<p>New York State Reliability Council</p>	<p>Disagree</p>	<p>Comments: NYSRC believes the use of “shall” and “all” coupled with the broad applicability of this Standard and the broad definition of Interoperability Communication will result in entities either not complying with R2 or making statements regarding the Operating Alert State when unnecessary. Attachment 1-Com-003 is very prescriptive in the use pre-defined terminology, colors and levels, and what to report on. There is no benefit to specifying the specific terminology. This requirement should require the RC to define the terms/levels/alert states to include within the CPOP that sufficiently communicate the increased levels of Alert or Response encountered/required. Many entities have invested time and training in the existing processes that meet the intent of this requirement.</p> <p>Read strictly, the only predefined alert conditions are Physical security, Cyber security and Transmission</p>

Organization	Yes or No	Question 4 Comment
		<p>Security as it applies to the RC and TOP only.</p> <p>NYSRC notes that R2 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “Communication Protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p> <p><b>The SDT notes you referenced the term “Interoperability Communication” and the requirement to have a CPOP. Both have been eliminated in the second draft of the Standard. The SDT appreciates the observation and the word “all” was not in the requirement. It should not have been in the question.</b></p>		
National Grid	Disagree	<p>Defining specific wording per Attachment 1 is overly prescriptive. The requirements should focus on what is required not how. The RC and encompassing entities should be required to define terms that will be used in communications. This would allow for the use of terms that are well understood in an area rather than adding new terms.</p> <p>Also, System operators need to spend time looking for the right color and level to communicate the prevailing system condition terminology to avoid violating the standard. This task does not lend itself to promptly and effectively deal with the emergency situation.</p> <p>There is still plenty of grey area in Attachment 1 and there does not appear to be any differentiation in actions taken based on the alert levels.</p> <p>Finally, the section Background Information in the Comment's form mentions “The SDT proposes four system condition alerts instead of initial three in the RCWG version.” However, Attachment 1 only mentions 3 alerts - Physical Security, Cyber Security, and Transmission Emergency Alerts leading to confusion.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
American Municipal Power	Agree	<p>Eliminating lax communications and improving identifiers is one of the cheapest and easiest ways to improve reliability.</p>
<p><b>Response: The SDT thanks you for your comments. Your insight is refreshing as well as accurate.</b></p>		
Transmission	Disagree	<p>FPL agrees that standard system condition terminology could be beneficial in communications but this</p>

Organization	Yes or No	Question 4 Comment
Owner		requirement introduces alert level conventions with no clarity on what the corresponding associated actions for such levels are and as a result, aside from the value derived from have improvement in terminology during communications, it is unclear what reliability improvements this will achieve in carrying out instructions since details on what sort of tasks need to be carried out for each level have not been defined. Also, this requirement should clearly indicate that this alerting system and any communication conventions be required for emergency conditions.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Bonneville Power Administration	Agree	In Attachment #1 - Operating State Alert Levels, for the Transmission Emergency Alert (TEA) Level 2 definition, a “why” needs to be incorporated into the definition. It appears that the reason we're going to TEA 2 is to avoid violation of an SOL but it needs to be called out.
<p><b>Response: The SDT thanks you for your comments. The SDT is interested in your comment but would require additional information and discussion to address it properly.</b></p>		
Northeast Utilities	Disagree	It is not clear what value there is in identifying alert levels since there does not appear to be any differentiation in actions taken based on the alert levels. Additionally, it has been our experience of during the field-test of these Alert Levels, that there are inconsistencies in when to implement various stages of Alerts and, we believe, this introduces more confusion than exists today.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Independent Electricity System Operator	Disagree	It is not clear what value there is in identifying alert levels. There does not appear to be any differentiation in actions taken based on the alert levels. Why not just state the number of substations attacked, etc? Further, the “pre-defined” system conditions and alert levels are too detailed and overly prescriptive. System operators need to spend time looking for the right color and level to communicate the prevailing system condition terminology to avoid violating the standard. This task, in and of itself, does not ensure nor improve reliability and does not lend itself to promptly and effectively deal with the emergency situation.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>

		omissions (such as found in the table on page 14 of the draft - the cell, "Notify the following entities:" is blank).
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a "communication protocol" and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
NextEra Energy Resources, LLC	Disagree	NextEra agrees that standard system condition terminology could be beneficial in communications but this requirement introduces alert level conventions with no clarity on what the corresponding associated actions for such levels are and as a result, aside from the value derived from having improvement in terminology during communications, it is unclear what reliability improvements this will achieve in carrying out instructions.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a "communication protocol" and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Indiana Municipal Power Agency	Disagree	No. Does attachment 1 cover all possible communication scenarios and terminology? Using pre-defined condition terminology does not allow flexibility in communications and for near changes in communications that might be needed depending on the situation.
<p><b>Response: The SDT thanks you for your comments. Response: The SDT determined that determining alert levels falls outside the scope of a "communication protocol" and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
PEF	Disagree	PEF recommends that the color coding and definitions that are used by Homeland Security also be used for the notification of physical and cyber emergency alerts reported to the RC. This would follow the ES-ISAC standard already adopted by the electric industry.  If the attachment is adopted as is, PEF recommends adding the EEA levels to provide "pre-defined system condition terminology."
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a "communication protocol" and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
NYSEG	Disagree	R2 indicates the need to use pre-defined system condition terminology for all verbal and written Interoperability Communications yet Attachment 1 only defines transmission loading and physical and cyber security threats. Either need to rewrite the Requirement to include only these circumstances, or define every possible system condition used in Interoperability Communications.  Additionally, there does not appear to be any benefit in attempting to pre-define transmission loading, and physical and cyber alert system conditions since the actions associated with each are similar, if not the same,

Organization	Yes or No	Question 4 Comment
		for almost all conditions.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Bureau of Reclamation	Disagree	Reclamation does not agree with the Attachment 1 condition color coding as it will conflict with the DHS system of notification of change in threat condition. The three color system is unique to the notifications issued by DHS. Use of that color system is reserved by the DHS. Federal agencies are required to perform specific tasks when DHS issues alerts or changes the threat condition. Only DHS can change the threat condition. The concept needs to be revised considerably to avoid the conflict or create a potential security issue.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Pepco Holdings, Inc. - Affiliates	Disagree	Requiring system operators to use the color-coded system condition terminology during communication adds a layer of responsibility that will distract from the operator’s real-time reliability-related tasks.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Georgia Transmission Corp	Disagree	Should only include physical security emergency, cyber security emergency, or transmission emergency as stated in Attachment 1 instead of Interoperability Communications.
<p><b>Response: The SDT thanks you for your comments. The proposed term “Interoperability Communication” has been removed from the Standard. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Southern Company Transmission	Disagree	<p>Southern Company supports the SERC SOS comments.</p> <p>SERC SOS comments:</p> <p>The Alert Level Guides in Attachment 1 are not consistent with the proposed definitions of reliability-related communications. Both the Reliability Directive and Interoperability Communication, as currently defined, require some emergency action or change of equipment status. Why not just state the number of substations attacked, etc?</p> <p>Attachment 1 and R2 do not appear to be in synch primarily due to the definition of Interoperability Communications. By definition, Interoperability Communication is about how entities change the state of the BES and Attachment 1 is about notifying of what already happened to the BES.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
<p>SERC OC&amp;SOS Standards Review Group</p>	<p>Disagree</p>	<p>The Alert Level Guides in Attachment 1 are not consistent with the proposed definitions of reliability-related communications. Both the Reliability Directive and Interoperability Communication, as currently defined, require some emergency action or change of equipment status. Yet the Alert Level Guides were intended for announcement, not actions</p> <p>Requiring system operators to use the color-coded system condition terminology during communication adds a layer of responsibility that will distract from the operator’s real-time reliability-related tasks.</p> <p>We do not feel that these Alert Level Guides apply to all the responsible entities identified under Applicability in the draft standard - for example, TSPs and LSEs are not included in the list of notifications.</p> <p>There is also some redundancy in the Alert Level Guides - for example, the CIP-001 standard requires notification of sabotage events - it should not be repeated in this standard.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
<p>E.ON U.S. LLC</p>	<p>Disagree</p>	<p>The attachment adds a whole new lexicon for BES operators. E.ON U.S. suggests integrating attachment 1 and the relative alert levels into the EOP standards. The purpose of COM-003 indicates this standard is to ensure understanding of information during emergency alerts and emergency situations and not to establish the conditions, required notification, or levels of emergency alerts.</p> <p>While the attachment has been identified as a product of the RCWG it is unclear whether it has been reviewed and approved through the normal NERC and industry vetting.</p>

Organization	Yes or No	Question 4 Comment
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
MRO NERC Standards Review Subcommittee	Disagree	The attachment only applies to the RC. We recommend R2 state that the RC shall use pre-determined system condition terminology and the BA, DP, GOP, TOP, and TO shall follow orders and directives unless such acts violate safety, etc. Either the attachment should be changed or the requirement should be changed for accurate accountabilities.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
ATC and ITC	Disagree	The Attachment pertains to requirements of the RC, not all entities. Either the attachment should be changed or the requirement should be changed for accurate accountabilities.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Consumers Energy	Disagree	The COM Standards should put forth the methodology of communication, not provide communication for each event. For example, CIP-001 describes the communication to take place for CIP attacks, be they physical or cyber, EOP-002 describes the process for Generation and Capacity Emergencies. Utilizing the similar sounding vernacular (EEA,CEA,PSEA,TEA) is not prudent.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Progress Energy Carolina, Inc	Disagree	The link between COM-003-1 R2 and Attachment 1 for entities other than the Reliability Coordinator is unclear. R2 links with Attachment 1 and is applicable to a host of entities while Attachment 1 seems to only provide pre-defined system condition terminology for use during notifications by the RC to other entities.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
PSEG Companies	Disagree	The PSEG Companies agree with the concerns expressed in the comments filed by the PJM System Operations Subcommittee (SOS) Group.
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 4 Comment
<p>Please see our responses to by the PJM System Operations Subcommittee (SOS) Group.</p>		
<p>Pacific Northwest Small Utilities Comment Group</p>	<p>Disagree</p>	<p>The referenced attachment appears to list alert levels for RCs to use in communicating threats to BAs, DPs, GOs, TOPs and TOs. This requirement should apply only to RCs.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
<p>Xcel Energy</p>	<p>Disagree</p>	<p>The use of Yellow, Orange and Red, as related to the various alert levels, may conflict with existing color requirements that entities already have in use. We recommend instead only refer to the PSEA, CEA and TEA levels. Additionally, it is unclear how R2 applies to anyone other than the RC. Attachment 1 seems to only apply to the RC. If this is correct, then why would the other entities listed in R2 have to incorporate that terminology into their CPOP? If this is not correct, please clarify the requirement so that the other entities can clearly understand what is expected.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
<p>The Empire District Electric Company</p>	<p>Disagree</p>	<p>This attachment is not needed. It is a duplicate of the NERC Alert process that is already established as well as CIP-001 Sabotage reporting requirement R2 along with requirements of EOP-001 R5 and EOP-004 R2 dealing with disturbance reporting. The last thing the industry needs is more paperwork requirements that are redundant when an emergency event happens on the system.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
<p>Ameren</p>	<p>Disagree</p>	<p>This is an ambiguous reference in all of NERC standards for all but the RC. How would an LSE interpret this in communication between them and a DP. Would there ever be a red condition for issues that affect them? And as it relates to operating, it looks like this is exclusive of EEA type events, i.e. BA type emergencies seem to not be represented. It would seem that the pre-defined conditions should be established for each interaction that each entity might have, e.g. a predefined set for a BA to a TOP, a BA to an LSE, et al. While each entity can certainly address the 3 scenarios in Attachment 1 (RC to entity) those are not the only conditions where communication affects BES reliability.</p>

Organization	Yes or No	Question 4 Comment
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
NIPSCO	Disagree	This may not be necessary.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Power South Energy	Disagree	This requirement is unnecessary.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
PPL	Disagree	This requirement should be applicable to a RC only. Some registered entities may not even receive these types of communications. Since the responses are the same for all levels noted in attachment 1, there is questionable value to defining this level of additional administrative detail.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Puget Sound Energy	Disagree	<p>This requirement, along with the associated M2, will be almost impossible to substantiate for audit purposes. For example, would an entity be required to present, and an auditor be required to listen to, voice recorder records for the data retention time? It is difficult to image another way to prove an entity complied with this requirement</p> <p>Further the statement "as defined in Attachment 1" implies a set of definitions can be found and yet Attachment 1 is not structured in such that way.</p> <p>Is the system condition terminology just the terms "condition yellow", "condition orange", and "condition red".</p> <p>The procedural and time aspects described in this attachment create confusion as to whether compliance is required under this standard or a different one.</p> <p>Suggest more simplified presentation of definitions or glossary for clarity.</p> <p>Finally the inclusion of "written" communications creates a question relative to real-time information or whether this is extending beyond that timeframe. Most real time information sharing is verbal due to the</p>

Organization	Yes or No	Question 4 Comment
		urgency of it. Suggest removal of written.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
Santee Cooper	Disagree	Utilization of a color-coded system for all verbal and written Interoperability Communications adds a layer of complexity to the System Operator that is not necessary.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
South Carolina Electric and Gas	Agree	We agree with the proposal, however we feel that the color system should be evaluated to better distinguish the type of attack for example using P-YELLOW for physical vs. C-YELLOW for cyber instead of just "YELLOW" for both.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
NRECA RTF Members	Agree	We believe there is a need to use pre-defined system condition terminology and the ones provided in the attachment are easy to understand.
<p><b>Response: The SDT thanks you for your comments. Note that based on stakeholder comments, the team deleted the requirement. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		
FirstEnergy	Disagree	We do not support R2 and its referenced attachment and feel that they should be removed. The requirement and attachment are too convoluted, create confusion among system operators, and not necessary with regard to the goal of this standard. This standard mandates proper three-part communication in all reliability-related communication (including alert level situations). Other standards should define and mandate rules associated with the specifics surrounding urgent action situations (i.e. CIP, TOP, EOP standards). Together these standards will arrive at proper communication between entities during alerts.
<p><b>Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.</b></p>		

Organization	Yes or No	Question 4 Comment
Electric Market Policy	Disagree	<p>We object due to the following reasons;</p> <p>1 - There are 3 versions of Attachment 1-COM-003-1 which is potentially confusing. We suggest separating into 3 attachments, one for each type of notification.</p> <p>2 - The level(s) identified in the notification text are at odds with the condition (color vs. numerical). It is suggested that the standard either use to Condition (color) or the level (numerical).</p> <p>3 - None of the Operating State Alert Levels in Attachment 1 appears to address Energy Emergency Alerts (EEAs). The note in the “Attachment 1-COM-003-1 defines normal, alert, and emergency operating conditions as they relate to Transmission Loading, Physical and Cyber Security. These definitions for Transmission Loading, Physical and Cyber Security Alert states align with the Emergency Energy Alert (EEA) states (as already described in NERC Reliability Standard EOP-002-2.1). The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions.” This seems to limit use of Interoperability Communications to only events where there exists either a physical or cyber threat, or where an IROL can’t be mitigated. This emphasizes the confusion as described in item 2 above where the EEA levels in EOP-002-2.1 uses numerical values (i.e. EEA Level 1) without the colored conditions. We recommend adding a new section to Attachment 1 ‘Operating State Alert Levels’ as: ‘Reliability Coordinator Notifications for Energy Emergency Alerts.</p> <p>’4-Attachment 1 pertains specifically to Operating State Alert Levels and says nothing about the communication of information to be used to change the state or status of a BES element or facility (which is the SDT’s proposed definition of Interoperability Communications). Therefore, it is not appropriate to require that all verbal and written Interoperability Communications use the pre-defined terminology in Attachment 1.</p> <p>Only those communications concerning Operating State Alert Levels should be required to use that terminology. By the proposed definition, such communications are not Interoperability Communications since the information is not used to change the state or status of a BES element or facility. The SDT needs to revise this requirement to clarify that it pertains only to communicating the Operating State Alert Levels and nothing more.</p>

**Response: The SDT thanks you for your comments. The SDT determined that determining alert levels falls outside the scope of a “communication protocol” and has removed the requirement to use Attachment 1 from the revised standard.**

5. Requirement R4 of the draft COM-003-1 states, “Each Responsible Entity shall use Central Standard Time (24 hour format) as the common time zone for all verbal and written Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.

**Summary Consideration:**

The majority of commenters stated Requirement R4 would add confusion for the operators and decrease reliability. Some recommend the use of another time in place of Central Standard Time. In response, the OPCP SDT has modified the standard to use the 24 hour format (new 1.1.2) in all Operating Communications and the inclusion of a time zone reference (new 1.1.3) when Operating Communications occur between entities in different time zones.

There were also several comments of a general nature that indicated time zone issues as a non-factor for reliability. The OPCP SDT has modified the requirement to focus on Operating Communications in a format that it believes would increase reliability as it would reduce the potential for a miscommunication related to the desired time of a system operation.

Organization	Yes or No	Question 5 Comment
Bureau of Reclamation	Agree

Georgia Transmission Corp	Agree	
Independent Electricity System Operator	Agree	
Old Dominion Electric Cooperative	Agree	
Oncor Electric	Agree	

Organization	Yes or No	Question 5 Comment
Delivery		
Sunflower Electric Power Corp.	Agree	
Westar Energy	Agree	
Santee Cooper	Disagree	A common time zone is not necessary and is overly prescriptive. Companies should not have to worry about self-reporting or receiving a compliance violation if someone states the wrong time during a conversation.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity must explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
American Electric Power	Disagree	AEP believes that the significant efforts and significant system changes necessary to support a common time zone does not provide a significant enough reliability benefit. In fact, the focus on a common time may divert attention away from more pressing operational reliability needs.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone , and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
Electric Market Policy	Disagree	Any confusion about what time is being verbally communicated should be cleared up by three-part communications. There should be no confusion about what time is being communicated in writing as long as the time zone and AM\PM designation are included. Besides, many entities exchange written information via web-enabled applications that allow the users to configure their interface to show time in whatever format and time zone they prefer. This eliminates confusion. Operators will continue to use local time in their communications with field personnel, support staff, and management, and we see no demonstrable reliability-related need to require every operator in North America to have to convert their local time to CST in their communications with other operators. However, if the SDT feels a standard time must be adopted, it should be

Organization	Yes or No	Question 5 Comment
		GMT as this is the time that used by all 'true time' devices.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM 003 which we believe will address your concerns. Manitoba Hydro	Disagree	<p>As per below.</p> <p>1)The 24 hour format will certainly reduce the confusion of AM and PM and at present seems to be the current best practice for all entities so should not be a major change.</p> <p>2)Examining the definition of “Interoperability Communications” means that there is and will be real time communications with entities in other times zones, thus it is assumed that this being an NERC standard is enforcing that all other time zones (PST, MST, EST) will be using CST when communicating with interoperability.</p> <p>a. If this is the case, it appears that the other time zones (PST, MST and EST) must make effort to modify their local time to synchronize with CST.</p> <p>b. This brings to point that when interoperability communication is used, this fact must be mentioned, instead of 13:53, it should be 13:53 CST.</p> <p>3) Adding CST to verbal time formats will be difficult to implement, so maybe a statement confirming the time zone should be appropriate each time interoperability communications is used when required. Conclusion: 24 hour format is fine, further clarify that all other time zones must use CST.</p>
<p><b>Response: The SDT thanks you for your comments. The second draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p> <p><b>The SDT is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		

Organization	Yes or No	Question 5 Comment
ATC and ITC	Disagree	ATC is in the Central Standard Time zone, and would not be directly impacted by this requirement. With that being said we are concerned that forcing an organization to refer to a time zone that is not local may result in an increase of errors and a decrease in reliability. See comments for question #3.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p> <p>Please see response to question #3.</p>		
British Columbia Transmission Corporation	Disagree	BCTC's position: as a majority of the Interoperability Communications is within our time zone there is no advantage in using Central Standard Time as this will only make the communications more difficult as both parties are required to change time, R4 is unreasonable.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p>		
California Independent System Operator	Disagree	CAISO Comments; Any standardization of time zones, in order to enhance reliability or reduce costs would use GMT as the reference zone in our opinion. The use of Central Standard Time is problematic because some months of the year other time zones would be at the same time as CST (Eastern Daylight Savings Time) and others not. Adopting systems that require system operators to sometimes operate in a time zone that is not their own local time and sometimes to operate in a time zone that is equivalent to their own local time is standardization that is not actually standard. How does using Central Standard Time for all verbal and written communication improve or support reliability? The SDT needs to explain how this requirement provides an adequate level of reliability for real-time operations for any entity operating outside the Central Standard Time Zone.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address</p>		

Organization	Yes or No	Question 5 Comment
<p><b>your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
<p>New York State Reliability Council</p>	<p>Disagree</p>	<p>Comments: This requirement will burden those entities whose operations and communication needs are with other entities in the same time zone, which represents the overwhelming majority of all communications performed. It will increase the likelihood of errors for such entities. Further, some entities are operating both NERC BES elements and non-BES elements from the same control room. This requirement will significantly impact the efficiency and the safety of workers within those entities. NYSRC notes that R4 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. <p>Sunflower Electric Power Corporation</p>	<p>Agree</p>	<p>General question will time follow central prevailing time (standard/daylight savings)?</p>

Organization	Yes or No	Question 5 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, and include whether the time is standard or daylight saving when communicating with one or more entities in a different time zone.</b></p>		
<p>Hydro-Québec TransEnergie</p>	<p>Disagree</p>	<p>HQT agrees with using 24 hour format.</p> <p>However, there is no reliability need to use a common time zone for communications. There is already a requirement to use hour ending for scheduling purposes, inadvertent accounting, CPS and other standards where needed. There is no additional reliability need to use a common time zone.</p> <p>The time zone should be identified in the communication. Not only does this requirement attempt to determine HOW entities operate within their various footprints, it would significantly change the way many markets are structured. To implement this into existing Markets would cost significant time, money and resources while not enhancing reliability in these areas. When operating across time-zones, simply referencing “Central Standard Time” or “Eastern Standard Time” is sufficient for operating entities to reliably operate. The time zone adopted by the respective Reliability Coordinator (RC) and their area control center, e.g., NYISO Eastern Standard Time (EST), should be used. If each entity in the area and the RC are all using EST (or daylight savings), then why would a time zone be used that is foreign to all parties in the area? This can lead to considerable confusion. What cannot be ignored is how many entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc.</p> <p>We are strongly opposed to this requirement. The requirement should be that those entities which need to communicate and are in different time zones define which time they will use for communications</p> <p>.Any confusion about what time is being verbally communicated should be cleared up through three-part communications. There should be no confusion about what time is being communicated as long as the time zone (where applicable), and the 24 hour format designations are included. Besides, many entities exchange written information via web-enabled applications that allow the users to configure their interface to show time in whatever format and time zone they prefer. This eliminates confusion.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. Organization	Yes or No	Question 5 Comment
<p><b>Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
NIPSCO	Agree	I believe we call this "system time" in our area
<p><b>Response: The SDT thanks you for your comments. Many stakeholders proposed modifications to the standard – and the SDT revised the standard to only require inclusion of time and time zone when communicating with one or more entities in a different time zone.</b></p>		
E.ON U.S. LLC	Disagree	<p>If it is the intent that the requirements of this standard apply not only to control room operators but field personnel (line crews, substation crews, etc.) then E ON US is not in favor of using a common time zone nationwide. The confusion that this change could create in real-time operations outweighs the BES reliability benefit E.ON US would also like clarification that this requirement does not apply to control systems or elements thereof that may log equipment operations. The background information above suggests this possible interpretation.</p>
<p><b>Response: The SDT thanks you for your comments. This does include communications that involve field personnel.</b></p>		
We Energies	Disagree	<p>If requiring one standard time zone, it would seem prudent to specify Greenwich Mean Time (GMT) as a universal standard. That being said, solely utilizing Central Standard Time (CST), or even GMT, as the common time zone may cause undue confusion given that MISO and PJM already operate with established processes and systems that are inconsistent with this, and are based on their own market timing. In addition, many plant personnel and procedures already have a long and engrained history of successful operation under existing timing directions, which are not aligned with market timing. Forcing every plant across multiple time zones to establish a new standard ignores the need for cases of special consideration and historical circumstances. The potential confusion due to the forced timing standard across many entities within a given area is too high a price to pay for the possible clarity by a limited few due to the switch to CST. A preferred alternative would include focusing the standard on requiring very clear communication of the time zone being specified for a given Reliability Directive. Thus, compliance enforcement would only pertain to Reliability Directives.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone. This requirement would apply to verbal and written “Operating</b></p>		

Organization	Yes or No	Question 5 Comment
<p><b>Communications” as defined in the current draft of the standard. If you are a responsible entity as defined in the requirement then it is applicable.</b></p>		
<p>The Empire District Electric Company</p>	<p>Disagree</p>	<p>In dealing in real time, what possible benefit can be had by this requirement? I see this requirement benefitting NERC analysis after the fact and can lead to more operating mistakes in real time than it benefits. If a situation is occurring in real time and two entities are in communication with each other, the requirement of a common time zone holds no benefit.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
<p>American Municipal Power</p>	<p>Disagree</p>	<p>In other large industries one time zone is usually picked, and the time zone that is usually picked is the EST zone (JP Morgan Chase is an example). I feel that picking a standard time zone is very important, but I have not seen significantly good arguments to use CST. EST, on the other hand, is where the majority of the load for the electric industry resides. I suggest changing the standard to EST but with the 24 hour format.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
<p>NERC Staff</p>	<p>Disagree</p>	<p>In the “Background Information” section of this Comment Form, you state, “The SDT believes that Interoperability Communications would be enhanced with the use of a common time zone. Central Standard Time was chosen as it is already in use for NERC Time Error Corrections. The Blackout Report cited the need to tighten communication protocols and the SAR includes consideration of a common time zone to minimize mismatched time signature issues between control systems especially during an emergency.”NERC staff would like to see more detailed justification on how reliability would be enhanced with this requirement. This appears to solve issues for communications between time zones, but may add additional confusion for all additional communications that exist within a common time zone.</p>

Organization	Yes or No	Question 5 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p> <p>The OPCP SDT believes that any critical element to an Operating Communication (time, ordered action, clear understanding by all parties) must be governed by protocols that reduce the risk of communicating a misunderstood message. A misunderstood message increases the risk of a mishap which could destabilize the BES by creating an improper circuit arrangement. The time an event is supposed to occur in a sequence is critical. If a sender gives a time in EST and the receiver interprets it as CST the risk of a mishap that will affect reliability (not to mention people and equipment) increases dramatically.</p>		
<p>Progress Energy Carolina, Inc</p>	<p>Disagree</p>	<p>Mandating that all “Interoperability Communications” be based on Central Standard Time could generate an error precursor- (i.e. some entity communicating a reliability directive in a location using EST to a different entity in a location using EST having to convert the time stamp to CST introduces possibilities of errors and/or delays.) A better approach for those entities that communicate across time zones is for those entities to agree/coordinate on a time standard reference.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p>		
<p>NorthWestern Energy</p>	<p>Disagree</p>	<p>NorthWestern appreciates the opportunity to comment. We believe the requirement to use Central Standard Time will cause unnecessary confusion (translating to a different time zone and possibly to a different time reckoning - standard or daylight) at a time when the need for clarity is critical. NorthWestern suggests that each entity use their local time zone when issuing switching orders. Each entity should state the time zone they are using when giving any time reference (e.g., 15:20 Mountain Daylight Time) if necessary.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT understands your concerns and adopted your suggestion. Pepco Holdings, Inc. - Affiliates	Disagree	PHI believes that mandating one time zone for all Interoperability Communications will create more confusion during an emergency that it will prevent and may contribute to increased reliability issues.
<p><b>Response: The SDT thanks you for your comments.</b>                      The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p>		
Southern Company Transmission	Disagree	Southern Company supports the SERC SOS comments. SERC SOS comments: We feel that this requirement of a common time zone is overly prescriptive. The requirement should be that entities operating in different time zones agree on how to best eliminate any confusion regarding the time difference. Entities that routinely operate in different time zones already have an effective system for dealing with time differences. There seems to be no incentive to change a system that already works quite well, and the cost of updating computer systems could prove prohibitive. This group feels that mandating a common time zone across all of North America can only lead to confusion and increased reliability issues.
<p><b>Response: The SDT thanks you for your comments.</b>                      The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Puget Sound Energy	Disagree	The requirement for common time zone should be at the discretion of the Reliability Coordinator in the respective region to determine. The conversion to CST has no apparent value. It would be much more reasonable to require communications related to time to include the time zone used in that communication. If common time zone across the nation is required it should only be imposed on the RCs as they would communicate with each other more readily than entities to other national entities. If an entity does not operate within the CST, the need to convert during periods of stress may increase the potential for error and reduce reliability.
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. IRC Standards Review Committee	Disagree	There is no need to use a common time zone for communications. There is already a requirement to use hour ending for scheduling purposes, inadvertent accounting, CPS and other standards where needed. There is no demonstrated benefit to reliability to use a common time zone. The time zone should be identified in the communication. Use of CST will cause significant and unnecessary costs and the resulting reliability benefit is not clear. Some of the costs will arise to change systems such as RCIS, IDC, scheduling and E-Tag systems, etc. Not only does this requirement attempt to determine HOW entities operate within their various footprints, it would significantly change the way many markets are structured. To implement this into existing Markets would cost significant time, money and resources while not enhancing reliability in these areas. We believe that, when operating across time-zones, simply referencing “Central Standard Time” or “Eastern Standard Time” is sufficient for other operating entities to reliably operate; also, let’s not lose sight of HOW MANY entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT understands your concerns and adopted your suggestion for including the time zone in communications that involve communicating with one or more entities in a different time zone.</b></p>		
ISO New England Inc.	Disagree	There is no need to use a common time zone for communications. Organization	Yes or No	Question 5 Comment
		<p>Time” is sufficient for operating entities to reliably operate. The time zone adopted by the respective Reliability Coordinator (RC) and their area control center, e.g., NYISO Eastern Standard Time (EST), should be used. If each entity in the area and the RC are all using EST (or daylight savings), then why would a time zone be used that is foreign to all parties in the area? This can lead to considerable confusion. What cannot be ignored is how many entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement. The requirement should be that those entities which need to communicate and are in different time zones define which time they will use for communications. Any confusion about what time is being verbally communicated should be cleared up through three-part communications. There should be no confusion about what time is being communicated as long as the time zone (where applicable), and the 24 hour format designations are included. Besides, many entities exchange written information via web-enabled applications that allow the users to configure their interface to show time in whatever format and time zone they prefer. This eliminates confusion.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT understands your concerns and adopted your suggestion for including the time zone in communications that involve communicating with one or more entities in a different time zone.</b></p>		
Northeast Utilities	Disagree	<p>There is no reliability need to use Central Standard Time (CST) a common time zone for communications. Eastern Standard Time (EST) is used in New England and within the NPCC region. Converting to a different time zone will be confusing to the operators and the field personnel. The time zone that will be used should be agreed between each operating entity. This should only impact those entities that cross two time zones. If NERC or a Region were to perform an investigation that involves entities across the eastern interconnection, it would be appropriate for the investigation team to request data using a specific time zone.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
Western Area Power Administration	Disagree	<p>This could be a potential problem since Operators will need to communicate with field personnel and local utilities in their local applicable time zone. It could be confusing to communicate by referring to a different time zone in other instances. It seems like it would make more sense to require that the time zone being used in a communication must be specifically and clearly referred to and identified. It doesn't matter so much</p>

Organization	Yes or No	Question 5 Comment
		WHICH time zone is used, it just matters that everyone understands which one is being used.
<p><b>Response: The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
Bonneville Power Administration	Disagree	This creates a communication barrier between the utility and its customers and the local population. Do not go ahead with this provision. The very last thing that we want to do is to create confusion and this approach, given that the country itself is using different time zones, will do just that. With 3-part communications with specified time zones in Interoperability Communications as required and a common English language, the matter is covered.
<p><b>Response: The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
Entergy Services	Disagree	This is also a “how” requirement and not a “what” requirement. If the industry believes that confusion exists pertaining to what time zone different entities are referring to in written and verbal communications, the requirement should be focused on ensuring clear communication of time zone information is included in verbal and written communication. Forcing entities to change to any one time zone will impose significant effort and expense without a measurable improvement in reliability. However, Entergy is not aware that reliability issues have occurred as a result of entities communicating in written or verbal format in different time zones. Entergy proposes that this requirement be removed from the standard.
<p><b>Response: The SDT thanks you for your comments. The SDT understands your concerns and adopted the suggestion for including the time zone in communications that involve communicating with one or more entities in a different time zone.</b></p>		
ERCOT ISO	Disagree	This is an administrative task and prescribes how something should be done. Written Interoperability Communications are typically done through automated systems, in which time zone conversion should not be an issue. Verbal communication should be thorough enough to confirm the conversion. If the industry is in favor of this requirement, then perhaps consideration should be to use Central Prevailing Time to alleviate potential confusion with changes with Daylight Savings Time.

Organization	Yes or No	Question 5 Comment
<p><b>Response:</b> The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p>		
PPL	Disagree	This requirement is overly prescriptive and the benefit to reliability by switching everyone to CST is unclear.
<p><b>Response:</b> The SDT thanks you for your comments. The SDT revised COM-003 so that instead of requiring the use of a single continent-wide time zone, the revised standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p>		
Power South Energy	Disagree	This requirement will be too confusing and could lead to compliance violations because someone stated the wrong time during the conversation.
<p><b>Response:</b> The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p>		
Long Island Power Authority	Disagree	This requirement will burden those entities whose operations and communication needs are with other entities in the same time zone, which represents the overwhelming majority of all communications performed. It will increase the likelihood of errors for such entities. Further, some entities are operating both NERC BES elements and non-BES elements from the same control room. This requirement will significantly impact the efficiency and the safety of workers within those entities. LIPA notes that R4 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.
<p><b>Response:</b> The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p>		
NYSEG	Disagree	Unless the communication is across time zones, there is no benefit to using Central Standard Time, nor is it sensible. Entire system infrastructures and business processes are driven by current, local standard time and it is far more safe, reliable, and practical to use the established current time for system operations. If there is a

Organization	Yes or No	Question 5 Comment
		<p>compelling need for definitive time notation across time zones then the requirement should dictate the addition of the time zone when referring to a specific clock time (i.e., 1400 CST, 1400 EST, 1400 ED[aylight]T, etc.).</p>
<p><b>Response:</b> The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone. Your recommendation is the genesis of the proposal we have developed in the standard.</p>		
<p>Orange and Rockland Utilities, Inc.</p>	<p>Disagree</p>	<p>Use of the CST time format would present significant challenges as expressed in the comments of question #3 listed above.</p>
<p><b>Response:</b> The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone. Please see responses to Question#3 comments above as well.</p>		
<p>FirstEnergy</p>	<p>Disagree</p>	<p>Using a specific time zone that is subject to adjustments for daylight savings introduces additional complexity for an operator and has potential to introduce additional reliability issues. A significant portion of the Eastern Interconnection transmission operators have dealings with entities that do not span multiple time zones and are solely within the Eastern Time Zone. We do not feel that it is appropriate for this standard to mandate how time is communicated during three-part communication. Operating communication can deal with several different subjects and data during a conversation, and it would be inappropriate to mandate all the possible subjects and data through standard requirements. As a best practice, and not as a mandated requirement, it would be appropriate for operators to state the time zone they are in if necessary for the situation or if requested by an entity.</p>
<p><b>Response:</b> The SDT thanks you for your comments. NRECA RTF Members	Disagree	<p>We believe that adding the Central Time zone requirement for all verbal and written Interoperability Communications is unnecessary. For these type of activities there should already be accurate time stamps from equipment such as RTUs, EMS systems etc... for record keeping and documentation activities. In the future, with the implementation of Smart Grid technologies, time stamping will be included in the developed platforms for such technology, therefore, reducing the much of the time stamping errors. Because many of the actions required for Interoperability Communications, are completed by field personnel this requirement is onerous. It could potentially impact reliability since the field personnel might be more focused on documenting the correct time zone, for compliance to the requirement and the potential impact for non-compliance, than completing the required task safely and accurately. If time-stamping is an issue in event analysis, it might be more appropriate that Central Standard Time be utilized by recording devices such as RTUs, EMS systems etc... not for the actual verbal and written communications. In addition, how will daylight savings time be addressed in the proposed requirement of this standard?</p>
<p><b>Response: The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. Florida Municipal Power Agency	Disagree	<p>We believe that any time zone can be used as long as the parties come to a common understanding of time through communication. Also, if an Entity mistakenly starts off a conversation using a time other than Central</p>

Organization	Yes or No	Question 5 Comment
(FMPPA) and some members		Standard Time, but corrects themselves during the 3-part communication process, is that a violation? We believe not, that as long as the communicating entities come to a common understanding of time, there is no violation. More clarity on this is desired. We assume such opportunity to correct mistakes is present throughout the standard and the language of the standard ought to reflect that. A high VRF is not appropriate, especially if the parties involved in the communication have a common understanding of the time, who cares what time zone?
<p><b>Response: The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
MRO NERC Standards Review Subcommittee	Disagree	We believe that requiring the use of Central Standard Time (CST) in the Operating Arena (Real-Time) would reduce the level of reliability on a real-time basis. We understand that one of the primary reasons for going to one time zone is to aid in Event Analysis. It is our belief that during the analysis of an event, there is adequate time to make the necessary adjustments for time zones. The Group performing the analysis could require all data being submitted be in one time zone as the basis. Requiring the use of CST is an added burden to the Operations Staff in real-time that does not help them.
<p><b>Response: The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM -003 which we believe will address your concerns. Duke Energy	Disagree	We don't agree with this requirement because it would introduce confusion into communications, especially in all communications other than RC to RC. RC's already have protocols in place to deal with time zone

Organization	Yes or No	Question 5 Comment
		differences, and changing that and applying it to all entities would create reliability errors. We think that this is “a solution in search of a problem”.
<p><b>Response: The SDT thanks you for your comments. The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM- 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communications an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
PJM	Disagree	We feel that this requirement of a common time zone is overly prescriptive. The requirement should be that entities operating in different time zones agree on how to best eliminate any confusion regarding the time difference. Entities that routinely operate in different time zones already have an effective system for dealing with time differences. There seems to be no incentive to change a system that already works quite well, and the cost of updating computer systems could prove prohibitive. This group feels that mandating a common time zone across all of North America can only lead to confusion and increased reliability issues.

The specified role of the DP to shed load justifies the retention of the DP as an applicable entity.</p>

**6. Requirement R5 of the draft COM-003-1 states, “Each Responsible Entity shall use Three-part Communications when issuing a directive during verbal Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.**

**Summary Consideration:**

Most stakeholders who responded to this question disagreed with the proposed Requirement R5.

Many commenters offered differing recommendations on R5 regarding the application and definition of “Reliability Directive.” The proposed term “Reliability Directive” is being developed by the RC SDT for Project 2006-06, and the OPCP SDT has not utilized this term in the first or second drafts of COM- 003-1.

Many commenters recommended splitting proposed Requirement R5 to recognize the two distinct parties (sending and receiving) in a three part communication process. The OPCP SDT has done so by separating what had been R5 into two requirements – R2 for the sender and R3 for the receiver of an oral, person-to-person “Operating Communication.”

Some commenters expressed concerns regarding potential audit citations if a repeat-back was not word-for-word or verbatim. The OPCP SDT modified the standard, adding “not necessarily verbatim” to address the concern. In other words, communication is acceptable as long as the communication is clear and accurately conveys the Operating Communication and its substantive components.

The Quality Review team recommended that the OPCP SDT modify Requirements R2 and R3 to clarify that these requirements for performance of three-part communication exclude Reliability Directives. This eliminates the double jeopardy issue that may have existed if both COM-002 and COM-003 were approved.

Thus – the revised COM-003 does include the term, Reliability Directive. In addition, the implementation plan was revised to no longer recommend retirement of COM-002. As modified, the two standards can exist without conflict. COM-002 requires the issuer of an Operating Communication to identify that communication as a “Reliability Directive” which gives recipients notice that the directive is associated with an “Emergency”. COM-003 now specifically identifies that the requirements for thee part communication do not include “Reliability Directives.”

Per Standards Committee guidance, the SDT did not revise all the responses in this report that indicate COM-003 does not include the term, “Reliability Directive” nor did the team revise all the responses that indicated the team recommended retirement of COM-002.

Western Area Power Administration	Agree	
Pepco Holdings, Inc. - Affiliates	Disagree	As mentioned in Question 1 above, the term Reliability Directive has been defined in the draft standard COM-002-3 and should be considered in place of Interoperability Communication since the directive is specific to emergency operations. PHI recommends that the requirement changed to read “Each responsible entity shall use Three Part Communication when issuing or receiving a Reliability Directive”.
<p><b>Response: The SDT thanks you for your comments. The current draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered. Three part communications will be required when oral, person-to-person Operating Communications are used.</b></p>		
Independent Electricity System Operator	Disagree	3-part communication should be used for communicating a directive that must be complied with. The “must be complied with” is needed to distinguish between an “instruction type” of directive and a “need to perform type” of directive. We believe it is the latter that should require 3-part communication.
<p><b>Response: The SDT thanks you for your comments. The current draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered. Three part communications will be required when oral, person-to-person Operating Communications are used.</b></p>		
FirstEnergy	Disagree	Although we agree that proper communication should be used during actions that affect the reliability of the

Organization	Yes or No	Question 6 Comment
		<p>BES, we do not agree with this requirement as written. The following contains our rationale and suggestions:</p> <p>1. The lower case term "directive" is ambiguous, not defined, and confusing. This is especially true in light of the proposal of the RCSDT to modify COM-002-3 to include a definition of "Reliability Directive" and their plan to use this defined term to invoke 3-part communication. Since the plan of this OPCPSDT is to eventually incorporate the COM-002-3 requirements into this new COM-003-1 standard, we feel the definition of Reliability Directive should be moved to this standard now (instead of later) and the term should be broadened to include any actions that affect the BES reliability. Essentially then, the current proposed R1 of COM-002-3 can be moved to this COM-003-1 standard.</p> <p><b>Response: The implementation plan proposes retiring COM-002 when COM-003 becomes effective. We also agree the term should be broadened to include any actions that affect the BES reliability. As envisioned, the new term, "Operating Communications" includes "Reliability Directives."</b></p> <p>2. Our proposal for the term Reliability Directive in item 1 above incorporates the verbiage of the proposed Interoperability Communication definition. Therefore, the proposed term Interoperability Communication is no longer required and can be eliminated.</p> <p><b>The second draft version of COM-003-1 eliminates the term "Interoperability Communication" and proposes the term "Operating Communications" which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered.</b></p> <p>3. Once the term Reliability Directive and proposed R1 from COM-002-3 are moved to this COM-003-1 standard, the current R5 of COM-003-1 requiring the use of Three-Part Communication could then be revised to require three-part when a Reliability Directive is issued and continue until the operating condition that invoked the Reliability Directive is resolved, mitigated, or ended.</p> <p><b>The SDT believes that three part communication should be used for all oral, person-to-person Operating Communications.</b></p> <p>4. With respect to the proposed R2 and R3 of COM-002-3 which essentially discuss three-part communication,</p>

Organization	Yes or No	Question 6 Comment
		<p>these requirements could be eliminated and would be covered by COM-003-1. As a result, the COM-002-3 requirements being proposed by the RCSDT can be eliminated in their entirety since we have now incorporated all of them into this new COM-003-1.</p> <p><b>The SDT believes this is the intention as the projects progress through the Standard Development process.</b></p> <p>5. Since COM-002-3 included the Purchasing-Selling Entity as an applicable entity, since they could be the recipient of a Reliability Related Directive and since, with our proposed changes, COM-002-3 can be retired; the Purchasing-Selling Entity can be added to the applicability section of and incorporated into this new COM-003-1 standard as recommended below.</p> <p><b>The SDT again believes this is the intention as the projects as they progress through the Standard Development process. There are many contingencies that could surface that could impact the final outcome.</b></p> <p>In conclusion, we suggest the following changes/additions to COM-003-1:</p> <p>A. Move a revised version of the term "Reliability Directive" from COM-002-3 to this new COM-003-1 standard and define it as follows: "A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where the recipient is directed to change the state or report the status of an Element or Facility of the Bulk Electric System."</p> <p>B. Delete proposed definition "Interoperability Communication".</p> <p>C. Delete R2 and R3 of COM-002-3 as suggested in item 4 above.</p> <p>D. Insert a New Requirement R4, renumbered as R2, into new standard COM-003-1 taken from COM-002-3 R1: "When a Reliability Coordinator, Transmission Operator or Balancing Authority issues a Reliability Directive, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as a Reliability Directive to the recipient. [Violation Risk Factor: High][Time Horizon: Real-Time]"</p> <p>E. Revise Requirement R5 and renumber as R3: "Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity, Distribution Provider, and Purchasing-Selling Entity shall use Three-part Communication for all communications</p>

Organization	Yes or No	Question 6 Comment
		<p>concerning a Reliability Directive that was issued per Requirement R1 and continuing until the actions or status reporting identified in the Reliability Directive has been completed. [Violation Risk Factor: High][Time Horizon: Real time]"</p> <p>F. Add the Purchasing-Selling Entity as an applicable entity to COM-003-1.</p> <p><b>The SDT does not believe the requirements of COM-003 are applicable to the PSE. The PSE is not involved in real-time operating communication. In addition, the SAR for this project did not include the PSE as a responsible entity.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
Electric Market Policy	Agree	<p>As currently defined, Three-part Communications presumes the second party will repeat the information back “correctly.” Failure to do so is assigned a High VRF and a Severe VSL. The practical application of Three-part Communication involves a sender communicating information, a receiver repeating back the information, and the sender verifying the repeat back is either correct or incorrect. If the repeat back is incorrect, the process repeats until both parties have the same understanding of what is being communicated. This iterative process needs to be addressed within the definition of Three-part Communications.</p>
<p><b>Response: The SDT thanks you for your comments. The second draft of the standard captures many of your observations in Requirements R2 and R3. Note that the SDT modified the VRF for both R2 and R3 in the second draft of COM-003 to “Moderate” rather than “High”.</b></p>		
Transmission System Operations	Disagree	<p>As stated in Question #1, the definition of “Interoperability Communication” needs further clarification. Also, further clarification is needed as to when “Interoperability Communications” is required to be used.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The current draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered. <p>ATC and ITC</p>	<p>Disagree</p>	<p>ATC believes that the term “directive” should be replaced with the term “Reliability Directive” which is being developed under Project 2006-06. It is important for BES reliability that NERC use clearly defined term which will identify the circumstances under which this requirement is enforceable. We provide the definition for “Reliability Directive”, as it appears in the latest posting for Project 2006-06, in our response to question 1.</p>

Organization	Yes or No	Question 6 Comment
		<p>It is our understanding and interpretation that the intent of this requirement is to require entities to use Three-Part Communication during emergency situations in which “Reliability Directives” are being issued. In other words this requirement as proposed does not apply to normal (non-emergency) day-to-day switching. The replacement of the term “directive” with “Reliability Directive” provides the additional clarity around an entity’s compliance obligation.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The OPCP SDT met with the RC SDT and RTO SDT members to coordinate efforts on the use of the terms, “Three-part Communications” and “Reliability Directives”. The teams agreed that the RC SDT will advance the new Glossary term “Reliability Directive” in its Project 2006-06. The second draft version of COM-003-1 has not used the term directive and has now used the proposed defined term “Operating Communications,”</p> <p>The OPCP SDT changed Interoperability Communications to become Operating Communications which includes all communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System which could be applicable to routine operations that impact the BES.</p> <p>Your comments on the term Reliability Directive reflect the potential outcome of a Standard under development by another drafting team.</p>		
<p>IRC Standards Review Committee</p>	<p>Disagree</p>	<p>Based on the definition of Interoperability Communications, R5 could imply that three-part communications is required to communicate routine operating instructions. We believe this Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. We believe this Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. We support the work being done by the RC SDT and RTO SDT which would define a directive based on the determination of the person giving such an order. We believe, it should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and auditable and measureable. R5 is not consistent with the Functional Model. Only the RC, BA, and TOP issue directives. Thus, the term “...when issuing a directive...” should be “...when communicating directives...” , so both the issuer and receiver are included in the requirement.</p>
<p>The second draft version of COM-003-1 does not use or define the term directive and now proposes defined term “Operating Communications”. The SDT is aware of the term Reliability Directive proposed under NERC Project 2006-06 Reliability Coordination.</p>		

Organization	Yes or No	Question 6 Comment
<p>The term “Interoperability Communication” has been removed from the second draft of COM-003. The second draft includes a new R2 and R3 that fully assign the responsibility for accomplishing three-part communication. The use of three-part communication with Operating Communications does not apply to “non action” items, but to those that instruct a change or maintenance of the state, status, output, or input of an Element or Facility of the Bulk Electric System which could be applicable to routine operations that impact the BES. The entities listed as applicable for issuing an oral Operating Communication in the second draft of COM-003 are limited to Reliability Coordinators, Balancing Authorities, and Transmission Operators. The SDT believes miscommunications during routine operations as described in “Operating Communications” can and do lead to mishaps that impact reliability.</p>		
<p>ISO New England Inc.</p>	<p>Disagree</p>	<p>Based on the definition of Interoperability Communications, R5 could imply that three-part communications is required to communicate routine operating instructions. This would be a clear trigger and auditable and measureable. R5 is not consistent with the Functional Model. Only the RC, BA, and TOP can issue directives.</p>
<p><b>The second draft version of COM-003-1 does not use or define the term directive and now proposes defined term “Operating Communications”. The SDT is aware of the term Reliability Directive proposed under NERC Project 2006-06 Reliability Coordination.</b></p> <p><b>The term “Interoperability Communication” has been removed from the second draft of COM-003. The second draft includes a new R2 and R3 that fully assign the responsibility for accomplishing three-part communication. The use of three-part communication with Operating Communications does not apply to “non action” items, but to those that that instruct a change to, or maintenance of, the state, status, output, or input of an Element or Facility of the Bulk Electric System which could be applicable to routine operations that impact the BES. The entities listed as applicable for issuing an oral Operating Communication in the second draft of COM-003 are limited to Reliability Coordinators, Balancing Authorities, and Transmission Operators. The SDT believes miscommunications during routine operations as described in “Operating Communications” can and do lead to mishaps that impact reliability.</b></p>		
<p>Hydro-Québec TransEnergie</p>	<p>Disagree</p>	<p>Based on the definition of Interoperability Communications, R5 implies that three-part communications is required to communicate routine operating instructions, or during operational strategic discussions as well as other “non-action” oriented communications. This Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. This Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. The work being done by the RC SDT and RTO SDT in Project 2006-06 defines a Reliability Directive based on the determination of the person giving such an order. The entity that needs the action to be taken should establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger, auditable, and measureable. R5 is not consistent with the Functional Model. Only the RC, BA, and TOP can issue directives. Outside of allowing the individual who NEEDS the action to be taken, this is an auditable or measureable requirement whether it be for 3-part communications or for the receiving entity to actually take said action. By</p>

Organization	Yes or No	Question 6 Comment
		<p>definition, Three-part Communications presumes the second party will repeat the information back “correctly.” Failure to do so is assigned a High VRF and a Severe VSL. The practical application of Three-part Communication involves a sender communicating information, a receiver repeating back the information, and the sender verifying the repeat back is either correct or incorrect. If the repeat back is incorrect, the process repeats until both parties have the same understanding of what is being communicated.</p>
<p>The second draft version of COM-003-1 does not use or define the term directive and now proposes defined term “Operating Communications”. <p>during routine operations as described in “Operating Communications” can and do lead to mishaps that impact reliability.</p>		
National Grid	Disagree	<p>Based on the definition of Interoperability Communications, this would require 3- part communication to be used during virtually all control room communications. The definition of Interoperability Communications should be revised as proposed in response to Question 1.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The OPCP SDT replaced “Interoperability Communications” with “Operating Communications” which includes all communications that instruct a change to, or maintenance of, the state, status, output, or input of an Element or Facility of the Bulk Electric System. By use of the term, “Operating Communications” the second draft of COM-003 requires three-part communication only for operations that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</p>		
California Independent System Operator	Disagree	<p>CAISO Comments:</p> <p>Until “directive” is a defined term the industry should not accept requirements governing actions regarding directives. Directive is currently being defined in an interpretation. Subsequent interpretations may subvert the standards drafting process. Terms should be formally defined before inclusion in other standards to prevent future interpretation issues, including the changing of a standard outside of the accepted Standard Development process.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications”. The SDT is aware of the term Reliability Directive proposed under NERC Project 2006-06 Reliability Coordination.</p>		
New York State Reliability Council	Disagree	<p>Comments:</p> <p>The SDT should define Directive. Draft Com-002 -3 has a similar requirement to identify a directive and then utilize three-part communication. Also Com-002-3 Three part communication differs from the description of Three-part communication in this Standard. NYSRC prefers Com-002-3 usage of the word “intent” in the repeat back. Also see comments to Question 1.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 6 Comment
<p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications”. The SDT is aware of the term Reliability Directive proposed under NERC Project 2006-06 Reliability Coordination.</p> <p>The second draft of the standard includes the phrase, “not necessarily verbatim” in describing the repeat back.</p>		
<p>Tri-State Generation &amp; Transmission Assoc.</p>	<p>Disagree</p>	<p>Directive is not defined. This would require issuing a directive for each and every verbal communication between entities, even those that pose no risk to the BES, which is not necessary.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications”. The SDT is aware of the term Reliability Directive proposed under NERC Project 2006-06 Reliability Coordination. Unless a communication would impact the BES as described in the proposed definition of “Operating Communications” the SDT does not believe every conversation would require three-part communications.</p>		
<p>E.ON U.S. LLC</p>	<p>Disagree</p>	<p>E ON US believes more specificity is required as to what constitutes a “directive”. Moreover, this requirement is redundant in light of COM-002 R2 for normal operations. If COM-003 is only applicable to emergencies, then this R5 would appear reasonable. E.ON U.S. suggests editing R5 and M5 as follows: Each Responsible Entity shall use Three-part Communications when issuing and/or receiving a directive during verbal Interoperability Communications</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications”.</p> <p>COM -003 is not limited to emergencies only.</p> <p>The second draft includes a new R2 and R3 that fully assign the responsibility for accomplishing three-part communication and uses the new term Operating Communication.</p>		
<p>American Municipal Power</p>	<p>Agree</p>	<p>I feel that there needs to be a way to verify what has been said. Three-part Communications accomplish the verification that may be required as a result of the communication medium. If a better method is developed I</p>

Organization	Yes or No	Question 6 Comment
		propose that it be used.
<p><b>Response: The SDT thanks you for your comments.</b></p>		
American Electric Power	Disagree	Is a “directive” from the RC a “directive” all the way through the communication process, including down to the plant orders? Again, based on definitions provided in the functional model, the inclusion of the TSP and LSE in this standard is inappropriate. These entities manage the relationship with the end-use customer and are not responsible for the operation or maintenance of BES facilities. Consequently, when would such entities be responsible for issuing “directives?”
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications”. The term Reliability Directive is proposed under NERC Project 2006-06 Reliability Coordination.</p> <p>The SDT agrees with your comments on TSPs and LSEs and has removed them because they were not bound by this requirement in the originating SAR.</p>		
NIPSCO	Disagree	It's not clear whether this is limited to emergency situations. In the Purpose section of this standard the line "especially during alerts and emergencies" seems rather vague. When does this standard exactly apply?
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications”. The SDT is aware of the term “Reliability Directive” proposed under NERC Project 2006-06 Reliability Coordination. The second draft of COM-003 proposes requiring use of three part communications for, verbal “Operating Communications” to any communication that instructs a change to, or maintenance of, the state, status, output, or input of an Element or Facility of the Bulk Electric System and is not limited to emergencies.</p>		
Manitoba Hydro		<p>Move requirement as planned but keep Three-part Communication definition as stated originally in COM-002-2 R2.</p> <p>1) Reading the “Disposition/Explanation” it appears that COM-002-2 R2 will eventually be moved into COM-003 R5. This appears logical as COM-002-2 ensures staffing and communication capabilities.</p>

Organization	Yes or No	Question 6 Comment
		<p>a .The statement in COM-002 R2 is reasonably descriptive, but loses its depiction when replaced with statement found in COM-003-0 R5.</p> <p>2) Regarding COM-002-2 R2, Manitoba Hydro interprets part 2 (repeat back correctly) of Three-part Communication to mean; that the party receiving the directive has clearly received it in its full form and understands completely what is expected of him and to convey this to the sender</p> <p>i. We delineated “repeating back correctly” to mean any of the three protocols as acceptable:</p> <ol style="list-style-type: none"> <li>1. Actually repeating back the directives correctly.</li> <li>2. The recipient verifies the issued directive(s) are identical to a copy they have at hand.  Example for clarification: “The steps you have read are identical to what I have here on Order Number 1234, Revision 5 and I understand I can proceed with steps 3, 4 and 5.”</li> <li>3.The recipient summarizes the issued directive(s) to a copy they have at hand.  Example for clarification: “I will do step 8, open all 115 kV disconnects as read to me and are identical to the order 1234 Revision 5 that I have at hand”.</li> <li>4. This all could be resolved by using the term “repeat back the intent of the directive”. This statement could allow the operator to determine if the recipient fully understands and is capable of carrying out the directive, by the method of the recipient reply (any literate person can read back a written statement, but do they understand what they are doing and the consequences).</li> </ol> <p>ii.The purpose of protocols 2 and 3 are to alleviate potential of “lose of attention” due to the tedious receptiveness of long written directives. Summarizing or verifying these types of written orders will maintain the interest and attention to the detail.</p> <p>iii.Verbally detailing a directive at least once in any single conversation by either party should be sufficient to fulfill the first two parts of Three-part Communications (Clear and concise, repeat back).</p> <p>iv. Part 3 (acknowledge to satisfaction of the originator) could ensure that the person receiving the directive is capable and competent of carrying out the directive.</p> <p>v. None written (changes, revisions, real time emergency switching) and radio communication directives are a must for repeating back and are covered by other local policies. Part Two “Three Part Identification”</p>

Organization	Yes or No	Question 6 Comment
		<p><b>The SDT believes many of the details you have listed above are incorporated into the new R2 and R3 in the second draft of COM 003-01. We would appreciate your comments in the initial ballot.</b></p> <p>3) This new Standard COM-003-1 should contain a requirement for “Three Part Identification” or more commonly known as “Full Name Identification”. This is not addressed fully anywhere in the NERC standards.</p> <p>4) We have defined “Three Part Identification” based loosely on common industry best practice into three parts:</p> <ol style="list-style-type: none"> <li>1. Location - Company Name, Control Room Name, etc.</li> <li>2. Area of responsibility or authority (function) - The operator at the desk must identify his position such as Balancing Authority or Distribution Operate, etc.</li> <li>3. Identification - Unique identifier such as first and last Name.</li> </ol> <p><b>The SDT acknowledges and believes your comments on Full Name Identification do constitute a strong best practice which would add additional clarity to operating communications. For many organizations that becomes overly prescriptive and conflicts with their existing nomenclature scheme.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
NERC Staff	Disagree	<p>NERC staff agrees with the principle behind Requirement R5. We recommended in Question 1 that the term “Three-part Communication” be removed since it is only used in this requirement. We feel that this requirement should be split into two requirements so that the sender and receiver each have responsibility in the communication. Therefore, we offer the following as suggested replacement language for Requirement R5: Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider that receives a verbal Operating Communication shall repeat the communication to the initiator. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider that initiates a verbal Operating Communication shall ensure that the receiving party has repeated the communication, and shall verbally confirm the communication to be correct or reinitiate the communication.</p>

Organization	Yes or No	Question 6 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has removed the definition for “Three-part communication” in the second draft of COM-003-1 standard.</b></p> <p><b>The second draft includes a new R2 and R3 that fully assign the responsibility for accomplishing three-part communication.</b></p>		
<p>NextEra Energy Resources, LLC</p>	<p>Disagree</p>	<p>NextEra believes that by associating the “3-part communication” method with “directives” this standard drafting team could be at risk of unintentionally defining a directive as anything that takes the 3-part communication form. We would encourage the standard drafting team to continue to use the terms already employed in the draft standard: “... three-part communication be used when issuing instructions related to actual or expected emergency conditions.”</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>In the second draft of COM-003, the SDT proposes that three-part communication would be required when verbal person-to-person “Operating Communications” take place for any communication to instruct a change to, or maintenance of, the state, status, output, or input of an Element or Facility of the Bulk Electric System. This could include non emergency conditions.</b></p>		
<p>PPL</p>	<p>Disagree</p>	<p>Only RCs, TOPs, &amp; Bas issue directives. The other entities should be removed from this requirement.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications” for any communication to instruct a change to, or maintenance of, the state, status, output, or input of an Element or Facility of the Bulk Electric System. Other entities have to participate so they remain responsible as designated.</b></p>		
<p>Progress Energy Carolina, Inc</p>	<p>Disagree</p>	<p>PEC supports creating a definition of Reliability Directives. PEC may then agree that each entity shall use 3-part communications when issuing Reliability Directives during “Interoperability Communications.” Alternatively, simplify and change to use Three Part Communications when using Interoperability Communications.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes defined term “Operating Communications”. The SDT is aware of the term Reliability Directive proposed under NERC Project 2006-06 Reliability Coordination.</b></p>		

Organization	Yes or No	Question 6 Comment
<p>The second draft includes a new R2 and R3 that fully assign the responsibility for accomplishing three-part communication for verbal “Operating Communications”.</p>		
<p>Pacific Northwest Small Utilities Comment Group</p>	<p>Disagree</p>	<p>Per TOP-001 and IRO-001, only TOs and RCs have the authority to issue reliability directives (per the proposed definition of interoperability communications, such directives would qualify as reliability directives). All other entity types should be removed from this requirement.</p> <p><b>The applicable entities in the standard include senders and receivers of three part communications.</b></p> <p>As in Q2, the transition is a concern. Unless the effective date of COM-003-1 is the same as the date of retirement of COM-002; there will either be a reliability gap where neither active standard requires three-part communication, or there will be a situation where an entity could be doubly jeopardized for a single event.</p> <p><b>The implementation plan for COM-003 proposes retiring COM-002 when COM-003 becomes effective – as envisioned, only one standard will be in place at a time.</b></p> <p>Three-part communication is worthless unless the recipient understands what he/she is parroting and is authorized to take action. For example, many DPs/LSEs do not maintain 24/7 dispatch desks and an afterhours call may go to an answering service. Three-part communication with the answering service operator will only delay the requested action. The entity issuing the directive should be required to ensure their employee reaches someone authorized to take action before delivering the directive via Three-part communication.</p> <p><b>The SDT reviewed the SAR and has removed TSPs and LSEs as applicable entities; however DPs were included as applicable entities and have been retained in COM-003-1. The specified role of the DP to shed load justifies the retention of the DP as an applicable Entity.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Georgia Transmission Corp</p>	<p>Disagree</p>	<p>Replace “directive during verbal Interoperability Communications” with “Reliability Directive”.</p> <p>Replace "Each Responsible Entity" with "TOPs &amp; RCs". The other entities listed in the draft standard under Applicability do not issue Reliability Directives.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 6 Comment
<p>The second draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered. The term “Reliability Directive is being proposed under NERC Project 2006-06 Reliability Coordination and is not used in COM-003.</p> <p>The phrase “Each Responsible Entity” was replaced with the name of each of the responsible functional entities.</p>		
<p>Entergy Services</p>	<p>Disagree</p>	<p>Should be rewritten to say that “Each Responsible Entity shall use Three-part Communications when issuing a Reliability Directive.” This should use the definition of Reliability Directive as proposed in project 2006-06. Entergy recommends not including the definition of Interoperability Communications in this standard or in the R5 Requirement. Also, the list of responsible entities listed in the requirement R5 is not all able to issue Reliability Directives. So this requirement should be limited to Reliability Coordinators, Balancing Authorities and Transmission Operators, who can issue Reliability Directives.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes defined term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered. The SDT is aware of the term “Reliability Directive” proposed under NERC Project 2006-06 Reliability Coordination. It is a draft proposal and has not been filed or approved.</p> <p>There are other entities listed as applicable who have to receive and repeat back “Operating Communications.”</p>		
<p>Southern Company Transmission</p>	<p>Disagree</p>	<p>Southern Company supports the SERC SOS comments.</p> <p>SERC SOS comments:</p> <p>As suggested in Question 1 above, the term Reliability Directive (as defined in COM-002-3) should be used in place of Interoperability Communication, since the directive is specific to emergency operations.</p> <p>The requirement should read: “Each responsible entity shall use Three-part Communication when issuing a Reliability Directive”. In addition, this requirement should apply only to BAs, TOPs &amp; RCs. The other entities listed in the draft standard under Applicability do not issue Reliability Directives.</p> <p>Southern Company comments: conditional on if the definition of directive is not routine operational instruction.</p>

Organization	Yes or No	Question 6 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered.</p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes defined term “Operating Communications”. <p><b>Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered.</b></p>		
PSEG Companies	Disagree	The PSEG Companies agree with the concerns expressed in the comments filed by the PJM System Operations Subcommittee (SOS) Group.
<p><b>Response: The SDT thanks you for your comments.</b>  <b>Please see our response to the PJM System Operations Subcommittee (SOS) Group.</b></p>		
Puget Sound Energy	Disagree	The requirement should use the NERC defined term “Reliability Directive,” instead of the general term “directive.”
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The current draft version of COM-003-1 does not use or define the term “directive” and now proposes defined term “Operating Communications”.</b>  <b>The SDT is aware of the term “Reliability Directive” proposed under NERC Project 2006-06 Reliability Coordination.</b></p>		
ERCOT ISO	Disagree	The requirement, based on the definitions of the terms, introduces ambiguity or even conflict. Three part communication should be required for emergency situations and with the issuance of Reliability Directives (term not yet formally defined - in the works by the Reliability Coordination SDT). Interoperability communications refer to any communications in which a status of a facility or element is to be changed, which means not specifically related to emergencies.
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The second draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered.</b>  <b>This will apply to routine operations that impact the BES.</b>  <b>The second draft version of COM-003-1 does not define or use the term “directive” and now proposes defined term “Operating Communications”.</b>  <b>The SDT is aware of the term Reliability Directive proposed under NERC Project 2006-06 Reliability Coordination.</b>  <b>The term “Operating Communications” is not restricted to emergencies.</b></p>		

Organization	Yes or No	Question 6 Comment
Santee Cooper	Disagree	The SDT should consider using the now defined term Reliability Directive in place of Interoperability Communications. Typically, only BAs, TOPs, or RCs issue Reliability Directives so this requirement should only be applicable to those entities.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered. More applicable entities will be impacted by “Operating Communications” since three part communication involves both senders and receivers of communications.</p>		
Long Island Power Authority	Disagree	The SDT should define Directive. Draft Com-002 -3 has a similar requirement to identify a directive and then utilize three-part communication. Also Com-002-3 Three part communication differs from the description of Three-part communication in this Standard. LIPA prefers Com-002-3 usage of the word “intent” in the repeat back. Also see comments to Question 1.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered. The second draft version of COM-003-1 does not use or define the term “directive” and now proposes defined term “Operating Communications”. The SDT is aware of the term Reliability Directive proposed under NERC Project 2006-06 Reliability Coordination and is not filed or approved. The SDT current draft “correct but not necessarily verbatim” in describing the repeat back.</p>		
South Carolina Electric and Gas	Disagree	The term "directive" should be changed to "Reliability Directive" as defined in COM-002-3.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The term “Reliability Directive’ is not approved. It also has a very narrow focus and in its present form is restricted to emergencies. The OPCP SDT is proposing the term “Operating Communications” which is more inclusive and would have a bigger scope to improve reliability.</p>		

Organization	Yes or No	Question 6 Comment
Transmission Owner	Disagree	<p>The term “directive” as of yet has not been explicitly defined. Furthermore, FPL believes that by associating the “3-part communication” method with “directives” this standard drafting team could be at risk of unintentionally defining a directive as anything that takes the 3-part communication form. We would encourage the standard drafting team to continue to use the terms already employed in the draft standard: “... three-part communication be used when issue instructions related to “actual or expected emergency conditions.”</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The second draft version of COM-003-1 does not define or use the term “directive” and now proposes the defined term “Operating Communications” which will require three-part communication for communications required when the state or status of an Element or Facility of the BES is changed or altered. This will apply to routine operations that impact the BES.</b></p> <p><b>The SDT is aware of the term “Reliability Directive” proposed under NERC Project 2006-06 Reliability Coordination.</b></p>		
We Energies	Disagree	<p>The term “directive” should be replaced with the term “Reliability Directive” as defined by the Drafting Team working on Project 2006-06 which states it as: “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency”. Three-part Communication should be required (with regard to compliance) during emergency situations in which Reliability Directives are being issued. This requirement should not apply to normal or non-emergency situations, and should be enforceable between Functional Entities (distinct entities, not within a given organization). As noted in question 2, R5 should not apply to a TSP or LSE.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The term “Reliability Directive’ is not approved. It also has a very narrow focus and in its present form is restricted to emergencies. The OPCP SDT is proposing the term “Operating Communications” which is more inclusive and will require three-part communications when the state or status of an Element or Facility of the BES is changed or altered. This will apply to routine operations that impact the BES.</b></p> <p><b>The SDT is aware of the term “Reliability Directive” proposed under NERC Project 2006-06 Reliability Coordination. This standard would have a bigger scope to improve reliability.</b></p> <p><b>The SDT has removed the TSPs and LSEs because they were not bound by this requirement in the originating SAR.</b></p>		
Energy	Disagree	<p>The term interoperability communications is not clear.</p>

Organization	Yes or No	Question 6 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered.</p>		
Xcel Energy	Disagree	The way the standard is written, the term "directive" is still open to interpretation and could be inconsistently applied. The term "directive" should be defined.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not define or use the term “directive” and now proposes the defined term “Operating Communications”. The SDT is aware of the term “Reliability Directive” proposed under NERC Project 2006-06 Reliability Coordination.</p>		
Florida Municipal Power Agency (FMPA) and some members	Agree	<p>The word “directive” is ambiguous. The standard should either require the Reliability Coordinator to define a “directive” or the standard should make this a defined term so that there is clarity between what is and what is not a directive. In fact, the “disposition” does state that “Reliability Directive” definition is in the scope of the SDT’s effort.</p> <p>We do not think that this merits an increase from a “Medium” VRF in COM-002-2 R2 to a “High” VRF in this standard, especially if the actual action taken was in accordance with the direction given.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes defined term “Operating Communications”. The SDT is aware of the term “Reliability Directive” proposed under NERC Project 2006-06 Reliability Coordination.</p> <p>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in COM-003-01. The VRF associated with the requirement to use three-part communication in the second draft of COM-003 is “Medium.”</p>		
NRECA RTF Members	Disagree	We agree that Three-part communication is a more accurate form of communication for issuing and responding to a Directive during verbal Interoperability Communications and should remain as a requirement of this standard. However since the term “directive” has not been defined it is unclear when Three-part communication is required.

Organization	Yes or No	Question 6 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications” and proposes using three-part communication for any communication when the state or status of an Element or Facility of the BES is changed or altered.</b></p>		
Duke Energy	Disagree	<p>We believe that the term “directive” should be defined. This SDT should work with the COM-002 SDT to come up with common phraseology and definition for the term “Directive”. Work on COM-003-1 should have begun by defining “directive”, and limiting the requirement to use 3-part communications to “directives”, and not requiring it for general day-to-day communications. The entity issuing a “directive” should inform the receiving entity that it is a directive and therefore requires the use of 3-part communications.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications” which requires use of three-part communication for any communication when the state or status of an Element or Facility of the BES is changed or altered.</b></p>		
The Empire District Electric Company	Disagree	<p>When and why would a GO, TSP or LSE ever issue a directive? Directives are given by RC's. Use the definition of Third Party Communications provided earlier in this comment form.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications”. The SDT appreciates the comments with regards to concerns related to including GOs, TSPs and LSEs that do not own or operate facilities that are a part of the BES. The SDT has removed the TSPs and LSEs because they were not bound by this requirement in the originating SAR. The GO was not included in the draft standard of the requirement.</b></p>		
MRO NERC Standards Review Subcommittee	Disagree	<p>Without defining “directive” the SDT is leaving the industry in the same situation we are currently in. As discussed in the response to Question #1 above, it is our opinion that the definition of Reliability Directive must be developed and included in the discussion of this standard (COM-003-1), and should be as defined in Project 2006-06: “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency.”. Based on the definition</p>

Organization	Yes or No	Question 6 Comment
		<p>of Interoperability Communications, R5 could imply that three-part communications is required to communicate routine operating instructions. We believe this Requirement contradicts the work that has been done and substantially progressed through two other SDTs and creates confusion within the industry. We believe this Requirement would, in fact, be adverse to reliability instead of enhancing reliability by reducing the amount of pre-action communications that may occur prior to taking action because operators may be more concerned with not repeating back during such pre-action, strategic calls and/or discussion. We support the work being done by the RC SDT and RTO SDT which would define a directive based on the determination of the person giving such an order. We believe, it should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and auditable and measureable.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating Communications”. The SDT is aware of the term Reliability Directive proposed under NERC Project 2006-06 Reliability Coordination. The second draft version of COM-003-1 eliminates the term “Interoperability Communication” and now proposes the term “Operating Communications” which is defined as communications required when the state or status of an Element or Facility of the BES is changed or altered.</p> <p>This standard would apply when verbal “Operating Communications” take place and would apply to any communications involving a change to, or maintenance of, the state, status, output, or input of an Element or Facility of the Bulk Electric System.</p>		
Great River Energy	Disagree	<p>Without defining directive the SDT is leaving the industry in the same situation we are currently in. As discussed in the response to Question #1 above, it is GRE’s opinion that the definition of Reliability Directive must be developed and included in the discussion of this standard. The term directive should be as defined in Project 2006-06: A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency.. GRE believes it should be left to the entity that needs the action to be taken to establish the need for three-part communications by stating in the communication that they are issuing a directive. This would be a clear trigger and easily auditable and measureable.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 does not use or define the term “directive” and now proposes the defined term “Operating</p>		

Organization	Yes or No	Question 6 Comment
		<p>Communications” which would apply to any communication involving a change to, or maintenance of, the state, status, output, or input of an Element or Facility of the Bulk Electric System. The SDT is aware the term “Reliability Directive” is being proposed under NERC Project 2006-06 Reliability Coordination.</p>

**7. Requirement R6 of the draft COM-003-1 states, “Each Responsible Entity shall use the North Atlantic Treaty Organization (NATO) phonetic alphabet as identified in Attachment 2-COM-003-1 when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information during verbal Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.**

**Summary Consideration:**

Most stakeholders who responded to this question disagreed with the proposal. Many commenters indicated the use of a phonetic alphabet is not necessary and should not be required, as it will not improve reliability of the BES and indicated that there are no instances where the absence of its use has resulted in reliability problems. The SDT disagrees with this comment and believes that enhanced clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.

Commenters stated requiring strict adherence to and precise pronunciation of the NATO phonetic alphabet is overly prescriptive, and the proposed standard should allow for other phonetic clarifiers where clarity on alpha-numeric information is necessary. The SDT agrees, and has modified the requirement to allow use of “accurate alpha-numeric clarifiers,” which could include alpha-numeric clarifiers other than the NATO phonetic alphabet.

Commenters pointed out that the requirement is being applied too broadly (e.g. to notifications, directions, instructions, orders and other reliability related operating information). The SDT agrees and has modified the proposed standard by restricting the requirement's applicability only to verbal Operating Communication.

