Response:</b> Parenthetical “s” added.</p> <p>In Requirement R5, should “a cause” be “the cause” or “the cause(s)”?</p> <p><b>Response:</b> This use of “cause” is singular because the Corrective Action Plan timing is triggered off of the “first” identified cause. No change made.</p> <p>In the Rationale for R6, change “tivities” to “activities.”</p> <p><b>Response:</b> Correction made.</p>
American Electric Power	<p>As currently written, R5 may be interpreted as requiring the entity to both develop a CAP and complete the evaluation of the CAP’s applicability to other Protection Systems within 60 days.</p> <p><b>Response:</b> Yes, that is correct.</p> <p>For large entities, or in cases where the evaluation requires equipment outages, completing the evaluation of applicability within 60 days could be impossible. R5 should be revised to clearly state that the entity is only required to develop a CAP within 60 days. There should be an option to include the evaluation within the CAP. This would enable entities to complete the evaluation as part of the CAP and within a time window that is tailored to the scope of the corrective action and quantity of potentially applicable Protection Systems. AEP supports the concept of evaluating a corrective action’s applicability to other Protection Systems.</p> <p><b>Response:</b> The drafting team contends that 60 calendar days is an adequate amount of time to develop a high level evaluation. Timeframes associated with the execution of the evaluation are outside the scope of the standard. No change made.</p>

Organization	Question 4 Comment
	<p>However, the standard requirements provide no means of measuring what is an adequate evaluation. Without this, an auditor could question the adequacy of an entity’s evaluation, decide that the entity’s actions were not an evaluation and subsequently find the entity non-compliant with R5. We believe that the SDT’s Application Guide examples were an effort to demonstrate what would be acceptable. However, the examples are not exhaustive and therefore do not eliminate the audit risk. AEP believes that subject matter experts are in the best position to determine evaluation scope and content. AEP recommends that in lieu of adding additional examples in the Application Guideline, the drafting team should consider the possibility of an auditor invalidating an evaluation. The requirement should be revised so that it places bounds on this scenario and provide entities with certainty in how R5 might be reviewed by an auditor.</p> <p><b>Response:</b> The drafting team contends that there are no provisions within the draft PRC-004-3 Reliability Standard directing an auditor to determine the adequacy of an evaluation. No change made.</p> <p>AEP supports the overall efforts of the drafting team in the fundamental approach taken in the proposed standard. AEP has chosen to vote in the affirmative despite our concerns regarding the CAP and evaluation within R5, and how their compliance would ultimately be determined by an auditor.</p> <p><b>Response:</b> Thank you for your comment and support.</p>
Independent Electricity System Operator	<p>As indicated in our previous comments, we disagreed with the omission of UVLS while UFLS is included. The SDT’s response indicates that UVLS has not been included in the proposed standard’s Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 - Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 - Under-Voltage Load Shedding Program Performance. We do not find this rationale sufficient to justify the inclusion of UFLS but exclusion of UVLS since both need to be assessed and treated under the same light. Note that the SAR for Project PRC-022-1 is being revised to include UFLS. We suggest the PRC-004 SDT to</p>

Organization	Question 4 Comment
	<p>coordinate with the PRC-022 SDT to apply a consistent approach to addressing Misoperations of UFLS and UVLS.</p> <p><b>Response:</b> Undervoltage load shedding (UVLS) has not been included in the draft PRC-004-3 Reliability Standard’s Applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Adding UVLS in PRC-004-3 at this point would create unforeseen issues with having Requirements in two different Reliability Standards address the same activity.</p> <p>The purpose of the UFLS project is to address an outstanding FERC directive and review PRC-006-1 to determine if any steady state modifications are appropriate (i.e., Paragraph 81 criteria and recommendations of the Independent Expert Review Panel). Specifically, the other project’s standard drafting team will revise PRC-006-1 to address the directive included in FERC Order No. 763 and to provide for clear, unambiguous design and documentation requirements for automatic UFLS programs. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard. The drafting team added additional text to the background to explain both UVLS and UFLS. Clarification made.</p>
Bonneville Power Administration	<p>BPA believes that there is one other gap that has not been identified. This is the case where a TO, GO, or DP owns a BES interrupting device that operates, but does not own any of the Composite Protection System. This is a real scenario. In this situation, the owner of the BES interrupting device is not subject to R1 because R1.2 is not true, i.e. the owner of the BES interrupting device does not own all or part of the Composite Protection System. Likewise, the owner of the BES interrupting device is not subject to R2 because R2.1.1 is not true, i.e. the owner of the BES interrupting device does not share ownership of the Composite Protection System -- they don’t have any ownership of the Composite Protection System. With the owner of the BES interrupting device not subject to R1 or R2, the operation of the BES interrupting device would not be investigated. BPA suggests that this problem could be remedied with a slight change in language to R2.1.1 as follows: “The BES interrupting device owner does not own any of the Composite Protection System or shares the</p>

Organization	Question 4 Comment
	<p>Composite Protection System ownership with any other owner.” This change would require an owner of a BES interrupting device that does not own any of the Composite Protection System to provide notification of the operation to the owners of the Composite Protection System within 120 days per R2.1 so that they could then investigate the operation.</p> <p><b>Response:</b> The drafting team asserts that according to definition of Protection System which became effective April 1, 2013, the BES interrupting device owner owns a component of the Protection System, namely the trip coil(s) of that BES interrupting device (at a minimum). No change made.</p>
Cleco	<p>Cleco will continue to vote "Negative" as long as the SDT continues to support in R1 and R2 the deadline of 120 days to determine if an operation is a misoperation. There should be exceptions built into the standard when there are circumstances that create numerous outages such as ice storms or hurricanes. For example; In FAC-003, a footnote allows for circumstances that are beyond the control of the Registered Entity. Also, the standard should apply to all protection systems and the SDT should not exclude SPS or RAS.</p> <p><b>Response:</b> We understand your concern, however, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: “In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties.” While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. Remedial Action Schemes (RAS) and Special Protection Systems (SPS) are being addressed by Project 2010-05.2 – Special Protection Systems (Phase 2 of this project). No change made.</p>
Tennessee Valley Authority	<p>Currently, there is not a clear indication of regulatory relief for an entity following a major natural disaster. When recovering from major events such as Hurricane Sandy, the first priority is to get lights on and rebuild the system. Because a large natural event produces an influx of unique system</p>

Organization	Question 4 Comment
	<p>configurations that may not have been planned for by system planners or relay setters, analyzing and investigating all the operations and misoperations that occur takes months and is not the top priority for a utility that endures such an event. We respectfully request that the standard drafting committee add wording that states something similar to the following.</p> <p>In the event that the reporting entity is the victim of a weather related Category 4 or 5 event, 90 days are added to each of the required deadlines for misoperations caused by the weather related event.</p> <p><b>Response:</b> NERC and the Regional Entity do not have the authority to provide flexibility regarding the performance (timeframes) of a Reliability Standard in unique extenuating circumstances. However, the Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, says: “In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties.” While the drafting team recognizes the concern and that there are other standards which have similar provisions for natural disasters, the sanction guidelines provide sufficient flexibility to address extenuating circumstances in the event that they occur. No change made.</p>
<p>Electric Reliability Council of Texas, Inc.</p>	<p>ERCOT is concerned about Requirement 1 that allows entities 120 days to identify a misoperation. ERCOT believes this might negatively impact the reliability of the grid. Currently, entities have the responsibility to analyze disturbances to identify misoperations. A misoperation could indicate a greater threat to reliability and that threat could exist, unknown, for several months while entities make determinations if operations are truly a misoperation.</p> <p><b>Response:</b> The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load and the opportunity to identify any Misoperations which were initially missed. No change made.</p>

Organization	Question 4 Comment
	<p>The responsible entity under the new Standard will track misoperations and develop Corrective Action Plans (CAPs). There is no responsibility for the entity to share that information with Reliability Coordinators who have the responsibility for the wide area view of their Reliability Coordinator area. ERCOT is also concerned that while the responsible entity may develop CAPs, there is no responsibility of coordination of the CAP with other potentially affected entities.</p> <p><b>Response:</b> If a CAP results in a modification to a Protection System, PRC-001 – System Protection Coordination requires coordination with other owners. No change made.</p> <p>ERCOT is therefore recommending the following:</p> <p>R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 24 hours, identify whether its Protection System component(s) caused a Misoperation on an element that is part of an Interconnection Reliability Operating Limit under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]</p> <p>1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and</p> <p>1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and</p> <p>1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.</p> <p>R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 2 business days, identify whether its Protection System component(s) caused a Misoperation on an element at 200 kV or more under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]</p>

Organization	Question 4 Comment
	<p>2.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and</p> <p>2.2 The BES interrupting device owner owns all or part of the Composite Protection System; and</p> <p>2.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.</p> <p>R3. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 5 business days, identify whether its Protection System component(s) caused a Misoperation on an element that is a BES element under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]</p> <p>3.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and</p> <p>3.2 The BES interrupting device owner owns all or part of the Composite Protection System; and</p> <p>3.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.</p> <p>R7. Each Transmission Owner, Generator Owner, and Distribution Provider shall provide the CAP developed in R5, to the Reliability Coordinator with the expected date of completion, how the Composite Protection System will operate until the CAP is completed and detailed information of how the entity will coordinate the CAP with other affected entities if applicable.</p> <p><b>Response:</b> The drafting team contends that the draft PRC-004-3 Reliability Standard as written achieves the stated Purpose and therefore declines to make wholesale modifications to the Requirements. There is no requirement to provide a Corrective Action Plan to the Reliability Coordinator in the current version (i.e., PRC-004-2.1a) of the standard, although Regional procedures may have dictated the entity to do so. No change made.</p>

Organization	Question 4 Comment
Wisconsin Electric Power Company	<p>Facilities, Section 4.2.1, should have an exclusion for individual dispersed generators, or have its applicability limited to the point where the generators are aggregated to greater than 75 MVA. It is critical for the PRC-004-3 SDT to coordinate with the SDT for Project 2014-01, Standards Applicability for Dispersed Generation Resources, to assure that the new standard will have appropriate applicability consistent with BES reliability.</p> <p><b>Response:</b> It is not practical to implement changes to the draft PRC-004-3 Reliability Standard based on another project that is in active development. The standard drafting team for Project 2014-01 is aware of this concern and will be addressing the topic following adoption of the draft PRC-004-3 Reliability Standard. No change made.</p>
Flathead Electric Cooperative, Inc.	<p>Generally feel that the requirements should be the sole place where the actual compliance requirements appear. Lot of information in measures, application guidelines, definitional changes that are not technically requirements but may be treated as such depending upon the audience.</p> <p><b>Response:</b> The Requirements of the draft PRC-004-3 Reliability Standard are the only requirements an entity must follow to be compliant. Other information such as Measures and Guidelines and Technical Basis support measurement, provide clarity, and intent of the standard. No change made.</p>
Tri-State Generation and Transmission Association, Inc.	<p>In response to Tri-State’s previous concern to the review and reporting of operations of jointly-owned Composite Protection System components as opposed to multiple entities owning separate components. The SDT stated</p> <p style="padding-left: 40px;">“While a Protection System may be contractually owned by multiple entities that are not jointly registered, all of the entities would ultimately be responsible for the requisite documentation and results”</p> <p>appears to require all entities to report the operation giving double jeopardy to each misoperation on jointly-owned Composite Protection System components, unless a contract speaks to the designated “Compliance Entity”. Typically compliance contracts take some time to come to fruition.</p>

Organization	Question 4 Comment
	<p>Is it the drafting team’s intent that misoperations be reported by multiple entities in this situation until a contract is finalized?</p> <p><b>Response:</b> The reporting of Misoperations is outside the scope of the draft PRC-004-3 Reliability Standard and is being addressed by the NERC Rules of Procedure, Section 1600 Request for Data or Information (i.e., “data request”). Absent an agreement, all owners of a Protection System will have a compliance responsibility. No change made.</p>
Pepco Holdings Inc	None
Oncor Electric Delivery LLC	<p>Oncor initially balloted affirmative; however, based on the changes in the Application Guide, Oncor’s ballot position has changed. Oncor’s comments have been provided for the SDT’s consideration (response to Question #3)</p> <p>Oncor requests the SDT please consider the additional comment below:</p> <p style="padding-left: 40px;">In “R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation under the following circumstances: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]</p> <p style="padding-left: 40px;">1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and</p> <p style="padding-left: 40px;">1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and</p> <p style="padding-left: 40px;">1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.”</p>

Organization	Question 4 Comment
	<p>The circumstances mentioned in 1.1 and 1.3 cause confusion when you do not have a protection system component cause the BES interrupting device operation in the event a BES device is operated by manual intervention.</p> <p>Oncor recommends that 1.3 be written to state:</p> <p>The BES interrupting device owner identified that its Protection System component(s) were designed to cause the BES interrupting device(s) operation.</p> <p><b>Response:</b> The drafting team made a clarification to Requirement R1, Part 1.3 to address this oversight. Part 1.3, as intended, now includes “manual intervention” as a circumstance. Clarification made.</p> <p>The request below is an outstanding request from Oncor’s previous comment period:</p> <p>The Extenuating Circumstances process, as outlined on page 30 of the Application Guidelines, relies too heavily on a subjective review by Enforcement to determine whether penalties will be imposed. In alignment with the Reliability Assurance Initiative Oncor recommends the evaluation of an Extenuating Circumstance be initially reviewed by Compliance Operations in accordance with the system-wide and regional risk framework, an entity’s inherent risk assessment and controls to ensure extenuating circumstances are not evaluated as a “one size fits all” and findings are determined in accordance with RAI versus an automatic Enforcement path. Furthermore, Oncor recommends the Registered Entity be allowed to request a formal "state of extenuating circumstance" and coordinate an extension to the 120 day deadline with the Regional Entity.</p> <p><b>Response:</b> The drafting team does not have the ability to make modifications to the Rules of Procedure. No change made.</p>
Exelon Companies	<p>Paraphrasing many commenters from draft 4, Exelon agrees emphasis on due dates from the time of an operation be reconsidered. There is a significant administrative burden imposed by the proposed approach not commensurate with gains in reliable operations. The drafting team can review previous comments to this effect as well as references to the use of “calendar” as used in the PRC-005</p>

Organization	Question 4 Comment
	<p>supplemental reference to preclude the need to have reviews done by a specific date. We disagree with the SDT response that timeframes as proposed are required to force entities to be diligent about identifying and correcting misoperations.</p> <p><b>Response:</b> The drafting team contends that the timeframes should be measured from the operation date of the BES interrupting device which makes the use of calendar months or quarters difficult. The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load. The Protection System Maintenance and Testing Reliability Standard (i.e., PRC-005) is based on recurring activities over longer periods than the draft PRC-004-3 Reliability Standard, which is event driven. No change made.</p>
Manitoba Hydro	<p>R6 -when is a change to a CAP considered failure to implement and therefore a violation of R6 (since R6 both requires implementation of a CAP and allows changes to the CAP)</p> <p><b>Response:</b> The drafting team contends that modifying a CAP does not constitute a failure to implement a CAP. According to Requirement R6, a failure to update the CAP when actions or timetables change until completed is a failure to implement the CAP. No change made.</p>
Northeast Power Coordinating Council	<p>Regarding Section 5: Background (page 6), additional justification to explain the application of the standard would be beneficial. As indicated in our previous comments, we disagreed with the omission of UVLS while UFLS is included. The SDT’s response indicates that UVLS has not been included in the proposed standard’s Applicability because Misoperations of UVLS relays are being addressed under Project 2008-02 – Undervoltage Load Shedding when modifying Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance. This rationale is not sufficient to justify the inclusion of UFLS but exclusion of UVLS since both need to be assessed and treated the same. Note that the SAR for PRC-022-1 is being revised to include UFLS. We suggest the PRC-004 SDT coordinate with the PRC-022 SDT to apply a consistent approach to addressing Misoperations of UFLS and UVLS.</p>

Organization	Question 4 Comment
	<p><b>Response:</b> Undervoltage load shedding (UVLS) has not been included in the draft PRC-004-3 Reliability Standard’s Applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Adding UVLS in PRC-004-3 at this point would create unforeseen issues with having Requirements in two different Reliability Standards address the same activity.</p> <p>The purpose of the UFLS project is to address an outstanding FERC directive and review PRC-006-1 to determine if any steady state modifications are appropriate (i.e., Paragraph 81 criteria and recommendations of the Independent Expert Review Panel). Specifically, the other project’s standard drafting team will revise PRC-006-1 to address the directive included in FERC Order No. 763 and to provide for clear, unambiguous design and documentation requirements for automatic UFLS programs. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard. The drafting team added additional text to the background to explain both UVLS and UFLS. Clarification made.</p> <p>Requirement R1 does not work for the case where manual intervention to operate the BES device was required. Parts 1.1 thru 1.3 are all ANDS. Part 1.3 requires the Interrupting Device to be operated by the Protection System. This conflicts with the idea in Part 1.1 of MANUAL intervention. If an operator manually opens a breaker because the Composite Protection System does not clear a fault then the Protection System could not have operated the interrupting device. Therefore the threshold R1 would not be met and no identification is required even though the Composite Protection System may have failed-to-trip. Suggest Part 1.3 be revised to read:</p> <p>The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation; or manual intervention was required to operate the BES interrupting device because its Protection System failed to operate.</p> <p><b>Response:</b> The drafting team made a clarification to Requirement R1, Part 1.3 that it includes manual intervention. Clarification made.</p>

Organization	Question 4 Comment
	<p>Requirement R1 can be rephrased to provide clarity to the relationship of Parts 1.1 thru 1.3 to R1. Present phrasing has the added phrase, under the following circumstances, following Misoperation where it can ambiguously modify Misoperation. Clearly the intent is to describe the circumstances that a BES device owner has to embark on a process to identify a Misoperation. There are two inputs prior to beginning the process of identification; first the operation of a BES interrupting device occurs and second that the attributes of Parts 1.1 thru 1.3 are met. It would be clearer to place the reference to Parts 1.1 thru 1.3 prior to the word identify. Suggest Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated, and where such operation conforms to Parts 1.1 thru 1.3, shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation.</p> <p><b>Response:</b> The drafting team made the clarification in Requirement R1.</p>
National Grid	<p>Second part of sub-requirement R1.1 “The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate” seems to contradict with sub-requirement R1.3 “The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation”. R1.1 and R1.3 cannot be met at the same time.</p> <p><b>Response:</b> The drafting team made a clarification to Requirement R1, Part 1.3 that it includes manual intervention. Clarification made.</p> <p>An entity which receives notification of the BES interrupting device(s) operation in requirement R3 is allotted between 60 and 120 calendar days. However, the BES interrupting device(s) owner(s) are allotted 120 calendar days. Receiving entity also should be allotted full 120 calendar days counting from the day it receives notification.</p> <p><b>Response:</b> When an entity receives notification of a Protection System operation by the BES interrupting device owner, the Protection System owner is allotted at least 60 calendar days to</p>

Organization	Question 4 Comment
	<p>identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components. No change made.</p> <p>Requirements R1, R2, and R3 are assuming that an entity will make an attempt to determine the cause(s) of a Misoperation. However, an entity can choose to make no effort until requirement R4 becomes applicable. It is suggested to expand requirements R1, R2, and R3 with the obligation for an entity to make an effort to determine the cause(s) of a Misoperation before requirement R4 takes place.</p> <p><b>Response:</b> Requirements R1 and R3 do not preclude an entity from determining the cause of an identified Misoperation. (Note: Requirement R2 is for notification to others.) Requirement R4 becomes applicable only after a Protection System operation is “identified as a Misoperation” and does not have an identified cause. Requirement R4 is an exception-based Requirement and is only performed when the entity did not identify the cause(s) upon the identification of the Misoperation in either Requirement R1 or R3. No change made.</p>
Public Service Enterprise Group	<p>See the Consideration of Comments document, pp. 76-77. We interpreted that the SDT agreed to our proposed changes to R3; however it was not reflected in this draft.</p> <p><b>Response:</b> The drafting team meant to explain that it revised the Guidelines and Technical Basis to provide a more detailed explanation of the “two full calendar quarters” rather than change the Requirement R4 language to “180 calendar days.” No change made.</p>
Texas Reliability Entity	<p>Texas Reliability Entity is voting Negative on this standard due to the concern that the reliable operation of the BES is not ensured by this standard (as written) because the allowable time periods for investigating and correcting are too long and investigative actions are not required before R4. Please consider the following comments and recommendations.</p>

Organization	Question 4 Comment
	<p>1) Recommend changing the allowable time for identification of a Misoperation to 60 days for R1 and R2. The 120 identification period (in R1 and R2) coupled with the additional allowance in R3 of 60 days means a Misoperation may not be determined up to 179 days after the interrupting device operation. The risk to the BES is still undetermined during this time period and actions should be taken to identify if a Misoperation occurred more expeditiously.</p> <p><b>Response:</b> The drafting team concluded that most Protection System reviews would occur soon after a BES interrupting device operation. The 120 calendar days is a maximum time allowance and provides for seasonal variations in operations and work load and the opportunity to identify any Misoperations which were initially missed. No change made.</p> <p>2) Suggest revising language in Requirements 1 and 3 to include investigative actions: [each entity] “shall perform investigative actions to identify whether its Protection System component(s) caused a Misoperation” The proposed language would clarify the expectation that investigations are on-going prior to R4. As written, the standard conceivably allows for a period of up to 120 days before investigative actions are performed. Although the application guidelines for R4 states that an entity “is expected to use due diligence in taking investigative action(s) to determine the cause(s)...” and that R4 “provides the entity a mechanism to continue its investigative work...” the standard does not require an entity to do investigative work before R4.</p> <p><b>Response:</b> The drafting team contends that some level of investigation will be necessary to identify a Misoperation. Once a Misoperation is identified (without a cause), Requirement R4 becomes in effect. No change made.</p> <p>3) Recommend changing the performance of investigative actions to at least once every calendar quarter in R4. If a Misoperation is confirmed (through steps taken in R1 – R3) then the risk to the BES continues until such time as a cause is found and can be corrected. The application guidelines state that periodic investigative action minimizes compliance burden and focuses the entity’s efforts on determining cause, Texas Reliability Entity asserts that the time period of at least one investigative action every two full calendar quarters (180 days) is not adequate to protect reliability.</p>