A few commenters showed concern over having operators potentially struggling to remember the NATO phonetic alphabet during emergency situations, rather than focusing on the communication itself, in contradiction with the stated purpose of the standard. The SDT disagrees and believes that adequate training, familiarity with and use of alpha-numeric clarifiers will eliminate struggles for operators and avoid operating errors due to miscommunication.

Still other commenters stated this proposed requirement is a best practice. They suggest that the use of the NATO phonetic alphabet should only be required when needed for clarity. The SDT believes the use of a phonetic alphabet during verbal real-time communication between BES operating entities goes beyond a best practice and should be a mandatory requirement.

PEF	Agree	
Sunflower Electric Power Corporation	Agree	
Bonneville Power Administration	Disagree	
Orange and Rockland Utilities, Inc.	Disagree	
American Electric Power	Disagree	AEP does not believe that this should be a requirement. It is understood that three-part communications represent best practices, but it is not necessary to mandate the NATO phonetic alphabet. We are not aware of an instance where the use of “Ed” rather than “Echo” has resulted in a reliability compliance breakdown.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT agrees with your second comment, and has modified the requirement to allow for any accurate alpha-numeric clarifier.</b></p>		

Organization	Yes or No	Question 7 Comment
<p>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.</p>		
<p>Indiana Municipal Power Agency</p>	<p>Disagree</p>	<p>An entity should not be required to use a specific phonetic alphabet. If a letter needs to be clarified, then boy, bob or beta should be allowed to convey the letter "B". In an emergency, an entity wants its coordinators to be concentrating on the situation and not worrying about using the proper phonetic alphabet word for the letter "B".</p>
<p><b>Response: The SDT thanks you for your comments.</b>                      The SDT agrees with your comments, and has modified the requirement. The new language is in Requirement R1 Part 1.2. "When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers."</p>		
<p>Transmission System Operations</p>	<p>Disagree</p>	<p>As stated in Question #1, the definition of "Interoperability Communication" needs further clarification. Directives, notifications, directions, instructions, orders, and other reliability operating information needs to be clearly defined, including what it consists of and when it is to be utilized.</p>
<p><b>Response: The SDT thanks you for your comments.</b>                      The SDT has eliminated "Interoperability Communication" and is proposing the new term "Operations Communications." "Operations Communications" are communications instructing a change to, or maintenance of, the state, status, output, or input of an Element or Facility of the Bulk Electric System. The use of a phonetic clarifier will be required during verbal "Operating Communications."</p>		
<p>NERC Staff</p>	<p>Disagree</p>	<p>As stated in response to Question 2, NERC staff agrees with the proposal, but would offer the following modification in order to add clarity. We recommend that the phrase "when issuing directives, notifications, directions, instructions, orders or other reliability related operating information that involves alpha-numeric information during verbal Interoperability Communications" be replaced with "when verbal Operating Communications with alpha-numeric information is involved." This would require using the definition of Operating Communications offered in the response to Question 1. This will hopefully eliminate the need to further define what communication is or is not included in the phrase "directives, notifications, directions, instructions, orders or other reliability related operating information."</p>
<p><b>Response: The SDT thanks you for your comments.</b>                      The SDT has eliminated "Interoperability Communication" and is proposing the new term "Operations Communications." "Operations Communications" are communications instructing a change to, or maintenance of, the state, status, output, or input of an Element or Facility of the</p>		

Organization	Yes or No	Question 7 Comment
<p><b>Bulk Electric System. The use of a phonetic clarifier will be required during verbal “Operating Communications.”</b>  <b>The SDT agrees with your second comment, and has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p>		
<p>British Columbia Transmission Corporation</p>	<p>Disagree</p>	<p>BCTC's position: R6 requiring the use of North American Treaty Organization (NATO) phonetic alphabet adds no value and will only cause confusion. Presently an instruction would be issued as: “At Kelly Lake open 5CB4” R6 it will now become: “At Kelly Lake open Fife Charlie Bravo Fow-er”</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication among BES operating entities.</b>  <b>The SDT intends for R6 (new R1 Part 1.2 in the second draft of the standard) to apply to unique facility/element identifiers and not commonly used acronyms such as “CB” for circuit breaker. If “5CBR” is the unique facility/element identifier, then it would apply.</b></p>		
<p>New York State Reliability Council</p>	<p>Disagree</p>	<p>Comments: While NYSRC understands the benefit of utilizing a phonetic alphabet, we question the designation of a specific phonetic alphabet. This prescriptive requirement may result in absurd non-compliance reports, such as, using “Dog” for “D” instead of “Delta”. R6 requires the use of the alphabet when issuing information, but not in the repeat back step. This may be an oversight. Also Does the RC in its communication utilize the abbreviation for the threat type, e.g. PSEA, or does the RC use the NATO-Alphabet? If NATO, then the example in Attachment 1 should state this need.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT agrees, and has modified the Requirement to allow for any accurate alpha numeric clarifier.</b>  <b>The SDT believes that the proposed new requirements in the second draft of the COM-003-01 standard address the concern mentioned in the comment concerning use of the requirement only during the issuing and not the repeating back. The RC would only be required to communicate the abbreviation of verbally conveyed alpha-numeric information using an accurate alpha numeric clarifier or the NATO alphabet if it was during verbal “Operating Communications”. The SDT intends for new Requirement R1 Part 1.2 to apply to unique facility/element identifiers and not commonly used acronyms.</b></p>		
<p>Power South Energy</p>	<p>Disagree</p>	<p>Completely unnecessary to require each operator to learn and use the NATO alphabet for situations that may occur on a very limited basis.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 7 Comment
<p>The SDT has modified the requirement. The new language is in requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication among BES operating entities.</p>		
<p>Tri-State Generation &amp; Transmission Assoc.</p>	<p>Disagree</p>	<p>Directive is not defined. This poses an undue burden on the operators, which does not improve the reliability of the BES. NERC should only concern themselves with issues related to maintaining the reliability of the BES.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The current draft version of COM-003-1 does not use or define the term “directive” that task is assigned to the RCSDT – Project 2006-06. See Question 6.</p>		
<p>Entergy Services</p>	<p>Disagree</p>	<p>Entergy has 2 concerns with this requirement as written.</p> <p>First, the use of the NATO phonetic alphabet is overly prescriptive to convey alpha-numeric information. For instance, if I use the word “baker” instead of “bravo” in my communications, I would have still successfully communicated the letter “B” to the person receiving my communication. My communication may have supported reliable interconnected operations. However, according to this requirement, I would still have violated the standard.</p> <p>Second, the requirement as written is very broad, applying not just to directives, but also to “notifications, directions, instructions, orders and other reliability related operating information”. These terms are not defined, so I would assume that this covers Reliability Directives, and everything else. If the industry supports using a phonetic alphabet, it should be limited just to directives containing alpha-numeric information. Again, the requirement to use the NATO phonetic alphabet imposes a significant operational burden, creates a human error trap for operating personnel, and does not improve reliability. It should not be included in the new standard.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>The SDT also agrees with your second comment and has modified the proposed standard by restricting the requirement’s applicability to only those alpha numeric identifiers used during verbal “Operating Communications”.</p>		

Organization	Yes or No	Question 7 Comment
ERCOT ISO	Disagree	ERCOT ISO does not agree with this approach, which seems to be overly prescriptive (“directives, notifications, directions, instructions, orders, or other reliability related information”), which goes beyond the purpose of “during alerts and emergencies”. This is an administrative requirement that would increase communication timing and possibly negatively affect reliability. If using a common language and three part communication for directives is effective this is not required.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT agrees and has modified the proposed standard by restricting the requirement's applicability to only those alpha numeric identifiers used during verbal “Operating Communications”.</b></p> <p><b>The SDT believes that clarity for verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.</b></p> <p><b>Note that the scope of this standard is not limited to communications related to alerts and emergencies.</b></p>		
SERC OC&SOS Standards Review Group	Disagree	First, please note that “NATO” does not stand for North American Treaty Organization; it stands for North Atlantic Treaty Organization. Use of the NATO phonetic alphabet should be considered a “best practice” and should not be included as a requirement in a reliability standard. One failure, such as saying “Baker” instead of “Bravo”, results in a severe violation without any impact on system reliability. This group is concerned that operating personnel will be focused on using the correct word rather than managing the power system.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT agrees that NATO stands for “North Atlantic Treaty Organization” and that “American” was used in error.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.</b></p>		
Transmission Owner	Disagree	FPL believes that though aspiring to use a single strict phonetic alphabet is important, it is more important to ensure that ease of communication takes precedence especially under emergency conditions. As such, this requirement should be written more as a best practice or guideline. FPL believes this requirement could be improved by stating that under such emergency conditions, the NATO phonetic alphabet can be used as a base-line reference but that usage of ad-hoc phonetic alternatives that achieve the same real-time communication goal

Organization	Yes or No	Question 7 Comment
		can also be used.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities during routine or emergency conditions.</b></p>		
Pepco Holdings, Inc. - Affiliates	Disagree	Having system operators potentially struggle to remember the NATO phonetic alphabet during communications rather than focus on the communication and managing the bulk electric system itself is in contradiction with the purpose of the standard. Use of the NATO phonetic alphabet should be considered a “best practice” and should not be included as a requirement in a reliability standard. One failure, such as saying “Baker” instead of “Bravo”, results in a severe violation without any impact on system reliability.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p><b>The SDT believes that clarity for verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities</b></p>		
Florida Municipal Power Agency (FMPA) and some members	Disagree	How strict are the NATO pronunciations? E.g., “Uniform” is designated as pronouncing the “i” as a long “ee”, most people I know do not do that. Similarly, there are multiple pronunciations of “Quebec”, “Sierra”, “Victor”, “Three”, “Four”, “Five”, and “Nine” to name a few, yet one pronunciation is specified. We presume that if the wrong pronunciation is used in the current draft of the standard, there would be a violation, currently at a high risk factor and high severity level, which seems rather severe. FMPA suggests that the SDT revisit this with an eye towards at least not penalizing someone for saying “five” instead of “fife”, and possibly with an eye towards saying “‘F’ as in ‘frank’” is OK, rather than being strict with NATO nomenclature.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p>		
Sunflower Electric	Disagree	I don't feel we should use NATO phonetic alphabet. Use something in common use in the USA

Organization	Yes or No	Question 7 Comment
Power Corp.		
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The NATO phonetic alphabet is commonly used in the US and Canada. Some examples are the military, police and fire protection, medical industry and the air traffic control system. The BES, as in the previous examples, is a critical system requiring the same level of communication clarity. The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p>		
Progress Energy Carolina, Inc	Disagree	NATO stands for North Atlantic Treaty Organization. This proposed requirement is a best practice and does not serve to increase the reliability of the BES.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT agrees that NATO stands for “North Atlantic Treaty Organization” and that “American” was used in error. The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>The SDT disagrees with your second comment. The NATO phonetic alphabet is commonly used in the US and Canada. Some examples are the military, police and fire protection, medical industry and the air traffic control system. The BES, as with the previous examples, is a critical system requiring the same level of communication clarity. The use of the NATO alphabet provides this clarity which prevents miscommunication which reduces the risk of a mishap.</p>		
NextEra Energy Resources, LLC	Disagree	NextEra believes that though aspiring to use a single strict phonetic alphabet may be beneficial it is more important to ensure that ease of communication takes precedent especially under emergency conditions. The requirement for 3-part communication already ensures that understanding between two parties occurs. Moreover, it is overly burdensome to require that the phonetic alphabet be used in all communications which would include communications related to mundane interactions between interconnected parties and that might broadly fit the mold of the “interoperability” definition but not truly require the formality or rigor commanded by a phonetic approach.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The second draft version of COM-003-1 proposes in Requirement R1 Part 1.2 to use an accurate alpha-numeric clarifier such as the NATO phonetic alphabet during verbal Operating Communications when alpha-numeric identifiers are involved. Beyond that, its use to clarify confusion over a communication, mundane or otherwise, is not discouraged but is not required.</p>		

Organization	Yes or No	Question 7 Comment
Pacific Northwest Small Utilities Comment Group	Agree	No Comment
<b>Response: The SDT acknowledges No Comment.</b>		
NorthWestern Energy	Disagree	NorthWestern appreciates the opportunity to comment. The requirement, as drafted, appears to open the possibility of sanctions for incorrect use of the NATO phonetic alphabet during any verbal communication between entities. The use of the NATO phonetic alphabet would be difficult when performing local switching orders to field personnel. NorthWestern suggests that the requirement be reworded to state that entities “shall use a phonetic code (e.g., the NATO phonetic alphabet) when necessary, to verify accurate reception of alpha-numeric information.”
<b>Response: The SDT thanks you for your comments. The SDT agrees and has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b>		
Western Area Power Administration	Disagree	Not everyone is familiar with the NATO phonetic alphabet, so it would be another thing for operators to have to memorize or to always have in front of them to refer to.
<b>Response: The SDT thanks you for your comments. The SDT believes that operators will not have difficult problems adapting to the NATO alphabet. With proper training and familiarization it becomes a natural part of an individual’s vocabulary. The SDT also agrees with overall industry comment and has modified the Requirement (R1 Part 1.2 in the second draft of the standard) to require use of an accurate alpha-numeric clarifier such as the NATO phonetic alphabet during verbal Operating Communications when alpha-numeric identifiers are involved.</b>		
ISO New England Inc.	Disagree	Not only does this requirement attempt to determine HOW entities operate with their various footprints, it may change the way many Markets are structured. What is the difference between using the word “Zebra” instead of “Zulu” to signify the letter “Z”? And, why would this be enforceable? Perhaps this would be better served as a guideline document rather than an enforceable Requirement. Also, many organizations may have established communications protocols which are functioning properly and making a change may actually hinder reliable operations by introducing unnecessary confusion.
<b>Response: The SDT thanks you for your comments.</b>		

Organization	Yes or No	Question 7 Comment
<p>The SDT does not understand how this requirement would change market structure, please provide details for us to address.</p> <p>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>" So “Zebra” instead of “Zulu” to signify the letter “Z” would be acceptable, “Xerox” instead of “Zulu” to signify the letter “Z” would be non compliant.</p>		
Northeast Utilities	Disagree	<p>Not only does this requirement attempt to determine HOW entities operate with their various footprints, it may change the way many Markets are structured. What is the difference between using the word “Zebra” instead of “Zulu” to signify the letter “Z”? And, why would this be enforceable. Perhaps this should be a guideline document rather than an enforceable Requirement. There is no reliability need for this Requirement.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT does not understand how this requirement would change market structure, please provide details for us to address.</p> <p>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>“Zebra” instead of “Zulu” to signify the letter “Z” would be acceptable, “Xerox” instead of “Zulu” to signify the letter “Z” would be non compliant.</p> <p>The SDT believes there is a critical need for this requirement. The eclectic pattern of communication protocols that exist and those that do not exist across the BES is an ever present risk for miscommunication, which breeds mishaps.</p>		
Westar Energy	Disagree	<p>One of the more common or ad-hoc phonetic alphabets which are easier to remember could be a better fit since these communications happen infrequently. Having operators potentially struggle to remember the NATO phonetic alphabet during communications rather than focus on the communication itself is in contradiction with the stated purpose of the standard.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p>		
Ameren	Disagree	<p>Requirement should be revised to say that Attachment 2 needs to be used when single alphabetic characters, or when needed for clarity, are needed in communications. If we have a Bee Hollow-51 circuit, that is alpha-numeric information. But we wouldn’t support that Bee Hollow needs to be spelled out as Bravo-Echo-Echo-space-Hotel</p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 7 Comment
<p>The SDT intends for R6 to apply to a unique Facility/Element identifier and not commonly used acronyms such as “CB” for circuit breaker; or names such as “Bee Hollow”. In the case of this comment the identifier “Bee Hollow Five One” would meet the requirement.</p>		
<p>Southern Company Transmission</p>	<p>Disagree</p>	<p>Southern Company supports the SERC SOS comments. SERC SOS comments: Use of the NATO phonetic alphabet should be considered a “best practice” and should not be included as a requirement in a reliability standard. One failure, such as saying “Baker” instead of “Bravo”, results in a severe violation without any impact on system reliability. This group is concerned that operating personnel will be focused on using the correct word rather than managing the power system.</p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p>Southern Company comments: This requirement should be removed from the standard. Requirement 5 requires understanding by both parties during communication. Requirement 6 requires common identifiers which will enhance the chances of both parties understanding communications. Although using the phonetic alphabet may be necessary some times in order to gain understanding between two parties it should not be required. If both parties understand A as well as they do Alpha the reliability of the system has not been affected. No entity should be found in non-compliance of a Reliability Standard if reliability was not affected.</p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.</b></p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		
<p>E.ON U.S. LLC</p>	<p>Disagree</p>	<p>The entire standard should only apply to emergency operations, not all communications. If it is the intent that the requirements of this standard apply not only to control room operators but also field personnel (line crews, substation crews, etc.) then E ON U.S. is not in favor of using the NATO phonetic alphabet. The confusion that this change could create in real-time operations outweighs the BES reliability benefit. E ON U.S. suggests that if the objective is to avoid confusion over similarly pronounced words, use of an ad-hoc phonetic alphabet would more easily address the concern. E ON U.S. is also concerned that the attention paid to “how” orders are given and acknowledged may well detract from “what” it is responsible entities are attempting to do. Are responsible entities supposed to spell out each number and word using the phonetic alphabet? The drafting team should be more specific as to what is meant by “alpha-numeric information.”</p>

Organization	Yes or No	Question 7 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities during routine and emergency operating conditions.</p> <p>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>The SDT intends for Requirement R1 Part 1.2 to apply to unique Facility/Element alpha-numeric (numbers and letter codes or designators) identifiers and not commonly used acronyms such as “CB” for circuit breaker or names such as “Bee Hollow”. For example the identifier for Bee Hollow 51A circuit would be “Bee Hollow Five One Alpha” circuit.</p>		
American Municipal Power	Agree	The NATO Phonetic alphabet is easy to learn and use. Most people can learn it on their own much faster than it will take the SDT to read all of the comments for COM-003.
<p><b>Response: The SDT thanks you for your comments and your observation.</b></p>		
The Empire District Electric Company	Disagree	The NATO phonetic alphabet is too descriptive as a requirement. A common phonetic alphabet where both parties understand the communication should be a better requirement and left up to the parties in communication with each other as common across the USA.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT disagrees that use of the NATO phonetic alphabet is too descriptive as a requirement, but has modified the requirement based on stakeholder suggestions that other alpha-numeric identifiers should also be acceptable. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p>		
PSEG Companies	Disagree	The PSEG Companies agree with the concerns expressed in the comments filed by the PJM System Operations Subcommittee (SOS) Group.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.</p> <p>The SDT has modified the Requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>The SDT believes that adequate training, familiarity with and use of the phonetic alphabet will avoid and eliminate struggles for operators.</p>		

Organization	Yes or No	Question 7 Comment
MRO MRO NERC Standards Review Subcommittee	Disagree	<p>The required use of the phonetic alphabet should be documented in the Entities CPOP per our comments to question #3. While this requirement may represent a good utility practice or even a best practice, it is not so necessary to be enforceable through enforceable requirements.</p> <p>All information passed by a NERC Certified System operator falls under the scope of Requirement 6: “directives, notifications, directions, instructions, orders or other reliability related operating information”. Based on that definition, all communication would fall under this Requirement.</p> <p>The NATO phonetic alphabet does not allow for the use of numbers ten and beyond. An entity WOULD be found non compliant for saying “open switch fourteen bravo”. We do not believe this is reasonable as it adds nothing to the reliability of the BES is too prescriptive and all encompassing and could potentially confuse or slow down the communication process.</p> <p>We recommend that use of the NATO phonetic alphabet be included in the NERC operator certification training program and removed from this standard .As we recommended above, the term “directive” should be replaced with “Reliability Directive”.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has elected to eliminate the requirement to have a CPOP based on Industry Comment.</b></p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities and warrants being an enforceable requirement.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p><b>Numbers over nine are referred to by each individual digit for example 14 = “one, four”; 2559 = “two, five, five, nine” when communicating a unique alpha-numeric identifier. The SDT has modified the proposed standard by restricting the requirement's applicability only to verbal “Operating Communications.”</b></p> <p><b>The SDT respectfully considers your recommendation to remove this from the standard and include it in the NERC operator certification training program but elects to keep this as a requirement because it enhances reliability by reducing human error. Its integration into the NERC operator certification training program is a very good recommendation, but beyond the scope of the drafting team.</b></p>		
ATC and ITC	Disagree	<p>The use of the phonetic alphabet should be documented in the Entities CPOP per our comments to question #3. We do not agree that it needs to be included in Requirement 5 because it is too prescriptive and all encompassing and could potentially confuse or slow down the communication process. As we recommended in question 6 the</p>

Organization	Yes or No	Question 7 Comment
		term “directive” should be replaced with “Reliability Directive”.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has elected to eliminate the requirement to have a CPOP based on Industry Comment.</p> <p>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities. Many critical process industries utilize the NATO alphabet because it is effective in preventing mishaps due to miscommunication. Some examples are the military, medical and air traffic fields. The SDT feels strongly that operation of the BES is a similar critical process and should employ a proven communication protocol.</p> <p>The SDT has modified the second draft of the COM-003 standard by restricting the requirement's applicability only to verbal “Operating Communications”.</p> <p>The RCSDT is developing the term “Reliability Directive” in project 2006-06. The terms, “directive” and “Reliability Directive” are not used in the second draft of COM-003.</p>		
PPL	Disagree	The way this could be interpreted is that every type of communication between every applicable entity would have to use the NATO phonetic alphabet. This would be impractical since many of the current communications do not require this level of specificity.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has required the use of the NATO Alphabet or an accurate alpha numeric clarifier to clarify alpha numeric identifiers during verbal “Operating Communications” because operations on the BES do require this level of specificity.</p>		
Georgia Transmission Corp	Disagree	This is an operational burden and could easily cause a violation by using a different common identifier. If used, it should only apply to Reliability Directives.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>The proposed standard is required during both emergency operating states and also normal operating states.</p>		
California Independent System Operator	Disagree	This requirement is a best practice. Maybe the standardized alpha-numeric communication is something that companies should be required to train their personnel on, maybe it could even be a requirement of their CharliePapaOscarPapa. As this requirement is literally written a system operator who used the word ‘cat’ instead of the word ‘Charlie’ when giving a directive would violate a sanctionable standard with a VRF of ‘High’ and a VSL

Organization	Yes or No	Question 7 Comment
		of 'Severe'.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities</b></p> <p><b>The “Charlie, Papa, Oscar, Papa” requirement has been eliminated.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p><b>The SDT has modified the VRF and VSL to conform to NERC and FERC guidelines.</b></p>		
Puget Sound Energy	Disagree	<p>This requirement is too burdensome when compared to its benefits. The proposed requirement covers many different types of verbal communication and converts a useful communication protocol into mandatory requirement, which carries with it large potential penalties. Under this requirement, an operator’s use of the phrase “M as in Mary” instead of “M as in Mike” would be violation of NERC reliability standards. The requirement for Three-Part Communications covers most of this ground in a much more useful fashion and ensures parties understand the information. The use of this protocol is a matter that should be left for entities to consider for inclusion in their CPOPs, but should not be a mandatory requirement to use the protocol. Further it is again assumed that based on R1, this information is related to real time. As well further examples of what a real time issuing of a "notification" is and what "other reliability related operation information would be needs to be specified.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication among BES operating entities. The implementation of the requirement should not be overly burdensome.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p><b>The requirement to have a CPOP has been eliminated.</b></p> <p><b>With regard to the value of phonetic alphabet clarification, many critical process industries utilize the NATO alphabet because it is effective in preventing mishaps due to miscommunication. Some examples are the military, medical and air traffic control fields. The SDT feels strongly that operation of the BES is a similar critical process and should employ a proven communication protocol.</b></p>		

Organization	Yes or No	Question 7 Comment
NIPSCO	Disagree	This should not be a requirement, but could be a suggested option. If one were recorded using the wrong phonetic would that be a compliance violation? This doesn't seem reasonable.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>If you use Baker instead of Bravo for “B” that is compliant. If you use Phase instead of Foxtrot for “F” you would be non compliant.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p>		
Manitoba Hydro	Disagree	<p>To using NATO full time</p> <p>1) Being trained or being familiar with NATO Phonetics is a great idea, but should only be implemented, in bad communication connections, or upon request due to accents, quiet voice, fast talk, too loud, unusual request, etc.</p> <p>2) Communication technology for the most part is exceptionally clear, and the regular use of NATO Phonetics would be difficult to implement and time consuming to use. The RC and neighbouring entities are familiar with common terminology between each other.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>1. The SDT believes that clarity around verbally conveyed alpha-numeric information during “Operating Communications” is critical for ensuring clear and effective real-time communication among BES operating entities. The SDT would not discourage its use outside of “Operating Communications” in the context of your comments.</b></p> <p><b>2. Communication technology may be exceptionally clear for much of the time, but human factors and natural electromagnetic abnormalities do occur on a frequent basis making it important to have structured and clear communication protocols to prevent miscommunication.</b></p>		
Xcel Energy	Disagree	<p>Use of the NATO phonetic alphabet should be a best practice not a reliability requirement. We are not convinced that there is any threat to reliability if someone were to use a different phonetic than what is indicated. Additionally, we do not feel that it is necessary to use the phonetic alphabet unless there is an indication that the initial communication has been misunderstood. If the drafting team feels this requirement should remain in the standard, we feel it should be modified to address:</p> <p>1) There should be an exception for approved acronyms, such as NERC, FERC, etc.,</p> <p><b>The SDT intends for Requirement R1, Part 1.2 in the revised standard to apply to unique Facility/Element alpha-numeric (numbers and letter codes or designators) identifiers and not commonly used acronyms such as “CB” for circuit breaker; or names such as “Bee Hollow”.</b></p>

Organization	Yes or No	Question 7 Comment
		<p>2) it should only be required upon repeat-back, when the first communication was misunderstood, and <b>It will be required when alpha numeric identifiers are used only during verbal “Operating Communications.”</b></p> <p>3) Any phonetic alphabet should be acceptable for use, such as military or police, not just NATO's. <b>The SDT has modified the requirement to allow the use of any phonetic alphabet. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication among BES operating entities.</b></p> <p><b>The SDT believes that adequate training, familiarity with and use of the phonetic alphabet will avoid and eliminate confusion among operators. The military, medical and air traffic control fields utilize the NATO alphabet as a proven means of voice communication clarification.</b></p>		
PJM	Disagree	<p>Use of the NATO phonetic alphabet should be considered a “best practice” and should not be included as a requirement in a reliability standard. One failure, such as saying “Baker” instead of “Bravo”, results in a severe violation without any impact on system reliability. This group is concerned that operating personnel will be focused on using the correct word rather than managing the power system. Also, many organizations may have established communications protocols which are functioning properly and making a change may actually hinder reliable operations by introducing unnecessary confusion.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.</b></p> <p><b>The SDT has modified the requirement. Santee Cooper	Disagree	<p>Use of the NATO phonetic alphabet should not be a requirement of this standard. This also adds a layer of complexity to the system operator position that is not necessary.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT disagrees and believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p>		
Electric Market Policy	Disagree	<p>Use of this adds a lot to verbal communication but has little value. Where either the issuing or receiving party is unsure as to which letter was used, their choice of word to associate with the alphabet need not be dictated by a specific phonetic alphabet. If I am unclear, whether I ask “did you say ‘F’ as in Frank or ‘F’ as in Foxtrot, it is my belief that we will both know that I heard the letter F not the letter S. Using Frank instead of Foxtrot will result in a violation of Requirement R6 which carries a High VRF and a Severe VSL; even though there would be no impact on effective communication. There is no compelling reason to require every operator in North America to learn and use the NATO phonetic alphabet. It would be overkill to do so, and it could create some really bizarre conversations. For example, consider a TOP in the eastern time zone who calls his RC (also in the eastern time zone) at 10:00 A.M.to confirm that a line that tripped earlier that morning will be ready to switch back in service at</p>

Organization	Yes or No	Question 7 Comment
		<p>10:35. Taken to the extreme, a strict interpretation of R6 and R4 (the CST requirement) would say that the TOP operator would have to state the estimated time of restoration as “niner tree fife, Alpha Mike, Charlie Sierra Tango”. There is no need for that.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication among BES operating entities.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p><b>The SDT intends for Requirement R1, Part 1.2 in the revised standard to apply to unique Facility/Element alpha-numeric (numbers and letter codes or designators) identifiers and not commonly used acronyms such as “CB” for circuit breaker; or names such as “Bee Hollow”. Since your example is not a unique Facility/Element alpha-numeric identifier it would read as “0-9-3-5 Central Standard Time” You would not use am/pm as R3 (new Requirement R1 Part 1.1.2) requires the 24 hour format.</b></p> <p><b>Please note under proposed R3 (new requirement R1 Part 1.1.3) The SDT has offered an alternative to the single time zone.</b></p>		
National Grid	Disagree	<p>Using the NATO phonetic alphabet is useful, but to what extent? Does it apply to facility identifications, key words, or every letter of every word? Is it up to the judgment of the operators? If so how will compliance be monitored? If during a communication, personnel used a term different than that in the NATO alphabet i.e. D as in Dog rather than Delta however, the listener understood the message and the correct action was taken would there still be the possibility of a compliance violation?</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p><b>D as in “Dog” rather than “Delta” would be compliant; F as in “phase” rather than “Foxtrot” would be non compliant.</b></p> <p><b>The revised requirement applies during verbal “Operating Communications”, when alpha-numeric information is involved.</b></p>		
NRECA RTF Members	Disagree	<p>We agree that using the NATO phonetic alphabet is a more accurate form of communication for issuing and responding to a directive during verbal Interoperability Communications. However, other forms of phonetic alphabet communications could be utilized to achieve the same results and entities should not be forced to use only the NATO phonetic alphabet. As stated in question 6 we are concerned about the undefined term “directive”. In addition to the NATO alphabet, did the drafting team consider including the 10-Code system many utilities use</p>

Organization	Yes or No	Question 7 Comment
		for verbal communication (ex: 10-4)? If not, why not and if so, why not included?
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has eliminated “Interoperability Communication” and is proposing the new term “Operations Communications.” “Operations Communications” are communications with the intent to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. The use of a phonetic clarifier will be required only during verbal “Operating Communications” that involve alpha-numeric identifiers.</p> <p>The SDT has modified the Requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>The SDT believes the ten code system is not appropriate for use with unique Facility/Element alpha numeric identifiers. The ten code system varies over North America and may not exist in Canada. The NATO alphabet, as an example, is more universal, consistent and more applicable.</p>		
Duke Energy	Disagree	We believe that R6 should be deleted, because it is focused on the details of the “how” rather than the “what” in communications. The key is accurate 3-part communications for “directives”, as required by R5. R6 is far too broad in the communications that would be included. Also, we believe that there is no reasonable way to implement, self-certify or audit compliance with this requirement.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The OPCP SDT was chartered to develop Communication Protocols for Operating Personnel. The SDT proposes that the second draft of the standard is more focused on “what” protocols to use in specific situations.</p> <p>The SDT has modified the proposed standard by restricting the requirement's applicability only to verbal “Operating Communications” that involve alpha-numeric identifiers.</p> <p>The measure (now contained within M1 but previously M6) includes types of evidence that may be used to demonstrate compliance with this requirement.</p>		
South Carolina Electric and Gas	Disagree	We believe this should only be required when issuing Reliability Directives.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has modified the proposed standard by restricting the requirement's applicability only to verbal “Operating Communications” which can include normal, alert and emergency operating conditions and involve alpha-numeric identifiers.</p>		

Organization	Yes or No	Question 7 Comment
NYSEG	Disagree	While it is perhaps a good practice to include the use of phonetics to avoid miscommunications, it should be left up to each entity to determine the appropriateness of adopting such a practice (e.g., field switching, internal instructions, etc.) and should not be included in the Requirement, especially if Interoperability is not further clarified/defined.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has eliminated “Interoperability Communication” and is proposing the new term “Operations Communications.” “Operations Communications” are communications with the intent to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. The SDT has modified the proposed standard by restricting the requirement’s applicability (Requirement R1, Part 1.2 in the revised standard) only to verbal “Operating Communications” alpha-numeric identifiers.</p>		
Long Island Power Authority	Disagree	While LIPA understands the benefit of utilizing a phonetic alphabet, we question the designation of a specific phonetic alphabet. This prescriptive requirement may result in absurd non-compliance reports, such as, using “Dog” for “D” instead of “Delta”. R6 requires the use of the alphabet when issuing information, but not in the repeat back step. This may be an oversight. Also Does the RC in its communication utilize the abbreviation for the threat type, e.g. PSEA, or does the RC use the NATO-Alphabet? If NATO, then the example in Attachment 1 should state this need.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has modified the requirement to allow for the "NATO phonetic alphabet or another “accurate alpha numeric clarifier.”, so D as in “Dog” rather than “Delta” would be compliant; F as in “Phase” rather than “Foxtrot” would be non compliant.</p> <p>The SDT intends for Requirement R1, Part 1.2 in the revised standard to apply to unique Facility and Element alpha numeric identifiers and not commonly used acronyms such as “PSEA” for Physical Security Emergency Alert.</p> <p>The SDT has modified the proposed standard by restricting Part 1.2 of the revised requirement’s applicability only to verbal “Operating Communications” that involve alpha-numeric identifiers.</p>		
We Energies	Disagree	While R6 could be recommended as a good utility practice when communicating Reliability Directives, it is not appropriate to enforce it as a requirement for all communications. The focus of the standard should be on the achievement of clear communications, with individual organizations retaining some freedom to implement practices appropriate for their own unique situations. If Violation Severity Levels will be “high” as indicated in Attachment 1-COM-003-1, then the standard must be much more specific as to what constitutes “directives, notifications, directions, instructions, orders or other reliability operating information”. Assigning a high Violation

Organization	Yes or No	Question 7 Comment
		<p>Severity Level to the failure to use a specific phonetic alphabet (NATO) instead of to a failure to use any phonetic alphabet seems unreasonable and is likely to cause as much confusion as failing to use any sort of phonetic pronunciation. If attachment 2 is utilized, it should only be required for situations where Attachment 1 applies. As noted in question 2, R6 should not apply to a TSP or LSE.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT believes that clarity around verbally conveyed alpha-numeric identification information is critical for ensuring clear and effective real-time communication among BES operating entities and should be enforceable.</b></p> <p><b>The SDT agrees with your concerns over applicable communications and has modified the proposed standard by restricting Part 1.2 of the revised requirement's applicability only to verbal "Operating Communications" that involve alpha-numeric identifiers.</b></p> <p><b>The new language is Requirement R1 Part 1.2. "When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers."</b></p> <p><b>The SDT has removed the TSPs and LSEs because they were not bound by this requirement in the originating SAR.</b></p>		
Dynergy	Disagree	<p>While this Requirement may represent a good utility practice in certain situations, it is not necessary to be used in all verbal Interoperability Communications and is certainly not necessary to be included as an enforceable Requirement. Imagine the situation in which an operator says "A as in apple" instead of using the NATO Alpha. Even though the listener should clearly be able to discern the correct meaning, the speaker's company could be sanctioned even if the correct actions were taken as a result of the clear communication. There is no reliability need for this Requirement.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has modified the proposed standard by deleting the term Interoperability Communications and adding the new term - "Operating Communications".</b></p> <p><b>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. "When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers."</b></p> <p><b>"A as in apple" instead of using the NATO "Alpha" would be compliant; F as in "Phase" rather than "Foxtrot" would be non compliant.</b></p> <p><b>The SDT believes there is a reliability need for this requirement and that it will enhance reliability by clarifying communications to prevent misunderstandings that could cause mishaps on the BES.</b></p>		
Hydro-Québec	Disagree	<p>While this Requirement may represent a good utility practice in certain situations, it is not necessary to be used in</p>

Organization	Yes or No	Question 7 Comment
TransEnergie		<p>all verbal Interoperability Communications, and is certainly not necessary to be included as an enforceable Requirement.</p> <p>For example, a situation in which an operator says “A” as in apple” instead of using the NATO Alpha. Even though the listener should clearly be able to discern the correct meaning, the speaker’s company could be sanctioned even if the correct actions were taken as a result of the clear communication. The objective of good communications is to assure that the parties understand each other. The statement “... shall use the NATO phonetic alphabet” doesn’t make sense for North America. If the Real-Time Operator states “breaker 6-North,” under the NATO phonetic alphabet that would be unacceptable, because the operator did not use the appropriate NATO term “breaker 6-November,” even though the “N” on the one line diagram refers to the “North” breaker and not the “South” breaker. Many organizations may have established communications protocols which are working well. Making a change may actually hinder reliable operations by introducing unnecessary confusion and questioning. Not only does this requirement attempt to determine HOW entities operate with their various footprints, it may change the way many Markets are structured. What is the difference between using the word “Zebra” instead of “Zulu” to signify the letter “Z”? And, why would this be enforceable. Perhaps this should be a guideline document rather than an enforceable Requirement. There is no reliability need for this Requirement. Furthermore, the use of three part communication eliminates the need for a mandatory use of NATO phonetic alphabet.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT believes there is a reliability need for this requirement (Requirement R1, Part R1.2 in the revised standard) and that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.</b></p> <p><b>The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</b></p> <p><b>“A as in apple” instead of using the NATO “Alpha” would be compliant; F as in “Phase” rather than “Foxtrot” would be non compliant.</b></p> <p><b>With regard to “breaker 6-North,” under the NATO phonetic alphabet and the revision for a correct phonetic alphabet substitute that would be acceptable as long as the operator used either NATO term “breaker 6-November,” or correct phonetic alphabet substitute “breaker 6-North.” If the operator used the term “breaker 6-“N” (pronounced “en”) he or she would be non compliant.</b></p>		
Midwest ISO Standards Collaborators	Disagree	<p>While this Requirement may represent a good utility practice in certain situations, it is not necessary to be used in all verbal Interoperability Communications and is certainly not necessary to be included as an enforceable Requirement. Imagine the situation in which an operator says “A as in apple” instead of using the NATO Alpha.</p>

Organization	Yes or No	Question 7 Comment
<p>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>“A as in apple” instead of using the NATO “Alpha” would be compliant; F as in “Phase” rather than “Foxtrot” would be non compliant.</p> <p>With regard to “breaker 6-North,” under the NATO phonetic alphabet and the revision for a correct phonetic alphabet substitute that would be acceptable as long as the operator used either NATO term “breaker 6-November,” or correct phonetic alphabet substitute “breaker 6-North.” If the operator used the term “breaker 6-“N” (pronounced “en”) he or she would be non compliant.</p>		
Great River Energy	Disagree	<p>While this requirement may represent a good utility practice or even a best practice, it is not so necessary to be enforceable through enforceable requirements. The NATO phonetic alphabet does not allow for the use of numbers ten and beyond. An entity WOULD be found non compliant for saying OPEN SWITCH FOURTEEN BRAVO. GRE does not believe this is reasonable as it adds nothing to the reliability of the BES. It is too prescriptive and all encompassing and could potentially confuse or slow down the communication process especially in an emergency situation.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication between BES operating entities.</p> <p>The SDT has modified the requirement. The new language is in Requirement R1 Part 1.2. “When participating in verbal Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.”</p> <p>If the nomenclature of the switch on the single line is “14B” the requirement would have it read as “One, Four Bravo.” The number “2347” would be read as “Two, Three, Four, Seven” under R6 (new R1 Part 1.2).</p> <p>The SDT believes that adequate training, familiarity with and use of the phonetic alphabet will avoid and eliminate confusion among operators.</p>		
Independent Electricity System Operator	Disagree	<p>While this requirement may represent a good utility practice or even a best practice, it is not so necessary to be enforceable through sanctionable requirements. Similar to R2, having to use the NATO phonetic alphabet is overly prescriptive and forces system operators to learn and remember “languages” in addition to the power system language. System operators should not be penalized for using some means other than the NATO phonetic alphabet to communicate equally effectively. We see no short coming in operations that would require these additional requirements and that the added complexity and additional training requirements may deteriorate reliability.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 7 Comment
<p>The SDT believes that clarity around verbally conveyed alpha-numeric information is critical for ensuring clear and effective real-time communication among BES operating entities.</p> <p>The SDT has modified the requirement. - 8. Requirement R7 of the draft COM-003-1 states, “Each Responsible Entity shall use pre-determined, mutually agreed upon line and equipment identifiers during for all verbal and written Interoperability Communications.” Do you agree with this proposal? If not, please explain in the comment area.**

**Summary Consideration:**

Most stakeholders who responded to this comment disagreed with the proposal.

Many commenters said the terms “. . . pre-determined, mutually agreed upon . . .” are confusing and difficult to measure. The SDT agrees and modified the requirement to remove the term “mutually agreed upon”.

Commenters indicated a general consensus for the mandatory use of line and equipment identifiers applying only to interface Elements or Facilities, not Elements or Facilities internal to the footprint of the entity. The SDT agreed, and modified the standard to apply only to interface Elements and Facilities.

There were additional comments that uniform and mutually agreed line and equipment identifiers should not be mandated so long as the identifiers are pre-determined. The SDT agrees documentation of mutual agreement is not necessary, so long as the identifiers are pre-determined, understood and used during Operating Communications. The SDT has modified the requirement to require use of the name specified by the owner(s) of the Transmission interface Element/Facility when referring to that Element/Facility.

Many commenters indicated Requirement R7 should not have been applicable to TSPs and LSEs. The SDT agrees, and has removed TSPs and LSEs from the standard to be consistent with the approved SAR.

Additional commenters indicated the word “equipment” as used in Requirement R7 was too broad. The standard has been modified to use the defined terms “Element” and “Facility” instead.

Other commenters indicated Requirement R7 addressed a planning function already included in TOP-002, and should not be included in COM-003. While the SDT agrees that TOP-002-2a R18 is a planning function, the team believes communications between entities would be improved when use of pre-determined identifiers is required for interface Elements and Facilities. The SDT proposes the concept of R7 be retained and transferred to R1 Part 1.1.4.

Some additional comments were received indicating the previously posted standard was too prescriptive in specifying “how” to communicate, instead of “what.” The SDT proposes that the second draft of COM-003 provides identifies “what” communications protocols to use and when to use them.

Some commenters also indicated the proposed standard was unnecessary and would distract operators from reliably controlling the system. The SDT disagreed based on Blackout Task Force Report recommendation 26, which calls for tightening communication to improve reliability.

Question 8 mis-states R7 in that it inserts the word “all” in the question and it was not in R7. The performance that was specified in Requirement R7 in the initial draft of COM-003 has been modified so it is more narrowly focused and allows greater flexibility in meeting the reliability objective. See Requirement R1, Part 1.1.4 in the second draft of COM-003:

R1. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider shall use the following communications protocols:: [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time Operations* ]

1.1. When participating in oral or written Operating Communications:

- 1.1.1. Use the English language when communicating between functional entities, unless another language is mandated by law or regulation.
- 1.1.2. Use the 24-hour clock format when referring to clock times.
- 1.1.3. When communicating with one or more entities in different time zones, include the time, local time zone and indicate whether time is daylight saving time or standard time.
- 1.1.4. When referring to a Transmission interface Element or a Transmission interface Facility, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility. .

Westar Energy	Agree	
Western Area Power Administration	Agree	
Progress Energy Carolina, Inc	Disagree	
American Electric Power	Disagree	AEP does not believe it is appropriate for the standard to have been edited to remove the clarification that neighboring BAs use uniform line identifiers when communicating information about their lines and to add the addition requirement of using pre-determined "equipment" identifiers.
<p><b>Response: The SDT thanks you for your comments. The SDT developed Requirement R1 Part 1.1.4 in the second draft of the standard to require use of the name specified by the owner(s) of a Transmission interface Element/Facility, when referring to that Element/Facility. The term "interface" is used instead of neighboring for greater clarity.</b></p>		
FirstEnergy	Disagree	Although we agree with moving this current TOP-002 R18 requirement to this standard, we question the use of the phrase "mutually agreed upon". It is not clear how the line and equipment identifiers will be mutually agreed upon and how this will be measured. We suggest using similar wording from the current TOP-002 R18 and reword COM-003-1 R7 as follows: "Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use uniform line and equipment identifiers for verbal and written communications."
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT modified the requirement to remove the term "mutually agreed upon". The SDT developed Requirement R1 Part 1.1.4 in the second draft of the standard to require use of the name specified by the owner(s) of a Transmission interface Element/Facility, when referring to that Element/Facility during verbal and written Operating Communications.</b></p>		
Puget Sound Energy	Disagree	As discussed in Question 2, Requirement 18 should be removed from TOP-002-2 (or any successor standard) upon adoption of this standard if this requirement is included in this standard. Further the term mutually agreed implies that a discussion has occurred prior to the need to verbalize or write these types of communications. The additional specificity of "pre-determined" is duplicative or leads one to think there is formal guidance as to what the "identifier" should be. Remove "pre-determined". It also begs the question of timeframe which could bring interpretation issues during an audit.

Organization	Yes or No	Question 8 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The drafting team asserts that communications between entities would be tightened when use of pre-determined identifiers are required for interface Elements/Facilities. The SDT proposes for R7 (R1 Part 1.1.4 in the second draft of this standard) to remain on its own merit. The SDT modified the requirement to remove the term “mutually agreed upon”.</p> <p>The SDT modified the requirement so that during oral and written Operating Communications entities must use the name specified by the owner(s) of a Transmission interface Element/Facility when referring to that Element/Facility.</p>		
Bonneville Power Administration	Disagree	BPA Would like further clarification about what is meant by “pre-determined, mutually agreed upon line and equipment identifiers”. Is it a specified format no matter which part of the system is being used, or is it only for 115 kV and above as it applies to LSE’s and TSP’s. If it only refers to Transmission equipment above 115 kV, then BPA would likely agree.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT modified the requirement to remove the term “mutually agreed upon”. The SDT developed Requirement R1 Part 1.1.4 in the second draft of the standard to require use of the name specified by the owner(s) of a Transmission interface Element/Facility, when referring to that Element/Facility. The new term “Operating Communications” applies when communications involve actions relative to Elements or Facilities of the Bulk Electric System.</p>		
Ameren	Agree	But how does CMEP process check this “mutually agreed”. Much more work needs to be done with this requirement and measures to address this.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT modified the requirement to remove the term “mutually agreed upon”.</p>		
California Independent System Operator	Disagree	CAISO Comments; This Requirement is problematic as it doesn’t actually steer towards standardization. It mandates that companies have potentially scores of agreements agreeing on terms with each party it interacts with, all of which may be different. It ensures the system operator will spend more time ensuring terminology is correct for a given inter-company communication and once again, less time actually reliably operating the system. Standardization can only occur in a meaningful manner at very minimum, the interconnection level. Also the language in the VSL section uses “mutually understood”, which the CAISO supports as opposed to the requirement and measure use “mutually agreed upon”. Mutually agreed upon is overly prescriptive.
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 8 Comment
<p>The SDT does not agree there will more time spent ensuring terminology is correct for a given inter-company communication and less time actually reliably operating the system.</p> <p>The SDT developed Requirement R1 Part 1.1.4 in the second draft of the standard to require use of the name specified by the owner(s) of a Transmission interface Element/Facility, when referring to that Element/Facility. The SDT modified the requirement and VSLs to be consistent with each other.</p> <p>The SDT modified the requirement to remove the term “mutually agreed upon” which should address your concern on multiple agreements.</p>		
NYSEG	Agree	COM-003-1 R7 is more clearly defined than TOP-002 R18 in that R7 and associated M7 speak only to written and verbal Interoperability Communication, where TOP-002 R18 and M10 dictate a more extensive use of the identifier. The adoption of a more narrow purpose is preferred.
<p><b>Response: The SDT thanks you for your comments.</b></p>		
New York State Reliability Council	Agree	Comments: NYSRC notes that R7 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.
<p><b>Response: The SDT thanks you for your comments. The SDT appreciates the observation and the word “all” is not in the requirement. It should not have been in the question.</b></p>		
Duke Energy	Disagree	Delete this requirement. See our response to Question #2 above.
<p><b>Response: The SDT thanks you for your comments. Please see the response to Question #2.</b></p>		
ERCOT ISO	Disagree	Does the phrase ‘mutually agreed upon line and equipment identifiers’ mean that identifiers do not have to be identical, but that all parties understand the equipment discussed? If this is the general understanding, then no further comment, otherwise, please clarify. Although the related bullet item in the Background Information section describes that they do not have to be identical, many auditors many only look at the requirement language
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT modified the requirement to remove the term “mutually agreed upon”.</p> <p>The SDT developed Requirement R1 Part 1.1.4 in the second draft of the standard to require use of the name specified by the owner(s) of a Transmission interface Element/Facility, when referring to that Element/Facility. The SDT would expect a single pre-determined name for each interface Element/Facility to reduce the potential for confusion among operators.</p>		

Organization	Yes or No	Question 8 Comment
Pacific Northwest Small Utilities Comment Group	Disagree	DPs and LSEs are typically users, not owners or operators of interconnected BES equipment per the registry criteria. DPs and LSEs should be removed from this requirement.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT appreciates the comments with regards to concerns related to including DPs and LSEs that do not own or operate facilities that are a part of the BES. The SDT has removed the TSPs and LSEs because they were not bound by this requirement in the originating SAR. However, the SDT believes that DPs carry out actions related to the reliability of the Bulk Electric System such as voltage reduction and load shedding. Several existing standards contain requirements concerning operating communications that TSPs, DPs and LSEs must presently comply with that would be governed by the protocols of COM-003-1. It should be noted that the requirements of COM-003-1 are only applicable to “Operating Communications.” To the extent that these entities do not operate or do not take actions that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, COM-003-1 would not apply.</p>		
MRO NERC Standards Review Subcommittee	Disagree	Field personnel may not have access to the predetermined agreed to line and equipment identifiers. Requiring universal use of these identifiers could lead to confusion with field personnel within and between companies. This could lead to a decrease in the reliability and safety of the BES.As written R7 is expanding the requirement for agreed upon identifiers. We believe it is not necessary or required to have agreed upon equipment identifiers between companies as long as the line identifiers have been agreed upon.TOP-002 R18 states that BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003-1, R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications. TOP-002 allowed the TOP to communicate what the line identifiers were via a list and use during communications. The new requirement implies that the parties must agree upon the line identifiers and that agreement must be documented. We believe the requirement should require the exchange of line identifiers but not impose that they be mutually agreed upon.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT developed Requirement R1 Part 1.1.4 in the second draft of the standard to require use of the name specified by the owner(s) of a Transmission interface Element/Facility, when referring to that Element/Facility.</p> <p>The new term “Operating Communications” applies when communications involve actions relative to Elements or Facilities of the Bulk Electric System.</p>		

Organization	Yes or No	Question 8 Comment
<p><b>The SDT modified the requirement to remove the term “mutually agreed upon”.</b></p>		
<p>Florida Municipal Power Agency (FMPA) and some members</p>	<p>Agree</p>	<p>For clarity, a NERC Glossary defined term is more appropriate than “line or equipment” identifiers, such as “Facility” or “Element” identifiers’ VRF of “High” is not appropriate. Note that TOP-002-2, R18, which this requirement replaces, was “Medium”.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT changed “equipment” to Element or Facility. The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. The SDT believes the new assignments (Medium VRF for each of the requirements in the second draft of the standard) more accurately classify the VRFs assigned to the Requirements in COM-003-1.</b></p>		
<p>Transmission Owner</p>	<p>Disagree</p>	<p>FPL believes that R7 should be withdrawn as it repeats TOP-002 R18 requirements. Please refer to comments on Q3.</p>
<p><b>Response: The SDT thanks you for your comments. SDT feels that this requirement is appropriate under COM-003. The use of the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities during oral and written Operating Communications supports the purpose of COM-003 by preventing miscommunication. Please see response to Q3.</b></p>		
<p>American Municipal Power</p>	<p>Agree</p>	<p>How many substations have the same name? Unique identifiers easily and inexpensively eliminate confusion and errors.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		
<p>The Empire District Electric Company</p>	<p>Disagree</p>	<p>I would suggest a more efficient method of designating common pre-determined line and equipment identifiers through the Reliability Coordinator. As similar to the response earlier. A definition of "Equipment" is needed as well.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT believes your recommendation has merit but may be viewed by some stakeholders as overly prescriptive. The SDT developed Requirement R1 Part 1.1.4 in the second draft of the standard to require use of the name specified by the owner(s) of a Transmission interface Element/Facility, when referring to that Element/Facility.</b></p>		

Organization	Yes or No	Question 8 Comment
E.ON U.S. LLC	Disagree	<p>In the absence of evidence that the lack of common identifiers is an imminent and continuing risk to BES reliability, it does not make sense to have operators addressing urgent, real-time situations that bear significant penalty risk should they refer to a BES element by something other than the common identifier. The operator focus at such times should be on resolving the situation not avoiding penalties over nomenclature. Is it the intent of the requirement that the common identifiers be the same for all neighboring parties, all of whom must “agree” to the identification? If not, then an element might be referred to by one identifier with Party A, another with Party B, and so on, which might well defeat the purpose of the requirement. If it is required that there be a single identifier, then all neighbors would have to agree upon the identifier constrained as each may be by, for example, the formatting limitation of their respective SCADA/EMS systems. Cost to modify software to accommodate common identifiers could be significant and NERC should weigh these costs and the aforementioned operational risks against the perceived incremental improvements to the BES reliability.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The Blackout Report Recommendation #26 states, communication protocols should be tightened especially those for alerts and emergency communications. FERC Order 693 P531 directed that communication protocols be tightened and suggested a new COM Reliability Standard as an acceptable approach. The SAR for this SDT charged the team to “tighten communication protocols, especially for communications during alerts and emergencies.” Additionally the SAR required “the use of specific communication protocols, enabling information to be efficiently conveyed and mutually understood for all operating conditions.”</p> <p>SDT feels that the revised requirement (Requirement R1, Part 1.1.4 in the second draft) is appropriate under COM-003 as the use of identifiers only for interface Elements/Facilities during oral and written Operating Communications supports the purpose of COM-003. A clear knowledge of Facility and Element nomenclature at interface interconnections can only strengthen operator performance through understanding how operating system anomalies could impact their system. It will and has confused operators when they are not familiar with their neighbor’s system and are not prepared to take action to mitigate the disturbance. The SDT would argue that if the operator is not familiar with his or her neighboring system’s Elements and Facilities those operators will likely take even more time to attempt to learn in the “heat of battle.”</p> <p>The SDT disagrees that the cost to modify software would be significant as it would be limited to the interface Elements/Facilities as stated in R1 Part 1.1.4 of the second draft of the standard.</p>		
Kansas City Power & Light	Disagree	<p>Including “equipment” is too broad. This could mean anything and should be limited to transmission devices that could affect the reliable operation of the bulk electric system.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT modified the requirement so that entities must use the names specified by the owner(s)</b></p>		

Organization	Yes or No	Question 8 Comment
<p><b>of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</b></p>		
<p>Long Island Power Authority</p>	<p>Agree</p>	<p>LIPA notes that R7 in the draft Standard does not match R2 in this question. Specifically the word ALL is not in the Standard.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT appreciates the observation and the word “all” is not in the requirement. It should not have been in the question.</b></p>		
<p>Manitoba Hydro</p>	<p>Disagree</p>	<p>Move this new requirement R1.3 in COM-002-2. This is similar to Question 4 and should be treated in the same way: (This requirement is moved from TOP-002-2 R18)</p> <p>1) COM-003-1 R7 “Pre-determined, mutually agreed upon line and equipment identifiers” are all planned definitions.</p> <p>2) COM-003-1 purpose is to “convey information effectively” meaning the use of English, NATO, three-part communication, 24 time format are all verbal aspects to accomplish this purpose and not suited to pre-determined or planned items. a. COM-003-1 R7 appears more appropriate and relevant placed in COM-002-2. COM-002-2’s Purpose is “capabilities for addressing real time emergencies and to ensure communications by personnel are effective”.</p> <p>3) Placing “Pre-determined, mutually agreed upon line and equipment identifiers” in COM-002-2 after R1.1 as R1.3 appears to have more of a chronological approach.</p> <p>i. R1.1 states “conditions that could threaten”</p> <p>ii. R1.2 use “pre defined system conditions”</p> <p>iii. R1.3 use “pre determined equipment identifiers</p> <p>”Conclusion: Remove COM-003-1 R7 and replace in COM-002-2 as R1.3</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>SDT respectfully disagrees with shifting what is now Requirement R1, Part 1.1.4 in the second draft of COM-003 to COM-002-2 and feels that Requirement R1, Part 1.1.4 is appropriate under COM-003-1 as the use of pre-determined identifiers only for interface Elements/Facilities during oral and written Operating Communications supports the purpose of COM-003-1.</b></p>		
<p>NERC Staff</p>	<p>Disagree</p>	<p>NERC staff is unaware of any instance where not having a mutually agreed upon nomenclature has led to an adverse reliability event. Rather than requiring a national database for all line and equipment identifiers, it appears that restricting the list to jointly-owned facilities and tie-line would accomplish the team’s goal. We</p>

Organization	Yes or No	Question 8 Comment
		recommend that the phrase “Interoperability Communications” be replaced with “Operating Communications involving jointly-owned Facilities and tie lines.”
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The requirement does not require a national database. The SDT modified the requirement to use pre-determined identifiers only for interface Elements/Facilities during oral and written Operating Communications. The new term “Operating Communications” applies to Element or Facilities of the Bulk Electric System.</p> <p>The SDT modified the requirement to remove the term “mutually agreed upon”.</p>		
NextEra Energy Resources, LLC	Disagree	NextEra believes that R7 should be withdrawn as it repeats TOP-002 R18 requirements. Please refer to comments on Q3.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>SDT feels that this requirement is appropriate in COM-003 as the use of identifiers only for interface Elements/Facilities during oral and written Operating Communications supports the purpose of COM-003.</p> <p>Please see the response to Q3 comments.</p>		
IRC Standards Review Committee	Disagree	Please confirm our understanding of this requirement. We believe that the SDT intends for the requirement to compel all companies to use the same name for all facilities. If this is the intention, we disagree with the requirement. This may represent a good utility practice but it is not necessary to be a requirement. The key question is: “Do the companies’ personnel understand one another?” If I know that my company refers to a tie-line as Alpha and my neighboring company calls it Beta, I know what he means when communicating to me. That is all that matters.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</p>		
PJM	Disagree	Requirement R7 in draft COM-003-1 came from TOP-002-2, Requirement R18. The original requirement intended that neighboring Balancing Authorities use uniform line identifiers when communicating information about their tie lines. This requirement drops that clarification and introduces the additional requirement to use pre-determined “equipment” identifiers. Having to mutually agree in advance on identifiers for every switch & transformer is another example of a prescriptive requirement whose violation will not affect system reliability,

Organization	Yes or No	Question 8 Comment
		yet will expose entities to large fines. The key question is: “Do the companies’ personnel understand one another?”
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</b></p> <p><b>The SDT removed the term “mutually agreed upon”.</b></p> <p><b>The SDT would respectfully answer your last question “no, not always” and to create a protocol to address that issue is proper.</b></p>		
PJM SOS Comments	Disagree	Requirement R7 in draft COM-003-1 came from TOP-002-2, Requirement R18. The original requirement intended that neighboring Balancing Authorities use uniform line identifiers when communicating information about their tie lines. This requirement drops that clarification and introduces the additional requirement to use pre-determined “equipment” identifiers. 		determined “equipment” identifiers. Having to mutually agree in advance on identifiers for every switch & transformer is another example of a prescriptive requirement whose violation will not affect system reliability, yet will expose entities to large fines.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</b></p> <p><b>The SDT modified the requirement to remove the term “mutually agreed upon”.</b></p>		
PSEG Companies	Disagree	The PSEG Companies agree with the concerns expressed in the comments filed by the PJM System Operations Subcommittee (SOS) Group.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</b></p> <p><b>The SDT modified the requirement to remove the term “mutually agreed upon”.</b></p>		
Entergy Services	Disagree	The requirement as it was written in TOP-002-2 pertained to communication between neighbors for shared lines and facilities. That intent has been lost in this version of the requirement. Also a term “equipment identifiers” has been added, but it is not clear what additional equipment is covered by this requirement, or what reliability concern is being addressed by these changes. Entergy recommends that this requirement be changed to be similar to the language that exists in TOP-002-2 R18 “Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use pre-determined mutually agreed upon line identifiers when referring to transmission facilities of an interconnected network.”
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT agrees and has modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</b></p> <p><b>The new term “Operating Communications” applies when communications involve actions relative to Elements or Facilities of the Bulk Electric System.</b></p>		
National Grid	Disagree	The way this and TOP-002 R18 requirements are written they could be interpreted to mean that the line identifiers have to be unique. The requirement should be written similar to the bullet on page 7 of the comment

Organization	Yes or No	Question 8 Comment
		<p>form also listed below.”TOP-002 R18. Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.””Pre-determined Line and Equipment Identifiers: COM-003-1 requires the use of predetermined line and equipment identifiers in Requirement R7 however the Requirement does not stipulate a single/unique identifier as long as all parties mutually agree on the identifier for the line or equipment. The mutual agreement shall be reached in advance of the use of the identifiers as described in the functional entity’s CPOP”</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</b></p> <p><b>The SDT modified the requirement to remove the term “mutually agreed upon”.</b></p> <p><b>In the revised standard the requirement to have a CPOP has been eliminated.</b></p>		
<p>Tri-State Generation &amp; Transmission Assoc.</p>	<p>Disagree</p>	<p>This is not NERC’s responsibility to define. There are too many lines and too much equipment to identify each as a NERC definition. Definitions are already agreed upon between operating entities.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</b></p> <p><b>The new term “Operating Communications” applies to Element or Facilities of the Bulk Electric System. The new term “Operating Communications” applies when communications involve actions relative to Elements or Facilities of the Bulk Electric System. It will be the owner’s responsibility to define names for its interface Elements/Facilities.</b></p>		
<p>Dynegy</p>	<p>Disagree</p>	<p>This may represent a good utility practice but it is not necessary to be included as a Requirement. The key question is: “Do the companies’ personnel understand one another?” If I know that my company refers to a tie-line as Alpha and my neighboring company calls it Beta, I know what he means when communicating to me. That is all that matters. This is a “how” based Requirement that should be eliminated.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT would respectfully answer your question “no, not always” and to create a protocol to address that issue is proper.</b></p>		

Organization	Yes or No	Question 8 Comment
<p>SDT feels that this requirement is appropriate in COM-003 as the use of pre-determined identifiers only for interface Elements/Facilities during oral and written Operating Communications supports the purpose of COM-003. The SDT is proposing a single predetermined name to reduce the potential for confusion. The SDT developed Requirement R1 Part 1.1.4 in the second draft of the standard to require use of the name specified by the owner(s) of a Transmission interface Element/Facility, when referring to that Element/Facility.</p>		
<p>Independent Electricity System Operator</p>	<p>Disagree</p>	<p>This may represent a good utility practice but it is not necessary to be a requirement. The key is whether or not operation personnel understand one another. Similar comments as in Q4 and Q7 also apply here.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The Blackout Report Recommendation #26 states communication protocols should be tightened, “especially” those for alerts and emergency communications. FERC Order 693 P531 directed that communication protocols be tightened and suggested a new COM Reliability Standard as an acceptable approach. The SAR for this SDT charged the team to “tighten communication protocols, especially for communications during alerts and emergencies.” Additionally the SAR required “the use of specific communication protocols, enabling information to be efficiently conveyed and mutually understood for all operating conditions.”</p> <p>Please see response to comments for Q4 and Q7.</p>		
<p>Midwest ISO Standards Collaborators</p>	<p>Disagree</p>	<p>This may represent a good utility practice but it is not necessary to be included as a Requirement. The key question is: “Do the companies’ personnel understand one another?” If I know that my company refers to a tie-line as Alpha and my neighboring company calls it Beta, I know what he means when communicating to me. That is all that matters. This is a “how” based Requirement that should be eliminated.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT would respectfully answer your question “no, not always” and to create a protocol to address that issue is proper.</p> <p>SDT feels that this requirement is appropriate in COM-003 as the use of pre-determined names only for interface Elements/Facilities during oral and written Operating Communications supports the purpose of COM-003. The SDT is proposing a single predetermined identifier to reduce the potential for confusion.</p>		
<p>NIPSCO</p>	<p>Disagree</p>	<p>This question includes a mis-statement in quotes. This is not what the requirement says. Furthermore, the word "Neighboring" was removed from the TOP-002 R18 which changes the meaning and intent of the requirement. Why not bring in R18 verbatim?</p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 8 Comment
<p>The SDT appreciates the observation and the word “all” is not in the requirement. It should not have been in the question.</p> <p>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities. The SDT decided to leave R18 in TOP-002 because it represents a planning function. Requirement R7 will remain in the second draft of COM 003 as Requirement R1, Part 1.1.4, specifying when to use those identifiers.</p>		
<p>Pepco Holdings, Inc. - Affiliates</p>	<p>Disagree</p>	<p>This requirement came from TOP-002 R18 and is fundamentally different from the new proposed requirement in COM-003-1 R7. TOP-002 R18 states that the BA, TOP, GO, LSE and TSP shall use uniform line identifiers when referring to transmission facilities of an interconnected network. The requirement in COM-003-1 R7 introduces an additional requirement to use pre-determined “equipment” identifiers is another example of a prescriptive requirement that will not impact bulk electric system reliability and will expose entities to large fines. PHI believes the TOP-002 R18 could be included in COM-003-1 but included as defined in TOP-002 R18.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities. The SDT is proposing a single predetermined identifier established by the owner of the Element/Facility to reduce the potential for confusion.</p> <p>The SDT decided to leave R18 in TOP-002 because it represents a planning function. Requirement R7 will remain in the second draft of COM 003 as Requirement R1, Part 1.1.4, specifying when to use those identifiers.</p>		
<p>Consumers Energy</p>	<p>Disagree</p>	<p>This requirement is better served under the TOP Standards. The TOP standards already require this (TOP-002-2 R18), and the requirement should not be duplicated.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT decided to leave R18 in TOP-002 because it represents a planning function. Requirement R7 will remain in the second draft of COM 003 as Requirement R1, Part 1.1.4, specifying when to use those identifiers.</p>		
<p>ATC and ITC</p>	<p>Disagree</p>	<p>TOP-002 R18 states that BA, TOP, GOP TSP and LSE shall use uniform line identifiers when referring to transmission facilities of an interconnected network. COM-003 R7 states that each RC, BA, TO, TOP, GOP, TSP, LSE and DP shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications. TOP-002 allowed the TOP to communicate what the line identifiers were via a list and use during communications. The new requirement implies that the parties must agree upon the line identifiers and that agreement must be documented. ATC believes that the requirement should state that “mutual</p>

Organization	Yes or No	Question 8 Comment
		<p>agreement” allows for multiple identifiers. We believe that this is needed in order to avoid the following issues.</p> <ol style="list-style-type: none"> <li>1) This clarification will avoid any need for arbitration or formal dispute resolution steps.</li> <li>2) If the standard does not allow for this provision entities will be forced to deviate from their own line naming convention and will result in entities to modify their drawings, field signs, and SCADA systems.</li> </ol>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT decided to leave R18 in TOP-002 because it represents a planning function. Requirement R7 will remain in the second draft of COM-003 as Requirement R1, Part 1.1.4, specifying when to use those identifiers. The SDT is proposing a single predetermined identifier established by the owner of the Element/Facility to reduce the potential for confusion.</p> <p>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</p> <p>The new term “Operating Communications” applies when communications involve actions relative to Elements or Facilities of the Bulk Electric System.</p> <p>The SDT modified the requirement to remove the term “mutually agreed upon”.</p>		
We Energies	Disagree	<p>TOP-002-2 R18 requires uniform line identifiers. The wording of R7 and the statement by the SDT that “the Requirement does not stipulate a single/unique identifier as long as all parties mutually agree” is in conflict with TOP-002-2 R18. Allowing multiple line and equipment identifiers to be used does not improve reliability or improve communications in an emergency. TOP-002-2 applies to Transmission Facilities of an Interconnected Network...R7 should do the same for clarity. Having the term “mutually agreed upon” in a standard is unworkable, since it allows a non-cooperative party to disrupt the genuine efforts of others and to exploit unfair leverage in discussions or negotiations. A better approach is having the Transmission Owners develop identifiers for transmission, and Generation Operators develop identifiers for generation. The process should be defined such that comments are solicited and input within a pre-specified convention, and then a specific entity is given the ability to make the final determination. Again, R7 is more appropriate as a best practices recommendation, rather than a requirement.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT decided to leave R18 in TOP-002 because it represents a planning function. Requirement R7 will remain in the second draft of COM 003 as Requirement R1, Part 1.1.4, specifying when to use those identifiers.</p> <p>The SDT modified the requirement to remove the term “mutually agreed upon”.</p>		

Organization	Yes or No	Question 8 Comment
<p>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</p>		
<p>ISO New England Inc.</p>	<p>Agree</p>	<p>We agree that the stipulation of a single/unique identifier is unnecessary as long as all parties mutually agree on the identifier for the line or equipment, and therefore, support this change to the existing Requirement in TOP-002.</p>
<p>Response: The SDT thanks you for your comments.</p>		
<p>NRECA RTF Members</p>	<p>Agree</p>	<p>We agree using pre-determined, mutually agreed upon line and equipment identifiers during for all verbal and written Interoperability Communications is a more accurate form of communication and should remain as a requirement of this standard.</p>
<p>Response: The SDT thanks you for your comments.</p>		
<p>Xcel Energy</p>	<p>Disagree</p>	<p>We feel this requirement needs clarification, particularly regarding how granular an entity would have to go into the various pieces of equipment/lines. We would also recommend that R7 be modified to not require mutual agreement. We feel the owner (or majority owner) of the line or equipment should be the one setting the identifiers. For example, R7 could instead read like this: "Owner-determined line and equipment identifiers shall be used for all verbal and written Interoperability Communications."</p>
<p>Response: The SDT thanks you for your comments.</p> <p>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities.</p> <p>The SDT modified the requirement to use pre-determined identifiers only for interface Elements/Facilities during oral and written Operating Communications. The new term "Operating Communications" applies when communications involve actions relative to Element or Facilities of the Bulk Electric System.</p> <p>The SDT modified the requirement to remove the term "mutually agreed upon".</p>		
<p>Electric Market Policy</p>	<p>Agree</p>	<p>While we agree conceptually, it is our experience that Interoperability Communications concerning BES elements do not usually specifically identify the element or facility when the BA, RC or TOP is communicating with the TSP, LSE or GOP. This may have to do with concerns about Standards/Codes of Conduct or may be because specific identification of the element or facility isn't required in order to communicate action(s) that entity is required to take.</p>

Organization	Yes or No	Question 8 Comment
		<p>Response: The SDT thanks you for your comments.</p> <p>The SDT has eliminated the term Interoperability Communications. The SDT has proposed a new term “Operating Communication”.</p> <p>The SDT modified the requirement so that entities must use the names specified by the owner(s) of Transmission interface Elements and Transmission interface Facilities when referring to those Elements and Facilities. If an interface Element/Facility is not used in the Operating Communication, it would not be subject to this requirement.</p>

**9. Attachment 1-COM-003-1 is based upon work performed by the Reliability Coordinator Working Group (RCWG). Do you have any concerns or suggestions for improvement of the attachment? If yes, please provide in the comment area. (If you are involved in the field testing of the Alert Level Guide please share any comments regarding the use of the guideline as it relates to the field test.)**

**Summary Consideration:**

Most stakeholders who responded to this question indicated the attachment needs improvement.

Commenters indicate the alert for the Physical Emergency and the Cyber Alert are nearly identical and should be combined.

Many commenters indicated that Attachment 1 includes actions only for the RC. Therefore, there is no reason to have the other Functions listed as having responsibility for Attachment 1.

Commenters suggest that the use of a “color code” adds an unnecessary level of complexity, adds no value to the Alert Level guidelines, and could result in confusion with Home Land Security terrorist alerts.

Commenters recommend that Distribution Service Provider be changed to Distribution Provider and that change was made.

Commenters stated that the introductory paragraph in COM-003 - Attachment 1 conflicts with the Alert Level Guide.

The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. The SDT removed the requirement from the second draft of the standard as outside the scope of this standard.

<p><b>various alert levels. The SDT removed the requirement from the second draft of the standard as outside the scope of this standard.</b></p>		
<p>MRO NERC Standards Review Subcommittee</p>	<p>Agree</p>	<p>As Attachment 1 is written it only applies to the RC and is a one-way communications path. The BA, DP, GOP, TOP, and TO are to be notified by the RC but the attachment doesn't state what they are to do with the information. COM-003-1, R1 states that the RC, BA, TO, TOP, GOP, TSP, LSE and DP are to have a CPOP with the elements in R2 through R7, which refer to Attachment 1. If Attachment 1 is applicable only to the RC, as we recommend, there is no reason to have the other Functions listed for Attachment 1. Requirement R2 and Measure M2 need to be revised to be applicable to the RC only. Attachment 1 makes reference to "Distribution Service Providers". There is no definition of a Distribution Service Provider in the NERC Functional Model, and we believe this should either be revised to Distribution Provider, or deleted entirely from the list.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a "communication protocol" – rather the requirement was attempting to define various alert levels. <p>Pepco Holdings, Inc. - Affiliates</p>	<p>Agree</p>	<p>As noted in our comments to Question 4, Attachment 1 has examples for Reliability Coordinators only. It is not a good guide for other Interoperability Communications. Additionally, Attachment 1 identifies the Level 1, Level 2 and Level 3 communications by color codes that are not referenced in the sample messages. PHI finds the addition of color codes to not be helpful and possibly confused with national security Alert Levels. The color coding should be eliminated and examples for entities in addition to the Reliability Coordinator should be included.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a "communication protocol" – rather the requirement was attempting to define various alert levels. <p>Ameren</p>	<p>Agree</p>	<p>As stated earlier, this is an excellent document for RC interactions. But it is wholly unclear how this impacts other entity-to-entity relationships in pre-defining states. And as mentioned having only Attachment 1 seems to ignore the energy balance alerts/emergencies</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined</b></p>		

Organization	Yes or No	Question 9 Comment
<p>that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. The SDT removed the requirement from the second draft of the standard as outside the scope of this standard.</p>		
Entergy Services	Agree	<p>As written, the actions that fall into interoperability communications in requirement 2 are much broader than the set of conditions described in the table in attachment 1. To the extent that the communications are outside of the ones in the table, entities will be non-compliant because their communications are not pre-defined. Recommend that requirement 2 be changed to indicate that “Any Reliability Coordinator or <i>Transmission Operator</i> experiencing a physical security emergency, cyber security emergency, or transmission emergency will communicate their status using the conditions and processes in Attachment 1.” Is this a better write up for R1 (New)</p>
<p><b>Response: The SDT thanks you for your comments.</b>                      The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. The SDT removed the requirement from the second draft of the standard as outside the scope of this standard.</p>		
We Energies	Agree	Attachment 1 is written for an RC. Usage of Attachment 1 by entities other than an RC should be clarified.
<p><b>Response: The SDT thanks you for your comments.</b>                      The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. The SDT removed the requirement from the second draft of the standard as outside the scope of this standard.</p>		
California Independent System Operator		<p>CAISO Comments; Information regarding the Alert Level Guide field test has not been widely circulated and unproductive as of late. Does not the Alert Level Guide need to be approved prior to any standard which references the guide be approved? What was the outcome of the field testing? Was reliability enhanced? Attachment 1 describes ‘normal, alert, and emergency operating conditions’, then goes on to never use those terms again in any meaningful manner. To further confuse it then mixes color coding of steps with levels. Which is it, Condition Red or Level 3? The attachment directs Reliability Coordinators to make vague notifications to the functional entities in its footprint. It directs Reliability Coordinators to make these vague notifications to entities that do not use, in our case the WECCNet. Is it really anticipated that the Reliability Coordinator calling on the telephone every DP in its footprint with a vague notification will be an enhancement to reliability?</p>
<p><b>Response: The SDT thanks you for your comments.</b></p>		

Organization	Yes or No	Question 9 Comment
<p>The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. The SDT removed the requirement from the second draft of the standard as outside the scope of this standard.</p>		
<p>New York State Reliability Council</p>	<p>Agree</p>	<p>Comments: In addition to the response to Question 4, NYSRC does not understand why there are Levels and color designations since only the threat level numeral is being communicated. Attachment 1-Com-003 is very prescriptive in the use pre-defined terminology, colors and levels. There is no benefit (Verbatim?) to specifying the specific terminology. Requiring system Operators to state Colors and Levels would seem to result in slower and more confused communication.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. <p>E.ON U.S. LLC</p>	<p>Disagree</p>	<p>E.ON U.S. has many concerns with this proposed attachment. The use of color coding and multiple types of alerts adds unnecessary levels of complexity. Any proposed alert level should be consistent throughout the suite of reliability standards, e.g. level 1,2,3. Also, as previously noted in our comment to question 4 above, E.ON U.S. suggests integrating attachment 1 and the relative alert levels into the EOP standards and focusing the COM standards on the requirements of communications protocol.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. Organization	Yes or No	Question 9 Comment
<p><b>levels. The SDT removed the requirement from the second draft of the standard as outside the scope of this standard.</b></p>		
<p>Bonneville Power Administration</p>	<p>Agree</p>	<p>In Attachment #1 - Operating State Alert Levels, for the Transmission Emergency Alert (TEA) Level 2 definition, a “why” needs to be incorporated into the definition. It appears that the reason we’re going to TEA 2 is to avoid violation of an SOL but it needs to be called out. The color scheme may be confusing with (DHS) Homeland Security’s terrorist alert levels. (The RC makes the notifications to all based upon the Operator’s reported conditions per the scheme.). Suggest only using the Emergency Energy Alert numerical levels versus the color scheme, to avoid confusion with Homeland Security alerts. An example: A red alert is a breakup like 2003 and 1996, not shedding of load to prevent it, The color scheme does not work for this. Agree with Notifications for Physical Security and Cyber Security. Disagree with Notifications for Transmission Emergency Alerts. This appears to be only IROL related, but could progress to SOL. May have too many of these issued. Suggest the following: Yellow - approaching IROL limit; Orange - procedures implemented to correct IROL; RED - shedding firm to respect an IROL.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. <p>Hydro-Québec TransEnergie</p>	<p>Agree</p>	<p>It is not clear what value is realized by declaring an alert status particularly with regard to cyber and physical attacks. There do not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information, for example 12 substations have been physically or cyber attacked. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked.</p> <p>Furthermore, we question the value of communicating the physical and cyber alerts. How does this notification help the BES reliability? Consider the following example. One BA in Oklahoma is 34,323 sq miles. Communicating that an attack occurred in the BA and RC tells other operators that somewhere in Oklahoma an attack occurred. This notification does not present any information that could require actions on the operators’ parts, and will only generate phone calls for more information.</p> <p>Furthermore, PSE and CSE is a type of sabotage already reported in CIP-001 R2. TEA Alerts are already covered in IRO-006-East-1, IRO-009, IRO-010, IRO-014.01 R2.</p> <p>Also it has been the experience of several entities during the field test of these Alert Levels that there are</p>

Organization	Yes or No	Question 9 Comment
		<p>inconsistencies as to when to implement various stages of Alerts, and this introduces more confusion than exists today. Reliability has not been enhanced.</p> <p>Attachment 1 contains a conflict. The last sentence of the opening paragraph of Attachment 1 reads, “The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions.” In Transmission Emergency Alerts Condition Yellow, Orange and RED: The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available generation resources are committed to respect the IROL and/or is concerned about its ability to respect the IROL. Foresees is a forecast condition.</p> <p>There is an inconsistency between the inclusion of Attachment 1 and what is stated in the document posted with the standard entitled Disposition of Requirements Identified in the SAR for Operations Communications Protocols as Possibly Needing either Modification or Movement. The document states that the standard focuses on “how to” communicate rather than on specified scenarios of “to whom” or “when to” communicate; however, Attachment 1 does just the opposite. In condition Orange and Red for TEA Level Two/Three, the initial notification requirements are redundant with IRO-006-East-1 R3.2.</p> <p>Under the Make Final Notifications, is curtailed intended to mean canceled or terminated? The term Curtailed in operations generally means cuts for schedules/tags. EEA’s use terminated. Terminated is the preferred term.</p> <p>Distribution Service Providers should be Distribution Provider to be consistent with the Functional Model. Refer to the response to Question #4.</p>

Transmission System Operations	Agree	<p>It should be made clear that Attachment 1 applies to the RC’s. It is not specifically stated in R2 that it is the RC’s responsibility to make notifications. In Attachment 1, we believe the wording under “Initial Notifications” should be changed. For example, on the 2nd row and 1st column of the matrix, it states that the RC makes initial notification and states that “...there is a Physical Emergency Alert, PSEA Level One within...” Nowhere is it ever mentioned that there is a “Condition Yellow”. Since it is never mentioned by the RC in the notification that the Condition is “Yellow”, what is the use or benefit of having the conditions?</p> <p>It should also be made clear that when the RC states, for example, that “There is a Physical Security Emergency Alert-PSEA Level One within...” that this refers to specific definitions given in Attachment 1 of EOP-002-2.1. This fact is mentioned at the top of the matrix, but the wording of this explanation is not consistent with the wording used in the body of the matrix.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. NERC Staff	Agree	<p>NERC staff recommends that a line be added to each table that provides the expectation for entities communicating events to the Reliability Coordinator. Using the existing tables, all expectations and requirements rest solely on the Reliability Coordinator. We also recommend eliminating the color designations of yellow, orange, red and the Alerts be changed to Level One, Two and Three for consistency. The use of colors does not appear to add anything to the clarity or effectiveness in conveying the content of an Alert and may be inconsistent with the Department of Homeland Security’s threat level system. Additionally, the team should update Attachment 1 to include the criteria and notifications for Energy Emergency Alerts.</p>

NIPSCO	Disagree	No comment
PPL		No comments either way since this applies specifically to RCs.
Northeast Utilities	Disagree	No concerns or suggestions (Disagree = No)
Westar Energy	Agree	no suggestions
NextEra Energy Resources, LLC	Disagree	None at this time.
Consumers Energy		None.
<p><b>Response: The SDT thanks you for your participation</b></p>		
PJM	Agree	<p>Our concern is that the Alert Level Guides of Attachment 1 were written for Reliability Coordinators, not the industry as a whole, and now they are being incorporated into an industry-wide standard.</p> <p>This attachment is very prescriptive as to how the notifications take place, such as through the RCIS. If the RCIS is not functioning and the hotline is used instead, is the entity vulnerable to a violation by virtue of the fact that these alert guides are included in the standard?</p> <p>We believe that the color-coded system condition terminology should be defined/required externally to the COM standards. The use of clear &amp; consistent alert level terminology, while important, does not fit in well with the reliability-related communication standards, especially at these high violation severity levels.</p> <p>It is our suggestion that the Alert Level Guides be balloted separately, and include the Energy Emergency Alerts (EEA) as well. EEA requirements currently exist in NERC Standard EOP-002-2.</p> <p>It is not clear what value is realized by declaring an alert status particularly with regard to cyber and physical attacks. There do not appear to be any differing actions taken based on the alert status. Given that no differing actions are taken for cyber and physical attacks, it seems it would be more beneficial to use specific information, for example 12 substations have been physically or cyber attacked. This is more meaningful than issuing a red alert that would only indicate more than one site has been attacked.</p> <p>Furthermore, we question the value of communicating the physical and cyber alerts. How does this notification</p>

Organization	Yes or No	Question 9 Comment
		<p>help the BES reliability? Consider the following example. One BA in Oklahoma is 34,323 sq miles. Communicating that an attack occurred in the BA and RC tells other operators that somewhere in Oklahoma an attack occurred. This notification does not present any information that could require actions on the operators’ parts, and will only generate phone calls for more information.</p> <p>Furthermore, PSE and CSE is a type of sabotage already reported in CIP-001 R2. TEA Alerts are already covered in IRO-006-East-1, IRO-009, IRO-010, IRO-014.01 R2.</p> <p>Attachment 1 contains a conflict. The last sentence of the opening paragraph of Attachment 1 reads, “The time frame for declaration of these Alert states shall be consistent with the approach used to declare EEAs and would normally apply to Real Time declarations and not forecast conditions.” In Transmission Emergency Alerts Condition Yellow, Orange and RED: The Reliability Coordinator or Transmission Operator foresees or is experiencing conditions where all available generation resources are committed to respect the IROL and/or is concerned about its ability to respect the IROL. Foresees is a forecast condition.</p> <p>In condition Orange and Red for TEA Level Two/Three, the initial notification requirements are redundant with IRO-006-East-1 R3.2.</p> <p>Under the Make Final Notifications, is curtailed intended to mean canceled or terminated? The term Curtailed in operations generally means cuts for schedules/tags. EEA’s use terminated. Terminated is the preferred term.</p> <p>Distribution Service Providers should be Distribution Provider to be consistent with the Functional Model. Refer to the response to Question #4.</p>

<p>requirement was attempting to define various alert levels. The SDT removed the requirement from the second draft of the standard as outside the scope of this standard.</p>		
Sunflower Electric Power Corp.		Use a Phonetic alphabet in common use in the USA
<p><b>Response: The SDT thanks you for your comments. See response to Question 7.</b></p>		
FirstEnergy	Disagree	<p>We do not support Att. 1 and feel that it should be removed. This attachment is too convoluted, creates confusion among system operators, and not necessary with regard to the goal of this standard. This standard mandates proper three-part communication in all reliability-related communication. Other standards should define and mandate rules associated with the specifics surrounding urgent action situations (i.e. CIP, TOP, EOP standards). Together these standards will arrive at proper communication between entities during alert level situations.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. The SDT removed the requirement from the second draft of the standard as outside the scope of this standard.</b></p>		
ExxonMobil Research and Engineering	Disagree	We have no concerns or suggestions for improvement.
<p><b>Response: The SDT thanks you for your comments.</b></p>		
Duke Energy	Agree	<p>We support the development of this attachment, but question whether it belongs in this standard, especially since it is under field trial. We think it belongs in the EOP standards.</p> <p>We note the Attachment 1 is only associated with notifications by the RC, so we question whether these are Interoperability Communications as that term is defined.</p> <p>Also, the introduction on Attachment is very confusing. Attachment 1 states that definitions for Transmission Loading, Physical and Cyber Security Alert states align with the Emergency Energy Alert (EEA) states as already described in Standard EOP-002-2.1. EOP-002-2.1 and associated EEA Levels provides guidance on Energy and Capacity Emergencies rather than Transmission or Physical/Cyber Alerts.</p>

Organization	Yes or No	Question 9 Comment
		<p>Energy Emergency is defined as a condition when a LSE has exhausted all other options and can no longer provide its customers’ expected energy requirements. This is a totally different classification of Emergency Alert. We suggest deleting the 2nd and 3rd sentences of the introduction to Attachment 1. In addition, Attachment 1 does not contain four system condition alerts, as the SDT has proposed.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT reviewed Requirement R2 and the associated attachment and, based on stakeholder comments and additional deliberations, determined that Requirement R2 is not a requirement that defines a “communication protocol” – rather the requirement was attempting to define various alert levels. PSEG Companies	Agree	<p>Yes. The PSEG Companies agree with the concerns and suggestions expressed in the comments filed by the PJM System Operations Subcommittee (SOS) Group.</p>
<p><b>Response: The SDT thanks you for your comments. Please see the response to PJM SOS Group.</b></p>		

**10. Are you aware of any regional variances that would be required as a result of this standard? If yes, please identify the regional variance.**

**Summary Consideration:**

Commenters stated that if the Central Standard Time zone were required as proposed in R4, there should be a regional variance to allow the WECC to select the time zone to use as a standard. The standard R4 (new Requirement R1, Part 1.1.2) and (new Part 1.1.3) of COM-003-1 is shown below:

1.1.2 Use the 24-hour clock format when referring to clock times.

1.1.3. When the communication is between entities in different time zones, include the time, time zone and indicate whether time is daylight saving time or standard time.

Commenters raised questions about requiring the use of “English” which may conflict with legal requirements of non-English speaking Regions covered by NERC’s standards. The draft standard has been modified to account for law and regulation that mandates another language other than English.

1.1.1. Use the English language when communicating between functional entities, unless another language is mandated by law or regulation.

There were comments expressing concern that “blast” or “all-call” communications used by many RCs conflict with FERC Standards of Conduct issues, especially with respect to Distribution Providers and Generator Operators. The standard no longer references communications that involve “blast” or “all-call” communications.

<b>Response: The SDT thanks you for your comments.</b>		
Pacific Northwest Small Utilities Comment Group	Agree	<p>(This is a yes or no questions)Yes, The RC in the WECC region has no communication with any entity other than the sixteen listed in <a href="http://www.bpa.gov/corporate/business/reliability/Docs/2007/PNSC_RE_Data_Letter_2_070723.pdf">http://www.bpa.gov/corporate/business/reliability/Docs/2007/PNSC_RE_Data_Letter_2_070723.pdf</a>. Although the linked document is on PNSC letterhead, WECC as RC continues this policy. Communication paths involving the RC and any other entity in the west other than the sixteen should be exempt from all the requirements in this standard.</p> <p>If DPs and LSEs must be included in this standard, then there should be an agreement in force beforehand between them and their RC, BA and TOP that they may receive directives, or require the RC, BA and TOP to list those DPs and LSEs that would not receive directives.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The LSEs were eliminated as responsible entities from this standard but some DPs are applicable depending on the impact they have on the BES. We have discussed the use of the letter cited in your comments with our WECC SDT member and he advises us that this arrangement is obsolete as the WECC RC does NOT continue to follow that policy. The WECC RC communicates with all registered Balancing Authorities and Transmission Operators within the Western Interconnection on a regular basis. In accordance with NERC Standard IRO-001-1.1 R3, the RC shall have clear decision-making authority to act and to direct actions to be taken by the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities within its Reliability Coordinator Area to</b></p>		

Organization	Yes or No	Question 10 Comment
<p>preserve the integrity and reliability of the Bulk Electric System. In accordance with NERC Standard IRO-001-1.1 R8, Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall comply with Reliability Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements.</p> <p>While it is typical for WECC RC to communicate, advise and direct Balancing Authorities or Transmission Operators, it is important for other registered entities to recognize that the RC may contact them directly if the situation requires such. Based on this scenario the requirements in COM 003 would apply to those entities if BES conditions warrant it.</p>		
<p>NERC Staff</p>	<p>Agree</p>	<p>Although no questions were asked about Requirement R3, NERC staff is aware that some areas in North America require a language other than English for official communication. In addition, it may be hard to define what “internal communications” are. NERC staff recommends that the phrase “Interoperability Communications. Responsible Entities may use an alternate language for internal communications” be replaced with “Operating Communications between functional entities, unless prohibited by law.” In addition, regions that exist solely in one time zone may ask for a variance from the requirement to use CST for communication.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT appreciates the comments with regards to the possible legal issues associated with the requirement to use English for oral and written Operating Communications. The draft standard has been modified to exempt entities from use of the English language where another language is mandated by law or regulation.</p> <p>The definition for “Interoperability Communication” has been removed and a new definition has been proposed for the term “Operating Communications”.</p> <p>The second draft of COM-003 does not mandate the use of the Central Time Zone and should obviate the need for the identified variance. The second draft of COM-003 includes the following as a replacement for the requirement to use the Central Time Zone:</p> <p><b>1.1.3. When the communication is between entities in different time zones, include the time, local time zone and indicate whether time is daylight saving time or standard time.</b></p>		
<p>California Independent System Operator</p>	<p>Agree</p>	<p>CAISO Comments; The proposed requirement R7 will cause regions operating in any time zone other than Central to draft regional standards to avoid this non-reliability supporting requirement.</p>
<p><b>Response: The SDT thanks you for your comments:</b></p> <p>The SDT has developed an alternative for the common time zone. Instead of requiring the use of a single continent-wide time zone, the</p>		

Organization	Yes or No	Question 10 Comment
<p>standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone and indicate whether time is daylight saving time or standard time when communicating with one or more entities in a different time zone.</p>		
Puget Sound Energy		I might suggest one for R4 by each region that is not in the Central Standard Time zone.
<p><b>Response: The SDT thanks you for your comments</b>                      The SDT has developed an alternative for the common time zone. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone and indicate whether time is daylight saving time or standard time when communicating with one or more entities in a different time zone</p>		
MRO NERC Standards Review Subcommittee	Agree	If the Central Standard time zone is required as noted in R4, we believe there should be a regional variance to allow the WECC to select the time zone to use as a standard.
<p><b>Response: The SDT thanks you for your comments</b>                      The SDT has developed an alternative for the common time zone. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone and indicate whether time is daylight saving time or standard time when communicating with one or more entities in a different time zone.</p>		
Hydro-Québec TransEnergie	Agree	In the Province of Quebec, the use of French is mandatory, according to law, for communication within the Province.R3 should include: Within the Québec Interconnection, the French language shall be used for verbal and written interoperability communication between entities (RC, BA, TO, TOP, GOP, TSP, LSE and DP). For their interoperability communication with entities outside of the Québec Interconnection, they shall use the English language.
<p><b>Response: The SDT thanks you for your comments.</b>                      The SDT appreciates the comments with regards to the possible legal issues associated with the requirement to use English for oral and written Operating Communications. The draft standard has been modified to exempt entities from use of the English language where another language is mandated by law or regulation.</p>		
IRC Standards Review Committee	Agree	Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the parties such as Distribution Provider and Generation Operator cannot have access to these systems due FERC standards of conduct requirements. Requirement 2 and the listing of functional entities

Organization	Yes or No	Question 10 Comment
		<p>required to be notified within the RC footprint in attachment 1 create a de facto requirement for them to have RCIS access or an unnecessary burden to communicate with all functional entities listed separately. Having to communicate to all functional entities in that list verbally and individually would create an unnecessary burden that distracts the RC from actual system operation and represents a detriment to reliability.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT has deleted COM-003 - Attachment 1 and Requirement R2 from the second draft of COM-003 in response to stakeholder concerns.</b></p>		
<p>ISO New England Inc.</p>	<p>Agree</p>	<p>Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the parties such as Distribution Provider and Generation Operator cannot have access to these systems due FERC standards of conduct requirements. Requirement 2 and the listing of functional entities required to be notified within the RC footprint in attachment 1 create a de facto requirement for them to have RCIS access or an unnecessary burden to communicate with all functional entities listed separately. 		interoperability communication with entities outside of the Québec Interconnection, they shall use the English language.
<p><b>Response: The SDT thanks you for your comments. The SDT deleted Requirement R2 and the associated COM-003 - Attachment 1 from the second draft of the standard in response to stakeholder concerns.</b></p> <p><b>The SDT appreciates the comments with regards to the possible legal issues associated with the requirement to use English for oral and written Operating Communications. The draft standard has been modified to exempt entities from use of the English language where another language is mandated by law or regulation.</b></p>		
PJM SOS Comments	Agree	Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. Several of the parties such as Distribution Provider and Generation Operator cannot have access to these systems due FERC standards of conduct requirements. Requirement 2 and the listing of functional entities required to be notified within the RC footprint in attachment 1 create a de facto requirement for them to have RCIS access or an unnecessary burden to communicate with all functional entities listed separately. Having to communicate to all functional entities in that list verbally and individually would create an unnecessary burden that distracts the RC from actual system operation and represents a detriment to reliability.
<p><b>Response The SDT thanks you for your comments.</b></p> <p><b>The SDT deleted Requirement R2 and the associated COM-003 - Attachment 1 from the second draft of the standard in response to stakeholder concerns.</b></p>		
PJM	Disagree	Many RC communications are issued to multiple parties using blast communication systems such as the RCIS. The Empire District Electric	Agree	NO

Consideration of Comments on OPCP SDT — Project 2007-02

Organization	Yes or No	Question 10 Comment
Company		
PSEG Companies	Disagree	No regional variances would be required to the best of PSEG's knowledge.
SERC OC&SOS Standards Review Group	Disagree	No, we are not aware of any regional variances.
National Grid	Disagree	None
NIPSCO	Disagree	none
NextEra Energy Resources, LLC	Disagree	None at this time.
Consumers Energy		None.
Westar Energy	Agree	not aware
Orange and Rockland Utilities, Inc.	Disagree	Not aware
FirstEnergy		Not aware of any
<b>Response: The SDT thanks you for your comments.</b>		
Pepco Holdings, Inc. - Affiliates	Agree	PHI asserts that WECC would say NO to Central Standard Time.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has developed an alternative for the common time zone. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</p>		
NRECA RTF	Agree	POSSIBLE FRCC VARIENCE - FRCC appears to have developed a communication protocol in which “any or all

Organization	Yes or No	Question 10 Comment
Members		conversations on the phone are considered a directive. If this case, we suggest that the drafting team review the FRCC approach and determine if a regional variance should be included in this standard or consider utilizing the FRCC approach for clearly defining the term “directive” for inclusion in the NERC Glossary.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT cannot comprehend how every conversation could be a directive. The SDT would have to understand the rationale and logic of such a communication protocol before rendering a response.</b></p>		
Transmission System Operations	Agree	Refer to Question #5; we do not agree with using Central Standard Time.
<p><b>Response: The SDT thanks you for your comments. The SDT has developed an alternative for the common time zone. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
Electric Market Policy	Agree	Some ISO/RTOs have market rules which allow participants to elect NOT to follow instructions issued by their market operator (who may also perform BA, TOP and/or RC entity functions) unless an Emergency exists.
<p><b>Response The SDT thanks you for your comments. The SDT recognizes different regions may have various market rules, but feels that the NERC Reliability Standards clearly identify requirements to follow reliability directives and indicate acceptable reasons for not complying with a directive.</b></p>		
ExxonMobil Research and Engineering	Disagree	We are not aware of any regional variances that would be required as a result of this standard.
<p><b>Response: The SDT thanks you for your comments.</b></p>		

**11. Are you aware of any conflicts between the proposed standard and any regulatory function, rule order, tariff, rate schedule, legislative requirement or agreement? If yes, please identify the conflict.**

**Summary Consideration:**

Commenters again point out requiring use of “English” may conflict with legal requirements of non-English speaking footprints covered by NERC. The draft standard has been modified to exempt entities bound by law or regulation from applicability of R3 (new Requirement R1, Part 1.1.1).

1.1.1. Use the English language when communicating between functional entities, unless another language is mandated by law or regulation.

Comments regarding a common Central Standard Time zone reference warned of confusion and cost impacting commercial electric power capacity and energy markets. R3 (new Requirement R1, Part 1.1.2 and 1.1.3) of COM-003-1 has been modified to:

1.1.2. Use the 24-hour clock format when referring to clock times.

1.1.3. When the communication is between entities in different time zones, include the time, local time zone and indicate whether time is daylight saving time or standard time.

*(Example: 1500 EST or Eastern Standard Time).*

Commenters state that TSPs, DPs and LSEs may not own or operate any Facilities, and indicated that inclusion of these entities as proposed in COM-003 is an unnecessary burden. The SDT removed TSPs and LSEs from the applicability of COM-003 as they were not identified in the SAR. The specified role of the DP to shed load justifies the retention of the DP as an applicable Entity. The requirements of COM-003-1 are only applicable to Operating Communications. To the extent that entities do not operate, or do not take actions that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System, COM-003-1 would not apply.

Commenters raised concern that requirements of the proposed COM-003 Standard conflict with Energy Policy Act of 2005 by shifting real time operator’s focus from reliable operation of the BES to complying with communication protocol. The SDT respectfully disagrees, and believes that COM-003 will lead to a tightening of communications, which in turn will contribute to enhanced reliable operations of the BES.

Florida Municipal Power Agency (FMPA) and some members	Disagree	(FMPA assumes that "Disagree" means that we are not aware of any conflicts)
<b>Response: The SDT thanks you for your comments.</b>		
Pacific Northwest Small Utilities Comment Group	Agree	(This is a Yes or No Questions)Yes, see our comments to Q2.
<b>Response: The SDT thanks you for your comments. Please see SDT response to Q2 comments.</b>		
Santee Cooper	Agree	A lot of the requirements in this standard could be considered a “best practice” for the industry rather than reliability related.
<b>Response: The SDT thanks you for your comments. The SDT believes these requirements play an important role in managing the human factor to eliminate miscommunication that would result in adverse effects on the BES.</b>		
NERC Staff	Agree	Although no questions were asked about Requirement R3, NERC staff is aware that some areas in North America require a language other than English for official communication. In addition, it may be hard to define what “internal communications” are. NERC staff recommends that the phrase “Interoperability Communications. Responsible Entities may use an alternate language for internal communications” be replaced

Organization	Yes or No	Question 11 Comment
		with “Operating Communications between functional entities, unless prohibited by law.”
<p><b>Response: The SDT thanks you for your comments. The draft standard has been modified to exempt entities from use of the English language where another language is mandated bylaw or regulation. The second draft of the standard clarifies that the requirement to use English only applies with the Operating Communication involves more than one functional entity.</b></p> <p><b>The definition for “Interoperability Communication” has been removed and a new definition has been proposed for the term “Operating Communications” in the current draft of the standard.</b></p>		
Bureau of Reclamation	Disagree	As indicated in the previous response the standard conflicted with DHS notifications.
<p><b>Response: The SDT thanks you for your comments. The SDT removed Requirement R2 and the associated attachment from the revised standard.</b></p>		
MRO NERC Standards Review Subcommittee	Agree	Attachment 1, Physical Security is a basis for the SAR for Project 2009-02, Disturbance and Sabotage reporting SDT.
<p><b>Response: The SDT thanks you for your comments and bringing that reference for PSEA to our attention. The SDT removed Requirement R2 and the associated attachment from the revised standard. The SDT has recommended that Project 2009-01 – Disturbance and Sabotage Reporting pick up the requirement to issue notifications to operating entities when the BES is in an alert or emergency state.</b></p>		
PacifiCorp	Disagree	Currently, PacifiCorp’s Open Oasis Access Same-Time Information System (OASIS) allows time to be shown displays time in Pacific Standard Time. Mandating all Interoperability Communications to be held in Central Standard Time may cause confusion with regard to transactions and activities conducted on OASIS - which ultimately relate to real-time operations.
<p><b>Response: The SDT thanks you for your comments. The SDT has developed an alternative for the common time zone. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
E.ON U.S. LLC	Disagree	If the requisite protocols are intended to be followed by all field personnel, applicability of these requirements to Distribution Providers could run afoul of FPA Section 215(a) codified in 18CFR39.1.
<p><b>Response: The SDT thanks you for your comments. The SDT requires more detail on how FPA Section 215(a) codified in 18CFR39.1 is affected by the protocols of COM- 003-01. The second draft of COM-003 provides greater clarity on when to use the various communication protocols.</b></p>		

Organization	Yes or No	Question 11 Comment
<p>Please review the second draft of the standard to see if you still have concerns about the applicability of these protocols.</p>		
We Energies	Agree	<p>In general, establishing CST as a uniform time zone may conflict with individual Tariffs regarding references to wholesale electric market commercial activities and could cause additional confusion if commercial market time zone references are independent of reliability time zone references.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT has developed an alternative for the common time zone. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
Hydro-Québec TransEnergie	Agree	<p>In some market structures, TSPs and LSE do not own or operate equipment. Thus, including them in the requirements is an unnecessary burden for these areas. The requirement to use CST attempts to determine HOW entities operate within their various footprints and it would significantly change the way many Markets are structured. To implement this into existing Markets would cost significant time, and resources while not enhancing reliability in these areas. When operating across time-zones, simply referencing “Central Standard Time” or “Eastern Standard Time” is sufficient for other operating entities to reliably operate. Many entities would have to modify their existing practices, hardware, software, Control System, billing systems, bidding systems, etc. We are strongly opposed to this requirement.</p>
<p><b>Response: The SDT thanks you for your comments.</b>  <b>The SDT appreciates the comments with regards to concerns related to including TSPs and LSEs that do not own or operate facilities that are a part of the BES. The SDT has removed the TSPs and LSEs because they were not bound by this requirement in the originating SAR.</b>  <b>The SDT has modified Requirement R4 (Now Requirement R1, Part 1.1.3 of the second draft) and believes it has addressed the concerns identified in your comments about time zones. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when communicating with one or more entities in a different time zone.</b></p>		
IRC Standards Review Committee	Agree	<p>In some market structures, TSPs and LSE do not own or operate equipment. Thus, including them in the requirements is an unnecessary burden for these areas. The requirement to use CST attempts to determine HOW entities operate within their various footprints and it would significantly change the way many Markets are structured. 		already adopted by the electric industry.
<p><b>Response: The SDT thanks you for your comments. The SDT removed Requirement R2 and the associated attachment from the revised standard.</b></p>		
Electric Market Policy	Agree	PJM members are only required to comply during an Emergency.
<p><b>Response: The SDT thanks you for your comments. Please provide the specific Requirements and terms of those requirements that PJM members “are only required to comply during an Emergency.”</b></p>		
Southern Company Transmission	Agree	Southern Company supports the SERC SOS comments. SERC SOS comments: We do see a potential conflict with the Energy Policy Act 2005, which set the framework for the Electric Reliability Organization (ERO). The ERO’s mission is to oversee and protect the reliability of the Bulk Electric System. This standard seems to cross the line between reliability-related activities and other types of operating actions. The concern here is that system operators will focus on the letter of the standard rather than on good operating practice. The fear of a violation among operators may have a greater impact on reliability than the violation itself.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT appreciates the comments with regard to concerns that COM-003 conflicts with the Energy Policy Act of 2005. The SDT respectfully disagrees, and believes that COM-003 will lead to a tightening of communications, which in turn will contribute to reliable operations of the BES. The Blackout Report Recommendation #26 states, communication protocols should be tightened especially those for alerts and emergency communications. FERC Order 693 P531 directed that communication protocols be tightened and suggested a new COM Reliability Standard as an acceptable approach. The SAR for this SDT charged the team to “tighten communication protocols, especially for communications during alerts and emergencies.” Additionally the SAR required “the use of specific communication protocols, enabling information to be efficiently conveyed and mutually understood for all operating conditions.” As one element of complying with this charge, the SDT has captured the industry wide practice of three part communications as an integral element of this standard. This requirement is currently in COM-002-2 R2.</b></p>		
ExxonMobil Research and Engineering	Disagree	We are not aware of any conflicts.
<p><b>Response: The SDT thanks you for your participation.</b></p>

**12. Do you have any other comments to improve the draft standard? If yes, please elaborate in the comment area.**

**Summary Consideration:**

Many commenters stated high VRFs and severe VSLs are too harsh for the requirements of this standard. The potential penalties associated with violating these requirements could be very significant for violating a communication protocol even if no adverse impact occurs on the BES. The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in COM-003-1. In the second draft of the standard all VRFs are Medium.

Some commenters suggested modifications to COM-002-3 should be switched from Project 2006-06 and absorbed into COM-003-1 to simplify coordination of the changes on each of these standards. The Operating Personnel Communications Protocol SDT has been directed by the NERC Standards Committee to coordinate with the RC SDT and continue development of both standards simultaneously. Note however, that the OPCP SDT proposes retirement of COM-002 when COM-003 becomes effective.

Commenters pointed out the effective date listed in the proposed standard did not agree with the effective date shown in the COM-003-1 Implementation Plan. After comparing the effective dates listed in the COM-003-1 Implementation Plan and the proposed standard, the SDT has modified the Implementation Plan to match the proposed standard's effective date, providing entities at least six months after approvals before the standard becomes effective.

One commenter indicated that the Data Retention period should be expressed in days instead of months because of the inconsistency in the number of days per month. The SDT agrees that that the data retention periods should be expressed in a term other than months.

Commenters questioned if the standard should apply to Transmission Owners, Generator Owners, Distribution Providers, Interchange Authorities (Interchange Coordinators), Load-Serving Entities, and Purchasing-Selling Entities. The second draft of the

The Quality Review team recommended that the OPCP SDT modify Requirements R2 and R3 to clarify that these requirements for performance of three-part communication exclude Reliability Directives. This eliminates the double jeopardy issue that may have existed if both COM-002 and COM-003 were approved.

Thus – the revised COM-003 does include the term, Reliability Directive. In addition, the implementation plan was revised to no longer recommend retirement of COM-002. As modified, the two standards can exist without conflict. COM-002 requires the issuer of an Operating Communication to identify that communication as a “Reliability Directive” which gives recipients notice that the directive is associated with an “Emergency”. COM-003 now specifically identifies that the requirements for three part communication do not include “Reliability Directives.”

Per Standards Committee guidance, the SDT did not revise all the responses in this report that indicate COM-003 does not include the term, “Reliability Directive” nor did the team revise all the responses that indicated the team recommended retirement of COM-002.

standard has eliminated the Transmission Owner, Load-Serving Entity, and Purchasing-Selling Entity from the list of applicable entities. The SDT did not remove the Distribution Provider and did not add the Generator Owner or the Interchange Authority (Interchange Coordinator). The intent of the proposed standard is to apply only to those entities that send or receive Operating Communications and operate Facilities on the BES as a result of those communications, thus eliminating both the Transmission Owner and Transmission Service Provider from the standard. Because the Distribution Provider does participate in real-time communications for actions such as load shedding, the Distribution Provider was not removed from the second draft of the standard.

A commenter stated that the requirement in the Data Retention section for an entity found to be non-compliant to retain data until found compliant does not belong in a standard, because it is already mandated in the NERC Compliance Violation Investigation process. The SDT developed this language to be consistent with the NERC Standard Drafting Team Guidelines.

A commenter recommends the word “timely” should be removed from the Purpose statement since none of the requirements specify a time period. Since none of the Requirements specify a time limit for executing the required communications, the SDT removed “timely” from the second draft of COM-003.

Florida Municipal Power Agency (FMPA) and some members	Agree	<p>(FMPA assumes that "Agree" means "Yes, we do have other comments")</p> <p>The Violation Risk Factor for R2 should be “Low”, not “High”. It is administrative in nature.</p> <p><b>The SDT removed Requirement R2 from the revised standard.</b></p> <p>The Measures make the types of evidence an “or” statement, e.g., “(e)vidence may include ... voice recording, transcripts, operating logs, OR on site observations” (emphasis added). The Data Retention section seems to make evidence an “and” statement, e.g., “Each ... (Responsible Entity) shall retain ... dated operator logs for the most recent 12 months AND voice recordings or transcripts ... for ... 3 months” (emphasis added). These statements are inconsistent with each other and both ought to be “or” statements.</p> <p><b>The SDT appreciates the comment in regard to the difference between the Data Retention requirement and the documentation listed in Measure 2 (new standard format). The Data Retention section “format” for standards has been modified to eliminate the specificity in the section. As a result the AND language has been eliminated</b></p>

Organization	Yes or No	Question 12 Comment
		<p>and the conflict is eliminated.</p> <p><b>After consideration, the SDT has decided to modify the language of</b> Due to the variability of the length of a month, data retention ought to be expressed in days rather than months, e.g., 90 days instead of 3 months.</p> <p><b>The SDT agrees that that the data retention periods should be expressed in a term other than months. The SDT revised the standard so that the data retention now says, “the most recent 365 days.”</b></p> <p>Why is the Transmission Owner included in the applicability of the standard? What “Interoperability Communications” are they involved with? If the Transmission Owner is included, why isn’t the Generation Owner? Explain the inconsistent treatment of Transmission Owners and Generator Owners.R3</p> <p><b>With regard to COM-003-1 the second draft of the standard does not apply to Transmission Owners or Generator Owners as (according to the Functional Model) they don’t engage in real-time Operating Communications. The intent of the proposed standard is to apply only to those entities that send or receive Operating Communications and operate facilities on the BES as a result of those communications.</b></p> <p>- what if an entity starts to communicate in a language other than English, but, as part of the 3 part communication process changes to English and completes all steps of 3-part communication in English, is that entity non-compliant or compliant?</p> <p><b>The SDT would like to point out that R3 is now requirement R1 Part 1.1.1 in the revised standard and uses the term “Operating Communications”. As envisioned, the oral or written Operating Communication would be in English no matter what language previous conversations took place in unless another language is mandated law or regulation.</b></p> <p>How should EOP-001-0, R4.1 coordinate with COM-003-1? Should EOP-001-0, R4.1 focus on internal Entity communications?</p> <p><b>R4.1 of EOP-001 as a whole requires “plans” for mitigating emergencies. These communication protocols differ from COM-003 protocols in that R4.1 (now R3.1 in EOP-001-2b) involves actions and tasks for mitigating operational emergencies and for coordinating activities; not how to communicate.</b></p>

Organization	Yes or No	Question 12 Comment
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Pacific Northwest Small Utilities Comment Group</p>	<p>Agree</p>	<p>(This is a Yes or No Questions)The proposed standard seems to have just thrown everyone into the pot, and not considered how registered entities interact with the BES or what other standard requirements apply to them. We cannot lose sight of the original objective of, not only ERO Compliance, but the “purpose” described in regards to the development of this standard (Posted as background information on Project 2007-02). The stated purpose is, “To ensure that reliability-related information is conveyed effectively, accurately, consistently, and timely to ensure mutual understanding by all key parties, especially during alerts and emergencies.”With this said, The BA’s, TOP’s and RC’s are the key registered entities that have the power to take action, they are the key players in the communication of information which “impacts” the BES. We fail to see the value added by including DP’s and LSE in most of the requirements of this standard. If anything, we see the opposite affect taking place by adding DP &amp; LSE’s. This may be an extra tier of unnecessary communication that would not only slow down this process, but just may contribute to greater inefficiencies. Please note that many DP &amp; LSE in the WECC region are very small utilities that do not have 24 by 7 coverage.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has modified R4 and R5 (now requirement R1 Parts 1.3.1, 1.3.2 and 1.3.3 in the second draft of COM-003) to address your concerns. The revisions made narrow the list of responsible entities to just those that actually are involved in “Operating Communication” – defined as communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</b></p> <p><b>The SDT appreciates the comments with regards to concerns related to including DPs and LSEs. The SDT has removed the LSEs because they were not bound by this requirement in the originating SAR. The specified role of the DP to shed load justifies the retention of the DP as an applicable Entity.</b></p> <p><b>COM-003-1 does not address the required real time response or the required coverage for small utilities. To the extent they operate BES assets they must comply with applicable standards.</b></p>		
<p>Xcel Energy</p>	<p>Agree</p>	<p>1) Recommend removal of the references to measures in the data retention section of the standard. It is only necessary to refer to the requirements, which is already included.</p> <p>2) The data retention section should also be modified to refer generically to evidence, instead of "dated operator logs... and voice recordings or transcripts of voice recordings...". This is because the measures specifically allow for other types of evidence, as stated: "Evidence of use may include but is not limited to voice recordings, transcripts, operating logs, or on site observations."</p>

Organization	Yes or No	Question 12 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>1 The SDT appreciates the comment in regard to the Data Retention section referring to Requirements instead of Measures. The drafting team has reviewed the Drafting Team Guideline document and notes that on page 41, both Requirements and Measures appear in Data Retention.</b></p> <p><b>2 The SDT agrees with the comment regarding the use of “evidence” in the Data Retention section and has modified the Data Retention section to eliminate the specific references to types of evidence in support of your suggestion.</b></p>		
Consumers Energy	Agree	Amplification of the communication process is needed but this draft reaches beyond Communication to the start of drafting procedures for three separate emergency conditions while it leaves one alone. Focusing on the communication process is in order.
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT removed Requirement R2 and the associated Attachment from the second draft of COM-003 based on stakeholder comments and concerns that the required performance went beyond requiring use of specific communications protocols.</b></p>		
Duke Energy	Agree	<p>As a general comment, all the requirements other than R1 are High VRFS with only Severe VSLs. As this standard is written to apply broadly to routine as well as emergency communications between entities, we believe that failure to meet these requirements would rarely impact the reliability of the Bulk Electric System. For example if in routine switching an operator says “Baker” instead of “Bravo”, the entity is subject to FERC’s most severe penalty.</p> <p>Clearly the basis for this standard needs to be reassessed. If we use the test that if a requirement or a standard supports/encourages reliability and security, then entities should invest the time and effort to track performance to ensure auditable compliance. For example - Does DCS compliance support/encourage reliability/security? The industry would generally say yes - so the tracking and determination of auditable compliance is justified. But would auditable compliance to this draft of COM-003-1 support/encourage reliability/security? We don’t think so, given the vague and general nature of this draft. It certainly would not justify the amount of work and effort it would take to ensure auditable compliance with this COM-003-1 draft, given the amount of effort it would take to monitor all recorded communications that fit within this vague draft standard. Bottom line is that we think COM-003 is not needed. As proposed, it is a “how” and not a “what” based standard that will create more distraction from reliability/security than any value it might add.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. The VRFs in the second draft are all Medium.</b></p>		

Organization	Yes or No	Question 12 Comment
<p>Additionally, the SDT modified the requirement to approve accurate “accurate alpha-numeric clarifiers” to address the example you provided. (See Requirement R1, Part 1.2 in the second draft of COM-003.)</p> <p>The Blackout Report Recommendation #26 states, communication protocols should be tightened especially those for alerts and emergency communications. FERC Order 693 P531 directed that communication protocols be tightened and suggested a new COM Reliability Standard as an acceptable approach. The SAR for this SDT charged the team to “tighten communication protocols, especially for communications during alerts and emergencies.” Additionally the SAR required “the use of specific communication protocols, enabling information to be efficiently conveyed and mutually understood for all operating conditions.”</p> <p>The OPCP SDT was chartered to develop Communication Protocols for Operating Personnel. The SDT proposes that the second draft of the standard is more focused on “what” protocols to use in specific situations. In short COM 003 is needed and required.</p>		
<p>New York State Reliability Council</p>	<p>Agree</p>	<p>Comments: R1 requires each entity to create a CPOP. There is not a requirement to coordinate CPOP’s amongst entities beyond the requirements in the Standard. There is no requirement to exchange CPOP’s between entities with an operating relationship. The SDT should consider adding a requirement either that allows entities with operating relationships to request and be provided a copy of the other’s CPOP, or a requirement requiring the exchange of CPOP between entities with operating relationships.</p> <p>Additionally, we cannot understand how all requirements but R1 have been determined to have a HIGH VRF when, many of them are dictating HOW communications should take place and not when and why or what. High Risk Factor requirement (a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures. NYSRC does not believe that any requirement in this Standard if violated would have the results specified in the definition of a High VRF, especially since these requirements are addressing the HOW of communication.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>Many of the comments we received pointed out that having a CPOP is an administrative activity. The SDT deleted the requirement for a CPOP in the second draft of COM-003-1.</p> <p>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. In the second draft of the standard all VRFs are Medium. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in COM-003-1.</p>		
<p>ExxonMobil</p>	<p>Agree</p>	<p>Compliance paragraph 1.4 bullet 2 implies that all entities retain 3 months worth of telephone voice recordings</p>

Organization	Yes or No	Question 12 Comment
Research and Engineering		<p>through its use of the word ‘and’ in the statement “Distribution Provider shall retain for Requirement 2 through 7, Measure 2 through 7, dated operator logs for the most recent 12 months and voice recordings or transcripts of voice recordings for the most recent 3 months”. While many utility companies employ the use of voice recorders, many industrial facilities do not. When a facility does not currently employ the use of voice recorders, is it the intent of this document to require the facility to install the infrastructure necessary to record and store telephone conversations? If so, what is the time line for deploying the infrastructure necessary to record and store telephone conversations?</p> <p>Currently, we maintain a log of our communications which includes the question or instruction and our (or in the case of a question the third party’s) response. Does this satisfy the evidence criteria as defined in measures M2 through M7 of the proposed standard?</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT appreciates the comment in regard to the difference between the Data Retention requirement and the documentation listed in Measures 2 through 7. After consideration, the SDT has decided to modify the language of the Data Retention section to eliminate specific references to types of evidence.</b></p> <p><b>Recorded voice conversations are one of several measurement options. The entity is permitted to use any measurement method to demonstrate compliance. Written transcripts with appropriate and accurate information or on site observations are acceptable forms of evidence.</b></p>		
FirstEnergy	Agree	<p>Coordination of SDT Efforts - We feel that the NERC Standards Committee should direct the Reliability Coordination SDT to hand over COM-002 to this OPCPSDT since those requirements will eventually be moved to COM-003-1. It is difficult to coordinate all these changes on a separate basis and moving the development to one SDT would help better coordinate these efforts. The current path forward is inefficient and causes confusion, not only for industry but also for the two drafting teams.</p> <p>Purpose Statement - We feel the phrase "especially during alerts and emergencies" implies that using proper communications protocol during normal operating situations is not as important as during emergencies. It is not appropriate to include this phrase in the purpose statement of a standard, and we suggest it be removed. Also, we suggest removing the word "timely" since this standard does not mandate time limits on communications.</p> <p>Compliance Section 1.4 Data Retention - We do not agree with the following statement for data retention "If a Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator, Transmission Service Provider, Load Serving Entity or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant." We feel that this is not appropriate in a</p>

Organization	Yes or No	Question 12 Comment
		<p>reliability standard since it is already mandated through Compliance Violation Investigations (CVI). Also, we feel that it is more applicable to NERC’s Rules of Procedure. Therefore, we suggest it be removed from the standard.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT sees some merit in your recommendation to hand over COM-002 to this OPCP SDT but the RC SDT and the OPCP SDT are at a stage in the standards development process where that change would impede progress on both initiatives. The drafting teams are coordinating the efforts of the two SDTs to address issues and to ensure there are no conflicts. As envisioned, the COM-002 standard will be retried when COM-003 becomes effective.</p> <p>The SDT also agrees with your statement that using proper communications protocol during normal operating situations is as important as during emergencies. We have removed the phrase "especially during alerts and emergencies" from the purpose statement. It now reads:                      “To specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of the BES.”</p> <p>In addition, the SDT created the proposed term “Operations Communications” that applies to any communications that will change the state of the BES.</p> <p>The SDT appreciates the comment in regard to the word “timely” being used in the Purpose statement of the proposed standard. Since none of the Requirements specify a time limit for executing the required communications, the SDT removed “timely”.</p> <p>The SDT appreciates the comment in regard to Data Retention for an entity which is found to be non-compliant. The SDT developed this language to be consistent with the NERC Standard Drafting Team Guidelines. This has been updated to now say, “until mitigation is complete”</p>		
Great River Energy	Agree	<p>GRE believes that the existing standard COM-002 is actually better than this standard. This standard actually causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT feels that the current version of the draft COM-003-1 standard clarifies a lot of industry concerns and will contribute greater value to reliability.</b></p>		
PPL	Agree	<p>If this draft standard would be approved as it is currently proposed, the implementation plan is way too short considering all the process and system changes that are needed to comply with the numerous additional requirements.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has made several changes to the draft standard that will simplify the Implementation Plan. The SDT has reviewed the Implementation Plan</p>		

Organization	Yes or No	Question 12 Comment
<p><b>and extended it to give a minimum of six months following approval before the new requirements become effective.</b></p>		
<p>NextEra Energy Resources, LLC</p>	<p>Agree</p>	<p>In the case of nuclear plant operations, NRC communication requirements and the requirements of NERC NUC-001 for nuclear facilities more than adequately cover communication requirements. COM-003 should not be applicable to Nuclear Generator Operators since doing so will introduce an additional, unnecessary, and potentially conflicting level of requirements.</p> <p>Measures: Next Era suggests that the SDT clarify the periodicity of providing evidence of compliance and on what constitutes sufficient evidence of CPOP acceptance.</p> <p>Violation Severity Levels: Next Era encourages the SDT to revisit the violation severity levels. In the case of most of the requirements it is unreasonable to levy Severe penalties in instances where the operator may have deviated from the requirements but the communication occurred in an unencumbered and successful manner as evidenced by the use/acknowledgement outcomes of three-part communication.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has reviewed NUC 001, specifically R9.4 and could not readily find a conflict with the second draft of COM 003. The SDT would expect the entities affected to incorporate the Requirements of COM 003 where applicable.</b></p> <p><b>The SDT has deleted the requirement for a CPOP in the second draft of COM-003-1.</b></p> <p><b>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. All requirements in the second draft of the standard have been assigned a Medium VRF. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in COM-003-1.</b></p>		
<p>Transmission Owner</p>	<p>Agree</p>	<p>In the case of nuclear plant operations, NRC communication requirements and the requirements of NERC NUC-001 for nuclear facilities more than adequately cover communication requirements. COM-003 should not be applicable to Nuclear Generator Operators since doing so will introduce an additional, unnecessary, and potentially conflicting level of requirements</p> <p>Measures: FPL suggests that the SDT clarify the periodicity of providing evidence of compliance and on what constitutes sufficient evidence of CPOP acceptance.</p> <p>Violation Severity Levels: FPL encourages the SDT to revisit the violation severity levels. In the case of most of the requirements it is unreasonable to levy severe penalties in instances where the operator may have deviated from the requirements but the communication occurred in an unencumbered and successful manner as evidenced by the use/acknowledgement outcomes of three-part communication.</p>

Organization	Yes or No	Question 12 Comment
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT has reviewed NUC 001, specifically R9.4 and could not readily find a conflict with the second draft of COM 003. The SDT would expect the entities affected to incorporate the Requirements of COM 003 where applicable.</p> <p>The SDT has deleted the requirement for a CPOP in the second draft of COM-003-1.</p> <p>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. All requirements in the second draft of the standard have been assigned a Medium VRF. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in COM-003-1.</p>		
Northeast Utilities	Agree	<p>Many of the requirement proposed in this posting either reiterate the drafts as posted (i.e. English language) or introduce confusion when compared to the drafts as posted. The scope should be limited to R2 and R7, so as not to duplicate or contradict the on-going work of other SDTs. (Agree = Yes)</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT feels that the requirements in the second draft of COM 003 are appropriate because they comply with the purpose identified in the SAR. The SDT also is aware of the efforts and progress of other SDTs and coordinates with them in order to avoid duplicative efforts or contradiction.</p>		
NERC Staff	Agree	<p>NERC staff questions whether this standard applies to the Transmission Service Provider and the Transmission Owner. It is unclear from the functional model where they would be involved in real-time operations communications.</p> <p>It is also unclear why the Violation Risk Factor for every requirement is High, and the Violation Severity Level for all but the first requirement is Severe. This automatically elevates any violation of any of these requirements to the highest penalty level that is imposed. The NERC staff recommends that the SDT review the latest guidelines for assignment of VSLs and consider alternatives that could expand/graduate the VSLs to account for varying severity of non-compliances.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT appreciates the comments with regards to concerns related to including TSPs. The SDT has removed the TSPs because they were not bound by this requirement in the originating SAR. The SDT removed the Transmission Service Provider and Transmission Owner from the second draft of the standard. The intent of the proposed standard is to apply only to those entities that send or receive "Operating Communications." The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. All requirements in the second draft of the standard have been assigned a Medium VRF. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in COM-</p>		

Organization	Yes or No	Question 12 Comment
<b>003-1.</b>		
Westar Energy	Agree	no additional comments
Orange and Rockland Utilities, Inc.	Disagree	No additional Comments
<b>Response: The SDT thanks you for your participation.</b>		
NorthWestern Energy	Agree	NorthWestern feels that the current communication standards are sufficient for reliable BES Operations.
<b>Response: The SDT thanks you for your comments. The SDT respectfully points out that various FERC Orders and Directives (FERC Order 693 P531 ) supported by the findings of the Blackout Report Recommendation #26 states, communication protocols should be tightened especially those for alerts and emergency communications. That communication protocols be tightened and suggested a new COM Reliability Standard as an acceptable approach. The SAR for this SDT charged the team to “tighten communication protocols, especially for communications during alerts and emergencies.” Additionally the SAR required “the use of specific communication protocols, enabling information to be efficiently conveyed and mutually understood for all operating conditions.”</b>		
PEF	Agree	<p>PEF believes additional NERC defined entities (such as Generators Owners) should be made applicable to this standard. Specifically, PEF believes that the Interchange Authority should be added due to the communications required between the Reliability Coordinator and the Interchange Authority.</p> <p>PEF also believes that the adoption of R4 would have major implications on the tagging process. PEF believes that all tagging would be required to be done using CST due to schedule check-out between BAs, TSPs, LSEs and RCs. Therefore, PSEs should be made applicable as well for R3 and R4.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The proposed standard has been made applicable to the Functional Entities defined by the SAR. The intent of the proposed standard is to apply only to those entities that send or receive Operating Communications and own and operate Facilities on the BES as a result of those communications.</p> <p>The SDT understands your concerns and is proposing an alternative requirement in the second draft of COM 003 which we believe will address your concerns. Instead of requiring the use of a single continent-wide time zone, the standard now requires that during Operating Communication an applicable entity shall explicitly state the time and time zone, and indicate whether the time is daylight saving or standard time, when</p>		

Organization	Yes or No	Question 12 Comment
<p><b>communicating with one or more entities in a different time zone.</b></p>		
<p>Long Island Power Authority</p>	<p>Agree</p>	<p>R1 requires each entity to create a CPOP. There is not a requirement to coordinate CPOP’s amongst entities beyond the requirements in the Standard. There is no requirement to exchange CPOP’s between entities with an operating relationship. The SDT should consider adding a requirement either that allows entities with operating relationships to request and be provided a copy of the other’s CPOP, or a requirement requiring the exchange of CPOP between entities with operating relationships.</p> <p>Additionally, we cannot understand how all requirements but R1 have been determined to have a HIGH VRF when, many of them are dictating HOW communications should take place and not when and why or what. High Risk Factor requirement (a) is one that, if violated, could directly cause or contribute to bulk power system instability, separation, or a cascading sequence of failures, or could place the bulk power system at an unacceptable risk of instability, separation, or cascading failures. LIPA does not believe that any requirement in this Standard if violated would have the results specified in the definition of a High VRF, especially since these requirements are addressing the HOW of communication.</p>
<p><b>Response: The SDT thanks you for your comments. Many of the comments we received pointed out that this is an administrative function and not a reliability function. It has been decided by the SDT to delete the requirement for a CPOP in the second draft of COM-003-1.</b></p> <p><b>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. All requirements in the second draft of the standard have been assigned a Medium VRF. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in the second draft of COM-003-1.</b></p>		
<p>Bonneville Power Administration</p>	<p>Agree</p>	<p>R3 creates a special need for multi language operators. US and US-involved entities need to use English in all instances, not only for reliability purposes, but for internal communication purposes and to be able to hire replacements without competing for an artificially small set of operators and to be auditable by NERC.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT agrees that English is the mandatory language for “Operating Communications“ except where another language is mandated by law or regulation.</b></p>		
<p>We Energies</p>	<p>Agree</p>	<p>Remove “timely” from the Purpose section, since a time period is not part of any requirement.</p> <p>According to the NERC Reliability Standards Development Procedure, Compliance Monitoring Period and Reset are required elements, and should be included. M1 through M7 should indicate which requirement they pertain to.</p> <p>Compliance enforcement should be focused on Reliability Directives only. Rather than proving 100% compliance,</p>

Organization	Yes or No	Question 12 Comment
		<p>it is more practical if each party is obligated to report instances of unclear communication to the other party/parties involved in the Reliability Directive(s). Defining a remediation plan could be part of the requirement, with a measure being whether or not the remediation was implemented.</p> <p>An overall observation is that the intended communication updates could be implemented through modification of existing COM-001 &amp; COM-002 standards without the need for another overlapping standard. Additional industry focus regarding communication protocols could be further emphasized through NERC System Operation Certification Program requirements and training.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The word “timely” has been removed from the purpose statement in the second draft of COM 003--1.</p> <p>The requirement for Compliance Monitoring Period and Reset has been removed from the RSDP – the RSDP was retired some time ago. Standards are now developed in accordance with the Standard Processes Manual.</p> <p>For the second draft of the standard, the SDT has added a reference to each Measure to identify the requirement it supports.</p> <p>Compliance will be applicable to all “Operating Communications” that alter the state of the Bulk Electric System. The terms “directive” and “Reliability Directive” have not been included in the second draft of COM-003.</p> <p>With regard to your proposal to report unclear communication, the SDT has changed the standard’s requirement to direct both parties involved in operating communications to repeat information until clarity is achieved among all parties. (See Requirements R2and R3 in the second draft of COM-003.)The SDT believes this will address your concern.</p> <p>The SDT feels that the existing COM standards are not clear in some instances and do not cover important communication protocols. The proposed plan is to retire COM-002 and any of its successors when COM-003 becomes effective.</p>		
Southern Company Transmission	Agree	<p>Southern Company supports SERC SOS comments.</p> <p>SERC SOS comments:</p> <p>This review group has identified several problems with this standard, as noted above.</p> <p>Other observations include:</p> <p>The effective dates in the draft standard and in the implementation plan do not seem to match. In the standard, the effective date mentions one calendar year following regulatory approval, while the implementation plan refers to the third calendar quarter after regulatory approval.</p> <p><b>The SDT has made several changes to the draft Standard that required changes to the Implementation Plan. The SDT updated the Implementation Plan to ensure the changes can be made in an appropriate time frame</b></p>

Organization	Yes or No	Question 12 Comment
		<p><b>and accurately reflect the changes to the Standard. In the second drafts of the COM-003 standard and Implementation Plan, the effective dates are identical and provide at least six months for entities to become compliant.</b></p> <p>Furthermore, we do not feel that any of the requirements in this standard warrant Violation Risk Factors or Violation Severity Levels in the high or severe category. In summary, this review group feels that COM-003-1 is not yet ready to be acted upon and may have been posted too soon.</p> <p><b>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. In the second draft of the standard, all requirements have been assigned a Medium VRF. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in the second draft of COM-003-1.</b></p> <p>There does not seem to be sufficient coordination between the drafting teams of all the COM standards, or any attempt to integrate these standards.</p> <p><b>The SDT is working with the RC SDT to avoid conflicts – and proposes retiring COM-002 when COM-003 becomes effective.</b></p> <p>One example is the inconsistency between COM-003-1 and COM-002-3 regarding the meaning of three-part communication (mentioned in our response to Question 1 above). As noted above, we feel that many of the requirements prescribe specific “how to” methods for compliance rather than focusing on the “what” of the requirement.</p> <p><b>Another way of looking at the requirements for three-part communication would be to say that the requirements specify “what” by requiring confirmation that the message was accurately received.</b></p> <p>Overall, COM-003-1 is much too prescriptive to be tied to million dollar-level fines.</p> <p>Southern Company comments:</p> <p>There are possible inconsistencies with the references to the term “CIP Free Form” and a more generic term “Free Form” in the tables described in Attachment 1 - COM-003-1 - Operating State Alert Levels. Reference the</p>

Organization	Yes or No	Question 12 Comment
		<p>fields where functional entities “outside” the Reliability Coordinator Area are identified for both the initial alert notification and the end of alert notification.</p> <ul style="list-style-type: none"> <li>• For Physical Security, the field mentions only RC’s using the “CIP Free Form.” For Cyber Security, the field mentions RC’s and CIP Participants using the “CIP Free Form.”</li> <li>• For Transmission Emergency Alerts, the field mentions only RC’s using the generic “Free Form.” Is there a distinction between the two forms?</li> <li>• Is it consistent to reference CIP Participants only for Cyber Security alerts and not for Physical or Transmission?</li> </ul> <p><b>The SDT has reviewed and addressed the form and participation issues you raised. The requirements associated with the Alert Levels have been removed from the second draft of the standard.</b></p> <p>Although this standard is well intentioned it is not ready for presentation to the ballot body. When this standard is applicable is in question just by the way the Title and Purpose are written. The Purpose needs to make it absolutely clear to all parties, complying entities as well as compliance enforcement, when the standard is applicable. For example, the Purpose of the standard is subject to interpretation. Does this standard apply all of the time or just during Alerts and Emergencies? Or does the word especially mean that a non-compliance during an emergency is more severe? Is the phonetic alphabet required when an alert is declared or just after the alert is declared?</p> <p><b>The SDT believes the Title is straightforward and has revised the Purpose Statement to read: “To specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of the BES.” We believe this more accurately defines the problem and the solution.</b></p> <p><b>This standard has a charge: to address the requirements of the SAR, FERC Order 693 and the Blackout Report – item 26.</b></p> <p><b>The draft revisions, based on stakeholder comments, clarify applicability with the proposed definition of Operating Communications which could include routine as well as alert and emergency conditions.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
California	Agree	The Drafting team should take a hard look at the VRFs and VSLs established in this standard and contrast them

Organization	Yes or No	Question 12 Comment
Independent System Operator		<p>against VRFs and VSLs for other adopted standards. We do not feel, as an example, that the use of Spanish in a normal communication between two companies, while improper, should carry a VRF of ‘high’ with a VSL of ‘severe’. The draft standard focuses too much attention on prescriptive remedy than ensuring understanding.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. In the second draft of the standard, all requirements have been assigned a Medium VRF. <p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Transmission Agency of Northern California</p>	<p>Agree</p>	<p>The requirements of this standard as drafted should not be applicable to Transmission Owners (TO). This standard pertains to real-time operations, whereas the TO function does not have real-time operational responsibilities according to the currently effective and proposed NERC Reliability Functional Model, Versions 4 and 5, respectively.</p>
<p><b>Response: The SDT appreciates the comment in regard to COM-003-1 applying to Transmission Owners and the SDT has deleted the Transmission Owners from the second draft of the standard. The intent of the proposed standard is to apply only to those operating entities that send or receive Operating Communications.</b></p>		

Organization	Yes or No	Question 12 Comment
Santee Cooper	Agree	The SDT has put a lot of work into this standard and we appreciate their effort. The SDT of COM-002 and COM-003 may need to integrate the reliability related requirements of these two standards into one standard that the industry can approve. This standard as written could lead to some extremely high dollar fines when in reality the reliability of the bulk electric system has not been affected at all.
<p><b>Response</b> The SDT thanks you for your comments and recommendation.</p> <p>The SDTs are coordinating issues to ensure consistency and to avoid duplication and conflict. The implementation plan for COM-003 includes retirement of COM-002 to avoid duplication.</p>		
South Carolina Electric and Gas	Agree	The SDT should consider vertically integrated utilities, where communication between functional entities is internal.
<p><b>Response:</b> The SDT thanks you for your comments. The SDT determined that operations communications that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System are subject to the requirements of the proposed COM-003-1 standard whether they be external or internal.</p>		
Electric Market Policy	Agree	The VRFs for R2-R7 are all “High”, and the VSLs are all “Severe”. That is too harsh. Failing to comply with one of the requirements does not automatically mean that a miscommunication occurred that caused a reliability problem. There should be a “Moderate” VSL for failure to comply with a requirement but no miscommunication occurred. There should be a “High” VSL for failure to comply with a requirement that caused a miscommunication but resulted in no violation of another reliability standard. The “Severe” VSL should only apply to failures to comply with a requirement that caused a miscommunication that lead to a violation of another reliability standard. If approved, this standard will require a number of distracting things be added to each entity’s control center with little value added. Clock - set to the ‘standard time’ Attachment 1 - COM-003 (all 3 versions) Attachment 2 - COM-003
<p><b>Response:</b> The SDT thanks you for your comments.</p> <p>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. The second draft of the standard proposes assigning a Medium VRF to each of the requirements. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in the second draft of COM-003-1.</p> <p>The SDT would like clarification on your comment “Clock - set to the ‘standard time’ Attachment 1 - COM-003 (all 3 versions) Attachment 2 - COM-003” if the current draft of the Standard does not address your concerns.</p>		

Organization	Yes or No	Question 12 Comment
Progress Energy Carolina, Inc	Agree	This proposed revision, if implemented, may introduce unnecessary complications into communications between entities which may lead to delays and misunderstandings, potentially decreasing the reliability of the BES.
<p><b>Response: The SDT thanks you for your comments. The SDT does not recognize any specific details in your comment. If the revised draft of the Standard does not address your specific concerns please provide details for the SDT to address.</b></p>		
The Empire District Electric Company	Disagree	This proposed standard seems to be a redundant standard to many other already approved NERC standards such as CIP-001, EOP-001, EOP-004, as well as the NERC alert process. I see little to no benefit from this standard as proposed.
<p><b>Response: The SDT thanks you for your comments. The SDT does not see any redundant requirements in the standards you cite in your comments.</b></p>		
SERC OC&SOS Standards Review Group	Agree	<p>This review group has identified several problems with this standard, as noted above. Other observations include:</p> <p>The effective dates in the draft standard and in the implementation plan do not seem to match. In the standard, the effective date mentions one calendar year following regulatory approval, while the implementation plan refers to the third calendar quarter after regulatory approval.</p> <p><b>The SDT has made several changes to the draft standard that resulted in changes to the Implementation Plan. The effective dates in the second drafts of the standard and Implementation Plan are identical and provide at least six months for entities to become compliant.</b></p> <p>Furthermore, we do not feel that any of the requirements in this standard warrant Violation Risk Factors or Violation Severity Levels in the high or severe category</p> <p><b>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in the second draft of COM-003-1.</b></p> <p>In summary, this review group feels that COM-003-1 is not yet ready to be acted upon and may have been posted too soon. There does not seem to be sufficient coordination between the drafting teams of all the COM standards, or any attempt to integrate these standards. One example is the inconsistency between COM-003-1</p>

Organization	Yes or No	Question 12 Comment
		<p>and COM-002-3 regarding the meaning of three-part communication (mentioned in our response to Question 1 above).</p> <p><b>The OPCP SDT has been and is aware of the progress and content of other COM standard development teams. The implementation plan for COM-003 includes retirement of COM-002 to avoid duplication.</b></p> <p>As noted above, we feel that many of the requirements prescribe specific “how to” methods for compliance rather than focusing on the “what” of the requirement.</p> <p><b>The OPCP SDT was chartered to develop Communication Protocols for Operating Personnel. The SDT proposes that the second draft of the standard is more focused on “what” protocols to use in specific situations.</b></p> <p>Overall, COM-003-1 is much too prescriptive to be tied to million dollar-level fines.</p> <p><b>The SDT acknowledges your concerns and wishes to balance them with the need for reliability on the BES. With the changes to VRFs, (Medium in the second draft of COM-003) the fear of million dollar-level fines should be relieved.</b></p> <p>“The comments expressed herein represent a consensus of the views of the named members of the SERC OC&amp;SOS Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”</p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
NIPSCO	Disagree	<p>This standard is based on COM-002-3 however that standard has not been voted-in or NERC approved yet. I think this COM-003 effort should be put on hold until the 2006-06 project is complete. At that time the term "directive" should be replaced by "Operational Directive" and "Reliability Directive" based on context and all of these terms should be defined in the NERC Glossary of Terms.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT respectfully disagrees with your statement that the team should stop work on COM-003-1 until project 2006-6 is complete. The SDTs are coordinating issues to ensure consistency, eliminate conflict and avoid duplication. The implementation plan for COM-003 includes retirement of COM-002 to avoid duplication.</b></p> <p><b>The SDT has eliminated the term “Interoperability Communications” and revised the draft standard to include the new term “Operating</b></p>		

Organization	Yes or No	Question 12 Comment
<p><b>Communications". The SDT feels this term will clarify the issues you have raised. The term "Reliability Directive" is being developed in a different standard by the RC SDT.</b></p>		
<p>Indiana Municipal Power Agency</p>	<p>Agree</p>	<p>This standard is not needed because requirement two in COM-002 takes into account the use of Three-part Communication which is the main reliability requirement from COM-003. The use of a procedure (R1), the English language (R3), a standard time zone (R4), the NATO phonetic alphabet (R6), and a pre-defined system condition terminology (R2) are administrative requirements (not performance based requirements) and if not used, all of them definitely do not have a high VRF. If an entity does not use a procedure, but ensures they follow requirement 2 of COM-002 and both parties have a clear understanding of the directive what other reliability requirement is necessary. One recommendation might be for the COM-002 Standard Drafting Team or another SDT to come up with a definition for a directive.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT sees the Requirements of COM 003-1 as key operations communication protocols that will standardize the manner in which Functional entities communicate BES matters thereby reducing the potential for mishaps due to miscommunications. The SDT does not feel that they are "administrative requirements".</b></p> <p><b>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. In the second draft of the standard the SDT proposed a Medium VRF for each of the requirements. The SDT believes the new assignments more appropriately classify the VRFs and VSLs assigned to the Requirements in the second draft of COM-003-1.</b></p> <p><b>The Implementation Plan calls for COM -002 R2 to be retired when COM-003-1 becomes effective.</b></p> <p><b>The SDT has eliminated the term "Interoperability Communications" and revised COM-003 to include the new term "Operating Communications". The SDT feels this term will clarify your concerns. The term "Reliability Directive" is being developed in a standard under development, COM-002-3, by the RC SDT.</b></p>		
<p>Tri-State Generation &amp; Transmission Assoc.</p>	<p>Agree</p>	<p>This standard should not apply to DPs, LSEs or TSPs as they do not have control over the BES. That responsibility resides entirely with the TOP. Additionally, it is concerning that the term "directive" is not defined. The proposed definition for Interoperability Communication could be interpreted to include all communication between entities. This is too restrictive.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p><b>The SDT appreciates the comments with regards to concerns related to including TSPs, DPs and LSEs that do not own or operate facilities that are a part of the BES. The SDT has removed the TSPs and LSEs because they were not bound by this requirement in the originating SAR. The specified role</b></p>		

Organization	Yes or No	Question 12 Comment
<p>of the DP to shed load justifies the retention of the DP as an applicable Entity.</p> <p>The SDT has eliminated the term “Interoperability Communications” and revised the draft standard to include the new term “Operating Communications”. The SDT feels this term will address your concerns. The term “Reliability Directive” is being developed in a standard under development, COM-002-3, by the RC SDT.</p>		
E.ON U.S. LLC	Disagree	<p>This standard should only apply to alerts and emergencies. E.ON U.S. suggests eliminating “especially” in the purpose statement of COM-003-1. During emergency situations, operational focus on the semantics of how communications are to occur does little to enhance the reliability of the system. High VRFs with Severe VSLs may add stress and distraction to operation personnel during times of emergency thus potentially harming, not improving reliability.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The term “especially” has been removed from the Purpose Statement. It now reads: “To specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES.”</p> <p>The SDT disagrees with the statement “This standard should only apply to alerts and emergencies”. Is there a difference if a miscommunication causing a reliability event occurs during routine operations or during alerts or emergency operations? The SDT believes the impact on the BES would be the same.</p> <p>The SDT has no knowledge that “stress and distraction induced by high VSRs and VSL severity levels to operation personnel during times of emergency thus potentially harming, not improving” reliability will occur, and has no response to that comment. Note, however, that the SDT revised the VRFs and VSLs in the second draft of COM-003 to better align with NERC and FERC guidelines – and the VRFs for the revised requirements are “Medium.”</p>		
American Electric Power	Agree	<p>Unfortunately, the standard seems to be losing its value as the emphasis overly focusing on procedures while missing the intent. The SDT should reconsider the standard in the context of “what” rather than “how.” Lastly, we do not believe that this standard is ready to advance and needs significant re-working before the revised draft is posted. The SDT should attempt to better coordinate with the necessary other drafting teams as these standards are integrated.</p>
<p><b>Response: The SDT thanks you for your comments.</b></p> <p>The SDT was chartered to develop Communication Protocols for Operating Personnel. The SDT proposes that the second draft of the standard is more focused on “what” protocols to use in specific situations.</p> <p>The SDT has made significant changes to the original draft to address valid concerns from the Industry.</p>		

Organization	Yes or No	Question 12 Comment
<p>The SDTs involved with various COM standard projects have been and are coordinating to ensure consistency, to avoid conflict and to avoid duplication.</p>		
<p>Independent Electricity System Operator</p>	<p>Agree</p>	<p>We believe that the existing standard COM-002 can be simply modified to cover the 3-part communication requirement. This COM-003 standard actually causes more confusion and ambiguity, and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. This standard is not needed.</p>
<p><b>Response: The SDT thanks you for your comments</b>  <b>The SDT believes the revised COM-003-1 standard is more appropriate as a location for three-part communications because it focuses on communications protocol.</b>  <b>The SDT respectfully disagrees with your comments regarding “This COM-003 standard actually causes more confusion and ambiguity, and creates unnecessary or overly cumbersome requirements that add little or no value to reliability.” We also respectfully disagree with your comments that “This standard is not needed”.</b></p>		
<p>IRC Standards Review Committee</p>	<p>Agree</p>	<p>The existing standard COM-002 is better than this proposed Standard. This Standard actually causes more confusion and ambiguity, and creates unnecessary or overly cumbersome requirements that add little or no value to reliability. All requirements with the exception of R1 have been determined to have a HIGH VRF, when many of them are dictating HOW communications should take place and not when, why, or what.COM-002 retirement does not appear to be consistent with the direction of the RC SDT in Project 2006-06. The RC SDT is adding requirements. More coordination is required between the Standard Drafting Teams. Again, we support the work being done by the RC SDT and RTO SDT and do not believe this adds more necessary requirements.</p> <p><b>The SDT respectfully disagrees with you statement regarding COM-002 as a superior standard. We do not see it as comparative nor do we feel the second draft of COM-003 creates unnecessary or overly cumbersome requirements that add little or no value to reliability.</b></p> <p><b>The COM related SDTs are coordinating to ensure there are no conflicts and that one standard supports the requirements of the other. The implementation plan for COM-003 includes retirement of COM-002 to avoid duplication.</b></p> <p><b>The SDT has modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. In the second draft of the standard the SDT proposed a Medium VRF for each of the requirements. The SDT believes the new assignments more appropriately classify the VRFs and VSLs assigned to the Requirements in the second draft of COM-003-1.</b></p>

Organization	Yes or No	Question 12 Comment
		<p>Recommendation 26 of the August 14, 2003 blackout report is cited as a driver for extending three-part communications. We believe the title of Recommendation 26 is misleading and when reviewed separately from the supporting text of the recommendation and direct and contributing factors in the report results in an incorrect interpretation. “Failure to identify emergency conditions and communicate that status to neighboring systems” is one of the contributing factors and the supporting text of the recommendation clearly refer to shoring up communications during emergency and anticipated emergency conditions and establishing an emergency broadcast communication system to alert regulatory, state and local officials. The supporting text of Recommendation 26 only mentions addressing alerts, emergencies or other critical situations. Some have incorrectly inferred the initial clause of Recommendation 26, “Tighten communication protocols”, means the recommendation applies to all routine communications.</p> <p><b>The SDT cites additional “Recommendation 26 of the August 14, 2003 Blackout Report” text from the from the same section you are referencing:</b></p> <p><b>“On August 14, 2003, reliability coordinator and control area communications regarding conditions in northeastern Ohio were in some cases ineffective, unprofessional, and confusing. Ineffective communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade. Consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability. “</b></p> <p><b>There are several key points here:</b></p> <p><b>Clearly, ineffective, unprofessional, and confusing communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade.</b></p> <p><b>Note the context of this statement especially the word “particularly (“Consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability.”). It is apparent to the SDT that this means all communication should be subject to consistent, structured protocols. The use of “particularly” and “especially” (used in the Recommendation text) are used for emphasis only for alerts and emergencies and the intent is not to exclude other types of communications.</b></p> <p><b>The SDT believes the text of Recommendation 26 is very clear and is in no way misleading or confusing and that the Recommendation means exactly what it says: Tighten communications protocols, especially for communications during alerts and emergencies.</b></p>

Organization	Yes or No	Question 12 Comment
		<p><b>Also please read FERC Order 693 paragraph 532 to review clarification on the application of three-part communications to routine directives. The SDT is working in accordance with the August 2003 Blackout Recommendation #26 and FERC Order 693 directives.</b></p> <p>The first paragraph in Attachment 1 of COM-003-1 an EEA is stated as being an Emergency Energy Alert rather than an Energy Emergency Alert. This should be corrected for consistency with other standards and to avoid confusion. Also in this paragraph, the term "states" should be replaced with "levels" in order to maintain consistency with the tables in the Attachment as well as EOP-002-2.1 to which this Attachment refers.</p> <p><b>The SDT has removed the requirement that required use of alert levels from the second draft of the standard.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
<p>ISO New England Inc.</p>	<p>Agree</p>	<p>The existing standard COM-002 is better than this proposed Standard. The implementation plan for COM-003 includes retirement of COM-002 to avoid duplication.</p> <p>The SDT does not believe its work to be inconsistent with results-based principles. The Need or Problem Statement for this standard is that miscommunication can lead to action or inaction harmful to the reliability of the BES. This was identified by the NERC President in his January 2011 report to the industry as one of the eight top priority issues for BPS reliability, and there are a number of events that have occurred in the past where miscommunication was a contributing factor to the event or exacerbated the severity of the event. The Goal, therefore, is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication. The key Objective to accomplish this Goal is to use communication protocols to reduce or correct misunderstandings. The requirements have been written to accomplish this Objective, and are risk-mitigating requirements (while operator performance is measured, the actions themselves are primarily designed to mitigate the risk of miscommunication that could lead to poor BES performance). We believe this standard is consistent with results-based principles, and it will improve the reliability of the BES.</p>

<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
NRECA RTF		We recommend replacing the term “Distribution Service Providers” in Attachment 1 with the term “Distribution

Organization	Yes or No	Question 12 Comment
Members		<p>Provider” as stated in the Applicability of this standard. In addition, please see our response to Question 3 regarding a modification to the Applicability portion of the standard to address concerns about the inclusion of Distribution Providers and Load Serving Entities. We are concerned with the onerous communication requirements for Load Serving Entities and Distribution Providers with field personnel that have rare or possibly no opportunities to communicate with personnel working at an entity registered as a Transmission Operator, Transmission Owner, Balancing Authority, Reliability Coordinator, Generator Operator or Transmission Service Provider.</p>
<p><b>Response: The SDT thanks you for your comments. We agree with your recommendation on the term “Distribution Provider” and this change is reflected in the second draft of COM-003. We also note your comments on applicability in Question 3 and have provided our response there.</b></p>		
Transmission System Operations	Agree	<p>We think the SDT should coordinate their work closely with the team of the Reliability Coordination Project 2006-06, especially regarding new definitions related to communications and reliability directives.</p>
<p><b>Response: The SDT thanks you for your comments. The SDT agrees and the SDTs involved with COM standard development have been and are coordinating issues to ensure consistency, to avoid conflict and to avoid duplication.</b></p> <p><b>The SDT has revised the definitions to the proposed COM-003-1 Standard to define Operating Communication that should address your concerns over the applicability of three-part communications. The implementation plan for COM-003 includes retirement of COM-002 to avoid duplication.</b></p>		
Ameren		<p>We understand the binary function of VSL that forces Severe for most requirements. However, the standard itself seems to offer some hope with the definition to address the VSL issue better. The definition has at the end, “especially during alerts and emergencies” Given that this implies stratification, couldn’t Severe VSL be assigned to violations during emergencies, High be assigned to alerts, and moderate to all other system conditions. When emergency conditions exist, entities should have their “A” game on, and failure to communicate during these times is a more severe violation of the communication protocols than during the thousands of daily interactions that are not likely to affect BES, (alternatively, the VRF could be adjusted for the situation)</p>
<p><b>Response: The SDT thanks you for your comments</b></p> <p><b>The SDT has reviewed and modified the VRFs and VSLs to comply with approved NERC and FERC guidelines. The SDT believes the new assignments more accurately classify the VRFs and VSLs assigned to the Requirements in the second draft of COM-003-1. In the second draft of COM-003 the requirements are all assigned a “Medium” VRF – and the VSLs are more graduated.</b></p>		
MRO NERC Standards Review	Agree	<p>Without “Directive” being defined, this proposed standard still leaves a huge area that will cause problems and issues within the industry. We believe the SDT should replace “directive” with “Reliability Directive” and use the</p>

Organization	Yes or No	Question 12 Comment
Subcommittee		<p>definition developed in Project 20006-06: “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an actual or expected Emergency.”</p> <p><b>COM 002 -3 and Reliability Directive are under development by the RC SDT. The term, “Reliability Directive” is not used in the second draft of COM-003.</b></p> <p>We believe Reliability Standard COM-003-1 is entirely too prescriptive, and is in actuality a procedure and not a standard. The Standard needs to focus on the “What” and not the “How”. If the industry is going to truly embrace the Results Based Standards Initiative, this standard must be significantly revised to reflect that philosophy.</p> <p><b>The SDT believes that the requirements in the second draft of COM 003 are appropriate because they support the purpose identified in the SAR. If you believe Reliability Standard COM-003-1 is entirely too prescriptive, and is in actuality a procedure and not a standard it should have been addressed in the SAR development process. The SDT was chartered to develop Communication Protocols for Operating Personnel. The SDT proposes that the second draft of the standard is more focused on “what” protocols to use in specific situations.</b></p> <p><b>The SDT does not believe its work to be inconsistent with results-based principles. The Need or Problem Statement for this standard is that miscommunication can lead to action or inaction harmful to the reliability of the BES. This was identified by the NERC President in his January 2011 report to the industry as one of the eight top priority issues for BPS reliability, and there are a number of events that have occurred in the past where miscommunication was a contributing factor to the event or exacerbated the severity of the event. The Goal, therefore, is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication. The key Objective to accomplish this Goal is to use communication protocols to reduce or correct misunderstandings. The requirements have been written to accomplish this Objective, and are risk-mitigating requirements (while operator performance is measured, the actions themselves are primarily designed to mitigate the risk of miscommunication that could lead to poor BES performance). We believe this standard is consistent with results-based principles, and it will improve the reliability of the BES.</b></p> <p>We believe that the existing standard COM-002 is actually better than this standard. This standard actually</p>

Organization	Yes or No	Question 12 Comment
		<p>causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability.</p> <p><b>The SDT respectfully disagrees with your statement that “COM-002 is actually better than this standard and this standard actually causes more confusion and ambiguity and creates unnecessary or overly cumbersome requirements that add little or no value to reliability.” COM 002-2 is too vague and has left much doubt in the stakeholders’ minds. The SDT believes COM 003 adds clarity to the communication standards.</b></p>
<p><b>Response: The SDT thanks you for your comments. Please see our responses above.</b></p>		
PSEG Companies	Agree	<p>Yes. The PSEG Companies agree with the concerns expressed in the comments filed by the PJM System Operations Subcommittee (SOS) Group.</p>

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting SAR on June 8, 2007.
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007.
6. Version 1 draft of Standard posted November 2009 for Informal Comments closed January 15, 2010.