Organization	Question 4 Comment
	<p><b>Response:</b> The drafting team contends that the periodic action balances the compliance burdens and focuses the entity’s effort on determining the cause(s) of the Misoperation while providing measurable evidence. In addition, certain planned investigative actions may require months or years to schedule and complete due to outages and other factors. No change made.</p> <p>4) In order for R4 to be measurable there should be a stated time horizon (per NERC’s Acceptance of a Reliability Standard, Item 7, first bullet). The investigation may end either by identification of the cause of the Misoperation or a declaration that no cause was found. Suggest adding requirement to either determine the cause or make the no cause found declaration within 365 days after interrupting device operation.</p> <p><b>Response:</b> The drafting team contends that listing a defined time limit to complete the requirement would actually decrease reliability. It would have the unintended consequence of causing entity to discontinue its investigation. The requirement allows the entity to either determine the cause or conclude its investigation when it is confident that a cause cannot be determined. The Time Horizons are used by Compliance Enforcement Authority in determining penalties and does not impact the timing or measurability of the requirement. No change made.</p> <p>5) The investigation and CAP timelines (as written) exceed 12 months so the evidence retention period of 12 months is insufficient. Evidence of investigative actions may be disposed of before corrective action is completed; meaning that a full record of an interrupting device operation may not be available for review by the CEA. In addition, the 12 month evidence retention schedules for R5 and R6 mean that an entity may not have any evidence to prove compliance to a CEA during an audit (which can be several years after a Misoperation).</p> <p><b>Response:</b> The drafting team clarified the time periods for retaining evidence is “a minimum of” and also added for Requirements R1-R4. The “development” was revised to “completion” to reflect the intended retention period. Clarification made.</p>

Organization	Question 4 Comment
MRO NERC Standards Review Forum	Thank you for the opportunity to comment.
Nebraska Public Power District	<p>The 1.2 Evidence Retention section states 12 months is the required evidence retention period for the requirements. It also notes that “the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.” I would recommend that the evidence retention be longer since it will be difficult to reproduce audit period evidence if it has been discarded.</p> <p><b>Response:</b> Evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit. The drafting team used NERC guidance in determining the appropriate evidence retention periods. See the document <i>Background Information on Quality Reviews</i>, February 7, 2012 (<a href="http://www.nerc.com/files/Background_Document_20120207.pdf">http://www.nerc.com/files/Background_Document_20120207.pdf</a>). No change made.</p> <p>Project 2014-01 Dispersed Generation has noted that PRC-004 needs to be reviewed and updated to direct the industry as to the appropriateness of the BES elements that require misoperation analysis and documentation related to dispersed generation. It is recommended to consider adding these changes rather than issuing multiple versions of this standard unless there is a serious reliability risk with the existing PRC-004 standard.</p> <p><b>Response:</b> The drafting team recognizes that having multiple versions of a Reliability Standard is not ideal; Additionally, it is not practical to implement changes to the draft PRC-004-3 Reliability Standard based on another project when it is in active development. Because of this, the draft PRC-004-3 Reliability Standard must move forward for approval so that other projects can use a final version as a basis for any proposed inclusions or revisions.</p>

Organization	Question 4 Comment
	<p>The Draft 5 Application Guidelines states “The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.” There are concerns that some CAP evaluations including programs for other locations could be open for long periods of time creating significant audit tracking burdens.</p> <p>Is it acceptable in some cases if a CAP for correcting the issue with equipment that misoperated also has an evaluation to only identify other locations that have a similar issue and once other locations are identified the CAP is considered completed and no other audit tracking is required?</p> <p>If this is acceptable this may be beneficial for cases where there is an issue with a large number of similar breakers, relays, communication schemes, potential devices or current transformers that might be widespread on some systems requiring years to replace or update as part of a program or several programs. If the above is not acceptable as the standard is written consider adding a 3rd bullet to R5 to allow a CAP for the specific misoperations and a requirement to identify other locations or allow a declaration that can be used for creating a CAP for other locations that will be considered separately from PRC-004-3.</p> <p><b>Response:</b> Yes, the drafting team believes your approach meets the intent of Requirement R5. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5. Timeframes and actions associated with the execution of the evaluation are outside the scope of the standard. No change made.</p>

Organization	Question 4 Comment
	<p>There are still concerns with including manual intervention as part of R1 since most appear to agree it is rare. Can the SDT provide some thoughts on the best way to guarantee that a manual intervention is duly tracked and provided to the protection departments for review?</p> <p>Perhaps dispatch centers need to have a procedure or process that specifically states “any manual intervention for a failed protection system must be reported to the appropriate protection system owner”. Would this be considered a reasonable process approach to satisfy the requirements of auditors that the proper misoperation procedures are in place?</p> <p>It may be that the manual intervention requirement is better suited to the SPS, UFSL, UVLS or plant shutdown schemes since those schemes are more likely to allow operators time to react rather than having manual intervention a part of all types of system operations as it is in R1. Perhaps there are cases where an operator has taken action for a transmission line fault or issue that did not clear with primary/secondary/breaker failure or backup remote clearing but I am not aware of any of these cases. It may be better to clarify the types of practical manual interventions that are intended to be covered by the standard or remove it and place it in another standard mentioned above with clarification for the most practical cases where this should be tracked to simplify the misoperation process documents utilities would likely need to have in place. There is concern that an auditor will have the latitude to ask how you guarantee that you are aware and tracked all manual interventions for protection system failures that have taken place on your system in the last audit period and this could be difficult to prove.</p> <p><b>Response:</b> The drafting team asserts that manual interventions do not necessarily need to be tracked, but they are a condition for which a Protection System must be reviewed for Misoperation. Since it is such an unusual occurrence, the drafting team would expect the entity to be informed of such an operation. An example of manual intervention is a Generator Owner intervening to trip a unit where the operator believes a Protection System failure to operate has occurred. No change made.</p>

Organization	Question 4 Comment
SERC Protection and Controls Subcommittee	<p>The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Protection and Control Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.</p> <p><b>Response:</b> Thank you for your comment.</p>
Omaha Public Power District	<p>The Omaha Public Power District (OPPD) is still concern with the 60-day requirement to develop a Corrective Action Plan (CAP) for an identified misoperation. This timing is not practical, and depending on the time of the year, budget cycle, scope of work, 60 days is not sufficient to obtain funding for CAPs. Also, the first bullet under R5 would require evaluation of the applicability of all CAPs to all BES locations which, depending on the CAP, could be overly burdensome. As worded, a wiring or setting error would require that all wiring and all settings at all BES locations be checked. The evaluation should be limited to CAPs related to scheme logic or relay design deficiencies. OPPD proposes that 180 days (6 months) is a sufficient timeframe to practically develop a CAP addressing both operational and budgetary coordination.</p> <p><b>Response:</b> The drafting team contends that 60 calendar days is an adequate amount of time to develop a high level evaluation. Timeframes associated with the execution of the evaluation are outside the scope of the standard. No change made.</p>
Northeast Utilities	<p>The Unnecessary Trip definitions as written are unclear and seem to indicate that the total compliment of the Composite Protection System. Suggest the following clarifications; Unnecessary Trip - During Fault - An unnecessary operation of any Protection System of a Composite Protection System for a Fault condition on another Element. Unnecessary Trip - Other Than Fault - An unnecessary operation of any Protection System of a Composite Protection System for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.</p>

Organization	Question 4 Comment
	<p><b>Response:</b> The drafting team added “Composite” to the definition of “Misoperation” for categories 5 and 6 based on comments during the draft 4 posting (e.g., see RFC – Question 1). This was done for consistency within the definition of “Misoperation.” No change made.</p>
<p>SPP Standards Review Group</p>	<p>UFLS is mentioned in 4.2.2 of the Applicability Section but there is no mention of UVLS. Should it be included here?</p> <p><b>Response:</b> Undervoltage load shedding (UVLS) has not been included in the proposed PRC-004-3 standard’s Applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Adding UVLS in PRC-004-3 at this point would create unforeseen issues with having Requirements in two different standards address the same activity.</p> <p>The purpose of the UFLS project is to address an outstanding FERC directive and review PRC-006-1 to determine if any steady state modifications are appropriate (i.e., Paragraph 81 criteria and recommendations of the Independent Expert Review Panel). Specifically, the other project’s standard drafting team will revise PRC-006-1 to address the directive included in FERC Order No. 763 and to provide for clear, unambiguous design and documentation requirements for automatic UFLS programs. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard. The drafting team added additional text to the background to explain both UVLS and UFLS. Clarification made.</p> <p>We would suggest that the drafting team consider incorporating the evaluation of the CAP’s applicability mentioned in the first bullet under Requirement R5 into the CAP itself. This falls in line with the second bullet in the Requirement which is included in the CAP and gets the burden of making the evaluation concurrently with the development of the CAP out of the way. The evaluation could delay the completion of the CAP.</p>

Organization	Question 4 Comment
	<p><b>Response:</b> By definition the CAP consists of actions to remedy a specific problem (i.e., the Protection System Misoperation). Because the CAP is a specific plan, the evaluation is structured as a separate activity. No change made.</p> <p>References to days should be calendar days and they should be hyphenated; for example 30-, 45-, 60-, or 120-calendar days. Similarly, references to months should be treated in the same manner; for example 12-calendar months.</p> <p><b>Response:</b> The use of a hyphen as suggested is not consistent with the NERC style guide. No change made.</p>
PPL NERC Registered Affiliates	<p>We continue to disagree that stating whether or not a Misoperation occurred (per R1) and (under some circumstances) what the cause was (per R3) should be due within 120 days even though identifying the cause may take much longer or may even prove impossible (per R4). That is, the SDT apparently prefers where uncertainty exists to classify events as Misoperations and retract the declaration if later findings show otherwise, while we prefer the present approach of not assuming a Misoperation if evidence to support such a conclusion is lacking. The difficulty foreseen regarding the SDT's approach is that dated evidence is required in M1 that an entity, "identified the Misoperation... within the allotted time period," and in M3 that it, "identified whether its protection System component(s) caused a Misoperation within the allotted time period," while all we may be able to say after 120 days is that we don't know why an event happened. R4 describes what to do in such a situation, but it does not retract the obligation to provide impossible-to-obtain evidence satisfying M1 and M3.</p> <p><b>Response:</b> Requirements R1 and R3 do not require, but do not preclude an entity from determining the cause of an identified Misoperation. (Note: Requirement R2 is for notification to others.) Requirement R4 becomes applicable only after a Protection System operation is "identified as a Misoperation" and has not identified the cause(s). Requirement R4 is an exception and is only</p>

Organization	Question 4 Comment
	<p>performed when the entity did not identify the cause(s) upon the identification of the Misoperation in either Requirement R1 or R3. No change made.</p> <p><b>Response:</b> The requirement does not preclude the entity from using judgment in the classification of the operation if the available evidence is inconclusive. No change made.</p>
JEA	<p>We disagree with the 60 day limit in R5 to develop a CAP and think it should be 180 days.</p> <p><b>Response:</b> The drafting team believes that 60 days is sufficient to develop a CAP including its applicability to other Protection Systems as there is opportunity to update the CAP in Requirement R6 as needed. The drafting team believes that issues such as cost/benefit scenarios, resource coordination, scheduling, and funding procurement can be considered while developing the schedule of the CAP. No change made.</p>
Southern California Edison Company	<p>With respect to Requirement 5 on the Corrective Action Plan requirements, we are concerned that an entity’s declaration that no corrective action will be taken without supporting evidence, could leave a system problem unresolved.</p> <p><b>Response:</b> The drafting team contends that each entity when making a declaration will have to explain “why corrective actions are beyond the entity’s control or would not improve BES reliability.” This is consistent with the Requirement and Measure. No change made.</p> <p>The decision that a Corrective Action Plan is unnecessary, or the development of a Corrective Action Plan, are both complex actions that should be done jointly by respective owners of the composite protection system in a consensus-building manner. The failure to reach consensus on Correction Action Plans can leave the problem unresolved.</p> <p><b>Response:</b> The drafting team contends that the requirements are structured in a manner that each entity that has identified a cause of a Misoperation of its Protection System components must develop a CAP according to Requirement R5. Other entities are required to develop a CAP if they</p>

Organization	Question 4 Comment
	<p>identified that their components caused a Misoperation, unless corrective actions would not improve BES reliability or are beyond the entity’s control.</p> <p>If a CAP results in a modification to a Protection System, PRC-001 – System Protection Coordination requires coordination with other owners.</p>
<p>Wolverine Power Supply Cooperative, Inc.</p>	<p>Wolverine's position is that the PRC-005 standard sufficiently covers the maintenance and testing requirements for protection systems. Because of this maintenance performed, it is not necessary to perform a detailed engineering analysis of every BES protection system operation. Wolverine's position is to only perform an engineering review of protection system operations if there is an apparent misoperation, for example, an over reach condition, failure to trip, etc. These are easily identified by transmission operators if only the correct facility cleared. To use a protection system operation to verify if a primary and backup protection system work properly seems to conflict with the requirement in PRC-005, which is written to ensure protection systems are maintained so they work properly.</p> <p><b>Response:</b> The drafting team notes that the NERC State of Reliability, May 2013 states, “Key Finding 4: Protection System Misoperations are a significant contributor to disturbance events and automatic transmission outage severity. Incorrect settings/logic/design errors, relay failures/malfunions, and communication failures are the three primary factors that result in such Misoperations.” No change made.</p>

END OF REPORT

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

### Standard Development Timeline

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

#### Development Steps Completed

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.
6. Draft 4 of PRC-004-3 was posted for a 45-day additional comment period from January 17 – March 11, 2014 and an additional ballot in the last ten days of the comment period from February 2 – March 11, 2014 under the new Standards Process Manual (Effective: June 26, 2013).
7. Draft 5 of PRC-004-3 was posted for a 45-day additional comment period from May 16 – July 9, 2014 and an additional ballot in the last ten days of the comment period from June 20 – July 9, 2014.

#### Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft 6 of PRC-004-3 – Protection System Misoperation Identification and Correction for a 10-day final ballot.

Anticipated Actions	Anticipated Date
10-day Final Ballot	July 2014
BOT Approval	August 2014

#### Effective Dates

The standard, the revised definition of “Misoperation,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

applicable governmental authority is not required, the standard, the revised definition of “Misoperation,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC’s Order is effective as of September 26, 2011)	
2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2	
2.1a		Errata change: Edited R2 to add “...and generator interconnection Facility...”	Revision under Project 2010-07
2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
3	TBD	Adopted by Board of Trustees	Revision under Project 2010-05.1

### Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms Used in NERC Reliability Standards* (“NERC Glossary”) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the NERC Glossary.

#### Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element’s Protection System(s) is excluded.

#### Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.

## **Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

---

- 6. Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

*When this standard has received ballot approval, the rationale boxes will be moved to the Application Guidelines Section of the Standard.*

### A. Introduction

1. **Title:** Protection System Misoperation Identification and Correction
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.
4. **Applicability:**
  - 4.1. **Functional Entities:**
    - 4.1.1 Transmission Owner
    - 4.1.2 Generator Owner
    - 4.1.3 Distribution Provider
  - 4.2. **Facilities:**
    - 4.2.1 Protection Systems for BES Elements, with the following exclusions:
      - 4.2.1.1 Non-protective functions that are embedded within a Protection System.
      - 4.2.1.2 Protective functions intended to operate as a control function during switching.<sup>1</sup>
      - 4.2.1.3 Special Protection Systems (SPS).
      - 4.2.1.4 Remedial Action Schemes (RAS).
    - 4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

**Rationale for Applicability:** Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded in this standard because they are planned to be handled in the second phase of this project.

### 5. Background:

A key factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and

---

<sup>1</sup> For additional information and examples, see the “Non-Protective Functions” and “Control Functions” sections in the Application Guidelines.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a “fill-in-the-blank” standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the Requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

### **Misoperation**

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needed more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical, yet explainable, condition is a Misoperation.

The SAR for this project also included clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information (“data request”). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for compliance with the standard and data request are intended to be independent of each other.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

The proposed Requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

Undervoltage load shedding (UVLS) has not been included in this standard's applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard currently.

### **6. Effective Dates:**

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**B. Requirements and Measures**

- R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: [*Violation Risk Factor: Medium*][*Time Horizon: Operations Assessment, Operations Planning*]
- 1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and
  - 1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and
  - 1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.
- M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

**Rationale for R1:** This Requirement ensures that entities review those Protection System operations meeting the circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*
- 2.1** For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:
- 2.1.1** The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and
- 2.1.2** The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and
- 2.1.3** The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.
- 2.2** For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.
- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

**Rationale for R2:** Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System. The phrase “owner(s) that share Misoperation identification responsibility” allows entities to notify the specific other owners that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. [*Violation Risk Factor: Medium*][*Time Horizon: Operations Assessment, Operations Planning*]
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

**Rationale for R3:** When an entity receives notification of a Protection System operation by the BES interrupting device owner, the other Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Assessment, Operations Planning*]
- The identification of the cause(s) of the Misoperation; or
  - A declaration that no cause was identified.
- M4.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

**Rationale for R4:** If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]
- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations; or
  - Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.
- M5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

**Rationale for R5:** A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, the potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc.

In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the absence of a CAP.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

- R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. [*Violation Risk Factor: Medium*][*Time Horizon: Operations Planning, Long-Term Planning*]
- M6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

**Rationale for R6:** Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

## **C. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### **1.2. Evidence Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for a minimum of 12 calendar months following the completion of each Requirement.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, R3, and R4, for a minimum of 12 calendar months following completion of each CAP, completion of each evaluation, and completion of each declaration.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

**1.3. Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

**1.4. Additional Compliance Information**

None.

D. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation.  OR The responsible entity failed to identify whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

**Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
<b>R2</b>	Operations Assessment, Operations Planning	Medium	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation.  OR  The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.

**Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
<b>R3</b>	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late.  OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.

### Guidelines and Technical Basis

#### Introduction

This standard addresses the reliability issues identified in the letter<sup>3</sup> from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

“Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. ...Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization.”

The standard also addresses the findings in the *2011 Risk Assessment of Reliability Performance*<sup>4</sup>; July 2011.

“...a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry.”

The *State of Reliability 2014*<sup>5</sup> report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

#### Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 “Transmission Protective Relay System Performance Measuring Methodology<sup>6</sup>.” Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

<sup>5</sup> “State of Reliability 2014.” NERC. <http://www.nerc.com/pa/Stand/Pages/ReliabilityCoordinationProject20066.aspx>. May 2014. Pg. 18 of 106.

<sup>6</sup> “Transmission Protective Relay System Performance Measuring Methodology.” Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society. 1999.

For reference, a “Protection System” is defined in the *Glossary of Terms Used in NERC Reliability Standards* (“NERC Glossary”) as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

**Composite Protection System** – *The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element’s Protection System(s) is excluded.*

The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation.

### ***Composite Protection System – Line Example***

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

### ***Composite Protection System – Transformer Example***

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

### **Composite Protection System – Generator Example**

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

### **Composite Protection System – Breaker Failure Example**

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker's Composite Protection System. Considering breaker failure protection to be part of another Element's Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the "Slow Trip" criteria of the Misoperation definition.

- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line's Composite Protection System.
- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker's Composite Protection System.
- An example of an "Unnecessary Trip – During Fault" is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

**Misoperation** – *The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:*

- 1. Failure to Trip – During Fault** – *A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
- 2. Failure to Trip – Other Than Fault** – *A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*

3. ***Slow Trip – During Fault*** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. ***Slow Trip – Other Than Fault*** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. ***Unnecessary Trip – During Fault*** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. ***Unnecessary Trip – Other Than Fault*** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

The Misoperation definition is based on the principle that an Element's total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a "Failure to Trip" or a "Slow Trip" does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended for protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

### ***Failure to Trip – During Fault***

This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation.

**Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.

**Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated.

**Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.

**Example 1d:** A failure of an overall differential relay to operate is not a "Failure to Trip – During Fault" Misoperation as long as another component such as a generator differential relay operated.

**Example 1e:** The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one “Failure to Trip – During Fault” Misoperation of the bus Composite Protection System.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – During Fault” category applies to the operation.

### ***Failure to Trip – Other Than Fault***

This category of Misoperation may have resulted in operator intervention. The “Failure to Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

**Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

**Example 2b:** A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator's Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – Other Than Fault” category applies to the operation.

### ***Slow Trip – During Fault***

This category of Misoperation typically results in remote backup Protection System operation before the Fault is cleared.

**Example 3a:** A Composite Protection System that is slower than required for a Fault condition is a Misoperation if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. The current differential element of a multiple function relay failed to operate for a line Fault. The same relay's time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

**Example 3b:** A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element's Composite Protection System. If a generating unit's Composite Protection System operates due to instability caused by the slow trip of the breaker's Composite Protection System, it is not an “Unnecessary Trip – During Fault” Misoperation of the generating unit's Composite Protection System. This event would be a “Slow Trip – During Fault” Misoperation of the breaker's Composite Protection System.

**Example 3c:** A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase “resulted in the operation of any other Composite Protection System” refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip – During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

### ***Slow Trip – Other Than Fault***

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

**Example 4:** A phase to phase fault occurred on the terminals of a generator. The generator's Composite Protection System and a transmission line's Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line's correctly set overreaching zone of protection to operate. This was a Misoperation of the generator’s Composite Protection System, but not of the transmission line’s Composite Protection System.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

### ***Unnecessary Trip – During Fault***

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the faulted Element to clear the Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

**Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

**Example 5b:** An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.

**Example 5c:** If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

### ***Unnecessary Trip – Other Than Fault***

Unnecessary trips for non-Fault conditions include but are not limited to: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

**Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.

**Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

**Example 6c:** An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

**Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

**Example 6e:** A BES interrupting device operation that occurs at the remote end of a line during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation because of the maintenance exclusion in category 6 of the definition of “Misoperation.”

The “on-site” activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the “on-site” Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

### Special Cases

Protection System operations for these cases would not be a Misoperation.

**Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations that occur when the protected Element is out of service and that do not trip any in-service Elements are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

**Example 7b:** The high-side of a transformer connected to a line may be within the zone of protection of the supplying line’s relaying. In this case, the line relaying is planned to protect the area of the high-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

**Example 7c:** A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization.

**Example 7d:** A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush after being released for operational service. Only the high-side breaker opens since the low-side breaker had not yet been closed.

### Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

### Control Functions

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

**Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.

**Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.

The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

**Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

### Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: "In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties." The Regional Entities to whom NERC has delegated

authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

### **Requirement Time Periods**

The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations without an identified cause become subject to Requirement R4 and any subsequent Requirements as necessary. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.

Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins. The time period(s) in Requirement R4 resets upon each period. When the applicable entity's investigative actions identify the cause of the identified Misoperation or the applicable entity declares that no cause was found, the applicable entity has completed its performance in Requirement R4.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

### Requirement R1

This Requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

**Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, the BES interrupting device owner would still review the operation under Requirement R1. However, if the BES interrupting device owner determines that its Protection System component operated as backup protection for a condition on another entity's BES Element, the owner would provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar

days from the date of its BES interrupting device operation to identify whether its Protection System component(s) caused a Misoperation.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC *Misoperations Report*<sup>7</sup> which states:

“In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation.”

The following is an example of a condition that is not a Misoperation.

**Example R1b:** A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

### Requirement R2

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This Requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little

---

<sup>7</sup> “Misoperations Report.” Reporting Multiple Occurrences. NERC Protection System Misoperations Task Force. [http://www.nerc.com/docs/pc/psmtf/PSMTF\\_Report.pdf](http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf). April 1, 2013. pg. 37 of 40.

benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

**Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external Fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

**Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, notified the Generator Owner of the operation. The Generator Owner investigated and determined that its Protection System components caused the Misoperation. In this example, the Generator Owner's Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the Generator Owner and Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

**Example R2c:** Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B's Composite Protection System (owned by entity 2) and zone 3 portion of Line C's Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

### Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not

a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

### Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

**Example R4a:** A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 as the first investigative action (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, requesting an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.<sup>8</sup>

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

**Example R4b:** A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014 as the first investigative action. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

**Example R4c:** A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

---

<sup>8</sup> NERC System Protection and Control Subcommittee. Misoperations Report. April 1, 2013: [http://www.nerc.com/docs/pc/psmtf/PSMTF\\_Report.pdf](http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf). Figure 15: NERC Wide Misoperations by Cause Code. pg. 22 of 40.

### Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, *"A list of actions and an associated timetable for implementation to remedy a specific problem."* Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must develop the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation. In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAP(s) to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of each CAP in Examples R5a through R5d, please see Examples R6a through R6d.

**Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.

A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

**Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

**Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.

**Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

**Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

**Example R5h:** As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

**Example R5i:** During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

### Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

**Example R6a:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

**Example R6b:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.

CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

**Example R6c:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

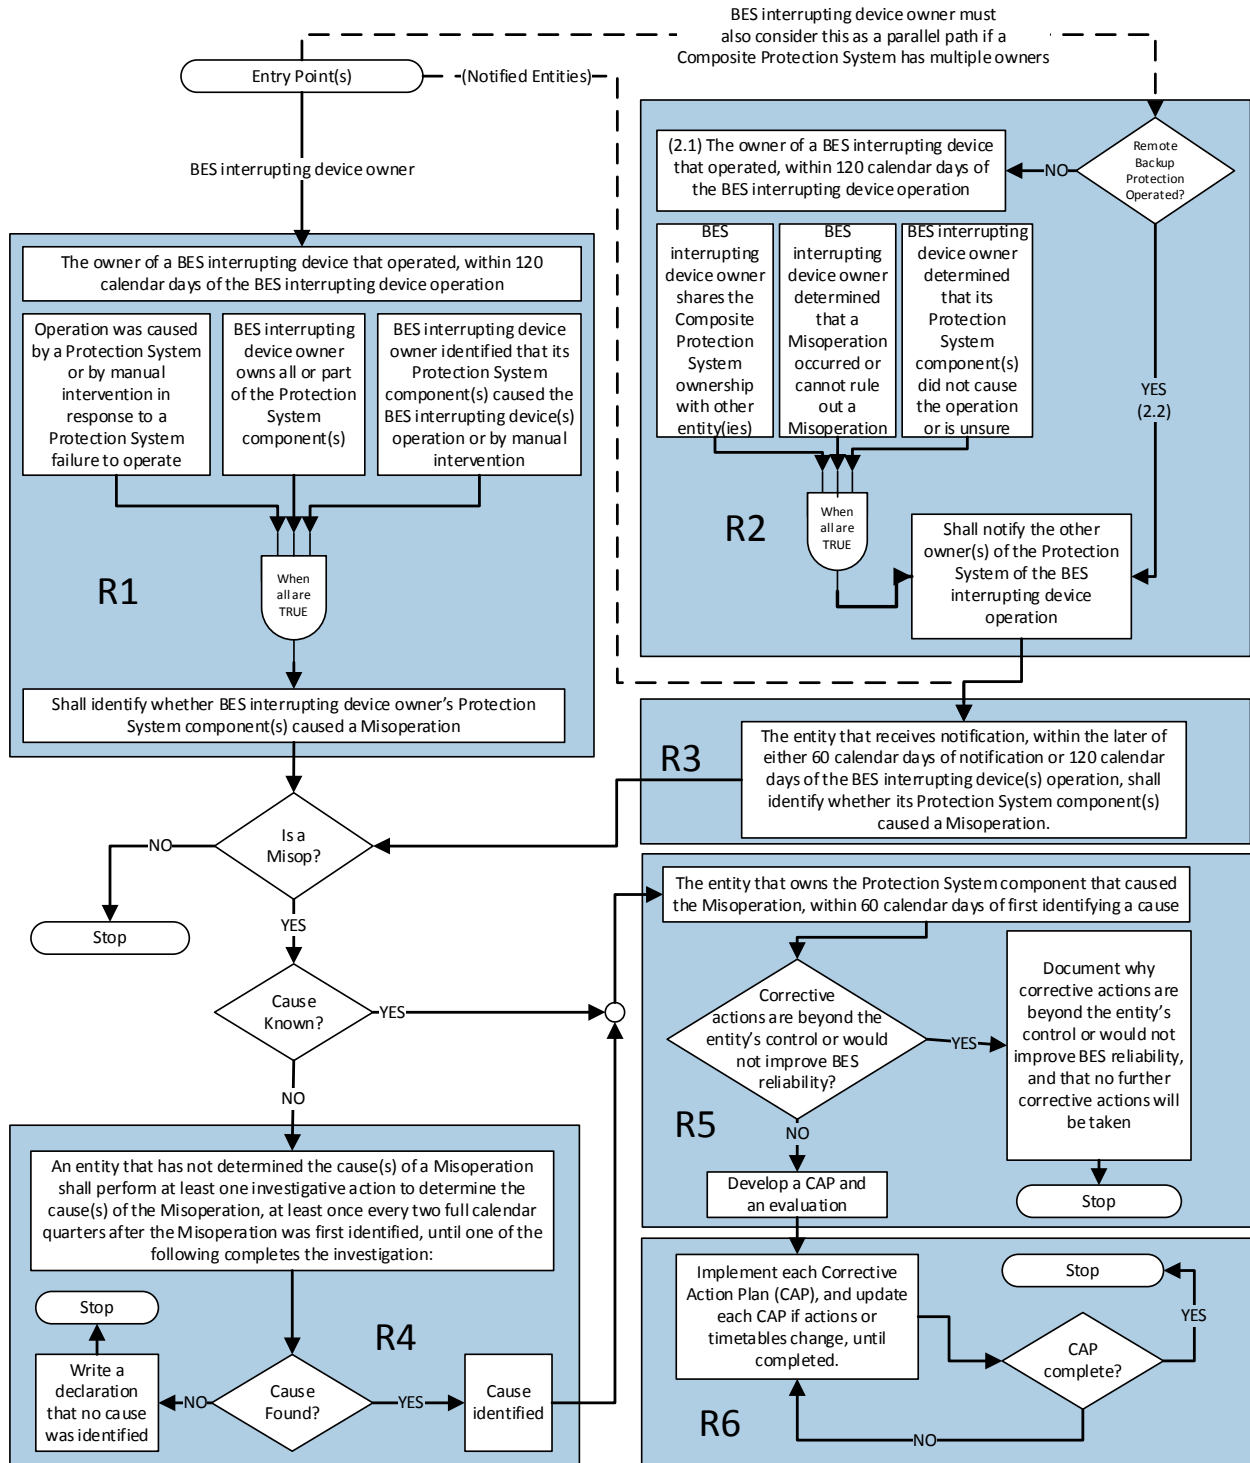

**Example R6d:** Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.

**Process Flow Chart:** Below is a graphical representation demonstrating the relationships between Requirements:

# Standard PRC-004-3 — Protection System Misoperation Identification and Correction

## Standard Development Timeline

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.
6. Draft 4 of PRC-004-3 was posted for a 45-day additional comment period from January 17 – March 11, 2014 and an additional ballot in the last ten days of the comment period from February 2 – March 11, 2014 under the new Standards Process Manual (Effective: June 26, 2013).
7. Draft 5 of PRC-004-3 was posted for a 45-day additional comment period from May 16 – July 9, 2014 and an additional ballot in the last ten days of the comment period from June 20 – July 9, 2014.

### Description of Current Draft

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft ~~56~~ of PRC-004-3 – Protection System Misoperation Identification and Correction for a ~~4510~~-day ~~additional comment period and additional final~~ ballot ~~in the last ten days of the comment period under the new Standards Process Manual (Effective: June 26, 2013).~~

Anticipated Actions	Anticipated Date
<del>Additional 45-day Formal Comment Period with Parallel Ballot</del>	<del>May 2014</del>
10-day Final Ballot	July 2014
BOT Approval	August 2014

### Effective Dates

The standard, the revised definition of “Misoperation~~2~~,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of “Misoperation<sup>2,3</sup>” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC’s Order is effective as of September 26, 2011)	
2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2	
2.1a		Errata change: Edited R2 to add “...and generator interconnection Facility...”	Revision under Project 2010-07

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	
2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
3	TBD	Adopted by Board of Trustees	Revision under Project 2010-05.1

### Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms ~~used~~Used in NERC Reliability Standards* (“NERC Glossary”) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the NERC Glossary.

#### Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided ~~to~~by a ~~remote~~different Element’s Protection System(s) is ~~included~~excluded.

#### Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

- 6. Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

*When this standard has received ballot approval, the rationale boxes will be moved to the Application Guidelines Section of the Standard.*

### A. Introduction

1. **Title:** Protection System Misoperation Identification and Correction
2. **Number:** PRC-004-3
3. **Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.
4. **Applicability:**
  - 4.1. **Functional Entities:**
    - 4.1.1 Transmission Owner
    - 4.1.2 Generator Owner
    - 4.1.3 Distribution Provider
  - 4.2. **Facilities:**
    - 4.2.1 Protection Systems for BES Elements, with the following exclusions:
      - 4.2.1.1 Non-protective functions that are embedded within a Protection System.
      - 4.2.1.2 Protective functions intended to operate as a control function during switching.<sup>1</sup>
      - 4.2.1.3 Special Protection Systems (SPS).
      - 4.2.1.4 Remedial Action Schemes (RAS).
    - 4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

**Rationale for Applicability:** Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded in this standard because they are planned to be handled in the second phase of this project.

### 5. Background:

A key factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and

---

<sup>1</sup> For additional information and examples, see the “Non-Protective Functions” and “Control Functions” sections in the Application Guidelines.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a “fill-in-the-blank” standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the ~~requirements~~Requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

### **Misoperation**

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition ~~needs~~needed more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical, yet explainable, condition is a Misoperation.

The SAR for this project also ~~includes~~included clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information (“data request”). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for compliance with the standard and data request are intended to be independent of each other.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

The proposed ~~requirements~~Requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

Undervoltage load shedding (UVLS) has not been included in this standard's applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard currently.

### 6. Effective Dates:

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

## B. Requirements and Measures

- R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation ~~under the following circumstances:~~ *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*
- 1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and
  - 1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and
  - 1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.
- M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

**Rationale for R1:** This ~~requirement~~Requirement ensures that entities review those Protection System operations meeting the circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

- R2.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in [Parts 2.1 and 2.2](#). *[Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]*
- 2.1** For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:
- 2.1.1** The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and
- 2.1.2** The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and
- 2.1.3** The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.
- 2.2** For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.
- M2.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

**Rationale for R2:** Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System. The phrase “owner(s) that share Misoperation identification responsibility” allows entities to notify the specific others/other owners that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which ~~that~~ backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that ~~when~~ Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

- R3.** Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. [*Violation Risk Factor: Medium*][*Time Horizon: Operations Assessment, Operations Planning*]
- M3.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

**Rationale for R3:** When an entity receives notification of a Protection System operation by the BES interrupting device owner, the other Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

- R4.** Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Assessment, Operations Planning*]
- The identification of the cause(s) of the Misoperation; or
  - A declaration that no cause was identified.
- M4.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

**Rationale for R4:** If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

- R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning, Long-Term Planning*]
- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations; or
  - Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.
- M5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

**Rationale for R5:** A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, the potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc.

In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the absence of a CAP.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

- R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. [*Violation Risk Factor: Medium*][*Time Horizon: Operations Planning, Long-Term Planning*]
- M6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or ~~hard-copy~~hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

**Rationale for R6:** Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

## C. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

#### 1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for a minimum of 12 calendar months following the completion of each Requirement.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, R3, and R4, for a minimum of 12 calendar months following developmentcompletion of each CAP, developmentcompletion of each evaluation, and developmentcompletion of each declaration.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

**1.3. Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

~~Periodic Data Submittal~~

**1.4. Additional Compliance Information**

None.

D. Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	Operations Assessment, Operations Planning	Medium	The responsible entity identified whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation.  OR The responsible entity failed to identify whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1.

<sup>2</sup> <http://www.nerc.com/comm/PC/System%20Protection%20and%20Control%20Subcommittee%20SPCS%20DL/PRC-003-004-016%20Report.pdf>

### Guidelines and Technical Basis

#### Introduction

This standard addresses the reliability issues identified in the letter<sup>3</sup> from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

“Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. ...Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization.”

The standard also addresses the findings in the *2011 Risk Assessment of Reliability Performance*<sup>4</sup>; July 2011.

“...a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry.”

[The State of Reliability 2014<sup>5</sup> report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.](#)

#### Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 “Transmission Protective Relay System Performance Measuring Methodology<sup>6</sup>.” Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a ~~fault~~**Fault** or non-~~fault~~**Fault** condition.

<sup>6</sup> “Transmission Protective Relay System Performance Measuring Methodology.” Working Group I3 of Power System Relaying Committee of IEEE Power Engineering Society. 1999.

For reference, a “Protection System” is defined in the *Glossary of Terms ~~used~~Used in NERC Reliability Standards* (“NERC Glossary”) as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

**Composite Protection System** – *The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided ~~to~~by a ~~remote~~different Element’s Protection System(s) is ~~included~~excluded.*

The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation.

### **Composite Protection System – Line Example**

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

### **Composite Protection System – Transformer Example**

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

### **Composite Protection System – Generator Example**

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

### **Composite Protection System – Breaker Failure Example**

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker's Composite Protection System. Considering breaker failure protection to be part of another Element's Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the "Slow Trip" criteria of the Misoperation definition.

- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line's Composite Protection System.
- An example of a correct operation of the breaker's Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker's Composite Protection System.
- An example of an "Unnecessary Trip – During Fault" is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

**Misoperation** – *The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:*

- 1. Failure to Trip – During Fault** – *A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*
- 2. Failure to Trip – Other Than Fault** – *A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.*

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

The Misoperation definition is based on the principle that an Element's total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a ~~fault~~Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a "Failure to Trip" or a "Slow Trip" does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended ~~for~~ protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

### **Failure to Trip – During Fault**

This category of Misoperation typically results in the ~~fault~~Fault condition being cleared by remote backup Protection System operation.

**Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer ~~fault~~Fault is a Misoperation.

**Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer ~~fault~~Fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated.

**Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.

**Example 1d:** A failure of an overall differential relay to operate is not a “Failure to Trip – During Fault” Misoperation as long as another component such as a generator differential relay operated.

**Example 1e:** The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one “Failure to Trip – During Fault” Misoperation of the bus Composite Protection System.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – During Fault” category applies to the operation.

### ***Failure to Trip – Other Than Fault***

This category of Misoperation may have resulted in operator intervention. The “Failure to Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

**Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

**Example 2b:** A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator's Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – Other Than Fault” category applies to the operation.

### ***Slow Trip – During Fault***

This category of Misoperation typically results in remote backup Protection System operation before the ~~fault~~**Fault** is cleared.

**Example 33a:** A ~~failure of a line's~~ Composite Protection System ~~to operate as quickly as intended that is slower than required~~ for a ~~line-fault~~**Fault condition** is a Misoperation- if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. The current differential element of a multiple function relay failed to operate for a line ~~fault~~**Fault**. The same relay's time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

~~Installing high-speed protection may be a part of a utility's standard practice without having the need for high-speed protection to prevent voltage or dynamic instability or to maintain relay coordination. For this case, a “Slow Trip – During Fault” of the high-speed protection is not a Misoperation because it would not negatively impact the dynamic BES performance, unless the Composite Protection System operation is slower than previously identified as being necessary to~~

~~prevent voltage or dynamic instability. The Composite Protection System must also coordinate with other Protection Systems to prevent the trip (e.g., an over-trip) of additional Protection Systems.~~

**Example 3b:** A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element's Composite Protection System. If a generating unit's Composite Protection System operates due to instability caused by the slow trip of the breaker's Composite Protection System, it is not an "Unnecessary Trip – During Fault" Misoperation of the generating unit's Composite Protection System. This event would be a "Slow Trip – During Fault" Misoperation of the breaker's Composite Protection System.

**Example 3c:** A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase "resulted in the operation of any other Composite Protection System" refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the "Unnecessary Trip – During Fault" category to determine if an "unnecessary trip" applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

### ***Slow Trip – Other Than Fault***

The phrase "slower than required" means the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times,

but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

**Example 4:** A failure phase to phase fault occurred on the terminals of a generator. The generator's Composite Protection System and a transmission line's Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line's correctly set overreaching zone of protection to operate as quickly as intended for an overexcitation condition is. This was a Misoperation of the generator's Composite Protection System, but not of the transmission line's Composite Protection System.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

### ***Unnecessary Trip – During Fault***

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the ~~fault~~Fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the faulted Element to clear the ~~fault~~Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

**Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line ~~fault~~Fault is a Misoperation. The ~~fault~~Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

**Example 5b:** An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.

**Example 5c:** If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

### **Unnecessary Trip – Other Than Fault**

Unnecessary trips for non-~~fault~~**Fault** conditions include but are not limited to: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

**Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.

**Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

**Example 6c:** An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

**Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-~~fault~~**Fault** condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

**Example 6e:** A BES interrupting device operation that occurs at the remote end of a line during a non-~~fault~~**Fault** condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation- because of the maintenance exclusion in category 6 of the definition of "Misoperation."

The "on-site" activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

~~If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip," category of Misoperation at the remote terminal.~~

### **Special Cases**

Protection System operations for these cases would not be a Misoperation.

**Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations ~~which~~**that** occur ~~with~~**when** the protected Element ~~is~~ out of service, ~~and~~ that do not trip any in-service Elements, are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

**Example 7b:** The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for ~~faults~~Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer ~~fault~~Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

**Example 7c:** A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization. ~~The operation trips only the capacitor bank breaker that was closed to energize the bank. Since closing the breaker put the capacitor bank into service, this is a Misoperation.~~

**Example 7d:** A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush ~~following a maintenance outage after being released for operational service.~~ Only the high-side breaker opens since the low-side breaker had not yet been closed. ~~Since closing the breaker put the transformer bank into service, this is a Misoperation.~~

### Non-Protective Functions

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

### Control Functions

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

**Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity's normal or routine process.

**Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.

The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

**Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

### Extenuating Circumstances

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: “In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties.” The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

### Requirement **R4** Time Periods

The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations without an identified cause become subject to Requirement R4 and any subsequent Requirements as necessary. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.

Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one

investigative action every two full calendar quarters begins. The time period(s) in Requirement R4 resets upon each period. When the applicable entity’s investigative actions identify the cause of the identified Misoperation or the applicable entity declares that no cause was found, the applicable entity has completed its performance in Requirement R4.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

### **Requirement R1**

This ~~requirement~~**Requirement** initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

**Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case, where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, Requirement R2, Part 2.2 requires the entity that had the BES interrupting device operation to notify the other owner(s) to owner would still review the operation under Requirement R1. However, if the BES interrupting device owner determines that its portion of Composite Protection System component operated as backup protection for Misoperation a condition on another entity’s BES Element, the owner would

provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner’s differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure, ~~it.~~ The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation ~~until~~ for a cause of the entity determines otherwise Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether ~~or not a Misoperation of~~ its Protection System component(s) ~~occurred. caused a Misoperation.~~

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under ~~requirement~~ Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC SPCS guidance-*Misoperations Report*<sup>7</sup> which states:

~~Repeated Misoperations which occur during the same 24 hour period do not need a separate identification under requirement R1. This is consistent with NERC PSMTF guidance.~~

~~When Elements are isolated from the BES and undergoing maintenance, they are not subject to the standard, provided they do not result in the operation of any interrupting devices that are part of the BES.~~

“In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation.”

---

<sup>7</sup> “Misoperations Report.” Reporting Multiple Occurrences. NERC Protection System Misoperations Task Force. [http://www.nerc.com/docs/pc/psmtf/PSMTF\\_Report.pdf](http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf). April 1, 2013. pg. 37 of 40.

The following is an example of a condition that is not a Misoperation.

**Example R1b:** A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

## Requirement R2

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This ~~requirement~~**Requirement** does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

**Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external ~~fault~~**Fault**. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

**Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, ~~was required to notify~~**notified** the Generator Owner of the operation. The Generator Owner investigated ~~to determine if~~**and determined that** its Protection System components caused the Misoperation. In this example, the Generator Owner's Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in ~~part~~Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the ~~GO~~Generator Owner and ~~TO~~Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

Example R2c: Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B's Composite Protection System (owned by entity 2) and zone 3 portion of Line C's Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

### Requirement R3

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure, ~~it~~. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the ~~latter~~second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES

interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

### Requirement R4

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

**Example R4a:** A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 as the first investigative action (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, requesting an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for

identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.<sup>8</sup>

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

**Example R4b:** A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014. ~~as the first investigative action.~~ The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

**Example R4c:** A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

### Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, "A list of actions and an associated timetable for implementation to remedy a specific problem." Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must ~~create~~develop the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation; ~~in.~~ In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple ~~CAPs~~CAP(s) to correct multiple causes of a Misoperation. The 60 calendar

---

<sup>8</sup> NERC System Protection and Control Subcommittee. Misoperations Report. April 1, 2013: [http://www.nerc.com/docs/pc/psmtf/PSMTF\\_Report.pdf](http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf). Figure 15: NERC Wide Misoperations by Cause Code, pg. 22 of 40.

day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

~~The time periods within Requirement R1, R3 and R5 are distinct and separate. If a cause of a Misoperation is identified quickly, the time period in Requirement R1 or R3 ends and the 60 calendar day period to develop the CAP becomes applicable. The ultimate goal is to keep all time periods as short as possible, including the correction of the cause(s) of the Misoperation. See Requirement R6 for CAP implementation. Where there are multiple Protection System owners involved in a Misoperation, each owner whose Protection System component(s) contributed to the Misoperation is subject to Requirement R5.~~

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of ~~the CAP~~each CAP in ~~examples~~Examples R5a through R5d, please see ~~examples~~Examples R6a through R6d.

**Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.

A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

**Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

**Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.

**Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

**Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that desensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

**Example R5h:** As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

**Example R5i:** During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase ~~fault~~Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this ~~fault~~Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity's control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

### Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

**Example R6a:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

**Example R6b:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.

CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

**Example R6c:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

**Example R6d:** Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

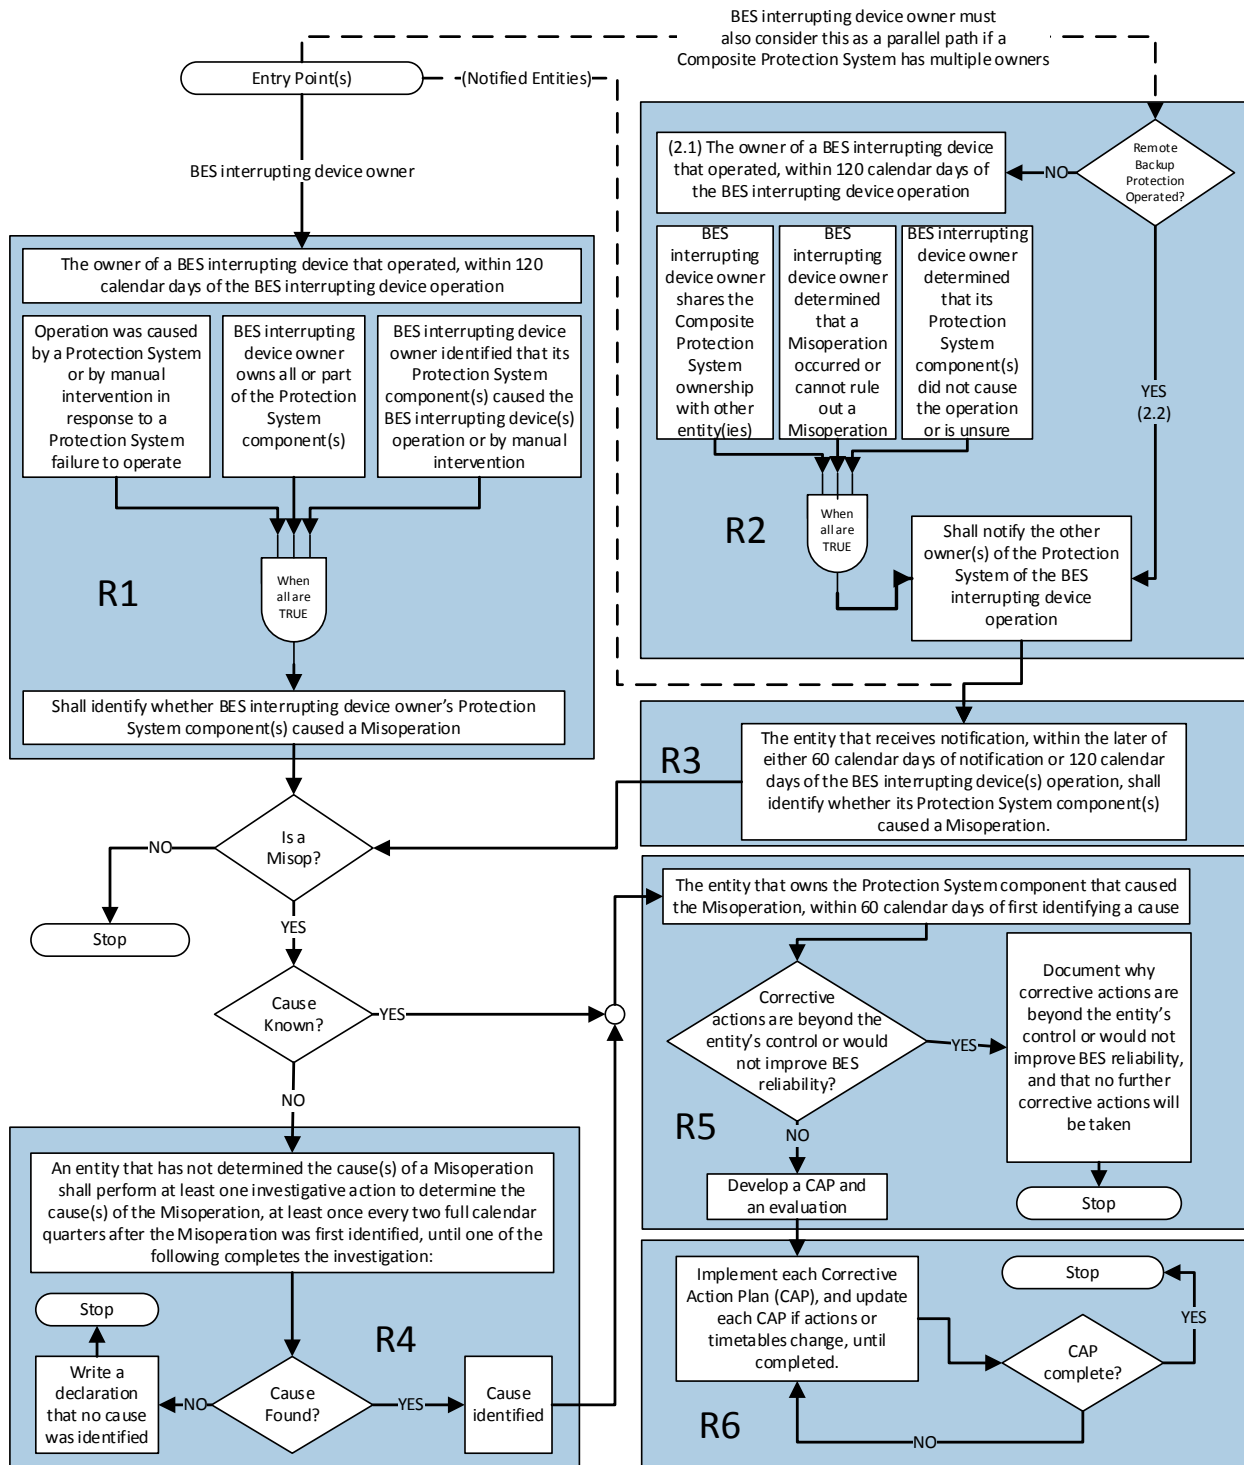

Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.

**Process Flow Chart:** Below is a graphical representation demonstrating the relationships between ~~requirements~~ Requirements:

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

### A. Introduction

#### **Title: — Analysis Standard Development Timeline**

*This section is maintained by the drafting team during the development of the standard and Mitigation of Transmission will be removed when the standard becomes effective.*

Formatted: Font: Times New Roman, 12 pt, Not Bold

#### **Development Steps Completed**

1. The SC authorized moving the SAR forward for standard development at their June 9, 2011 meeting.
2. The SAR was posted for informal comment June 10 – July 11, 2011.
3. Draft 1 of PRC-004-3 was posted for a 30-day formal comment period from June 10 – July 11, 2011.
4. Draft 2 of PRC-004-3 was posted for a 45-day formal comment period from July 25 – September 7, 2012 and Generation an initial ballot in the last ten days of the comment period from August 29 – September 7, 2012.
5. Draft 3 of PRC-004-3 was posted for a 30-day formal comment period from January 22 – February 20, 2013 and a successive ballot in the last ten days of the comment period from February 11-20, 2013.
6. Draft 4 of PRC-004-3 was posted for a 45-day additional comment period from January 17 – March 11, 2014 and an additional ballot in the last ten days of the comment period from February 2 – March 11, 2014 under the new Standards Process Manual (Effective: June 26, 2013).
7. Draft 5 of PRC-004-3 was posted for a 45-day additional comment period from May 16 – July 9, 2014 and an additional ballot in the last ten days of the comment period from June 20 – July 9, 2014.

#### **Description of Current Draft**

The Protection System Misoperations Standard Drafting Team (PSMSDT) is posting Draft 6 of PRC-004-3 – Protection System Misoperation Identification and Correction for a 10-day final ballot.

- ~~1. Number: PRC-004 2.1a~~
- ~~2. Purpose: Ensure all transmission and generation Protection System Misoperations affecting the reliability of the Bulk Electric System (BES) are analyzed and mitigated.~~
- ~~3. Applicability~~
  - ~~3.1. Transmission Owner.~~
  - ~~3.2. Distribution Provider that owns a transmission Protection System.~~

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

### ~~3.3. Generator Owner.~~

- ~~4. (Proposed) Effective Date: In those jurisdictions where regulatory approval is required, all requirements become effective upon approval. In those jurisdictions where no regulatory approval is required, all requirements become effective upon Board of Trustees' adoption.~~

#### ~~A. Requirements~~

- ~~R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.~~
- ~~R2. The Generator Owner shall analyze its generator and generator interconnection Facility Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.~~
- ~~R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.~~

#### ~~B. Measures~~

- ~~M1. The Transmission Owner, and any Distribution Provider that owns a transmission Protection System shall each have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.~~
- ~~M2. The Generator Owner shall have evidence it analyzed its Protection System Misoperations and developed and implemented Corrective Action Plans to avoid future Misoperations of a similar nature according to the Regional Entity's procedures.~~
- ~~M3. Each Transmission Owner, and any Distribution Provider that owns a transmission Protection System, and each Generator Owner shall have evidence it provided documentation of its Protection System Misoperations, analyses and Corrective Action Plans according to the Regional Entity's procedures.~~

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

### B. Compliance

#### 1. ~~Compliance Monitoring Process~~

##### 1.1. ~~Compliance Enforcement Authority~~

~~Regional Entity:~~

##### 1.2. ~~Compliance Monitoring Period and Reset Time Frame~~

~~Not applicable.~~

##### 1.3. ~~Compliance Monitoring and Enforcement Processes:~~

~~Compliance Audits~~

~~Self-Certifications~~

~~Spot-Checking~~

~~Compliance Violation Investigations~~

~~Self-Reporting~~

~~Complaints~~

##### 1.4. ~~Data Retention~~

~~The Transmission Owner, and Distribution Provider that own a transmission Protection System and the Generator Owner that owns a generation or generator interconnection Facility Protection System shall each retain data on its Protection System Misoperations and each accompanying Corrective Action Plan until the Corrective Action Plan has been executed or for 12 months, whichever is later.~~

~~The Compliance Monitor shall retain any audit data for three years.~~

##### 1.5.1.2. ~~Additional Compliance Information~~

~~The Transmission Owner, and any Distribution Provider that owns a transmission Protection System and the Generator Owner shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.~~

#### 2. ~~Violation Severity Levels (no changes)~~

### C. ~~Regional Differences~~

~~None identified.~~

<del>Anticipated Actions</del>	<del>Anticipated Date</del>
<del>10-day Final Ballot</del>	<del>July 2014</del>
<del>BOT Approval</del>	<del>August 2014</del>

**Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

**Effective Dates**

The standard, the revised definition of “Misoperation,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of “Misoperation,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Version History**

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
1	December 1, 2005	1. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 2. Added “periods” to items where appropriate. Changed “Timeframe” to “Time Frame” in item D, 1.2.	01/20/06
2		Modified to address Order No. 693 Directives contained in paragraph 1469.	Revised
2	August 5, 2010	Adopted by NERC Board of Trustees	
1a	February 17, 2011	Added Appendix 1 - Interpretation regarding applicability of standard to protection of radially connected transformers	Project 2009-17 interpretation
1a	February 17, 2011	Adopted by the Board of Trustees	
1a	September 26, 2011	FERC Order issued approving the interpretation of R1 and R3 (FERC’s Order is effective as of September 26, 2011)	

**Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

—2a	September 26, 2011	Appended FERC-approved interpretation of R1 and R3 to version 2	
2.1a		Errata change: Edited R2 to add “...and generator interconnection Facility...”	Revision under Project 2010-07
2.1a	February 9, 2012	Errata change adopted by the Board of Trustees	
2.1a	September 19, 2013	FERC Order issued approving PRC-004-2.1a (approval becomes effective November 25, 2013).	
<u>3</u>	<u>TBD</u>	<u>Adopted by Board of Trustees</u>	<u>Revision under Project 2010-05.1</u>

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

### Appendix 4<sup>1</sup>

#### Requirement Number and Text of Requirement

~~R1. The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for Reliability Standard PRC-003 Requirement 1.~~

~~R3. The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.~~

#### Question:

~~Is protection for a radially connected transformer protection system energized from the BES considered a transmission Protection System subject to this standard?~~

#### Response:

~~The request for interpretation of PRC-004-1 Requirements R1 and R3 focuses on the applicability of the term "transmission Protection System." The NERC Glossary of Terms Used in Reliability Standards contains a definition of "Protection System" but does not contain a definition of transmission Protection System. In these two standards, use of the phrase transmission Protection System indicates that the requirements using this phrase are applicable to any Protection System that is installed for the purpose of detecting faults on transmission elements (lines, buses, transformers, etc.) identified as being included in the Bulk Electric System (BES) and trips an interrupting device that interrupts current supplied directly from the BES.~~

~~A Protection System for a radially connected transformer energized from the BES would be considered a transmission Protection System and subject to these standards only if the protection trips an interrupting device that interrupts current supplied directly from the BES and the transformer is a BES element.~~

<sup>1</sup>When the request for interpretation was made, it was for a previous version of the standard. Although the interpretation references a previous version of the standard, because it is still applicable in this case, it is appended to this version of the standard.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

### Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the *Glossary of Terms Used in NERC Reliability Standards* (“NERC Glossary”) are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the NERC Glossary.

#### Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element’s Protection System(s) is excluded.

#### Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

*When this standard has received ballot approval, the rationale boxes will be moved to the Application Guidelines Section of the Standard.*

### C. Introduction

- 2. Title:** **Protection System Misoperation Identification and Correction**
- 3. Number:** PRC-004-3
- 4. Purpose:** Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.
- 5. Applicability:**
  - 5.1. Functional Entities:**
    - 5.1.1** Transmission Owner
    - 5.1.2** Generator Owner
    - 5.1.3** Distribution Provider
  - 5.2. Facilities:**
    - 5.2.1** Protection Systems for BES Elements, with the following exclusions:
      - 5.2.1.1** Non-protective functions that are embedded within a Protection System.
      - 5.2.1.2** Protective functions intended to operate as a control function during switching.<sup>2</sup>
      - 5.2.1.3** Special Protection Systems (SPS).
      - 5.2.1.4** Remedial Action Schemes (RAS).
    - 5.2.2** Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

**Rationale for Applicability:** Protection Systems that protect BES Elements are integral to the operation and reliability of the BES. Some functions of relays are not used as protection but as control functions or for automation; therefore, any operation of the control function portion or the automation portion of relays is excluded from this standard. See the Application Guidelines for detailed examples of non-protective functions. Special Protection Systems (SPS) and Remedial Action Schemes (RAS) are excluded in this standard because they are planned to be handled in the second phase of this project.

---

<sup>2</sup> For additional information and examples, see the “Non-Protective Functions” and “Control Functions” sections in the Application Guidelines.

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

### 6. Background:

A key factor for BES reliability is the correct performance of Protection Systems. The monitoring of Protection System events for BES Elements, as well as identifying and correcting the causes of Misoperations, will improve Protection System performance. This Reliability Standard PRC-004-3 – Protection System Misoperation Identification and Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In the FERC Order No. 693, the Commission identified PRC-003-0 as a “fill-in-the-blank” standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-0. Because PRC-003-0 (now PRC-003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the Requirements of PRC-004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

This project includes revising the existing definition of Misoperation, which reads:

#### Misoperation

- Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection.
- Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone).
- Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

In general, this definition needed more specificity and clarity. The terms “specified time” and “abnormal condition” are ambiguous. In the third bullet, more clarification is needed as to whether an unintentional Protection System operation for an atypical, yet explainable, condition is a Misoperation.

The SAR for this project also included clarifying reporting requirements. Misoperation data, as currently collected and reported, is not optimal to establish consistent metrics for measuring Protection System performance. As such, the data reporting obligation for this standard is being removed and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information (“data request”). As a result of the data request, NERC will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify remediation techniques; and publicize lessons learned for the industry. The removal of the data collection obligation from the standard does not result in a reduction of reliability. The standard and data request have been developed in a manner such that evidence used for

## Standard PRC-004-3 — Protection System Misoperation Identification and Correction

---

compliance with the standard and data request are intended to be independent of each other.

The proposed Requirements of the revised Reliability Standard PRC-004-3 meet the following objectives:

- Review all Protection System operations on the BES to identify those that are Misoperations of Protection Systems for Facilities that are part of the BES.
- Analyze Misoperations of Protection Systems for Facilities that are part of the BES to identify the cause(s).
- Develop and implement Corrective Action Plans to address the cause(s) of Misoperations of Protection Systems for Facilities that are part of the BES.

Misoperations associated with Special Protection Schemes (SPS) and Remedial Action Schemes (RAS) are not addressed in this standard due to their inherent complexities. NERC plans to handle SPS and RAS in the second phase of this project.

The Western Electric Coordinating Council (WECC) Regional Reliability Standard PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation relates to the reporting of Misoperations of Protection Systems and RAS for a limited set of WECC Paths. The WECC region plans to conduct work to harmonize the regional standard with this continent-wide proposed standard and the second phase of this project concerning SPS and RAS.

Undervoltage load shedding (UVLS) has not been included in this standard's applicability because Misoperations of UVLS relays are currently addressed by Reliability Standard PRC-022-1 – Under-Voltage Load Shedding Program Performance, Requirement R1.5. Underfrequency load shedding (UFLS) was added to PRC-004-3 to close a gap in reliability as Misoperations of UFLS relays are not covered by a Reliability Standard currently.

### 7. Effective Dates:

The standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

**Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

**D. Requirements and Measures**

**R1.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]

**1.1** The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

**1.2** The BES interrupting device owner owns all or part of the Composite Protection System; and

**1.3** The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.

**M1.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

**Rationale for R1:** This Requirement ensures that entities review those Protection System operations meeting the circumstances in all three Parts (1.1, 1.2, and 1.3) and identify any that are Misoperations. The BES interrupting device owner is assigned the responsibility to initiate the review because the owner is in the best position to be aware of the operation. Manual intervention is included as a condition that initiates a review. Occasionally, Protection System failures do not yield other Protection System operations and manual intervention is required to isolate the problematic equipment. The 120 calendar day period accounts for the sporadic volumes of Protection System operations, and provides the opportunity to identify any Misoperations which were initially missed.

**Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]

2.1 For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

**Rationale for R2:** Part 2.1 ensures that the BES interrupting device owner notifies the other owners of the Composite Protection System. The phrase "owner(s) that share Misoperation identification responsibility" allows entities to notify the specific other owners that will actually review the operation to determine if a Misoperation occurred. Part 2.2 ensures that the Protection System owner(s) for which backup protection was provided receives notification, within the same 120 calendar day period as R1. This ensures other entities are notified to review their Protection System components. The expectation is that entities will communicate accordingly and when it is clear that Part 2.1, 2.2, or both are met, the entity would make the notification. It is not intended for entities to automatically and unnecessarily notify other entities before adequate detail is known.

**Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

---

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. [Violation Risk Factor: Medium][Time Horizon: Operations Assessment, Operations Planning]

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

Rationale for R3: When an entity receives notification of a Protection System operation by the BES interrupting device owner, the other Protection System owner is allotted at least 60 calendar days to identify whether it was a Misoperation. A shorter time period is allotted on the basis that the BES interrupting device owner has already performed preliminary work, collaborated with the other owners, and that other owners generally have fewer associated Protection System components.

R4. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: [Violation Risk Factor: Medium] [Time Horizon: Operations Assessment, Operations Planning]

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

**Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

**Rationale for R4:** If a Misoperation cause is not identified within the time period established by Requirements R1 or R3 (i.e., 120 calendar days), the Protection System component owner must demonstrate investigative actions toward identifying the cause(s). Performing at least one action every two full calendar quarters from first identifying the Misoperation encourages periodic focus on finding the cause of the Misoperation.

**R5.** Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-Term Planning]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations; or
- Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

**M5.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

**Rationale for R5:** A formal CAP is a proven tool for resolving and reducing the possibility of reoccurrence of operational problems. A time period of 60 calendar days is based on industry experience and operational coordination time needed for considering such things as alternative solutions, coordination of resources, or development of a schedule. When the cause of a Misoperation is identified, a CAP will generally be developed. An evaluation of the CAP's applicability to the entity's other Protection Systems including other locations helps identify similar problems, the potential for Misoperation occurrences in other Protection Systems, common mode failure, design problems, etc. In rare cases, altering the Protection System to avoid a Misoperation recurrence may lower the reliability or performance of the BES. In those cases, a statement documenting the reasons for taking no corrective actions is essential for future reference and for justifying the absence of a CAP.

**Standard PRC-004-3 — Protection System Misoperation Identification and Correction**

---

**R6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. [Violation Risk Factor: Medium][Time Horizon: Operations Planning, Long-Term Planning]

**M6.** Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

**Rationale for R6:** Each CAP must accomplish all identified objectives to be complete. During the course of implementing a CAP, updates may be necessary for a variety of reasons such as new information, scheduling conflicts, or resource issues. Documenting changes or completion of CAP activities provides measurable progress and confirmation of completion.

**D.E. Compliance**

**3.8. Compliance Monitoring Process**

**3.1.8.1. Compliance Enforcement Authority**

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

**8.2. Evidence Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, R3, and R4, Measures M1, M2, M3, and M4 for a minimum of 12 calendar months following the completion of each Requirement.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, R3, and R4, for a minimum of 12 calendar months following completion of each CAP, completion of each evaluation, and completion of each declaration.

The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

**Guidelines and Technical Basis**

**Introduction**

This standard addresses the reliability issues identified in the letter<sup>4</sup> from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

“Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. ...Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization.”

The standard also addresses the findings in the *2011 Risk Assessment of Reliability Performance*<sup>5</sup>; July 2011.

“...a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry.”

The *State of Reliability 2014*<sup>6</sup> report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

**Definitions**

The Misoperation definition is based on the IEEE/PSRC Working Group I3 “Transmission Protective Relay System Performance Measuring Methodology<sup>7</sup>.” Misoperations of a Protection

**PRC-004-3 – Application Guidelines**

---

System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

For reference, a “Protection System” is defined in the *Glossary of Terms Used in NERC Reliability Standards* (“NERC Glossary”) as:

- Protective relays which respond to electrical quantities.
- Communications systems necessary for correct operation of protective functions.
- Voltage and current sensing devices providing inputs to protective relays.
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

**Composite Protection System** – *The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element’s Protection System(s) is excluded.*

The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation.

**Composite Protection System – Line Example**

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

### **Composite Protection System – Transformer Example**

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

### **Composite Protection System – Generator Example**

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

### **Composite Protection System – Breaker Failure Example**

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker’s Composite Protection System. Considering breaker failure protection to be part of another Element’s Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the “Slow Trip” criteria of the Misoperation definition.

- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line’s Composite Protection System.
- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker’s Composite Protection System.
- An example of an “Unnecessary Trip – During Fault” is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

Misoperation – The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. Failure to Trip – During Fault – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. Failure to Trip – Other Than Fault – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. Slow Trip – During Fault – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
4. Slow Trip – Other Than Fault – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
5. Unnecessary Trip – During Fault – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. Unnecessary Trip – Other Than Fault – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

The Misoperation definition is based on the principle that an Element’s total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a “Failure to Trip” or a “Slow Trip” does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended for protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

**Failure to Trip – During Fault**

This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation.

**Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.

**Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated.

**Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.

**Example 1d:** A failure of an overall differential relay to operate is not a "Failure to Trip – During Fault" Misoperation as long as another component such as a generator differential relay operated.

**Example 1e:** The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one "Failure to Trip – During Fault" Misoperation of the bus Composite Protection System.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – During Fault" category applies to the operation.

**Failure to Trip – Other Than Fault**

This category of Misoperation may have resulted in operator intervention. The "Failure to Trip – Other Than Fault" conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

**Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

**Example 2b:** A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator's Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the "Slow Trip – Other Than Fault" category applies to the operation.

**Slow Trip – During Fault**

This category of Misoperation typically results in remote backup Protection System operation before the Fault is cleared.

**Example 3a:** A Composite Protection System that is slower than required for a Fault condition is a Misoperation if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. The current differential element of a multiple function relay failed to operate for a line Fault. The same relay’s time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line’s time-overcurrent element was found to be set to trip too slowly.

**Example 3b:** A failure of a breaker’s Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element’s Composite Protection System. If a generating unit’s Composite Protection System operates due to instability caused by the slow trip of the breaker’s Composite Protection System, it is not an “Unnecessary Trip – During Fault” Misoperation of the generating unit’s Composite Protection System. This event would be a “Slow Trip – During Fault” Misoperation of the breaker’s Composite Protection System.

**Example 3c:** A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase “resulted in the operation of any other Composite Protection System” refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip – During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a “Slow Trip,” category of Misoperation at the local terminal.

### **Slow Trip – Other Than Fault**

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

**Example 4:** A phase to phase fault occurred on the terminals of a generator. The generator's Composite Protection System and a transmission line's Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line's correctly set overreaching zone of protection to operate. This was a Misoperation of the generator's Composite Protection System, but not of the transmission line's Composite Protection System.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

### **Unnecessary Trip – During Fault**

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the faulted Element to clear the Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

**Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

**Example 5b:** An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

**Example 5c:** If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

**Unnecessary Trip – Other Than Fault**

Unnecessary trips for non-Fault conditions include but are not limited to: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

**Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.

**Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

**Example 6c:** An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

**Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

**Example 6e:** A BES interrupting device operation that occurs at the remote end of a line during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation because of the maintenance exclusion in category 6 of the definition of "Misoperation."

The "on-site" activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

**Special Cases**

Protection System operations for these cases would not be a Misoperation.

**Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations that occur when the protected Element is out of service and that do not trip any in-service Elements are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

**Example 7b:** The high-side of a transformer connected to a line may be within the zone of protection of the supplying line's relaying. In this case, the line relaying is planned to protect the area of the high-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

**Example 7c:** A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization.

**Example 7d:** A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush after being released for operational service. Only the high-side breaker opens since the low-side breaker had not yet been closed.

### **Non-Protective Functions**

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

### **Control Functions**

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard's Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity's process or planned

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

switching sequence. The following are examples of conditions to which this standard is not applicable:

**Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity’s normal or routine process.

**Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.

The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

**Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

### **Extenuating Circumstances**

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: “In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties.” The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

### **Requirement Time Periods**

The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations without an identified cause become subject to Requirement R4 and any subsequent Requirements as necessary. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.

Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins. The time period(s) in Requirement R4 resets upon each period. When the applicable entity's investigative actions identify the cause of the identified Misoperation or the applicable entity declares that no cause was found, the applicable entity has completed its performance in Requirement R4.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

**Requirement R1**

This Requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

**Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, the BES interrupting device owner would still review the operation under Requirement R1. However, if the BES interrupting device owner determines that its Protection System component operated as backup protection for a condition on another entity's BES Element, the owner would provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner's differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or Disturbance Monitoring Equipment (DME) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether its Protection System component(s) caused a Misoperation.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC *Misoperations Report*<sup>8</sup> which states:

“In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation.”

The following is an example of a condition that is not a Misoperation.

**Example R1b:** A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

## **Requirement R2**

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This Requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

---

<sup>8</sup> “Misoperations Report.” Reporting Multiple Occurrences. NERC Protection System Misoperations Task Force. [http://www.nerc.com/docs/pc/psmtf/PSMTF\\_Report.pdf](http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf). April 1, 2013. pg. 37 of 40.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

The following is an example of a notification to another Protection System owner:

**Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external Fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

**Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, notified the Generator Owner of the operation. The Generator Owner investigated and determined that its Protection System components caused the Misoperation. In this example, the Generator Owner’s Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the Generator Owner and Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

**Example R2c:** Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B’s Composite Protection System (owned by entity 2) and zone 3 portion of Line C’s Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

### **Requirement R3**

For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

**Requirement R4**

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

**Example R4a:** A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 as the first investigative action (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer's documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity's effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, requesting an outage, or confirming a schedule.

The entity's investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.<sup>9</sup>

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

---

<sup>9</sup> NERC System Protection and Control Subcommittee, Misoperations Report, April 1, 2013: [http://www.nerc.com/docs/pc/psmtf/PSMTF\\_Report.pdf](http://www.nerc.com/docs/pc/psmtf/PSMTF_Report.pdf), Figure 15: NERC Wide Misoperations by Cause Code, pg. 22 of 40.

**Standard PRC-004-2.1a— Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

The following are examples of a declaration where no cause was determined:

**Example R4b:** A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014 as the first investigative action. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

**Example R4c:** A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

**Requirement R5**

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, "A list of actions and an associated timetable for implementation to remedy a specific problem." Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1, R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity's control or would not improve BES reliability. The entity must develop the CAP or make a declaration why additional actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation. In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAP(s) to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of each CAP in Examples R5a through R5d, please see Examples R6a through R6d.

**Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.

A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

**Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity's control or would not improve BES reliability and that no further corrective actions will be taken.

**Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.

**Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

**Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

**Example R5h:** As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

**Example R5i:** During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity’s control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

**Requirement R6**

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

**Example R6a:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

---

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

**Example R6b:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.

CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

**Example R6c:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

**Example R6d:** Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

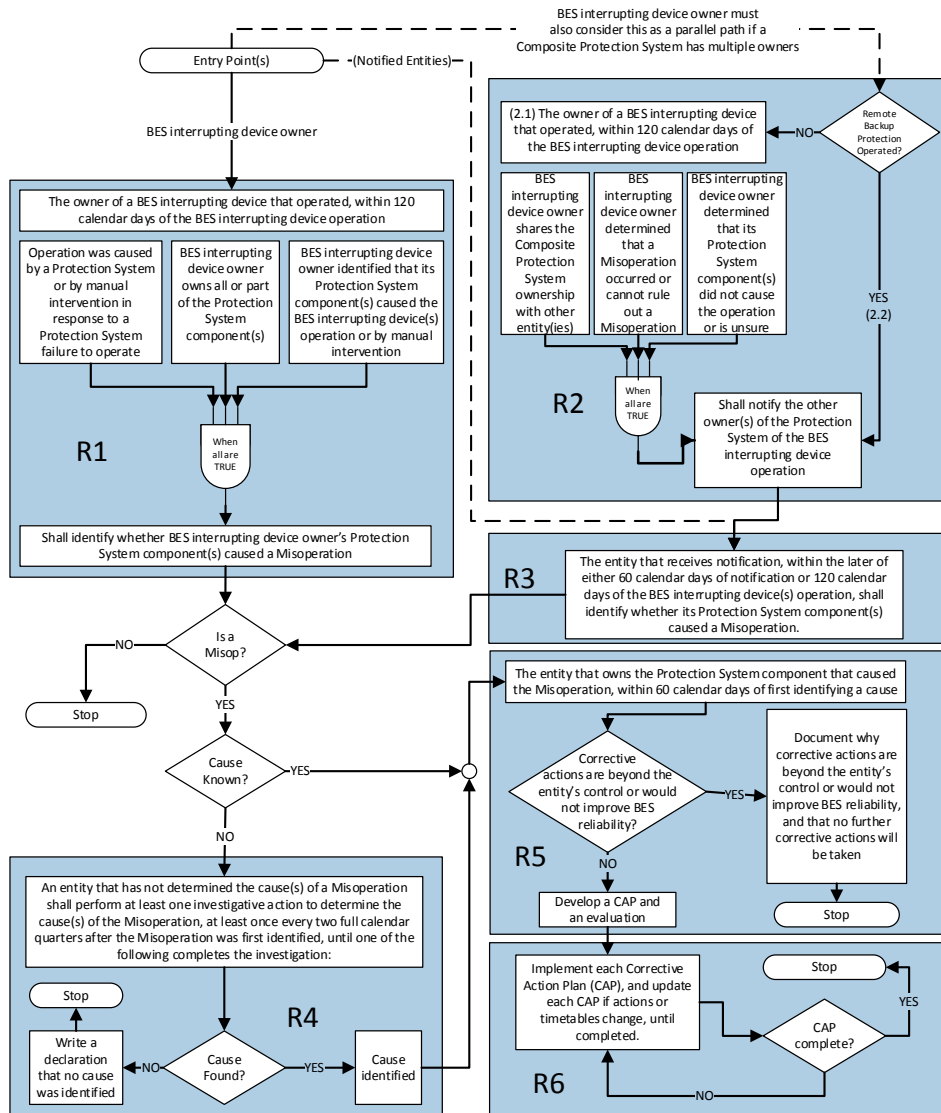

Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.

**Standard PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations**  
**PRC-004-3 – Application Guidelines**

**Process Flow Chart:** Below is a graphical representation demonstrating the relationships between Requirements:

## Implementation Plan

### Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

#### Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction
- Definitions of “Composite Protection System” and “Misoperation”

#### Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

#### Prerequisite Approvals

- None

#### Revisions to Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definition:

##### **Composite Protection System:**

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element’s Protection System(s) is excluded.

The standard drafting team proposes the following revised definition:

##### **Misoperation:**

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage,

overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.

### General Considerations

The implementation period allows adequate time for applicable entities to develop or modify its procedures and processes for reviewing Protection System operations. The development and implementation of a Corrective Action Plan remains within the scope of PRC-004; therefore, little additional time and resources should be needed to account for the increased detail in the required performance identified in the proposed PRC-004-3 Reliability Standard. The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information.

### Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements, with the following exclusions:
  - Non-protective functions that are embedded within a Protection System.
  - Protective functions intended to operate as a control function during switching.
  - Special Protection Systems (SPS).
  - Remedial Action Schemes (RAS).
- Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

### **Effective Dates of New or Revised Standards and Definitions**

The standard, the revised definition of “Misoperation,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of “Misoperation,” and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### **Retirement of Existing Standards**

The existing standards, PRC-003-1 and PRC-004-2.1a, shall be retired at midnight of the day immediately prior to the Effective Date of PRC-004-3.

# Implementation Plan

## Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

### Requested Approvals

- PRC-004-3 – Protection System Misoperation Identification and Correction
- Definitions of “Composite Protection System” and “Misoperation”

### Requested Retirements

- PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection System
- PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

### Prerequisite Approvals

- None

### Revisions to Defined Terms in the NERC Glossary

The standard drafting team proposes the following new definition:

#### Composite Protection System:

The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided ~~to~~by a ~~remote~~different Element’s Protection System(s) is excluded.

The standard drafting team proposes the following revised definition:

#### Misoperation:

The failure of a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a

Misoperation as long as the ~~duration of its operating time resulted in~~ performance of the operation of at least one other Element's Composite Protection System is correct.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation if the duration of its operating time resulted in the operation of at least one other Element's Composite Protection System.
5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.
6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction or commissioning activities is not a Misoperation.

### General Considerations

The implementation period allows adequate time for applicable entities to develop or modify its procedures and processes for reviewing Protection System operations. The development and implementation of a Corrective Action Plan remains within the scope of PRC-004; therefore, little additional time and resources should be needed to account for the increased detail in the required performance identified in the proposed PRC-004-3 Reliability Standard. The obligation for reporting Misoperations has been removed from PRC-004 and is being developed under the NERC Rules of Procedure, Section 1600 – Request for Data or Information.

### Applicability

This standard applies to the following functional entities:

- Transmission Owner
- Generator Owner
- Distribution Provider

This standard applies to the following Facilities:

- Protection Systems for BES Elements. ~~Non-protective functions that are embedded within a Protection System are excluded. Protective functions intended to operate as a control function during switching are excluded.~~ with the following exclusions:
  - Non-protective functions that are embedded within a Protection System.
  - Protective functions intended to operate as a control function during switching.
  - Special Protection Systems (SPS).
  - Remedial Action Schemes (RAS).
- Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

### Effective Dates of New or Revised Standards and Definitions

The standard, the revised definition of “Misoperation”<sup>2</sup> and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard, the revised definition of “Misoperation”<sup>2</sup> and the new definition of “Composite Protection System” shall become effective on the first day of the first calendar quarter that is twelve (12) months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

### Retirement of Existing Standards

The existing standards, PRC-003-1 and PRC-004-2.1a, shall be retired at midnight of the day immediately prior to the Effective Date of PRC-004-3.

## Mapping Document

### Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

#### Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the standard drafting team is recommending revisions to the standard, those changes are identified in the “Translation to PRC-004-3 or Other Action” column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
<b>4. Applicability:</b> <b>4.1. Regional Reliability Organization</b>	<b>4. Applicability:</b> <b>4.1. Functional Entities:</b> <b>4.1.1</b> Transmission Owner <b>4.1.2</b> Generator Owner <b>4.1.3</b> Distribution Provider	The proposed standard properly assigns responsibility to the registered entity functions that are responsible for Protection System Misoperation identification and correction. The Transmission Owner, Generator Owner, and Distribution Provider, by function, are Protection System asset owners and are in the best position be aware of and apply resources to review Protection System operations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
<p><b>R1.</b> Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:</p>		<p>The Requirements in the proposed PRC-004-3 standard by their results-based standard (RBS) construction requires performance that is implicit of having procedures for the analysis of Protection System operations (R1, R2, R3, and R4) and mitigation of identified Misoperations (R5 and R6). The proposed requirements also directs focus to areas most important to reliability.</p> <p>For example, Requirement R1 requires the applicable entity to initiate a review upon a Bulk Electric System (BES) interrupting device operation and identify any Misoperation. Requirement R2 requires the applicable entity to notify all other owners that share a Misoperation identification responsibility of the Composite Protection System when it determines (or is unsure) its Protection System component(s) did not cause the BES interrupting device operation or it cannot rule out a Misoperation. Requirement R3 requires the notified entity to identify any Misoperation of its Protection System component(s) similar to Requirement R1. Requirement R4 directs the applicable entity to</p>

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
		<p>continue its investigative work to determine the cause(s) of an identified Misoperation, if not determined in R1 or R3, until the cause(s) is determined or the entity declares that it is unable to determine the cause.</p> <p>Requirements R5 and R6 for developing and implementing a Corrective Action Plan (CAP) are also implicit of having a documented procedure. The implicit performance required by Requirements R1 through R6 necessitate that an entity have procedures to accomplish the objectives of the proposed standard. Requiring the applicable entities to have procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.</p>
<p><b>R1.1.</b> The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).</p>	<p><b>4.2.</b> Facilities:  <b>4.2.1</b> Protection Systems for BES Elements, with the following exclusions:  <b>4.2.1.1</b> Non-protective functions that are embedded</p>	<p>The previous PRC-003-1, Requirement R1.1 required the Regional Reliability Organization (RRO) to identify the Protection Systems to be reviewed and analyzed for Misoperation.</p> <p>The applicable Facilities have been clarified in the proposed PRC-004-3 to include Protection Systems for</p>

for Misoperations (due to their potential impact on BES reliability).	<p>shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in 2.1 and 2.2.</p> <p><b>2.1</b> When a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:</p> <p><b>2.1.1</b> The BES interrupting device owner shares the Composite Protection System ownership with any other entity; and</p>	<p>the cause of a Protection System operation was not caused (or is undetermined) by the BES interrupting device owner and when a Misoperation is identified (or cannot be ruled out) in accordance with Part 2.1, including sub-parts 2.1.1 through 2.1.3.</p>

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
	<p><b>2.1.2</b> The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and</p> <p><b>2.1.3</b> The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.</p> <p><b>2.2</b> For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity's BES Element, notification of the operation shall</p>	<p>(Part 2.2) Since Requirement R1 initiates the reliability activity upon the operation of a BES interrupting device, Requirement R1 does not address the case of a Protection System failure where a remote BES interrupting device operates.</p> <p>The second Part 2.2 of Requirement R2 is a provision to require notification to the other owners when a remote BES interrupting device operates as backup protection for a condition on another entity's BES Element. This generally indicates that another BES interrupting device has most likely failed to operate. Part 2.2 requires the other owner for which backup protection was provided to be notified, thus initiating the reliability activity to</p>

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
	be provided to the other Protection System owner(s) for which that backup protection was provided.	identify a possible Misoperation under Requirement R3 by the other owner(s).
(Continued) <b>R1.1.</b> The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).	<b>R3.</b> Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation.	Requirement R3 places responsibility on the applicable entity that receives notification to review its Protection System component(s) for Misoperations similar to Requirement R1. It is common practice for the BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 calendar days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 calendar days) to conduct its review.
(Continued) <b>R1.1.</b> The Protection Systems to be reviewed and analyzed	<b>R4.</b> Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a	Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
for Misoperations (due to their potential impact on BES reliability).	<p>Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation:</p> <ul style="list-style-type: none"> <li>• The identification of the cause(s) of the Misoperation; or</li> <li>• A declaration that no cause was identified.</li> </ul>	<p>cause(s) of a Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it could not determine the cause.</p>
<b>R1.2.</b> Data reporting requirements (periodicity and format) for Misoperations.	None.	<p>NERC Rules of Procedure, Section 1600 Request for Information or Data will replace the reporting obligations of the applicable entities. As such, reporting to Regional Entities will end and continent-wide single reporting to the Electric Reliability Organization (ERO) will be required. The ERO will analyze the data to: develop meaningful metrics; identify trends in Protection System performance that negatively impact reliability; identify</p>

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
		remediation techniques; and publicize lessons learned for the industry. Metrics will be validated and shared with each Regional Entity. The removal of the data collection from the standard does not result in a reduction of reliability.
<b>R1.3.</b> Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	<p><b>R5.</b> Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation:</p> <ul style="list-style-type: none"> <li>• Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations, or</li> <li>• Explain in a declaration why corrective actions are beyond the</li> </ul>	<p>The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP’s applicability to the entity’s other Protection Systems, including those at other locations.</p> <p>Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity may</p>

Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
	entity's control or would not improve BES reliability, and that no further corrective actions will be taken.	document in a declaration that a CAP is not practical. The entity must explain in a declaration why no further action will be taken.
(Continued) <b>R1.3.</b> Process for review, analysis follow up, and documentation of Corrective Action Plans for Misoperations.	<b>R6.</b> Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.	Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
<b>R1.4.</b> Identification of the Regional Reliability Organization group responsible for the procedures and the process for approval of the procedures.	None.	The proposed PRC-004-3 now requires the applicable entities (GO, DP, and TO) to individually address Misoperations of its Protection Systems for BES Elements without regard to the Region or Regions in which it owns Protection Systems for BES Elements. The proposed PRC-004-3 Reliability Standard, revised definition of "Misoperation," and new definition of "Composite Protection System" provide sufficient clarity to entities; therefore, there is no reliability benefit to obtain the Regional Entity's (formerly Regional Reliability

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
		Organization or RRO) approval of procedures. Each applicable entity will be measured on its performance with the proposed PRC-004-3 requirements.
<b>R2.</b> Each Regional Reliability Organization shall maintain and periodically update documentation of its procedures for review, analysis, reporting, and mitigation of transmission and generation Protection System Misoperations.	<b>4. Applicability:</b> <b>4.1. Functional Entities:</b> <b>4.1.1</b> Transmission Owner <b>4.1.2</b> Generator Owner <b>4.1.3</b> Distribution Provider	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no need to have a specific requirement for dictating the updating of such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) or applicable entities. Requiring the applicable entities to update procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.
<b>R3.</b> Each Regional Reliability Organization shall distribute procedures in Requirement 1 and any changes to those procedures, to the affected Transmission	None.	The proposed PRC-004-3 implicitly requires each applicable entity to have its own procedures and processes; therefore, there is no longer a need to distribute such procedures or processes by the previous Regional Reliability Organization (now Regional Entity) to the applicable entities. Requiring the applicable entities to distribute procedures is an activity or task that does

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems

	<p><b>R4.</b> Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation:</p> <ul style="list-style-type: none"> <li>• The identification of the cause(s) of the Misoperation; or</li> <li>• A declaration that no cause was identified.</li> </ul> <p><b>R5.</b> Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar</p>	<p>in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 calendar days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 calendar days) to conduct its review.</p> <p>Requirement R4 is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the cause(s) of an identified Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative action every two full calendar quarters until the entity determines the cause(s) or declares that it could not determine the cause.</p>

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
	<p>days of first identifying a cause of the Misoperation:</p> <ul style="list-style-type: none"> <li>• Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations, or</li> <li>• Explain in a declaration why corrective actions are beyond the entity’s control or would not improve BES reliability, and that no further corrective actions will be taken.</li> </ul> <p><b>R6.</b> Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed.</p>	<p>The proposed PRC-004-3, Requirement R5 provides a step not apparent in the previous PRC-003-1 which is the development of a Corrective Action Plan (CAP) within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP’s applicability to the entity’s other Protection Systems, including those Protection Systems at other locations.</p> <p>Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity must document in a declaration that a CAP actions are beyond the entity’s control or would not improve BES reliability. The entity must explain in a declaration why no further action will be taken.</p>

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
		Requirement R6 requires the implementation of the CAP. The applicable entity must update the CAP if actions or timetables change until the CAP is completed.
<b>R3.</b> The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity's procedures.	None.	Since the NERC Rules of Procedure, Section 1600 Request for Data or Information will replace the reporting obligations, NERC will receive the data on a periodic basis, analyze, establish metrics, and share results accordingly with the Regional Entities as well as industry. Having reporting obligations as a Requirement is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

## Mapping Document

### Project 2010-05.1 Protection Systems: Phase 1 (Misoperations)

#### Revisions or Retirements to Already Approved Standards

This mapping document shows the translation of PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations into the proposed PRC-004-3 – Protection System Misoperation Identification and Correction Reliability Standard. The following table identifies the sections of the approved standard that shall be added, retired, or revised when this standard is implemented. If the standard drafting team is recommending revisions to the standard, those changes are identified in the “Translation to PRC-004-3 or Other Action” column.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
<b>4. Applicability:</b> <b>4.1. Regional Reliability Organization</b>	<b>4. Applicability:</b> <b>4.1. Functional Entities:</b> <b>4.1.1</b> Transmission Owner <b>4.1.2</b> Generator Owner <b>4.1.3</b> Distribution Provider	The proposed standard properly assigns responsibility to the registered entity functions that are responsible for Protection System Misoperation identification and correction. The Transmission Owner, Generator Owner, and Distribution Provider, by function, are Protection System asset owners and are in the best position be aware of and apply resources to review Protection System operations.