### Description of Current Draft:

This is the second draft of a new standard requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team requests posting for a 30-day concurrent Formal Comment period and Ballot.

### Future Development Plan:

Anticipated Actions	Anticipated Date
1. Drafting team considers comments, makes conforming changes, and requests SC approval to proceed to pre-ballot comment period.	March 2012
2. First ballot of standards.	June 2012
3. Successive Ballot of Standards	September 2012
4. Recirculation ballot of standards.	October 2012
5. Board adopts standards.	November 2012

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*When using terms or phrases contained in the Reliability Standards Glossary of Terms Used in NERC Reliability Standards it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms Used in Reliability Standards are capitalized.*

**Operating Communication** — Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.

Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-003-1
3. **Purpose:** To specify clear, formal and universally-applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES.
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Reliability Coordinator
    - 4.1.2 Transmission Operator
    - 4.1.3 Balancing Authority
    - 4.1.4 Generator Operator
    - 4.1.5 Distribution Provider
5. **Effective Date:** First day of the first calendar quarter, six calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter a year from the date of Board of Trustees adoption.

## B. Requirements

- R1. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider shall use the following communications protocols: [*Violation Risk Factor: Medium*] [*Time Horizon: Real-time Operations* ]
  - 1.1. When participating in oral or written Operating Communications:
    - 1.1.1. Use the English language when communicating between functional entities, unless another language is mandated by law or regulation.
    - 1.1.2. Use the 24-hour clock format when referring to clock times.
    - 1.1.3. When the communication is between entities in different time zones, include the time and time zone and indicate whether the time is daylight saving time or standard time.
    - 1.1.4. When referring to a Transmission interface Element or a Transmission interface Facility, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility.
  - 1.2. When participating in oral Operating Communications and using alpha-numeric identifiers, use accurate alpha-numeric clarifiers.<sup>1</sup>

---

<sup>1</sup>The North Atlantic Treaty Organization (NATO) Spelling Alphabet is one example of a set of alpha-numeric clarifiers.

**R2.** Each Reliability Coordinator, Transmission Operator and Balancing Authority that issues an oral, two-party, person-to-person Operating Communication, excluding Reliability Directives shall:

**2.1.** Issue the Operating Communication and wait for a response from the receiver.

**2.2.** After the response is received, or if no response is received, do one of the following:

- Confirm the receiver's response, if the repeated information is correct (not necessarily verbatim).
- Reissue the Operating Communication if the repeated information is incorrect or if the receiver does not issue a response.
- Reissue the Operating Communication, if requested by the receiver.

*[Violation Risk Factor Medium][Time Horizon: Real-Time]*

**R3.** Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider that receives an oral two-party, person-to-person Operating Communication, excluding Reliability Directives, shall take one of the following actions:

- Repeat the Operating Communication (not necessarily verbatim) and wait for confirmation from the issuer that the repetition was correct.
- Request that the issuer reissue the Operating Communication.

*[Violation Risk Factor: Medium][Time Horizon: Real-Time]*

### **C. Measures**

**M1.** Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall provide evidence that the communication protocols specified by the requirement were implemented during Operating Communications. For requirement R1, Part 1.1.1, provide a copy of the law or regulation that mandates use of a language other than English. Evidence may include, but is not limited to, voice recordings, transcripts of voice recordings, operating logs, on-site observations, or other equivalent evidence. (R1)

**M2.** Each Reliability Coordinator, Transmission Operator and Balancing Authority, shall provide evidence that the communication protocol specified by the requirement was implemented. Evidence may include, but is not limited to, voice recordings, transcripts of voice recordings, on-site observations, or other equivalent evidence. (R2)

**M3.** Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider shall provide evidence that the communication protocol specified by the requirement was implemented. Evidence may include, but is not limited to, voice recordings, transcripts of voice recordings, on-site observations, or other equivalent evidence. (R3)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Enforcement Authority**

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA), unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

#### **1.2. Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance, as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider shall retain evidence for Requirement R1 Measure M1 for the most recent 365 calendar days.
- Each Reliability Coordinator, Transmission Operator and Balancing Authority shall retain evidence for Requirement R2, Measure M2, for the most recent 180 calendar days.
- Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider shall retain evidence for Requirement R3, Measure M3, for the most recent 180 calendar days.

If a Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

#### **1.3. Compliance Monitoring and Assessment Processes**

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

**1.4. Additional Compliance Information**

None

**Table of Compliance Elements**

R #	Time Horizon	VRF	Violation Severity Levels

## Project 2007-02 Operating Personnel Communications Protocols

*Unofficial Comment Form for Standard COM-003-1 —Operating Personnel Communications Protocols*

Please **DO NOT** use this form. Please use the [electronic comment form](#) located at the link below to submit comments on the proposed draft COM-003-1 Operating Personnel Communications Protocols standard. Comments must be submitted by **June 20, 2012**. If you have questions please contact Joseph Krisiak at [Joseph.Krisiak@nerc.net](mailto:Joseph.Krisiak@nerc.net) or by telephone at 609-651-0903.

[http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

### *Background Information:*

Effective communication is critical for Real-time operations. Failure to successfully communicate clearly can create misunderstandings resulting in improper operations increasing the potential for failure of the BES.

The Standard Authorization Request (SAR) for this project was initiated on March 1, 2007 and approved by the Standards Committee on June 8, 2007. It established the scope of work for the Project 2007-02 Operating Personnel Communications Protocols Standard Drafting Team (OPCP SDT). The scope described in the SAR is to establish essential elements of communications protocols and communications paths such that operators and users of the North American Bulk Electric System will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Report, Recommendation Number 26, calls for a tightening of communications protocols. FERC Order 693 Paragraph 532 amplifies this need and applies it to all Operating Communications. This proposed standard's goal is to ensure that effective communication is practiced and delivered in clear language and standardized format via pre-established communications paths among pre-identified operating entities.

The SAR indicated that references to communication protocols in other NERC Reliability Standards may be moved to this new standard. The SAR instructed the standard drafting team to consider incorporating the use of Alert Level Guidelines and three-part communications in developing this new standard to achieve high level consistency across regions. The SDT believes the Alert Level Guidelines, while valuable, belong in a separate standard and has petitioned the Standards Committee to approve the transfer to another standard or to start a separate project.

The standard will be applicable to Transmission Operators, Balancing Authorities, Reliability Coordinators, Generator Operators, and Distribution Providers. These requirements ensure that communications include essential elements such that information is efficiently conveyed and mutually understood for communicating changes to real-time operating conditions and responding to directives, notifications, directions, instructions, orders, or other reliability related operating information.

The Purpose statement of COM 003-1 states: “To specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES.”

Based on stakeholder comments and observations from the Quality Review team, the OPCP SDT made the following changes to COM-003-1:

- **New NERC Glossary terms:**  
The SDT has eliminated the definitions; Communications Protocol, Three-part Communication and Interoperability Communication proposed in the first draft of the standard and added a definition for *Operating Communications*. Operating Communications more accurately defines the broad class of communications that deal with changing or altering the state of the BES. Changes to the BES operating state with unclear communications create increased opportunities for *events that could place* the BES at an unacceptable risk of instability, separation, or cascading failures.
- **Communication Protocol Operating Procedure (CPOP):**  
The SDT eliminated the CPOP from the standard based on stakeholder comments indicating this is administrative in nature.
- **English Language:**  
The SDT modified the standard (R3 in the first draft of COM-003-1, R1 Part 1.1.1 in the second draft of COM-003-1) to address comments which point out that in some regions, the use of another language other than English may be mandated by law.
- **Pre-defined System Condition Terminology:**  
The Alert Level Guide document was originally prepared by the Reliability Coordinator Working Group (RCWG) in accordance with a U.S./Canada Task Force Blackout Report Recommendation. Recommendation #20 called for the establishment of clear definitions of normal, alert, and emergency operational system conditions, and to clarify the roles, responsibilities, and authorities of Reliability Coordinators and other responsible entities under each condition.  
  
After many comments and much discussion the SDT believes the Alert Level Guide is better suited in its own standard or in a standard that deals with alert conditions and notification. The content was not related to communication protocols designed to clarify operating communication on the BES. The SDT has petitioned the Standards Committee to approve of a transfer to another standard or to a new standard as it deems appropriate.
- **Time Zone Reference:**  
The first draft of COM-003-1 included a requirement to use Central Standard Time for operating communications (R4) and stakeholders identified that unless people are communicating in different time zones, this requirement may be a distraction. The SDT modified the standard to require inclusion of time zone references only in those situations where communication is between entities in different time zones.

- **Three-part Communication:**  
The first draft of COM-003-1 included a single requirement for use of three-part communication (R5). Several stakeholders noted that three-part communication is being addressed in two standards. While the OPCP SDT originally planned on proposing retirement of COM-002-3, the team has been convinced that keeping three part communication in both COM-002-3 and COM-003-1 has value.
  - The three-part communications in COM-002-3 are limited to Reliability Directives and have a “High” VRF.
  - The three-part communications in COM-003-1 are focused on Operating Communication except for Reliability Directives which are a subset of Operating Communications. The requirements for three-part communications in COM-003 have a “Medium” VRF.

The OPCP SDT split the three-part communication requirement into two separate proposed requirements; R2 and R3 to address responsibilities of the issuer and of the receiver respectively during Operating Communications. The SDT also clarified that repeat-back does not have to be exactly verbatim; however the message must be accurately conveyed and understood.

- **NATO Alphabet or Correct alpha numeric clarifiers:**  
The first draft of COM-003-1 had a requirement for use of the NATO Alphabet during operating communications (R6). Many stakeholders indicated that the NATO Alphabet is only one way of providing clarity and proposed that other alpha-numeric clarifies should be acceptable. In response the modified the standard to require use of the NATO Phonetic Alphabet or a correct alpha-numeric clarifier when issuing and replying to verbal Operating Communications that involve alpha-numeric information. The revised standard clarifies that the use of another correct alphanumeric clarifier is permitted as long as the content is fully and accurately conveyed. During spoken communications certain sounds become difficult to discern because they are audibly similar. The use of the NATO Phonetic Alphabet or proper phonetically correct clarifiers is not intended for all verbal communications but is required for Operating Communications involving alpha-numeric identifiers. (See Requirement R1, Part 1.2 in the second draft of COM-003-1.)
- **Line and Equipment Identifiers:**  
The first draft of COM-003-1 had a requirement (R7) for use of pre-determined, mutually agreed upon line and equipment identifiers for verbal and written operating communications. Stakeholders indicated that obtaining such agreements was not necessary and recommended narrowing the scope of this requirement. In response, the OPCP SDT modified the scope of the requirement so it only applies to oral and written operating communications involving a Transmission interface Element or Facility and replaced the need for an agreement with use of the name of the Facility/Element specified by the owner of that Transmission interface Element or Facility. (See Requirement R1, Part 1.1.4 in the second draft of COM-003-1.)
- **VSL and VRF Changes from version one:**  
The OPSDT reviewed the VRFs and VSLs associated with R1, R2 and R3 and made changes to more closely conform to NERC and FERC guidelines. Where the first draft of COM-003-1 proposed having a

“High” VRF for all real-time communications, the second draft of COM-003-1 proposes a “Medium” VRF for each of the three remaining requirements.

The choice of VRFs was made on the basis of the potential impact on the Bulk Electric System of a miscommunication during Operating Communications. Requirements R1, R2 and R3 are assigned a Medium Violation Risk Factor – a violation of one of these requirements, by itself, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System, but a violation by itself would not lead to Bulk Electric System instability, separation, or Cascading failures.

The VSLs in the second draft of COM-003-1 are all new.

The drafting team is posting the standard for industry comment for a 45-day comment period.

The Operating Personnel Communications Protocols Drafting Team would like to receive industry comments on this draft standard. Accordingly, we request that you include your comments on this form by **June 20, 2012**.

*\*Please use the [electronic comment form](#) to submit your final comments to NERC.*

1. Do you agree with the addition of “Operating Communication” as a proposed new definition for the NERC Glossary and the elimination of “Communication Protocol,” “Interoperability Communication” and “Three part Communications” proposed in the first draft of COM-003-1?

**Operating Communication:** Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.

If not, please explain in the comment area.

Yes

No

Comments:

2. The SDT eliminated the requirement to have a Communications Protocol Operating Procedure from the proposed standard because it is administrative in nature. Do you agree with this modification? If not, please explain in the comment area.

Yes

No

Comments:

3. The SDT has proposed to transfer the requirement to use Alert Levels in Attachment 1 to another more closely aligned standard or to a separate new standard. Do you agree with this transfer? If not, please explain in the comment area.

Yes

No

Comments:

4. The SDT modified the standard to allow an exemption from the requirement to use English language where the use of another language is mandated by law or regulation. (See Requirement R1, Part 1.1.1) Do you agree with this modification? If not, please explain in the comment area.

Yes

No

Comments:

5. The SDT modified the standard to mandate utilization of a 24 hour clock for all times and to mandate the use of a time zone and indicate whether the time is daylight saving time or standard time reference when Operating Communications occur between different time zones. (See Requirement R1, Part 1.1.3) Do you agree with this modification? If not, please explain in the comment area.

Yes

No

Comments:

6. The SDT modified the requirement for use of three-part communications for Operating Communications to clarify that this is not applicable for Reliability Directives and split the single requirement into two requirements: one for the issuer (R2) and another for the receiver (R3). Do you agree with this modification?

Yes

No

Comments:

7. The SDT modified the requirement for use of the NATO phonetic alphabet to allow use of another correct alpha numeric clarifier. (See Requirement R1, Part 1.2.) Do you agree with this modification?

Yes

No

Comments:

8. The SDT modified the requirement for use of identifiers to limit the applicability to operating communications involving Transmission interface Elements/Facilities and to require use of the name for that Element/Facilities specified by the Element/Facility's owner(s). Do you agree with this modification?

Yes

No

Comments:

**9. Do you agree with the VRFs and VSLs for Requirements R1, R2 and R3?**

Yes

No

Comments:

**10. If you have any other comments or suggestions to improve the draft standard that you have not already provided in response to the previous questions please provide them here.**

## Implementation Plan

Project 2007-02 - Operating Personnel Communications Protocols

### Implementation Plan for COM-003-1 – Operating Personnel Communications Protocols

#### *Approvals Required*

COM-003-1 – Operating Personnel Communications Protocols

#### *Prerequisite Approvals*

None.

#### *Revisions to Glossary*

The following term is proposed for addition to the NERC Glossary of Terms:

**Operating Communication** — Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.

#### *Applicable Entities*

Balancing Authority  
Distribution Provider  
Generator Operator  
Reliability Coordinator  
Transmission Operator

#### *Revisions or Retirements to Approved Standards*

Approved Requirement to be Retired	Proposed Replacement Requirement(s)
<p>COM-001-1.1 Requirement R4</p> <p>R4. Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.</p>	<p>COM-003-1 Requirement R1 Part 1.1.1</p> <p>R1. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider shall use the following communications protocols:</p> <p>1.1. When participating in oral or written Operating Communications:</p> <p style="padding-left: 40px;">1.1.1. Use the English language when communicating between functional entities, unless</p>

	another language is mandated by law or regulation.
--	--

### *Conforming Changes to Other Standards*

Revisions to COM-001-1.1- are under development in two projects. Project 2006-06 includes revisions to Requirements R1-R3 and R5-R6 and Project 2007-02 includes revisions to R4.

### *Effective Dates*

COM-003-1 shall become effective the first day of the first calendar quarter, six calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter a year from the date of Board of Trustee adoption.

- If the version of COM-001-2 revised under Project 2006-06 is approved before COM-003-1 is approved, then the remaining requirement (R4) from COM-001-1.1 shall expire midnight of the day immediately prior to the Effective Date of COM-003-1 in the particular jurisdiction in which COM-003-1 is becoming effective.
- If the version of COM-001-2 revised under Project 2006-06 is not approved before COM-003-1 is approved, then COM-001-1.1 shall expire midnight of the day immediately the version of COM-001-2 developed under Project 2007-02 shall become effective on the first day of the first calendar quarter, six calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter a year from the date of Board of Trustee adoption.

## Implementation Plan for COM-003-1 — Operating Personnel Communications Protocols

### Approvals Required

COM-003-1 – Operating Personnel Communications Protocols

### **Prerequisite Approvals**

None

### Revisions to Glossary

The following term is proposed for addition to the NERC Glossary of Terms:

**Operating Communication** — Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.

### ~~Conforming Changes to Requirements in Already Approved Standards~~

- ~~• Remove R4 from COM-001-1~~
- ~~• Move R2 (or subsequent replacements) from COM-002-3 into COM-003-1 and retire COM-002-3~~

### **Standard Summary**

~~The OPCP SDT developed this new standard and is proposing removing requirements R4 from COM-001-1 and R2 (or subsequent replacements) from COM-002-3 for inclusion in this standard. This standard addresses part of Blackout Recommendation #26 and issues in FERC Order 693.~~

### Compliance with Standards**Applicable Entities**

Once these standards become effective, the responsible entities identified in the Applicability section of the standard must comply with the requirements. These include:

- Reliability Coordinator
- Balancing Authority
- ~~• Transmission Owner~~
- Transmission Operator
- Generator Operator
- Distribution Provider
- ~~• Transmission Service Provider~~
- ~~• Load Serving Entity~~

## Revisions or Retirements to Approved Standards

<u>Approved Requirement to be Retired</u>	<u>Proposed Replacement Requirement(s)</u>

## Conforming Changes to Other Standards

Revisions to COM-001-1.1- are under development in two projects. Project 2006-06 includes revisions to Requirements R1-R3 and R5-R6 and Project 2007-02 includes revisions to R4.

## **Effective Date**

COM-003-1 shall become ~~The proposed effective date for this standard is~~ the first day of the ~~third~~ first calendar quarter, ~~six calendar months following after~~ applicable regulatory approval; ~~or, s~~ ~~have been received (or the Reliability Standard otherwise becomes effective the first day of the~~ third calendar quarter after BOT adoption in those jurisdictions where ~~no~~ regulatory approval is ~~not required,)-~~ the first day of the first calendar quarter a year from the date of Board of Trustees adoption.

- If the version of COM-001-2 revised under Project 2006-06 is approved before COM-003-1 is approved, then the remaining requirement (R4) from COM-001-1.1 shall expire midnight of the day immediately prior to the Effective Date of COM-003-1 in the particular jurisdiction in which COM-003-1 is becoming effective.
- If the version of COM-001-2 revised under Project 2006-06 is not approved before COM-003-1 is approved, then COM-001-1.1 shall expire midnight of the day immediately the version of COM-001-2 developed under Project 2007-02 shall become effective on the first day of the first calendar quarter, six calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required,

the first day of the first calendar quarter a year from the date of Board of Trustee adoption.

NORTH AMERICAN ELECTRIC  
RELIABILITY CORPORATION

Most of the requirements in COM-003-1 are new – the only requirement from COM-001 associated with COM-003 is COM-001, Requirement R4.

## Project 2007-02: Operating Personnel Communication Protocols

Mapping Document

**Mapping Document Showing Translation of COM-001-1, R4 – Telecommunications into COM-003-1– Operating Personnel Communications Protocol**

Requirement in Approved Standard	Translation to New Standard or Other Action	Comments
<p>R4. Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations</p>	<p>Moved into COM 003-1 R1, Part 1.1.1</p>	<p>R1. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator and Distribution Provider shall use the following communications protocols: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations ]</p> <p>1.1. When participating in oral or written Operating Communications:</p> <p>1.1.1. Use the English language when communicating between functional entities, unless another language is mandated by law or regulation.</p>

## Project 2007-2 – Operating Personnel Communications Protocol

### **VRF and VSL Justifications**

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM 003-1 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### **NERC Criteria - Violation Risk Factors**

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a Cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or Cascading failures, or could hinder restoration to a normal condition.

#### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures; or a requirement in a planning time frame that, if violated, could, under Emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk

Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under Emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or Cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the Emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. A planning requirement that is administrative in nature.

### **FERC Violation Risk Factor Guidelines**

#### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the bulk power system:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings

- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

**Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

**Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

**Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

**Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

**NERC Criteria - Violation Severity Levels**

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

**FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

**Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

**Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

**Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justifications – COM 003-1, R1	
Proposed VRF	Medium
NERC VRF Discussion	R1 is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The VRF for this requirement is “Medium,” which is consistent with NERC guidelines
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard:</b> Consistency within a Reliability Standard. The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned, so there is no conflict.
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b> Consistency among Reliability Standards. This requirement calls for the use of communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. This requirement is analogous to R2 of COM-002-2, which requires the use of communication protocols. The VRF for this requirement (COM-002-2, R2) is “Medium,” which is consistent with COM-003-1 R1 at a “Medium.” The SDT considers “Medium” as the proper assignment because it is consistent with NERC and FERC guidelines.
FERC VRF G4 Discussion	<b>Guideline 4- Consistency with NERC Definitions of VRFs:</b> Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The VRF for this requirement is “Medium,” which is consistent with NERC guidelines.
FERC VRF G5 Discussion	<b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b> COM-003-1, Requirement R1 contains only one objective, which is to specify clear, formal and universally-applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.

Proposed VSLs for R1			
Lower	Moderate	High	Severe
N/A	<p>The responsible entity did not correctly implement one (1) of the four (4) parts of Requirement R1, Part 1.1 when it was appropriate to use all four parts.</p> <p>OR</p> <p>The responsible entity did not correctly implement Part 1.2 of the requirement.</p>	<p>The responsible entity did not correctly implement two (2) of the four (4) parts of Requirement R1, Part 1.1 when it was appropriate to use all four parts.</p> <p>OR</p> <p>The responsible entity did not correctly implement one (1) of the four (4) parts of the requirement when it was appropriate to use three of the four parts.</p>	<p>The responsible entity did not correctly implement any of the parts of Requirement R1, Part 1.1 when it was appropriate to use all four Parts.</p> <p>OR</p> <p>The responsible entity did not correctly implement three (3) or more of the four (4) parts of Requirement R1, Part 1.1 when it was appropriate to use all four parts.</p> <p>OR</p> <p>The responsible entity did not correctly implement two (2) of the four (4) parts of Requirement R1, Part 1.1 when it was appropriate to use three of the four parts.</p> <p>OR</p> <p>The responsible entity did not correctly implement one (1) of the four (4) parts of Requirement R1, Part 1.1 when it was appropriate to use two of the four parts.</p>

VSL Justifications – COM 003-1, R1	
<p><b>FERC VSL G1</b> Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>The most comparable requirement is COM-002-2, R2. Based on the VSL Guidance, the SDT developed four VSLs based on misapplication or absence of common communication protocols. If no communication protocols are used at all or if the number of required protocols falls below the listed thresholds, then the VSL is Severe.</p>
<p><b>FERC VSL G2</b> Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>Guideline 2a:</p> <ul style="list-style-type: none"> <li>• The VSL assignment for R1 is not binary.</li> </ul> <p>Guideline 2b:</p> <ul style="list-style-type: none"> <li>• The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</li> </ul>
<p><b>FERC VSL G3</b> Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement</p>
<p><b>FERC VSL G4</b> Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>The VSL is based on a single violation and not cumulative violations</p>
<p><b>FERC VSL G5</b> Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs</p>	<p>Non CIP</p>

<p><b>FERC VSL G6</b> VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence</p>	<p>Non CIP</p>
---	----------------

<p>VRF Justifications – COM 003-1, R2</p>	
<p>Proposed VRF</p>	<p>Medium</p>
<p>NERC VRF Discussion</p>	<p>R2 is a requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The VRF for this requirement is “Medium,” which is consistent with NERC guidelines</p>
<p>FERC VRF G2 Discussion</p>	<p><b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has sub-requirements; only one VRF was assigned, so there is no conflict. No one subrequirement is a “Low” or a “High,” so a VRF of “Medium” was assigned.</p>
<p>FERC VRF G3 Discussion</p>	<p><b>Guideline 3- Consistency among Reliability Standards:</b> Consistency among Reliability Standards. This requirement calls for use of formal three-part communication by the issuer of an Operating Communication. This requirement is analogous to R2 of COM-002-2, which describes a communication protocol required for operating personnel to use when giving a directive. The VRF for this requirement is “Medium,” which is consistent with COM-003-1 R2 at a “Medium.” The SDT considers “Medium” as the proper assignment because it is consistent with NERC and FERC guidelines.</p>
<p>FERC VRF G4 Discussion</p>	<p><b>Guideline 4- Consistency with NERC Definitions of VRFs:</b> Failure to utilize formal communication protocols could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of the requirement is unlikely to lead to Bulk Electric System instability, separation, or Cascading failures. The VRF for this requirement is “Medium,” which is consistent with NERC guidelines.</p>

## Introduction

---

Communication (COM) Standard COM-003-1 features requirements, the purpose of which is to provide clear, formal and universally applied communication protocols that reduce the possibility of miscommunication that could lead to action or inaction that is detrimental to the reliability of the Bulk Electric System (BES). Significant events have occurred on the BES when unclear communication created or exacerbated misunderstandings that led to instability and separation. Communication protocols used in many industries, militaries and government departments have added clarity to oral and written communications and have prevented potential errors that would have resulted in catastrophic events.

### Purpose

The Operations Personnel Communications Protocol Standards Drafting Team (OPCP SDT) drafted a Standard Authorization Request (SAR) for Project 2007-02. The purpose of the proposed standard is to: “Require that real time System Operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.”

The purpose of this paper is to establish the reliability value of requiring three-part communication for all operations on the BES described in the proposed definition of COM-003 - 1 “Operating Communications.” Additionally, it addresses the reliability benefit of other communication protocols featured in COM 003-1 that provide addition clarity for “Operating Communications.”

### Background

NERC Project 2007-02 was created from the 2003 Blackout Report, Recommendation 26. In April 2004, the “Blackout Report” was submitted to the President of the United States of America and the Prime Minister of Canada.

The Blackout Report stated that:

“Ineffective communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade. Consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability.”

The report also recommended that industry,

“Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate.”

FERC Order No. 693, Paragraph 532 directs the ERO and the industry to develop communication protocols based on the following guidelines:

“532. While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System. We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions. This is important because the Bulk-Power System is so tightly interconnected that System impacts often cross several operating entities’ areas.”

In response to this recommendation in FERC Order No. 693, a SAR team was established in April of 2007. These reports, directives and approved guidance documents provide the framework from which the OPCP SDT derived the concepts that contributed to the development of the COM-003-1 requirements.

## Three-Part Communication

---

### Overview

Three-part communication, sometimes known as the “repeat back” method of communications, is used to communicate changes to physical Facility equipment during work activities via face-to-face, telephone, or radio communications. This communication protocol requires three oral exchanges between a sender and a receiver to promote a reliable transfer of information and understanding. The person originating the communication is the sender and is responsible for verifying that the receiver understands the message, as intended. The receiver makes sure he or she understands what the sender is saying and repeats back the message to the sender.

### Steps for Three Part Communication

COM-003-1 requires the use of three-part communication for “Operating Communications,” which is defined as, “Communication of instruction to change or maintain the state, status, output, or input of an Element<sup>1</sup> or Facility<sup>2</sup> of the Bulk Electric System.”

#### **This is a general description of how three-part communication functions:**

1. First - The sender orally transmits information (face-to-face, telephonic or other electronic equivalent) clearly and concisely to the receiver, directing them to alter an element that could impact the BES.
2. Second - The receiver orally acknowledges the communication by repeating the message back to the sender. The receiver does not need to repeat every part of the communication verbatim, but he or she must restate the equipment-related information exactly as spoken by the sender. If the receiver does not understand the message, he or she must ask for clarification.
3. Third - The sender acknowledges the reply and confirms to the receiver that the message is correct and properly understood by stating the communication was correct. If the sender does not understand the receiver’s reply, the sender must then respond by saying, “That is wrong,” (or words to that effect) and then restate the original message. If corrected, the receiver must acknowledge the corrected message and repeat back the message to the sender.

---

<sup>1</sup> In the NERC Glossary of Terms, Element is defined as, “Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.”

<sup>2</sup> In the NERC Glossary of Terms, Facility is defined as “a set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)”

Verbal three-part communication should be used during the operation or alteration of Facility equipment. Applicable entities are to use three-part communications when performing steps or actions using an approved procedure that impact equipment or activities, the safety of personnel, the environment, or the Facility. Finally, three-part communication should be implemented for tasks where the consequences of a mishap are unacceptable and could lead to instability, uncontrolled separation, or Cascading.

As a best practice, it may also be used when discussing the condition of Facility equipment or the value of an important parameter in utility operations.

## Phonetic Alphabet or Alpha-numeric Clarifiers

### Overview

Several letters in the English language sound alike and can be confused in stressful or noisy situations. For example, some letters sound alike when spoken, and can easily be confused; such as “D” and “B.” The phonetic alphabet specifies a common word for each letter of the English alphabet. By using a word for each letter, there is less chance that the person listening will confuse the letters. Using the phonetic alphabet, “Delta” and “Bravo” are more easily differentiated. The effects of noise, weak telephone or radio signals, and an individual's accent are reduced through the use of the phonetic alphabet.

People use the phonetic alphabet and unit designators when describing unique identifiers for specific components. When the only distinguishing difference between two component labels is a single letter, then the phonetic alphabet form of the letter should be substituted for the distinguishing character. For example, 2UL-18L and 2UL-18F would be stated, “two Uniform Lima dash one eight Lima” and “two Uniform Lima dash one eight Foxtrot.”

### COM-003-1 Featured Phonetic Alphabet

<u>Letter - Word</u>	<u>Letter - Word</u>	<u>Letter - Word</u>	<u>Letter - Word</u>
A - Alpha	H - Hotel	O - Oscar	V - Victor
B - Bravo	I - India	P - Papa	W - Whiskey
C - Charlie	J - Juliet	Q - Quebec	X - X-ray
D - Delta	K - Kilo	R - Romeo	Y - Yankee
E - Echo	L - Lima	S - Sierra	Z - Zulu
F - Foxtrot	M - Mike	T - Tango	
G - Golf	N - November	U – Uniform	

<u>Number</u>	<u>pronounced as:</u>	<u>Number</u>	<u>pronounced as:</u>
1 - One	(wun)	6 - Six	(six)
2 - Two	(too)	7 – Seven	(sev-en)
3 - Three	(tree)	8 – Eight	(ait)
4 - Four	(fow-er)	9 – Nine	(nin-er)
5 – Five	(fife)	0 – Zero	(zee-row)

The phonetic alphabet or a correct alpha-numeric clarifier is to be used for any, “Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.”

## COM-003-1 Operating Personnel Communication Protocols

---

The nature of communication between people can be complex and subject to many variables. Accents, moods, regional jargon, cultural interpretations, multiple languages, individual skill sets, and physiological conditions are but a few of the universe of factors that can and do have an impact on the clarity of two-party, person-to-person communication. Until the human factor is completely eliminated, there will be the risk of human error due to miscommunication.

Miscommunication has created unintended results on the Bulk Electric System (BES) that have led to outages and, in some cases, the inability of an operator to prevent the spread of Cascading. Although the potential for human error can never be completely eliminated, successful, proven communication protocols from other industries that also deal with critical processes and systems can be implemented to reduce the risk to BES reliability. The successful implementation of these widely-accepted communication protocols from other industries into the requirements of COM-003-1 will have a significant, positive impact on the reliability of the BES.

COM-003-1 requires the use of three-part communication for all Operating Communications. The reliability benefits of using three-part communication is threefold:

1. The removal of any doubt that communication protocols will be used and when they will be used. This will reduce the opportunity for confusion and misunderstanding among entities that may have different doctrine. An example is: One entity uses three-part for emergencies, and the other uses it for all operating conditions.
2. There will be no mental “transition” when operating conditions shift from normal to Emergency. The communication protocols for the operators will remain standard during transitions through all conditions.
3. The formal requirement for three-part communication will create a heightened sense of awareness in operators that the task they are about to execute is critical, and recognize the risk to the reliable operation of the BES is increased if the communication is misunderstood.

## Electric Utility Industry Communication Practices

The risk of BES failure due to miscommunication is very significant in the electric power industry. Blackouts that affect millions of customers in major cities are guaranteed to create undesirable media attention. The public at large in North America is heavily dependent on technology and is intolerant of massive blackouts. The public is conditioned to 24/7 access to technology, climate control and lighting. A sudden loss of service quickly causes immediate public frustration. If the root cause was determined to be industry operating miscommunication instead of uncontrollable environmental factors, criticism increases even more dramatically. Other industries that currently deal with risks, challenges and potentially widespread consequences similar to the electric utility industry have successfully reduced miscommunication by implementing uniform communication protocols similar to those identified in and required by COM 003-1.

### Table of Communication Practices of the Electric Utility Industry

The examples listed in the table below represent the communication practices of many major registered entities that engage in three part communication when altering the operating state of the BES. These registered entities account for a large amount of the generation, load and customers served in North America.

**Table 1-A Registered Entities that Currently Use Three-Part Communication during Both Emergencies and Non-emergencies<sup>3</sup>**

Registered Entity Location and Description	Generation Operations	Transmission Operations	Distribution Operations	Normal Operations	Emergency Operations	Customers Impacted	Load
South/Central US Entity (large)	Yes	Yes	Yes	Yes	Yes	23 Million	82 GW
Large Southern Entity #1	Yes	Yes	Yes	Yes	Yes	4.4 Million	43 GW
Large Mid Atlantic RTO Entity	Yes	Yes	NA	Yes	Yes	60 Million	185 GW
Large Southern Entity #2	Yes	Yes	Yes	Yes	Yes	2.8 Million	30 GW
Large West Coast Entity#1	Yes	Yes	Yes	Yes	Yes	5.1 Million	Not Available
Large Canadian HYDRO	Yes	Yes	Yes	Yes	Yes	1.3 Million	27 GW
Large	Yes	Yes	Yes	Yes	Yes	3.4	17 GW

<sup>3</sup> Industry use of three part communication analysis is based on publicly published documents, policies, procedures and internal standards.

Registered Entity Location and Description	Generation Operations	Transmission Operations	Distribution Operations	Normal Operations	Emergency Operations	Customers Impacted	Load
Midwestern/Western Utility						Million	
Large Florida TOP	Yes	Yes	Yes	Yes	Yes	4.5 Million	43GW
Midwestern RTO Entity	Yes	Yes	NA	Yes	Yes	39 Million	110 GW
DOE	Yes	Yes	Yes	Yes	Yes	NA	NA
INPO	Yes	Yes	Yes	Yes	Yes	NA	NA

This is strong evidence of an embedded electric utility practice that establishes, without doubt, the significant element of reliability value of three-part communications and the other communications protocols. The fact that the majority of BES entities already employ three-part (or repeat back) communications for routine, alert and Emergency operations (and document it in very strong language in their policy and procedures) demonstrates that the electric utility industry recognizes this significant element of value.

## Human Factor Considerations

---

As previously discussed, there are a myriad of reasons that miscommunications occur. Beyond the typical environmental concerns (loud background noise, radio static, dialects, etc.), humans are very likely to have misunderstandings based on other factors. Humans are susceptible to expectation errors, relating to context and meaning, which will often drive understanding. People often discern what they want to hear, usually at a subconscious level. The importance of verifying what is heard becomes the first step in assuring that the message was understood.

When a person hears a message, an interpretation emerges from the different pieces of conversation data; this is called data-driven or bottom-up processing. Perception can be largely data-driven because one wants to make sure their understanding accurately reflect events in the outside world; in this case, the message from the sender. A person wants the interpretation of a message to be determined mostly by data (perception), then to understand the information in the environment (comprehension), and to make the appropriate decision from the senses; not by the listener's expectations. This data-driven processing can lead to miscommunications and may affect situational awareness because if the perception of the information is wrong, the chances of correct understanding and making proper future decisions are dramatically reduced.<sup>4</sup>

Situation awareness is fundamentally based on one's understanding of a system, how it operates, its characteristics, and performance parameters; couplings within itself and other systems and how one interacts with it. This understanding is referred to as one's mental model. It is a representation of the surrounding world, the relationships between its various parts and a person's intuitive perception about his or her own actions and their consequences. One's mental model helps to shape one's behavior and define one's approach to solving problems (a personal algorithm) and carrying out tasks, especially within a system. Mental models can be partially or completely right or wrong, complete or incomplete, and most often are unique for each individual. Sometimes mental models are carried throughout an organization through operating norms and commonly understood practices. Part of building a mental model for a particular problem or event is to gain information through active communication with others. Miscommunication can hamper immediate decisions and can also lay in waiting as a latent error, which can expose itself later when the incorrect information is retrieved or used in the processing of decision making.

---

<sup>4</sup> Endsley, M. R. (1995). Toward a theory of situation awareness in dynamic systems. Human Factors, 37(1), 32-64.

## Communication Practices External to the Electric Utility Industry

---

The purpose of effective communication is to create mutual understanding between two or more people. Effective communication is an important defense in the prevention of errors and events. Many industries mandate communication protocols due to the high potential for catastrophic results if an important communication is misunderstood. While the effects of critical mishaps from ineffective communications differ, the offending organization and associated industry will find itself dealing with legal, regulatory, financial, market and political consequences.

### Medical Field Industry

Ineffective communication is a root cause for nearly 66 percent of all sentinel events (events that signal the need for immediate investigation and response) reported in the medical industry. In other words, 66 percent of all reported deaths or serious injuries (accidents) in healthcare from 1995-2005 were related to ineffective communication.<sup>5</sup>

One step the medical industry is implementing to solve ineffective communication problems in the healthcare industry is to implement a “read-back” process for taking verbal or telephone orders.

Oral communication possesses a greater risk of misunderstanding compared to written forms of communication. Misunderstandings are most likely to occur when the individuals involved have different understandings, or mental models, of the current work situation or use terms that are potentially confusing. Therefore, confirmation of verbal exchanges of operational information between individuals must occur to promote understanding and reliability of the communication. In addition, the medical industry is standardizing abbreviations, acronyms, and symbols used throughout the field, to include compiling a list of those abbreviations, acronyms, and symbols that are not to be used.

### Commercial Air Transportation Industry

Based on available data, in the last 67 years there have been 274 commercial airline accidents involving at least 60 fatalities or more. Miscommunication between pilots and controllers can clearly be identified as a causal factor in 36 (13 percent) of these tragedies. Based on this analysis, the aviation community has implemented interpersonal communication tools like three-part communications and language standardization.

---

<sup>5</sup> JCAHO1 Root Causes and Percentages for Sentinel Events (All Categories) January 1995–December 2005.

### Military Communication Protocols

Military organizations have a long history of communication protocols that they have developed and have improved over time. Firing orders, shipboard orders to the helm, aircraft launch and recovery contain elements of three-part communication and alpha numeric clarifiers. The reasons these communication protocols are required are due to the extreme risks and consequences that exist if miscommunication occurs. Military organizations also make use of the NATO alphabet and various shorthand codes to provide a status or update.

### Railroad Operations

Rail operations have similar risks of catastrophic results due to miscommunication. Switching rails, moving cars, coupling, decoupling and loading freight necessitate clear communication and require three-part communication and formal protocols.

### Other Organizations

Police and fire dispatch, the Department of Energy, and The Institute of Nuclear Power Operations (INPO) are among other organizations that value and mandate communication protocols similar to those in COM-003-01.

## Performance of the Electric Utility Industry

---

Of all of the System events that NERC has either analyzed or investigated, 50 percent of those have involved findings of a deficiency of clear, concise communications. These events have either impacted, or potentially impacted, a significant amount of Load and/or generation.

Significant blackout events, such as the Northeastern Blackout of 2003 and the Florida Blackout of 2008, have communication issues listed among the top contributors to loss of Load and generation.

This analysis highlights the fact that industry Operating Communication performance over the last 10 years still has room for significant improvement. The lack of clear standard communication protocols when operating the BES will continue to create unacceptable levels of risk for large-scale failures.

Table 1 indicates that, across electric power industry, internal policies specify three-part communications for all BES operations, including routine or normal operations. This high level of compliance can be associated with the history of enforcement of COM 002-2a, R2, which requires three-part communication for all directives. This requirement has been mandated and has been enforceable for several years. When compared to COM 002-2a, COM 003-1 features improved approaches and structure for three-part communication that assigns proper responsibility for the “issuer” (sender) and for the “receiver.” When combined with the proposed definition of “Operating Communications,” COM 003 clarifies the circumstances of when to use three-part communication. The other improvement COM 003-1 offers, to improve the reliability of the BES, is the addition of several proven communication protocols that will clarify Operating Communications to reduce the risk of mistakes. Clarifying several key elements of an “Operating Communication,” such as time, time zone, equipment identifiers, a common language and alpha-numeric clarifiers, all contribute to reducing misunderstandings and reduce the risk of a grave error during BES operations.

### Summary

The BES across North America is a “tightly” interconnected System where instability can spread quickly. When a decision is made to alter the state of an Element on the BES, there is an increased threat to reliability, no matter what type of operating condition (normal, alert, Emergency) exists. The transition from normal to Emergency operation can be sudden and indistinguishable until recognized, often after the damage is done. There are multiple human factors during communication that occur naturally and contribute to unclear communication, which increases the risk to reliable operation of the BES.

The electric power industry widely deploys communication protocols such as three-part communications for all BES Operating Communications. The uniform deployment of these protocols in the three Interconnections is in part due to Requirement 2 in the mandatory and

enforceable Reliability Standard COM-002-2a. Industry's widespread utilization of three-part communications for BES Operating Communication is a confirmation of the reliability value of the protocol.

The official results of the 2003 Blackout Report cites unclear communications as a major factor in the cause, spread, and impedance of restoration of major BES failures. Other industries have successfully implemented universal communication protocols, which have resulted in fewer accidents and fatalities caused by miscommunications. Preventable blackouts or widespread loss of generation or load continues to be politically, socially and economically unacceptable in North America.

### Conclusion

The critical nature of BES configuration and its impact on reliability demands, that any action planned to alter the System under any condition should be systematically and clearly conveyed. Given the extent of human involvement in the process, the risk of miscommunication increases based on our own human tendencies and perceptions.

COM 003-1 takes communication protocols for the BES to the next level of reliability by requiring protocols that will reduce the risk of miscommunication. It clarifies when to use three-part communication. It provides a superior requirement structure that properly assigns the elements of three-part communication to the "issuer" (sender) and "receiver" and requires additional communication protocols that provide greater clarity when engaged in operating communication on the BES. Based on the facts listed above, communication protocols, as contained in proposed Standard COM-003-1, will provide a strong and much improved reliability benefit to address existing communication reliability gaps that continue to negatively impact the reliable operation of the BES.

The proposed communication protocols in COM 003-1 have been successfully developed and proven in other organizations' processes. The use of repeat backs and the added layer of value they provide to BES reliability make them essential to all "Operating Communications." The OPCP SDT endorses the use of these protocols.

Requirement R4 was assigned to Project 2007-02. All other requirements were assigned to Project 2006-06 and are being revised or retired under Project 2006-06.

**A. Introduction**

- 1. Title:** **Telecommunications**
- 2. Number:** COM-001-2
- 3. Purpose:** Each Reliability Coordinator, Transmission Operator and Balancing Authority needs adequate and reliable telecommunications facilities internally and with others for the exchange of Interconnection and operating information necessary to maintain reliability.
- 4. Applicability**
  - 4.1.** Transmission Operators.
  - 4.2.** Balancing Authorities.
  - 4.3.** Reliability Coordinators.
  - 4.4.** NERCNet User Organizations.
- 5. (Proposed) Effective Date:** First day of the first calendar quarter, six calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter a year from the date of Board of Trustee adoption.

**B. Requirements**

- R1.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information:
  - R1.1.** Internally.
  - R1.2.** Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities.
  - R1.3.** With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability.
  - R1.4.** Where applicable, these facilities shall be redundant and diversely routed.
- R2.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall manage, alarm, test and/or actively monitor vital telecommunications facilities. Special attention shall be given to emergency telecommunications facilities and equipment not used for routine communications.
- R3.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide a means to coordinate telecommunications among their respective areas. This coordination shall include the ability to investigate and recommend solutions to telecommunications problems within the area and with other areas.
- R4.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have written operating instructions and procedures to enable continued operation of the system during the loss of telecommunications facilities.
- R5.** Each NERCNet User Organization shall adhere to the requirements in Attachment 1-COM-001, “NERCNet Security Policy.”

**C. Measures**

- M1.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include, but is not limited to communication facility test-procedure documents, records of testing, and maintenance records for communication facilities or equivalent that will be used to confirm that it manages, alarms, tests and/or actively monitors vital telecommunications facilities. (Requirement 2 part 1)
- M2.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request its current operating instructions and procedures, either electronic or hard copy, that will be used to confirm that it meets Requirement 4.
- M3.** The NERCnet User Organization shall have and provide upon request evidence that could include, but is not limited to, documented procedures, operator logs, voice recordings or transcripts of voice recordings, electronic communications, etc., that will be used to determine if it adhered to the (User Accountability and Compliance) requirements in Attachment 1-COM-001. (Requirement 5)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

NERC shall be responsible for compliance monitoring of the Regional Reliability Organizations  
Regional Reliability Organizations shall be responsible for compliance monitoring of all other entities

#### **1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 calendar days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### **1.3. Data Retention**

For Measure 1 each Reliability Coordinator, Transmission Operator, Balancing Authority shall keep evidence of compliance for the previous two calendar years plus the current year.

For Measure 2, each Reliability Coordinator, Transmission Operator, Balancing Authority shall have its current operating instructions and procedures to confirm that it meets Requirement 4.

For Measure 3, each Reliability Coordinator, Transmission Operator, Balancing Authority and NERCnet User Organization shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor.

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

Attachment 1 — COM-001 — NERCnet Security Policy

**2. Levels of Non-Compliance for Transmission Operator, Balancing Authority or Reliability Coordinator**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** There shall be a separate Level 3 non-compliance for every one of the following requirements that is in violation:

**2.3.1** There are no written operating instructions and procedures to enable continued operation of the system during the loss of telecommunication facilities, as specified in R4.

**2.4. Level 4:** Telecommunication systems are not actively monitored, tested, managed or alarmed, as specified in R2.

**3. Levels of Non-Compliance — NERCnet User Organization**

**3.1. Level 1:** Not applicable.

**3.2. Level 2:** Not applicable.

**3.3. Level 3:** Not applicable.

**3.4. Level 4:** Did not adhere to the requirements in Attachment 1-COM-001, NERCnet Security Policy.

**E. Regional Differences**

None Identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New

1.1	October 29, 2008	BOT adopted errata changes; updated version number to “1.1”	Errata

### Attachment 1 — COM-001 — NERCnet Security Policy

#### Policy Statement

The purpose of this NERCnet Security Policy is to establish responsibilities and minimum requirements for the protection of information assets, computer systems and facilities of NERC and other users of the NERC frame relay network known as “NERCnet.” The goal of this policy is to prevent misuse and loss of assets.

For the purpose of this document, information assets shall be defined as processed or unprocessed data using the NERCnet Telecommunications Facilities including network documentation. This policy shall also apply as appropriate to employees and agents of other corporations or organizations that may be directly or indirectly granted access to information associated with NERCnet.

The objectives of the NERCnet Security Policy are:

- To ensure that NERCnet information assets are adequately protected on a cost-effective basis and to a level that allows NERC to fulfill its mission.
- To establish connectivity guidelines for a minimum level of security for the network.
- To provide a mandate to all Users of NERCnet to properly handle and protect the information that they have access to in order for NERC to be able to properly conduct its business and provide services to its customers.

#### NERC’s Security Mission Statement

NERC recognizes its dependency on data, information, and the computer systems used to facilitate effective operation of its business and fulfillment of its mission. NERC also recognizes the value of the information maintained and provided to its members and others authorized to have access to NERCnet. It is, therefore, essential that this data, information, and computer systems, and the manual and technical infrastructure that supports it, are secure from destruction, corruption, unauthorized access, and accidental or deliberate breach of confidentiality.

#### Implementation and Responsibilities

This section identifies the various roles and responsibilities related to the protection of NERCnet resources.

#### NERCnet User Organizations

Users of NERCnet who have received authorization from NERC to access the NERC network are considered users of NERCnet resources. To be granted access, users shall complete a User Application Form and submit this form to the NERC Telecommunications Manager.

#### Responsibilities

It is the responsibility of NERCnet User Organizations to:

- Use NERCnet facilities for NERC-authorized business purposes only.
- Comply with the NERCnet security policies, standards, and guidelines, as well as any procedures specified by the data owner.
- Prevent unauthorized disclosure of the data.
- Report security exposures, misuse, or non-compliance situations via Reliability Coordinator Information System or the NERC Telecommunications Manager.
- Protect the confidentiality of all user IDs and passwords.
- Maintain the data they own.
- Maintain documentation identifying the users who are granted access to NERCnet data or applications.
- Authorize users within their organizations to access NERCnet data and applications.

- Advise staff on NERCnet Security Policy.
- Ensure that all NERCnet users understand their obligation to protect these assets.
- Conduct self-assessments for compliance.

### **User Accountability and Compliance**

All users of NERCnet shall be familiar and ensure compliance with the policies in this document.

Violations of the NERCnet Security Policy shall include, but not be limited to any act that:

- Exposes NERC or any user of NERCnet to actual or potential monetary loss through the compromise of data security or damage.
- Involves the disclosure of trade secrets, intellectual property, confidential information or the unauthorized use of data.

Involves the use of data for illicit purposes, which may include violation of any law, regulation or reporting requirement of any law enforcement or government body.

Requirement R4 was assigned to Project 2007-02. All other requirements were assigned to Project 2006-06 and are being revised or retired under Project 2006-06.

## A. Introduction

1. **Title:** Telecommunications
2. **Number:** COM-001-~~1.12~~
3. **Purpose:** Each Reliability Coordinator, Transmission Operator and Balancing Authority needs adequate and reliable telecommunications facilities internally and with others for the exchange of Interconnection and operating information necessary to maintain reliability.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - 4.3. Reliability Coordinators.
  - 4.4. NERCNet User Organizations.
5. **(Proposed) Effective Date:** First day of the first calendar quarter, six calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter a year from the date of Board of Trustee adoption. ~~May 13, 2009~~

## B. Requirements

- R1. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information:
  - R1.1. Internally.
  - R1.2. Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities.
  - R1.3. With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability.
  - R1.4. Where applicable, these facilities shall be redundant and diversely routed.
- R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall manage, alarm, test and/or actively monitor vital telecommunications facilities. Special attention shall be given to emergency telecommunications facilities and equipment not used for routine communications.
- R3. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide a means to coordinate telecommunications among their respective areas. This coordination shall include the ability to investigate and recommend solutions to telecommunications problems within the area and with other areas.

~~R4. Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.~~

~~R5.~~R4. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have written operating instructions and procedures to enable continued operation of the system during the loss of telecommunications facilities.

~~R6-R5.~~ Each NERCNet User Organization shall adhere to the requirements in Attachment 1-COM-001, “NERCNet Security Policy.”

### C. Measures

**M1.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include, but is not limited to communication facility test-procedure documents, records of testing, and maintenance records for communication facilities or equivalent that will be used to confirm that it manages, alarms, tests and/or actively monitors vital telecommunications facilities. (Requirement 2 part 1)

~~M2. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request its current operating instructions and procedures, either electronic or hard copy, that will be used to confirm that it meets Requirement 4. The Reliability Coordinator, Transmission Operator or Balancing Authority shall have and provide upon request evidence that could include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent, that will be used to determine compliance to Requirement 4.~~

~~M3. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request its current operating instructions and procedures, either electronic or hard copy that will be used to confirm that it meets Requirement 5.~~

~~M4.~~**M3.** The NERCnet User Organization shall have and provide upon request evidence that could include, but is not limited to, documented procedures, operator logs, voice recordings or transcripts of voice recordings, electronic communications, etc., that will be used to determine if it adhered to the (User Accountability and Compliance) requirements in Attachment 1-COM-001. (Requirement ~~65~~)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

NERC shall be responsible for compliance monitoring of the Regional Reliability Organizations  
Regional Reliability Organizations shall be responsible for compliance monitoring of all other entities

##### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 calendar days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

##### 1.3. Data Retention

For Measure 1 each Reliability Coordinator, Transmission Operator, Balancing Authority shall keep evidence of compliance for the previous two calendar years plus the current year.

~~For Measure 2 each Reliability Coordinator, Transmission Operator, and Balancing Authority shall keep 90 days of historical data (evidence).~~

For Measure ~~3~~2, each Reliability Coordinator, Transmission Operator, Balancing Authority shall have its current operating instructions and procedures to confirm that it meets Requirement ~~5~~4.

For Measure ~~4~~3, each Reliability Coordinator, Transmission Operator, Balancing Authority and NERCnet User Organization shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor.

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

#### 1.4. Additional Compliance Information

Attachment 1 — COM-001 — NERCnet Security Policy

### 2. Levels of Non-Compliance for Transmission Operator, Balancing Authority or Reliability Coordinator

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:

~~2.3.1 — The Transmission Operator, Balancing Authority or Reliability Coordinator used a language other than English without agreement as specified in R4.~~

~~2.3.2.3.1~~ There are no written operating instructions and procedures to enable continued operation of the system during the loss of telecommunication facilities, as specified in ~~R5~~R4.

2.4. Level 4: Telecommunication systems are not actively monitored, tested, managed or alarmed, as specified in R2.

### 3. Levels of Non-Compliance — NERCnet User Organization

3.1. Level 1: Not applicable.

3.2. Level 2: Not applicable.

3.3. Level 3: Not applicable.

3.4. Level 4: Did not adhere to the requirements in Attachment 1-COM-001, NERCnet Security Policy.

## E. Regional Differences

None Identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>

1	November 1, 2006	Adopted by Board of Trustees	Revised
1	April 6, 2007	Requirement 1, added the word “for” between “facilities” and “the exchange.”	Errata
1.1	October 29, 2008	BOT adopted errata changes; updated version number to “1.1”	Errata

## **Attachment 1 — COM-001 — NERCnet Security Policy**

### **Policy Statement**

The purpose of this NERCnet Security Policy is to establish responsibilities and minimum requirements for the protection of information assets, computer systems and facilities of NERC and other users of the NERC frame relay network known as “NERCnet.” The goal of this policy is to prevent misuse and loss of assets.

For the purpose of this document, information assets shall be defined as processed or unprocessed data using the NERCnet Telecommunications Facilities including network documentation. This policy shall also apply as appropriate to employees and agents of other corporations or organizations that may be directly or indirectly granted access to information associated with NERCnet.

The objectives of the NERCnet Security Policy are:

- To ensure that NERCnet information assets are adequately protected on a cost-effective basis and to a level that allows NERC to fulfill its mission.
- To establish connectivity guidelines for a minimum level of security for the network.
- To provide a mandate to all Users of NERCnet to properly handle and protect the information that they have access to in order for NERC to be able to properly conduct its business and provide services to its customers.

### **NERC’s Security Mission Statement**

NERC recognizes its dependency on data, information, and the computer systems used to facilitate effective operation of its business and fulfillment of its mission. NERC also recognizes the value of the information maintained and provided to its members and others authorized to have access to NERCnet. It is, therefore, essential that this data, information, and computer systems, and the manual and technical infrastructure that supports it, are secure from destruction, corruption, unauthorized access, and accidental or deliberate breach of confidentiality.

### **Implementation and Responsibilities**

This section identifies the various roles and responsibilities related to the protection of NERCnet resources.

#### **NERCnet User Organizations**

Users of NERCnet who have received authorization from NERC to access the NERC network are considered users of NERCnet resources. To be granted access, users shall complete a User Application Form and submit this form to the NERC Telecommunications Manager.

#### **Responsibilities**

It is the responsibility of NERCnet User Organizations to:

- Use NERCnet facilities for NERC-authorized business purposes only.
- Comply with the NERCnet security policies, standards, and guidelines, as well as any procedures specified by the data owner.
- Prevent unauthorized disclosure of the data.
- Report security exposures, misuse, or non-compliance situations via Reliability Coordinator Information System or the NERC Telecommunications Manager.
- Protect the confidentiality of all user IDs and passwords.
- Maintain the data they own.
- Maintain documentation identifying the users who are granted access to NERCnet data or applications.
- Authorize users within their organizations to access NERCnet data and applications.

- Advise staff on NERCnet Security Policy.
- Ensure that all NERCnet users understand their obligation to protect these assets.
- Conduct self-assessments for compliance.

**User Accountability and Compliance**

All users of NERCnet shall be familiar and ensure compliance with the policies in this document.

Violations of the NERCnet Security Policy shall include, but not be limited to any act that:

- Exposes NERC or any user of NERCnet to actual or potential monetary loss through the compromise of data security or damage.
- Involves the disclosure of trade secrets, intellectual property, confidential information or the unauthorized use of data.

Involves the use of data for illicit purposes, which may include violation of any law, regulation or reporting requirement of any law enforcement or government body.

## Standards Announcement

### Project 2007-02 – Operating Personnel Communications Protocols

Initial Ballot and Non-Binding Poll Open Through 8 p.m. Wednesday,  
June 20, 2012

#### [Now Available](#)

An initial ballot of COM-003-1 – Operating Personnel Communications and Protocols and a non-binding poll of the associated VRFs/VSLs is open through **8 p.m. Eastern on Wednesday, June 20, 2012.**

#### Instructions

Members of the ballot pools associated with this project may log in and submit their vote for the Standard and opinion in the non-binding poll of the associated VRFs and VSLs by clicking [here](#).

Due to modifications to NERC's balloting software, voters will no longer be able to submit comments via the balloting software

#### Next Steps

The drafting team will consider all comments received during the formal comment period and initial ballot and determine whether to make changes to the standard and associated documents. After the standards and associated documents are revised, the drafting team will submit its work for quality review prior to the next posting.

#### Background

There are two projects that have the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination has limited the scope of its modifications to the COM family of standards to those that address communication during emergency operations. The Project 2006-06 team has proposed a new term, "Reliability Directive," to specifically address those communications. The proposed definition of Reliability Directive is "A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact." The Project 2006-06 drafting team is proposing to require three-part communication for Reliability Directives, with a VRF of High for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols must address communication protocols for both normal and emergency operations, the Project 2007-02 drafting team is proposing a new term, "Operating Communication." The proposed definition for Operating Communication is

“Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.” Given that Reliability Directives are a subset of Operating Communications, and to avoid any possibility of double jeopardy, the Project 2007-02 SDT is proposing to require three-part communication for all Operating Communications other than Reliability Directives, and has proposed a Medium VRF for these requirements. Having a High VRF for a violation of three-part communication involving a Reliability Directive and having a Medium VRF for a violation of three-part communication involving other Operating Communications supports the appropriate differentiation of risk for normal and emergency communications.

Additional information is available on the [project webpage](#).

### **Standards Development Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Standards Announcement

### Project 2007-02 – Operating Personnel Communications Protocols White Paper on Operating Communications Protocols now Posted

#### [Now Available](#)

A white paper on Operating Communications protocols has been posted with the clean version COM-003-1 – Operating Personnel Communications Protocols that has been posted for a 45-day formal comment period, initial ballot and non-binding poll. The drafting team prepared this white paper to aid in the evaluation of proposed COM-003-1 and the associated proposed definition of Operating Communication.

#### **Background**

NERC Project 2007-02 was created from the 2003 Blackout Report, Recommendation 26. In April 2004, the “Blackout Report” was submitted to the President of the United States of America and the Prime Minister of Canada.

The Blackout Report stated that:

“Ineffective communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade. Consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability.”

The report also recommended that industry,

“Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate.”

FERC Order No. 693, Paragraph 532 directs the ERO and the industry to develop communication protocols based on the following guidelines:

“532. While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System. We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions. This is important because the Bulk- Power System is so tightly interconnected that System impacts often cross several operating entities’ areas.”

The purpose of the white paper is to establish the reliability value of requiring three-part communication for all operations on the BES described in the proposed definition of COM-003 -1 “Operating Communication.” Additionally, it addresses the reliability benefit of other communication protocols featured in COM 003-1 that provide addition clarity for “Operating Communication.”

The requirements in COM-003-1 also support one of the eight high priority issues identified in the NERC President’s Top Priority Issues for BPS Reliability Issued January 7, 2011:

Ambiguous or incomplete voice communications – Out of longstanding tradition, system operators and reliability coordinators are comfortable with informal communications with field and power plant personnel and neighboring systems. Experience from analyzing various events indicates there is often a sense of awkwardness when personnel transition from conversational discussion to issuing reliability instructions. It is also human nature to be uncomfortable in applying formal communication procedures after personnel have developed informal styles over many years. Confusion in making the transition from normal conversation to formal communications can introduce misunderstandings and possibly even incorrect actions or assumptions. Further, once the need to transition to more formal structure is recognized, the transition is often not complete or effective. Results can include unclear instructions, confusion whether an instruction is a suggestion or a directive, whether specific action is required or a set of alternative actions are permissible, and confusion over what elements of the system are being addressed.

The drafting team is in the process of preparing for a webinar on the proposed COM-003-1. The webinar is scheduled to be held on Thursday June 7, 2012 from 1:30—3:30 p.m. Eastern Daylight Time. An announcement for the webinar with additional details is forthcoming.

### Standards Development Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at [monica.benson@nerc.net](mailto:monica.benson@nerc.net).

## Standards Announcement

### Project 2007-02 – Operating Personnel Communications Protocols

Ballot Pools Forming: May 7 – June 5, 2012

Formal Comment Period Open: May 7 – June 20, 2012

Ballot Windows Open for Initial Ballot and Non-Binding Poll:  
June 11 – June 20, 2012

#### [Now Available](#)

A clean version COM-003-1 – Operating Personnel Communications Protocols has been posted for a 45-day formal comment period, initial ballot and non-binding poll. The drafting team has also posted its implementation plan, mapping document, justification for Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) and proposed changes to COM-001. The drafting team has not posted a redline of COM-003-1 because the changes to the last posted version of COM-003-1 are so extensive that a redline is not useful.

#### **Instructions for Joining Ballot Pools**

Registered Ballot Body members must join the ballot pools to be eligible to vote in the upcoming ballot of Project 2007-02 Operating Personnel Communications Protocols by clicking [here](#) for the Initial ballot and the non-binding poll of the associated Violation Risk Factors and Violation Severity Levels.

During the pre-ballot windows, members of the ballot pools may communicate with one another by using their “ballot pool list servers.” (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list servers for the ballot pools are:

**Initial ballot:** [bp-2007-02\\_COM-003-1\\_in@nerc.com](mailto:bp-2007-02_COM-003-1_in@nerc.com)

**Non-binding poll:** [bp-2007-02\\_COM-003-1\\_NB\\_in@nerc.com](mailto:bp-2007-02_COM-003-1_NB_in@nerc.com)

The ballot pools are open **through 8 a.m. Eastern on Tuesday, June 5, 2012.**

#### **Instructions for Commenting**

A formal comment period is open through **8 p.m. Eastern on Wednesday, June 20, 2012.** Please use this [electronic comment form](#) to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at [monica.benson@nerc.net](mailto:monica.benson@nerc.net). An off-line, unofficial copy of the comment form is posted on the [project page](#).

Commenters and voters must submit comments through the [electronic comment form](#). Due to modifications to NERC's balloting software, voters are no longer able to submit comments via the balloting software.

### Next Steps

The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

### Background

There are two projects that have the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination has limited the scope of its modifications to the COM family of standards to those that address communication during emergency operations. The Project 2006-06 team has proposed a new term, "Reliability Directive," to specifically address those communications. The proposed definition of Reliability Directive is "A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact." The Project 2006-06 drafting team is proposing to require three part communication for Reliability Directives, with a VRF of High for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols must address communication protocols for normal and emergency operations, the Project 2007-02 drafting team is proposing a new term, "Operating Communication." The proposed definition for Operating Communication is "Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System." Given that Reliability Directives are a subset of Operating Communications, and to avoid any possibility of double jeopardy, the Project 2007-02 SDT is proposing to require three part communication for all Operating Communications other than Reliability Directives, and has proposed a Medium VRF for these requirements. Having a High VRF for a violation of three part communication involving a Reliability Directive and having a Medium VRF for a violation of three part communication involving other Operating Communications supports the appropriate differentiation of risk for normal and emergency communications.

## Standards Announcement

### Project 2007-02 – Operating Personnel Communications Protocols

#### Initial Ballot and Non-Binding Poll Results

##### [Now Available](#)

An initial ballot of COM-003-1 – Operating Personnel Communications Protocols and non-binding polls of the associated VRFs and VSLs concluded Wednesday, June 20, 2012.

Voting statistics for each ballot are listed below, and the [Ballots Results](#) page provides a link to the detailed results.

Approval	Non-binding Poll Results
Quorum: 84.14%	Quorum: 81.01%
Approval: 21.11 %	Supportive Opinions: 28.78%

#### Next Steps

The drafting team will consider all comments submitted, and based on the comments will determine whether to make additional changes. If the drafting team decides to make substantive revisions, the drafting team will submit the revised standard and consideration of comments received for a quality review prior to posting for a parallel formal 30-day comment period and successive ballot.

#### Background

There are two projects that have the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. Project 2006-06 – Reliability Coordination has limited the scope of its modifications to the COM family of standards to those that address communication during emergency operations. The Project 2006-06 team has proposed a new term, “Reliability Directive,” to specifically address those communications. The proposed definition of a Reliability Directive is “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.” The Project 2006-06 drafting team is proposing to require three-part communication for Reliability Directives, with a VRF of High for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols must address communication protocols for normal and emergency operations, the Project 2007-02 drafting team is proposing a new

term, “Operating Communication.” The proposed definition for Operating Communication is “Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.” Given that Reliability Directives are a subset of Operating Communications, and to avoid any possibility of double jeopardy, the Project 2007-02 SDT is proposing to require three-part communication for all Operating Communications other than Reliability Directives, and has proposed a Medium VRF for these requirements. Having a High VRF for a violation of three-part communication involving a Reliability Directive, and having a Medium VRF for a violation of three-part communication involving other Operating Communications, supports the appropriate differentiation of risk for normal and emergency communications.

Northeast Power Coordinating Council
No
The proposed Operating Communication term is not markedly different from the originally proposed term (Interoperability Communication). The proposal continues to expand the scope of the SAR from the concept of tightening the protocols associated with Emergencies by now applying to all communications. The text box in the draft standard indicates that Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. There is little difference between the two terms despite the SDT's assessment that Reliability Directive is a type (or a subset) of Operating Communication. If the intent is to use the proposed new term to require three-part communication (as suggested in R2 and R3), then that intent can be accomplished by using the term Reliability Directive as it covers not only the emergency state but also instructions needed to address Adverse Reliability Impacts. Both the Blackout Report and the FERC directive deal with tightening protocols for Emergencies. The proposed requirements completely fail to address emergencies and focus solely on developing non-emergency protocols.
No
An alternative approach would be to introduce communications protocols as a mandatory non-standard (e.g. as a requirement for certification) that would center on a corporate communications manual that encourages three-part communications; and that includes how monitoring would be audited internally. Such an alternative would change the requirement from monitoring personnel mistakes to a requirement monitoring corporate culture.
No
A general suggestion for all reliability standards that has been made is that standards' requirements be eliminated that do not address reliability problems. No available information indicates that language is causing reliability problems. In the absence of such evidence that this is a reliability problem, consideration should be given to eliminating this requirement.
No

This requirement is outside the scope of the approved SAR which proposes responding to the Blackout Recommendation to tighten communications protocols especially during emergencies. This proposed requirement is both procedural and does not address tightening communications of situational awareness. As an alternative a standard could require the Functional Entities to have a communications protocol that could indeed include this, but it should not be a requirement on personnel. By adopting an alternative category (i.e. not making this a standard) a Reliability Entity could adopt a progressive best practice approach without concern for violating the strictest features of the proposed best practice.

No

There are a number of references appearing that state "excluding Reliability Directives". If Reliability Directive is going to be defined in a separate project (Project 2006-06), how will stakeholders understand what is really being excluded for the purposes of this Standard's scope? It also needs to be made clear when an action is a Reliability Directive. Will each entity be required to define what is to be included as a Reliability Directive? With the definition of Operating Communication, three-part communications is expanded to include communications beyond directives, communications that might not warrant governance by this Standard. The proposed exception (specifically Reliability Directives used during emergencies) does not support the reason the SAR was proposed--to improve protocols during emergencies. The term Operating Communications is not significantly different from the term Reliability Directives (see comments to Q1). Using the term Reliability Directives to support the requirements for 3-part communication can avoid (a) any confusion with the requirement in COM-002-3, (b) potential double jeopardy of violating both COM-002 and COM-003, and (c) the need to exercise 3-part communication for routine operating instructions. Suggest consider removing the term Operating Communications. Are Requirements R2 and R3 needed if Reliability Directives already cover non-emergency conditions (instructions/actions that are needed to address potential Adverse Reliability Impact)? The requirement to exercise three-part communication to handle Reliability Directives is thus duly addressed in COM-002-3. It hasn't been shown that three-part communication is necessary for routine operating instructions. Realistically the definition of Operating Communications covers all communications. Only Reliability Directives should require three-part communications, and should be enforceable if a miscommunication results in an error on the BES.

No

What determines whether a clarifier used is an "accurate alpha-numeric clarifier"? What dictates non-compliance? This is a procedural issue. The Standard should require the Functional Entities to have a communications protocol that could include this, but it should not be a standard on personnel. Complexity is being added to communications, not improvement. There are equipment designations that are commonly used and understood, and to force the use of clarifiers will disrupt operating communications.

No

The applicability of this Standard is unclear in the case of Distribution Providers. The definition of Operating Communication includes "Elements" that could impact the BES. The NERC Glossary definition for Elements includes non-BES devices and equipment. Additionally, the Purpose section of the Standard states "harmful to the reliability of the BES." Since non-BES Elements could affect the BES this Standard could be deemed applicable to non-BES devices. If it is the intent of the SDT to apply this Standard to All Operating Communications concerning both BES and non-BES Facilities this should be explicitly stated in the applicability section for transparency. Otherwise clarifying language should be added to exclude non-BES Facilities. This is a procedural issue. Suggest that the Standard should require the Functional Entities to have a communications protocol that could indeed include this suggestion, but it should not be a standard on personnel.

No

The white paper discusses many non-utility industries use of the three-part communication. However, they are not out of compliance if they fail to use three-part communications. Only the Reliability Directives should require three-part communications (and dictate compliance). This should be enforceable only if the miscommunication results in an error on the BES. We support the use of three-part communications with limitations. There is concern over the potential for being out of compliance when there is no BES impact. Failure to meet Requirement R2, part 2.2 bullets 1 or 3 is either a Moderate or High. Failure to meet bullet 2 is a Severe VSL. It is not clear why this differentiation was adopted. The White Paper reflects on Human Performance, and how miscommunications can cause a

BES error resulting in an outage, or possible cascading effects. Then the Standard (and the associated out of compliance) should apply when, and to the extent that communications lapse (e.g., when there is an impactful violation of bullets 1, 2 and/or 3) results in an impactful error on the BES. Otherwise, an out of compliance is inappropriate. Non-impactful violations should be rated "Lower VSL."

The three-part communications in COM-003-1 are expanded beyond reliability directives which unnecessarily forces the inclusion of conversations which may be impractical or unnecessary. Good practice dictates that three part communication be used as a tool, but it should not be a requirement. The Standard is specifying how to accomplish, not just what is required. "1.1.4 When referring to a Transmission interface Element or a Transmission interface Facility, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility" may create a detriment to reliability. Oftentimes, for switching, TOs have very detailed names for individual elements, devices, equipment which may not translate into the TOP/RC systems. However, it is known what equipment is being talked about. The requirement is unnecessary, unreasonable and burdensome. The communications protocol to be followed in the event that there is a situation that requires the removal of BES (or any other power system equipment for that matter) from service on an immediate and emergency basis to protect the health and safety of the public and/or an employee/s needs to be addressed. The instructions issued to meet this condition fall under the definition of Operating Communication, but in an emergency situation the time taken for the required repetition could be catastrophic. This also applies to BES (or any other power system) equipment that is in imminent danger of failure, phase angle regulator or transformer tap changer runaway, or other emergency conditions. This is also true of situations where the BES response to a disturbance results in a facility or facilities being overloaded real time over their STE and LTE ratings, and those facility loadings have to be reduced below their STE and LTE ratings within five and fifteen minutes respectively. The time spent for the necessary three part communication could mean the difference between maintaining continuity of service, or having to shed load. Suggest that wording be added to address the emergency situations described by recognizing the possibility that an operator might have to respond to a situation by issuing a "one way" order, then have a requirement for after the fact communications which would be informational as to what emergency actions were taken, and then resume normal communications protocols for subsequent actions. Regarding the wording for the issuer in R2 "...that issues an oral, two-party, person-to-person Operating Communication", and the wording for the receiver in R3 "...that receives an oral two-party, person-to-person Operating Communication", what is the significance of the use of the comma after "oral" in R2? What is the difference between two-party and person-to-person communication? Also regarding R2, the Generator Operator should be included as an authority to issue an Operating Communication. It is not necessary to separate normal and emergency communications into two standards (COM-003, COM-002). One standard should encompass both. But having two Standards, the communication protocols in COM-003 R1 should be incorporated in COM-002. The proposals expand the scope of the SAR by ignoring communications protocols used during emergencies and focusing on procedures imposed on personnel during normal situations. This standard overreaches into routine operations by requiring three-part communication for all instructions that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. Because of the real-time frequency of use these instructions, requiring operating personnel to apply a three-part communication procedure for these instructions is unnecessary and can in fact adversely affect reliability. Any requirement for three-part communication for routine operating instructions should be removed.

The Dayton Power and Light Company

No

We have concerns with the true scope and depth of this standard. How far does this standard reach? A tie line utility wants us to utilize three part communication for tie line check outs, which we assume is not part of 'operating communications'. Not sure this is the intent of the standard, but seems to be a coverall by them. One could argue the tie line data (which is up to 23 hours old by the time we check out, is an output from the BES) How do resolve this? Operating Communications is a very broad term that could be interpreted differently by the many individuals we interact with leading to 'overuse' of three part communication when in doubt. This may counteract the importance of its use for the conditions we truly need to utilize this protocol.

No
This standard specifically excludes "Reliability Directives" which is a term that does not currently exist in the list of definitions, rather it is proposed in a separate standard (COM-002-3) which is currently in the approval process. Not sure how you can reference a term from a pending standard.
No
This requires using a 'correct' alpha numeric clarifier, while the proposed standard is written as 'accurate'. It would be great if there were consistency between the proposed standard and the comment form. Not sure how one can define accurate or correct. The standard indicates that NATO has one, but there are others as well. The moniker for "A" in the LAPD definition is ADAM, while NATO is ALPHA. Both are 'accurate and/or correct' but if I use one version and the person I'm talking to uses another, is this a violation of the standard? The language in this proposed version is better than the last (where they required the use of the NATO language) but I'm still not comfortable this proposal fixes the problem.

Recommend that R1.1.4 incorporate use of the term Uniform Line Identifiers, in conformance with R18 of TOP-002.
No
VSL should provide for a Lower Violation Severity Level for first occurrences of the violation. For the most part violation of this standard should be addressable through FFT process.

ACES Power Marketing Standards Collaborators
No
1. We do not agree with the need to use three-part communication for all operations on the BES. Requiring entities to employ three-part communication for routine operating instructions is excessive and burdensome. The 2003 Blackout Report recommended that industry, "Tighten communications protocols, especially for communications during alerts and emergencies." We strongly support using

three-part communication for the execution of Reliability Directives as defined in the proposed COM-002-3 draft standard in Project 2006-06 but not for routine operating instructions. 2. The COM-003-1 Operating Communications Protocols White Paper states three reliability benefits of using three-part communication as follows: a. "The removal of any doubt that communication protocols will be used and when they will be used. This will reduce the opportunity for confusion and misunderstanding among entities that may have different doctrine." We don't agree with the premise that implementing three-part communications for all operating instructions will reduce confusion. If there is a standard such as draft COM-002-3 that requires the use of three-part communication for Reliability Directives and the issuer is required to state that a Reliability Directive is being issued, then there should be no confusion. The example provided in this bullet where "one entity uses three-part for emergencies, and the other uses it for all operating conditions" is used to support the premise. However, Table 1-A of the White Paper only lists 11 entities that currently use three-part communication during both emergencies and non-emergencies. Eleven out of how many entities? The paragraph immediately following Table 1-A states, "The fact that the majority of BES entities already employ three-part (or repeat back) communications for routine...operations..." Eleven entities do not make a majority. We don't believe the actions of a few should dictate the actions of all. Much stronger evidence to support this "fact" is needed. b. "There will be no mental "transition" when operating conditions shift from normal to Emergency." Once again, if there is a standard such as COM-002-3 that requires three-part communication for Reliability Directives and the issuer is required to state that a Reliability Directive is being issued, then there should be no confusion. System Operators are trained to make mental transitions every day. It is an inherent characteristic of the job. Operators should be able to mentally "transition" when a Reliability Directive is issued. c. "The formal requirement for three-part communication will create a heightened sense of awareness in operators that the task they are about to execute is critical..." Not all operating instructions are "critical" so this premise is flawed. This bullet makes perfect sense for Reliability Directives because the actions taken to address those would be considered critical based on the proposed definition of Reliability Directive in COM-002-3. It does not make sense for routine operating instructions. 3. Based on the above, we do not agree with the definition of Operating Communication as proposed in this draft standard since we do not support the use of three-part communication for all operations on the BES.

Yes

Yes

Yes

No

1. The SDT should consider clarifying that use of relative times will not be subject to this requirement. For example, if a System Operator communicates that they will begin switching in 10 minutes, no 24 hour clock requirement is necessary.

No

1. We do not agree that excluding Reliability Directives is a good idea. We would prefer to see COM-003-1 and COM-002-3 combined and have the requirements only apply to Reliability Directives. If these protocols should be used for any type of communication, we believe they should be used for Reliability Directives as we've stated in our comments in Question 1. The definition of a Reliability Directive as proposed in COM-002-3 is "where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact." There is no type of communication more important than a Reliability Directive, therefore, the protocols outlined in R2 and R3 of COM-003-1 should be applicable to them. During the webinar on June 7, 2012, it was said that the only distinctions between COM-002-3 and COM-003-1 are the VRF/VSL levels and that a Reliability Directive must be stated as such when issued. There is no reason both standards can't be combined into a single standard and simply split out the VRF/VSL levels for Reliability Directives while keeping the requirement where the RC, TOP and BA shall identify the action as a Reliability Directive when one is issued. We suggest that the SDTs consider combining their efforts in this manner. 2. However, if both projects are to continue along separate paths, we'd like to see the requirements in both mirror one another so entities aren't wondering what the distinction is between the two descriptions of three-part communication. COM-003-1 is more detailed in outlining the steps that should be taken when using three-part

communication than COM-002-3. COM-002-3 R2 states that the recipient “shall repeat, restate, rephrase or recapitulate...” COM-003-1 doesn’t use these words. It simply states that the receiver shall “repeat” or “request the issuer reissue...” 3. We do agree with splitting the single requirement into two requirements: one for the issuer and one for the receiver. However, we suggest the SDT develop a flow chart that demonstrates the communication paths and the loop flow of the steps to further clarify what needs to be done and when. For example, in R2 Part 2.2, after an Operating Communication is reissued at the request of the receiver (bullet 3), the receiver should repeat the information to make sure they received it correctly (R3 bullet 1) and the issuer should confirm the receiver’s response (Part 2.2 bullet 1). As the parts are written currently, the loop flow of the steps isn’t clear. It may seem intuitive but a literal reading doesn’t capture the loop flow as intended. R3 even has a gap in that the recipient can choose to repeat the Operating Communication or they can request it be reissued. Thus, if they request it is reissued, they don’t have to repeat it back. 4. In R3, we suggest adding the words, “before taking action” to the end of the first bullet to further emphasize the importance of receiving confirmation from the issuer. If action is taken prior to confirmation, a critical mistake could be made if the instruction was heard and repeated back incorrectly.

No

1. First the requirement uses the word “accurate” instead of “correct” as stated in this question. 2. What is meant by the term “accurate alpha-numeric clarifiers?” Can someone make up their own alpha-numeric clarifiers in the heat of the moment and expect the other party to mentally “transition” and understand what they mean? Or does it have to be another established and recognized alpha-numeric clarifier? A made up alpha-numeric clarifier could be confusing to someone who isn’t familiar with the clarifiers being used. This is more of a mental “transition” than determining the difference between an Emergency (which will be stated up front as a Reliability Directive as proposed in draft COM-002-3) and a normal operating instruction. We suggest that only established alpha-numeric clarifiers be used.

No

1. We don’t believe this requirement is necessary. A similar requirement was removed from TOP-002-2 Project 2007-03. From the Project 2007-03 mapping document: “R18. Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network.” Project 2007-03 SDT’s reason for deletion of R18 from TOP-002-2: “This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers.” We agree with these reasons and believe they should apply to R1 Part 1.1.4 in COM-003-1. 2. Another issue we have with the requirement is that this draft standard is not applicable to TOs or GOs yet the requirement calls for the use of “the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility.” Are the auditors going to ask the TOs and GOs for their list of named Elements or Facilities when they audit the applicable entities in this standard?

No

1. The first Severe VSL listed for R1 says, “...did not correctly implement any of the parts...” What is the definition of the word “any” in this VSL? We’ve interpreted the VSL to mean that none of the parts of R1 were implemented. If this is the intent of the SDT, then we suggest removing this VSL since the next Severe VSL listed says, “...did not correctly implement three (3) or more of the four (4) parts...” Three or more would include all of the parts (4 of 4) not being implemented correctly. Not implementing 1 of the 4 parts is a Moderate VSL while not implementing 2 of the 4 parts is a High VSL. So, not implementing 3 or more of the parts would be a Severe VSL. 2. The second Moderate VSL for R1 says, “The responsible entity did not correctly implement Part 1.2 of the requirement.” Corresponding with our comments in Question 7 above, we don’t know how this requirement will be measured since the term “accurate” in the requirement is not defined. If an entity can make up their own clarifiers, who determines if they were “accurate” and whether they were correctly implemented? Measure M1 doesn’t specify a measurement for Part 1.2 of R1. 3. The High VSL for R3 should be clarified to align with our suggestion of adding the words, “before taking action” in Question 6 above.

1. It is not clear that COM-003-1 R1 applies to COM-002-3. The latest draft of COM-002-3 doesn’t reference the communications protocols listed in COM-003-1 R1 and the definition of Reliability

Directive does not state that it is a type of Operating Communication. The only place that describes the relationship between a Reliability Directive and Operating Communications is the text box under the definition of Operating Communication in COM-003-1. There should be a better connection between the two standards to emphasize this fact. We recommend the SDTs work together to bridge this gap. 2. Bullet 2 of the Implementation Plan Effective Dates is missing a word or words (section in question in parentheses): "If the version of COM-001-2 revised under Project 2006-06 is not approved before COM-003-1 is approved, then COM-001-1.1 shall expire midnight of the day (immediately the) version of COM-001-2 developed under Project 2007-02 ..." In addition, this bullet is simply too wordy and difficult to comprehend. We suggest re-wording or splitting into separate sentences for easier comprehension. 3. Because all three Measures include voice recordings as evidence, the Data Retention section inappropriately and without justification raises the bar on retention of voice recordings. The section requires 365 days of voice recordings for R1 and 180 days for R2 and R3. Many registered entities keep no more than 90 days of voice recordings. Keeping more than 90 days would require unnecessary additional storage. Furthermore, it is not consistent with any other NERC standard (including COM-002) that compels, at most, 90 days. Thus, many registered entities probably have evidence retention policies that actually require destruction of such recordings after 90 days. 4. While we do not agree with all parts of the Whitepaper, we believe one major point of clarification is needed. On page 3, in the first bullet regarding a general description of how three-part communications is conducted, the face-to-face communication needs to be clarified or removed. Including face-to-face communications is not necessary for two primary reasons. First, the major reason that three-part is necessary for telephonic communications is because you cannot see the receiver and really tell if they comprehend the message. Second, this could draw in communications between operators within the control center. Since these conversations are not easily recordable, how does a registered entity prove compliance?

Lakeland Electric

Yes

Would modify R1 as noted below to remove the implication that a Distribution would have to provide evidence that all Distribution Provider communications used the required protocols. R1. Each Reliability Coordinator, Transmission Operator, Balancing Authority[, and] Generator Operator, and Distribution Provider [receiving a Operating Communications,] shall use the following communications protocols:

Yes

Yes

Yes

Yes

No

I do not understand why Reliability Directives would be excluded! Reliability Directives are capitalized in the box on the Development Roadmap and in this question but I cannot find the term in the February 8, 2012 NERC Glossary. So where is Reliability Directives defined? I am concerned that the exclusion will cause problems especially if the clarifying box is omitted from the final standard. The split is OK.

Yes

Yes

Yes

Individual
John D. Brockhan
CenterPoint Energy Houston Electric, LLC.
No
Question 1 Comments: Instead of adding the proposed new definition of "Operating Communication" to the NERC Glossary, the definition should be used to define the industry known terminology "Directive", as "an instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System". Aligning this definition with Project 2006-006 Reliability Coordination and a new proposed definition of "Reliability Directive" to be "A communication initiated by a Reliability Coordinator, transmission operator or Balancing Authority to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System where action by the recipient is necessary to address an emergency or adverse Reliability Impact".
Yes
Question 3 Comments: CenterPoint Energy believes the SDT should only use existing defined alert levels, rather than implementing new alert levels or categories.
No
Question 6 Comments: The proposed language in this requirement can be omitted and incorporated in COM-002-2 R2, where language has already been written and is currently in force regarding 3-part communications. The industry is well aware and versed in the method of communicating using 3-part communications. The elaboration of performing a three part communication is a "how to" and not necessary and can be omitted altogether. The term "3-Part Communication" could be defined and added to the NERC Glossary to suffice the elaboration of the definition proposed in this requirement. The idea of requiring all communications (Operating Communications) to be made as 3-part communications is not practical and should be left up to the communicating entities. Requiring ongoing administration of "3-part" communications will impede rather than improve timely communications consequently affecting the reliability of the BES.
No
Question 7 Comments: The use of correct alpha numeric clarifiers represents a "how to" and although it may be an example of a good utility practice, it should not be a requirement to the extent of not only just having to use the alpha numeric clarifiers, but required to use them correctly or "accurate" as it is currently worded in the language of proposed COM-003-1 R 1.2 draft 2. The requirement is unclear as to whether the accurate use of alpha –numeric clarifiers is required only when the clarifiers are used, or whether accurate use of alpha-numeric clarifiers are required for all oral Operating Communications. The use of any alpha- numeric clarifiers should be left up to the discretion of the communicating entities during their exchange, acknowledgement, and agreement of information of any such communication.
No
Question 8 Comments: The language in requirement 1.1.4 will require the limitation to a single identifier for an interface element or facility between neighboring entities which will require the neighboring entities to agree upon a specified single identifier. This may possibly require entities to make changes to their EMS system and their model and incur a cost to complete such tasks. Similar language is currently enforced in TOP-002-2 R18, where Entities are required to use uniform line identifiers when referring to transmission facilities of an interconnected network, making this requirement language redundant.
No
Question 9 Comments: No. VRFs and VSLs for requirements R1, R2, and R3 should not be high or severe unless Adverse Reliability Impact has occurred.
Question 10 Comments: It appears that the SDT is using an undefined definition of Reliability Directive to propose the new definition of Operating Communication. Is the intent of the SDT to also

introduce this definition for Reliability Directive with this project? The purpose is not consistent with language in other currently enforced standards. The words "could" and "possibility" needs to be removed from the language. The purpose needs to be concrete. An alternative purpose would be "To specify clear, formal, and universally-applied communication protocols for the operation of BES facilities, that reduce miscommunication, which will have a negative influence on the reliability of the Bulk Electric System. The six month effective date following approval is too short and should be extended to 12 months to allow adequate time for training and implementation.

IESO

No

The IESO agrees with the removal of the 3 terms proposed in the previous draft. However, the IESO does not agree with the introduction of a new term Operating Communication. This term is not materially different than the originally proposed term Interoperability Communication. The text box in the draft standard indicates that Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. We see insufficient difference between the two terms despite the SDT's assessment that Reliability Directives are a type (or a subset) of Operating Communication. If the intent is to use the proposed new term to require 3-part communication (as suggested in R2 and R3), the intent can be accomplished by using the term Reliability Directives as it covers not only emergency state but also instructions needed to address Adverse Reliability Impacts. Please also see our comments under Q6 on using the proposed term to support the requirements for 3-part communication.

Yes

We agree that Attachment 1 should not form part of COM-003-1 and support suppressing any requirements in this standard that stipulate the Alert Levels. We need more details on the specific proposal to re-locate Attachment 1 before we can comment on the merit of the transfer.

Yes

We have no preference one way or the other as long as the personnel understand each other. However, if the option to use daylight saving time or standard time is allowed (to be agreed by the personnel), it begs the question as to why the 24-hour clock hours must be followed, and why the 12-hour clock with am and pm specified is not allowed.

No

The IESO disagrees with using the term Operating Communications as it is not much different from the term Reliability Directives (see our comments under Q1). Using the term Reliability Directives to support the requirements for 3-part communication can avoid (a) any confusion with the requirement in COM-002-3, (b) potential double jeopardy of violating both COM-002 and COM-003, and (c) the need to exercise 3-part communication for routine operating instructions. However, if the SDT's intent is to require 3-part communication for any and all operating instructions (as the proposed term suggest), then this intent will result in unnecessary 3-part communication burdens for simple actions such as when requests for the removal of a line, or switching, or generation output changes are issued. We suggest the SDT to remove the term Operating Communications. With respect to Requirements R2 and R3, we question the need for having these requirements if Reliability Directives also cover non-emergency conditions (instructions/actions that are needed to address potential Adverse Reliability Impact). The requirement to exercise 3-part communication to handle Reliability Directives is thus duly addressed in COM-002-3. Other than emergency conditions and potential Adverse Reliability Impact conditions, we do not see a need to exercise 3-part communication for routine operating instructions.

Yes

While we agree with allowing appropriate alpha numeric qualifiers other than the NATO phonetic alphabet, we do not support the mandatory use of these qualifiers for each and every instruction. They should only be required when clarification by either party is requested.

Yes

No
We do not agree with Requirements R2 and R3 to begin with. We therefore do not agree with the VRFs and VSLs for these two requirements.
1. This standard is over-reaching into routine operations as it requires 3-part communication for all instructions that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. This type of instructions occurs every hour, if not every minute. Requiring operating personnel to apply a 3-part communication procedure for each and all of these instructions is absolutely unnecessary and overburdening, and can in fact adversely affect reliability. We strongly suggest that any requirement for 3-part communication for routine operating instructions be removed. 2. The proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after "applicable regulatory approval" in the Effective Dates Section A5 on P. 4 of the draft standard COM-001, COM-002 and IRO-001, and on P. 2 of COM-001's Implementation Plan and P. 1 of COM-002's and IRO-001's Implementation Plans, to the following effect: ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities."
Individual
Thad Ness
American Electric Power
Our efforts in this regard should first be focused solely on Reliability Directives before expanding this work, and creating similar requirements for all other Operating Communications. Requiring three part communications for every scenario might be considered a best practice by some, but making it a mandatory practice for routine operations seems to emphasize the manner of communications rather than the operations themselves. In addition, requiring three part communications for Reliability Directives will likely result in more widespread usage for more routine operating communications, without making it a requirement. AEP believes that there should not be multiple project teams proposing concurrent changes to COM-001, COM-002, and COM-003. Unless there are overwhelming reasons for not doing so, these efforts should be consolidated and managed by a single project team. In addition, current efforts on COM-003 need to be co-located with the proposed changes to COM-002 within a single standard. Having multiple project teams proposing concurrent changes results in problems such as this, where a) changes are proposed to the same standard or b) similar changes are proposed to separate standards. AEP cannot support revisions on these matters until they are managed by a single project team.

Requirement 1.2 should be removed from the standard. The number of directives and switching orders that have been issued in North America over time probably number in the billions. If one could determine the percentage of issues caused by miscommunications out of that large number, it would be extremely small. The reason that miscommunication issues exist is because the communication is between two human beings and where people are involved, issues will happen. A requirement for three part communications is more than sufficient to address the issue of miscommunications. Adding a requirement to use alpha-numeric clarifiers such as the NATO Spelling Alphabet is not going to prevent miscommunications. The only thing that adding this requirement will accomplish is to require auditors to listen to recorded conversations trying to verify that operators used alpha-numeric clarifiers and then penalizing a company if an operator does not even though the directive or switching order was followed correctly.

Believe the additional definition is not necessary and it is not clear what value it would have to small Distribution Providers other then additional compliance complexity.
Yes
No
Don't understand this change, but wonder why seperate alert levels are necessary to incorporate in this set of standards.
Yes
No
Not sure this is necessary for small entities.
Yes
Yes
No
Think this requirement is duplicative of TOP-002a, R18
No
We believe there should be a distinction in the "Applicability" section of the standard between "Scheduling Distribution Provider" and "Non-scheduling Distribution Provider". Many small WECC entities re small rural cooperatives and PUDs are Full service customers. This means that the TO/TOP is the power supplier and scheduling agent and therefore handles all reliability directives, scheduling, tagging, dispatching of resources and curtailments of load from breakers on the BES system. According to a letter from the WECC Reliability Coordinator (VRCC and LRCC) none of the smaller entities in the Pacific Northwest will ever receive a "Reliability Directive" directly from teh RC. Such a Directive would be sent to either a Balancing Authority (BA), or a Transmission Operator (TOP). We estimate there are over 100 entities that are BPA Full Service customers that are in a similar position and making this standard applicable to them does nothing to enhance reliability. A simple declarative statement in the Applicability section of the standard could focus the intent of the SDT on those entities that need it while lessening the compliance risk and clerical burden for other entities that the standard should not apply to. We suggest: 4. Applicability: 4.1. Functional Entities 4.1.1 Reliability Coordinator 4.1.2 Transmission Operator 4.1.3 Balancing Authority 4.1.4 Generator Operator 4.1.5 Distribution Provider: With Real-time Operations and Scheduling desk We believe the above change will lessen the compliance burden on small, non-scheduling entities while still meeting the SDT's intent with regard to Operating Personnel Communications. We also note that FERC and NERC, on

multiple occasions and in multiple filings, have indicated their openness to lessening unnecessary compliance requirements for small entities.

There was a COM-002 NOP issued in January 2011, a COM-002 interpretation recently approved by NERC, and presently there is a draft of both a COM-002 and a COM-003 out for vote. These projects appear to address 3 part communication requirements in a non-consistent manner. Why not combine these efforts into a single project that the industry can review and understand? The VRF/VSL difference between routine and emergency does not warrant having two standards. A suggested plan of attack could be to withdraw the NERC approved COM-002 interpretation from FERC and combine the COM002-COM003 drafting efforts into one project resulting in a new version of COM-002; we already have enough standards. The content of the two new drafts is good, the webinar was informative, and the work of the SDTs is appreciated.

SMUD

Yes

Yes

Yes

No

We believe the requirement to only speak English is detrimental to reliability. Entities who have predominantly speaking Spanish personnel would be inhibited with ineffective communications mandated by the English only requirement. Further, this particular requirement is in direct conflict with COM0-001 R4 which states "...Transmission Operators and Balancing Authorities may use an alternate language for internal operations."

Mandating use of a 24-hour clock reference provides no improvement to reliability. This is an auditing function only, there is no reliability benefit to differentiate 0800 and 8 am.

No

Requirements R2 and R3 are over prescriptive and included as a business practice in the entities' training program.

No

Communication should not be restricted to only use of the phonetic alphabet. Referencing a "103-C"

switch versus a "103-Charley" does not enhance reliability and has the potential of hindering reliable operation of the BPS by forcing the Operator Communications personnel to focus on being compliant with the correct phonetics rather than the actual instruction.

No

First, this requirement is redundant to Requirement R18 in the TOP-002 standard. It also put an administrative burden on the RC to know each "correct" name specified by the respective entity's line segment causing a hindering timely operation of BPS elements.

No

Individual

Daniel Duff

Liberty Electric Power LLC

No

Routine market communications between entities are not a valid area of regulation under the NERC Standards.

Yes

Yes

Yes

No

No. Communications which do not involve Directives are not the proper subject of NERC standards.

No

Three part communication is a best business practice. Three part communication should be required during a declared Emergency. But there is no reason to create a standard, and the massive monitoring requirements and records obligations which go along with a standard, to cover business communications.

No

Again, this is beyond the proper scope of reliability standards.

No

This requirement is already covered under TOP-002 R18, and opens double-jeopardy for entities by including it in a second standard.

No

Yes. The regulation of market communications between entities is not the proper subject for NERC standards. The STD proposes placing entities into the realm of zero tolerance for thousands of routine communications. This assures failure. Further, this will force entities to reallocate precious resources away from more critical reliability functions to assure compliance and allow for self-certification. As such, the proposed standard weakens the reliability of the BES. The proposed standard should be withdrawn and the SAR closed.

Individual

San Diego Gas & Electric

No

San Diego Gas & Electric ("SDG&E") agrees with the proposed exemption from the requirement to use English language where the use of another language is mandated by law or regulation. However,

SDG&E recommends including the following language as an additional exemption: "or a formal agreement has been established between the functional entities to use an alternative language," so that R1.1.1. states: "Use the English language when communicating between functional entities, unless another language is mandated by law or regulation or a formal agreement has been established between the functional entities to use an alternative language."

No

SDG&E recommends removing the language, "When the communication is between entities in different time zones" in R1, Part 1.1.3, and replacing it with "Communication is to...", so that R1.1.3 states: "Communication is to include the time and time zone and indicate whether the time is daylight saving time or standard time." The proposed requirement for the communicator to determine if an entity is in a different time zone appears to be an unintended impact of the wording proposed in R1.1.3, and may prove to cause inefficiencies in complying with this requirement. Communicators SHOULD NOT NEED to determine whether or not an entity is in the same time zone as they are, but should simply state the time zone where they are calling from or the KNOWN element of their operations. Though a majority of communication will occur within the same time zones, System Operators and others affected by the requirement will be assured that the timing of ANY event will be KNOWN and never assumed.

No

The boxed note in the draft of COM-003-1 states that "Reliability Directives are a type of Operating Communications..." and the process described in R2 and R3 is 3 way communication. Why is the SDT segregating this as if it is a "separate process" that needs to be followed by operating personnel? The two do not appear to be separate communication processes. SDG&E recommends removing the word, "excluding," and replacing it with the word "including," so that R2 states: "Each Reliability Coordinator, Transmission Operator and Balancing Authority that issues an oral, two-party, person-to-person Operating Communication, including Reliability Directives shall:" SDG&E also recommends that the following language be added in a bullet to R2.2: • Request that the receiver repeat the Operating Communication if the receiver does not issue a response (not necessarily verbatim). R3 notes that the Registered Entity who receives the Operating Communication needs to repeat the Operating Communication provided. In order to promote compliance and proper communications, this bullet point should be added.

Individual

Stephen J. Berger

PPL Generation, LLC on behalf of its Supply NERC Registered Entities

No

PPL Generation, LLC on behalf of its Supply NERC Registered Entities does not agree with the addition of "Operating Communication" as a proposed definition because it imposes three part communication on the industry for routine communications of changes of output in generation. Also the language as written does not specify if these changes include communication of future planning to change the status of generation in instances of future planned outages. The standard should specify if communication of real time operations is what falls under the definition of "Operation Protocol." This ensures that communication which would be considered a compliance event and require the scrutiny of an audit.

Yes

Yes

Yes

Yes

No
Three part communication should not be required for routine operating communications.
No
PPL Generation, LLC on behalf of its Supply NERC Registered Entities does not believe that this sub requirement is appropriate when applied with the new definition "Operating Communication." Common operating communications should not be considered a compliance event that requires the use of correct alpha numeric clarifiers. Under the current language, it could be interpreted that according to "Operating Communication" that every change in generation output must be stated in alpha numeric clarifiers in every instance of communication. This requirement shifts operators focus from communicating proper information to a focus on communicating using the specified terms in all instances of communication, where in everyday normal business activities and operation should not require such scrutiny.
Yes
No
PPL Generation, LLC on behalf of its Supply NERC Registered Entities does believe that this sub requirement R1.2 should be considered a moderate violation when alpha numeric clarifiers are not used in general communication.
The statement, "Evidence may include, but is not limited to, voice recordings, transcripts of voice recordings, on-site observations, or other equivalent evidence," in the Measures section of COM-003 is impractical. Any comprehensive body of evidence would be unreasonably voluminous as well as requiring far more effort to compile than could be justified. The only evidence required for Generation Owners should be a procedure on the subject and a record showing that all applicable personnel have been trained.
Individual
Cristina Papuc
TransAlta Centralia Generation LLC
The current effective date only gives the registered entities 6 calendar months to be compliant with the requirements. We do not think this will be achievable. A longer implementation time is required, such as 12 months. In order to comply with standard requirements, the registered entities need to develop the internal controls, such as the procedures/operator training documents, and then provides the training to the operators. The 6 calendar months are not long enough to complete these tasks. In the white paper, Table 1-A shows only the three-part communication are currently used in the registered entities. However, for all other requirements, such as using alpha-numeric clarifiers, the white paper does not show that these are currently used in the registered entities. Thus, there is no base to justify that 6 months is reasonable to achieve the compliance.

The MRO NSRF recommends the following comments for consideration by the SDT: 1. The sentence structure of this definition is incorrect. It is unclear whether the prepositional phrase "of the Bulk Electric System" applies to both Facility and Element or only to a Facility. Recommend this be rewritten to read "... Bulk Electric System Elements and Facilities". 2. The definition should be for only actionable commands (to accomplish an actionable item). Status of does necessitate 3 part communication. 3. The inclusion of a Reliability Directive as a subset of the Operating Communication definition adds confusion as to what is a Reliability Directive. This confusion is compounded by having Reliability Directives in a different standard with different descriptions for three part communication. 4. The 2003 Blackout Report recommended that industry, "Tighten communications protocols, especially for communications during alerts and emergencies." We strongly support using three-part communication for the execution of Reliability Directives as defined in the proposed COM-002-3 draft standard in Project 2006-06 but not for routine operating instructions. 5. Table 1-A of the White Paper lists 11 entities that currently use three-part communication during both emergencies and non-emergencies. We agree that this can be an utility 'best practice', however, there is a major difference between good utility practice and a no-fault, no exception Reliability Standard.
Yes
Yes
Yes
No
There are two time zones in the eastern interconnection and two time zones in the western interconnect with Arizona not utilizing daylight savings time. The Reliability Coordinator and entities can agree on what time zone to use. The NSRF does not understand if the "time zone" issue has caused any past performance issues? Please clarify with a basis of time zone inclusion.
No
The MRO NSRF recommends the following comments for consideration by the SDT: 1. The NSRF does not understand how three part communication is not applicable to Reliability Directives, when COM-002-3 states that three part communication shall be used when issuing a Reliability Directive. This adds confusion and is further evidence that there should only be one communication standard. 2. How are group calls going address three part communication? Many entities use blast calls to forward system wide information in a very short period of time. The intent of a blast call is to speed up the dispersing of information from one to many. Please clarify. 3. Currently there are 1681 entities (BA,

TOP, RC, GOP, and DP) registered with NERC. Assume that each entity has one phone call every 10 minutes in a 12 hour day shift and half during a night shift (being conservative). A single entity will have 72 per day on an average. Note that both parties (sender and receiver) will need to use COM-003 requirements. There will be about 120,000 calls per day within NERC where COM-003 will need to be applied. That equates to 44,176,680 calls per year that require COM-003 requirements to be used. While all these communications will not necessarily be an Operating Communication, but the NSRF believes that at least 75% will be Operating Communications. This alone will slow down the reliability of our system. Is this the intent of the SDT? Please consider all industry comments and upon development of "consideration of comments", run the number of instances where COM-003 will need to be applied. The question should be, does this hamper our system reliability or not.

No

The MRO NSRF recommends the following comments for consideration by the SDT: As written, if an operator simply states "open switch c138", they would be found non compliant. The SDT has not given any justification (reference to a FERC Directive) to why they are mandating the use of alpha-numeric clarifiers within this requirement. It is not needed to be written within this (or any other standard). It is agreed that it may be a good practice in some cases, but when written within a standard, it is driving for a zero tolerance. Entities will make a mistake and this non compliance issue will be forward via the CEA as an FFT. Section 81 of the Commission's March 15th, 2012 order questions if a violation is forwarded in an FFT format, is it really needed for reliability. This requirement needs to be deleted. If an entity wishes to use an alpha-numeric format, they can as part of their internal controls to reduce their risk of violating a different standard or for safety reasons. The requirement of using alpha-numeric as a standard will be administratively burdensome and punitive. For example: An operator states, "open switch fifteen twenty six" instead of "open switch one, five, two, six" is now subject to a potentially significant fine for no reliability benefit. Suggest dropping the Alpha Numeric clarifier requirement from the standard.

No

The MRO NSRF recommends the following comments for consideration by the SDT: 1. This requirement is too closely associated with TOP-002-2b, R18. As written, a BA, TOP, and GOP will be in double jeopardy of non compliance if either TOP-002-2b, R18 or COM-003, R1.1.4 is violated. 2. A similar requirement was removed from TOP-002-2 Project 2007-03. From the Project 2007-03 mapping document: "R18. Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network." Project 2007-03 SDT's reason for deletion of R18 from TOP-002-2: "This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers." The standard is not applicable to TOs or GOs yet the requirement calls for the use of "the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility." Suggest deleting this requirement.

No

The MRO NSRF recommends the following comments for consideration by the SDT: System Operators receive and issue many Operating Communications a day. The VSL for one Operating Communication is Moderate. That is too high. While improving communications is a laudable goal, the zero tolerance VSL is unacceptable and will lead to a preponderance of self-reports and compliance and administrative overhead. Also overlooked is the added stress that every time a System Operator speaks they may be in violation.

The MRO NSRF recommends the following comments for consideration by the SDT: 1. Concerning the "Purpose": Recommend rewrite to state: "To specify universally-applied communication protocols that reduce the possibility of miscommunication which could impact the reliability of BES". This shorter and to the point purpose clearly defines the intent of the Standard. 2. R1.1.3, An entity will be found non compliant if it merely has a written BES switching order that does not contain a time, time zone or whether it is daylight savings time or standard time. The Requirement states nothing about implementing the written communication, just that it is written. The NSRF does not believe that this is the intent of the SDT. 3. This also applies to oral communications. If two operators are communicating between each other while in different time zones and executing a BES switching order, they would need to establish what time it is in both time zones. indicate whether it is daylight

saving time or standard time. So, since a Reliability Directive is a component of an Operating Communication, prior to receiving an oral Reliability Directive senders and receivers would need to establish what time it is in both time zones, indicate whether it is daylight saving time or standard time and then give and receive the Reliability Directive. The NSRF does not believe that this is the intent of the SDT. 4. The SAR for this standard incorrectly addresses the blackout recommendation number 26. Recommendation 26 states: "26. Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate". " NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information." "NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date." 5. Order No. 693 clearly says that the tightened protocols are primarily intended for actions during alerts and emergencies. This was partially addressed in the interpretation on COM-002 and is being addressed in Project 2006-06. Below is the summary determination in the Order on this issue. "535, Accordingly, we direct the ERO to either modify COM-002 or develop a new Reliability Standard that requires tightened communication protocols, especially for communications during alerts and emergencies." 6. It is not clear that COM-003-1 R1 applies to COM-002-3. The latest draft of COM-002-3 doesn't reference the communications protocols listed in COM-003-1 R1 and the definition of Reliability Directive does not state that it is a type of Operating Communication. Suggest combining the two standards into a single communication standard. 7. The white paper states "Significant events have occurred on the BES when unclear communication created or exacerbated misunderstandings that led to instability and separation." However, no specific examples were identified. During the June 7 webinar when this question was brought up, it was stated that three part communication was used during these events. This begs the question as to why this standard is needed for normal operations. 8. In order to assign the same level of responsibility as COM-002-2, R2, the RC, TOP, and BA should be the only applicable entities since a Reliability Directive is a sub component of Operating Communications. The RC, TOP, and BA clearly understand clear, concise and definitive communications. They are the only required entities to be NERC Certified and should be held to the highest standards. They can establish other controls to mitigate their risk by training and informing DPs and GOPs that are within their control. DPs and GOPs do not need to be included in R3.

This requirement is still overly prescriptive. Practically all switches, breakers, and transformers have alpha-numeric identifiers and the proposed Requirement R1.2 will require the use of some form of alpha-numeric clarifier (either NATO or some other accurate clarifier). However, many alpha-numeric identities need no clarifier to be accurately understood. Additionally, any such mis-understandings would become obvious during the three-way communication process. The SDT needs to modify this requirement to allow the judgment of the system operator to be used in the determination of whether an alpha-numeric clarifier is needed. This judgment would be based on (1) common sense in understanding that some letters or numbers may sound similar when broadcast over communications equipment, (2) past experience with certain letters or numbers requiring clarification, (3) an understanding by each individual system operator (as supplemented by managerial oversight) of that system operator's ability to correctly pronounce letters and numbers (in the English language, unless another language is mandated by law or regulation), and (4) confidence derived from the accurate and understandable repetition of the alpha-numeric identifiers in the three way communication process. Clark believes that Requirement R1.2 needs to rely on the determination by the system operator as to whether the use of an alpha-numeric clarifier is needed or not. These system operators are required to obtain certifications and ongoing training and the operating process needs to defer to the judgment of trained and certified system operators to resolve this potential communication issue.
Yes
No
Failure to implement R1.2 is not necessarily a reliability problem. As stated in our previous comments, not all alpha-numeric identifiers need clarification. However, the current proposed standard would deem a failure to use a clarifier in any Operating Communication that uses alpha-numeric identifiers as a violation.
Group
Detroit Edison

No
The definition of Operating Communication is overly broad, increasing the scope of the standard. It should be limited to actionable items. Suggested rewording of the definition: "Communication of instruction to perform an action relating to a physical change or a control system data change affecting an Element or Facility of the Bulk Electric System."
Yes
Yes
Yes
No
In 1.1.3 "When the communication is between entities in different time zones..." should read "When the communication is between entities in operating in different time zones...". Two entities may be physically located in the same time zone but one may operate in standard time and the other in daylight time. When communication is between entities operating in different time zones, clarify which time zone takes precedence.
Yes
No
"use accurate alpha-numeric clarifiers" is vague. Suggest re-wording and adding verbiage: "use defined (or standard or specified) alpha-numeric clarifiers as specified in Registered Entities communication protocols." Concern with requirement 1.2- alpha-numeric clarifiers. Would like clarification if any alpha clarifier can be used or must the phonetic alphabet listed in the white paper (military Communication protocol) be used. example: for "R", is it required to use "Romeo" or can "Robert" be used? Concern with VSL table for R1. Current format shows that an entity must be 100% compliant. The break down from medium to severe is based on how many elements of R1 was not followed. Suggest changing the format to how many times it was not followed rather than the number of elements.
Yes
No
VSL table for R1. Current format shows that an entity must be 100% compliant. The break down from medium to severe is based on how many elements of R1 was not followed. Suggest changing the format to how many times it was not followed rather than the number of elements.
There is a significant amount of redundancy between COM-002-3 and COM-003-1. These two standards should be combined and one of them eliminated. COM-002 purpose states "To ensure communications by operating personnel are effective." COM-003 could be sub-requirements under R2 of COM-002. The blue box on page 2 does not clarify Reliability Directives. Suggest using the same language as the proposed definition of Reliability Directive from COM-002-3.

The intent of Recommendation 26 was to improve the communications around situational awareness. The SAR states the purpose is to "efficiently convey and mutually understood for all operating conditions." Paragraph 532 seeks to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions The new definition limits the communication to taking actions during non-emergencies, and ignores the finding that poor communication occurred in the events leading up to the 2003 Blackout.
Yes

Te CPOP was overly administrative.

UI disagrees with the necessity for this Standard. The intent of Recommendation 26 was to improve the communications around situational awareness. The SAR states the purpose is to “efficiently convey and mutually understood for all operating conditions.” This Draft does not address the concern and a Reliability Standard will not resolve the problem. It will create a compliance burden. The White Paper does not provide justification for imposing a compliance burden of recording, reviewing and tagging every conversation in a control center for the applicability of COM-003. There is no correlation between non-emergency communication and BES reliability. There is no study to demonstrate that the cause of awkwardness when transitioning from non-emergency to emergency communication will be resolved by any of the requirements in this Standard. Awkwardness has been resolved by Com-002 Requirement to explicitly identify an action as a Directive.

On page 2 of 10 (blue box), the SDT has a blue box that defines Reliability Directives as a “type” of Operating Communications. This gives the appearance that Reliability Directives are part of Operating Communications and this could be a double-jeopardy issue. If an entity is found with a potential non-compliance finding on the communication of a Reliability Directive (COM-002), then it is very likely that the entity could have a potential non-compliance finding on COM-003 (proper communication of an Operating Communication).
Yes
No
IMPA agrees with the splitting of a single requirement into two requirements. However, the blue box on page 2 of 10 makes the statement “Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status output, or input of an Element or Facility of the Bulk Electric System” which seems to include Reliability Directives by simply referencing Operating Communications in each requirement (R2 and R3). By excluding Reliability Directives, the requirement is now very confusing and can be interpreted two different ways. Requirement 2 does not include the Generator Operator as a potential entity that could issue an Operating Communication. Within its organization or company, a Generator Operator could issue an Operating Communication, such as one location calling and telling another location to start its generating unit. IMPA believes the Generator Operator should be included in R2.
No

The question uses the word "correct" and the requirement uses the word "accurate". The use of either word adds ambiguity to the requirement, and an entity being found compliant or non-compliant depends on how the entity and the auditor interprets the meaning of "use of an accurate alpha-numeric clarifier". The SDT should allow the entity to pick the alpha-numeric clarifier that its company wants to use or the same clarifier that was used when the Operating Communication was given, and not give an auditor the chance to say it is not an "accurate" alpha-numeric clarifier.

No

The requirement that requires entities to use uniform line identifiers when referring to transmission facilities of an interconnected network is in the TOP-002-2b standard (R18). Requirement R1.1.4 of COM-003-1 draft is not needed and should be deleted.

IMPA believes that each organization should follow its internal communication protocol up to the point where a Reliability Directive is issued. IMPA does not see why NERC is stating the "how" in this standard (sub-requirements 1.1, 1.1.1 thru 1.1.4) when its common practice has been to stay away from telling the entities "how" to do a standard requirement. Therefore, IMPA believes that COM-003 should just state that an entity needs to have a communication protocol in place for issuing and receiving instructions. In addition, an entity should only have to do training on its communication protocol in order to prove compliance that it is following or using it. The record keeping or data retention of phone recordings will become very burdensome on entities, especially if they have to keep five or six years worth (back to its last audit date).

Michelle D'Antuono

Ingleside Cogeneration LP

No

Ingleside Cogeneration LP believes that the definition of "Operating Communication" widely expands the scope of COM-003-1 beyond entity-to-entity or multiple-entity communications. Instead, all conversations conducted by System Operators, field personnel, engineers, or vendors that may refer to the status of a BES component are applicable – even those discussed face-to-face. We believe the original intent to bound the communications to those which can be captured in control room recordings and/or logbooks is manageable; not so every side conversation or email that takes place during the natural course of the operating day. The original term, "Interoperability Communication", captured this concept. It seems like the Draft 1 definition could be easily modified to read as follows: Interoperability Communication: Communication of instruction <between two or more entities> to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. Ingleside Cogeneration LP is in full agreement with the removal of the definitions for "Communication Protocol," and "Three part Communications". Neither term helps address an ambiguity in the body of NERC Standards that we are aware of.

Yes

Ingleside Cogeneration LP agrees that a communication procedure is unnecessary for routine operations. In our view, the remaining requirements in COM-003-1 will drive entities to continually reinforce communications protocols without it.

Yes

There are already other project teams addressing the handling of incidents related to transmission, physical, and cyber security. It is appropriate in our view to separate emergency operations communications from normal ones – as done in the second draft of COM-003-1.

Yes

Yes

Yes

Ingleside Cogeneration LP agrees that Reliability Directives must be handled in a more prescriptive manner. Since Reliability Directives are also an important piece of Project 2006-06, it makes sense to move the developmental responsibility to them – and avoid unnecessary overlap between the two projects.

Yes
No
<p>Ingleside Cogeneration LP agrees with restricting the applicability of COM-003-1 R1.2 to Transmission interface Elements/Facilities. These are the most likely to carry more than one identifier, as each entity may use different numbering conventions. However, we see two separate types of identifiers which may need to be addressed separately. First, those provided on control room monitors often come from a centrally managed Regional database. It is not reasonable to expect System Operators to refer to a Facility owner's one-line diagram to reference these interconnections – and may reduce reliability. Conversely, field personnel and engineers may rely on the one-line for their identifiers. The use of the owner's documentation is more appropriate in these cases. We will further point out that COM-003-1 does not apply to Facility owners, so it seems as though they could decline to provide identifiers if they so choose.</p>
Yes
<p>With the transition of emergency communications to other projects, it is appropriate to downgrade COM-003-1's VRFs from "High" to "Medium".</p> <p>Ingleside Cogeneration LP agrees in principle with the need for Operators and Field Personnel to express and validate their intent before taking actions that may pose a risk to the BES. However, we have serious reservations with the use of the audit methodology to drive consistent behavior. Perhaps most significant is the assessment of violations for a single instance where an operator does not use alphanumeric identifiers or a 24 hour clock during the course of an Operating Communication. We believe that even in an extremely well managed organization that 100% adherence is statistically impossible. In our view, this flies in the face of fairness – and raises serious questions about the "public/private partnership" that is supposed to be the foundation of NERC standards. This points to the "bean counting" type of Standards that NERC is trying to get away from, rather than focusing on reliability of the BES. Furthermore, entities will be assessed violations if they cannot prove that every side conversation did not take place in accordance with COM-003-1. In order to comply, we estimate it will take two or three times the time to document a non-recorded communication than it will be to actually conduct one. This is not an appropriate use of our front-line resources available time – nor does the documentation serve a reliability purpose in our view. In addition, COM-003-1 is silent as to multiparty calls that are typical in some regions, where an entity at random is elected for the three part response for the group on conference calls, and not all parties are required to respond, but rather only participate on the call.</p>

No
Yes
Yes
No
See previous comment to Question 1.

Not certain as I do not know the specifics of the NATO phonetic alphabet.
No
We should always use the identifier adopted by the RTO, not one developed by the Element/Facility's owner.
No
The standard should not be mandating the "HOW".
Group
Duke Energy
No
The definition of Operating Communication is vague, general and overly broad. We don't believe the Blackout Report recommendations and Order 693 directives require 3-part communications for routine communications. Communications protocols can be tightened, and more effective communications can be achieved without this extreme approach. See our comments under question #2.
No
We believe that having a reliability standard requirement to develop a Communications Protocol Operating Procedure, to address items similar to those under R1.1 would be an appropriate method to address the Blackout Report recommendations and Order 693 directives to tighten communications protocols. An entity's CPOP could address the language to be used between functional entities, what clock format is to be used, how time zone/Daylight Savings Time will be addressed, and transmission equipment identifiers. The CPOP should have a required review frequency, and personnel should be trained on the CPOP. This approach, unlike the draft standard could be audited and certified. We see no way to reasonably audit or certify compliance with the draft standard in its current form. Duke suggests this approach to COM-003: Rather than specifying the solutions to achieving effective communication, COM-003 should instead focus on developing and training on an approach that is designed appropriately for each RE. For instance, another approach to COM-003 might be along the lines of: Requirement R1 could be written in a manner to require the appropriate registered entities to develop a communications protocol that is appropriate for each RE. This communications protocol should address how the RE is handling: Time Zone Designations – for both internal and external communications Language Alpha-numeric identifiers 3-part communications – when is it required, etc. Use of defined terminology Use of common transmission equipment identifiers Other items deemed important for the communications protocol to address – again, this would not define HOW these items are addressed. This approach would require the RE to specify how it is addressing these issues, without prescribing solutions. For instance, a RE could include a section in its protocol to deal with time zone designation. In this section the RE could explain that it, and its neighbors, all are in and use the same time zone. As a result, the RE has determined that requiring the identification of time zone reference in communication is not necessary. Requirement 2 could be written in a manner to require the training of operators on the communication protocol. Requirement 3 could be written in a manner to require the RE to define its internal controls it uses to review that its protocol is being followed. The compliance approach would be to: 1) assess whether the RE has developed a written protocol and whether the protocol addresses each item – this does not mean there is an assessment of HOW each item is assessed; 2) assess whether the RE has trained its operators on the communications protocol 3) assess whether the RE is following its internal controls
Yes
No
We think mandating English is over-reaching (As currently written, the Standard erroneously focuses on "how" an entity can be compliant, rather than describing "what" an entity needs to achieve to be compliant). Let the entity that develops the CPOP and its neighbors decide on language, clock format, etc.
No
We think mandating the 24 hour clock is over-reaching (As currently written, the Standard erroneously focuses on "how" an entity can be compliant, rather than describing "what" an entity

needs to achieve to be compliant). Let the entity that develops the CPOP and its neighbors decide on clock format, how time zone differences will be addressed, etc.

No

We don't believe that 3-part communications are needed for ALL routine communications, and that R2 and R3 should be deleted. Also, there should only be one standard for communications protocols. The communications efforts in Projects 2007-02, 2006-06 and 2007-03 should be combined.

No

We think that this is over-reaching (As currently written, the Standard erroneously focuses on "how" an entity can be compliant, rather than describing "what" an entity needs to achieve to be compliant), and creating a requirement that can't reasonably be audited or certified.

No

We don't believe that this requirement is consistent with the TOP requirement to use common line identifiers. This is more restrictive, in that it mandates the use of a name specified by the asset owner, while TOP simply requires the development of common identifiers without dictating what party defines the names. We understand the issue of identifying common terms for equipment, but believe the development and use of "common identifiers" is already covered in the TOP Standard and should be eliminated altogether from COM-003.

No

The VRF's should all be "Low". For example, there will be thousands of routine communications per year, and each instance of missing one alpha numeric identifier (ex. "balloon" versus "baker") would be a violation. As written, this standard would drive allocation of resources for little reliability benefit.

We believe that having effective communications is an important goal; and there are instances where the use of 3-part communication is appropriate. We also believe that the industry is maturing, and the use of 3-part communication as a tool to achieve effective communication has grown (as evidenced by Table 1-A in the May 2012 COM-003-1 Whitepaper. This maturity and expanded use of 3-part communication has occurred without a Standard in place; and that we do not believe a Standard is needed that focuses on one way of establishing effective communication.

Yes

Yes

COM-003-1 and COM-002-3 cannot be processed separately since they are inextricably inter-related. In fact, they are so inter-related that there is no compelling reason provided that suggests they should be separate standards. The comment form for COM-003-1 even indicates that Reliability Directives are a subset of Operational Communication which further indicates that all of the requirements surrounding how communication is performed regardless of the nature of the content should be addressed in one standard. Further, 3 part communication is being cited as ensuring reliable operation of the BES. It is not the act of 3 part communication that ensures reliable operation. Rather, it is the effective transfer of information that does. Requiring 3 part communication for all communication will reduce the effectiveness of the communication as the novelty factor wears off and individuals only go through the motions. Active listening and truly understanding the communication is what accomplishes the intent. Use of 3 part communication for situations that the

initiator determines it is warranted based on their knowledge and training is the most appropriate approach to ensure reliable operation of the BES.
Group
BC Hydro
No
BC Hydro does not support limiting operating communications to instructions. We believe this should account for notification or reporting and that in these cases three part communication should be used to ensure understanding. For example, if an element is out of service and that is being reported to an operating entity, the receiver of that communication should show confirmation of understanding by repeating their understanding and receiving confirmation. Example: 1) TOP Call to RC: Our transmission Line XX is currently out of service and is expected to remain out until field crews respond. 2) RC to TOP : OK, I understand that Line XX is out of service and will remain out until further notice. 3) TOP to RC: That's correct. I'll call you when I have some more information.
Yes
Yes
Yes
Yes
Yes
Yes
No
BC Hydro does not support the full time use of alpha numeric clarifiers for all Operating Communication. In some cases we believe it detracts from the instruction being delivered. In our system, devices are identified by a combination of alpha and numeric. For example, to call transmission line 5L98, '5-Line-98' or a circuit breaker 5CB11, '5-circuit breaker-11' does not add value. This may help in some areas depending on their naming conventions. BC Hydro does not think the use of the term 'accurate' effectively describes what is permissible to be used as an alpha numeric clarifier.
No
BC Hydro supports this in most cases, especially when dealing with the RC, but in many cases there may be lack of clarity around ownership. We believe this needs to be reworded to account for designation that is agreed to by the parties that are communicating.

We have a problem with the standard and therefore we inherently don't agree with VRFs and VSLs.
Recommendation: Not-Approve We feel that the direction for this communications standard is grossly in error. Focus should be on ensuring proper training programs are in place that emphasize and best prepare the System Operator for effective communication. The idea that effective communication can be scripted is entirely mis-guided and that a regulatory body might subject an entity to financial penalties for communication standards that attempt to script the language spoken, how time is referenced, naming conventions and alpha-numeric clarifiers has no precedence in industry that we are aware of. The United States' Air Traffic Control protocols for communications between controllers and commercial airline pilots are very tested, well trained and effective. Controllers and pilots are trained in effective communication and the situations and pronunciation types that may lead to confusion. But they are not fined for any instance of not following them. From the Air Traffic Controllers Handbook, <a href="http://avstop.com/ac/atc/2-4-1.html#2-4-1">http://avstop.com/ac/atc/2-4-1.html#2-4-1</a> 2-4-3 Pilot Acknowledgment / Readback a. When issuing clearances or instructions ensure acknowledgment by the pilot. NOTE - Pilots may acknowledge clearances, instructions, or other information by using "Wilco," "Roger," "Affirmative," or other words or remarks. REFERENCE - AIM, Contact Procedures, paragraph 4-2-3. b. If altitude, heading, or other items are read back by the pilot, ensure the readback is correct. If incorrect or incomplete, make corrections as appropriate. Mandating the use of the English language in all communications is not in the best interest of reliability. We are not aware of any issue that has been raised of significance with the current requirement contained within COM-001-1.1, R4

Due to these extensive comments and desire for these comments to be formatted for the SDT we have also sent these comments to Monica Benson in a Word document. While we agree with the definition, we do not agree with R1, R2 and R3. While we are not enamored of having a Requirement to have a procedure, in this instance, the exception seems to be necessary. Below is suggested language to replace all of the Requirements and sub-Requirements in COM-003: Proposed new text: "R1. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall develop a written communications procedure for Operating Communications among personnel responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System. The procedure shall address at minimum: [Violation Risk Factor: Low][Time Horizon: Long Term Planning] 1.1 When communicating between functional entities 1.1.1. Establish the language to be used. 1.1.2. Time format to be used. 1.1.3. Establish treatment for time zones when multiple time zones are crossed. 1.1.4. Identify naming convention for Transmission interface Element or a Transmission interface Facility. 1.1.5. For oral Operating Communications, establish the treatment for the circumstances in which alpha-numeric identifiers must be used." The SDT has not listened to the industry comments given in previous ballots. It also appears to be focused on imposing three part communications on the industry for routine communications despite the fact that neither the blackout report nor the SAR on which these standards are based emphasize that issue.
No
We believe that this version of COM-003 actually embeds a "CPOP" within the Requirements. This is inappropriate intrusion beyond identification of with "what" an entity must comply into "how" that entity must comply. Our suggested R1 provides replacement language that would require a communications procedure. We see no reliability value in having a defined term for "Communications Protocol Operating Procedure", as the term "communications procedure" is completely understandable using the normally accepted meanings of the words.
No
We disagree – this concept more properly belongs in the NERC Rules of Procedure and should be

designed to address Recommendation 26 of the NERC 2003 Blackout Report. This is an expectation of NERC itself, not of the industry (and NERC can't write Requirements for the ERO). Also, this team should take the time to become familiar with recent NERC Operating Reliability Subcommittee (ORS) discussions and recommendations regarding the elimination of the Transmission Alert Levels. Even the DHS has found that Alert Levels has diminished value.

No

We disagree with all of the Requirements and sub-Requirements in this standard, due to the fact that they embody a procedure into the Requirements. There is no reliability need being fulfilled by taking this approach. See our suggested replacement R1 in our response to Q1. This would replace R1, R2 and R3 and their associated sub-Requirements.

No

See our response to Q1, Q2 and Q4.

No

Three part communications should not be required for routine operating communications. See the definition of Reliability Directive in COM-002, which addresses the actual reliability issues associated with communications. This team once had coordinated with the RC SDT (Project 2006-06), and the RTO SDT (Project 2007-03), with a different approach for routine communications resulting from a meeting between the chairs of the three SDTs on November 17, 2009 in the SERC offices in Charlotte, NC. Quoting from the meeting setup email: "On the basis that the SC members are the key drivers of the joint effort to finalize "Directives and Three-Part Communications", [...] and [...] indicated a preference for Tuesday 1-3PM ET November 17. Some members of the RTOSDT and RCSDT will be attending the meeting in person...." At that meeting it was agreed that RC SDT (Project 2006-06) would develop the definition for "Reliability Directives", and require 3-way communication for Reliability Directives by the RC. Conversely, it was decided that OPCP (Project 2007-02) would handle ordinary communications, but would not require 3-way communications for routine communications. RTO SDT (Project 2007-03) only agreed to this course of action (in effect, backing out of writing ordinary communications standards as part of Project 2007-03) because OPCP SDT (Project 2007-02) had committed to this approach during that meeting. It should be noted that "COM-001-1 Telecommunications" and "COM-002-2 Communications and Coordination" are included in the SAR for RTO SDT (Project 2007-02) and its coordination with RC SDT and OPCP SDT was conditioned upon RC SDT and OPCP SDT following the course of action agreed-to in the November 17, 2009 Charlotte, NC meeting. OPCD SDT (Project 2007-02) should honor the intent of that meeting in Charlotte and remove R2 and R3 from this standard. We suggest that R2 and R3 should be eliminated, since neither one will result in increased reliability.

No

See our responses to Questions #1, 2 and 4.

No

See our responses to Questions #1, 2 and 4.

No

We disagree only in the sense that we disagree with the requirements, therefore, the VRFs and VSLs are not relevant. We suggest deletion of all three requirements, and the insertion of one new requirement. See Response to Questions 1, 2 and 4.

NERC standards are not procedures and this standard attempts to impose a single procedure on the industry. Tightening of communications protocols between entities does not equate to a procedural requirement to use 3-part communications between personnel at various registered entities. The actual impact to reliability of routine communications between entities is minimal and further diminished by the Reliability Directive construct espoused by RC SDT (Project 2006-06), which fully addresses the reliability implications of communications. While most of the industry practices three-way communications routinely, this is not necessary to assure reliable operations. Rather, in many cases, entities are viewing this as a "best practice", that helps to formalize communications so that Operators will develop good communications habits. The work by the RC SDT (Project 2006-06) on Reliability Directives is all that is necessary to assure BES reliability, and the approach currently espoused by OPCP SDT (Project 2007-02) in this COM-003 standard is massively redundant to that effort while not helping reliability. We agree with SERC in suggesting another approach to COM-003. Rather than to specify the solutions to achieving effective communication, COM-003 should instead

focus on developing and training on an approach that is designed appropriately for each RE. For instance, another approach to COM-003 might be along the lines of: Requirement 1 (See our suggested alternate language in our response to Question 1) could be written in a manner to require the appropriate registered entities to develop a communication protocol that is appropriate for each RE. This communications protocol should address how the RE is handling: Time Zone Designations – for both internal and external communications Language Alpha-numeric identifiers Three – part communications – circumstances in which is it required, etc Use of defined terminology This approach would require the RE to address how it is addressing these issues, without prescribing solutions. For instance, a RE could include in its protocol a section dealing with time zone designation. In this section the RE could explain that it, and its neighbors, all are in and use the same time zone. As a result, the RE has determined that requiring the identification of time zone reference in communication is not necessary Procedures should address the training of operators on the communication protocol Procedures should address the internal controls that the RE uses to review that its protocol is being followed. The compliance approach would be to: Assess whether the RE has developed a written protocol and whether the protocol addresses each item – this does not mean there is an assessment of HOW each item is assessed; assess whether the RE has trained its operators on the communications protocol and assess whether the RE is following its internal controls. Compliance with this requirement should not require 100% accuracy in compliance with the entities communication procedure by real-time operations staff. That would cause misdirection of resources and training time from issues more important to BES reliability. Any data retention requirements should be consistent with the COM-002 reliability standard. What is the role of the Operating Communications Protocols White paper? Is it a position of the STD? Was there a minority opinion? Why was it not vetted with a wide spectrum of industry stakeholders (we are unaware of any effort to circulate this white paper even as far as to the standing Technical Committees of NERC ). Does the industry agree that we need a standard on three part Communications for normal operations? We have seen no evidence to support this contention. This revision to COM-003 seems to have sprung into existence without any substantive industry comments indicating that the industry would benefit from having a procedure memorialized as a set of Requirements.

Individual

Anthony Jablonski

ReliabilityFirst

No

ReliabilityFirst votes in the Affirmative for this standard because the standard further enhances reliability by providing communication protocols when participating in Operating Communications (specifically three way communication). Clear, formal and universally-applied communication protocols will help reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Even though ReliabilityFirst votes in the Affirmative standard, ReliabilityFirs votes in the negative for the VSLs and offer the following comments for consideration: 1. VSL for Requirement R2 a. When referencing “Part” numbers within the VSL, a consistent format (e.g. Requirement R2, Part 2.2 first bullet) should be used. 2. VSL for Requirement R3 a. The VSLs should state “oral ... Operating Communication” rather than “verbal ... Operating Communication” to be consistent with the language in the requirement. b. For consistency with the first part of the first bullet in Requirement R3, RFC recommends the following language be considered for the “High” VSL: “The responsible entity received and repeated an oral two-party, person-to-person Operating Communication but did not wait for confirmation that the repetition was correct. (Requirement R3, first bullet)”

Dominion
No
Dominion agrees with the elimination of Communication Protocol, Interoperability Communication and Three part Communications proposed in the first draft. Each standard requirement (R1, R2 & R3) specifically excludes Reliability Directives, further adding confusion to the issue of what is a reliability directive. The Reliability Directive should stand on its own and if the SDT does not agree then the relationship between Reliability Directives and Operating Communications should be clarified in the Standard. When the standard is implemented, the text box (on page 2 of the clean standard) will be removed, therefore losing any tieback to a Reliability Directive as a type of operating communication.
Yes
Yes
Yes
No
Dominion currently views this requirement as being too prescriptive, the standard should be written to allow a 24 hour clock and time zone designation or 12 clock with an AM or PM and time zone designation.
No
The current version of this standard expands the use of three-part communication to all Operating Communications, not just Reliability Directives as specified in draft standard COM-002-3, Project 2006-06. Also, given the definition of Operating Communication (i.e., communication of instruction to change...an Element or Facility...) and the use of "two-party, person-to-person" in the Requirements, communications between two members of the same organization (e.g., two Generator Operators, two Transmission Operators) would be subject to this standard. This seems impractical, requiring organizations to document, as evidence, internal communications. Dominion suggests the language be clarified to eliminate this issue. The requirement as written could also be interpreted to mean that three-part communications are not necessary for communicating Reliability Directives. If the protocol for Reliability Directives must be covered by a different standard, then that standard should be referenced in this requirement in order to clarify the intent of the exclusion and remove the implication that three-part communications do not apply to Reliability Directives. COM-003-1 R2 could be rewritten to add clarification for Reliability Directives only as "Each Reliability Coordinator, Transmission Operator and Balancing Authority that issues an oral, two-party, person-to-person Operating Communication, excluding Reliability Directive (as referenced in COM-002-3 R2 and R3) shall: "
No
Dominion suggests that Requirement R1, Part 1.2 is ambiguous in that the use of alpha-numeric identifiers appears optional (but if they are used, they must be accurate). If the purpose of Part 1.2 is to USE alpha-numeric identifiers, then this statement needs to be modified to state that more directly and to give that clarity.
No
The requirement as written is superior to Requirement R18 of TOP-002b which requires the use of ". . . uniform line identifiers when referring to transmission facilities of an interconnected network." However, the industry can't have two different standards with different requirements for identifying transmission facilities.
Dominion acknowledges the term Reliability Directive is proposed for inclusion in the draft of COM-002-3, but we also prefer a notation be added, to clarify this is not an existing term in the current version of the NERC Glossary of Terms. As mentioned in response to Question #1; When the standard is implemented, the text box (on page 2 of the clean standard) will be removed, therefore losing any tieback to a Reliability Directive as a type of operating communication. The data retention period for this standard for normal operating communications is extensively longer than the COM-002-3 standard for emergency communications as discussed in Project 2006-06. Dominion suggests the

same data retention period as COM-002-3 for Requirements 1, 2 and 3 of this standard, which is for the most recent 3 months. Dominion also questions why the proposed standard is applicable to Distribution Providers since changing the state of BES elements is not what they do. Therefore, they would never receive an Operating Communication instructing them to do anything to a BES element, so it would not be practical or useful for a DP to include this standard in its compliance program. DP is included as an applicable Registered Entity in COM-002. Other than a load shed Reliability Directive (during emergencies), what other Operating Communication would a DP receive?

City of Austin dba Autin Energy

No

To clarify that Operating Communications occur in real-time, AE offers the following change to the definition: "Real-time communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System."

Yes

No

AE believes the SDT should carefully review existing alert levels (e.g. EEA levels, threat levels). AE requests that the SDT use only the Alert Levels in Attachment 1 if they enhance existing levels or fill a gap. AE's preference is for the SDT to build upon existing alert levels instead of imposing a new category.

No

There is not enough evidence to support the need for these types of specifics. Recommendation 26 encourages NERC "to ensure that all key parties ... receive timely and accurate information." COM-003-1 seems to interpret the recommendation by telling entities "how" to ensure information is accurate (e.g., use English, 24-hour clock, time zones, alpha-numeric identifiers, etc.). This standard reaches too far into the "how" instead of focusing on the "what," which is "timely and accurate information." Registered entities should decide the best methods to ensure accurate information for themselves (through three-part communication, use of the 24-hour clock or otherwise).

No

It makes sense to separate R2 from R3; however, AE respectfully objects to mandating three-part communication for normal operating communications. The fact that most registered entities already use three-part communications for normal operating communications makes it a best practice; it does not mean a NERC Reliability Standard should require it.

No

There is not enough evidence to support the need for these types of specifics. Recommendation 26 encourages NERC "to ensure that all key parties ... receive timely and accurate information." COM-003-1 seems to interpret the recommendation by telling entities "how" to ensure information is accurate (e.g., use English, 24-hour clock, time zones, alpha-numeric identifiers, etc.). This standard reaches too far into the "how" instead of focusing on the "what," which is accurate information. Registered entities should decide the best methods to ensure accurate information for themselves (through three-part communication, use of the 24-hour clock or otherwise).

Yes

No

AE respectfully objects to the contents of COM-003-1 as described in these comments. If, however, AE were to assume agreement with the requirements, we offer the following comments regarding the VSLs: AE does not believe the R1 VSLs provide for a fair application in practice. Risk to the BES is not increased when fewer communication protocols apply to an entity. As proposed, missing 1 of 4 parts when 4 parts are required is a Moderate VSL. Missing 1 of 4 when 3 are required is a High VSL (and it never has an opportunity for a lower severity level because Moderate VSL applies only when 4 parts are required). Similarly, if an entity misses 1 of 4 when 2 are required, it should not be penalized with

a Severe VSL. AE suggests the solution to this issue is to assign Moderate VSL to missing 1 of 4, High VSL to missing 2 of 4 and Severe VSL to missing 3 or more of 4, in all instances regardless of how many parts are required. If the structure suggested above is not adopted, AE offers the following comments for consideration: Within the Severe VSL column for R1, the first paragraph (missing all of the parts when four are required) duplicates the second paragraph (missing three or more when four are required.) Within the Severe VSL column for R1, the third and final paragraphs should say "two (2) or more" and "one (1) or more," respectively, to account for all possible situations. Doing so aligns with the second paragraph which already says "three (3) or more." Finally, with respect to the VSLs for R2 and R3, all instances of "verbal" should be changed to "oral" to match the language of the requirement.

Austin Energy (AE) respectfully disagrees with COM-003-1 because it: (1) reaches beyond the SAR and (2) requires "how" communication should take place instead of "what" and "when." The scope of COM-003-1 reaches beyond the SAR by imposing protocols on normal communications when the focus of the 2003 Blackout Report, Recommendation 26 and Order 693, Paragraph 532 is on timely and accurate EMERGENCY communication. Recommendation 26 does not recommend tightened communication protocols under normal operating conditions. It recommends that NERC "work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations...." AE believes Project 2006-06 (COM-002-3) sufficiently addresses this recommendation by requiring three-part communication for Reliability Directives. If used correctly, the say-repeat-confirm method improves effectiveness of communications during alerts, emergencies and other critical time periods. The other source for COM-003-1 (Paragraph 532) references communications during normal conditions, but only in response to an EEI comment. The actual directive is in paragraph 535, where FERC states, "Accordingly, we direct the ERO to either modify COM-002-2 or develop a new Reliability Standard that requires tightened communications protocols, especially for communications during alerts and emergencies." AE notes that the directive focuses on communications during alerts and emergencies, similar to Recommendation 26. AE recognizes that the SDT reads Paragraph 532 to indicate a need for communication protocols even under normal operating conditions. However, AE believes that a NERC Reliability Standard is not the appropriate place to address the "how" of communication protocols under normal conditions. Industry stakeholders are justifiably concerned that deviations from the requirements during normal operating conditions will inevitably occur (human performance factor) without a risk to reliability. The potential number of self-reports industry-wide carries an overly burdensome cost without an associated benefit to the BES. AE believes that efforts at the regional level (e.g., training, guidelines, etc.) would be more effective and relevant. In summary, AE believes the focus of COM-003-1 should be on achieving accurate and timely information (the "what" and "when"), not prescribing exactly "how" registered entities achieve it. As written, COM-003-1 goes too far into the realm of mandating best practices and claiming it is necessary for reliability.