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
<p><b>R1.</b> Each Regional Reliability Organization shall establish, document and maintain its procedures for, review, analysis, reporting and mitigation of transmission and generation Protection System Misoperations. These procedures shall include the following elements:</p>		<p>The Requirements in the proposed PRC-004-3 standard by their results-based standard (RBS) construction requires performance that is implicit of having procedures for the analysis of Protection System operations (R1, R2, R3, and R4) and mitigation of identified Misoperations (R5 and R6). The proposed requirements also directs focus to areas most important to reliability.</p> <p>For example, Requirement R1 requires the applicable entity to initiate a review upon a Bulk Electric System (BES) interrupting device operation and identify any Misoperation. Requirement R2 requires the applicable entity to notify all other owners that share a Misoperation identification responsibility of the Composite Protection System when it determines (or is unsure) its Protection System component(s) did not cause the BES interrupting device operation or it cannot rule out a Misoperation. Requirement R3 requires the notified entity to identify any Misoperation of its Protection System component(s) similar to Requirement R1. Requirement R4 directs the applicable entity to</p>

Standard: PRC-003-1 - Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
		<p>continue its investigative work to determine the cause(s) of an identified Misoperation, if not determined in R1 or R3, until the cause(s) is determined or the entity declares that it is unable to determine the cause.</p> <p>Requirements R5 and R6 for developing and implementing a Corrective Action Plan (CAP) are also implicit of having a documented procedure. The implicit performance required by Requirements R1 through R6 necessitate that an entity have procedures to accomplish the objectives of the proposed standard. Requiring the applicable entities to have procedures is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.</p>
<p><b>R1.1.</b> The Protection Systems to be reviewed and analyzed for Misoperations (due to their potential impact on BES reliability).</p>	<p><b>4.2.</b> Facilities:  <b>4.2.1</b> Protection Systems for BES Elements, with the following exclusions:  <b>4.2.1.1</b> Non-protective functions that are embedded</p>	<p>The previous PRC-003-1, Requirement R1.1 required the Regional Reliability Organization (RRO) to identify the Protection Systems to be reviewed and analyzed for Misoperation.</p> <p>The applicable Facilities have been clarified in the proposed PRC-004-3 to include Protection Systems for</p>

	<p>interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation.</p> <p><b>R4.</b> Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation:</p> <ul style="list-style-type: none"> <li>• The identification of the cause(s) of the Misoperation; or</li> <li>• A declaration that no cause was identified.</li> </ul> <p><b>R5.</b> Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System</p>	<p><u>BES interrupting device owner that initiates the review to be in communication and collaboration with other Protection System component(s) owners during its review within the 120 calendar day period. The shorter 60 calendar day period for the notified entity assures that in the rare case where the notifying entity takes the majority of its allotted time (120 calendar days) to review an operation, the receiving entity will always have a minimum and reasonable time (60 calendar days) to conduct its review.</u></p> <p><u><del>Last,</del> Requirement R4 <del>requires</del> is essentially a new requirement to determine the cause(s) of a Misoperation where the previous requirements (i.e., R1 or R3) failed to reveal the cause(s) of an identified Misoperation. In most cases, the cause(s) of a Misoperation will be revealed during the course of review and when the cause(s) is not readily apparent, the applicable entity is required in Requirement R4 to conduct at least one investigative actions-action every two full calendar quarters until the entity determines the cause(s) or declares that it has been unable to could not determine the cause(s).</u></p>

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
	<p>component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation:</p> <ul style="list-style-type: none"> <li>• Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations, or</li> <li>• Explain in a declaration why corrective actions are beyond the entity’s control or would not improve BES reliability, and that no further corrective actions will be taken.</li> </ul> <p><b>R6.</b> Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP</p>	<p><u>The proposed PRC-004-3, Requirement R5 addresses provides a step not apparent in the “develop—a previous PRC-003-1 which is the development of a Corrective Action Plan (CAP)” portion, within 60 calendar days of first identifying the Misoperation cause. Requirement R5 also requires each applicable entity to perform an evaluation of the CAP’s applicability to the entity’s other Protection Systems, including those Protection Systems at other locations.</u></p> <p><u>Furthermore, Requirement R5 accounts for those cases why corrective actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken. This could be a result of a cause created by a non-registered third party, such as a communication provider. Also, should implementing the changes not improve BES reliability, the entity must document in a declaration that a CAP actions are beyond the entity’s control or would not improve BES reliability. The entity must explain in a declaration why no further action will be taken.</u></p>

Standard: PRC-004-2.1a - Analysis and Mitigation of Transmission and Generation Protection System Misoperations		
Requirement in Approved Standard	Translation to PRC-004-3 or Other Action	Comments
	if actions or timetables change, until completed.	Requirement R6 <del>addresses the “implement” portion of the CAP</del> requires the implementation of the CAP. <u>The applicable entity must update the CAP if actions or timetables change until the CAP is completed.</u>
<b>R3.</b> The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Entity, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity’s procedures.	None.	Since the NERC Rules of Procedure, Section 1600 Request for Data or Information will replace the reporting obligations, NERC will receive the data on a periodic basis, analyze, establish metrics, and share results accordingly with the Regional Entities as well as industry. Having reporting obligations as a Requirement is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

# Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction  
Project 2010-05.1 – Protection System (Misoperations)

## Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 – Protection System Misoperation Identification and Correction.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the base penalty amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

### NERC Criteria - Violation Risk Factors

#### *High Risk Requirement*

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

#### *Medium Risk Requirement*

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if

violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### ***Lower Risk Requirement***

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

### **FERC Violation Risk Factor Guidelines**

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:<sup>1</sup>

#### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VRF Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:<sup>2</sup>

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination

<sup>1</sup> *N. Am. Elec. Reliability Corp.*, 119 FERC ¶ 61,145 (2007) (“VRF Order”), *order on reh’g and compliance filing*, 120 FERC ¶ 61,145 (2007) (“VRF Rehearing Order”).

<sup>2</sup> *Id.* at fn 15.

- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

### **Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

### **VRF Discussion**

The discussion below in the tables addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and Correction is a

revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations and combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1.<sup>3</sup> First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform an evaluation of the CAP's applicability to the entity's other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity's control or would not improve BES reliability, it must explain this in a declaration why no further corrective actions will be taken.

In the last Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

---

<sup>3</sup> The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives. In developing the new VRFs for the Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team’s VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

**NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance</p> <p>The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance.</p> <p>The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.</p> <p>The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance.</p> <p>The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

**FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

***Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance***

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

***Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties***

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

***Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement***

VSLs should not expand on what is required in the requirement.

***Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations***

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1

Proposed VRF	Medium
<p>NERC VRF Discussion</p>	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p> <p>Composite Protection System operations reviewed for proper operation by an owner is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is not in itself likely to lead to bulk electric system instability, separation, or cascading failures.</p>
<p>FERC VRF G1 Discussion</p>	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.</p>
<p>FERC VRF G2 Discussion</p>	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p>

VRF and VSL Justifications – PRC-004-3, R1	
	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO), which both have a VRF of “High.” The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan”. The performance activity that has been isolated in Requirement R1 of PRC-004-3, to “review” (similar to “analyze”), is consistent with similar requirements in Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p> <p>A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement comingles multiple activities</p>
FERC VRF G4 Discussion	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p> <p>Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage.</p>
FERC VRF G5 Discussion	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

VRF and VSL Justifications – PRC-004-3, R1			
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation.  OR The responsible entity failed to identify whether its Protection System component(s) caused a Misoperation in accordance with Requirement R1.
NERC VSL Guidelines	Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R1	
<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p>This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.</p>
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>

VRF and VSL Justifications – PRC-004-3, R1	
Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R2	
<b>Proposed VRF</b>	<b>Medium</b>
NERC VRF Discussion	A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify the other owner(s) of a Composite Protection System when the initiating owner determined its Protection System components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.

VRF and VSL Justifications – PRC-004-3, R2	
	Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system by creating a gap in analysis.
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of the Composite Protection System component(s) when it determines that (or is unsure whether) its component(s) did not cause a Misoperation or when it is unable to rule out a Misoperation of the Composite Protection System owned by others. This ensures that all owners review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
FERC VRF G3 Discussion	Guideline 3- Consistency among Reliability Standards:

VRF and VSL Justifications – PRC-004-3, R2

	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO), which both have a VRF of High. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan”. This requirement and a VRF assignment of Medium is consistent, for example, with Reliability Standards FAC-008-3 – Facility Ratings, R7 (“...shall provide Facility Ratings (for its solely and jointly owned Facilities...)”), MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 (“...shall provide appropriate equipment characteristics and system data...”), IRO-015-1 – Special Protection System Data and Documentation, R1.1 (“...shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.”), and IRO-016-1 – Coordination of Real-time Activities Between Reliability Coordinators, R1 (“...shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem.”) which all have a VRF of Medium.</p> <p>Other Protection Systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 (“...shall provide documentation...”), PRC-016-0.1 – Special Protection System Misoperations, R3 (“...that owns an SPS shall provide documentation of the misoperation analyses...”), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 (“...SPS shall provide documentation of the program...”) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.</p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p>

VRF and VSL Justifications – PRC-004-3, R2			
	<p>Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p> <p>Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.</p>		
FERC VRF G5 Discussion	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>		
Proposed VSL			
Lower	Moderate	High	Severe
<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.</p>	<p>The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation.</p> <p>OR</p>

VRF and VSL Justifications – PRC-004-3, R2			
			The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.
NERC VSL Guidelines	Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as Composite Protection Systems that are owned by multiple entities is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.		
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties	<p>Guideline 2a: This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p>		

**VRF and VSL Justifications – PRC-004-3, R2**

<p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p> <p>Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>
<p>FERC VSL G4</p> <p>Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

**VRF and VSL Justifications – PRC-004-3, R3**

<b>Proposed VRF</b>	<b>Medium</b>
<p>NERC VRF Discussion</p>	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p> <p>Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage.</p>
<p>FERC VRF G1 Discussion</p>	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.</p>
<p>FERC VRF G2 Discussion</p>	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>

VRF and VSL Justifications – PRC-004-3, R3

<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which both have a VRF of High. This Requirement R3, to “review” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p> <p>A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.</p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure of another Composite Protection System owner to review its component(s) for Misoperation, upon notification, for each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p> <p>Composite Protection System operations reviewed for proper operation by the other owner(s) is an important step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage.</p>

VRF and VSL Justifications – PRC-004-3, R3			
FERC VRF G5 Discussion	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>		
Proposed VSL			
Lower	Moderate	High	Severe
<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was less than or equal to 30 calendar days late.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.</p>	<p>The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late.</p> <p>OR</p> <p>The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.</p>
NERC VSL Guidelines	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.</p>		

VRF and VSL Justifications – PRC-004-3, R3

<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO &amp; TO) for the notified Protection System owner. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p>A VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.</p>
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

VRF and VSL Justifications – PRC-004-3, R3	
<p>FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>
<p>FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

VRF and VSL Justifications – PRC-004-3, R4	
<b>Proposed VRF</b>	<b>Medium</b>
<p>NERC VRF Discussion</p>	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation (if not determined in Requirements R1 or R3) could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p>

VRF and VSL Justifications – PRC-004-3, R4	
	An Unidentified cause(s) of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
FERC VRF G3 Discussion	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO), which have a VRF of High. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” This Requirement R4, to perform at least one “investigative action” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p>

VRF and VSL Justifications – PRC-004-3, R4	
	<p>A VRF of Medium is not inadvertently lowering the current VRF of High in the former PRC-004-2.1a, Requirements R1 or R3, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.</p>
FERC VRF G4 Discussion	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p> <p>Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.</p>
FERC VRF G5 Discussion	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

VRF and VSL Justifications – PRC-004-3, R4			
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late.  OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.
NERC VSL Guidelines	Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO & DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.		

VRF and VSL Justifications – PRC-004-3, R4	
	This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p> <p>Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>

VRF and VSL Justifications – PRC-004-3, R4	
<p>FERC VSL G4</p> <p>Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	Medium
<p>NERC VRF Discussion</p>	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p> <p>An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p>

VRF and VSL Justifications – PRC-004-3, R5	
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
FERC VRF G3 Discussion	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“...shall take corrective actions to avoid future Misoperations”), PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan...”), FAC-003, R5 (“...Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management”) all three of which have a VRF of Medium.</p>
FERC VRF G4 Discussion	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p>

VRF and VSL Justifications – PRC-004-3, R5			
	An unresolved cause of a Misoperation could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system if the same condition resulted in a future Misoperation.		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.  OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.  OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.  OR	The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation.  OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5.  OR

VRF and VSL Justifications – PRC-004-3, R5

<p>The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.</p>	<p>The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.</p>	<p>The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.</p>	<p>The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation.</p> <p>OR</p> <p>The responsible entity failed to develop an evaluation in accordance with Requirement R5.</p>
<p>NERC VSL Guidelines</p>	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. Varying VSLs are provided for the omission of the evaluation when developing the Corrective Action Plan and for failure to develop the evaluation.</p>		
<p>FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have varying VSLs.</p> <p>This VSL does not lower the current level of compliance because the former VSL in PRC-004-2.1a was comingled with the other activities. This Requirement has a Severe VSL for failure to develop the CAP with the other VSLs being based on tardiness of the development.</p>		

VRF and VSL Justifications – PRC-004-3, R5

<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p> <p>Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>
<p>FERC VSL G4</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	
---	--

**VRF and VSL Justification – PRC-004-3, R6**

Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p> <p>An uncorrected cause of a Misoperation as a result of not implementing a Corrective Action Plan, could affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system since the condition could occur again.</p>

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
FERC VRF G3 Discussion	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2.1a, R1 (TO &amp; DP) and R2 (GO), which both have a VRF of High. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan”. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“...shall take corrective actions to avoid future misoperations.”) and PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan...”) which both have a VRF of Medium.</p> <p>The proposed VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.</p>

<b>VRF and VSL Justification – PRC-004-3, R6</b>			
FERC VRF G4 Discussion	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.</p> <p>An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage.</p>		
FERC VRF G5 Discussion	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>		
<b>Proposed VSL</b>			
<b>Lower</b>	<b>Moderate</b>	<b>High</b>	<b>Severe</b>
The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.

VRF and VSL Justification – PRC-004-3, R6

VRF and VSL Justification – PRC-004-3, R6	
NERC VSL Guidelines	Meets NERC’s VSL Guidelines—The VSLs cover aspects of this Requirement that are not equal in importance and performance.
<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p>The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based on the failure of updating the CAP when actions or timetables change which is administrative in nature.</p>
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

VRF and VSL Justification – PRC-004-3, R6

<p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	
<p>FERC VSL G3</p> <p>Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>
<p>FERC VSL G4</p> <p>Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

# Violation Risk Factors and Violation Severity Level Justifications

PRC-004-3 – Protection System Misoperation Identification and Correction  
Project 2010-05.1 – Protection System (Misoperations)

## Violation Risk Factor and Violation Severity Level Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in: PRC-004-3 — Protection System ~~Misoperations~~ Misoperation Identification and Correction.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the ~~Base Penalty Amount~~ base penalty amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Protection System Misoperations Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project.

### NERC Criteria - Violation Risk Factors

#### *High Risk Requirement*

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

#### *Medium Risk Requirement*

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if

violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### *Lower Risk Requirement*

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

### **FERC Violation Risk Factor Guidelines**

The standard drafting team (SDT) also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:<sup>1</sup>

#### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the ~~VSL~~VRF Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:<sup>2</sup>

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination

<sup>1</sup> ~~North American Electric~~N. Am. Elec. Reliability Corp., 119 FERC ¶ 61,145, (2007) (“VRF Order”), order on reh’g and compliance filing, 120 FERC ¶ 61,145 (2007) (“VRF Rehearing Order”).

<sup>2</sup> ~~Id.~~ at footnote 15.

- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

#### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

#### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

#### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

#### **Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

#### **VRF Discussion**

The ~~following~~ discussion [below in the tables](#) addresses how the SDT considered FERC's VRF Guidelines 1 through 5. PRC-004-3 – Protection System Misoperation Identification and

Correction is a revision of PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations. ~~“The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations. In FERC Order No. 693, the Commission identified PRC 003-0 as a “fill in the blank” standard. The Order stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC 003-0. Because PRC 003-0 (now PRC 003-1) is not enforceable, there is not a mandatory requirement for Regional Entity procedures to support the requirements of PRC 004-2.1a. This is a potential reliability gap; consequently, PRC-004-3 and~~ combines the reliability intent of the two legacy standards PRC-003-1 and PRC-004-2.1a.

The proposed PRC-004-3 Reliability Standard has six (6) discrete requirements that incorporate and enhance the intent of the requirements of PRC-004-2.1a and PRC-003-1.<sup>3</sup> First, the revised standard requires the Transmission Owner, Generator Owner, and Distribution Provider to review each BES interrupting device operation meeting the criteria in Requirement R1, which includes: when caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate and identify each that is a Misoperation; regardless of whether the BES interrupting device owner owns all or part of the Composite Protection System; and when BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation.

Second, the BES interrupting device owner is required to notify the other Composite Protection System component owner(s) when the criteria in Requirement R2 are met, which includes: Composite Protection System ownership is shared with another owner; the BES interrupting device owner determined that a Misoperation occurred or cannot rule out a Misoperation; and the BES interrupting device owner determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or is unsure.

Third, if a Transmission Owner, Generator Owner, or Distribution Provider is notified by a BES interrupting device owner that the Composite Protection System operated, it must review the operation according to Requirement R3. In most cases, Requirement R1 or R3 will reveal the cause of the Misoperation. If not, Requirement R4 mandates the entity perform investigative action(s) to determine the cause(s) as the fourth discrete Requirement. If a cause is not identified, the entity either may continue its investigation until a cause is identified or the entity may write a declaration that no cause was identified. If a cause is identified, the entity advances to the fifth Requirement.

In Requirement R5, the entity whose Protection System component was identified as the cause of the Misoperation must either develop a Corrective Action Plan (CAP) or explain in a declaration why it cannot correct the cause of the Misoperation. In developing a Corrective Action Plan (CAP) for the identified Protection System component(s), the entity must perform

<sup>3</sup> [The Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems requires Regional Entities to establish procedures for analysis of Misoperations.](#)

an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations. If the entity determines that corrective actions are beyond the entity’s control or would not improve BES reliability, it must explain this in a declaration why no further corrective actions will be taken.

In the last Requirement R6, the entity must implement and complete the CAP. The entity must update the CAP during implementation when actions or timetables change.

The requirements of the proposed PRC-004-3 do not map, one-to-one, with the Requirements of the two legacy standards, PRC-003-1 and PRC-004-2.1a. The new Requirements comingle various reliability attributes of the legacy standards with precise reliability objectives, ~~thus a Requirement to Requirement comparison of VRFs is not possible.~~ In developing the new VRFs for the Requirements of PRC-004-3, the Standard Drafting Team carefully considered the NERC criteria for developing VRFs, as well as the FERC VRF guidelines. The VRFs of the FERC approved PRC-004-2.1a – Analysis and Mitigation of Transmission and Generation Protection System Misoperations (R1 & R2 – High VRF), PRC-004-WECC-1 – Protection System and Remedial Action Scheme Misoperation (R1 – Lower VRF), PRC-016-0.1 – Special Protection System Misoperation (R2 – Medium VRF), and PRC-022-1 – Under-Voltage Load Shedding Program Performance (R1 & R1.5 – Medium VRF), all influenced (citing FERC VRF Guideline 3) the drafting team’s VRF decisions, as such, the VRFs for PRC-004-3 Requirements R1 through R6 are assigned a VRF of Medium.

**NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance  The performance or product measured has significant value as it almost meets	Missing at least one significant element (or a moderate percentage) of the required performance.  The performance or product measured still has significant value in meeting the	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.  The performance or product has limited	Missing most or all of the significant elements (or a significant percentage) of the required performance.  The performance measured does not meet the intent of

the full intent of the requirement.	intent of the requirement.	value in meeting the intent of the requirement.	the requirement or the product delivered cannot be used in meeting the intent of the requirement.
-------------------------------------	----------------------------	---	---

***FERC Order on Violation Severity Levels***

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

***Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance***

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

***Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties***

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

***Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement***

VSLs should not expand on what is required in the requirement.

***Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations***

... unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF and VSL Justifications – PRC-004-3, R1	
Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p> <p>Composite Protection System operations reviewed for proper operation by an owner is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is <del>unlikely</del><u>not in itself likely</u> to lead to bulk electric system instability, separation, or cascading failures.</p>
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis noted that zone 3 relays increased the severity of the blackout. Reviewing Protection Systems for Misoperation, identifying an unnecessary operation and taking corrective actions would reduce the likelihood of reoccurrence. This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p>

VRF and VSL Justifications – PRC-004-3, R1	
	This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.
FERC VRF G3 Discussion	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO-), <u>which both have a VRF of “High.”</u> The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” <del>which both have a VRF of High. This</del>. <u>The performance activity that has been isolated in Requirement R1 of PRC-004-3, to “review” (similar to “analyze”), comports consistent with similar requirements in</u> Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p> <p>A VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement <del>contained multiple activities and is ambiguous. The VRF assignment also comports with the currently effective standards PRC-016-0.1 and PRC-022-1. comingles multiple activities</del></p>
FERC VRF G4 Discussion	Guideline 4- Consistency with NERC Definitions of VRFs:

VRF and VSL Justifications – PRC-004-3, R1

	<p>Failure to review each BES interrupting device operation caused by a Protection System operation or by manual intervention in response to a Protection System failure to operate for Misoperation could, in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p> <p>Protection System operations reviewed for proper operation by their owner(s) is the first step in preventing the future severity of disturbances affecting a wider area, or potential equipment damage. <del>However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</del></p>
<p>FERC VRF G5 Discussion</p>	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

VRF and VSL Justifications – PRC-004-3, R1			
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity identified whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity identified whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity identified whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity identified whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1, but in more than 180 calendar days of the BES interrupting device operation.  OR The responsible entity failed to identify whether <del>or not</del> its Protection System component(s) caused a Misoperation in accordance with Requirement R1.
NERC VSL Guidelines	Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R1	
<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p>This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The VSLs appropriately assess the severity of the violation with the failure to perform a review for Misoperation as Severe.</p>
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>

VRF and VSL Justifications – PRC-004-3, R1

<p>Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	
<p>FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

VRF and VSL Justifications – PRC-004-3, R2

Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to notify the other owner(s) of a Composite Protection System when the initiating owner determined its Protection System components did not cause a Misoperation or it did not rule out a Misoperation, could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p> <p>Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could <del>contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</del> <u>affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system by creating a gap in analysis.</u></p>
FERC VRF G1 Discussion	Guideline 1- Consistency w/ Blackout Report:

VRF and VSL Justifications – PRC-004-3, R2	
	<p>This is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. A lack of coordination on system protection was one of eight factors common to substantive outages prior to and including the August 14, 2003 Blackout. The initiating entity in the planning time frame is required to notify the other owner(s) of the Composite Protection System component(s) when it determines that (or is unsure whether) its component(s) did not cause a Misoperation or when it is unable to rule out a Misoperation of the Composite Protection System owned by others. This ensures that all owners review their equipment for proper operation which may include checking for proper coordination depending on the circumstances.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
FERC VRF G3 Discussion	<p>Guideline 3- Consistency among Reliability Standards:</p>

VRF and VSL Justifications – PRC-004-3, R2

	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO), <u>which both have a VRF of High</u>. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” <u>which both have a VRF of High</u>.” This requirement and a VRF <u>assignment</u> of Medium is consistent, <u>for example</u>, with Reliability Standards FAC-008-3 – Facility Ratings, R7 (“...shall provide Facility Ratings (for its solely and jointly owned Facilities...)”), MOD-012-0 – Dynamics Data for Modeling and Simulation of the Interconnected Transmission System, R2 (“...shall provide appropriate equipment characteristics and system data...”), <del>and IRO-015-1 – NAME</del> <u>Special Protection System Data and Documentation</u>, R1.1 (“...shall make notifications to other Reliability Coordinators of conditions in its Reliability Coordinator Area that may impact other Reliability Coordinator Areas.”), <del>and IRO-016-1 – Coordination of Real-time Activities Between Reliability Coordinators, R1 (“...shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem.”)</del> which all have a VRF of Medium.</p> <p>Other Protection Systems based Reliability Standards such as PRC-005-1b – Transmission and Generation Protection System Maintenance and Testing, R2 (“...shall provide documentation...”), PRC-016-0.1 – Special Protection System Misoperations, R3 (“...that owns an SPS shall provide documentation of the misoperation analyses...”), and PRC-017-0 – Special Protection System Maintenance and Testing, R2 (“...SPS shall provide documentation of the program...”) all have a VRF of Lower; however, these requirements involve the administrative reporting to either the Regional Reliability Organization (now Regional Entity) or NERC and not a reliability function like the previously mentioned FAC-008-3 and MOD-012-0 Reliability Standards. As such, this Requirement R2 is assigned a VRF of Medium because it has a reliability need to be communicated to other owners.</p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p>

VRF and VSL Justifications – PRC-004-3, R2

	<p>Failure to notify other entities to review each Protection System operation, identify Misoperations, and determine the cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p> <p>Unresolved Misoperations of Composite Protection Systems owned by others that are not ruled out as a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. <del>However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</del></p>
<p>FERC VRF G5 Discussion</p>	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

VRF and VSL Justifications – PRC-004-3, R2			
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 120 calendar days and less than or equal to 150 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 150 calendar days and less than or equal to 165 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 165 calendar days and less than or equal to 180 calendar days of the BES interrupting device operation.	The responsible entity notified the other owner(s) of the Protection System component(s) in accordance with Requirement R2, but in more than 180 calendar days of the BES interrupting device operation.  OR  The responsible entity failed to notify one or more of the other owner(s) of the Protection System component(s) in accordance with Requirement R2.
NERC VSL Guidelines	Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R2	
<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement is new to the standard and had no previous level of compliance. Other Reliability Standards use a variety of VSLs ranging from a single severe level (i.e., binary), two levels, to four VSL levels. Some use a percentage as the failure of the number entities not notified; however, this would not be practical for this requirement as Composite Protection Systems that are owned by multiple entities is generally limited to one or two owners. The incremental increase in violation is consistent with the NERC Guidelines and is reasonable in consideration of the time periods provided by the Requirement.</p>
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>

The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 30 calendar days and less than or equal to 45 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 45 calendar days and less than or equal to 60 calendar days late.	The responsible entity identified whether or not its Protection System component(s) caused a Misoperation in accordance with Requirement R3, but was greater than 60 calendar days late.  OR The responsible entity failed to identify whether or not a Misoperation of its Protection System component(s) occurred in accordance with Requirement R3.
NERC VSL Guidelines	Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.		

VRF and VSL Justifications – PRC-004-3, R3

<p>FERC VSL G1</p> <p>Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (DP) and R2 (GO &amp; TO) for the notified Protection System owner. The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p>A VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.</p>
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

## VRF and VSL Justifications – PRC-004-3, R3

FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations.

VRF and VSL Justifications – PRC-004-3, R4	
Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to identify the cause(s) of a Misoperation (if not determined in Requirements R1 or R3) could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p> <p>An Unidentified cause(s) of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. <del>However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</del></p>
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>This requirement is consistent with Recommendation 8: Improve System Protection to Slow or Limit the Spread of Future Cascading Outages. The applicable entity must conduct investigative action(s) to determine the cause(s) of a Misoperation, if not determined during the course of a review as proposed in Requirements R1 and R3.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>

VRF and VSL Justifications – PRC-004-3, R4

<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO-), <del>which have a VRF of High.</del> The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” <del>which have a VRF of High.”</del> This Requirement R4, to perform at least one “investigative action” (similar to “analyze”), comports with Reliability Standards PRC-016-0.1 – Special Protection System Misoperations, R1 (“...shall analyze its SPS operations and maintain a record of all misoperations...”) and PRC-022-1 – Under-Voltage Load Shedding Program Performance, R1 (“...shall analyze and document all UVLS operations and Misoperations.”) which both have a VRF of Medium.</p> <p>A VRF of Medium is not inadvertently lowering the current VRF of High in the former PRC-004-2.1a, Requirements R1 or R3, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous. This VRF of Medium comports with the VRF assignment of Medium for PRC-004-3, Requirements R1 and R3, which will generally reveal the cause(s) of an identified Misoperation.</p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to identify the cause(s) of a Misoperation could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p>

VRF and VSL Justifications – PRC-004-3, R4			
	Unidentified causes of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. <del>However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</del>		
FERC VRF G5 Discussion	Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.		
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity performed at least one investigative action in accordance with Requirement R4, but was less than or equal to one calendar quarter late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than one calendar quarter and less than or equal to two calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was greater than two calendar quarters and less than or equal to three calendar quarters late.	The responsible entity performed at least one investigative action in accordance with Requirement R4, but was more than three calendar quarters late.  OR The responsible entity failed to perform investigative action(s) in accordance with Requirement R4.

VRF and VSL Justifications – PRC-004-3, R4	
NERC VSL Guidelines	Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. The VSL is entity size-neutral because performance is event-driven and not by individual assets.
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p>This VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. This VSLs appropriately assess the severity of the violation with the failure to perform investigative actions as Severe.</p>
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties  Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent  Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	<p>Guideline 2a: This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b: This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

VRF and VSL Justifications – PRC-004-3, R4

<p>FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>
<p>FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

VRF and VSL Justifications – PRC-004-3, R5	
Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to develop a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p> <p>An unresolved cause of a Misoperation or failing to consider other locations with similar Protection System components could <del>contribute</del> <u>affect</u> the <del>severity</del> <u>electrical state or capability</u> of <del>future disturbances affecting a wider area, or potential equipment damage.</del> <del>However, violation of this requirement is unlikely to lead to</del> <u>the</u> bulk electric system <del>instability, separation, or cascading failures</del> <u>the ability to effectively monitor, control, or restore the bulk electric system.</u></p>
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the development of a Corrective Action Plan (CAP) associated with Protection Systems.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>

VRF and VSL Justifications – PRC-004-3, R5

<p>FERC VRF G3 Discussion</p>	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have a VRF of High. This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“...shall take corrective actions to avoid future Misoperations”), PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan...”), FAC-003, R5 (“...Transmission Owner or applicable Generator Owner shall take corrective action to ensure continued vegetation management”) all three of which have a VRF of Medium.</p>
<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to develop a CAP for a Misoperation with an identified cause or failing to consider other locations with similar components could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p> <p>An unresolved cause of a Misoperation could <del>contribute</del><u>affect</u> the <del>severity</del><u>electrical state or capability</u> of <del>future disturbances affecting a wider area, or potential equipment damage.</del> <del>However, violation of this requirement is unlikely to lead to the</del> bulk electric system <del>instability, separation, or cascading failures</del><u>the ability to effectively monitor, control, or restore the bulk electric system if the same condition resulted in a future Misoperation.</u></p>

VRF and VSL Justifications – PRC-004-3, R5

<p>FERC VRF G5 Discussion</p>	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation: This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>		
<p>Proposed VSL</p>			
<p>Lower</p>	<p>Moderate</p>	<p>High</p>	<p>Severe</p>
<p>The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.  OR</p>	<p>The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.  OR</p>	<p>The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.  OR The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 80 calendar days and less than or equal to 90 calendar days of first identifying a cause of the Misoperation.</p>	<p>The responsible entity developed a CAP, or explained in a declaration in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation.  OR The responsible entity failed to develop a CAP or explain in a declaration in accordance with Requirement R5.  OR</p>

VRF and VSL Justifications – PRC-004-3, R5			
<p>The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 60 calendar days and less than or equal to 70 calendar days of first identifying a cause of the Misoperation.</p>	<p>The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 70 calendar days and less than or equal to 80 calendar days of first identifying a cause of the Misoperation.</p>		<p>The responsible entity developed an evaluation in accordance with Requirement R5, but in more than 90 calendar days of first identifying a cause of the Misoperation.</p> <p>OR</p> <p>The responsible entity failed to develop an evaluation in accordance with Requirement R5.</p>
<p>NERC VSL Guidelines</p>	<p>Meets NERC’s VSL Guidelines—There is an incremental aspect to the VSL for tardiness and a binary aspect for failure. Varying VSLs are provided for the omission of the evaluation when developing the Corrective Action Plan and for failure to develop the evaluation.</p>		
<p>FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” which have varying VSLs.</p> <p>This VSL does not lower the current level of compliance because the former VSL in PRC-004-2.1a was comingled with the other activities. This Requirement has a Severe VSL for failure to develop the CAP with the other VSLs being based on tardiness of the development.</p>		

VRF and VSL Justifications – PRC-004-3, R5	
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>This VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p> <p>Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>This VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>
<p>FERC VSL G4</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

VRF and VSL Justifications – PRC-004-3, R5	
Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	

VRF and VSL Justification – PRC-004-3, R6	
Proposed VRF	Medium
NERC VRF Discussion	<p>A Violation Risk Factor of Medium is consistent with the NERC VRF Guidelines. Failure to implement a CAP for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p> <p>An uncorrected cause of a Misoperation as a result of not implementing a Corrective Action Plan, could <del>contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</del> <u>affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system since the condition could occur again.</u></p>

VRF and VSL Justification – PRC-004-3, R6	
FERC VRF G1 Discussion	<p>Guideline 1- Consistency w/ Blackout Report:</p> <p>The blackout report and subsequent technical analysis resulted in entities performing corrective actions; however, there were no negative reliability outcomes concerning the implementation of a Corrective Action Plan (CAP) associated with Protection Systems.</p>
FERC VRF G2 Discussion	<p>Guideline 2- Consistency within a Reliability Standard:</p> <p>This requirement has a single reliability activity associated with the reliability objective and no sub-Requirement(s) which allows a single VRF to be assigned; therefore no conflict(s) exist.</p>
FERC VRF G3 Discussion	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2.1a, R1 (TO &amp; DP) and R2 (GO<del>+</del>), <del>which both have a VRF of High.</del> The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan” <del>which both have a VRF of High.</del> This requirement is consistent with Reliability Standards PRC-016-0.1, R2 (“...shall take corrective actions to avoid future misoperations.”) and PRC-022-1, R1.5 (“For any Misoperation, a Corrective Action Plan...”) which both have a VRF of Medium.</p> <p>The proposed VRF of Medium does not inadvertently lower the current VRF of High in the former PRC-004-2.1a, Requirements R1 and R2, because this Requirement now provides a clear and concise single reliability activity whereas the former Requirement contained multiple activities and is ambiguous.</p>

VRF and VSL Justification – PRC-004-3, R6

<p>FERC VRF G4 Discussion</p>	<p>Guideline 4- Consistency with NERC Definitions of VRFs:</p> <p>Failure to implement a Corrective Action Plan for a Misoperation with an identified cause could in the planning time frame, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. <del>However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.</del></p> <p>An uncorrected cause of a Misoperation could contribute to the severity of future disturbances affecting a wider area, or potential equipment damage. <del>However, violation of this requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures.</del></p>
<p>FERC VRF G5 Discussion</p>	<p>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</p> <p>This requirement does not co-mingle reliability objectives of differing risk; therefore, the assigned VRF of Medium is consistent.</p>

VRF and VSL Justification – PRC-004-3, R6			
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity implemented, but failed to update a CAP, when actions or timetables changed, in accordance with Requirement R6.	N/A	N/A	The responsible entity failed to implement a CAP in accordance with Requirement R6.
NERC VSL Guidelines			
Meets NERC’s VSL Guidelines—The VSLs cover aspects of this Requirement that are not equal in importance and performance.			
FERC VSL G1			
Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	<p>Guideline 3- Consistency among Reliability Standards:</p> <p>This requirement replaces one of the three performance components of PRC-004-2a, R1 (TO &amp; DP) and R2 (GO). The three performance components (paraphrased) are “analyze Protection System Misoperations,” “develop a Correction Action Plan,” and “implement a Corrective Action Plan.” The VSLs are based on the three components and not individually as presented in the proposed PRC-004-3 standard.</p> <p>The proposed VSL does not lower the current level of compliance because the former VSL was comingled with the other activities. The proposed Requirement is a Severe VSL for failure to implement the CAP with the Lower VSL being based on the failure of updating the CAP when actions or timetables change which is administrative in nature.</p>		

VRF and VSL Justification – PRC-004-3, R6	
<p>FERC VSL G2</p> <p>Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p>Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p>Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <p>This requirement is not binary; therefore, this criterion does not apply.</p> <p>Guideline 2b:</p> <p>The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>
<p>FERC VSL G3</p> <p>Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>The proposed VSL uses similar terminology to that used in the associated requirement, and is therefore consistent with this Requirement.</p>
<p>FERC VSL G4</p>	<p>The VSL is based on a single violation and not cumulative violations.</p>

VRF and VSL Justification – PRC-004-3, R6

Violation Severity Level  
Assignment Should Be Based on  
A Single Violation, Not on A  
Cumulative Number of  
Violations

## Table of Issues and Directives

### Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)

Table of Issues and Directives Associated with PRC-003-1

Source	Issue or Directive Language (including Para. #)	Section and/or Requirement(s)	Consideration of Issue or Directive
FERC Order No. 693, P 1460.	<p>For the reasons stated in the NOPR, the Commission will not approve or remand PRC-003-1.</p> <p>(For reference) P 1458. In the NOPR, the Commission identified PRC-003-1 as a fill-in-the-blank standard. The NOPR stated that because the regional procedures had not been submitted, the Commission proposed not to approve or remand PRC-003-1 until the ERO submitted the additional information.</p>	PRC-004-3	PRC-003-1 will be retired and replaced by PRC-004-3.

Table of Issues and Directives Associated with PRC-003-1

Source	Issue or Directive Language (including Para. #)	Section and/or Requirement(s)	Consideration of Issue or Directive
<p>FERC Order No. 693, P 1461.</p>	<p>We agree with APPA that the ERO should consider whether greater consistency can be achieved in this Reliability Standard. In Order No. 672, the Commission also encouraged greater uniformity in the development of Reliability Standards. Consistent with that goal, the Commission directs the ERO to consider APPA’s suggestions in the Reliability Standards development process as it modifies PRC-003-1 to provide missing information needed for the Commission to act on this Reliability Standard.</p> <p>(For reference) P 1459. APPA agrees with the Commission’s proposed course of action. It states that there are significant and substantive differences between regional procedures due to the characteristics of various regional grids and industry structures. Further it suggests that NERC and the Regional Entities consider whether they can attain greater consistency on an Interconnection-wide basis in completing this Reliability Standard.</p>	<p>NERC Rules of Procedure, Section 1600 Request for Data or Information.</p>	<p>PRC-003-1 will be retired and replaced by PRC-004-3. The responsibility to address all aspects of a Protection System Misoperation is assigned to the owner(s) of the Protection System(s) - the Transmission Owner, Generation Owner, and Distribution Provider.</p> <p>Additionally, further consistency has been achieved by specifying the data reporting requirements for periodic Misoperations reporting based on a continent-wide template. All reporting of Misoperations will be done through a data request according to the NERC Rules of Procedures, Section 1600, Request for Data or Information instead of having PRC-004-3 specify an administrative reporting requirement.</p>

Table of Issues and Directives Associated with PRC-003-1

Source	Issue or Directive Language (including Para. #)	Section and/or Requirement(s)	Consideration of Issue or Directive
<p>FERC Order No. 693, P 1469 (first directive only)</p>	<p>We direct the ERO to consider ISO-NE’s suggestion that LSEs and transmission operators should be included in the applicability section, in the Reliability Standards development process as it modifies PRC-004-1.</p> <p>(For reference) P 1466. ISO-NE further requests the Commission to direct NERC to modify PRC-004-1 to include LSEs and transmission operators in the applicability section. It states that based on current practice in the ISO-NE balancing area, transmission operators, transmission owners, LSEs and distribution providers may individually or jointly own and operate a protection system. It therefore suggests that transmission operators and LSEs should also be included in the applicability section. ISO-NE provides the same suggestion with regard to PRC-005-1, PRC-008-0, PRC-011-0, PRC-015-0, PRC-016-0, PRC-017-0 and PRC-021-1.</p>	<p>PRC-004-3 all Requirements.</p>	<p>PRC-004-2.1a will be retired and replaced by PRC-004-3. The Transmission Owner, Generator Owner, and Distribution Provider own the BES Protection Systems. The owners of BES Protection Systems have been assigned responsibility for this standard.</p>

# Standards Announcement

## Project 2010-05.1 Protection System (Misoperations)

### PRC-004-3

Final Ballot Now Open through August 7, 2014

#### [Now Available](#)

A final ballot for **PRC-004-3 – Protection System Misoperation Identification and Correction** and is open through **8 p.m. Eastern on Thursday, August 7, 2014.**

#### Instructions for Balloting

In the final ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the final ballot window. If a ballot pool member previously cast a vote, but does not participate in the final ballot, the member's vote cast in the previous ballot will be carried over as their vote in the final ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard by clicking [here](#).

#### Next Steps

Voting results for the standard will be posted and announced after the ballot window closes. If approved, it will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, please refer to the [Standard Processes Manual](#).

*For more information or assistance, please contact [Wendy Muller](#) (via email),  
Standards Development Administrator, or at 404-446-2560.*

# Standards Announcement **Updated**

## Project 2010-05.1 Protection System (Misoperations) PRC-004-3

### Final Ballot Results

#### [Now Available](#)

A final ballot for **PRC-004-3 – Protection System Misoperation Identification and Correction** concluded **8 p.m. Eastern on Thursday, August 7, 2014**.

The standard achieved a quorum and sufficient affirmative votes for approval. Voting statistics are listed below, and the [Ballot Results](#) page provides a link to the detailed results for the ballot.

Standard	Quorum / Approval
PRC-004-3	77.94% / <b>79.75%</b>

Background information for this project can be found on the [project page](#).

### Next Steps

The standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the **Standards Development Process**, please refer to the [Standard Processes Manual](#).

*For more information or assistance, please contact [Wendy Muller](#) (via email),  
Standards Development Administrator, or at 404-446-2560.*

## Preface

The North American Electric Reliability Corporation (NERC) is a not-for-profit international regulatory authority whose mission is to ensure the reliability of the bulk power system (BPS) in North America. NERC develops and enforces Reliability Standards; annually assesses seasonal and long-term reliability; monitors the BPS through system awareness; and educates, trains, and certifies industry personnel. NERC’s area of responsibility spans the continental United States, Canada, and the northern portion of Baja California, Mexico. NERC is the electric reliability organization (ERO) for North America, subject to oversight by the Federal Energy Regulatory Commission (FERC) and governmental authorities in Canada. NERC’s jurisdiction includes users, owners, and operators of the BPS, which serves more than 334 million people.

The North American BPS is divided into several assessment areas within the eight Regional Entity (RE) boundaries, as shown in the map and corresponding table below.

<b>FRCC</b>	Florida Reliability Coordinating Council
<b>MRO</b>	Midwest Reliability Organization
<b>NPCC</b>	Northeast Power Coordinating Council
<b>RF</b>	ReliabilityFirst
<b>SERC</b>	SERC Reliability Corporation
<b>SPP-RE</b>	Southwest Power Pool Regional Entity
<b>TRE</b>	Texas Reliability Entity
<b>WECC</b>	Western Electricity Coordinating Council

## Introduction and Survey Scope

---

In accordance with Section 1600 of the NERC *Rules of Procedure*,<sup>1</sup> NERC may request data or information (“Data Request”) necessary in order to meet its obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d)<sup>2</sup> of the Federal Energy Regulatory Commission’s (“FERC” or “Commission”) regulations.

Standard development Project 2010-05.1 – Phase 1: Protection Systems (Misoperations<sup>3</sup>) involves the revision of Reliability Standard PRC-004-2.1a (Analysis and Mitigation of Transmission and Generation Protection System Misoperations). The revised standard, PRC-004-3 (Protection System Misoperation Identification and Correction), will combine Reliability Standard PRC-003-1 – Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems and Reliability Standard PRC-004-2.1a.