"Use the English language when communicating between functional entities, unless another language is mandated by law or regulation." If two or more functional entities (say BA & TOP) reside within the same utility (perhaps even co-located in the same control center) and are communicating solely with each other, mayn't they speak their native language to each other - with or without the aid of law?
Yes
the use of "prevailing time" should be allowed, when appropriate, along with daylight and standard.
Yes
No
the term "correct alpha-numeric clarifier" is itself unclear. Searching on Google, I can find no other use of this term outside of this Standard. Therefore, this does not appear to be a standard term or concept. Did the SDT mean to require the use of a phonetic alphabet (NATO's or any other)? If so, please just state so. If the intent was to permit means other than phonetic alphabets to ensure clear communication of alpha-numeric identifiers, then I suggest clarifying the Standard's language. Perhaps, "When participating in oral Operating Communications and using alpha-numeric identifiers, use a phonetic alphabet or similar means to ensure clear understanding."
Yes
The possibility exists for an element/facility to be co-owned and for each owner to have a different name.
Yes

No
Defining the new term 'Operating Communication', and including the approved definition of 'Reliability Directive' under this newly defined term and then requiring the use of three part communications for all 'Operating Communications' is redundant and unnecessary. There is no reason to have two separate Standards governing the use of three-part communications.
No
The use of English should be mandated for communications between entities in separate regions where the common language in one of the regions may not be English. Allowing an entity to use a language other than English when communicating with regions where English is the required language

is counter to the purpose of the Standard and could in fact jeopardize reliability through miscommunication.
No
This provides minimal real-time benefits to the Operators, but only serves to make it easier to conduct an after the fact analysis. As such, this is an administrative requirement that should not be included in the Standard.
No
Although I agree with the requirement making the receiver responsible for repeating the message, this should be included in COM-002. Again, having two separate Standards on this topic is redundant and unnecessary.
No
If the purpose of this Standard is to improve and standardize communications, than all entities should use the same alpha numeric clarifiers.
Group
JEA
No
Yes
No
Yes

The two standards (COM002&COM003) should be merged into one standard. Three part communications should be considered a best practice and only required during emergency directives.
Yes
R1.2 is unclear. The term "alpha-numeric identifiers" is not defined. We believe examples would help. For example we assume that if we say the Northside 1, this would not be alpha-numeric but what if we used logical letters such as NS1 in internal communications. Is it all alpha-numeric communications or just illogical meaningless letters and numbers. We believe we should be able to use logical alpha numeric things like MS for motor-switch and not have to use alpha-numeric clarifiers. Also please specify if this is for both internal and external communications. Again we believe that this should be for external communications using illogical meaningless letters and numbers not for internal normal nomenclature.
Yes
R1.1.4 is unclear. Does this apply to both internal and external communications? JEA believes that this should only apply to external communications only. Many entities have internal numbering systems that have been in place without incident for decades and should be able to continue to use these internal systems when performing internal communications.
No
R2 & R3 should be removed from the standard. They are a best practice and do not substantially affect reliability when a simple command such as increase load by 100MW for a new purchase agreement.
Combine COM002 & COM003.
Thomas McElhinney

Associated Electric Cooperative JRO00088
No
Although the intent appears to be only for oral communications of NERC Certified System Operators, and those directly aimed at affecting the altered or continued state of BES elements of Facilities, the wording is insufficiently bounded. For instance, it could include any communications between a unit or plant operator and internal plant personnel, were the net output of the plant to change, significantly or insignificantly, current or future (status), its injection to the BES. The same would be true of loads, and so communication of Distribution providers with any manufacturing plant managers would necessarily become subject to this standard (extractions from the BES – significant or insignificant). Taken to one extreme, purchasing personnel could also be responsible for whatever part their telephone conversations play in altering the future status of plant real or reactive power production or consumption. AECI agrees with the SERC OC STANDARDS REVIEW GROUP consensus comment, that COM-002 should be sufficient in addressing any industry deficiencies in this area and if not, the deficiencies addressed there.
No
AECI agrees with SERC OC STANDARDS REVIEW GROUP's comments pertaining to question 2.
No
AECI agrees with SERC OC STANDARDS REVIEW GROUP's comments pertaining to question 3.
No
Although this qualification appears to now be accommodating of regional government mandates, it fails to address decorum where a non-English bounded Entity is communicating externally with entities who are unbounded by the same mandates or vice-versa. Best to let the Regional Entities work this out among themselves and document the agreements, where applicable.
No
There are remaining issues where Entities deal with those few areas who swap time-zones dependent upon SDT, and they could be unfairly ensnared by non-compliance, in their not realizing that nuance. In addition, given the unbounded scope of this standard, it would seem best to allow operator discretion or this clause is a PV magnet.
No
AECI appreciates the SDT's desire to add flexibility and yet clarity for what is expected, but we absolutely disagree with a split into two requirements. Such a split unnecessarily increases the industry's risk, of a single three-part communication failure, being assessed in violation of two separate requirements, yet with no added value to BES reliability. Given today's environment, PVs will be written although the intended content was accurately conveyed and the system properly operated, should these requirements exist. So AECI agrees with SERC OC STANDARDS REVIEW GROUP's assessment that R2 and R3 should be entirely removed.
No
AECI appreciates the SDT's desire to afford flexibility to the industry, and yet we still view this level of prescription as unnecessarily burdensome, given the current broad scope of this particular standard.
No
AECI agrees with SERC OC STANDARDS REVIEW GROUP's response to Question 8.
No
AECI agrees with SERC OC STANDARDS REVIEW GROUP's response to question 9.
AECI remains unconvinced that COM-003-1 adds sufficient value to our industry reliability, for the degree of non-compliance risk it imposes. There are several issues with the supporting white paper: 1) this paper appears void of citations supporting its assertions, 2) it also fails to differentiate cited industry failures in communication, between; situations where somebody failed to communicate a field-change that significantly affected BES situational awareness, situations where the change was clearly understood and yet its situational impact was not, and situations where the affected objects were misunderstood. All of these failures are critical to our industry's assessing true value in introducing and enforcing broad-scope three-part communication, because COM-003-1 can only improve the last of those three miscommunications, 3) its citation, of 12 Entity's broadly adopting three-point communication, seems hardly a majority practice within our industry, 4) while Entities

may internally adopt similar policies, that does not mean we should risk being subject to Federal law in support of conceptual theories, 5) citations of similar adoptions by other industries or cultures, fail to provide useful differentiation between their critical and casual operational communications, except in the case of military, where COM-003's proposed broad scope of communication appears to be inconsistent, while COM-002's narrowed scope appears in alignment with the military's adopted practices as described.

definition of Reliability Directive in COM-002, which addresses reliability issues. We suggest that R2 and R3 be eliminated, since neither one will increase reliability.
No
This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT".
No
This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT". Requirement 1.1.4 does not need to be in this standard as the requirement for unique line identifiers is stipulated in TOP-002-2 R18.
No
LG&E and KU Services suggest deletion of all three requirements
Does the industry agree that we need a standard on three part communications for normal operations? Has a lack of a standard on three part communications for normal operations created any reliability issues? If so, what are they? LG&E and KU Services believes that the concerns expressed by the Blackout Report and cited as the reason for creating this NERC Project are already addressed through EOP and TOP Standards that specify what information is to be communicated, instead of how information is to be communicated. "Lack of situational awareness" (2003 Blackout Report, Recommendation 26) cannot be overcome by dictating "how" communication takes place, but instead, can be overcome by responsible individuals (NERC certified operators) ensuring that proper information is communicated. LG&E and KU Services believes that the concerns expressed by the Blackout Report and FERC Order 693, Paragraph 532 are not (and need not be) addressed by this or any other NERC RS Project. First, the recommendation for "tightened communication protocols" (FERC Order 693, Paragraph 531) is within the context of "alerts and emergencies." Second, FERC's Order 693, Paragraph 532 calls for "communication uniformity as much as practical on a continent-wide basis." This is calling for uniformity in emergency communications, which was the context within which FERC was speaking, as evidenced by the previous sentence ("during emergencies"). By establishing emergency communication uniformity, "ambiguities in communications during normal, alert and emergency conditions" will be eliminated. Nothing in the Commission's Determination was calling for establishing communication uniformity for all communications. LG&E and KU Services suggest removing requirements R2 and R3. These requirements do not improve reliability, but instead shift Operator focus from communicating proper information ("what") to communicating in a compliant manner ("how"). System Operator need to be wholly concerned with the information they are communicating, not making sure they "say things the right way" so they will not be non-compliant. Every communication should not be a compliance event. While LG&E and KU Services supports the addition of using the 24-hour clock format, subpart 1.1.4 is already addressed in TOP-002-2b R18. Including such a similar requirement here simply provides entities with a double jeopardy opportunity to be non-compliant. We suggest subpart 1.1.4 be removed, along with subpart 1.2, which again goes too far in dictating "how" and simply creates another compliance event. We suggest subpart 1.1.3 be rewritten to explicitly allow for entities to agree upon using a particular format for communicating time. With these suggestions in mind, it would be more appropriate to put the remaining requirements into COM-001. We also suggest removing the definition for Operating Communication since this also unnecessarily creates opportunities for non-compliance. LG&E and KU Services have concerns about the white paper posted on the project page. Some assertions made in the white paper are not defensible, and some are not technically sound. This should not be used as support for the existing draft of COM-003.

Group
PNGC Small Entity Comment Group
Modified PNGC Small Entity Group Comments: The PNGC comment group believes there should be a distinction in the "Applicability" section of the standard between "Scheduling Distribution Provider" and "Non-scheduling Distribution Provider". PNGC members are small rural cooperatives that are "Full service BPA customers." This means that BPA is our power supplier and scheduling agent and therefore handles all reliability directives, scheduling, tagging, dispatching of resources and curtailments of load from breakers on BPA's system for PNGC members. According to a letter from the WECC Reliability Coordinator (VRCC and LRCC) none of PNGC's members will ever receive a "Reliability Directive". Such a Directive would be sent to either a Balancing Authority (BA), or a Transmission Operator (TOP). We estimate there are over 100 entities that are BPA Full Service customers that are in a similar position and making this standard applicable to them does nothing to enhance reliability. A simple declarative statement in the Applicability section of the standard could focus the intent of the SDT on those entities that need it while lessening the compliance risk and clerical burden for other entities that the standard should not apply to. We suggest: 4. Applicability: 4.1. Functional Entities 4.1.1 Reliability Coordinator 4.1.2 Transmission Operator 4.1.3 Balancing Authority 4.1.4 Generator Operator 4.1.5 Distribution Provider: With Real-time Operations and Scheduling desk The PNGC comment group believes the above change will lessen the compliance burden on small, non-scheduling entities while still meeting the SDT's intent with regard to Operating Personnel Communications. We also note that FERC and NERC, on multiple occasions and in multiple filings, have indicated their openness to lessening unnecessary compliance requirements for small entities.

Yes
Yes
No
This is too similar to but different than what is required for a directive. Since 99.9% or more communications will not be directives, we will be conditioning operators to use this for directives also. If I reissue an Operating communication because the other party does not respond soon enough for me for whatever reason, the other party has violated R3 of this standard. R3 in general would not apply to a DP except for loads connected at transmission voltages.
No
Use of "accurate" accurate alpha-numeric clarifiers is subjective. What are they? Who decides what is "accurate"? An auditor? The NATO phonetic alphabet is really still being mandated. What if I use the NATO version and another entity uses a different one. Can we talk to each other? We will now also have to specify what phonetic alphabet we are using before any communication.
No
See the Mapping Document for Project 2007-03 Real-time Operations, TOP-002 R18: "This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. This is an administrative item, as seen in the measure, which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the difficulty in assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers."
We agree that accurate communication is necessary and we must strive to eliminate mistakes due to miscommunications. In the White Paper, other industries are cited that use three-part communication. Which of these industries also imposes sanctions and penalties on a company if an operator says "for" instead of "fow-er"? In order to verify compliance with this standard, there will be entities that will need to listen to thousands of hours of voice recordings (8760 hours in a year, and multiple operators). Listening to 10% of the voice recordings will be a full time job for one or more persons. What is the reliability benefit of this cost? Unless it is tempered with some reasonableness, this standard as written will be detrimental to reliability because it will slow down communications considerably with innumerable repeats because of fear of violating the standard.

No
The SRC agrees with the elimination of the three terms but not with the addition of "Operating Communication". The SRC does not believe that the proposed term (Operating Communication) is sufficiently different from the originally proposed term (Interoperability Communication) to warrant adoption. The SDT's proposal continues to expand the scope of the SAR from the concept of tightening the protocols associated with Emergencies or Adverse Reliability Impact to now applying to all communications. The text box in the draft standard indicates that Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. We see little difference between the two terms despite the SDT's assessment that Reliability Directives is a type (or a subset) of Operating Communication. If the SDT intent is to use the proposed new term to require 3-part communication (as suggested in R2 and R3), then that intent can be accomplished by using the term Reliability Directives as it covers not only emergency state but also instructions needed to address Adverse Reliability Impacts. Please also see our comments under Q6 regarding the use of the proposed term to support the requirements for 3-part communication. The SRC would note that both the Blackout Report and the FERC directive deal with tightening protocols for Emergencies, whereas the proposed SDT requirements completely fail to address emergencies and focuses solely on developing non-emergency protocols. SRC Note: there is no mention in the Blackout Report of "operational communications breakdowns re: changing states of equipment; most of the documentation points to: (1) emergencies/alerts; and (2) notification OUTSIDE of the entity experiencing the problem. The SRC requests that in the next posting the SDT provide real examples (without naming the registered entities) where reliability was jeopardized by the failure of 3-part communications under routine operational situations. Effectiveness of Communications "Under normal conditions, parties with reliability responsibility need to communicate important and prioritized information to each other in a timely way, TO HELP PRESERVE THE INTEGRITY OF THE GRID. THIS IS ESPECIALLY IMPORTANT IN

EMERGENCIES. DURING EMERGENCIES, OPERATORS SHOULD BE RELIEVED OF DUTIES UNRELATED TO PRESERVING THE GRID. A COMMON FACTOR IN SEVERAL OF THE EVENTS DESCRIBED ABOVE WAS THAT INFORMATION ABOUT OUTAGES OCCURRING IN ONE SYSTEM WAS NOT PROVIDED TO NEIGHBORING SYSTEMS." (2003 Blackout Report, page 108) 26. "Tighten communications protocols, ESPECIALLY FOR COMMUNICATIONS DURING ALERTS AND EMERGENCIES. UPGRADE COMMUNICATION SYSTEM HARDWARE WHERE APPROPRIATE. NERC should work with reliability coordinators and control area operators to improve the EFFECTIVENESS OF INTERNAL AND EXTERNAL COMMUNICATIONS DURING ALERTS, EMERGENCIES, OR OTHER CRITICAL SITUATIONS, AND ENSURE THAT ALL KEY PARTIES, INCLUDING STATE AND LOCAL OFFICIALS, RECEIVE TIMELY AND ACCURATE INFORMATION." (2003 Blackout Report, page 108) SRC note – Nowhere in the above quoted Recommendation 26 is there a reference to person-to-person communications of required actions; rather it references communication of the state of the operating system itself. SRC Note: there is no mention in FERC Order 693 of "operational communications breakdowns re: changing states of equipment; the Order does state: 532. "While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System. We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions. This is important because the Bulk-Power System is so tightly interconnected that system impacts often cross several operating entities' areas." SRC note – The above section concerns "ineffective communications" not "incorrect communications". The key to the above is "communication uniformity" not 3 part communications. The SRC believes the both the FERC Order's directives and the Blackout Report Recommendation 26 are clear in their respective requests to address general protocols; and that neither request suggests a need for mandating a specific procedure let alone 3 part communications for all operational communications.

No

The question is structured as an "either" "or" question about one requirement and does not include a "neither" option relating to the other requirements. The SDT has replaced one procedure with another set of procedures. Neither is an appropriate requirement. The SRC believes that this and other detailed procedural requirements on personnel are not valid applications for NERC reliability standards. The SRC believes that standards must mandate outcomes and that standards such as this one on 3 part communication procedures are better left to the registered entities. If the Industry were to support the SDT's proposed requirement, the SRC would urge the SDT to turn away from the "zero defect" standard that it is proposing and to replace it with a requirement that allows for reasonable number of deviations. The proposed requirement will be prohibitively expensive to implement with little improvement in reliability (also see "whitepaper" included in response to Question 10). The requirement will require all communications channels to not just be recorded (which is done today) but will require each recording to be reviewed by a compliance person for self-reporting purposes. The proposed requirement would actually reduce reliability by taking the above required compliance personnel away from reliability related standards and placing them on these procedural requirements ; and (2) distracting operators from their core responsibility of reliability due to concerns with meeting compliance obligations. A more acceptable alternative approach would be to introduce communications protocols as a mandatory non-standard (e.g. as a requirement for certification) that would center on a corporate communications manual that encourages three-part communications; and that includes how monitoring would be audited internally. Such an alternative would change the requirement from monitoring personnel mistakes to a requirement for monitoring corporate culture. Moreover, the use of a non-standard alternative would encourage the creation of innovative Best Practices; as opposed to a mandatory fixed procedure which would limit innovation.

No

FERC has made it clear that it would be amenable to eliminating requirements that are not reliability problems. A requirement regarding language comes under that category. There are no reports indicating that language is causing reliability problems. The SRC does not believe this issue rises to the level of a mandatory standard. The SRC would ask if the SDT has any evidence that language is a problem causing reliability impacts. In the absence of such evidence that it is a reliability problem, the SDT should eliminate this requirement.

No

This requirement is outside the scope of the approved SAR which proposes responding to the Blackout Recommendation to tighten communications protocols especially during emergencies. This proposed requirement is both procedural and does not address tightening communications of situational awareness. The SRC would suggest that as an alternative a standard could require the Functional Entities to have a communications protocol that could indeed include this suggestion, but it should not be a standard on personnel. By adopting an alternative category (i.e. not making this a standard) a Reliability Entity could adopt a progressive best practice approach without concern for violating the strictest features of the "proposed" best practice.

No

The SRC agrees that if there is a requirement for 3 part communications as proposed, then the proposed exception is needed to avoid double jeopardy, and the differentiation between issuer and receiver is needed. The SRC however does not agree with the need for the requirement itself. By introducing the proposed exception (i.e. of Reliability Directives used during emergencies) the SDT has invalidated the very reason that its SAR was proposed (i.e. to improve protocols DURING emergencies). The SRC disagrees with using the term Operating Communications because the term is not significantly different from the term Reliability Directives (see our comments under Q1). Using the term Reliability Directives to support the requirements for 3-part communication can avoid (a) any confusion with the requirement in COM-002-3, (b) potential double jeopardy of violating both COM-002 and COM-003, and (c) the need to exercise 3-part communication for routine operating instructions. If the SDT's intent is to require 3-part communication for any and all operating instructions (as the proposed term suggests), then this intent will result in unnecessary 3-part communication burdens for simple actions such as requesting the removal of a line, or switching, or raising generation, or even to "maintain" its current state. We suggest the SDT remove the term Operating Communications. With respect to Requirements R2 and R3, we question the need for having these requirements if Reliability Directives already cover non-emergency conditions (instructions/actions that are needed to address potential Adverse Reliability Impact). The requirement to exercise 3-part communication to handle Reliability Directives is thus duly addressed in COM-002-3. Other than emergency conditions and potential Adverse Reliability Impact conditions, we do not see, nor has the SDT proven a need to exercise 3-part communication for routine operating instructions.

No

This requirement is a procedural issue and is outside the scope of the approved SAR which proposes responding to the Blackout Recommendation to tighten communications protocols especially during emergencies. This proposed requirement is both procedural and does not address tightening communications of situational awareness. The SRC would suggest that the standard should require the Functional Entities to have a communications protocol that could indeed include this suggestion, but it should not be a standard on personnel.

No

This requirement is a procedural issue and is outside the scope of the approved SAR which proposes responding to the Blackout Recommendation to tighten communications protocols especially during emergencies. This proposed requirement is both procedural and does not address tightening communications of situational awareness.

The SDT's proposals do not conform to the Standards Process because those proposals do not reflect the public comments that were submitted. The Process requires the SDT to use the Industry's comments to drive the requirements and as such the requirements should not be mandating three part communications procedures for all "changes in status" much less the maintaining of such status. Such a request was not made by any of the commenters let alone a majority of the commenters. It would be more appropriate if the SDT asked who favored the approach being used, as opposed to asking if an "adjustment" to the requirement were acceptable. Many of the adjustments are better than if they were not there, but that ignores the fact that the requirement itself is not supported by the majority of commenters. The SDT's proposals expand the scope of the SAR by totally ignoring communications protocols used during emergencies and simply focusing on procedures imposed on personnel during normal situations. This standard over-reaches into routine operations by requiring 3-part communication for all instructions that change or maintain the state, status, output, or input of

an Element or Facility of the Bulk Electric System. This type of instructions occurs every hour, if not minute. Requiring operating personnel to apply a 3-part communication procedure for these instructions is absolutely unnecessary and overburdening, and can in fact adversely affect reliability. We strongly suggest that any requirement for 3-part communication for routine operating instructions be removed. \*\*\*\* FERC Order 693 510. "The Commission proposed... (4) requires tightened communications protocols, especially for communications during alerts and emergencies. " SRC Note – The above language while allowing for a requirement to go beyond emergencies, it states that the primary intent is "during alerts and emergencies". The SDT has no requirement for "alerts and emergencies" and focuses solely on normal operations. 532. While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System. We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions. This is important because the Bulk-Power System is so tightly interconnected that system impacts often cross several operating entities' areas. 230 EOP-001-0, Requirement R4 provides, in relevant part, that: "[e]ach Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plan shall include [c]ommunication protocols to be used during emergencies." SRC Note – the communications ambiguities noted above do not refer to issues with interpersonal communications but rather refer to situational ambiguities. 540. "While the Commission identified concerns regarding COM-002-2, the proposed Reliability Standard serves an important purpose by requiring users, owners and operators to implement the necessary communications and coordination among ENTITIES. SRC Note – the above does not say "among OPERATING PERSONNEL" it says "among ENTITIES". 540. (continued) ALTERNATIVELY, with respect to this final issue, the ERO may develop a new Reliability Standard that responds to Blackout Report Recommendation No. 26 in the manner described above. " SRC note – The above is a key directive. It states tightened communications protocols [it does not say three part communications for normal actions]' Also note that the Blackout report recommendation is "an alternative" solution and not necessarily a part of the FERC proposed solution. The SDT is also asked to identify the role of the posted White Paper. Is the White paper to be retained as part of the support documentation? If so, then the paper must be vetted by the Industry. The SDT did not afford the opportunity to respond to the paper. There was no indication if the paper was a unanimous SDT position or if there were any minority opinions. The SRC would offer the following "whitepaper" to help in deciding whether or not a requirement for 3 part communications for all operational communications rises to the level of requiring a mandatory standard. The "whitepaper" frames the communications issues generically providing an alternative to a zero defects standard. \*\*\*\*\* The strides NERC is making in the areas of Events Analysis and Human Factors will likely lead to useful practices and value-added standards. A fact-based approach to standards will lead to improved reliability. This paper attempts to quantify the problem that COM-003 is trying to address. While human error is often the first theory to explain major accidents, the follow-on investigation typically finds many factors beyond the front-line operator's control. There is an axiom in the field of quality control that attributes 80% of manufacturing defects are controllable by management rather than the cause of the front-line workers . Many people make errors that contribute to outages. Manufacturers have equipment defects, planners make incorrect design decisions, technicians draw maps incorrectly, managers cut budgets (plant maintenance, vegetation management), etc. A study of errors at nuclear power plants sheds light on the causes behind the scenes. Although 92% of all root causes were man-made, only a small number of these were initiated by front-line operators. Most originated in either maintenance-related activities or in bad decisions within the organization. In another study, a review of summaries of three major industrial events (Three Mile Island, Bhopal, and Chernobyl) identified operators as committing less than 10% of the missteps that led to the disasters. Table 1 Contributors to Major Accidents To be conservative, this paper assumes that 30% of all major human errors that impact the BPS are attributed to front-line workers (dispatchers, field operators, technicians and maintenance personnel). With regard to which front-line workers commit errors, a study of electrical system incidents at nuclear plants were generally evenly distributed between operators, maintenance personnel and technicians. As to communications problems causing trouble, an EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures. This was nearly identical to

another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators' errors were due to communication problems. Figure 1 EPRI Study Results on Operating Errors Bringing the pieces of this discussion together, the following assumptions are used to estimate the percent of human errors on the BPS caused by operator communication breakdowns: • 30% of human failures impacting the BPS are due to front line workers. • Front line errors were generally evenly split into 3 groups o Dispatchers o Field Personnel o Maintenance and Relaying Technicians • 18% of dispatcher errors are due to communication problems. The net result is that using estimates of existing research shows that dispatcher communications represent roughly 2% of the human failure on the BPS. Figure 2 Summary Human Failure Estimate While it has been stated that communication problems are found during the review of all system events, this is similar to saying that gravity is involved in all trips and falls. The statements are true, but the solutions to the problems are multidimensional. During a system event, there are hundreds, if not thousands of communications among different operators, often on situations never seen by the participants. Many of the communications are troubleshooting and information sharing that requires give and take and must be done quickly. If every communication during a disturbance needed to be 3-way, system restoration times for those disturbances would increase. NERC has built a solid foundation to make informed decisions in the future. The Events Analysis process, GADS and TADS should yield data on the impacts and contributors to BPS failures. NERC's Human Factors efforts can be used to develop good practices for all front line personnel. NERC should build on the research similar to that outlined in this paper via industry-wide surveys of operators to collect additional data, lessons-learned and tips for improvement. \*\*\*\*\* A quick estimate of the workload associated with COM-003, for the number of registered entities under the standard's applicability list. If we assume 1 call each 10 minutes for a BA, TOP and RC and ¼ this amount for GOP and DP, you get the totals below. Each of these are an auditable and sanctionable event. The review and self report on all of these is incompatible with the reliability impacts realized? BA TOP RC GOP DP Total 132 181 22 795 551 # of Entities 19008 26064 3168 28620 19836 96,696 Calls per Day 35,294,040 Calls per year \*\*\*\*\* Lastly, the SRC requests that in the next posting that the SDT include the question: Does the Industry: • Support continued development of a standard on personnel discussions during non-emergency conditions? • Support withdrawal of the standard? • Support the creation of an alternative non-standard (e.g. certification) that addresses the corporate protocols on communications?

City Water Light and Power

No

Definition is overly broad and should at least be tailored to indicate the operating time frame is the relevant concern.

Yes

No

This requirement should certainly not be a part of this standard, but should be eliminated entirely. It specifies a process, not a result - the requirement should be based on resultant functionality, not the process by which the entity achieves it.

Yes

No

Entities who have an agreed upon protocol which includes the time zone to be used for system operations should not be required to repeat the time zone for every communication. For instance, if Entity A and Entity B are in different time zones but both have an operating policy that states all communication between the two is in Eastern Standard Time and all operating personnel are trained on this policy, this should be sufficient. This achieves the same functional goal. The requirement to restate the time zone in this case only serves to set up a situation where a simple single-instance omission would have no effect on reliability but still be noncompliant.

No

Three part communications should not be required for routine operating communications. See the

definition of Reliability Directive in COM-002, which addresses reliability issues.
No
Again, this requirement attempts to dictate process as opposed to being a standard. The standard should only dictate the result, not how it is achieved.
No
This is already addressed in TOP-002 R18. Even if moved, the requirement should be focused on agreed upon identifiers and the process for coordination should be left to the entities.
No
These requirements should be eliminated entirely
CWLP generally echoes the SERC Operating Committee comments. Additional comments have been provided to suggest better functionality if the standard moves forward in its current form.

Manitoba Hydro
No
Manitoba Hydro disagrees with the term "Operating Communication" as we do not feel there should be a distinction between Reliability Directive and "Operating Communications". We suggest that the term "Operating Communication" be replaced with the term Reliability Directive as any instruction to change the status or function of the BES must be clear and concise and confirmed with three way communication to ensure system reliability and personnel safety.
Yes
Yes
Yes
No
Manitoba Hydro agrees with R1.1.2 but disagrees with R1.1.3. R1.1.3 is unnecessary and should be modified to "1.1.3 - When communication is between entities in different time zones, clarify the difference in time to ensure mutual understanding". Making R1.1.3 more generic gives operators the opportunity to determine the best method for them to ensure mutual understanding and clarify the time difference.
Yes
Manitoba Hydro agrees with splitting the single requirement into (R2) issuer and (R3) receiver, but as stated in our response to Question 1, we do not agree with the term "Operating Communications".
No
Manitoba Hydro agrees with the use 'accurate alpha-numeric identifiers' and feels that they should also be required when referring to a Transmission interface Element or a Transmission interface Facility in R1.1.4
Yes
See question 7 comments
Yes
Manitoba Hydro is voting negative on COM-003-1 based on our comments in the previous questions in addition to the following: (M1/M2/M3)– it is unclear what specifically is meant by 'on site observations' or how 'on site observations' can be an effective measure of compliance with the standard's requirements.

This standard (COM-003-1) should be combined with COM-002-3 and issued as one standard to require ONE 3-part communications protocol for both Reliability Directives and non-Reliability Directives. Both require 3-part communications; however, COM-003-1 sets ADDITIONAL communications protocols and introduces a new definition (Operating Communication) that is not contained in COM-002-3. In addition, the text box on page 2 appears to redefine "Reliability Directive" inappropriately. While the sentence confusion is the text box may be unintended, its needs to be clarified.

Hydro One Networks Inc.
No
The proposed Operating Communication term is not sufficiently different from the originally proposed term (Interoperability Communication). The proposal continues to expand the scope of the SAR from the concept of tightening the protocols associated with Emergencies to now applying to all communications. The text box in the draft standard indicates that Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. There is little difference between the two terms despite the SDT's assessment that Reliability Directive is a type (or a subset) of Operating Communication. If the intent is to use the proposed new term to require 3-part communication (as suggested in R2 and R3), then that intent can be accomplished by using the term Reliability Directive

as it covers not only the emergency state but also instructions needed to address Adverse Reliability Impacts. Both the Blackout Report and the FERC directive deal with tightening protocols for Emergencies. The proposed requirements completely fail to address emergencies and focus solely on developing non-emergency protocols.

Yes

No

In the past there was a lot of confusion regarding the use and applicability of three-part communication. We believe that all communication protocol related requirements and information should be contained within one standard. This should include Alert Levels and their definitions.

No

We believe that this requirement should be eliminated. As a general rule, standards' requirements that do not address reliability problems should be eliminated. No available information indicates that language is causing reliability problems and there. In addition to this, there are some jurisdictions where this requirement might cause decrease in reliability (i.e. Quebec)

Yes

No

The term Operating Communications is not significantly different from the term Reliability Directives. Using the term Reliability Directives to support the requirements for 3-part communication can avoid (a) any confusion with the requirement in COM-002-3, (b) potential double jeopardy of violating both COM-002 and COM-003, and (c) the need to exercise 3-part communication for routine operating instructions. Realistically, the definition of Operating Communications covers all communications. We believe that only Reliability Directives should require 3-part communications, and should be enforceable if a miscommunication results in an error on the BES.

No

This requirement adds added complexity to communications, not improvement. There are equipment designations that are commonly used and understood, and to force the use of clarifiers will disrupt operating communications.

Yes

No

The white paper discusses many non-utility industries use of the three-part communication. However, they are not out of compliance if they fail to use three-point communications. Only the Reliability Directives should require three-part communications (and dictate compliance). This should be enforceable only if the miscommunication results in an error on the BES. We support the use of three-part communications. There is concern over the potential for being out of compliance when there is no BES impact. Failure to meet Requirement R2, part 2.2 bullets 1 or 3 is either a Moderate or High. Failure to meet bullet 2 is a Severe VSL. It is not clear why this differentiation was adopted. The White Paper reflects on Human Performance, and how miscommunications can cause a BES error resulting in an outage, or possible cascading effects. Then the Standard (and the associated out of compliance) should apply when, and to the extent that communications lapse (e.g., when there is an impactful violation of bullets 1, 2 and/or 3) results in an impactful error on the BES. Otherwise, an out of compliance is inappropriate. Non-impactful violations should be rated "Lower VSL."

- Hydro One strongly believes that three-part communication should be limited to Reliability Directives only. It application to virtually all communications will prove to be an additional burden for operators, burden that is not justified and would not increase the reliability of the BES. - While we don't agree with inclusion of the three part communication for Operating Communication (as stated above), we believe that the communication protocol related requirements from both existing COM standards should be merged into COM-003 to improve clarity. In the current draft, COM-003 does this only partially by including COM-001 R4. In addition to already mentioned Alert Levels and their definitions (already mentioned in our reply to Q3), we believe that COM-002 R2 should be moved into this standard as well for clarity purposes.

No
No. The current language addressing alpha-numeric clarifiers is a significant improvement over the formulation addressing the same issue in the previous draft. However, this requirement remains overly-prescriptive, especially with respect to numeric clarifiers. Even with the NATO clarifiers, not all numbers have clarifiers. As a result, it not clear when a numeric clarifier would be required and when it is acceptable not to use such a clarifier. The requirement to use alpha-numeric clarifiers should be removed from the proposed standard entirely. If the requirement is not removed in its entirety, the requirement should be modified to exclude numeric clarification.

SPP Standards Review Group
No
The definition is fine but it may not be necessary based on the comments provided to the remaining questions below. It's not so much what's contained in the definition, it's more about what the standard requires the industry to do with that definition. We believe eliminating the other three definitions was a positive move by the SDT.
Yes
Eliminating the requirement to have the procedure (documentation) was a move in the right direction. We are glad it was eliminated because that's one less piece of paper we have to keep track of.
Yes
We agree with the Alert Levels being removed from COM-003-1 and question the need to move them somewhere else. During its May, 2012 meeting, the Operating Reliability Subcommittee (ORS) approved a motion to '...terminate the pilot program using Alert Levels and to discontinue any efforts to include the guidelines in reliability standards projects.' This was based on the inability of the ORS to demonstrate any reliability improvements during the six years that the Alert Level pilot program had been in existence. That being the case, there is no need to create a SAR and transfer this to another SDT.
Yes
While we concur with the inclusion of the exemption, we question how the industry can ensure effective communications in a situation where the exemption comes into play.
No
Requiring time zone notifications at times other than those around the time of the transition from standard to daylight savings and back again is excessive. For a brief period of time around this

transition, ensuring the correct times are communicated would probably require including standard or daylight savings designations. Some consideration for this issue needs to be incorporated into the requirement. That said, trying to be overly prescriptive with the requirement creates an unnecessary burden on operating personnel without significantly improving BES reliability. A one-size fits all requirement may not be appropriate. Entities whose geographical area is located in multiple time zones probably have internal procedures detailing how they handle time differences within their area. Most often this entails selecting one time zone as the entity's reference. As written, the requirement overrides any internal procedures which may unnecessarily complicate internal communications. Allowances should be made for internal procedures which cover this situation. Requirement 1.1.3 requires that time and time zone, including standard or daylight savings time designations, must be communicated at all times. Yet Requirement 1.1.2 includes a provision that requires use to the 24-hour clock only when clock times are referenced. This needs to be included in Requirement 1.1.3 as shown below: When the communication is between entities in different time zones and refers to clock times, include the time and time zone and indicate whether the time is daylight saving time or standard time.

No

The format of the requirement is an improvement. However, we have concerns about the standard being overly prescriptive. All actions '...to change or maintain the state, status, output or input of an Element or Facility...' of the BES do not have a significant impact on the reliability of the BES. The draft standard mandates that they do. Applying 3-part communications to all Operating Communications places an overly burdensome task on the industry in monitoring and tracking compliance. Additionally, a zero-tolerance interpretation of this requirement places an unjustified risk on the industry without making an appreciable improvement in BES reliability.

Yes

We concur with the elimination of the NATO phonetic alphabet and thank the SDT for making this change. This is an excellent example of backing away from being overly prescriptive by requiring the NATO alphabet and allowing the industry to use any of several other options to ensure effective communications. We do have concerns with the use of 'correct' or 'accurate', depending on which document you refer to. What is correct? What is accurate? How does one measure compliance with these terms? We would propose to delete the word 'accurate' altogether. The requirement would then read: When participating in oral Operating Communications and using alpha-numeric identifiers, use alpha-numeric clarifiers.<sup>1</sup>

Yes

While the industry probably understands what is meant by 'Transmission interface Element or Facility', the terms are somewhat cumbersome. Additionally, for situations where there may be an agreement between owners designating multiple names for an Element or Facility, we propose adding an '(s)' to 'name'. For example, if one owner calls a line A-B and the other owner calls the line B-A and they agree to use both names interchangeably, then either would be correct. Requirement 1.1.4 would then read: When referring to an Element or Facility that is part of an interconnection between entities, use the name(s) specified by the owner(s) for that Element or Facility.

No

With the additional burden of monitoring and tracking compliance and the increased risk of the zero-tolerance VSLs without a subsequent improvement in reliability of the BES, the VRFs should be changed to Low. The VSLs should be reduced to Lower. We suggest modifying the second part of the existing Moderate VSL for Requirement 1 to include specific reference to Requirement 1 as is done in the first part of that VSL. The VSL would then read: The responsible entity did not correctly implement Requirement R1, Part 1.2. Likewise, we also suggest modifying the second part of the existing High VSL for Requirement 1 to include specific reference to Requirement 1. The VSL would then read: The responsible entity did not correctly implement one (1) of the four (4) parts of Requirement R1 when it was appropriate to use three of the four parts.

We believe the standard is too prescriptive as written. The purpose of the standard is to ensure effective communications. The standard has given us a very specific listing of items that must be done in a specific manner in order to accomplish this goal. What the industry needs is flexibility in how it achieves the goal of effective communications. The standard does not recognize that flexibility. The Measures for Requirements 1, 2 and 3 do not contain specific references to the requirements they are associated with. There is a parenthetical following the measure that does include that reference but

including the reference specifically in the measure is a stronger statement and eliminates any possibility for confusion. The section of M1 to be modified would then read: '...that the communication protocols specified by Requirement 1 were implemented...' The section of M2 to be modified would then read: '...that the communication protocol specified by Requirement 2 was implemented.' The section of M3 to be modified would then read: '...that the communication protocol specified by Requirement 3 was implemented.'

Robert Rhodes

Group

Avista

No

Yes

This standard as drafted is very prescriptive and will not ensure improved reliability. A better approach would be to require applicable entities to; develop and implement an internal communication plan that takes into consideration recommendations discussed in the proposed NERC OC System Operator Verbal Communications Guideline, implement internal controls and monitoring to ensure adherence to the communication plan, and implement an adequate communication training program.

Suggest the definition be clarified to scope to 'real-time' operating instructions to eliminate discussion of future outages.

Yes

Yes

Yes

No

Since Reliability Directives are a subset of Operating Communications, if this was done to lower the VRF for Operating Communications that are not Reliability Directives, this modification makes sense. However, having two stds/rqmts address 3-part communication (even if not in same words) is not as clear as it could be. One standard requiring 3-part comm for Real-time operating communications which includes Reliability Directives would be more straight-forward, with a higher VRF for Reliability Directives.

Yes

No

This requirement seems duplicative of TOP-002-2 R18.

Regarding R1.1.3: I request the SDT consider allowing for the Applicable Functional Entity to develop an Operating Procedure such that if all parties in the communication are in the same time zone that the time zone does NOT need to be used in the Operating Instruction. Regarding the VSL/VRF: I request the SDT consider adjusting the std or VSLs to allow for compliance with a 95% confidence. Such that 1 incomplete 3-part Operating Communication could be considered low or not a PV. If sampling of voice recordings provides a 95% confidence, this should be sufficient. E.g. If one sample of 30 voice recordings results in 1 incomplete 3 part and a second sample of 30 finds no issues, the audit result should be no PV. This is a standard sampling techniques. We thank the SDT for their efforts. PPL EU supports the value added by using 3-part communications and a phonetic alphabet as both are included in our current communications operating instructions. Even with the many Human Performance tools we use, our concern with the standard is being found non-compliant if one of hundreds/thousands of operating communications in a year is not perfect 3-part comm.

We do not agree that this definition should include "or maintain", and recommend that be struck. The scope should only include instructions that would require an action by the recipient.
Yes
Yes
Yes
No
Is there any evidence of an actual event where there was confusion in the time zone, which led or contributed to an event? We are not aware of any. If the drafting team has no basis for mandating the use of a time zone and daylight/standard time reference, then we suggest this requirement be struck because we do not believe it would increase reliability. In fact, we think it may have the opposite effect of reducing reliability. If the SDT decides to retain the sub-requirement, please clarify which entity's time zone should be used. As written, this sub-requirement may create confusion for field personnel if they are to repeat the order back in their own time zone. We are concerned this will actually increase the likelihood of human error, and therefore potentially reduce reliability. As a company that has field personnel in different time zones, company procedures dictate that CPT be used as that is the time zone the control center is in. Adding additional oral verification for time zones will promote human error.
Yes
No
1) "Accurate alpha-numeric identifier" needs to be clarified. Could each entity (or even each operator) create their own alpha-numeric identifiers? Further would it be a violation if an operator used "Charlie" in one conversation and "chalk" in another? Or, is it an expectation that the entity/operator adopts an existing list of alpha-numeric identifiers, which is published publicly? 2) We recommend that device names be excluded from the requirement to use alpha-numeric identifiers when both parties are working off of written instructions. We do not feel requiring this would improve reliability. Instead, it could actually slow down the recovery of the system. For example, we have devices in the field that may be labeled 12B34-W gang switches and it makes no sense to say, "Open and tag the one, two, B as in Bravo, three, four W as in Whiskey gang switch, when both parties have "12B34-W" written in the instructions they are both working from. Three-way communications are occurring and if there is any question as to the device name, it can be caught and clarified during that process.
Yes
No
The Moderate VSL for missing one part of the sub-requirements in R1.1.1 thru R1.1.4 is too harsh with a six month effective date. We suggest a phased in VSL or a twelve month effective date, as further explained under question 10.

(1) Requirement R1.1 refers to both written and oral Operating Communications. It was our understanding that COM-003-1 was to be focused solely on oral communications. If that was the SDT's intent, then we suggest striking the word "written" from this sub-requirement. (2) Six month Effective Date is not likely to be enough time to develop, implement, and test a new communication program. We need enough time to train the field personnel, plant control room operators and system operators to use alpha-numeric identifiers, 24-hr clock, time zone, etc. before the standard becomes effective. A twelve month implementation period would be more appropriate.

We recommend that the SDT eliminate the words "...or maintain..." in the definition. We believe that inclusion of these words would drastically reduce side conversations that continuously occur between different entities. These side conversations provide additional information and perspectives to real-time operators that ensure they understand the real-time status of the BES. In other words, due to fear of possible non-compliance consequences for failure to properly converse in a three-part protocol at all times, entities will drastically curtail side discussions and deprive all BES operators of this pertinent and useful real-time information.

Yes

No

We recommend the Alert Levels be used by the SDT to define a workable time period when three-part communications is mandatory.

Yes

Yes

No
From our perspective, use of such a split for all Operating Communications (not directives) would add to the confusion.
No
We recommend to the SDT that one industry-wide alpha-numeric clarifying system should be used. Multiple systems may add confusion by use of clarifying words that some Operators may not be familiar with. We agree with use of the NATO Spelling Alphabet.
No
We suggest the SDT to provide clarification and guidance on precisely what Elements and Facilities are included in these terms. Since the word "interface" is not capitalized or defined in the NERC Glossary or this Standard, it will be difficult for TO, TOP, GO, GOP and DP entities to precisely identify the equipment associated with these terms. We also recommend that the SDT consider use of the term "Interconnected Facilities" as defined by Project 2007-06 System Protection Coordination for use in the new Standard PRC-027-1. Multiple definitions in multiple Standards for the same BES Elements and Facilities create unnecessary risk and uncertainty for both Auditors and Functional Entities.
No
We believe that the VSLs in this draft Standard create the potential for a violation or self-report for almost every single individual conversation about the BES by real-time operators. In this regard, we are concerned that the Functional Entities will greatly decrease their oral communications to minimize the risk of a self-report or violation which ultimately would undermine necessary discussions between operating entities.
We believe that multiple communication standards (COM-002, COM-003) are not necessary and suggest that SDT work with the NERC Operating Committee members to appropriately address what requirements are necessary from operating/reliability perspective as well as any related FERC directives.

The prescriptive requirements currently in R2, and R3, tell how, not what, an entity is obligated to do. To address the fact that most Operating entities engage in "Operating Communications", one requirement (combining R2 and R3) is all that is needed, and ATC recommends that Requirement 2 be restated as follows: R2 Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider that issues, or receives an Operating Communication, excluding Reliability Directives, shall use Three-part Communications. Furthermore, ATC recommends that the SDT reconsider adding the "three-part communication" as a defined term properly vetted through the appropriate process, and added to the NERC Glossary of Terms. The definition as previously noted in Draft #1 is below. Three-part Communication — A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct by the party who initiated the communication.
Yes
No
Entities will face double jeopardy with existing Reliability Standard TOP-002-2b R18. Requirement 18 of TOP-002-2b is proposed to be removed from NERC Standards by the respective SDT because it adds no reliability benefit.
No
System Operators receive and issue many Operating Communications each day. The VSL for "one" Operating Communication is Moderate, which is considered too high. While improving communications is a laudable goal, the zero tolerance VSL is unacceptable and will lead to a preponderance of self-reports and compliance and administrative overhead. Also overlooked is the added stress that every time a System Operator speaks, they may be in violation.
When a situation necessitating alpha-numeric clarifiers in an Operational Communication arises, per the standard requirement, it becomes mandatory. There are many instances when marginally defined elements such as a carrier grounding switch, may need to be operated or changed state. If these devices can't be clearly defined as an element or facility, yet have alpha-numeric identifiers, the use of clarifiers should be discretionary. FERC Orders and recommendations point to "Tightening communications protocols, especially for communications during alerts and emergencies." The NERC standards addressing this issue are not approved yet. When they are approved by FERC, subsequently implemented, and allowed to mature, the concept of tighter protocols for normal operations may be developed.
Individual
Marie Knox
MISO
No
We do not agree with the proposed definition of Operating communication and agree with the elimination of the other three definitions. The SDT does not appear to respond positively to the

majority of industry comments submitted along with ballots. It also appears to be focused on imposing three part communications on the industry for routine communications despite the fact that neither the blackout report nor the SAR on which these standards are based emphasize that issue. The blue text box that mentions Reliability Directives seems to be a back door attempt to change COM-002 and should be clarified or eliminated. Splitting communications requirements across different standards creates unnecessary confusion.

No

The SDT did not eliminate a communications procedure requirement! It turned the former requirement into R1 and its sub-parts, forcing a single communication procedure on the industry. This goes far too deeply into the "HOW" of communication as opposed to the "WHAT".

No

We disagree – this concept more properly belongs in the NERC Rules of Procedure and should be designed to address Recommendation 26 of the NERC 2003 Blackout Report. This is an expectation of NERC and not of the industry. Also, see recent NERC Operating Reliability Subcommittee (ORS) discussions and recommendations regarding the elimination of the Transmission Alert Levels.

No

This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT".

No

This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT".

No

Three part communications should not be required for routine operating communications. See the definition of Reliability Directive in COM-002, which addresses reliability issues. We suggest that R2 and R3 should be eliminated, since neither one will increase reliability.

No

This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT".

No

This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT". Requirement 1.1.4 does not need to be in this standard as the requirement for unique line identifiers is stipulated in TOP-002-2 R18.

No

We suggest deletion of all three requirements.

We support the need to strive for good communications among users, owners and operators of the grid, but believe the standard as drafted is misdirected. Review of research done by EPRI and others shows that dispatcher communications cause on the order of 1-2% of human failure impacting the BPS. It is well less than 1% of all failures of the BPS. We also estimate there are millions of conversations annually that self-inspecting entities would need to review. Recommendation 26 of the Blackout Report, on which the SAR for this standard is based, was not focused on operator communications. Rather it suggested a mechanism by the Regions to keep regulators and government officials informed during emergencies. We would not be opposed to a requirement for entities to have a procedure for communication expectations of operators and that the entities have a process for periodic (no less than quarterly) sampling of operator communication for use in training and counseling. The requirement would need to be framed such that it does not become a "fill in the blank" standard, such that an investigator can ask for tapes of hundreds of conversations looking to find any kinks in communications. As drafted, this standard can actually impede reliability as there are at times better ways to communication when group action is needed and there are times when speed or "give and take" are needed. The standard also fails to acknowledge that SCADA forms part of the feedback process in communications. For example, ACE recovery and generation movement during a DCS event are better confirmation that the message was received and understood than just parroting back a phone call.

Individual

Eric Salsbury
Consumers Energy
No
As there is no definition of what alpha – numeric clarifiers must be used, this leaves too much room for interpretation for audit staff.
We believe this standard attempts to redefine “Reliability Directive” and should not do so. Specifics of communication for this standard should be centered on emergency operations and not a blanket protocol for almost all operations communications.
Individual
Karen Webb
City of Tallahassee
Yes
The City of Tallahassee Electric Utility (TAL) agrees with the addition of this proposed new definition; however, TAL is not clear on the scope of the phrase "input of an Element or Facility of the Bulk Electric System".
Yes
Yes
Yes
No
TAL is concerned with any unnecessary complication of communications. If more than one Time Zone is entailed in a communication, it is reasonable to require clarification of such. However, if both the sender and receiver observe the same prevailing time (e.g. Eastern Standard Time versus Eastern Daylight Time), it does not facilitate communication to require this clarification.
Yes
TAL agrees with this split into two requirements for the protection of each party in the event of non-compliance by the opposing party. TAL seeks clarification on the application of this requirement in an instance where a receiver never acknowledges the issuer.
Yes
Yes
TAL is concerned that the proposed standard focuses too heavily on the communications method without consideration of a successful result. While the administrative approach/focus of this proposed language appears to be crafted with the intent of standardizing communications and thereby improving communications, it does not appear to place sufficient value on results-based performance. Should an entity take proper action on a communication that is not delivered precisely in accordance with this language, consideration of such at the Enforcement level would be warranted.
Group
Florida Municipal Power Agency

implement the same three-part communication language contained in COM-002-3. Specifically, COM-003-1 R1, R2 and R3 would be replaced with the following language that mirrors COM-002-3: "R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as an Operating Communication, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as an Operating Communication to the recipient. R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Communication shall repeat, restate, rephrase or recapitulate the Reliability Directive. R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Communication shall either: • Confirm that the response from the recipient of the Operating Communication (in accordance with Requirement R2) was accurate, or • Reissue the Operating Communication to resolve any misunderstandings." Although NextEra prefers that the SDT use the above language, in the event the SDT chooses not to mirror COM-002-3, NextEra requests the SDT implement the proposed modifications to R1 and R2 as set forth in response to questions 5, 7 and 10.

No

Similar to the 24 clock, it appears that R1.2 does not fully consider how communications and naming conventions are used in the industry. Specifically, alpha-numeric identifiers are used when there is an uncommon naming convention. Examples of common naming conventions include AM/PM, breaker names such as (8W15), etc. As written, the requirement could be interpreted to require alpha-numeric identifiers for all alpha applications even though the industry has never had a need to use such identifiers. This will likely lead to unnecessary confusion, and, therefore, will likely not promote reliability. Moreover, the R1.2 and COM-003-1 technical paper suggest there is only one set of alpha-numeric clarifiers that are "accurate." NextEra does not agree with this perspective, and believes it is counterproductive to narrowing a System Operator's discretion on which alpha-numeric clarifiers he or she may use. To address these matters, NextEra recommends that R1.2 be revised to read: "When an oral Operating Communication does not use a common naming convention, alpha-numeric identifiers shall be used."

No

See comments in response to question 7.

NextEra has the following additional recommended changes to increase the clarity of COM-003-1: 1. A new provision on written Operating Communications that requires that the sender to receive a notification that the recipient has received and read the communication. As currently written, there is no read receipt requirement for written Operating Communications. This appears to create a possible reliability gap, given that the sender will not know that its instructions were received and read, which leaves the system in a state of limbo as to what actions will or will not be taken. Accordingly, NextEra recommends that a requirement be added that reads as follows: "When a Reliability Coordinator, Transmission Operator and Balancing Authority sends a written Operating Communication it shall include a "read receipt" requirement or similar mechanism to ensure the sender has received and read the Operating Communication. If a "read receipt" is not received by the sender, the sender shall call the intended recipient or rescind the Operating Communication." 2. R2.1 is confusing because it attempts to mix what occurs when a response is received and when no response is received during a oral communication. To ensure no confusion occurs, as well as providing for additional practical discretion when a response is not received, NextEra recommends that R2.1 be separated into two distinct sections and be rewritten to read as follows: R2.2. After the response is received, do the following: • Confirm the receiver's response is correct (not necessarily verbatim). • Reissue the Operating Communication if the repeated information is incorrect or if the receiver does not issue a response. • Reissue the Operating Communication, if requested by the receiver. R2.3 If no response is received, do one of the following: • Ask the receiver if the Operating Communication was received. If receiver confirms receipt of the Operating Communication, then proceed through R2.2. If the receiver, however, does not confirm receipt or no response is received, the sender of the Operating Communication shall either reissue or rescind the Operating Communication. 3. Unlike language on Reliability Directives in IRO-001-3 – "unless compliance with the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory or statutory requirements" – there is no similar qualifier for Operating Communications. To provide the recipient of an Operating Communication the same rights as a Reliability Directive, NextEra requests that a new section be added: "The recipient of an Operating Communication is required to implement the

instruction, unless compliance with the instruction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory or statutory requirements. In the event the recipient is unable to carry out the instruction, it shall communicate this situation to the sender of the Operating Communication." This last recommended addition should be added in both cases: (a) if NextEra's response to question 6 is adopted, or (b) if NextEra's response to question 6 is not adopted. 4. To provide clarity to COM-003-1, NextEra recommends that the purpose stated in the white paper be transferred to the purpose statement of COM-003-1. The white paper states that "[t]he purpose of the proposed standard is to: 'Require that real time System Operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.'" NextEra recommends that this purpose statement replace the draft purpose statement in COM-003-1, so COM-003-1 is not misinterpreted to require three way communications outside of real-time system operations.

We agree, in view of the additional comments we provide below.

Yes

Yes

Yes

Yes

Yes

Yes

Consider removing the word "accurate" from part 1.2. We do not believe it adds anything to the

requirement, and it may cause confusion.
No
The name specified by the operators of the equipment should be used, rather than the name given by the owner, and it should be jointly agreed to as the identifier for the equipment. For example, an owner name could be the "Lyndon Baines Johnson East Johnson City Substation Line 3" but the Transmission Operator refers to it as "East Johnson City 3" or "EJC3" or "Johnson 3". The Planning Authority/Coordinator may dictate a naming convention to be used in Operations systems that are used by the System Operators (i.e. RTCA, outage scheduler, etc.). The name to be used should be clearly identifiable, concise, and easily understood by all parties involved in the Operating Communication. We suggest re-wording R1.1.4 to "When referring to a Transmission interface Element or a Transmission interface Facility, each responsible entity shall use a pre-determined, uniform identifier for each Element or Facility."
1. The use of exploder or hotline calls, where a single oral communication is used to alert a multitude of entities simultaneously to issues and directions affecting the BES, should be addressed by this Standard. The use of these types of calls is economic, efficient, and should be recognized for the purpose of providing Operating Communications, including Reliability Directives. Not addressing this issue will have a serious impact on System Operators during times, normal or emergency, when clear, concise, and effective communications are needed. The 2003 Blackout Recommendation #26 includes the following text: "Standing hotline networks, or a functional equivalent, should be established for use in alerts and emergencies (as opposed to one-on-one phone calls) to ensure that all key parties are able to give and receive timely and accurate information." This proposed Standard should address the issue of what communication protocols should be applied to exploder or hotline calls. 2. There is a disconnect between COM-003-1 and COM-002-3 that will create confusion within the industry regarding communications. COM-002-3 has limited applicability, restricted to use of Reliability Directives ONLY in an Emergency or Adverse Reliability Impact. COM-003-1 is limited to oral two party communications, but it applies outside of Emergency situations. With proposed IRO-001-3 contained in Project 2006-06, a Reliability Coordinator or other entity may not be certain of whether to give a directive, a Reliability Directive, or an Operating Communication, and a recipient may dispute whether the correct communication type was used. What is the intended compliance impact of using the wrong type of communication, for both the initiating entity and the receiving entity? 3. COM-003-1 and COM-002-3 will cause substantial confusion as drafted because they both require three-part communication, but they use different language to describe it. That suggests that the communication protocols that are required must be different, and as an entity moves from non-Emergency into Emergency operations, its communication protocol will be expected to change. We strongly suggest that a single three-part-communication protocol be set forth in one place only, and that any differences between Emergency and non-Emergency communication requirements be clearly identified.
Group
FirstEnergy
No
The requirement for line identifiers should not be included and is unnecessary. This type of requirement was also removed from standard TOP-002 in recently board approved project 2007-03. The drafting team position for the removal was the following: "This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. This is an administrative item, as seen in the measure, which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the difficulty in

assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers." Therefore we suggest the removal of R1.1.4 for the same reason.

Although we believe the team made significant improvements to the standard, and would support a 3-part communication standard, we believe the introduction of both COM-002-2 which utilizes Reliability Directives and COM-003-1 which utilizes Operating Communications cause confusion for system operators and may in fact be detrimental to reliability. We do not support two standards on three-part communication. We suggest, as we have in the past, that the subject of three-part communication be addressed in a single standard, and that the requirements be developed for simplicity. The industry is, and has been, using three-part communication for decades and although we agree it should be more consistently practiced and standardized, the required communications protocols should be simple while meeting the goal of BES reliability. Introducing complicated requirements and standards that have different definitions such as Reliability Directive and Operating Communication may cause the operator to hesitate when issuing directives in real-time and every second counts when a potential system emergency must be mitigated. Therefore, FE does not support the creation of both COM-003-1 nor COM-002-2 (see project 2006-06 vote and comments) and ask NERC to reevaluate the need to have two separate standards for three-part communication.

Kenneth A Goldsmith

Alliant Energy

Yes

Yes

Yes

No

We believe that adding the mandate to use a 24 hr clock and list the time zone and Daylisght Savings Time or not is going too far. We agree that it could be considered a best practice, but to require it and have a violation every time it is not used will result in multiple frivolous violations and clog the system with violations that have no impact on the reliability of the BES. With a zero-defect philosophy, which currently exists in the regulatory model, this is unworkable.

No

We do not believe there is a need for COM-003 at all and recommend it be deleted. COM-002 covers Reliability Directives very well. For three-part communications in a non-Reliability Directive situation we beleive it should be considered an industry best-practice. By requiring three-part communications as dictated in this standard, there will be requests for interpretations, CAN's produced for the CEA, and numerous violations written for what the industry considers a non-problem. In our opinion this standards goes against the concept of risk-based standard making and reinforces a zero-defect operation, which opposite of how the industry works.

GENERAL COMMENT: While SERC does not agree that the mandatory procedure for three part communications will improve reliability of the BES, SERC offers the following comments: We do not agree with the proposed definition of Operating communication and agree with the elimination of the other three definitions. The SDT has not listened to the industry comments given in the previous commenting periods. It also appears to be focused on imposing three part communications on the industry for routine communications despite the fact that neither the blackout report nor the SAR on which these standards are based emphasize that issue. The blue text box that mentions Reliability Directives seems to be a back door attempt to change COM-002 and should be clarified or eliminated. Splitting communications requirements across different standards creates unnecessary confusion.
No
The SDT did not eliminate a communications procedure requirement! It turned the former requirement into R1 and its sub-parts, forcing a single communication procedure on the industry. This goes far too deeply into the "HOW" of communication as opposed to the "WHAT".
No
We disagree – this concept more properly belongs in the NERC Rules of Procedure and should be designed to address Recommendation 26 of the NERC 2003 Blackout Report. This is an expectation of NERC and not of the industry. Also, see recent NERC Operating Reliability Subcommittee (ORS) discussions and recommendations regarding the elimination of the Transmission Alert Levels.
No
This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT".
No
This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT".
No
Three part communications should not be required for routine operating communications. See the definition of Reliability Directive in COM-002, which addresses reliability issues. We suggest that R2 and R3 should be eliminated, since neither one will increase reliability.
No

This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT".

No

This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT". Requirement 1.1.4 does not need to be in this standard as the requirement for unique line identifiers is stipulated in TOP-002-2 R18.

No

We suggest deletion of all three requirements.

Where is the demonstrated need for such a Standard? Has communications, especially during periods of normal operations, been shown to be the root cause of many, if any, events? While there is easy agreement for the need of clear and concise communication between entities, we must avoid creating a system that is unmanageable and quite possibly results in less reliability. FERC Order 693 directs the ERO to "and (3) requires tightened communications protocols, especially for communications during alerts and emergencies.", in paragraph 532. The proposed standard goes too far, especially for communications outside of alerts and emergencies. NERC standards are not procedures and this standard attempts to impose a single procedure on the industry. SERC suggests another approach to COM-003. Rather than to specify the solutions to achieving effective communication, COM-003 should instead focus on developing and training on an approach that is designed appropriately for each RE. For instance, another approach to COM-003 might be along the lines of: Requirement 1 could be written in a manner to require the appropriate registered entities to develop a communication protocol that is appropriate for each RE. This communications protocol should address how the RE is handling the following: Time Zone Designations – for both internal and external communications language comm Alpha-numeric identifiers Three – part communications – when is it required, etc. Use of defined terminology Other items deemed important for the communications protocol to address – again, this would not define HOW these items are addressed This approach would require the RE to address how it is addressing these issues, without prescribing solutions. For instance, a RE could include in its protocol a section dealing with time zone designation. In this section the RE could explain that it, and its neighbors, all are in and use the same time zone. As a result, the RE has determined that requiring the identification of time zone reference in communication is not necessary Procedures should address the training of operators on the communication protocol Procedures should address the internal controls that the RE uses to review that its protocol is being followed. The compliance approach would be to: Assess whether the RE has developed a written protocol and whether the protocol addresses each item – this does not mean there is an assessment of HOW each item is assessed; assess whether the RE has trained its operators on the communications protocol and assess whether the RE is following its internal controls. Any data retention requirements should be consistent with the COM-002 reliability standard. What is the role of the Operating Communications Protocols White paper? Is it a position of the STD? If not, was there a minority opinion? Will it be part of the standard? Does the industry agree that we need a standard on three part communications for normal operations? Yes or No? Has a lack of a standard on three part communications for normal operations created any reliability issues? If so, what are they? "The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers."

While ee absolutely support the promotion and use of 3-part oral communication protocol, the failure of individual persons to use "proper" and "correct" oral operational communications should NOT constitute a Standard violation. It is reasonable to require the responsible entities to have written procedures requiring such use; to have evidence of applicable personnel training on such; and to have

a program for internal monitoring and enforcement of such. As written, a subjective review of many oral operational communications will arguably be identified by Compliance Auditors as medium, high or even severe levels.

Yes

Yes

No

Splitting the requirement is okay but the exclusion of reliability directives and the structure of R2 and R3 to take one of the following actions based on the other party's action is ambiguous.

Yes

Yes

No

Western Electricity Coordinating Council

How are facilities that might affect the operation of the BES treated? Would the changing of an LTC or the low voltage taps on a 230/92 kV transformer be subject to this standard?

Yes

Yes

Yes

Any thoughts given to including a provision for agreement between specific entities to use a language other than English for areas that another language may be common, but not mandated by law or regulation?

Yes

Is the exclusion of Reliability Directives because they are covered under COM-002? Since all COM-002 covers is Reliability Directives, why not include it in this standard? Operators should use the same protocol for all Operating Communications. We agree with the split for the issuer and the receiver.

From an enforcement perspective, this could be problematic. As drafted this will allow virtually any alpha numeric clarifier. Who is to determine if the identifies is "correct?" This will put the auditor in the position of determining whether or not a clarifier was correct or accurate. For auditing purposes there should be clear direction on what is acceptable.

No

We question the need for this part of the requirement based on the fact that it appears to be redundant with TOP-002-2b, R18.

As noted in our response to question 6, there is still a concern about having two standards for communications on changes to elements of the BES. Bifurcations may lead to the issues of one protocol in place of another for the two standards.

By using the term "correct" alpha numeric clarifier, it implies that an incorrect alpha numeric clarifier can exist. In reality as long as an alpha numeric clarifier is used to verify the letters or numbers are conveyed the intent is made. The standard language should be revised to state that "When participating in oral Operating Communications and using alpha-numeric identifiers, use alpha-numeric clarifiers for the letters and numbers to convey the correct numbers and letters in the Operating Communication."
Yes
Yes
The standard should clarify what is evidence is considered acceptable to demonstrate compliance with R 1.2. The requirement 3 appears to require the use of voice recording to demonstrate compliance with repeating the operating communication requirement. Not all facilities in which operating instruction may be received have voice recording capability. The requirement/measure should clarify an alternative evidence when such a means is not present.
Group
Southern Company
No
Southern agrees with the elimination of "Communication Protocol," "Interoperability Communication" and "Three part Communications" proposed in the first draft of COM-003-1; however, Southern does not agree with the proposed new definition for "Operating Communication". The definition of Operating Communications is too broad. The SDT appears to be focused on imposing 3-part communication on the industry for routine communications even though the August 2003 Blackout Report and the direction in FERC Order 693 Paragraph do not require such. The word "maintain" should be removed. Three part communication is not needed to keep things as they are in real time unless the communication is meant to be a Directive issued by the RC or TOP and identified as such. From a real time operations standpoint, only communications that are meant to initiate a change (e.g., open, close, enable, disable, increase, decrease) should require 3 part communications. In addition, any instruction to change or maintain the state, status, output, or input of an Element or Facility of the BES should not be considered a Reliability Directive. A more appropriate definition of Reliability Directive has been included in Project 2006-06 (Reliability Coordination) for COM-002-3. As such, the definition of Reliability Directive developed in Project 2006-06 should be used here as part of this Project 2007-02. Further, this capitalized term should have one definition and should not be defined differently in different standards. Otherwise, there will be ambiguity and unnecessary confusion.

No
It appears as though the SDT did remove the term Communications Protocol Operating Procedure, but replaced it with very prescriptive requirements and subrequirements in R1 of this revised standard. This newly revised standard focuses on the "HOW" of communication when it should be more focused on the "WHAT".
No
Southern suggests that this concept more properly belongs in the NERC Rules of Procedure and should be designed to address Recommendation 26 of the NERC 2003 Blackout Report. This suggestion of placing Alert Levels in the reliability standards is an expectation of NERC, but it is not an expectation of the industry. Also, see recent NERC Operating Reliability Subcommittee (ORS) discussions and recommendations regarding the elimination of the Transmission Alert Levels.
No
While Southern agrees with the concept of allowing the use of another language when mandated by law or regulation, Southern does not agree with R1 and its subrequirements as they are focused on the "HOW" of communication when they should be more focused on the "WHAT".
No
Southern suggests that this requirement of a common time zone is overly prescriptive. The requirement should be that entities operating in different time zones agree on how to best eliminate any confusion regarding the time difference. Entities who have an agreed upon protocol which includes the time zone to be used for system operations should not be required to repeat the time zone for every communication. For instance, if Entity A and Entity B are in different time zones but both have an operating policy that states all communication between the two is in Eastern Standard Time and all operating personnel are trained on this policy, this should be sufficient. This achieves the same functional goal. The requirement to restate the time zone in this case only serves to set up a situation where a simple single-instance omission would have no effect on reliability but still be noncompliant.
No
Southern disagrees that three part communications should be required for routine operating communications. A more appropriate definition of Reliability Directive has been included in Project 2006-06 (Reliability Coordination) for COM-002-3. As such, the definition of Reliability Directive developed in Project 2006-06 should be used here as part of this Project 2007-02. Further, this capitalized term should have one definition and should not be defined differently in different standards. Otherwise, there will be ambiguity and unnecessary confusion. Southern suggests that R2 and R3 should be eliminated, since neither one will increase reliability.
No
Southern does not agree with R1 and its sub-requirements as they appear to force a single communications procedure on the industry and are focused on the "HOW" of communication when they should be more focused on the "WHAT". Also, the word "accurate" should be removed from R1.2, as it is not needed.
No
Southern does not agree with R1 and its subrequirements as they appear to force a single communications procedure on the industry and are focused on the "HOW" of communication when they should be more focused on the "WHAT". Furthermore, requirement 1.1.4 does not need to be in this standard as the requirement for unique line identifiers is stipulated in TOP-002-2 R18. Also, is it certain that both parties in the communication will know the name for the element/facility that is specified by the element/facility's owner(s)?
No
As mentioned in the previous comments, Southern does not agree with R1 as it is imposing a single communications procedure on the industry and is focused on the "HOW" as opposed to the "WHAT", and does not agree with R2 and R3 as they imply that that 3-part communications are needed for all communications, not just during Reliability Directives, emergencies, or alerts. As such, Southern disagrees with the VRFs and VSLs.
NERC standards are not procedures and this standard attempts to impose a single procedure on the industry. Where is the demonstrated need for such a standard? Have communications, especially during periods of normal operations, been shown to be the root cause of many, if any, events?

Registered Entities agree that there is a need of clear and concise communication between entities; however, we must avoid creating a system that is unmanageable and quite possibly results in less reliability. FERC Order 693 directs the ERO to "and (3) requires tightened communications protocols, especially for communications during alerts and emergencies", in paragraph 532. The proposed standard goes too far, especially for communications outside of alerts and emergencies.

Yes

Yes

This was a much warranted improvement.

Yes

Yes

No

We believe that the requirement to specify "daylight" versus "standard" is unwarranted and may lead to confusion among the parties. All time is understood to be "prevailing time" without this clarification. Requiring such will only serve to confuse rather than clarify.

No

I have not seen the parallel requirement that pertains to Reliability Directives, but I can imagine no reason why the communication protocols for Operating Communications would ever differ from those for Reliability Directives. Making the distinction here in this requirement adds unnecessary confusion.

Yes

Agree that it ought not to be restricted to NATO only, but we are confused about what "correct" means. Perhaps it means any spoken word that begins with the subject alpha character?

Yes

Agree, however, we suggest that there be more clarity provided about what constitutes a Transmission interface Element/Facility. Is it a connection between BA's or between TOP's within a BA?

Maggy Powell

Exelon Corporation and its affiliates

No

Exelon believes it is not necessary to create a new defined term "Operating Communication." Please see response to Q10 with alternate standard language that avoids the need for a new term.

No

Exelon agrees with the elimination of the requirement to have a Communications Protocol Operating Procedure and we also believe the basic approach as proposed is wrong. The burden for demonstrating compliance for non-emergency, non-directive communications, including retention and review of 180-365 days worth of evidence to be able to demonstrate 100% compliance presents significant burden potentially detracting from the work of reliability. Auditing, whether by a NERC CEA or by entities conducting internal self assessments for self-certifications, would potentially involve listening to thousands of hours of tapes to review. This is an overly prescriptive, burdensome approach. We believe that a more effective approach would be for the standard to mandate reliability based outcomes and require entities to design practices to achieve the desired outcome. See response to Q10.

No

While Exelon agrees with deleting the Alert Levels in Attachment 1 from COM-003-1, Exelon does not agree with transferring the requirement to use Alert Levels to any other standard or the creation of a separate new standard. As stated by many of the commenters to the previous draft, the addition of "Alert Levels" with defined colors have been used by DHS and may be misinterpreted. In response to these comments the SDT removed the requirement to Attachment 1 as falling outside the scope of a "communication protocol." Exelon reiterates that the concept of adding colored "Alert Levels" not only be deleted from COM-003-1, but also not be transferred to another SAR in the future.

No

Exelon finds it unnecessary for the standard to include a requirement that discusses specifics concerning language requirements. If discussion of language is important to clarify within a Registered Entity's protocol, then the standard could suggest it as an attribute to be included in an entity developed protocol. See alternate standard language proposal in response to Q10.

No

It's not clear that this addresses a reliability problem. We are not aware of instances where failure to specify the time zone and daylight saving time resulted in communication failures between entities leading to a condition that threatened an outage or a cascading outage. Further, specifically creating a requirement is overly prescriptive. If it is justified as important to reliability, then the standard could suggest it as an attribute to be included in an entity developed protocol. See alternate standard language proposal in response to Q10.

No

Please see response to Q10.

No

While Exelon agrees with the modification to allow the use of another alpha numeric clarifier, Exelon does not agree with the designation of "correct" related to alpha numeric communication. Requiring "accurate" alpha-numeric clarifiers is overly prescriptive and unclear. An entity should not be held accountable for 100% adherence to a set phonetic alphabet. For example, if a communicator and receiver use the phonetic nomenclature "motor operated disconnect one foxtrot" but in a later communication the equipment is referenced as "motor operated disconnect one fox" by the Standard as written this could be considered a violation. It should be an expectation but not a requirement as long as the transmitter and receiver use three way communications effectively. Again, the standard should emphasis entity practice for effective communication not impose an overly prescriptive set of requirements that pose compliance challenges.

No

Exelon is concerned with the requirement to use "the name" for the Element/Facility specified by the Element/Facility's owner(s). By dictating "the name" this requirement may become overly prescriptive. An entity should not be held accountable for 100% adherence to a set "specified name" for an Element/Facility. It is reasonable for entities to fully understand what Element/Facility is communicated; however, verbatim use of a "specified name" should not in itself be a requirement. For instance, if the formal name of a generating unit is "ABC Fossil Generating Station Unit 1" and an entity communicates "ABC Station Unit 1" or "ABC Generating Station 1" by the Standard as written this could be considered a violation even though it can effectively communicate the needed information. As in other sub-requirements to R1, the use of "specified name" should be an expectation but not a requirement as long as the transmitter and receiver use three way communications effectively. Further, this appears as an internal inconsistency in the standard between R1 and R2. For example, an entity owner specifies a unique name for an interface element. R1.1.4 requires the use of that unique identifier but R2 does not require verbatim response. It is not clear which part of the repeated information three part response in R2 is allowed to be non-verbatim.

No

Exelon does not agree with the VRFs and VSLs for Requirements R1, R2 and R3. Requirement R1 - The Violation Severity Levels imply that if the responsible entity did not correctly implement any one (1) of the four (4) parts of R1 at any time that that entity would be non-compliant. It is not reasonable to hold an entity responsible to verify that every communication be in accordance with R1 at all times. It should be an expectation, but not a requirement. Requirements R2 and R3 – Similar to R1 it is not reasonable to hold an entity responsible to verify that every communication meet the requirement of R2 or R3 in all instances. Exelon suggests that this requirement be revised to address those instances where an actual event occurred due to improper communication or be limited to

communication of a stated Reliability Directive. In general, the current VSLs for the current draft of COM-003-1 do not seem commensurate to the risk to the BES. See the response to Q10 for a reasonable approach to implementation of the intent of this requirement.

Exelon believes that the proposed COM-003-1 exceeds what is necessary for reliability and creates other problems such that the proposed standard may in fact result in a decrease in reliability. In particular the language is overly prescriptive and presents significant compliance questions both in terms of creating a credible compliance measure and a reasonable way for entities to demonstrate compliance or conduct internal self-assessment. Exelon believes that an alternative approach to COM-003 is needed. The standard should set desired outcomes and leave the specific implementation of communication protocols to registered entities. Standards should not impede use of best practices and should encourage effective innovation. An alternate approach is worth consideration:

Requirements: 1. Entities must have a protocol addressing communications for operating personnel.

1.1. The protocol should address; three part communication, English language usage (include footnote for requirement to use legislatively prescribed language), time zone, entity unique identifiers, 24 hour clock and alpha numeric identifiers. 1.2. All control center operating personnel

should be trained on the use of the protocol. Measure: In an audit, a company would be expected to demonstrate that they had such a protocol and that they trained their operators on its use. This proposal would satisfy the Directives and Blackout Recommendation #26 which were to "tighten communication protocols, especially for... emergencies". Stakeholders and the NERC BOT approved COM-002-2 which addressed communications capabilities being staffed and available for addressing a real-time emergency condition. An associated interpretation of COM-002 clarified whether routine operating instructions are "directives" or whether "directives" are limited to actual and anticipated emergency operating conditions. Our proposed changes to COM-003 are responsive to the FERC recommendation to tighten operating protocols. Other possible responses to this recommendation would be to conduct an assessment of NERC certification requirements and if found lacking in this area, strengthen them. For the reasons stated above, we urge NERC to change the focus of COM-003 from a prescriptive what to do approach and allow entities to develop and implement protocols in keeping with NERC and ISO/RTO operator certification requirements and best practices within the industry. Thank you for the opportunity to comment.

Oncor Electric Delivery Company LLC
No
Oncor is in general agreement with the elimination of the three terms. Furthermore, Oncor takes the position that the proposed new definition for the NERC Glossary, "Operating Communication" is not needed because "person to person" communication is not cited or listed as a contributor to the events summarized in the 2003 Blackout Report. Oncor takes the position that improvements should emphasize communicating the state of the operating system as a whole during an emergency.
No
Oncor takes the position that elimination of the Communications Protocol Operating Procedure does not constitute the introduction of another set of procedures (i.e. 3 - Part Communication, or alpha-numeric clarifiers). Furthermore Oncor takes the position that a more productive approach would be to encourage the creation of innovative Best Practices; as opposed to a mandatory fixed procedure which would limit innovation.
No
Oncor takes the position that the introduction of new alert levels or categories simply introduces more complexity to what could be better addressed through a closer examination of existing alert levels. This includes EEA levels and threat levels.
No
Oncor takes the position that this requirement is unnecessary in that it is not aware of any evidence supporting the notion that failure to use the English language has been a significant contributor to reduction in reliability. Furthermore, FERC has made it known that it is in favor of eliminating requirements that do not contribute to reliability. Oncor recommends that this requirement be eliminated.
No
Oncor takes the position that more productive approach would be to encourage the creation of innovative Best Practices; as opposed to a mandatory fixed procedure which would limit innovation. Oncor believes that requiring registered entities to have its own internal communication protocols would encourage the adaption of best practices that could be shared, modified and implemented as a "best fit" and could potentially enhance reliability as opposed to a mandated "procedural specific" requirement
No
Oncor believes that the application of three part communication as prescribed in the proposed reliability standard COM-002-3 is appropriate as prescribed for emergencies. Any additional requirements, including those for routine operations goes well beyond what is called for in the 2003 Blackout Report which focused on emergencies. As such, Oncor also takes the position that the term Operating Communications should also be removed.
No
Oncor take the position that this requirement is far too much detail and goes well beyond the 2003 Blackout recommendations. Furthermore, Oncor take the position that a more appropriate approach would be to require internal procedures that address internal communication protocols.
No
Again, Oncor take the position that this requirement contains far too much detail and goes well beyond the 2003 Blackout recommendations. Furthermore, Oncor take the position that a more appropriate approach would be to require internal procedures that address internal communication protocols.

BPA believes that the existing language format should remain solely English and recognizes that this is the case with International & US air traffic controllers.
Yes
Yes
No
BPA disagrees with both clarifiers (NATO phonetic alphabet and alpha numeric) and believes the communication should be left to the discretion of each utility. This modification causes an undue burden when relaying communication; especially in a time of an emergency and dramatically increases the risk of human error. BPA recommends that the drafting team remove any and all language of NATO phonetic and alpha numeric identification of any device, (Alpha and especially numeric phonetic requirements). R2 and R3 clearly ensure that all parties are already properly communicating clearly and concisely. Should the drafting team remove the NATO phonetic and alpha numeric language, BPA would change its negative position to affirmative.
No
BPA believes that the uniform line identifiers between utilities should be identified by mutual consent and suggests the drafting team use the language from COM-003-1 R7, "Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications". BPA also recognizes that uniform line identifiers are already addressed in TOP-002-2b.
No
BPA believes the VSLs for R3 are too extreme as written. The SDT needs to add emphasis and clarity to the second *AND*. The requirement only asks for one of the two bullets; the VSL could be incorrectly interpreted by and auditor that both bullets are needed. Compliance is met if: (a) the receiver repeats back the Operating Communication and waits for confirmation, or (b) requests it to be repeated because it may not have been heard correctly. Compliance is not met if neither is done. So if the entity received a communication but did not repeat it AND did not request it to be repeated, that violation would be severe. For severity levels add impact to the Bulk Electric System as a qualifier. IF Cascading outage or 1000 MW of load is lost due to failure to repeat information back *AND* wait for confirmation ( equals SEVERE). If equipment is damaged as a result (equals Moderate). If fails to repeat *AND* fails to wait for confirmation (equals LOW). BPA would change its position if categorizing a level of impact to the BES beginning with an equivalent to the severity of the violation.

Central Lincoln
No
The change from "Interoperability Communications" to "Operating Communication" greatly expands the standard to include all internal communications regarding > 100 kV equipment. Central Lincoln does not consider the extra burden to be worth the negligible benefit.
Yes
Yes
Yes
but please see Q 10.

No
We appreciate the change from requiring Central Time, but believe that 12 hour designations with AM or PM qualifiers to be just as clear as 24 hour clock time. In addition, we suggest that the DT or ST designation should only be required when deviating from the prevailing time in effect.
Yes
but please see Q 10.
Yes
but please see Q 10.
Yes
but please see Q 10.
1) Central Lincoln supports the comments provided by PNGC. We have a similar situation, and believe the redirection of resources needed for compliance can only have a negative effect on our local level of service. 2) Central Lincoln is greatly concerned regarding how this standard will be audited. We expect the Compliance Enforcement Authority, in order to avoid a data dump in the form of a six year audit period's worth of radio recordings consisting of mainly distribution related instructions, will request searchable transcripts with pointers to the relevant >100 kV parts. This will represent a huge amount of time to transcribe the recordings and provide the pointers. This administrative burden in proving compliance after the fact will not result in any improvement in reliability.

We disagree that all DP's should be subject to this Standard. For many small entities, it is the TOP who will control the equipment to shed load. These DP's do not operate a 24x7 control center for receiving such instructions. During non-business hours calls are forwarded to an answering service or an on-call technician. We recommend the drafting team modify the applicability as follows: Applicability: 4.1. Functional Entities 4.1.1 Reliability Coordinator 4.1.2 Transmission Operator 4.1.3 Balancing Authority 4.1.4 Generator Operator 4.1.5 Distribution Provider who is the 24 x 7 entity that operates their load shedding equipment when instructed by the RC, TOP, or BA. The TOP should be the responsible entity unless the Distribution Provider has agreed on the responsibility for taking the action.
Mary Jo Cooper
Individual
Richard Vine

No
<p>While the objective of minimizing ambiguities in communications between functional entities is commendable, the standard as currently written goes too far by requiring "...English when communicating between functional entities, unless another language is mandated by law or regulation." (R1.1.1) To begin, requirement 1.1.1 is completely silent on who's law or regulation would satisfy this requirement if a functional entity wanted/needed to speak a different language. For example, it's unclear which of the following would satisfy this requirement: 1. A Canadian or Mexican law or regulation provided as evidence to WECC auditors? 2. An American law or regulation? 3. Perhaps both an American and a neighboring country's law/regulation would be required? Since the proposed standard is silent on what constitutes satisfactory evidence, both numbers 1 and 2 seem like potentially harmful unilateral moves that could be detrimental to reliability but may be allowable in COM-003-1 as currently proposed. So if functional entities would like/need to speak a different language, the requirement looks like it's attempting to set a high bar without specifying how high that bar is. I also think the requirement pre-supposes a level of English fluency by all North American citizens that simply does not exist and mandates a very high and very vague threshold for compliance while not allowing for exceptions. So ultimately, R1.1.1. is a vague, unnecessary and inflexible requirement that would be detrimental to real-time operators in a contingent status. It would deny operators that are fluent in other languages the ability to assist non-native English speakers experiencing difficulties in communications by using a language they are fluent in to mitigate a potentially serious issue. The requirement could also potentially require U.S. states, Canadian provinces and/or Mexican states to write laws and/or regulations to satisfy a requirement in a standard which seems like an unrealistic threshold. The bottom line is if an entity enters a contingent state and there is no legislation or regulation in place at the time of a contingency event, system operators may be forced to decide between two very difficult positions. Either adhere to COM-003 and run the risk of putting the grid at risk or violating COM-003 to ensure grid integrity is not compromised.</p>

No
<p>Create one standard for all operating conditions and retire the balance of those places where levels are referenced. We support a new or separate requirement speaking to all alert levels for operating</p>

conditions but not combination with another unique standard losing the efficiencies of a combined set of operating condition alert levels.

Yes

Yes

No

Do we lose the "speciality" of only using 3-part communication during times of issuing directives/emergencies?

Yes

Yes

No

VRFs and VSLs should be low.

This standard needs to be written such that it allows for entity flexibility. Many entities already have COM protocols that are used. To prove compliance in an audit, entities will we need to provide 3 years worth of voice recordings to the auditors. It would take a full-time position to review the daily voice recordings for submission and what value does this add to the reliability or security of the BES. This standard is "overkill" from what is existing standard already dictates. Overall – this standard is going to cost the registered entities way more than the realized benefits.

NERC Operating Committee (OC) comments on COM-003 (Operating Personnel Communications Protocols) The current draft of COM-003 is proscriptive and is in fact a procedure or rather a set of discrete tasks / actions that are not focused to support the reliability intent. The NERC OC recommends that the SDT develop a purpose that speaks to operators and their responsibility to maintain reliability not a process or set of protocols that cannot account for every nuance and variable in the realm of communications and human interaction. Restated Purpose: To provide system operators a holistic communications program that reduces the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES. The OC just approved a guideline for System Operator Verbal Communications. The OC feels this could be used as a basis for a new approach for COM-003-1. The OC proposes that the SDT changes the draft of COM-003 to the following three requirements: R1: Each RC, TOP, GOP, BA, DP shall develop a written communications procedure to address the following: • Protocols • Training and education • Internal controls (Preventive, Detective and Corrective) that demonstrates a process that will find, fix, track, trend.

analyze and continuously improve R2: Each RC, TOP, GOP, BA, DP shall train applicable personnel on the communication procedure developed for R1 R3: Each RC, TOP, GOP, BA, DP shall take appropriate actions to address deficiencies revealed by internal controls. Data retention must be rethought to focus less on significant data and evidence archiving (backwards looking) and more on the internal program to continuously improve (forward looking). Individual instances of not following the company's procedure should not be the basis of violation but instead – a demonstration of internal assessment and refinement. The VRF/VSL should be based on an entity either not having a program, not demonstrating their assessment and corrective action process or egregious / systemic problems with the implementation of their program.

Tom Bowe - OC Chair

# Consideration of Comments

## Operating Personnel Communications Protocols: Project 2007-02

The Operating Personnel Communications Protocols Drafting Team thanks all commenters who submitted comments on the proposed draft COM-003-1 Operating Personnel Communications Protocols standard. These standards were posted for a 45-day public comment period from May 7, 2012 through June 20, 2012. Stakeholders were asked to provide feedback on the standards and associated documents through a special electronic comment form. There were 94 sets of comments, including comments from approximately 292 people from approximately 166 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page:

[http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President of Standards and Training, Herb Schrayshuen, at 404-446-2560 or at [herb.schrayshuen@nerc.net](mailto:herb.schrayshuen@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

### Summary Consideration:

A common theme among many entities is that the approach to COM-003-1 should be changed. Most agreed with the comments submitted by the NERC Operating Committee that applicable entities should be required to

- a) develop written communication protocols that address the elements in draft 2 of COM-003-1,
- b) train on those protocols, and
- c) develop internal controls to find and correct deviances from those protocols.

*After discussion, the SDT agreed with the commenters and modified its approach to closely align with the proposal. In addition, the SDT felt that it would be beneficial to develop the RSAW for this standard in conjunction with NERC Compliance staff, and has posted the draft RSAW for comment along with draft 3 of COM-003-1.*

<sup>1</sup> The appeals process is in the Standard Processes Manual:  
[http://www.nerc.com/files/Appendix\\_3A\\_Standard\\_Processes\\_Manual\\_Rev%201\\_20110825.pdf](http://www.nerc.com/files/Appendix_3A_Standard_Processes_Manual_Rev%201_20110825.pdf)

Another prevalent theme was questioning the necessity of the standard, specifically one that requires three part communication for routine operations.

*During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT's concern.*

Another theme was the concern that the work of the SDT was overreaching the scope of the SAR.

*The purpose of the SAR for this project is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time." Additionally, the SAR is very specific in that it also includes the term "normal" operating conditions under Applicability: "Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors."*

Another theme was that the use of three part communications should be limited to Reliability Directives only.

*A Reliability Directive, by definition, is limited to instances where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact. The SDT believes that it is necessary to specify 3 part communication as a necessary communications protocol for all Operating Instructions, not just emergency situations. The OPCPSDT believes that the potential for risk to the reliability of the BES exists for all Operating Instructions.*

Other commenters expressed a desire to combine COM-002-3 and COM-003-1 into a single standard.

*The purpose of the SAR for this project is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time." This is a broader scope for communications than that for Project 2006-06.*

Another concern was that this standard addressed "how" to communicate instead of "what" to communicate.

*When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.*

Many commenters also questioned the purpose of the whitepaper that was posted by the SDT during draft 2.

*The whitepaper was intended to assist industry stakeholders understand the rationale behind the content in the standard. For further information on communication guidelines, please refer to the paper developed by the NERC Operating Committee titled "Reliability Guideline: System Operator Verbal Communication – Current Industry Practices" located at <http://www.nerc.com/filez/oc.html>.*

**Definitions:** (Question 1)

Most commenters agreed with removing all three definitions (Communications Protocol, Three-part Communication, and Interoperability Communication) in draft 1 of COM-003-1. However, most commenters also disagreed with the new proposed term Operating Communications, introduced in Draft 2 and defined as: “Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.” Commenters stated:

- The proposed term Operating Communication is still confusing and the large extent of operations it applies to would create an overwhelming compliance exposure due to the large number of communications described in the definition.
- The term, Operating Communication, and its relation to the proposed term “Reliability Directive” from COM-002-3 is unclear.
- The meaning of the word “maintain” in the definition is unclear. *The OPCP SDT changed “maintain” to “preserve” to differentiate this term from maintenance activities.*

*To eliminate the confusion expressed by commenters; and to clarify the scope and intent of an Operating Instruction, the SDT has revised the definition to read:*

*Operating ~~Communication-Instruction~~ — ~~Communication of instruction~~ Command from a System Operator to change or ~~maintain~~ preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.*

**Requirements:**

**Requirement R1** *(required entities to use the English Language (Question 4), 24 Hour Clock and Time Zone reference (Question 5), Common interface identifiers (Question 7), and alpha-numeric clarifiers (Question 8) during oral and written Operating Communication):*

- The majority of the commenters agreed with the SDT’s decision to remove a Communications Protocol Operating Procedure (CPOP) because it would be administrative in nature and would not satisfy the criterion of enhancing the reliable operation of the BES.

Many commenters supported the development of internal communication protocols and internal controls to correct deficiencies in lieu of a zero defect standard. (Question 2)

- The majority of commenters agreed with the SDT’s decision to remove the Alert Level Guide from the standard but did not want it in another standard because it added no value to reliability. (Question 3)
- In response to Questions 4, 5, 7 and 8 dealing with the English language, 24 hour clock and time zone reference, common interface identifiers, and alpha-numeric clarifiers, a large majority of the commenters believe that all of subparts are too prescriptive and focus on the “how to” instead of the “what.” *The SDT acknowledges this and has defended it as necessary for this*

*standard in drafts 1 and 2. When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.*

- There was a lack of agreement on requiring the use of the English language as part of a communication protocol. Some commenters support requiring the use of English, and indicated that communicating in a language other than English would cause confusion, while others contested requiring English exclusively, stating in some areas the use of other languages in a localized environment may be effective. *The SDT believes that English should prevail in almost all cases and those situations where another language would be required by law would be a rare exception. Furthermore, this requirement only applies to communication initiated by a System Operator at one functional entity to another functional entity. The SDT added "Transmission Operators and Balancing Authorities may use an alternate language for internal operations." to provide some flexibility in areas where another language is commonly used.*
- Commenters were also divided on the use the 24 hour clock and time zone references as part of a communication protocol. Those who indicated support stated they felt it added clarity to communications. Other commenters stated that the 24 hour clock and time zone references are too prescriptive and should be eliminated. *The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications, which will enhance reliability by avoiding time mistakes that could affect the reliability of the BES.*
- Commenters were confused over the meaning of the word "accurate" to modify the phrase "alpha-numeric clarifier." Other commenters felt the NATO requirement was too restrictive, but indicated that the phrase "alpha-numeric clarifiers" was too vague. *The SDT has chosen to retain the inclusion of alpha-numeric clarifiers as an alternative to a strict requirement to include the use of the NATO alphabet, but has removed the word "accurate."*
- Many commenters stated that Requirement R1 is not necessary, stating that it is covered by standard TOP-002 R18. *The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. Project 2007-03 chose to eliminate TOP-002-2a Requirement R18 on the basis that "This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. This is an administrative item, as seen in the measure, which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the difficulty in assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers." COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface*

*Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.*

***Requirement R2 (required entities that send Operating Communications to use three part communication)***

***and***

***Requirement R3 (required entities that receive Operating Communications to use three part communication)***

- Many commenters indicated that the scope of Operating Communications and the requirement was too broad and that the sheer numbers of Operating Communications would overwhelm the entities in terms of monitoring and evidence retention. They also are concerned that under these Requirements, operators would be distracted to focus more on complying with the specifications for three part communication rather than effectively responding to incidents, thereby reducing reliability. *The SDT believes universal communication protocols are critical to avoid mistakes that would result in reduced reliability on the BES, which is within the scope of the SDT's SAR. After consideration of comments in these questions, as well as question 10, the SDT has modified its approach in COM-003-1, draft 3 to address the concerns expressed by commenters.*
- Several stakeholders continue to identify potential conflicts between COM-003-1 and work underway on COM-002-3 by the Project 2006-06 – Reliability Coordination SDT (RCSDT), which also addresses the use of three-part communications. Some stated that the applicability of the two standards was confusing and called for one communication standard to reduce the confusion. A few commenters stress this should be limited to COM-002-3 (which has been approved by its ballot pool and is pending NERC Board approval). In COM-002-3 the proposed requirements focus on the use of three part communication when issuing and receiving “Reliability Directives.” As proposed in COM-002-3, a Reliability Directive is a directive issued to address an Emergency or an Adverse Reliability Impact. *The OPCP SDT believes the scope of their SAR extends beyond communications during emergency situations, thereby necessitating a new standard such as the proposed COM-003-1. The OPCP SDT proposes use of three-part communication for all Operating Instructions, under normal and emergency conditions, and has worked with the RCSDT to ensure that COM-002-3 and COM-003-1 are complementary to achieve this objective.*
- In addition, a number of commenters pointed out that R2 and R3 of each standard dictate three part communication but the language in each standard is different, which may create confusion. *The SDT has changed the language referring to three part communication in COM-003-1 to match that of COM-002-3, R2 and R3.*

### VRFs and VSLs

The SDT acknowledges there were many comments on draft 2 regarding VSLs and VRFs and we appreciate the contributions. The SDT has dramatically changed draft 3 and all of the VRFs and VSLs have been changed to reflect those changes.

### Additional Issues addressed by the SDT:

Small numbers of commenters raised issues around:

- The standard's 6 calendar month implementation time frame. *The SDT has extended the implementation period to 12 calendar months to provide an adequate amount of time for training and implementation.*
- Whether the standard should address "all call" types of communications. *The SDT has added language to Requirements R1 and R2 to clarify how these Requirements apply when all calls are used to communicate,*
- Re writing the Purpose Statement, – *The SDT modified the purpose statement in response to comments,*
- Adding language to identify Transmission Interface "....., unless otherwise mutually agreed,"- *The SDT added the commenters' recommended language.*
- Clarifying the time horizon of draft 2; real time applicability; - *The SDT confirmed that draft 2 was in the real time horizon.*

### Outstanding Unresolved Issues:

- Whether read receipts for written Operating Communications should be addressed in the Measures. - *This is in reference to R2 and R3 which is applicable only to oral Operating Communication, so the SDT made no change,*
- Exclusion of R2 and R3 for Face to Face Operating Communication in a control room, - *The SDT clarified that COM-003-1 only applies to communication between functional entities. For example, if a TOP System Operator is issuing an Operating Instruction to an individual that is internal to that TOP, three part communication is not required by this standard. If a TOP System Operator is issuing an Operating Instruction to an individual in another TOP or another functional entity (e.g. Distribution Provider, Generator Operator), then three part communication is required by this standard. If a TOP System Operator is issuing an Operating Instruction to an individual that is not in a functional entity, then three part communication is not required by this standard.*

**Index to Questions, Comments, and Responses**

\_Toc333408803

1. Do you agree with the addition of “Operating Communication” as a proposed new definition for the NERC Glossary and the elimination of “Communication Protocol,” “Interoperability Communication” and “Three part Communications” proposed in the first draft of COM-003-1? Operating Communication: Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. If not, please explain in the comment area. ....22
2. The SDT eliminated the requirement to have a Communications Protocol Operating Procedure from the proposed standard because it is administrative in nature. Do you agree with this modification? If not, please explain in the comment area. ....63
3. The SDT has proposed to transfer the requirement to use Alert Levels in Attachment 1 to another more closely aligned standard or to a separate new standard. Do you agree with this transfer? If not, please explain in the comment area. ....76
4. The SDT modified the standard to allow an exemption from the requirement to use English language where the use of another language is mandated by law or regulation. (See Requirement R1, Part 1.1.1) Do you agree with this modification? If not, please explain in the comment area. ....87
5. The SDT modified the standard to mandate utilization of a 24 hour clock for all times and to mandate the use of a time zone and indicate whether the time is daylight saving time or standard time reference when Operating Communications occur between different time zones. (See Requirement R1, Part 1.1.3) Do you agree with this modification? If not, please explain in the comment area. ....103
6. The SDT modified the requirement for use of three-part communications for Operating Communications to clarify that this is not applicable for Reliability Directives and split the single requirement into two requirements: one for the issuer (R2) and another for the receiver (R3). Do you agree with this modification? .....121
7. The SDT modified the requirement for use of the NATO phonetic alphabet to allow use of another correct alpha numeric clarifier. (See Requirement R1, Part 1.2.) Do you agree with this modification?.....154
8. The SDT modified the requirement for use of identifiers to limit the applicability to operating communications involving Transmission interface Elements/Facilities and to require use of the name for that Element/Facilities specified by the Element/Facility’s owner(s). Do you agree with this modification? .....175
9. Do you agree with the VRFs and VSLs for Requirements R1, R2 and R3?.....194
10. If you have any other comments or suggestions to improve the draft standard that you have not already provided in response to the previous questions please provide them here. ....210

**The Industry Segments are:**

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

1. **Do you agree with the addition of “Operating Communication” as a proposed new definition for the NERC Glossary and the elimination of “Communication Protocol,” “Interoperability Communication” and “Three part Communications” proposed in the first draft of COM-003-1? Operating Communication: Communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. If not, please explain in the comment area.**

#### Summary Consideration: Major Issues

The majority of commenters agreed with eliminating the three original definitions in draft 1; however the same majority had concerns about the proposed definition of Operating Communications. The concern is that the definition and the manner in which it was used in the requirements in COM-003-1 were potentially over reaching. Most commenters indicated that the evidence requirements would also strain an entity’s resources and would not improve reliability. The SDT believes that the use of the protocols, many of which are now in use by industry stakeholders, should be a required part of BES operations and communication. The SDT also believes that use of these protocols enhance reliability by providing a structure for communication that clarifies intent and meaning. This in turn provides a layer of defense in the reliable operation of the BES.

Many commenters indicated that they do not agree that the term Operating Communication is needed and believe that Reliability Directive, as defined in COM-002-3 is the only term needed to clarify the type of communications that should require three part communications. Some comments indicate that the scope of communications that would be considered Operating Communications was not sufficiently clear, and could include casual control room conversations and discussion over potential alternatives. The SDT believes the scope of the SAR extends beyond communications during emergency situations, thereby necessitating a term that involves communications during all situations, both normal and emergency. To clarify the intent and scope of the term, the SDT renamed the term Operating Communications to Operating Instruction, and modified the definition to “Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”

Commenters also stated the SDT has exceeded the scope of the SAR, the 2003 Blackout Report recommendations, and FERC Order 693. The SDT is confident that the concepts in COM-003-1 appropriately address the Blackout Report recommendations, FERC Order 693 and the SAR. The SDT also believes that the concepts in COM-003-1 address a reliability gap that exists because the vast numbers of Operating Communications that affect the state of BES Elements or BES Facilities are not currently subject to consistent protocols that clarify content and intent. This increases the risk of mistakes that could degrade the reliability of the BES.

A few commenters questioned the purpose and the standing of the White Paper the SDT drafted. The SDT responded that the Standards Committee requested that the team develop the White Paper to provide its justification for the application of Communication protocols. The White Paper was posted for information, not for industry approval.

A number of stakeholders agreed with the changes to replace the previous three defined terms with a single defined term, Operating Communication.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	<p>The proposed Operating Communication term is not markedly different from the originally proposed term (Interoperability Communication).</p> <p><b>Response: The SDT believes the term Operating Communication focuses on very specific actions that affect the reliability of the BES, making it more specific than Interoperability Communication. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p> <p>The proposal continues to expand the scope of the SAR from the concept of tightening the protocols associated with Emergencies by now applying to all communications. The text box in the draft standard indicates that Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. There is little difference between the two terms despite the SDT’s assessment that Reliability Directive is a type (or a subset) of Operating Communication. If the intent is to use the proposed new term to require three-part communication (as suggested in R2 and R3), then that intent can be accomplished by using the term Reliability Directive as it covers not only the emergency state but also</p>

Organization	Yes or No	Question 1 Comment
		<p>instructions needed to address Adverse Reliability Impacts.</p> <p><b>Response:</b> The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” The SDT does not believe that it has expanded the scope of this SAR. Reliability Directive, as defined in COM-002-3, is specifically focused on Emergencies or Adverse Reliability Impacts. The scope of COM-003-1 is to require the use of common communication protocols for all BES operations that affect the state of the BES.</p> <p>Both the Blackout Report and the FERC directive deal with tightening protocols for Emergencies. The proposed requirements completely fail to address emergencies and focus solely on developing non-emergency protocols.</p> <p><b>Response:</b> The OPCSDT disagrees that both the Blackout Report (and FERC Order 693 and the SAR) only addresses the need to tighten protocols for Emergencies. The Blackout Report uses the phrase “<i>especially for emergencies</i>” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating situations and used this language to amplify the importance of such protocols during emergency conditions. FERC Order 693 paragraph 532 (“<i>This will eliminate possible ambiguities in communications during <u>normal</u>, alert and emergency conditions</i>”) and the SAR are very specific in that both include the term “normal” operating conditions.</p>
<p><b>Response:</b> Thank you for your comments. Please see the responses above.</p>		
ACES Power Marketing Standards	No	<p>1. We do not agree with the need to use three-part communication for all operations on the BES. Requiring entities to employ three-part</p>

Organization	Yes or No	Question 1 Comment
Collaborators		<p>communication for routine operating instructions is excessive and burdensome. The 2003 Blackout Report recommended that industry, “Tighten communications protocols, especially for communications during alerts and emergencies.” We strongly support using three-part communication for the execution of Reliability Directives as defined in the proposed COM-002-3 draft standard in Project 2006-06 but not for routine operating instructions.</p> <p><b>Response: The OPCPSDT disagrees that the Blackout Report (and FERC Order 693 and the SAR) only addresses the need to tighten protocols for Emergencies. The Blackout Report uses the phrase “especially for emergencies” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating communication and used this language to amplify the importance of such protocols during emergency conditions. FERC Order 693 paragraph 532 (“This will eliminate possible ambiguities in communications during <u>normal</u>, alert and emergency conditions”) and the SAR are very specific in that both include the term “normal” operating conditions.</b></p> <p>2. The COM-003-1 Operating Communications Protocols White Paper states three reliability benefits of using three-part communication as follows:</p> <p>a. “The removal of any doubt that communication protocols will be used and when they will be used. This will reduce the opportunity for confusion and misunderstanding among entities that may have different doctrine.” We don’t agree with the premise that implementing three-part communications for all operating instructions will reduce confusion. If there is a standard such as draft COM-002-3 that requires the use of three-part communication for Reliability Directives and the issuer is required to state that a Reliability Directive is being issued, then there should be no</p>

Organization	Yes or No	Question 1 Comment
		<p>confusion.</p> <p><b>Response: The Blackout study cites a scenario where communication was unprofessional and confused. Communication protocols should used before, during, and after emergency conditions.</b></p> <p>The example provided in this bullet where “one entity uses three-part for emergencies, and the other uses it for all operating conditions” is used to support the premise. However, Table 1-A of the White Paper only lists 11 entities that currently use three-part communication during both emergencies and non-emergencies. Eleven out of how many entities? The paragraph immediately following Table 1-A states, “The fact that the majority of BES entities already employs three-part (or repeat back) communications for routine...operations...” Eleven entities do not make a majority. We don’t believe the actions of a few should dictate the actions of all. Much stronger evidence to support this “fact” is needed.</p> <p><b>Response: The SDT sampled major entities that manage significant amounts of load and serve large numbers of customers to capture the magnitude of impact of the sample on the BES. The SDT is confident that it would have achieved the same results if it sampled 100 additional entities based on the overwhelming consistency in the results provided in Table 1-A.</b></p> <p>b. “There will be no mental “transition” when operating conditions shift from normal to Emergency.” Once again, if there is a standard such as COM-002-3 that requires three-part communication for Reliability Directives and the issuer is required to state that a Reliability Directive is being issued, then there should be no confusion. System Operators are trained to make mental transitions every day. It is an inherent characteristic of the job. Operators should be able to mentally “transition” when a Reliability Directive is issued.</p> <p><b>Response: The SDT agrees that most System Operators are highly trained</b></p>

Organization	Yes or No	Question 1 Comment
		<p>and experienced, but it is risky to discount the human factor in communications. Low frequency, high impact events such as the 2003 Blackout are of such speed and magnitude that it is only natural to anticipate a potential inaccurate mental “transition.”</p> <p>c. “The formal requirement for three-part communication will create a heightened sense of awareness in operators that the task they are about to execute is critical...” Not all operating instructions are “critical” so this premise is flawed. This bullet makes perfect sense for Reliability Directives because the actions taken to address those would be considered critical based on the proposed definition of Reliability Directive in COM-002-3. It does not make sense for routine operating instructions.</p> <p><b>Response: The SDT believes that every instruction for a change to the BES carries some risk. If unclear communication causes an operator to open the wrong switch on an already compromised system the results could lead to an undesirable event.</b></p> <p>3. Based on the above, we do not agree with the definition of Operating Communication as proposed in this draft standard since we do not support the use of three-part communication for all operations on the BES.</p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>Midwest Reliability Organization NERC Standards Review Forum</p>	<p>No</p>	<p>The MRO NSRF recommends the following comments for consideration by the SDT:</p> <p>1. The sentence structure of this definition is incorrect. It is unclear whether the prepositional phrase “of the Bulk Electric System” applies to both Facility and Element or only to a Facility. Recommend this be rewritten to read “... Bulk Electric System Elements and Facilities”.</p> <p><b>Response: The SDT has reworded the definition in response to your</b></p>

Organization	Yes or No	Question 1 Comment
		<p>comment.</p> <p>2. The definition should be for only actionable commands (to accomplish an actionable item). Status of does necessitate 3 part communication.</p> <p><b>Response: The context was “maintain the status” which is an actionable command. The intent was related to commands to preserve the stability of a normally operating system. The SDT has proposed “preserve” as an alternative to “maintain” in draft 3.</b></p> <p>3. The inclusion of a Reliability Directive as a subset of the Operating Communication definition adds confusion as to what is a Reliability Directive. This confusion is compounded by having Reliability Directives in a different standard with different descriptions for three part communication.</p> <p><b>Response: The SDT has adopted the language in COM-002-3, R2 and R3 for three part communication. This change to make the two standards consistent is intended to reduce any potential for confusion.</b></p> <p>4. The 2003 Blackout Report recommended that industry, “Tighten communications protocols, especially for communications during alerts and emergencies.” We strongly support using three-part communication for the execution of Reliability Directives as defined in the proposed COM-002-3 draft standard in Project 2006-06 but not for routine operating instructions.</p> <p><b>Response: The OPCPSDT disagrees that the Blackout Report (and FERC Order 693 and the SAR) only addresses the need to tighten protocols for Emergencies. The Blackout Report uses the phrase “especially for emergencies” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating communication and used this language to amplify the importance of such protocols during emergency conditions. FERC Order 693 paragraph 532 (“This will eliminate possible ambiguities in</b></p>

Organization	Yes or No	Question 1 Comment
		<p><i>communications during <u>normal</u>, alert and emergency conditions”) and the SAR are very specific in that both include the term “normal” operating conditions.</i></p> <p>5. Table 1-A of the White Paper lists 11 entities that currently use three-part communication during both emergencies and non-emergencies. We agree that this can be an utility ‘best practice’, however, there is a major difference between good utility practice and a no-fault, no exception Reliability Standard.</p> <p><b>Response: The SDT acknowledges your position and has developed an alternative form of the standard that addresses your comment.</b></p>
<p><b>Response: The OPCPSDT appreciates your comments.</b></p>		
Detroit Edison	No	<p>The definition of Operating Communication is overly broad, increasing the scope of the standard. It should be limited to actionable items. Suggested rewording of the definition: "Communication of instruction to perform an action relating to a physical change or a control system data change affecting an Element or Facility of the Bulk Electric System."</p>
<p><b>Response: The OPCPSDT appreciates your comments. It was not the intent to include control system data change in the scope of Operating Communication. In response to your comment and other similar comments, the definition has been modified to “Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p>		
Duke Energy	No	<p>The definition of Operating Communication is vague, general and overly broad.</p> <p><b>Response: The definition has been modified to “Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p>

Organization	Yes or No	Question 1 Comment
		<p>We don't believe the Blackout Report recommendations and Order 693 directives require 3-part communications for routine communications. Communications protocols can be tightened, and more effective communications can be achieved without this extreme approach. See our comments under question #2.</p> <p><b>Response: The OPCSDT disagrees that the Blackout Report (and FERC Order 693 and the SAR) only addresses the need to tighten protocols for Emergencies. The Blackout Report uses the phrase "especially for emergencies" which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating communication and used this language to amplify the importance of such protocols during emergency conditions. FERC Order 693 paragraph 532 ("This will eliminate possible ambiguities in communications during <u>normal</u>, alert and emergency conditions") and the SAR are very specific in that both include the term "normal" operating conditions.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
BC Hydro	No	<p>BC Hydro does not support limiting operating communications to instructions. We believe this should account for notification or reporting and that in these cases three part communication should be used to ensure understanding. For example, if an element is out of service and that is being reported to an operating entity, the receiver of that communication should show confirmation of understanding by repeating their understanding and receiving confirmation.</p> <p>Example:</p> <p>1) TOP Call to RC: Our transmission Line XX is currently out of service and is</p>

Organization	Yes or No	Question 1 Comment
		<p>expected to remain out until field crews respond.</p> <p>2) RC to TOP: OK, I understand that Line XX is out of service and will remain out until further notice.</p> <p>3) TOP to RC: That’s correct. I’ll call you when I have some more information.</p>
<p><b>Response: Thank you for your comments. The SDT applauds your use of three part communication beyond our proposal and believes it adds clarity and enhances reliability. The SDT is not inclined at this point to broaden the scope of communications that would require the use of three part communications, but does not discourage entities who wish to employ three-part communication more broadly.</b></p>		
<p>Dominion</p>	<p>No</p>	<p>Dominion agrees with the elimination of Communication Protocol, Interoperability Communication and Three part Communications proposed in the first draft.</p> <p>Each standard requirement (R1, R2 &amp; R3) specifically excludes Reliability Directives; further adding confusion to the issue of what is a reliability directive.</p> <p><b>Response: COM-003-1, draft 2, R1 does apply to Reliability Directives. R2 and R3 had exclusion language to preclude potential double jeopardy with the requirements of COM-002-3, R2 and R3. The SDT has modified its approach in the latest draft, which should eliminate the confusion.</b></p> <p>The Reliability Directive should stand on its own and if the SDT does not agree then the relationship between Reliability Directives and Operating Communications should be clarified in the Standard. When the standard is implemented, the text box (on page 2 of the clean standard) will be removed, therefore losing any tieback to a Reliability Directive as a type of operating communication.</p> <p><b>Response: The SDT acknowledges this confusion and has been working</b></p>

		<p>with RCSDT to address it. The June 7<sup>th</sup> Webinar (Posted under Project 2007-02) addressed this issue and may provide additional clarification. <a href="http://www.nerc.com/docs/standards/dt/Webinar_Slides_Project_2007-02_June_7_2012_final.pdf">http://www.nerc.com/docs/standards/dt/Webinar_Slides_Project_2007-02_June_7_2012_final.pdf</a></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>Associated Electric Cooperative JRO00088</p>	<p>No</p>	<p>Although the intent appears to be only for oral communications of NERC Certified System Operators, and those directly aimed at affecting the altered or continued state of BES elements of Facilities, the wording is insufficiently bounded. For instance, it could include any communications between a unit or plant operator and internal plant personnel, were the net output of the plant to change, significantly or insignificantly, current or future (status), its injection to the BES. The same would be true of loads, and so communication of Distribution providers with any manufacturing plant managers would necessarily become subject to this standard (extractions from the BES - significant or insignificant). Taken to one extreme, purchasing personnel could also be responsible for whatever part their telephone conversations play in altering the future status of plant real or reactive power production or consumption. AECI agrees with the SERC OC STANDARDS REVIEW GROUP consensus comment, that COM-002 should be sufficient in addressing any industry deficiencies in this area and if not, the deficiencies addressed there.</p>
<p><b>Response: Thank you for your comments. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p>		

Organization	Yes or No	Question 1 Comment
<p>LG&amp;E and KU Services</p>	<p>No</p>	<p>LG&amp;E and KU Services do not agree with the proposed definition of Operating Communication and agree with eliminating the other three definitions. The standard appears to be focused on imposing three part communications on the industry for routine communications despite the fact that neither the blackout report nor the SAR on which these standards are based emphasize that issue.</p> <p><b>Response: The OPCSDT disagrees that the Blackout Report (and FERC Order 693 and the SAR) only addresses the need to tighten protocols for Emergencies. The Blackout Report uses the phrase “especially for emergencies” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating communication and used this language to amplify the importance of such protocols during emergency conditions. FERC Order 693 paragraph 532 (“This will eliminate possible ambiguities in communications during <u>normal</u>, alert and emergency conditions”) and the SAR are very specific in that both include the term “normal” operating conditions.</b></p> <p>The blue text box that mentions Reliability Directives seems to be a back door attempt to change COM-002 and should be clarified or eliminated. Splitting communications requirements across different standards creates unnecessary confusion</p> <p><b>Response: The blue text box and the exclusionary language regarding Reliability Directives in COM-003-1, R2 and R3 were added to address concerns over potential double jeopardy. The SDT has modified its approach in the latest draft.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		

Organization	Yes or No	Question 1 Comment
Pepco Holdings Inc & Affiliates	No	The distinction between Operating Communication definition and the Reliability Directive being a type of Operating Communication is confusing.
<p><b>Response:</b> Thank you for your comments. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</p>		
MEAG Power, Danny Dees, Steven Grego, Steve Jackson	No	Operating communication is not necessarily three part communication. If three part communication is being required, then it should be defined as three part communication.
<p><b>Response:</b> Thank you for your comments. Operating Communication is a definition to categorize any instruction that directly orders reconfiguration of the BES. The SDT developed requirements to utilize three part communication when issuing or receiving an Operating Communication to reduce the potential for a miscommunication that could reduce BES reliability.</p>		
ISO/RTO Standards Review Committee	No	<p>The SRC agrees with the elimination of the three terms but not with the addition of “Operating Communication”.</p> <p><b>Thank you for your comments.</b></p> <p>The SRC does not believe that the proposed term (Operating Communication) is sufficiently different from the originally proposed term (Interoperability Communication) to warrant adoption.</p> <p><b>Response:</b> The SDT believes the term Operating Communication is more distinct than Interoperability Communication because it focuses on very specific actions that affect reliability on the BES. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System</p>

Organization	Yes or No	Question 1 Comment
		<p><b>or Facility of the Bulk Electric System.”</b></p> <p>The SDT’s proposal continues to expand the scope of the SAR from the concept of tightening the protocols associated with Emergencies or Adverse Reliability Impact to now applying to all communications. The text box in the draft standard indicates that Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. We see little difference between the two terms despite the SDT’s assessment that Reliability Directives is a type (or a subset) of Operating Communication. If the SDT intent is to use the proposed new term to require 3-part communication (as suggested in R2 and R3), then that intent can be accomplished by using the term Reliability Directives as it covers not only emergency state but also instructions needed to address Adverse Reliability Impacts.</p> <p><b>Response: The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” The SDT does not believe that it has expanded the scope of this SAR. Reliability Directive, as defined in COM-002-3, is specifically focused on Emergencies or Adverse Reliability Impacts. The scope of COM-003-1 is to require the use of common communication protocols for all BES operations that affect the state of the BES.</b></p> <p>Please also see our comments under Q6 regarding the use of the proposed term to support the requirements for 3-part communication. The SRC would note that both the Blackout Report and the FERC directive deal with tightening protocols for Emergencies, whereas the proposed SDT requirements completely fail to address emergencies and focuses solely on developing non-emergency protocols.</p>

Organization	Yes or No	Question 1 Comment
		<p><i>SRC Note: there is no mention in the Blackout Report of “operational communications breakdowns re: changing states of equipment; most of the documentation points to:</i></p> <p><i>(1) emergencies/alerts; and</i></p> <p><i>(2) notification OUTSIDE of the entity experiencing the problem. The SRC requests that in the next posting the SDT provide real examples (without naming the registered entities) where reliability was jeopardized by the failure of 3-part communications under routine operational situations.</i></p> <p>Effectiveness of Communications “Under normal conditions, parties with reliability responsibility need to communicate important and prioritized information to each other in a timely way, TO HELP PRESERVE THE INTEGRITY OF THE GRID. THIS IS ESPECIALLY IMPORTANT IN EMERGENCIES. DURING EMERGENCIES, OPERATORS SHOULD BE RELIEVED OF DUTIES UNRELATED TO PRESERVING THE GRID. A COMMON FACTOR IN SEVERAL OF THE EVENTS DESCRIBED ABOVE WAS THAT INFORMATION ABOUT OUTAGES OCCURRING IN ONE SYSTEM WAS NOT PROVIDED TO NEIGHBORING SYSTEMS.” (2003 Blackout Report, page 108)26. “Tighten communications protocols, ESPECIALLY FOR COMMUNICATIONS DURING ALERTS AND EMERGENCIES. UPGRADE COMMUNICATION SYSTEM HARDWARE WHERE APPROPRIATE. NERC should work with reliability coordinators and control area operators to improve the EFFECTIVENESS OF INTERNAL AND EXTERNAL COMMUNICATIONS DURING ALERTS, EMERGENCIES, OR OTHER CRITICAL SITUATIONS, AND ENSURE THAT ALL KEY PARTIES, INCLUDING STATE AND LOCAL OFFICIALS, and RECEIVE TIMELY AND ACCURATE INFORMATION.” (2003 Blackout Report, page 108)SRC note - Nowhere in the above quoted Recommendation 26 is there a reference to person-to-person communications of required actions; rather it references communication of the state of the operating system itself.</p>

Organization	Yes or No	Question 1 Comment
		<p><i>SRC Note: there is no mention in FERC Order 693 of “operational communications breakdowns re: changing states of equipment; the Order does state:</i></p> <p>532. “While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System. We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions. This is important because the Bulk-Power System is so tightly interconnected that system impacts often cross several operating entities’ areas.”SRC note - The above section concerns “ineffective communications” not “incorrect communications”. The key to the above is “communication uniformity” not 3 part communications. The SRC believes the both the FERC Order’s directives and the Blackout Report Recommendation 26 are clear in their respective requests to address general protocols; and that neither request suggests a need for mandating a specific procedure let alone 3 part communications for all operational communications.</p> <p><b>Response: The OPCSDT disagrees that the Blackout Report (and FERC Order 693 and the SAR) only addresses the need to tighten protocols for Emergencies. The Blackout Report uses the phrase “especially for emergencies” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating communication and used this language to amplify the importance of such protocols during emergency conditions.</b></p> <p><b>FERC Order 693 paragraph 532 (“This will eliminate possible ambiguities in communications during <u>normal</u>, alert and emergency conditions”)</b> and the</p>

		<p>shorten response time.” The SDT does not believe that it has expanded the scope of this SAR. Reliability Directive, as defined in COM-002-3, is specifically focused on Emergencies or Adverse Reliability Impacts. The scope of COM-003-1 is to require the use of common communication protocols for all BES operations that affect the state of the BES.</p> <p>Both the Blackout Report and the FERC directive deal with tightening protocols for Emergencies. The proposed requirements completely fail to address emergencies and focus solely on developing non-emergency protocols.</p> <p>Response: The OPCPSDT disagrees that the Blackout Report and FERC Order 693 only address the need to tighten protocols for Emergencies. The Blackout Report uses the phrase “<i>especially for emergencies</i>” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating communication and used this language to amplify the importance of such protocols during emergency conditions. FERC Order 693 paragraph 532 (“<i>This will eliminate possible ambiguities in communications during normal, alert and emergency conditions</i>”) and the SAR are very specific in that both include the term “normal” operating conditions.</p> <p>COM-003-1 applies to communications in both emergency and non-emergency situations. R2 and R3 had exclusion language to preclude potential double jeopardy with the requirements of COM-002-3, R2 and R3.</p>
<p>Response: Thank you for your comments. Please see the responses above.</p>		
SPP Standards Review Group	No	<p>The definition is fine but it may not be necessary based on the comments provided to the remaining questions below. It’s not so much what’s contained in the definition; it’s more about what the standard requires the</p>

Organization	Yes or No	Question 1 Comment
		industry to do with that definition. We believe eliminating the other three definitions was a positive move by the SDT.
<p><b>Response: Thank you for your comments. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p>		
SERC OC Standards Review Group	No	<p>GENERAL COMMENT: While SERC does not agree that the mandatory procedure for three part communications will improve reliability of the BES, SERC offers the following comments: We do not agree with the proposed definition of Operating communication and agree with the elimination of the other three definitions.</p> <p><b>Response: Thank you for your comments. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p> <p>The SDT has not listened to the industry comments given in the previous commenting periods. It also appears to be focused on imposing three part communications on the industry for routine communications despite the fact that neither the blackout report nor the SAR on which these standards are based emphasize that issue.</p> <p><b>Response: The OPCSDT firmly believes it has listened to industry comment based on the sweeping changes to draft 2 compared to draft 1 (the original posting) and the new approach provided in draft 3.</b></p> <p><b>The SDT is focused on requiring three-part communication for Operating</b></p>

Organization	Yes or No	Question 1 Comment
		<p>Instructions (Communication) because it provides a proven means of clarifying communication which prevents mistakes that impact the reliability of the BES. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</p> <p>The blue text box that mentions Reliability Directives seems to be a back door attempt to change COM-002 and should be clarified or eliminated. Splitting communications requirements across different standards creates unnecessary confusion.</p> <p>Response: The blue text box and the exclusionary language regarding Reliability Directives in COM-003-1, R2 and R3 were added to address concerns over potential double jeopardy. The SDT has modified it approach in the latest draft.</p>
<p>Response: Thank you for your comments. Please see the responses above.</p>		
NERC Operating Committee	No	See Response 10
<p>Response: Thank you for your comments. Please see the responses for Question 10.</p>		
Southern Company	No	<p>Southern agrees with the elimination of “Communication Protocol,” “Interoperability Communication” and “Three part Communications” proposed in the first draft of COM-003-1; however, Southern does not agree with the proposed new definition for “Operating Communication”. The</p>

Organization	Yes or No	Question 1 Comment
		<p>definition of Operating Communications is too broad.</p> <p><b>Response:</b> Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</p> <p>The SDT appears to be focused on imposing 3-part communication on the industry for routine communications even though the August 2003 Blackout Report and the direction in FERC Order 693 Paragraph do not require such.</p> <p><b>Response:</b> The OPCPSDT disagrees that the Blackout Report (and FERC Order 693 and the SAR) only addresses the need to tighten protocols for Emergencies. The Blackout Report uses the phrase “<i>especially for emergencies</i>” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating communication and used this language to amplify the importance of such protocols during emergency conditions. FERC Order 693 paragraph 532 (“<i>This will eliminate possible ambiguities in communications during normal, alert and emergency conditions</i>”) and the SAR are very specific in that both include the term “normal” operating conditions.</p> <p>The word “maintain” should be removed. Three part communication is not needed to keep things as they are in real time unless the communication is meant to be a Directive issued by the RC or TOP and identified as such. From a real time operations standpoint, only communications that are meant to initiate a change (e.g., open, close, enable, disable, increase, decrease) should require 3 part communications.</p> <p><b>Response:</b> The context was “maintain the status” which is an actionable command. The SDT has proposed “preserve” as an alternative to</p>

Organization	Yes or No	Question 1 Comment
		<p><b>“maintain” in draft 3.</b></p> <p>In addition, any instruction to change or maintain the state, status, output, or input of an Element or Facility of the BES should not be considered a Reliability Directive. A more appropriate definition of Reliability Directive has been included in Project 2006-06 (Reliability Coordination) for COM-002-3. As such, the definition of Reliability Directive developed in Project 2006-06 should be used here as part of this Project 2007-02. Further, this capitalized term should have one definition and should not be defined differently in different standards. Otherwise, there will be ambiguity and unnecessary confusion.</p> <p><b>Response: The OPCSDT is aware of the definition of Reliability Directive and has collaborated with the RCSDT. The protocols of COM-003-1 cover all operating conditions and are in force during normal or routine operations.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>The Dayton Power and Light Company</p>	<p>No</p>	<p>We have concerns with the true scope and depth of this standard. How far does this standard reach? A tie line utility wants us to utilize three part communication for tie line check outs, which we assume is not part of ‘operating communications’. Not sure this is the intent of the standard, but seems to be a coverall by them. One could argue the tie line data (which is up to 23 hours old by the time we check out, is an output from the BES) How do resolve this? Operating Communications is a very broad term that could be interpreted differently by the many individuals we interact with leading to ‘overuse’ of three part communication when in doubt. This may counteract the importance of its use for the conditions we truly need to utilize this protocol.</p>
<p><b>Response: Thank you for your comments. The SDT agrees that the tie line check out as specified is not an Operating</b></p>		

Organization	Yes or No	Question 1 Comment
<p><b>Communication.</b> Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</p>		
<p>Center Point Energy Houston Electric, LLC.</p>	<p>No</p>	<p>Question 1 Comments: Instead of adding the proposed new definition of “Operating Communication” to the NERC Glossary, the definition should be used to define the industry known terminology “Directive”, as “an instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System”. Aligning this definition with Project 2006-006 Reliability Coordination and a new proposed definition of “Reliability Directive” to be “A communication initiated by a Reliability Coordinator, transmission operator or Balancing Authority to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System where action by the recipient is necessary to address an emergency or adverse Reliability Impact”.</p>
<p><b>Response:</b> Thank you for your comments. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.” The SDT has specifically chosen to not define “directive,” as it is used in other standards and the implications of the definitions would be far reaching.</p>		
<p>IESO</p>	<p>No</p>	<p>The IESO agrees with the removal of the 3 terms proposed in the previous draft. However, the IESO does not agree with the introduction of a new term Operating Communication. This term is not materially different than the originally proposed term Interoperability Communication.</p> <p><b>Response:</b> Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an</p>

<p>need for clear communication to avoid misunderstandings that could impact the BES.</p>		
<p>Liberty Electric Power LLC</p>	<p>No</p>	<p>Routine market communications between entities are not a valid area of regulation under the NERC Standards.</p>
<p><b>Response: Thank you for your comments. The standard does not address market communication. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p>		
<p>PPL Generation, LLC on behalf of its Supply NERC Registered Entities</p>	<p>No</p>	<p>PPL Generation, LLC on behalf of its Supply NERC Registered Entities does not agree with the addition of “Operating Communication” as a proposed definition because it imposes three part communication on the industry for routine communications of changes of output in generation.</p> <p><b>Response: Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”The SDT believes that routine operations pose a risk of a communication error. Three-part communication is a proven method of reducing operating errors.</b></p> <p>Also the language as written does not specify if these changes include communication of future planning to change the status of generation in instances of future planned outages. The standard should specify if communication of real time operations is what falls under the definition of “Operation Protocol.” This ensures that communication which would be considered a compliance event and require the scrutiny of an audit.</p> <p><b>Response: The SDT is not proposing a new term “Operation Protocol.”</b></p>

Organization	Yes or No	Question 1 Comment
<p>Response: Thank you for your comments. Please see the responses above.</p>		
<p>The United illuminating Company</p>	<p>No</p>	<p>The intent of Recommendation 26 was to improve the communications around situational awareness.</p> <p><b>Response: The Blackout Report, Recommendation 26, states <i>Tighten communications protocols, especially for communications during alerts and emergencies.</i></b> The SDT interprets that to mean the authors were recommending applicability of communication protocols for the total population of operating conditions and wanted to amplify the added importance of using protocols during emergency conditions.</p> <p>The SAR states the purpose is to “efficiently convey and mutually understood for all operating conditions.”</p> <p><b>Response: The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.”</b></p> <p>Paragraph 532 seeks to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions.</p> <p><b>Response: FERC Order 693 paragraph 532 (<i>This will eliminate possible ambiguities in communications during normal, alert and emergency conditions</i>) is very specific. Please reference the term “normal” operating conditions.</b></p> <p>The new definition limits the communication to taking actions during non-Emergencies, and ignores the finding that poor communication occurred in the events leading up to the 2003 Blackout.</p> <p><b>Response: Based on comments received about the scope and intent of an</b></p>

Organization	Yes or No	Question 1 Comment
		<p>Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</p> <p>COM-003-1 deals specifically with “tightening communications” as recommended in the 2003 Blackout Report, Recommendation 26. Please read the following excerpt from Recommendation 26:</p> <p><i>“On August 14, 2003, reliability coordinator and control area communications regarding conditions in northeastern Ohio were in some cases ineffective, unprofessional, and confusing. Ineffective communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade. <u>Consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability.</u>”</i></p> <p>COM-003-1 is focused on developing effective communications protocols that are consistently applied.</p>
<p>Response: Thank you for your comments. Please see the responses above.</p>		
Indiana Municipal Power Agency	No	<p>On page 2 of 10 (blue box), the SDT has a blue box that defines Reliability Directives as a “type” of Operating Communications. This gives the appearance that Reliability Directives are part of Operating Communications and this could be a double-jeopardy issue. If an entity is found with a potential non-compliance finding on the communication of a Reliability Directive (COM-002), then it is very likely that the entity could have a potential non-compliance finding on COM-003 (proper communication of an Operating Communication).</p>
<p>Response: Thank you for your comments. COM-003-1, draft 2, R2 and R3 contain exclusionary language exempting Reliability</p>		

Organization	Yes or No	Question 1 Comment
<p>Directives to preclude potential double jeopardy with the requirements of COM-002-3, R2 and R3. The SDT has modified its approach in the latest draft.</p>		
<p>Ingleside Cogeneration LP</p>	<p>No</p>	<p>Ingleside Cogeneration LP believes that the definition of “Operating Communication” widely expands the scope of COM-003-1 beyond entity-to-entity or multiple-entity communications. Instead, all conversations conducted by System Operators, field personnel, engineers, or vendors that may refer to the status of a BES component are applicable - even those discussed face-to-face. We believe the original intent to bound the communications to those which can be captured in control room recordings and/or logbooks is manageable; not so every side conversation or email that takes place during the natural course of the operating day. The original term, “Interoperability Communication”, captured this concept.</p> <p><b>Response: The SDT never intended to include every side conversation or email that takes place during the natural course of the operating day as an Operating Communication. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p> <p>It seems like the Draft 1 definition could be easily modified to read as follows:</p> <p>Interoperability Communication: Communication of instruction &lt;between two or more entities&gt; to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.</p> <p><b>Response: Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating</b></p>

Organization	Yes or No	Question 1 Comment
		<p><b>Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p> <p>Ingleside Cogeneration LP is in full agreement with the removal of the definitions for “Communication Protocol,” and “Three part Communications”. Neither term helps address an ambiguity in the body of NERC Standards that we are aware of.</p> <p><b>Response: Thank you for your comments.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
Roger Zaklukiewicz Consulting	No	<p>The proposed standard introduces a new term "Operating Communications" which in my opinion is unnecessary and which I believe will cause confusion with the term "Reliability Directives". The standard proposes to establish a three part communications for what I would describe as routing operating instructions. This aspect of the standard would require/mandate the use of an unnecessary and burdensome operating practice that in a number of cases may impede or jeopardize system reliability rather than improve the reliability of system operations.</p>
<p><b>Response: Thank you for your comments. Even routine operations pose a risk of a communication error that could impact the stability of the BES. Three-part communication is a proven method of clarifying the content of an order or directive, and is already required for Emergencies and Adverse Reliability Impacts in COM-002-3. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</b></p>		
Entergy Services	No	<p>Due to these extensive comments and desire for these comments to be formatted for the SDT we have also sent these comments to Monica Benson</p>

Organization	Yes or No	Question 1 Comment
		<p>in a Word document. While we agree with the definition, we do not agree with R1, R2 and R3. While we are not enamored of having a Requirement to have a procedure, in this instance, the exception seems to be necessary. Below is suggested language to replace all of the Requirements and sub-Requirements in COM-003:Proposed new text:"</p> <p>R1. Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider shall develop a written communications procedure for Operating Communications among personnel responsible for Real-time generation control and Real-time operation of the interconnected Bulk Electric System. The procedure shall address at minimum: [Violation Risk Factor: Low][Time Horizon: Long Term Planning]</p> <p>1.1 When communicating between functional entities</p> <p>1.1.1. Establish the language to be used.</p> <p>1.1.2. Time format to be used.</p> <p>1.1.3. Establish treatment for time zones when multiple time zones are crossed.</p> <p>1.1.4. Identify naming convention for Transmission interface Element or a Transmission interface Facility.</p> <p>1.1.5. For oral Operating Communications, establish the treatment for the circumstances in which alpha-numeric identifiers must be used."</p> <p><b>Response: The SDT agrees and is using a similar approach for draft 3.</b></p> <p>The SDT has not listened to the industry comments given in previous ballots. It also appears to be focused on imposing three part communications on the industry for routine communications despite the fact that neither the blackout report nor the SAR on which these standards are based emphasize</p>

Organization	Yes or No	Question 1 Comment
		<p>that issue.</p> <p>Response: The OPCPSDT believes it has listened to industry comment based on the sweeping changes to draft 2 compared to draft 1 (the original posting).</p> <p>The SDT is focused on requiring three-part communication for Operating Communication because it provides a proven means of clarifying communication which prevents mistakes that have the potential to impact the reliability of the BES.</p> <p>The SDT believes the 2003 Blackout Report and the SAR do focus on protocols being applied to all operating conditions.</p> <p>Please note the following excerpt from recommendation 26:</p> <p><i>On August 14, 2003, reliability coordinator and control area communications regarding conditions in northeastern Ohio were in some cases ineffective, unprofessional, and confusing. Ineffective communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade. <u>Consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability.</u></i></p> <p>Additionally, the SAR is very specific in that it also includes the term “normal” operating conditions under Applicability: <i>“Clear and mutually established communications protocols used during real time operations <u>under normal and emergency conditions</u> ensure universal understanding of terms and reduce errors.”</i></p>
<p>Response: Thank you for your comments. Please see the responses above.</p>		

Organization	Yes or No	Question 1 Comment
Utility Services, Inc.	No	Though we agree with the addition of “Operating Communication” definition and the elimination of “Communication Protocol”, “Interoperability Communication” and “Three part Communications” definitions, the use of a “blue box” around the example of a Reliability Directive (Reliability Directive are a type of Operating Communications, to the extent they change or maintain the state, status, output, or input of an Element of Facility of the Bulk Electric System.) implies this is also a definition. We suggest removing this “blue box” from COM-003-1 and leave the definition of Reliability Directive to Project 2006-06 which has been charged with developing this definition. An alternative would be a footnote to the other Project and/or the NERC Glossary of Terms if the other standard is approved prior to COM-003-1.
<p><b>Response: Thank you for your comment. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.” This and the new approach to the standard in draft 3 eliminate the need for the textbox.</b></p>		
City of Austin dba Austin Energy	No	To clarify that Operating Communications occur in real-time, AE offers the following change to the definition: “Real-time communication of instruction to change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System.”
<p><b>Response: Thank you for your comment. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p>		
Essential Power, LLC	No	Defining the new term ‘Operating Communication’, and including the approved definition of ‘Reliability Directive’ under this newly defined term

Organization	Yes or No	Question 1 Comment
		and then requiring the use of three part communications for all 'Operating Communications' is redundant and unnecessary. There is no reason to have two separate Standards governing the use of three-part communications.
<p><b>Response: Thank you for your comments. The SDT has modified its approach in the latest draft.</b></p>		
South Carolina Electric and Gas	No	SCE&G supports the comments submitted by the SERC OC standards Review Group.
<p><b>Response: Thank you for your comments. Please see the responses to the SERC OC Standards Review Group.</b></p>		
Manitoba Hydro	No	Manitoba Hydro disagrees with the term "Operating Communication" as we do not feel there should be a distinction between Reliability Directive and "Operating Communications". We suggest that the term "Operating Communication" be replaced with the term Reliability Directive as any instruction to change the status or function of the BES must be clear and concise and confirmed with three way communication to ensure system reliability and personnel safety.
<p><b>Response: Thank you for your comment. The purpose of the SAR for this project is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time." The definition of Reliability Directive is "A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact." The SDT does not believe that Reliability Directive captures communication during normal operations. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be "command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System."</b></p>		
PPL Electric Utilities	No	Suggest the definition be clarified to scope to 'real-time' operating instructions to eliminate discussion of future outages.

Organization	Yes or No	Question 1 Comment
<p>Response: Thank you for your comment. It was never the SDT’s intention to include side-bar conversations that might be a discussion of potential operating options in the scope of COM-003-1. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</p>		
Illinois Municipal Electric Agency	No	IMEA agrees with comments submitted by the SERC OC Standards Review Group.
<p>Response: Thank you for your comments. Please see the responses to the SERC OC Standards Review Group.</p>		
Xcel Energy	No	We do not agree that this definition should include “or maintain”, and recommend that be struck. The scope should only include instructions that would require an action by the recipient.
<p>Response: Thank you for your comments. The context was “maintain the status” which is an actionable command. The intent was related to commands to preserve the integrity of a normally operating system. The SDT has proposed “preserve” as an alternative to “maintain” in draft 3.</p>		
Ameren	No	We recommend that the SDT eliminate the words “...or maintain...” in the definition. We believe that inclusion of these words would drastically reduce side conversations that continuously occur between different entities. These side conversations provide additional information and perspectives to real-time operators that ensure they understand the real-time status of the BES. In other words, due to fear of possible non-compliance consequences for failure to properly converse in a three-part protocol at all times, entities will drastically curtail side discussions and deprive all BES operators of this pertinent and useful real-time information.
<p>Response: Thank you for your comment. It was never the SDT’s intention to include side bar conversations that might be a</p>		

Organization	Yes or No	Question 1 Comment
<p>discussion of potential operating options in the scope of COM-003-1. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</p>		
<p>MISO</p>	<p>No</p>	<p>Although the definition of “Operating Communication” is, in itself, clear, the relationship between an Operating Communication and a “directive,” as used in COM-002-2, Requirement R2 is ambiguous.</p> <p><b>Response: The SDT notes that directive is a non glossary term that would be supplanted in the COM family of standards when COM-002-3 and COM-003-1 are implemented.</b></p> <p>In particular, although an explanatory graphic placed beneath the proposed definition for “Operating Communication” in the draft Standard states that “Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System,” “Reliability Directive” does not appear to be defined and is not in the <i>Glossary of Terms Used in NERC Reliability Standards</i>. As a result, the definition of Operating Communication and splitting communications requirements across different standards could result in confusion due to the unclear relationship between COM-002-2, Requirement R2 and COM-003-1, Requirements R2 and R3.</p> <p><b>Response: The SDT notes that Reliability Directive is not yet a NERC glossary term, but the SDT believes it is important to clarify the relationship between the proposed terms (Reliability Directives and Operating Communications) before they become effective.</b></p> <p>MISO is aware that “Reliability Directive” has been defined in COM-002-3, which is part of Project 2006-06, but there is no reference to Project 2006-06 or to the pending definition of “Reliability Directive” in draft COM-003-1.</p>

Organization	Yes or No	Question 1 Comment
		<p>Response: The SDT has been collaborating with project 2006-06 and is also aware of its status in the process. The OPCPSDT supports the development of COM-002-3 and the proposed definition of Reliability Directive. COM-003-1 does refer to Reliability Directive in a text box where it states that a Reliability Directive is a type of Operating Communication; and in R2 and R3 where it excludes Reliability Directives to prevent double jeopardy. This interface between these standards is the primary subject of a Webinar presented on June 7, 2012. It is posted and may address your comments.</p> <p>MISO cannot, at this time, support the current version of COM-003-1.</p>
<p>Response: Thank you for your comments. Please see the responses above.</p>		
ISO New England Inc	No	We agree with, support and have signed onto the ISO/RTO Standards Review Committee comments.
<p>Response: Thank you for your comments. Please see the responses to those comments.</p>		
Exelon Corporation and its affiliates	No	Exelon believes it is not necessary to create a new defined term “Operating Communication.” Please see response to Q10 with alternate standard language that avoids the need for a new term.
<p>Response: Thank you for your comments. Please see the responses to Question 10.</p>		
Brazos Electric Power Cooperative	No	Please see formal comments provided by APM.
<p>Response: Thank you for your comments. Please see the responses to the comments of APM.</p>		
Oncor Electric Delivery Company LLC	No	<p>Oncor is in general agreement with the elimination of the three terms.</p> <p>Furthermore, Oncor takes the position that the proposed new definition for</p>

Organization	Yes or No	Question 1 Comment
		<p>the NERC Glossary, “Operating Communication” is not needed because “person to person” communication is not cited or listed as a contributor to the events summarized in the 2003 Blackout Report.</p> <p>Oncor takes the position that improvements should emphasize communicating the state of the operating system as a whole during an emergency.</p>
<p><b>Response:</b> Thank you for your comments. The SDT believes the Blackout Report, FERC Order 693 and the SAR deal with tightening protocols. The Blackout Report uses the word “especially for emergencies” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating levels and wanted to amplify the importance during emergency conditions. FERC Order 693 paragraph 532 (“<i>This will eliminate possible ambiguities in communications during normal, alert and emergency conditions</i>”) and the SAR are very specific in that both include the term “normal” operating conditions.</p>		
Central Lincoln	No	<p>The change from “Interoperability Communications” to “Operating Communication” greatly expands the standard to include all internal communications regarding &gt; 100 kV equipment. Central Lincoln does not consider the extra burden to be worth the negligible benefit.</p>
<p><b>Response:</b> Thank you for your comments. Based on comments received about the scope and intent of an Operating Communication, the SDT has revised the term to be Operating Instruction and changed the definition to be “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</p>		
Kansas City Power & Light	No	<p>The requirements in this standard specifically state “how” to meet the goal of this standard. This standard needs to be written such that it allows for entity flexibility. Many entities already have COM protocols that are used. The proposed standard is too prescriptive and is more effort than necessary to ensure reliability and security of the BES. Overall - this standard is going to cost the registered entities much more than the realized benefits.</p>

2. The SDT eliminated the requirement to have a Communications Protocol Operating Procedure from the proposed standard because it is administrative in nature. Do you agree with this modification? If not, please explain in the comment area.

**Summary Consideration:**

**Major Issues**

The majority of commenters approved of the elimination of the Communication Protocol Operating Procedure (CPOP) in draft 1, indicating that it was too prescriptive and administrative in nature. *The SDT agreed the requirement was administrative and chose to remove it.*

Many commenters suggested retaining the CPOP and use it to develop the protocols internal to the entity. *The SDT has developed an alternate standard for the next posting. The SDT notes there is a significant amount of support for the core elements of the standard the SDT has developed for draft 3, which is a different approach than that defined in the Communication Protocol Operating Procedure.*

Stakeholders that agreed with the change did not offer substantive comment.

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	An alternative approach would be to introduce communications protocols as a mandatory non-standard (e.g. as a requirement for certification) that would center on a corporate communications manual that encourages three-part communications; and that includes how monitoring would be audited internally. Such an alternative would change the requirement from monitoring personnel mistakes to a requirement monitoring corporate culture.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Duke Energy	No	We believe that having a reliability standard requirement to develop a Communications Protocol Operating Procedure, to address items similar to those under R1.1 would be an appropriate method to address the Blackout Report recommendations and Order 693 directives to tighten communications protocols. An

Organization	Yes or No	Question 2 Comment
		<p>entity's CPOP could address the language to be used between functional entities, what clock format is to be used, how time zone/Daylight Savings Time will be addressed, and transmission equipment identifiers. The CPOP should have a required review frequency, and personnel should be trained on the CPOP. This approach, unlike the draft standard could be audited and certified. We see no way to reasonably audit or certify compliance with the draft standard in its current form. Duke suggests this approach to COM-003: Rather than specifying the solutions to achieving effective communication, COM-003 should instead focus on developing and training on an approach that is designed appropriately for each RE. For instance, another approach to COM-003 might be along the lines of:</p> <p>Requirement</p> <p>R1 could be written in a manner to require the appropriate registered entities to develop a communications protocol that is appropriate for each RE. This communications protocol should address how the RE is handling:</p> <p>Time Zone Designations - for both internal and external communications</p> <p>Language</p> <p>Alpha-numeric identifiers</p> <p>3-part communications - when is it required, etc.</p> <p>Use of defined terminology</p> <p>Use of common transmission equipment identifiers</p> <p>Other items deemed important for the communications protocol to address - again, this would not define HOW these items are addressed.</p> <p>This approach would require the RE to specify how it is addressing these issues, without prescribing solutions. For instance, a RE could include a section in its protocol to deal with time zone designation. In this section the RE could explain that it, and its neighbors, all are in and use the same time zone. As a result, the RE has</p>

Organization	Yes or No	Question 2 Comment
		<p>determined that requiring the identification of time zone reference in communication is not necessary.</p> <p>Requirement 2 could be written in a manner to require the training of operators on the communication protocol.</p> <p>Requirement 3 could be written in a manner to require the RE to define its internal controls it uses to review that its protocol is being followed.</p> <p>The compliance approach would be to:</p> <ol style="list-style-type: none"> <li>1) assess whether the RE has developed a written protocol and whether the protocol addresses each item - this does not mean there is an assessment of HOW each item is assessed;</li> <li>2) assess whether the RE has trained its operators on the communications protocol</li> <li>3) assess whether the RE is following its internal controls</li> </ol>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Associated Electric Cooperative JRO00088	No	AECI agrees with SERC OC STANDARDS REVIEW GROUP’s comments pertaining to question 2.
<p><b>Response: Thank you for your comments. Please see the response to the SERC OC Standards Review Group’s comments.</b></p>		
LG&E and KU Services	No	The SDT did not eliminate a communications procedure requirement. It turned the former requirement into R1 and its sub-parts, forcing a single communication procedure on the industry. This goes far too deeply into the “HOW” of communication as opposed to the “WHAT”.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
ISO/RTO Standards Review	No	The question is structured as an “either” “or” question about one requirement and

Organization	Yes or No	Question 2 Comment
Committee		<p>does not include a “neither” option relating to the other requirements. The SDT has replaced one procedure with another set of procedures. Neither is an appropriate requirement. The SRC believes that this and other detailed procedural requirements on personnel are not valid applications for NERC reliability standards. The SRC believes that standards must mandate outcomes and those standards such as this one on 3 part communication procedures are better left to the registered entities.</p> <p><b>Response: The question is focused only on the elimination of the CPOP, which does not feature an option or a choice.</b></p> <p>If the Industry were to support the SDT’s proposed requirement, the SRC would urge the SDT to turn away from the “zero defects” standard that it is proposing and to replace it with a requirement that allows for reasonable number of deviations.</p> <p>The proposed requirement will be prohibitively expensive to implement with little improvement in reliability (also see “whitepaper” included in response to Question 10). The requirement will require all communications channels to not just be recorded (which is done today) but will require each recording to be reviewed by a compliance person for self-reporting purposes.</p> <p>The proposed requirement would actually reduce reliability by taking the above required compliance personnel away from reliability related standards and placing them on these procedural requirements ; and</p> <p>(2) distracting operators from their core responsibility of reliability due to concerns with meeting compliance obligations.</p> <p>A more acceptable alternative approach would be to introduce communications protocols as a mandatory non-standard (e.g. as a requirement for certification) that would center on a corporate communications manual that encourages three-part communications; and that includes how monitoring would be audited internally. Such an alternative would change the requirement from monitoring personnel mistakes to a requirement for monitoring corporate culture. Moreover, the use of a non-standard</p>

Organization	Yes or No	Question 2 Comment
		<p>alternative would encourage the creation of innovative Best Practices; as opposed to a mandatory fixed procedure which would limit innovation.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
SERC OC Standards Review Group	No	<p>The SDT did not eliminate a communications procedure requirement! It turned the former requirement into R1 and its sub-parts, forcing a single communication procedure on the industry. This goes far too deeply into the “HOW” of communication as opposed to the “WHAT”.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern. When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.</b></p>		
NERC Operating Committee	No	See Response 10
Southern Company	No	<p>It appears as though the SDT did remove the term Communications Protocol Operating Procedure, but replaced it with very prescriptive requirements and sub requirements in R1 of this revised standard. This newly revised standard focuses on the “HOW” of communication when it should be more focused on the “WHAT”.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern. When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.</b></p>		
Roger Zaklukiewicz Consulting	No	See previous comment(s) regarding the necessity for a Communications Protocol Operating Procedure.

Organization	Yes or No	Question 2 Comment
<b>Response: Thank you for your comments.</b>		
Entergy Services	No	We believe that this version of COM-003 actually embeds a “CPOP” within the Requirements. This is inappropriate intrusion beyond identification of with “what” an entity must comply into “how” that entity must comply. Our suggested R1 provides replacement language that would require a communications procedure. We see no reliability value in having a defined term for “Communications Protocol Operating Procedure”, as the term “communications procedure” is completely understandable using the normally accepted meanings of the words.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Utility System Efficiencies, InC.	No	Even though this is administrative, due to the vital importance of proper operating communications a Communications Operating Procedure is necessary to ensure that the Registered Entity has established its own communications procedures in compliance with the standard to use in training its operations personnel in proper communications protocols.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>

Organization	Yes or No	Question 2 Comment
<b>Committee.</b>		
Seminole Electric Cooperative	No	While we absolutely support the promotion and use of 3-part oral communication protocol, the failure of individual persons to use "proper" and "correct" oral operational communications should NOT constitute a Standard violation. It is reasonable to require the responsible entities to have written procedures requiring such use; to have evidence of applicable personnel training on such; and to have a program for internal monitoring and enforcement of such. As written, a subjective review of many oral operational communications will arguably be identified by Compliance Auditors as medium, high or even severe levels.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Exelon Corporation and its affiliates	No	Exelon agrees with the elimination of the requirement to have a Communications Protocol Operating Procedure and we also believe the basic approach as proposed is wrong. The burden for demonstrating compliance for non-emergency, non-directive communications, including retention and review of 180-365 days worth of evidence to be able to demonstrate 100% compliance presents significant burden potentially detracting from the work of reliability. Auditing, whether by a NERC CEA or by entities conducting internal self assessments for self-certifications, would potentially involve listening to thousands of hours of tapes to review. This is an overly prescriptive, burdensome approach. We believe that a more effective approach would be for the standard to mandate reliability based outcomes and require entities to design practices to achieve the desired outcome. See response to Q10.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Oncor Electric Delivery Company LLC	No	Oncor takes the position that elimination of the Communications Protocol Operating Procedure does not constitute the introduction of another set of procedures (i.e. 3 - Part Communication, or alpha-numeric clarifiers). Furthermore Oncor takes the

Organization	Yes or No	Question 2 Comment
		position that a more productive approach would be to encourage the creation of innovative Best Practices; as opposed to a mandatory fixed procedure which would limit innovation.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Avista	No	
South Carolina Electric and Gas	No	
MEAG Power, Danny Dees, Steven Grego, Steve Jackson	Yes	It is best for NERC to evaluate risk and performance and prescribe methods.
<b>Response: Thank you for your comments.</b>		
SPP Standards Review Group	Yes	Eliminating the requirement to have the procedure (documentation) was a move in the right direction. We are glad it was eliminated because that's one less piece of paper we have to keep track of.
<b>Response: Thank you for your comments.</b>		
The United Illuminating Company	Yes	The CPOP was overly administrative.
<b>Response: Thank you for your comments.</b>		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration LP agrees that a communication procedure is unnecessary for routine operations. In our view, the remaining requirements in COM-003-1 will drive entities to continually reinforce communications protocols without it.