The Standards Authorization Request in Project 2010-05.1, which sets the scope of work for combining Reliability Standards PRC-003-1 and PRC-004-2.1a, includes instructions to address the following in Project 2010-05.1:

- Clarify the definition of “Misoperation;”
- Establish a consistent metric for measuring Protection System performance with uniform applicability;
- Clarify reporting requirements and processes;
- Review all Faults or Protection System operations on the Bulk Electric System (“BES”) to identify those that are BES Protection System Misoperations;
- Analyze BES Protection System Misoperations to determine cause(s); and
- Develop and implement Corrective Action Plans to address the causes of BES Protection System Misoperations.

The Protection System Misoperations Standard Drafting Team (SDT) in Project 2010-05.1 has removed the data reporting obligation included in Reliability Standard PRC-004-2.1a<sup>4</sup> from the revised standard and recommended that NERC request the data required for performance analysis purposes pursuant to Section 1600 of the NERC *Rules of Procedure*. The revised Reliability Standard PRC-004-3 will continue to require retention of data or evidence of compliance with the standard, but will no longer require periodic reporting of that information. Periodic, quarterly submittals of Misoperation data will be associated with reporting under this Section 1600 Data Request.

The purpose of this Data Request is to continue consistent reporting of Misoperation data to NERC through a standardized template for performance analysis. NERC will analyze the data to:

- Develop meaningful metrics to assess Protection System performance;
- Identify trends in Protection System performance that negatively impact reliability;
- Identify remediation techniques to reduce the rate of occurrence and severity of Misoperations;

---

<sup>1</sup> NERC’s *Rules of Procedure* are available at: <http://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx>.

<sup>2</sup> 18 C.F.R. § 39.2(d) (2014).

<sup>3</sup> “Misoperation” is a defined term in the NERC *Glossary of Terms Used in NERC Reliability Standards* (“NERC Glossary”), available at: [http://www.nerc.com/pa/Stand/Glossary%20of%20Terms/Glossary\\_of\\_Terms.pdf](http://www.nerc.com/pa/Stand/Glossary%20of%20Terms/Glossary_of_Terms.pdf).

<sup>4</sup> Requirement R3 of PRC-004-2.1a requires Transmission Owners, any Distribution Providers that own a transmission Protection System, and Generator Owners to provide to its Regional Entity documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Entity’s procedures.

- Provide focused assistance to entities in need of guidance; and
- Publicize lessons learned to the industry.

Monitoring, analyzing, and tracking trends in Protection System Misoperations are critical to improve BES reliability. Historically, Protection System Misoperations have exacerbated the severity of most cascading power outages. For example, Protection System Misoperations played a significant role in expanding the impacts of the August 14, 2003 Northeast blackout.<sup>5</sup> In the 2012 State of Reliability report,<sup>6</sup> Misoperations were identified as one of the top risks to reliability. Additionally, Protection System Misoperations were cited as being one of the primary risk factors in the 2013 State of Reliability report.<sup>7</sup> Following the recommendations in the 2012 State of Reliability report, the Protection System Misoperations Task Force was formed to review Misoperations and provide recommendations for reducing Misoperations. The task force analyzed the top three causes of Misoperations between the first quarter of 2011 and the second quarter of 2012 and developed suggestions to reduce Misoperations. This analysis relied heavily on the data collected under Reliability Standard PRC-004-002.1a. Absent this information, the analysis would not have been possible. The 2014 State of Reliability report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

Further, Misoperation data collection provides several benefits to BES reliability and supports NERC's mission of ensuring the reliability of the BPS in North America. The proposed Data Request will make available the information necessary for NERC to provide high value risk analysis. This data will also allow NERC to identify areas for improvement in Misoperation rates through quantitative data analysis. For these reasons, NERC is proposing to continue collection of the data immediately upon the retirement of the data reporting obligation in Reliability Standard PRC-004-2.1a.

NERC posted a proposed Data Request in accordance with the requirements of Section 1602 of the NERC *Rules of Procedure* for a 45-day public comment period. On July 23, 2013, NERC provided this proposed Data Request to FERC for review as required by Section 1602 of the NERC *Rules of Procedure*. After consideration of comments received, NERC made revisions to the proposed Data Request. If approved by the Board as required by Section 1602 of the NERC *Rules of Procedure*, this Data Request will become mandatory concurrently with the retirement of Reliability Standard PRC-004-2.1a which presently contains the data reporting obligation.

## NERC Contact Information

---

The Data Request must be completed in electronic format. Should the submitting entity experience any issues with submitting its data, contact Charles Aderholdt via email at [Charles.Aderholdt@nerc.net](mailto:Charles.Aderholdt@nerc.net) or by telephone at (404) 446-2569. If the respondent believes that any of the responses to this survey should remain confidential, contact the project manager directly for further instructions.

Official correspondence may be mailed to:

NERC – Misoperations  
C/O Charles Aderholdt  
3353 Peachtree Road, Suite 600, North Tower  
Atlanta, GA 08540

## Authority

---

Under Section 215 of the Federal Power Act (16 U.S.C. § 824o), Congress entrusted FERC with the duties of approving and enforcing rules to ensure the reliability of the BPS, and with the duties of certifying an Electric Reliability Organization (“ERO”) that would be charged with developing and enforcing mandatory Reliability Standards, subject to FERC approval. NERC was certified as the ERO on July 20, 2006. NERC’s authority for issuing this survey is derived from Section 215 of the Federal Power Act, and from the following sources:

**Section 39.2(d) of the FERC’s regulations (18 C.F.R. §39.2(d)) provides:**

Each user, owner or operator of the Bulk-Power System within the United States (other than Alaska and Hawaii) shall provide the Commission, the Electric Reliability Organization and the applicable Regional Entity such information as is necessary to implement section 215 of the Federal Power Act as determined by the Commission and set out in the Rules of the Electric Reliability Organization and each applicable Regional Entity. The Electric Reliability Organization and each Regional Entity shall provide the Commission such information as is necessary to implement section 215 of the Federal Power Act.

**Section 1600 of NERC’s Rules of Procedure provides:**

***1601. Scope of a NERC or Regional Entity Request for Data or Information***

*Within the United States, NERC and Regional Entities may request data or information that is necessary to meet their obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of the Commission’s regulations, 18 C.F.R. § 39.2(d). In other jurisdictions, NERC and Regional Entities may request comparable data or information, using such authority as may exist pursuant to these rules and as may be granted by ERO governmental authorities in those other jurisdictions. The provisions of Section 1600 shall not apply to requirements contained in any Reliability Standard to provide data or information; the requirements in the Reliability Standards govern. The provisions of Section 1600 shall also not apply to data or information requested in connection with a compliance or enforcement action under Section 215 of the Federal Power Act, Section 400 of these Rules of Procedure, or any procedures adopted pursuant to those authorities, in which case the Rules of Procedure applicable to the production of data or information for compliance and enforcement actions shall apply.*

**1602. Procedure for Authorizing a NERC Request for Data or Information**

1. NERC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to the Office of Electric Reliability is for the information of the Commission. NERC is not required to receive any approval from the Commission prior to posting the proposed request or modification for public comment in accordance with paragraph 1602.2 or issuing the request or modification to reporting entities following approval by the Board.
2. NERC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.
  - 2.1. A proposed request for data or information shall contain, at a minimum, the following information: (i) a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements; (ii) a description of how the data or information will be collected and validated; (iii) a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("reporting entities"); (iv) the schedule or due date for the data or information; (v) a description of any restrictions on disseminating the data or information (e.g., "confidential," "critical energy infrastructure information," "aggregating" or "identity masking"); and (vi) an estimate of the relative burden imposed on the reporting entities to accommodate the data or information request.
  - 2.2. A proposed modification to a previously authorized request for data or information shall explain (i) the nature of the modifications; (ii) an estimate of the burden imposed on the reporting entities to accommodate the modified data or information request, and (iii) any other items from paragraph 1.1 that require updating as a result of the modifications.
3. After the close of the comment period, NERC shall make such revisions to the proposed request for data or information as are appropriate in light of the comments. NERC shall submit the proposed request for data or information, as revised, along with the comments received, NERC's evaluation of the comments, and recommendations, to the Board.
4. In acting on the proposed request for data or information, the Board may authorize NERC to issue it, modify it, or remand it for further consideration.
5. NERC may make minor changes to an authorized request for data or information without Board approval. However, if a reporting entity objects to NERC in writing to such changes within 21 days of issuance of the modified request, such changes shall require Board approval before they are implemented.

6. *Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the Board, an affected party appeals the authorization under this Section 1600 to the ERO governmental authority.*

**1603. Owners, Operators, and Users to Comply**

*Owners, operators, and users of the BPS registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a reporting entity within the United States fails to comply with an authorized request for data or information under Section 1600, NERC may request the Commission to exercise its enforcement authority to require the reporting entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. NERC will make any request for the Commission to enforce a request for data or information through a non-public submission to the Commission's enforcement staff.*

**1605. Confidentiality**

*If the approved data or information request includes a statement under Section 1602.1.1(v) that the requested data or information will be held confidential or treated as Critical Energy Infrastructure Information, then the applicable provisions of Section 1500 will apply without further action by a Submitting Entity. A Submitting Entity may designate any other data or information as Confidential Information pursuant to the provisions of Section 1500, and NERC or the Regional Entity shall treat that data or information in accordance with Section 1500. NERC or a Regional Entity may utilize additional protective procedures for handling particular requests for data or information as may be necessary under the circumstances.*

**1606. Expedited Procedures for Requesting Time-Sensitive Data or Information**

1. *In the event NERC or a Regional Entity must obtain data or information by a date or within a time period that does not permit adherence to the time periods specified in Section 1602, the procedures specified in Section 1606 may be used to obtain the data or information. Without limiting the circumstances in which the procedures in Section 1606 may be used, such circumstances include situations in which it is necessary to obtain the data or information (in order to evaluate a threat to the reliability or security of the BPS, or to comply with a directive in an order issued by the Commission or by another Applicable Governmental Authority) within a shorter time period than possible under Section 1602. The procedures specified in Section 1606 may only be used if authorized by Board prior to activation of such procedures.*
2. *Prior to posting a proposed request for data or information, or a modification to a previously-authorized request, for public comment under Section 1606, NERC shall provide the proposed request or modification, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability. The submission to the Commission's Office of Electric Reliability shall also include an explanation of why it is necessary to use the*

- expedited procedures of Section 1606 to obtain the data or information. The submission shall be made to the Commission's Office of Electric Reliability as far in advance, up to twenty-one (21) days, of the posting of the proposed request or modification for public comments as is reasonably possible under the circumstances, but in no event less than two (2) days in advance of the public posting of the proposed request or modification.*
- 3. NERC shall post the proposed request for data or information or proposed modification to a previously-authorized request for data or information for a public comment period that is reasonable in duration given the circumstances, but in no event shorter than five (5) days. The proposed request for data or information or proposed modification to a previously-authorized request for data or information shall include the information specified in Section 1602.2.1 or 1602.2.2, as applicable, and shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information.*
  - 4. The provisions of Sections 1602.3, 1602.4, 1602.5 and 1602.6 shall be applicable to a request for data or information or modification to a previously-authorized request for data or information developed and issued pursuant to Section 1606, except that (a) if NERC makes minor changes to an authorized request for data or information without Board approval, such changes shall require Board approval if a Reporting Entity objects to NERC in writing to such changes within five (5) days of issuance of the modified request; and (b) authorization of the request for data or information shall be final unless an affected party appeals the authorization of the request by the Board to the Applicable Governmental Authority within five (5) days following the decision of the Board authorizing the request, which decision shall be promptly posted on NERC's website.*

# Data Request

## Data Description

Effective immediately upon the retirement of Reliability Standard PRC-004-2.1a, data included in Table 1 below will be collected quarterly on a per-entity basis. The data will be collected for Misoperations, as defined in the NERC Glossary, which are identified pursuant to Reliability Standard PRC-004. In cases where multiple entities own a Protection System, the entity responsible for identifying whether its Protection System Component(s) caused a Misoperation pursuant to PRC-004 will report Misoperation data under this Data Request.

<b>Table 1: Protection System Misoperation Fields</b>	
<b>Tab 1 – Operation Summary</b>	
<b>Field Name</b>	<b>Field Description</b>
Data Submission Year	The calendar year for which the operation data is reported.
Data Submission Quarter	The calendar quarter for which the operation data is reported.
Regional Entity Name	The entity’s Regional Entity. If the entity is registered in multiple Regional Entities, the Regional Entity area where the Misoperation occurred.
Functional Entity NERC ID	The entity’s NERC compliance registry number. If the entity does not have a NERC compliance registry number, the company name.
Total Protection System Operations by Voltage Class	The total number of Protection System operations by system voltage based on the definition in the reporting template.
<b>Tab 2 – Misoperation Entry Form</b>	
<b>Field Name</b>	<b>Field Description</b>
Misoperation ID	An entity-specific Misoperation identifier.
Regional Entity	The entity’s Regional Entity. If the entity is registered in multiple Regional Entities, the Regional Entity area where the Misoperation occurred.
NERC ID	The entity’s NERC compliance registry number. If the entity does not have a NERC compliance registry number, the company name.
Misoperation Date	The date of the Misoperation.
Misoperation Time	The time of the Misoperation.
Time Zone	The time zone in which the Misoperation occurred.
Facility Name (Location of Misoperation)	The name of the facility (i.e., substation or generating station) where the Misoperation occurred.
Equipment Name (protected by Protection System that Misoperated)	The name of the generator, transmission line, transformer, bus, or equipment protected by the Protection System that misoperated.
Equipment Type	The type of equipment being protected (e.g., line, transformer, etc.).
Facility Voltage	The system voltage of the protected Element. If the Element is a transformer, the high-side voltage. If the Element is a generator, the GSU transformer high-side voltage.

Table 1: Protection System Misoperation Fields	
Equipment Removed from Service (Permanently or Temporarily) as the result of the Misoperation	The names of the equipment becoming unavailable due to the Misoperation (Equipment refers only to circuits, transformers, buses, but not breakers UNLESS the breaker is the only Element). Breaker should be used only if a single breaker tripped and did not disconnect any Element at one of its terminals (one breaker in a multiple breaker protected line, bus tie breaker, etc.).
Event Description	A brief description of the event including: <ol style="list-style-type: none"> <li>1. Initiating event: include a description of any internal or external fault causes, any abnormal system conditions which may have contributed to the Misoperation, or state that the Misoperation occurred under normal operating conditions.</li> <li>2. Facilities involved on which Protection Systems operated correctly and/or incorrectly concurrent with the Misoperation.</li> <li>3. Component(s) of the Protection System(s) that failed and/or did not function correctly.</li> <li>4. Detailed description of root causes determined by completed Corrective Action Plans.</li> </ol>
Misoperation Category (as defined in the reporting template)	The category of the Misoperation: <ul style="list-style-type: none"> <li>• Failure to Trip – During Fault</li> <li>• Failure to Trip – Other Than Fault</li> <li>• Slow Trip – During Fault</li> <li>• Slow Trip – Other Than Fault</li> <li>• Unnecessary Trip – During Fault</li> <li>• Unnecessary Trip – Other Than Fault</li> </ul>
Cause(s) of Misoperation (as defined in the reporting template)	The primary cause of the Misoperation: <ul style="list-style-type: none"> <li>• AC system</li> <li>• As-left personnel error</li> <li>• Communication failures</li> <li>• DC system</li> <li>• Incorrect settings</li> <li>• Logic errors</li> <li>• Design errors</li> <li>• Relay failures/malfunctions</li> <li>• Unknown/unexplainable</li> <li>• Other/Explainable</li> </ul>
Protection Systems/Components that Misoperated	Information on the Protection Systems/Components that Misoperated. If the “Cause of Misoperation” is “Relay failures/malfunctions,” “Incorrect settings,” “Logic errors,” or “Design errors,” and the cause is associated with a relay, this field is used to identify the relay models (types) and protection schemes.
Relay Technology	If the Cause of Misoperation is “Relay failures/malfunctions,” “Incorrect settings,” “Logic errors,” or “Design errors”, this field is used to identify the relay technology installed. <ul style="list-style-type: none"> <li>• Electromechanical</li> <li>• Solid State</li> <li>• Microprocessor</li> </ul>

Table 1: Protection System Misoperation Fields	
Is this a Transmission Availability Data System (TADS) reportable event?	Whether the Misoperation involved the automatic outage of a TADS-reportable transmission Element. (Reporting by Transmission Owners only.)
Select one or more TADS "Element IDs" for any TADS reportable Elements outaged in the Misoperation.	If a TADS reportable Element was outaged due to the Misoperation, the Element(s) in a comma-separated list. (Reporting by Transmission Owners only.)
Is this a Generation Availability Data System (GADS) reportable event?	Whether the Misoperation involved the automatic outage of a GADS-reportable Element. (Reporting by Generator Owners only.)
If the Misoperation caused a generator forced outage, select one or more Generation Availability Data System (GADS) "Unit IDs" for any GADS reportable Elements outaged in the Misoperation.	If a GADS reportable Element was outaged due to the Misoperation, the Element(s) in a comma-separated list. (Reporting by Generator Owners only.)
Analysis and Corrective Action Status	The status, selected from a drop-down list.
Corrective Action Plan	Identification of the corrective actions. "None" if, in place of a CAP, a declaration was made stating no further corrective actions will be taken.
Corrective Action Plan Target Completion Date	If corrective actions are not complete, an estimate of when they will be complete.
Actual Completion Date	If corrective actions are complete, the actual completion date.
Reported By	The person who filled out the report.
Reporter's Telephone Number	The reporting person's phone number.
Reporter's Email Address	The e-mail address of the reporter.
Date Reported	The report date.
Additional Contact Name (Optional)	An additional contact with knowledge of the data.
Additional Contact's Phone Number (Optional)	If entering an additional contact, the person's phone number.
Additional Contact's Email Address (Optional)	If entering an additional contact, the person's email.

There are several differences between the data fields used in previous reporting and the proposed data fields. These differences are summarized in Table 2 below.

Table 2: Changes to Misoperation Data Fields	
Field Name	Field Description
Misoperation Category	The Failure to Trip and Slow Trip categories have been divided into four categories by splitting each into "During Fault" and "Other than Fault" categories, consistent with the revised Misoperation definition.

**Table 2: Changes to Misoperation Data Fields**

Field Name	Field Description
Cause(s) of Misoperation	The “Incorrect settings/logic/design errors” cause has been separated into three causes: “Incorrect settings”, “Logic errors”, and “Design errors”.
Is this a Generation Availability Data System (GADS) reportable event?	A field has been added to identify whether the Misoperation involved the automatic outage of a GADS reportable Element.
If the Misoperation caused a generator forced outage, select one or more Generation Availability Data System (GADS) "Unit IDs" for any GADS reportable Elements outaged in the Misoperation.	A field has been added to identify the GADS reportable Elements outaged.

## Use of Data

NERC will continue to use the Misoperation information and Protection System operation information to develop statistics regarding the Misoperation rates for the BES. Collection of the total Protection System operations facilitates normalization to account for differences among Registered Entities (e.g., location, climate, size, density, protection schemes used). The Misoperation rate metric can be used to gauge the performance of BES Protection Systems for both generation and transmission Elements. The relative percentage indicates the relative performance of Protection System operations, specifically Protection System Misoperations as a ratio of total Protection System operations. Without knowledge of the Misoperation rates across NERC, normalized measurement of Misoperation reduction will not be possible. In addition, NERC and the Regional Entities will analyze the raw data to identify trends in Protection System Misoperations. Finally, the Misoperation data will be used to support statistical analysis of risks to the BES.

Section 215(g) of the Federal Power Act requires NERC to make periodic assessments on the reliability of the BPS in North America. This Data Request will provide NERC the data necessary to make periodic risk-based assessments to evaluate BPS reliability and provide for continuous analysis of performance and reliability risk. A better understanding of Protection System Misoperations will allow NERC to develop effective requirements to address one of the top risks to the BES.

## Entities Required to Comply

The submission of Protection System Misoperation data is mandatory for all U.S. Transmission Owners, Generator Owners, and Distribution Providers who are on the NERC Compliance Registry. Non-U.S. Transmission Owners, Generator Owners, and Distribution Providers should provide data in accordance with the legislation, laws, regulations, rules or orders of their Applicable Governmental Authority. Non-U.S. Transmission Owners, Generator Owners, and Distribution Providers are strongly encouraged to provide the requested data to ensure the completeness of the data collected for analysis.

## Scheduling and Reporting

Entities will report data on a quarterly basis. The first reporting period under the Data Request will be the quarter beginning on the first day of the first calendar quarter that is nine (9) months after the date that the PRC-004-3 is approved by an Applicable Governmental Authority or as otherwise provided for in a jurisdiction where approval by an Applicable Governmental Authority is required for a standard to go into effect. Where approval by an Applicable Governmental Authority is not required, the first reporting period under the Data Request will be the quarter beginning on first day of the first calendar quarter that is nine (9) months after the

date the Data Request is approved by the Board or as otherwise provided for in that jurisdiction. The deadline for reporting will be 60 days after the end of each quarter.

The reporting schedule is intended to prevent any gap or overlap with reporting that is required pursuant to PRC-004-2.1a. As a result, data for the last quarter occurring prior to retirement of PRC-004-2.1a will be reported under the Data Request. This transition is necessary because the reporting deadline for one period during transition will occur when PRC-004-2.1a is no longer subject to enforcement.

The data will be manually entered or bulk uploaded by Transmission Owners, Generator Owners, and Distribution Providers that own a BES Protection System into the Misoperation module of the webTADS system. After the software checks for errors, a review period will be provided for Regional Entities to review data submitted by the entities in their Region. The Regional Entities will review and sign-off on the data prior to review by NERC. Subsequent to Regional Entity review, NERC will further validate the data and use the data as described above. A final template to be used for bulk uploads is available at: [http://www.nerc.com/pa/RAPA/ProtectionSystemMisoperations/Section\\_1600\\_Misoperations\\_Final\\_Template.xlsx](http://www.nerc.com/pa/RAPA/ProtectionSystemMisoperations/Section_1600_Misoperations_Final_Template.xlsx). Data will be bulk uploaded or entered manually through a graphical user interface using the same fields.

## Dissemination of Data

NERC's treatment of confidential information is governed by Section 1500 of NERC's *Rules of Procedure* and other agreements with Applicable Governmental Authorities. Individual Misoperation reports are considered confidential. Aggregated Misoperation information is considered public information. However, aggregated Misoperation data public reports will not inadvertently release confidential information by the display of regional or NERC information from which an entity's confidential information could be ascertained.

## Burden to Entities

Because entities have been reporting similar data since 2011, there is minimal additional burden for this Data Request. All eight Regional Entities already collect this, or very similar, information using a common template. Reporting Entities are already reporting Misoperations data under the regional procedures as required in Reliability Standard PRC-004-2.1a and minimal changes should be necessary to comply with this Data Request.