Organization	Yes or No	Question 2 Comment
<b>Response: Thank you for your comments.</b>		
City of Jacksonville Beach dba/Beaches Energy Services	Yes	Yes, it would be administrative in nature and would not add value.
<b>Response: Thank you for your comments.</b>		
NV Energy	Yes	This was a much warranted improvement.
<b>Response: Thank you for your comments.</b>		
New York Power Authority		NYPA supports the comments submitted by the NPCC Regional Standards Committee (RSC).

3. The SDT has proposed to transfer the requirement to use Alert Levels in Attachment 1 to another more closely aligned standard or to a separate new standard. Do you agree with this transfer? If not, please explain in the comment area.

**Summary Consideration:**

The majority of commenters approved of moving the Alert Level guide out of COM-003-1, draft 1; however the many commenters still addressed the question as if the ALG was still retained. Many commenters wanted the guide eliminated completely, stating it was too prescriptive and scripted. *The SDT believes the ALG did have value for creating situational awareness and believes it belongs in another standard and will recommend that the Standards Committee assign it accordingly. The OPCPSDT stated that it does not have the authority to determine the ultimate disposition of the ALG. The SDT has addressed each misunderstanding to clarify the matter where appropriate.*

Stakeholders that agreed with the change did not offer substantive comment.

Organization	Yes or No	Question 3 Comment
Associated Electric Cooperative JRO00088	No	AECI agrees with SERC OC STANDARDS REVIEW GROUP's comments pertaining to question 3.
<b>Response: Response: Thank you for your comments. Please see the responses to the comments by the SERC OC Standards Review Group.</b>		
LG&E and KU Services	No	LG&E and KU Services disagree. This concept more properly belongs in the NERC Rules of Procedure and should be designed to address Recommendation 26 of the NERC 2003 Blackout Report. This is an expectation of NERC and not of the industry. Also, see recent NERC Operating Reliability Subcommittee (ORS) discussions and recommendations regarding the elimination of the Transmission Alert Levels.
<b>Response: Thank you for your comments. The SDT has removed the Alert Levels in Attachment 1 from COM-003-1 because it is a notification requirement, not a communication protocol. The Standards Committee has approved the removal and will determine its disposition.</b>		

Organization	Yes or No	Question 3 Comment
MEAG Power, Danny Dees, Steven Grego, Steve Jackson	No	The language, intent and purpose is not sufficiently defined. Needs better documentation and explanation.
<p><b>Response: Thank you for your comments. The SDT has removed the Alert Levels in Attachment 1 from COM-003-1 because it is a notification requirement, not a communication protocol. The Standards Committee has approved the removal and will determine its disposition.</b></p>		
City Water Light and Power	No	This requirement should certainly not be a part of this standard, but should be eliminated entirely. It specifies a process, not a result - the requirement should be based on resultant functionality, not the process by which the entity achieves it.
<p><b>Response: Thank you for your comments. The SDT has removed the Alert Levels in Attachment 1 from COM-003-1 because it is a notification requirement, not a communication protocol. The Standards Committee has approved the removal and will determine its disposition.</b></p>		
Hydro One Networks Inc.	No	In the past there was a lot of confusion regarding the use and applicability of three-part communication. We believe that all communication protocol related requirements and information should be contained within one standard. This should include Alert Levels and their definitions.
<p><b>Response: Thank you for your comments. The SDT has removed the Alert Levels in Attachment 1 from COM-003-1 because it is a notification requirement, not a communication protocol. The Standards Committee has approved the removal and will determine its disposition.</b></p>		
SERC OC Standards Review Group	No	We disagree - this concept more properly belongs in the NERC Rules of Procedure and should be designed to address Recommendation 26 of the NERC 2003 Blackout Report. This is an expectation of NERC and not of the industry. Also, see recent NERC Operating Reliability Subcommittee (ORS) discussions and recommendations regarding the elimination of the Transmission Alert Levels.

<p>notification requirement, not a communication protocol. The Standards Committee has approved the removal and will determine its disposition.</p>		
ISO New England Inc	No	<p>These Alert Levels have been and should continue to remain a product of the NERC OC and not a Standards issue.</p>
<p>Response: Thank you for your comments. The SDT has removed the Alert Levels in Attachment 1 from COM-003-1 because it is a notification requirement, not a communication protocol. The Standards Committee has approved the removal and will determine its disposition.</p>		
Exelon Corporation and its affiliates	No	<p>While Exelon agrees with deleting the Alert Levels in Attachment 1 from COM-003-1, Exelon does not agree with transferring the requirement to use Alert Levels to any other standard or the creation of a separate new standard. As stated by many of the commenters to the previous draft, the addition of "Alert Levels" with defined colors have been used by DHS and may be misinterpreted. In response to these comments the SDT removed the requirement to Attachment 1 as falling outside the scope of a "communication protocol." Exelon reiterates that the concept of adding colored "Alert Levels" not only be deleted from COM-003-1, but also not be transferred to another SAR in the future.</p>
<p>Response: Thank you for your comments. The SDT has removed the Alert Levels in Attachment 1 from COM-003-1 because it is a notification requirement, not a communication protocol. The Standards Committee has approved the removal and will determine its disposition.</p>		
Oncor Electric Delivery Company LLC	No	<p>Oncor takes the position that the introduction of new alert levels or categories simply introduces more complexity to what could be better addressed through a closer examination of existing alert levels. This includes EEA levels and threat levels.</p>
<p>Response: Thank you for your comments. The SDT has removed the Alert Levels in Attachment 1 from COM-003-1 because it is a notification requirement, not a communication protocol. The Standards Committee has approved the removal and will determine</p>		

Organization	Yes or No	Question 3 Comment
<b>its disposition.</b>		
Kansas City Power & Light	No	Create one standard for all operating conditions and retire the balance of those places where levels are referenced. We support a new or separate requirement speaking to all alert levels for operating conditions but not combination with another unique standard losing the efficiencies of a combined set of operating condition alert levels.
<b>Response: Thank you for your comments. The SDT has removed the Alert Levels in Attachment 1 from COM-003-1 because it is a notification requirement, not a communication protocol. The Standards Committee has approved the removal and will determine its disposition.</b>		
JEA	No	
Roger Zaklukiewicz Consulting	No	
South Carolina Electric and Gas	No	
SPP Standards Review Group	Yes	We agree with the Alert Levels being removed from COM-003-1 and question the need to move them somewhere else. During its May, 2012 meeting, the Operating Reliability Subcommittee (ORS) approved a motion to ‘...terminate the pilot program using Alert Levels and to discontinue any efforts to include the guidelines in reliability standards projects.’ This was based on the inability of the ORS to demonstrate any reliability improvements during the six years that the Alert Level pilot program had been in existence. That being the case, there is no need to create a SAR and transfer this to another SDT.
<b>Response: Thank you for your comments. The Standards Committee has approved the removal and will determine its disposition.</b>		

Organization	Yes or No	Question 3 Comment
Ingleside Cogeneration LP	Yes	There are already other project teams addressing the handling of incidents related to transmission, physical, and cyber security. It is appropriate in our view to separate emergency operations communications from normal ones - as done in the second draft of COM-003-1.
<b>Response: Thank you for your comments.</b>		
City of Jacksonville Beach dba/Beaches Energy Services	Yes	None.
Colorado Springs Utilities	Yes	better option would be to retire the concept
<b>Response: Thank you for your comments. The Standards Committee has approved the removal and will determine its disposition.</b>		
Idaho Power Company	Yes	Threat Alert Levels does not seem to fit this Standard.
<b>Response: Thank you for your comments.</b>

<b>Response: Thank you for your comments. Please see the responses to the comments by the NPCC Regional Standards Committee (RSC).</b>		

4. The SDT modified the standard to allow an exemption from the requirement to use English language where the use of another language is mandated by law or regulation. (See Requirement R1, Part 1.1.1) Do you agree with this modification? If not, please explain in the comment area.

**Summary Consideration: Major Issues**

The majority of commenters approved of the use of the English language with the exemption from the requirement to use English language where the use of another language is mandated by law or regulation.

Stakeholders that agreed with the change did not offer comment.

The commenters who disagreed cited the requirement was too prescriptive and too much of a “how to” requirement. *The SDT believes using a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. The SDT also believes standards should adhere to law and regulation where government jurisdiction exists.*

Other commenters believe a very small number functional entities have local agreements to speak a language other than English. These instances appear to be rare and isolated. The SDT added mutual agreement language similar to that found in COM-001-1.1, R4 to the standard.

Organization	Yes or No	Question 4 Comment
Northeast Power Coordinating Council	No	A general suggestion for all reliability standards that has been made is that standards' requirements be eliminated that do not address reliability problems. No available information indicates that language is causing reliability problems. In the absence of such evidence that this is a reliability problem, consideration should be given to eliminating this requirement.
<p><b>Response:</b> Thank you for your comments. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication</p>		

Organization	Yes or No	Question 4 Comment
<p>which reduces the possibility of an event that could compromise the reliability of the BES.</p>		
<p>Duke Energy</p>	<p>No</p>	<p>We think mandating English is over-reaching (As currently written, the Standard erroneously focuses on “how” an entity can be compliant, rather than describing “what” an entity needs to achieve to be compliant). Let the entity that develops the CPOP and its neighbors decide on language, clock format, etc.</p>
<p>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES.</p>		
<p>Associated Electric Cooperative JRO00088</p>	<p>No</p>	<p>Although this qualification appears to now be accommodating of regional government mandates, it fails to address decorum where a non-English bounded Entity is communicating externally with entities who are unbounded by the same mandates or vice-versa. Best to let the Regional Entities work this out among themselves and document the agreements, where applicable.</p>
<p>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES.</p>		
<p>LG&amp;E and KU Services</p>	<p>No</p>	<p>This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW” of communication as opposed to the “WHAT”.</p>
<p>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.</p>		

Organization	Yes or No	Question 4 Comment
MEAG Power, Danny Dees, Steven Grego, Steve Jackson	No	Too prescriptive. NERC should be addressing risk and performance.
<p><b>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES.</b></p>		
ISO/RTO Standards Review Committee	No	<p>FERC has made it clear that it would be amenable to eliminating requirements that are not reliability problems. A requirement regarding language comes under that category. There are no reports indicating that language is causing reliability problems. The SRC does not believe this issue rises to the level of a mandatory standard. The SRC would ask if the SDT has any evidence that language is a problem causing reliability impacts. In the absence of such evidence that it is a reliability problem, the SDT should eliminate this requirement.</p>
<p><b>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System.</b></p>		
Hydro One Networks Inc.	No	<p>We believe that this requirement should be eliminated. As a general rule, standards' requirements that do not address reliability problems should be eliminated. No available information indicates that language is causing reliability problems and there. In addition to this, there are some jurisdictions where this requirement might cause decrease in reliability (i.e. Quebec)</p>
<p><b>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. The SDT added the use of an alternate language for internal operations.</b></p>		

Organization	Yes or No	Question 4 Comment
<p>During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System.</p>		
<p>SERC OC Standards Review Group</p>	<p>No</p>	<p>This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW” of communication as opposed to the “WHAT”.</p>
<p><b>Response: The SDT appreciates your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.</b></p>		
<p>Bonneville Power Administration</p>	<p>No</p>	<p>BPA believes that the existing language format should remain solely English and recognizes that this is the case with International &amp; US air traffic controllers.</p>
<p><b>Response: Thank you for your comments.</b></p>		
<p>Southern Company</p>	<p>No</p>	<p>While Southern agrees with the concept of allowing the use of another language when mandated by law or regulation, Southern does not agree with R1 and its sub requirements as they are focused on the “HOW” of communication when they should be more focused on the “WHAT”.</p>
<p><b>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.</b></p>		
<p>SMUD</p>	<p>No</p>	<p>We believe the requirement to only speak English is detrimental to reliability. Entities that have predominantly speaking Spanish personnel would be inhibited with ineffective communications mandated by the English only requirement. Further, this</p>

Organization	Yes or No	Question 4 Comment
		particular requirement is in direct conflict with COM0-001 R4 which states "...Transmission Operators and Balancing Authorities may use an alternate language for internal operations."
<p><b>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. The SDT added use of an alternate language for internal operations.</b></p>		
San Diego Gas & Electric	No	San Diego Gas & Electric ("SDG&E") agrees with the proposed exemption from the requirement to use English language where the use of another language is mandated by law or regulation. However, SDG&E recommends including the following language as an additional exemption: "or a formal agreement has been established between the functional entities to use an alternative language," so that R1.1.1. states: "Use the English language when communicating between functional entities, unless another language is mandated by law or regulation or a formal agreement has been established between the functional entities to use an alternative language."
<p><b>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. The SDT added use of an alternate language for internal operations. Comments on prior postings of COM-003-1 rejected allowances for entities to agree upon particular protocols, feeling that the documentation of those agreements would be overly burdensome and is contrary to the purpose of the SAR, which is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time."</b></p>		
Sacramento Municipal Utility District	No	See response in #10
Entergy Services	No	We disagree with all of the Requirements and sub-Requirements in this standard, due to the fact that they embody a procedure into the Requirements. There is no

Organization	Yes or No	Question 4 Comment
		reliability need being fulfilled by taking this approach. See our suggested replacement R1 in our response to Q1. This would replace R1, R2 and R3 and their associated sub-Requirements.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Essential Power, LLC	No	The use of English should be mandated for communications between entities in separate regions where the common language in one of the regions may not be English. Allowing an entity to use a language other than English when communicating with regions where English is the required language is counter to the purpose of the Standard and could in fact jeopardize reliability through miscommunication.
<p><b>Response: Thank you for your comments. The SDT agrees with your comments and clarifies that is the intent of the requirement.</b></p>		
Illinois Municipal Electric Agency	No	IMEA agrees with comments submitted by the SERC OC Standards Review Group.
<p><b>Response: Thank you for your comments. Please see the responses to the comments by the SERC OC Standards Review Group.</b></p>		
Public Utility District No. 1 of Snohomish County	No	SNPD takes issue with the specification of “English” only communications and the Alpha-Numeric identifiers. There is no precedence established for the use of English, Alpha-Numeric or the use of a 24-hour clock format that warrant a severe VSL and the associated penalties that could be imposed by the Compliance Enforcement Agency
<p><b>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. The SDT has developed a new approach to the standard that addresses your compliance concern.</b></p>		

Organization	Yes or No	Question 4 Comment
MISO	No	<p>Fluent comprehension of and speaking ability in the English language must be uniform among all Reliability Coordinators, Transmission Operators, Balancing Authorities, Generator Operators, and Distribution Providers in order to ensure the safe and reliable operation of the Bulk Electric System. NERC must ensure that all such entities employ operators that can speak and understand English fluently, regardless of their primary or preferred language. The proposed exception, while well-intended, could lead to situations where effective communication between operators is compromised or entirely prevented due to language barriers.</p> <p>MISO notes that the use of English, unless otherwise agreed, is currently required for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System under COM-001-1.1, Requirement R4, but that requirement does not apply to Generator Operators or Distribution Providers. Further, COM-001-2, which is part of Project 2006-06 (see above), would no longer require English to be used in such instances.</p> <p>Thus, COM-003-1, Requirement 1, Part 1.1.1 should be modified to require that Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider operators can speak and understand English fluently, even if it is not the required primary language pursuant to law or regulation for oral or written Operating Communications.</p>
<p><b>Response: Thank you for your comments. The SDT believes the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. The SDT added use of an alternate language for internal operations. The exception provides for adherence to existing law.</b></p>		
ISO New England Inc	No	We agree with, support and have signed onto the ISO/RTO Standards Review

Organization	Yes or No	Question 4 Comment
		Committee comments.
<p><b>Response: Thank you for your comments. Please see the responses to the comments of the ISO/RTO Standards Review Committee.</b></p>		
Exelon Corporation and its affiliates	No	Exelon finds it unnecessary for the standard to include a requirement that discusses specifics concerning language requirements. If discussion of language is important to clarify within a Registered Entity’s protocol, then the standard could suggest it as an attribute to be included in an entity developed protocol. See alternate standard language proposal in response to Q10.
<p><b>Response: Thank you for your comments. Please see the responses to the comments in Question10.</b></p>		
Oncor Electric Delivery Company LLC	No	Oncor takes the position that this requirement is unnecessary in that it is not aware of any evidence supporting the notion that failure to use the English language has been a significant contributor to reduction in reliability. Furthermore, FERC has made it known that it is in favor of eliminating requirements that do not contribute to reliability. Oncor recommends that this requirement be eliminated.
<p><b>Response: Thank you for your comments. The SDT believes that the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES.</b></p>		
California Independent System Operator	No	While the objective of minimizing ambiguities in communications between functional entities is commendable, the standard as currently written goes too far by requiring “...English when communicating between functional entities, unless another language is mandated by law or regulation.” (R1.1.1) To begin, requirement 1.1.1 is completely silent on who’s law or regulation would satisfy this requirement if a functional entity wanted/needed to speak a different language. For example, it’s unclear which of the following would satisfy this requirement:

Organization	Yes or No	Question 4 Comment
		<p><b>Response: The SDT means any law or regulation within a jurisdiction that would mandate it.</b></p> <p>1. A Canadian or Mexican law or regulation provided as evidence to WECC auditors?  <b>Response: Yes</b></p> <p>2. An American law or regulation?  <b>Response: Yes</b></p> <p>3. Perhaps both an American and a neighboring country’s law/regulation would be required?  <b>Response: Yes, if both are mandatory and enforceable.</b></p> <p>Since the proposed standard is silent on what constitutes satisfactory evidence, both numbers 1 and 2 seem like potentially harmful unilateral moves that could be detrimental to reliability but may be allowable in COM-003-1 as currently proposed.</p> <p>So if functional entities would like/need to speak a different language, the requirement looks like it’s attempting to set a high bar without specifying how high that bar is.</p> <p><b>Response: The SDT believes the use of a common language contributes to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES.</b></p> <p>I also think the requirement pre-supposes a level of English fluency by all North American citizens that simply does not exist and mandates a very high and very vague threshold for compliance while not allowing for exceptions. So ultimately, R1.1.1. Is a vague, unnecessary and inflexible requirement that would be detrimental to real-time operators in a contingent status. It would deny operators that are fluent in other languages the ability to assist non-native English speakers experiencing difficulties in communications by using a language they are fluent in to mitigate a potentially</p>

Organization	Yes or No	Question 4 Comment
		<p>serious issue.</p> <p><b>Response: The SDT points out that existing Standard COM-001-1.1, Requirement R4, which is mandatory and enforceable, and stipulates use of the English language, has been in effect for years. The fluency issue and the characterization of the proposed Requirement R1.1.1 as described has not surfaced or does not appear to be at issue.</b></p> <p>The requirement could also potentially require U.S. states, Canadian provinces and/or Mexican states to write laws and/or regulations to satisfy a requirement in a standard which seems like an unrealistic threshold. The bottom line is if an entity enters a contingent state and there is no legislation or regulation in place at the time of a contingency event, system operators may be forced to decide between two very difficult positions. Either adheres to COM-003 and run the risk of putting the grid at risk or violating COM-003 to ensure grid integrity is not compromised.</p> <p><b>Response: The SDT notes that existing Standard COM-001-1.1, Requirement R4, has been in force and there has been no requirement for any governments to develop additional legislation or regulation for the use of a specific language. COM-003-1, R1.1.1 also does not require or warrant additional laws or regulation.</b></p> <p>The SDT has developed a new approach to the standard that may address your concern.</p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
South Carolina Electric and Gas	No	
SPP Standards Review Group	Yes	While we concur with the inclusion of the exemption, we question how the industry can ensure effective communications in a situation where the exemption comes into play.

Organization	Yes or No	Question 4 Comment
<p>Response: Thank you for your comments. The SDT notes that existing Standard COM-001-1.1, Requirement R4, has been in effect for years without major issues. Non English speaking entities will speak English when communicating externally and will follow their applicable laws or regulations internally.</p>		
Western Electricity Coordinating Council	Yes	Any thoughts given to including a provision for agreement between specific entities to use a language other than English for areas that another language may be common, but not mandated by law or regulation?
<p>Response: Thank you for your comments. The SDT believes that the use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. The SDT added the use of an alternate language for internal operations. Comments on prior postings of COM-003-1 rejected allowances for entities to agree upon particular protocols, feeling that the documentation of those agreements would be overly burdensome and is contrary to the purpose of the SAR, which is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time."</p>		
Colorado Springs Utilities	Yes	"Use the English language when communicating between functional entities, unless another language is mandated by law or regulation." If two or more functional entities (say BA & TOP) reside within the same utility (perhaps even co-located in the same control center) and are communicating solely with each other, mayn't they speak their native language to each other - with or without the aid of law?
<p>Response: Thank you for your comments. The SDT believes that use of a common language eliminates confusion and misunderstandings, and expedites response. These all contribute to clarifying communication which reduces the possibility of an event that could compromise the reliability of the BES. While the SDT added use of an alternate language for internal operations, the exception does not apply to communications between functional entities.</p>

5. The SDT modified the standard to mandate utilization of a 24 hour clock for all times and to mandate the use of a time zone and indicate whether the time is daylight saving time or standard time reference when Operating Communications occur between different time zones. (See Requirement R1, Part 1.1.3) Do you agree with this modification? If not, please explain in the comment area.

**Summary Consideration:**

Commenters who approved of the use the 24 hour clock and time zone references did not offer much comment except to state they felt it added clarity to communication. Those commenters who argued against the 24 hour clock and time zone references believe the requirement is too prescriptive, reaches too far and should be eliminated. *The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the stability of the BES.*

Organization	Yes or No	Question 5 Comment
Northeast Power Coordinating Council	No	This requirement is outside the scope of the approved SAR which proposes responding to the Blackout Recommendation to tighten communications protocols especially during emergencies. This proposed requirement is both procedural and does not address tightening communications of situational awareness. As an alternative a standard could require the Functional Entities to have a communications protocol that could indeed include this, but it should not be a requirement on personnel. By adopting an alternative category (i.e. not making this a standard) a Reliability Entity could adopt a progressive best practice approach without concern for violating the strictest features of the proposed best practice.
<p><b>Response:</b> Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” Additionally, the SAR is very specific in that it also includes the term “normal” operating conditions under <b>Applicability:</b> “Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.” The SDT believes use of the 24 hour clock and</p>		

Organization	Yes or No	Question 5 Comment
<p>time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the stability of the BES. The SDT has developed a new approach to the standard that addresses your concern.</p>		
<p>ACES Power Marketing Standards Collaborators</p>	<p>No</p>	<p>1. The SDT should consider clarifying that use of relative times will not be subject to this requirement. For example, if a System Operator communicates that they will begin switching in 10 minutes, no 24 hour clock requirement is necessary.</p>
<p><b>Response: Thank you for your comments. The requirement only applies to references to clock times, not relative time.</b></p>		
<p>Midwest Reliability Organization NERC Standards Review Forum</p>	<p>No</p>	<p>There are two time zones in the eastern interconnection and two time zones in the western interconnect with Arizona not utilizing daylight savings time. The Reliability Coordinator and entities can agree on what time zone to use. The NSRF does not understand if the ‘time zone’ issue has caused any past performance issues? Please clarify with a basis of time zone inclusion.</p>
<p><b>Response: Thank you for your comments. The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the reliability of the BES.</b></p>		
<p>Detroit Edison</p>	<p>No</p>	<p>In 1.1.3 "When the communication is between entities in different time zones..." should read "When the communication is between entities in operating in different time zones...". Two entities may be physically located in the same time zone but one may operate in standard time and the other in daylight time. When communication is between entities operating in different time zones, clarify which time zone takes precedence.</p>
<p><b>Response: Thank you for your comments. The SDT believes that two entities physically located in the same geographic time zone but one operating in standard time and the other in daylight time would constitute communication “between functional entities in different time zones.”</b></p>		

Organization	Yes or No	Question 5 Comment
Duke Energy	No	We think mandating the 24 hour clock is over-reaching (As currently written, the Standard erroneously focuses on “how” an entity can be compliant, rather than describing “what” an entity needs to achieve to be compliant). Let the entity that develops the CPOP and its neighbors decide on clock format, how time zone differences will be addressed, etc.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Dominion	No	Dominion currently views this requirement as being too prescriptive, the standard should be written to allow a 24 hour clock and time zone designation or 12 clock with an AM or PM and time zone designation.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Associated Electric Cooperative JRO00088	No	There are remaining issues where Entities deal with those few areas who swap time-zones dependent upon SDT, and they could be unfairly ensnared by non-compliance, in their not realizing that nuance. In addition, given the unbounded scope of this standard, it would seem best to allow operator discretion or this clause is a PV magnet.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
LG&E and KU Services	No	This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW” of communication as opposed to the “WHAT”.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
MEAG Power, Danny Dees, Steven Grego, Steve Jackson	No	Overly prescriptive. NERC should deal with risk and performance. This level of prescriptive standard language is not appropriate.

Organization	Yes or No	Question 5 Comment
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>ISO/RTO Standards Review Committee</p>	<p>No</p>	<p>This requirement is outside the scope of the approved SAR which proposes responding to the Blackout Recommendation to tighten communications protocols especially during emergencies. This proposed requirement is both procedural and does not address tightening communications of situational awareness.</p> <p><b>Response: The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” The SDT believes use of the 24 hour clock and time zone references does in fact tighten communication because it clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the reliability of the BES.</b></p> <p>The SRC would suggest that as an alternative a standard could require the Functional Entities to have a communications protocol that could indeed include this suggestion, but it should not be a standard on personnel. By adopting an alternative category (i.e. not making this a standard) a Reliability Entity could adopt a progressive best practice approach without concern for violating the strictest features of the “proposed” best practice.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>City Water Light and Power</p>	<p>No</p>	<p>Entities who have an agreed upon protocol which includes the time zone to be used for system operations should not be required to repeat the time zone for every communication. For instance, if Entity A and Entity B are in different time zones but both have an operating policy that states all communication between the two is in Eastern Standard Time and all operating personnel are trained on this policy, this</p>

Organization	Yes or No	Question 5 Comment
		<p>should be sufficient. This achieves the same functional goal. The requirement to restate the time zone in this case only serves to set up a situation where a simple single-instance omission would have no effect on reliability but still be noncompliant.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>SPP Standards Review Group</p>	<p>No</p>	<p>Requiring time zone notifications at times other than those around the time of the transition from standard to daylight savings and back again is excessive. For a brief period of time around this transition, ensuring the correct times are communicated would probably require including standard or daylight savings designations. Some consideration for this issue needs to be incorporated into the requirement. That said, trying to be overly prescriptive with the requirement creates an unnecessary burden on operating personnel without significantly improving BES reliability. A one-size fits all requirement may not be appropriate. Entities whose geographical area is located in multiple time zones probably have internal procedures detailing how they handle time differences within their area. Most often this entails selecting one time zone as the entity’s reference. As written, the requirement overrides any internal procedures which may unnecessarily complicate internal communications. Allowances should be made for internal procedures which cover this situation.</p> <p><b>The SDT has developed a new approach to the standard that addresses your concern. In addition, this stipulation only applies to communication “between functional entities in different time zones.” If the communication is not between functional entities in different time zones, it does not apply.</b></p> <p>Requirement 1.1.3 requires that time and time zone, including standard or daylight savings time designations, must be communicated at all times. Yet Requirement 1.1.2 includes a provision that requires use to the 24-hour clock only when clock times are referenced. This needs to be included in Requirement 1.1.3 as shown below:</p> <p>When the communication is between entities in different time zones and refers to clock times, include the time and time zone and indicate whether the time is daylight</p>

Organization	Yes or No	Question 5 Comment
		<p>saving time or standard time.</p> <p><b>Response: The SDT intentionally structured the parts of the requirement this way to mandate the use of the 24 hour clock (Requirement 1.1.2) for all time references and to use time zone references (Requirement 1.1.3) and indicate whether the time is daylight saving time or standard time only for those communications among entities operating in different time zones. The SDT has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
SERC OC Standards Review Group	No	<p>This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW” of communication as opposed to the “WHAT”.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
NERC Operating Committee	No	<p>Overly prescriptive</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Progress Energy	No	<p>To prevent unintended use of “standard time” or “daylight time” Progress Energy is requesting using “prevailing time.” Instructions issued at or near the time change could have individuals inadvertently use the wrong time reference further confusing the issue.</p>
<p><b>Response: Thank you for your comments. This stipulation only applies to communication “between functional entities in different time zones.” If the communication is not between functional entities in different time zones, it does not apply.</b></p>		
Southern Company	No	<p>Southern suggests that this requirement of a common time zone is overly</p>

Organization	Yes or No	Question 5 Comment
		<p>prescriptive. The requirement should be that entities operating in different time zones agree on how to best eliminate any confusion regarding the time difference. Entities who have an agreed upon protocol which includes the time zone to be used for system operations should not be required to repeat the time zone for every communication. For instance, if Entity A and Entity B are in different time zones but both have an operating policy that states all communication between the two is in Eastern Standard Time and all operating personnel are trained on this policy, this should be sufficient. This achieves the same functional goal. The requirement to restate the time zone in this case only serves to set up a situation where a simple single-instance omission would have no effect on reliability but still be noncompliant.</p>
<p><b>Response:</b> Thank you for your comments. This stipulation only applies to communication “between functional entities in different time zones.” If the communication is not between functional entities in different time zones, it does not apply. Comments on prior postings of COM-003-1 rejected allowances for entities to agree upon particular protocols, feeling that the documentation of those agreements would be overly burdensome and is contrary to the purpose of the SAR, which is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.”</p>		
Flathead Electric Cooperative, Inc.	No	Not sure this is necessary for small entities.
<p><b>Response:</b> Thank you for your comments. The SDT believes that all BES entities that send and receive operating instructions should utilize protocols to ensure orders are not miscommunicated. A Distribution Provider or Generator Operator that only receives Operating Instructions is only held accountable for receiver’s requirements in the standard.</p>		
Liberty Electric Power LLC	No	No. Communications which do not involve Directives are not the proper subject of NERC standards.
<p><b>Response:</b> Thank you for your comments. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address</p>		

Organization	Yes or No	Question 5 Comment
<p>necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</p>		
San Diego Gas & Electric	No	<p>SDG&amp;E recommends removing the language, “When the communication is between entities in different time zones” in R1, Part 1.1.3, and replacing it with “Communication is to...”, so that R1.1.3 states: “Communication is to include the time and time zone and indicate whether the time is daylight saving time or standard time.” The proposed requirement for the communicator to determine if an entity is in a different time zone appears to be an unintended impact of the wording proposed in R1.1.3, and may prove to cause inefficiencies in complying with this requirement. Communicators SHOULD NOT NEED to determine whether or not an entity is in the same time zone as they are, but should simply state the time zone where they are calling from or the KNOWN element of their operations. Though a majority of communication will occur within the same time zones, System Operators and others affected by the requirement will be assured that the timing of ANY event will be KNOWN and never assumed.</p>
<p><b>Response:</b> Thank you for your comments. If an entity does not know the time zone of the other entity it is communicating with, it is all the more imperative that both entities understand the time at which a certain action is to occur.</p>		
Sacramento Municipal Utility District	No	See response in #10
<p><b>Response:</b> Thank you for your comments. Please see the response to Question 10</p>		
Entergy Services	No	See our response to Questions 1, 2 and 4.
<p><b>Response:</b> Thank you for your comments. Please see the responses to Questions 1, 2 and 4.</p>		

Organization	Yes or No	Question 5 Comment
City of Austin dba Austin Energy	No	There is not enough evidence to support the need for these types of specifics. Recommendation 26 encourages NERC “to ensure that all key parties ... receive timely and accurate information.” COM-003-1 seems to interpret the recommendation by telling entities “how” to ensure information is accurate (e.g., use English, 24-hour clock, time zones, alpha-numeric identifiers, etc.). This standard reaches too far into the “how” instead of focusing on the “what,” which is “timely and accurate information.” Registered entities should decide the best methods to ensure accurate information for themselves (through three-part communication, use of the 24-hour clock or otherwise).
<p><b>Response: Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.</b></p>		
Essential Power, LLC	No	This provides minimal real-time benefits to the Operators, but only serves to make it easier to conduct an after the fact analysis. As such, this is an administrative requirement that should not be included in the Standard.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Salt River Project	No	In the real time environment we deal in current hour or next hour terms. Including the time zones in these conversations would further muddy the waters.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern. This would provide the latitude to utilize relative time. In addition, this stipulation only applies to communication “between functional entities in different time zones.” If the communication is not between functional entities in different time zones, it does not apply.</b></p>		
Manitoba Hydro	No	Manitoba Hydro agrees with R1.1.2 but disagrees with R1.1.3. R1.1.3 is unnecessary

Organization	Yes or No	Question 5 Comment
		<p>and should be modified to “1.1.3 - When communication is between entities in different time zones, clarify the difference in time to ensure mutual understanding”. Making R1.1.3 more generic gives operators the opportunity to determine the best method for them to ensure mutual understanding and clarify the time difference.</p>
<p><b>Response: Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” If the protocols are not standardized, it eliminates the whole purpose behind the SAR.</b></p>		
Illinois Municipal Electric Agency	No	IMEA agrees with comments submitted by the SERC OC Standards Review Group.
<p><b>Response: Thank you for your comments. Please see the response to comments submitted by the SERC OC Standards Review Group.</b></p>		
Xcel Energy	No	<p>Is there any evidence of an actual event where there was confusion in the time zone, which led or contributed to an event? We are not aware of any. If the drafting team has no basis for mandating the use of a time zone and daylight/standard time reference, then we suggest this requirement be struck because we do not believe it would increase reliability. In fact, we think it may have the opposite effect of reducing reliability.</p> <p><b>Response: The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the reliability of the BES. While the SDT cannot immediately cite evidence of a time zone event we believe that time zone confusion can negatively impact BES operations.</b></p> <p>If the SDT decides to retain the sub-requirement, please clarify which entity’s time zone should be used. As written, this sub-requirement may create confusion for field personnel if they are to repeat the order back in their own time zone. We are concerned this will actually increase the likelihood of human error, and therefore</p>

Organization	Yes or No	Question 5 Comment
		<p>potentially reduce reliability. As a company that has field personnel in different time zones, company procedures dictate that CPT be used as that is the time zone the control center is in. Adding additional oral verification for time zones will promote human error.</p> <p><b>Response: This stipulation only applies to communication “between functional entities in different time zones.” If the communication is not between functional entities in different time zones (e.g. the field personnel and System Operator are in the same functional entity, or the field personnel is not in a NERC functional entity), it does not apply.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>Public Utility District No. 1 of Snohomish County</p>	<p>No</p>	<p>SNPD takes issue with the specification of “English” only communications and the Alpha-Numeric identifiers. There is no precedence established for the use of English, Alpha-Numeric or the use of a 24-hour clock format that warrant a sever VSL and the associated penalties that could be imposed by the Compliance Enforcement Agency</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>MISO</p>	<p>No</p>	<p>The requirement to use a 24-hour clock for all times and to indicate time zone and Standard or Daylight Saving Time would result in the expenditure of significant time, resources and attention by System Operators for a minimal benefit to reliability. To date, the use of the 12-hour clock time has not been demonstrated as problematic or as having an adverse impact on reliability. The system time characteristics should inform the communication protocols regarding time. Finally, MISO notes that the use of the 24-hour clock time in communication is inconsistent with the 12-hour clock time currently utilized by most systems. Accordingly, this modification appears to place upon operators a requirement that is not justified and onerous. MISO respectfully requests that the SDT reconsider this requirement.</p>

Organization	Yes or No	Question 5 Comment
<p>Response: Thank you for your comments. The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the stability of the BES. The SDT believes the 12 hour clock adds an element of confusion if am or pm is missing or misapplied. The SDT has developed a new approach to the standard that addresses your concern.</p>		
City of Tallahassee	No	<p>TAL is concerned with any unnecessary complication of communications. If more than one Time Zone is entailed in a communication, it is reasonable to require clarification of such. However, if both the sender and receiver observe the same prevailing time (e.g. Eastern Standard Time versus Eastern Daylight Time), it does not facilitate communication to require this clarification.</p>
<p>Response: Thank you for your comments. This stipulation only applies to communication “between functional entities in different time zones.” If the communication is not between functional entities in different time zones, it does not apply.</p>		
NextEra Energy, Inc	No	<p>NextEra believes the current language in R 1.1.2 unnecessarily limits two other forms of clear communications on the implementation of an Operating Communication. Specifically, NextEra also believes it is appropriate to use “AM” or “PM,” or “effective immediately” for the timing of implementing an Operating Communication, instead of the 24 hour clock. To add these items, NextEra requests that R 1.1.2 be revised to read as follows:</p> <p>Use one of the following:</p> <ul style="list-style-type: none"> <li>(a) the 24-hour clock;</li> <li>(b) “AM/PM” or</li> <li>(c) “effective immediately,” when referring to the time an Operating Communication shall be implemented.</li> </ul>
<p>Response: Thank you for your comments. The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the stability of</p>		

Organization	Yes or No	Question 5 Comment
<p>the BES. The SDT believes the 12 hour clock adds an element of confusion if am or pm is missing or misapplied. The SDT has developed a new approach to the standard that addresses your concern.</p>		
Alliant Energy	No	<p>We believe that adding the mandate to use a 24 hr clock and list the time zone and Daylight Savings Time or not is going too far. We agree that it could be considered a best practice, but to require it and have a violation every time it is not used will result in multiple frivolous violations and clog the system with violations that have no impact on the reliability of the BES. With a zero-defect philosophy, which currently exists in the regulatory model, this is unworkable.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
ISO New England Inc	No	<p>We agree with, support and have signed onto the ISO/RTO Standards Review Committee comments.</p>
<p><b>Response: Thank you for your comments. Please see the response to the ISO/RTO Standards Review Committee comments.</b></p>		
NV Energy	No	<p>We believe that the requirement to specify "daylight" versus "standard" is unwarranted and may lead to confusion among the parties. All time is understood to be "prevailing time" without this clarification. Requiring such will only serve to confuse rather than clarify.</p>
<p><b>Response: Thank you for your comments. The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the stability of the BES. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Exelon Corporation and its affiliates	No	<p>It's not clear that this addresses a reliability problem. We are not aware of instances where failure to specify the time zone and daylight saving time resulted in communication failures between entities leading to a condition that threatened an outage or a cascading outage. Further, specifically creating a requirement is overly prescriptive. If it is justified as important to reliability, then the standard could</p>

Organization	Yes or No	Question 5 Comment
		suggest it as an attribute to be included in an entity developed protocol. See alternate standard language proposal in response to Q10.
<p><b>Response: Thank you for your comments. The SDT believes the use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the reliability of the BES. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Brazos Electric Power Cooperative	No	Please see formal comments provided by APM.
<p><b>Response: Thank you for your comments. Please see the response to the APM comments.</b></p>		
Oncor Electric Delivery Company LLC	No	Oncor takes the position that more productive approach would be to encourage the creation of innovative Best Practices; as opposed to a mandatory fixed procedure which would limit innovation. Oncor believes that requiring registered entities to have its own internal communication protocols would encourage the adaption of best practices that could be shared, modified and implemented as a “best fit” and could potentially enhance reliability as opposed to a mandated “procedural specific” requirement
<p><b>Response: Thank you for your comments. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System.</b></p>		
Central Lincoln	No	We appreciate the change from requiring Central Time, but believe that 12 hour designations with AM or PM qualifiers to be just as clear as 24 hour clock time. In addition, we suggest that the DT or ST designation should only be required when deviating from the prevailing time in effect.
<p><b>Response: Thank you for your comments. The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the reliability</b></p>

IESO		We have no preference one way or the other as long as the personnel understand each other. However, if the option to use daylight saving time or standard time is allowed (to be agreed by the personnel), it begs the question as to why the 24-hour clock hours must be followed, and why the 12-hour clock with am and pm specified is not allowed.
<p><b>Response:</b> Thank you for your comments. The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the reliability of the BES. The SDT believes the 12 hour clock adds an element of confusion if am or pm is missing or misapplied. The SDT has developed a new approach to the standard that addresses your concern.</p>		
SMUD		Mandating use of a 24-hour clock reference provides no improvement to reliability. This is an auditing function only, there is no reliability benefit to differentiate 0800 and 8 am.
<p><b>Response:</b> Thank you for your comments. The SDT believes use of the 24 hour clock and time zone references clarifies the time element of communications and by doing so enhances reliability by avoiding time mistakes that could compromise the reliability of the BES. 6. The SDT modified the requirement for use of three-part communications for Operating Communications to clarify that this is not applicable for Reliability Directives and split the single requirement into two requirements: one for the issuer (R2) and another for the receiver (R3). Do you agree with this modification?

**Summary Consideration:**

Many of the commenters who disagreed with the changes to Requirements R2 and R3 believed, while it was appropriate to separate sender from receiver in the standard, that there should only be one standard requiring 3 part communication. Many believed COM-002-3 should be the standard that requires three part communication and only during emergencies. Many also believe that COM-003-1 is too prescriptive. *The SDT believes three part communication should be used for all communications that are direct instructions to change the BES. The SDT believes three part communication is a proven protocol that improves clarity and reduces the risks to BES reliability by reducing miscommunication. Due to the change in approach, the SDT has removed the draft 2 clarification that this is not applicable for Reliability Directives.*

Organization	Yes or No	Question 6 Comment
Northeast Power Coordinating Council	No	There are a number of references appearing that state “excluding Reliability Directives”. If Reliability Directive is going to be defined in a separate project (Project

Organization	Yes or No	Question 6 Comment
		<p>2006-06), how will stakeholders understand what is really being excluded for the purposes of this Standard’s scope?</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p> <p>It also needs to be made clear when an action is a Reliability Directive. Will each entity be required to define what is to be included as a Reliability Directive?</p> <p><b>Response: Yes, COM-002-3, R1 requires that the entity “shall identify the action as a Reliability Directive to the recipient. “</b></p> <p>With the definition of Operating Communication, three-part communications is expanded to include communications beyond directives, communications that might not warrant governance by this Standard.</p> <p><b>Response: As defined in draft 3 of COM-003-1, an Operating Instruction is a “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p> <p>The proposed exception (specifically Reliability Directives used during emergencies) does not support the reason the SAR was proposed--to improve protocols during emergencies.</p> <p><b>Response: The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” The SAR is clear that normal operating state communications as well as emergency state communications are to be addressed in the standard.</b></p> <p>The term Operating Communications is not significantly different from the term Reliability Directives (see comments to Q1). Using the term Reliability Directives to support the requirements for 3-part communication can avoid</p>

Organization	Yes or No	Question 6 Comment
		<p>(a) any confusion with the requirement in COM-002-3,  <b>Response: This was a concern of the SDT also. A webinar was conducted on June 7, 2012 and was posted to NERC.com to clarify the relationship between the two standards.</b>  <a href="http://www.nerc.com/docs/standards/dt/Webinar_Slides_Project_2007-02_June_7_2012_final.pdf">http://www.nerc.com/docs/standards/dt/Webinar_Slides_Project_2007-02_June_7_2012_final.pdf</a></p> <p>(b) potential double jeopardy of violating both COM-002 and COM-003, and            (c) the need to exercise 3-part communication for routine operating instructions.  <b>Response: See our remarks below.</b></p> <p>Suggest consider removing the term Operating Communications. Are Requirements R2 and R3 needed if Reliability Directives already cover non-emergency conditions (instructions/actions that are needed to address potential Adverse Reliability Impact)?</p> <p>The requirement to exercise three-part communication to handle Reliability Directives is thus duly addressed in COM-002-3. It hasn't been shown that three-part communication is necessary for routine operating instructions. Realistically the definition of Operating Communications covers all communications. Only Reliability Directives should require three-part communications, and should be enforceable if a miscommunication results in an error on the BES.</p> <p><b>Response: The OPCSDT respectfully disagrees. The term "Reliability Directive" in the current draft of COM-002-3 covers a very narrow band of low frequency, high impact events. Communication protocols must be applicable to all BES communications to clarify content in order to prevent mistakes that could negatively impact the BES.</b></p>

Organization	Yes or No	Question 6 Comment
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>ACES Power Marketing Standards Collaborators</p>	<p>No</p>	<p>1. We do not agree that excluding Reliability Directives is a good idea. We would prefer to see COM-003-1 and COM-002-3 combined and have the requirements only apply to Reliability Directives. If these protocols should be used for any type of communication, we believe they should be used for Reliability Directives as we've stated in our comments in Question 1. The definition of a Reliability Directive as proposed in COM-002-3 is "where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact." There is no type of communication more important than a Reliability Directive, therefore, the protocols outlined in R2 and R3 of COM-003-1 should be applicable to them. During the webinar on June 7, 2012, it was said that the only distinctions between COM-002-3 and COM-003-1 are the VRF/VSL levels and that a Reliability Directive must be stated as such when issued. There is no reason both standards can't be combined into a single standard and simply split out the VRF/VSL levels for Reliability Directives while keeping the requirement where the RC, TOP and BA shall identify the action as a Reliability Directive when one is issued. We suggest that the SDTs consider combining their efforts in this manner.</p> <p><b>Response: The SDT has developed a new approach to the standard that may address your concern.</b></p> <p>2. However, if both projects are to continue along separate paths, we'd like to see the requirements in both mirror one another so entities aren't wondering what the distinction is between the two descriptions of three-part communication. COM-003-1 is more detailed in outlining the steps that should be taken when using three-part communication than COM-002-3. COM-002-3 R2 states that the recipient "shall repeat, restate, rephrase or recapitulate..." COM-003-1 doesn't use these words. It simply states that the receiver shall "repeat" or "request the issuer reissue..."</p> <p><b>Response: The SDT has changed the relevant language in COM-003-1, draft 3 to the</b></p>

Organization	Yes or No	Question 6 Comment
		<p>same language as COM-002-3, R2 and R3.</p> <p>3. We do agree with splitting the single requirement into two requirements: one for the issuer and one for the receiver. However, we suggest the SDT develop a flow chart that demonstrates the communication paths and the loop flow of the steps to further clarify what needs to be done and when. For example, in R2 Part 2.2, after an Operating Communication is reissued at the request of the receiver (bullet 3), the receiver should repeat the information to make sure they received it correctly (R3 bullet 1) and the issuer should confirm the receiver’s response (Part 2.2 bullet 1). As the parts are written currently, the loop flow of the steps isn’t clear. It may seem intuitive but a literal reading doesn’t capture the loop flow as intended. R3 even has a gap in that the recipient can choose to repeat the Operating Communication or they can request it be reissued. Thus, if they request it is reissued, they don’t have to repeat it back.</p> <p><b>Response: The SDT has changed the relevant language in COM-003-1, draft 3 to the same language as COM-002-3, R2 and R3 to avoid confusion.</b></p> <p>4. In R3, we suggest adding the words, “before taking action” to the end of the first bullet to further emphasize the importance of receiving confirmation from the issuer. If action is taken prior to confirmation, a critical mistake could be made if the instruction was heard and repeated back incorrectly.</p> <p><b>Response: The SDT believes this suggestion has merit, but has changed language in COM-003-1, draft 3 to the same language as COM-002-3, R2 and R3.</b></p>
<p><b>Response: Thank you for your comments. Please see the remarks above.</b></p>		
<p>Midwest Reliability Organization NERC Standards Review Forum</p>	<p>No</p>	<p>The MRO NSRF recommends the following comments for consideration by the SDT:</p> <p>1. The NSRF does not understand how three part communication is not applicable to Reliability Directives, when COM-002-3 states that three part communication shall be used when issuing a Reliability Directive. This adds confusion and is further evidence</p>

Organization	Yes or No	Question 6 Comment
		<p>that there should only be one communication standard.</p> <p><b>Response: Three part communication is applicable to Reliability Directives. If you are referring to the exclusion of Reliability Directives from COM-003-1, R2 and R3, that was incorporated to address double jeopardy issues. When an entity declares a Reliability Directive under COM-002-3, R1; requirements COM-002-3, R2 and R3 apply. The SDT has developed a new approach to the standard that addresses your concern.</b></p> <p>2. How are group calls going address three part communication? Many entities use blast calls to forward system wide information in a very short period of time. The intent of a blast call is to speed up the dispersing of information from one to many. Please clarify.</p> <p><b>Response: Both Standard drafts did not address “blast calls.” The SDT has addressed “blast” or “all” calls into COM-003-1, draft 3.</b></p> <p>3. Currently there are 1681 entities (BA, TOP, RC, GOP, and DP) registered with NERC. Assume that each entity has one phone call every 10 minutes in a 12 hour day shift and half during a night shift (being conservative). A single entity will have 72 per day on an average. Note that both parties (sender and receiver) will need to use COM-003 requirements. There will be about 120,000 calls per day within NERC where COM-003 will need to be applied. That equates to 44,176,680 calls per year that require COM-003 requirements to be used. While all these communications will not necessarily be an Operating Communication, but the NSRF believes that at least 75% will be Operating Communications. This alone will slow down the reliability of our system. Is this the intent of the SDT?</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p> <p>Please consider all industry comments and upon development of “consideration of comments”, run the number of instances where COM-003 will need to be applied.</p>

Organization	Yes or No	Question 6 Comment
		<p>The question should be, does this hamper our system reliability or not.</p> <p>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT's concern.</p>
<p><b>Response: Thank you for your comments. Please see the remarks above.</b></p>		
Duke Energy	No	<p>We don't believe that 3-part communications are needed for ALL routine communications, and that R2 and R3 should be deleted. Also, there should only be one standard for communications protocols. The communications efforts in Projects 2007-02, 2006-06 and 2007-03 should be combined.</p>
<p><b>Response: Thank you for your comments. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT's concern.</b></p>		
Dominion	No	<p>The current version of this standard expands the use of three-part communication to all Operating Communications, not just Reliability Directives as specified in draft standard COM-002-3, Project 2006-06. Also, given the definition of Operating Communication (i.e., communication of instruction to change...an Element or Facility...) and the use of "two-party, person-to-person" in the Requirements, communications between two members of the same organization (e.g., two Generator Operators, two Transmission Operators) would be subject to this standard.</p>

Organization	Yes or No	Question 6 Comment
		<p>This seems impractical, requiring organizations to document, as evidence, internal communications. Dominion suggests the language be clarified to eliminate this issue.</p> <p><b>Response: Requirement R1 in draft 3 of COM-003-1 only applies to Operating Instructions between functional entities, not within a functional entity.</b></p> <p>The requirement as written could also be interpreted to mean that three-part communications is not necessary for communicating Reliability Directives. If the protocol for Reliability Directives must be covered by a different standard, then that standard should be referenced in this requirement in order to clarify the intent of the exclusion and remove the implication that three-part communications do not apply to Reliability Directives. COM-003-1 R2 could be rewritten to add clarification for Reliability Directives only as “Each Reliability Coordinator, Transmission Operator and Balancing Authority that issues an oral, two-party, person-to-person Operating Communication, excluding Reliability Directive (as referenced in COM-002-3 R2 and R3) shall:”</p> <p><b>Response: Reliability Directive from COM-002-3 was excluded from that draft of COM-003-1 to avoid double jeopardy. If we specifically referenced COM-002-3, R2 and R3 in the text of COM-003-1 and COM-002-3 was altered or eliminated in the future COM-003-1 would have an erroneous or missing reference. The SDT has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
JEA	No	<p>The two standards (COM002&amp;COM003) should be merged into one standard. Three part communications should be considered a best practice and only required during emergency directives.</p>
<p><b>Response: Thank you for your comments. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols</b></p>		

Organization	Yes or No	Question 6 Comment
<p>concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT's concern.</p>		
<p>Associated Electric Cooperative JRO00088</p>	<p>No</p>	<p>AECI appreciates the SDT's desire to add flexibility and yet clarity for what is expected, but we absolutely disagree with a split into two requirements. Such a split unnecessarily increases the industry's risk, of a single three-part communication failure, being assessed in violation of two separate requirements, yet with no added value to BES reliability. Given today's environment, PVs will be written although the intended content was accurately conveyed and the system properly operated, should these requirements exist. So AECI agrees with SERC OC STANDARDS REVIEW GROUP's assessment that R2 and R3 should be entirely removed.</p>
<p>Response: The SDT appreciates your comments. The SDT believes that having the COM-003-1 three-part communication requirements separate: one for the sender and one for the receiver, more appropriately separates the unique actions and accountabilities for each. This is consistent with the three-part structure and language in COM-002-3. This separation also prevents double jeopardy and prevents the sender and receiver from being cited based on the other's action or inaction. The SDT has developed a new approach to the standard that addresses your concern.</p>		
<p>LG&amp;E and KU Services</p>	<p>No</p>	<p>Three part communications should not be required for routine operating communications. See the definition of Reliability Directive in COM-002, which addresses reliability issues. We suggest that R2 and R3 be eliminated, since neither one will increase reliability.</p>
<p>Response: Thank you for your comments. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. MEAG Power, Danny Dees, Steven Grego, Steve Jackson	No	Overly prescriptive. NERC should deal with risk and performance.
<p><b>Response:</b> Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</p>		
ISO/RTO Standards Review Committee	No	<p>The SRC agrees that if there is a requirement for 3 part communications as proposed, then the proposed exception is needed to avoid double jeopardy, and the differentiation between issuer and receiver is needed. The SRC however does not agree with the need for the requirement itself. By introducing the proposed exception (i.e. of Reliability Directives used during emergencies) the SDT has invalidated the very reason that its SAR was proposed (i.e. to improve protocols DURING emergencies).</p> <p><b>Response:</b> Reliability Directive from COM-002-3 was excluded from that draft of COM-003-1 to avoid double jeopardy. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” The SDT believes that reliability risk exists when routine changes to the configuration of the BES are ordered. Three part communication provides additional clarity to communicating parties that helps</p>

Organization	Yes or No	Question 6 Comment
		<p><b>prevent misunderstandings that could negatively impact the BES.</b></p> <p>The SRC disagrees with using the term Operating Communications because the term is not significantly different from the term Reliability Directives (see our comments under Q1). Organization	Yes or No	Question 6 Comment
SPP Standards Review Group	No	<p>The format of the requirement is an improvement. However, we have concerns about the standard being overly prescriptive. All actions ‘...to change or maintain the state, status, output or input of an Element or Facility...’ of the BES do not have a significant impact on the reliability of the BES. The draft standard mandates that they do. Applying 3-part communications to all Operating Communications places an overly burdensome task on the industry in monitoring and tracking compliance. Additionally, a zero-tolerance interpretation of this requirement places an unjustified risk on the industry without making an appreciable improvement in BES reliability.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
SERC OC Standards Review Group	No	<p>Three part communications should not be required for routine operating communications. See the definition of Reliability Directive in COM-002, which addresses reliability issues. We suggest that R2 and R3 should be eliminated, since neither one will increase reliability.</p>

During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</b></p>		
NERC Operating Committee	No	<p>See Response 10 - the OC sees these differing concepts for communications as overly prescriptive and complex.</p>
<p><b>Response: Thank you for your comments. Please refer to the response to your comments in Question 10.</b></p>		

Organization	Yes or No	Question 6 Comment
Southern Company	No	Southern disagrees that three part communications should be required for routine operating communications. A more appropriate definition of Reliability Directive has been included in Project 2006-06 (Reliability Coordination) for COM-002-3. As such, the definition of Reliability Directive developed in Project 2006-06 should be used here as part of this Project 2007-02. Further, this capitalized term should have one definition and should not be defined differently in different standards. Otherwise, there will be ambiguity and unnecessary confusion. Southern suggests that R2 and R3 should be eliminated, since neither one will increase reliability.
<p><b>Response: Thank you for your comments. The OPCPSDT respectfully disagrees. The term “Reliability Directive” in the current draft of COM-002-3 covers a very narrow band of low frequency, high impact events. Communication protocols must be applicable to all BES Operating Communications to clarify content in order to avoid mistakes that could negatively impact the BES. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</b></p>		
The Dayton Power and Light Company	No	This standard specifically excludes “Reliability Directives” which is a term that does not currently exist in the list of definitions, rather it is proposed in a separate standard (COM-002-3) which is currently in the approval process. Not sure how you can reference a term from a pending standard.
<p><b>Response: Thank you for your comments. We wanted to acknowledge the term because it has an impact on the content and intent of COM-003-1. The two SDTs have been coordinating because of the linkages between the two standards’ requirements.</b></p>		
Lakeland Electric	No	I do not understand why Reliability Directives would be excluded! Reliability Directives are capitalized in the box on the Development Roadmap and in this question but I cannot find the term in the February 8, 2012 NERC Glossary. So where is Reliability Directives defined? I am concerned that the exclusion will cause problems especially if the clarifying box is omitted from the final standard. The split is

Organization	Yes or No	Question 6 Comment
		OK.
<p><b>Response:</b> Thank you for your comments. Both standards, COM-003-1 and COM-002-3 are still under development so the terms in each are not yet effective. The reason Reliability Directives are excluded from COM-003-1, R2 and R3 is to prevent double jeopardy with requirements COM-002-3, R2 and R3 during Emergencies or Adverse Reliability Impacts. Both standards are going through ballot and industry should be afforded clarification of the relationship between two closely related concepts.</p>		
CenterPoint Energy Houston Electric, LLC.	No	<p>Question 6 Comments: The proposed language in this requirement can be omitted and incorporated in COM-002-2 R2, where language has already been written and is currently in force regarding 3-part communications. The industry is well aware and versed in the method of communicating using 3-part communications. The elaboration of performing a three part communication is a “how to” and not necessary and can be omitted altogether. The term “3-Part Communication” could be defined and added to the NERC Glossary to suffice the elaboration of the definition proposed in this requirement. The idea of requiring all communications (Operating Communications) to be made as 3-part communications is not practical and should be left up to the communicating entities. Requiring ongoing administration of “3-part” communications will impede rather than improve timely communications consequently affecting the reliability of the BES.</p>
<p><b>Response:</b> Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</p>		
IESO	No	<p>The IESO disagrees with using the term Operating Communications as it is not much different from the term Reliability Directives (see our comments under Q1). Using the term Reliability Directives to support the requirements for 3-part communication can avoid</p>

Organization	Yes or No	Question 6 Comment
		<p>(a) any confusion with the requirement in COM-002-3,  <b>Response: This was a concern of the SDT also. A webinar was conducted on June 7, 2012 and was posted to NERC.com to clarify the relationship between the two standards.</b>  <a href="http://www.nerc.com/docs/standards/dt/Webinar_Slides_Project_2007-02_June_7_2012_final.pdf">http://www.nerc.com/docs/standards/dt/Webinar_Slides_Project_2007-02_June_7_2012_final.pdf</a></p> <p>(b) potential double jeopardy of violating both COM-002 and COM-003, and  <b>Response: See the remarks above</b></p> <p>(c) The need to exercise 3-part communication for routine operating instructions.  <b>Response: See the remarks below.</b></p> <p>However, if the SDT’s intent is to require 3-part communication for any and all operating instructions (as the proposed term suggest), then this intent will result in unnecessary 3-part communication burdens for simple actions such as when requests for the removal of a line, or switching, or generation output changes are issued. We suggest the SDT to remove the term Operating Communications. With respect to Requirements R2 and R3, we question the need for having these requirements if Reliability Directives also cover non-emergency conditions (instructions/actions that are needed to address potential Adverse Reliability Impact). The requirement to exercise 3-part communication to handle Reliability Directives is thus duly addressed in COM-002-3. Other than emergency conditions and potential Adverse Reliability Impact conditions, we do not see a need to exercise 3-part communication for routine operating instructions.</p> <p><b>Response: The OPCSDT respectfully disagrees. The term “Reliability Directive” in the current draft of COM-002-3 covers a very narrow band of low frequency, high impact events. <p>development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT's concern.</p>		
<p>Indiana Municipal Power Agency</p>	<p>No</p>	<p>IMPA agrees with the splitting of a single requirement into two requirements. However, the blue box on page 2 of 10 makes the statement "Reliability Directives are a type of Operating Communications, to the extent they change or maintain the state, status output, or input of an Element or Facility of the Bulk Electric System" which seems to include Reliability Directives by simply referencing Operating Communications in each requirement (R2 and R3). By excluding Reliability Directives, the requirement is now very confusing and can be interpreted two different ways. Requirement 2 does not include the Generator Operator as a potential entity that could issue an Operating Communication. Within its organization or company, a Generator Operator could issue an Operating Communication, such as one location calling and telling another location to start its generating unit. IMPA believes the Generator Operator should be included in R2.</p>
<p>Response: The SDT appreciates your comments. This was a concern of the SDT also. A webinar was conducted on June 7, 2012 and was posted to NERC.com to clarify the relationship between the two standards.  <a href="http://www.nerc.com/docs/standards/dt/Webinar_Slides_Project_2007-02_June_7_2012_final.pdf">http://www.nerc.com/docs/standards/dt/Webinar_Slides_Project_2007-02_June_7_2012_final.pdf</a>                      Based on the revised definition of Operating Instruction, a GOP can only be a receiver of an Operating Instruction.</p>

Organization	Yes or No	Question 6 Comment
Entergy Services	No	<p>Three part communications should not be required for routine operating communications. See the definition of Reliability Directive in COM-002, which addresses the actual reliability issues associated with communications. This team once had coordinated with the RC SDT (Project 2006-06), and the RTO SDT (Project 2007-03), with a different approach for routine communications resulting from a meeting between the chairs of the three SDTs on November 17, 2009 in the SERC offices in Charlotte, NC. Quoting from the meeting setup email: “On the basis that the SC members are the key drivers of the joint effort to finalize “Directives and Three-Part Communications”, [...] and [...] indicated a preference for Tuesday 1-3PM ET November 17. Some members of the RTOSDT and RCSDT will be attending the meeting in person....” At that meeting it was agreed that RC SDT (Project 2006-06) would develop the definition for “Reliability Directives”, and require 3-way communication for Reliability Directives by the RC. Conversely, it was decided that OPCP (Project 2007-02) would handle ordinary communications, but would not require 3-way communications for routine communications. RTO SDT (Project 2007-03) only agreed to this course of action (in effect, backing out of writing ordinary communications standards as part of Project 2007-03) because OPCP SDT (Project 2007-02) had committed to this approach during that meeting. It should be noted that “COM-001-1 Telecommunications” and “COM-002-2 Communications and Coordination” are included in the SAR for RTO SDT (Project 2007-02) and its coordination with RC SDT and OPCP SDT was conditioned upon RC SDT and OPCP SDT following the course of action agreed-to in the November 17, 2009 Charlotte, NC meeting. OPCD SDT (Project 2007-02) should honor the intent of that meeting in Charlotte and remove R2 and R3 from this standard. We suggest that R2 and R3 should be eliminated, since neither one will result in increased reliability.</p>
<p><b>Response:</b> Thank you for your comments. The OPCPSDT is aware of the meeting in Charlotte in 2009. The OPCPSDT respectfully disagrees with your summarization of the meeting. The members of the OPCP SDT that were in attendance at the Charlotte meeting referenced above, while agreeing that the RCSDT was going to define “Reliability Directive,” have no record that there was an agreement to eliminate three part communication from the development of COM-003-1. During its discussion of the</p>		

Organization	Yes or No	Question 6 Comment
<p>approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</p>		
<p>City of Austin dba Austin Energy</p>	<p>No</p>	<p>It makes sense to separate R2 from R3; however, AE respectfully objects to mandating three-part communication for normal operating communications. The fact that most registered entities already use three-part communications for normal operating communications makes it a best practice; it does not mean a NERC Reliability Standard should require it.</p>
<p>Response: Thank you for your comments. The OPCSDT respectfully disagrees. The term “Reliability Directive” in the current draft of COM-002-3 covers a very narrow band of low frequency, high impact events. Communication protocols must be applicable to all BES Operating Communications to clarify content in order to avoid mistakes that could negatively impact the BES. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</p>		
<p>Essential Power, LLC</p>	<p>No</p>	<p>Although I agree with the requirement making the receiver responsible for repeating the message, this should be included in COM-002. Again, having two separate Standards on this topic is redundant and unnecessary.</p>
<p>Response: Thank you for your comments. The SDT respectfully disagrees that COM-002 and COM-003-1 are redundant.</p>		
<p>Salt River Project</p>	<p>No</p>	<p>This combination for R2 and R3 would open some vertical entities to be being fined multiple times for the same communication.</p>
<p>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</p>		

Organization	Yes or No	Question 6 Comment
Wisconsin Electric dba We Energies	No	<p>This is too similar to but different than what is required for a directive. Since 99.9% or more communications will not be directives, we will be conditioning operators to use this for directives also.</p> <p><b>Response: The applicability of COM-003-1 is for instructions that change the configuration of the BES, not for casual conversation or for discussions of potential options among entities.</b></p> <p>If I reissue an Operating communication because the other party does not respond soon enough for me for whatever reason, the other party has violated R3 of this standard. R3 in general would not apply to a DP except for loads connected at transmission voltages.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
PPL Electric Utilities	No	<p>Since Reliability Directives are a subset of Operating Communications, if this was done to lower the VRF for Operating Communications that are not Reliability Directives, this modification makes sense. However, having two stds/rqmts address 3-part communication (even if not in same words) is not as clear as it could be. One standard requiring 3-part comm for Real-time operating communications which includes Reliability Directives would be more straight-forward, with a higher VRF for Reliability Directives.</p>
<p><b>Response: Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” This is a broader scope for communications than that for Project 2006-06.</b></p>		

Organization	Yes or No	Question 6 Comment
Illinois Municipal Electric Agency	No	IMEA agrees with comments submitted by the SERC OC Standards Review Group.
<p><b>Response: Thank you for your comments. Please see the response to comments submitted by the SERC OC Standards Review Group.</b></p>		
Ameren	No	From our perspective, use of such a split for all Operating Communications (not directives) would add to the confusion.
<p><b>Response: Thank you for your comments. The SDT believes that a separate requirement for the sender and receiver is the only reasonable manner in which to capture applicability. The SDT is using the language of COM-002-3, R2 and R3 in draft 3 of COM 003-1.</b></p>		
Idaho Power Company	No	I'm not sure I understand the separation of Directives and these Operating Instructions. They seem very similar and could be incorporated into the same standard. The split between Issuer and Receiver seems to add some clarity.
<p><b>Response: Thank you for your comments. The purpose of the SAR for this project is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time." This is a broader scope for communications than that for Project 2006-06.</b></p>		
American Transmission Company, LLC	No	<p>The prescriptive requirements currently in R2, and R3, tell how, not what, an entity is obligated to do. To address the fact that most Operating entities engage in "Operating Communications", one requirement(combining R2 and R3) is all that is needed, and ATC recommends that Requirement 2 be restated as follows:</p> <p>R2 Each Reliability Coordinator, Transmission Operator, Balancing Authority, Generator Operator, and Distribution Provider that issues, or receives an Operating Communication, excluding Reliability Directives, shall use Three-part Communications.</p>

Organization	Yes or No	Question 6 Comment
		<p><b>Response: The SDT believes that a separate requirement for the sender and receiver is the only reasonable manner in which to capture applicability and to avoid possible violations that are caused by one entity to be awarded to the other.</b></p> <p>Furthermore, ATC recommends that the SDT reconsider adding the “three-part communication” as a defined term properly vetted through the appropriate process, and added to the NERC Glossary of Terms. The definition as previously noted in Draft #1 is below.</p> <p>Three-part Communication - A Communications Protocol where information is verbally stated by a party initiating a communication, the information is repeated back correctly to the party that initiated the communication by the second party that received the communication, and the same information is verbally confirmed to be correct by the party who initiated the communication.</p> <p><b>Response: The SDT proposed that in draft 1 and was heavily criticized by stakeholders. It was eliminated in draft 2 in response to those comments.</b></p>
<p><b>Response: Thank you for your comments. Please see the comments above.</b></p>		
MISO	No	<p>Given the broad applicability of R2 and R3 as a result of the definition of Operating Communication, the split of requirements may result in entities being assessed violations for multiple requirements as a result of 1 (one) communication or operating event. While MISO appreciates the clarity in roles and responsibilities the split provides, it is concerned about the future application and feasibility thereof. Please refer to MISO’s comments regarding the definition of Operating Communication for more detail on the likely adverse impact to reliability that will result from the diversion of time and resources the split will require.</p> <p>MISO cannot, at this time, support the addition of those requirements.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a different approach to the standard that addresses your concern.</b></p>		

Organization	Yes or No	Question 6 Comment
NextEra Energy, Inc	No	<p>NextEra does not agree with R2 or R3, as drafted. COM-002-2, which applies to three-way communications for Reliability Directives, is not mirrored by the proposed COM-003-1, thus creating two different three-way communication protocols. This disconnect between the two three-way communication Standards is counterproductive for System Operators, who we want focused on the reliable operation of the system, rather than memorizing multiple three-way communication protocols. As a member of the Standards Committee, NextEra has expressed its concern that Standard Drafting Teams (SDTs) are not sufficiently communicating and coordinating in a manner that promotes clear and effective Reliability Standards. It appears that the COM-002 and COM-003 SDTs have not coordinated their efforts, because COM-003-1 proposes to implement a more restrictive three-way communication protocol via R1, R2 and R3 than proposed for COM-002-3. NextEra believes that the easiest way to make COM-003-1 consistent with COM-002-3 is to implement the same three-part communication language contained in COM-002-3. Specifically, COM-003-1 R1, R2 and R3 would be replaced with the following language that mirrors COM-002-3:</p> <p>“R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as an Operating Communication, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as an Operating Communication to the recipient.</p> <p>R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Communication shall repeat, restate, rephrase or recapitulate the Reliability Directive.</p> <p>R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Communication shall either:</p> <ul style="list-style-type: none"> <li>o Confirm that the response from the recipient of the Operating Communication (in accordance with Requirement R2) was accurate, or</li> </ul>

Organization	Yes or No	Question 6 Comment
		<p>o Reissue the Operating Communication to resolve any misunderstandings.”</p> <p>Although NextEra prefers that the SDT use the above language, in the event the SDT chooses not to mirror COM-002-3, NextEra requests the SDT implement the proposed modifications to R1 and R2 as set forth in response to questions 5, 7 and 10.</p>
<p><b>Response: Thank you for your comments. The OPCPSDT agrees and has changed the language in COM-003-1 in draft 3 to be the same language as stated in COM-002-3, R2 and R3.</b></p>		
Alliant Energy	No	<p>We do not believe there is a need for COM-003 at all and recommend it be deleted. COM-002 covers Reliability Directives very well. For three-part communications in a non-Reliability Directive situation we believe it should be considered an industry best-practice. By requiring three-part communications as dictated in this standard, there will be requests for interpretations, CAN's produced for the CEA, and numerous violations written for what the industry considers a non-problem. In our opinion this standards goes against the concept of risk-based standard making and reinforces a zero-defect operation, which opposite of how the industry works.</p>
<p><b>Response: Thank you for your comments. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT's concern.</b></p>		
ISO New England Inc	No	<p>We agree with, support and have signed onto the ISO/RTO Standards Review Committee comments.</p>
<p><b>Response: Thank you for your comments. Please see the response to the ISO/RTO Standards Review Committee comments.</b></p>

Organization	Yes or No	Question 6 Comment
		structure of R2 and R3 to take one of the following actions based on the other party's action is ambiguous.
<b>Response: Thank you for your comments. The exclusion of Reliability Directives from COM-003-1 was incorporated to preclude double jeopardy.</b>		
NV Energy	No	I have not seen the parallel requirement that pertains to Reliability Directives, but I can imagine no reason why the communication protocols for Operating Communications would ever differ from those for Reliability Directives. Making the distinction here in this requirement adds unnecessary confusion.
<b>Response: Thank you for your comments. The OPCSDT agrees and has changed the language in COM-003-1 in draft 3 to be the same language as stated in COM-002-3, R2 and R3.</b>		
Exelon Corporation and its affiliates	No	Please see response to Q10.
<b>Response: Thank you for your comments. Please see the response to Question 10.</b>		
Brazos Electric Power Cooperative	No	Please see formal comments provided by APM.
<b>Response Thank you for your comments. Please see the response to the comments provided by APM.</b>		
Oncor Electric Delivery Company LLC	No	Oncor believes that the application of three part communication as prescribed in the proposed reliability standard COM-002-3 is appropriate as prescribed for emergencies. Any additional requirements, including those for routine operations go well beyond what is called for in the 2003 Blackout Report which focused on emergencies. As such, Oncor also takes the position that the term Operating Communications should also be removed.

Organization	Yes or No	Question 6 Comment
<p>Response: Thank you for your comments. The term “Reliability Directive” in the current draft of COM-002-3 covers a very narrow band of low frequency, high impact events. Communication protocols must be applicable to all BES Operating Communications to clarify content in order to avoid mistakes that could negatively impact the BES. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</p>		
Kansas City Power & Light	No	Do we lose the “speciality” of only using 3-part communication during times of issuing directives/emergencies?
<p>Response: Thank you for your comments. The SDT believes we have not lost a unique feature of emergency communication by requiring three part communication for routine operations. The SDT believes we are creating a higher level of communication discipline designed to avoid miscommunication and prevent mistakes that would harm the stability of the BES.</p>		
South Carolina Electric and Gas	No	
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration LP agrees that Reliability Directives must be handled in a more prescriptive manner. Since Reliability Directives are also an important piece of Project 2006-06, it makes sense to move the developmental responsibility to them - and avoid unnecessary overlap between the two projects.
<p>Response: Thank you for your comments.</p>		
Manitoba Hydro	Yes	Manitoba Hydro agrees with splitting the single requirement into (R2) issuer and (R3) receiver, but as stated in our response, we do not agree with the term “Operating Communications”.
<p>Response: Thank you for your comments. Please see the response to your comments to Question 1.</p>		

Organization	Yes or No	Question 6 Comment
City of Tallahassee	Yes	TAL agrees with this split into two requirements for the protection of each party in the event of non-compliance by the opposing party. TAL seeks clarification on the application of this requirement in an instance where a receiver never acknowledges the issuer.
<p><b>Response: Thank you for your comments. The OPCPSDT would expect the issuer to continue to establish communication with the receiver through multiple attempts and multiple media. If voice communication is not achieved the issuer must assume lost communication and contemplate other alternatives.</b></p>

Western Electricity Coordinating Council		Is the exclusion of Reliability Directives because they are covered under COM-002? Since all COM-002 covers is Reliability Directives, why not include it in this standard? Operators should use the same protocol for all Operating Communications. We agree with the split for the issuer and the receiver.
<b>Response: Thank you for your comments. Yes, the SDT wanted to avoid a double jeopardy situation.</b>		
New York Power Authority		NYPA supports the comments submitted by the NPCC Regional Standards Committee (RSC).
<b>Response: Thank you for your comments. Please see the response to the comments submitted by the NPCC Regional Standards Committee (RSC).</b>		
Public Service Enterprise Group		See #10.
<b>Response: Thank you for your comments. Please see the response to the comments in Question 10.</b>		

7. The SDT modified the requirement for use of the NATO phonetic alphabet to allow use of another correct alpha numeric clarifier. (See Requirement R1, Part 1.2.) Do you agree with this modification?

**Summary Consideration:**

Commenters were confused over the meaning of “accurate” alpha-numeric clarifier. The SDT stated these alpha-numeric clarifiers were offered as alternatives to the NATO alphabet required in draft 1. *The SDT noted other commenters who felt the NATO specification was too restrictive but felt alpha-numeric clarifiers were vague. The SDT will sustain the requirement for the use of alpha-numeric clarifier but has removed the word “accurate.”*

Commenters who disagreed felt this requirement is still overly prescriptive and did not improve reliability. *The SDT has developed an alternate approach to COM-003-1 that will allow an entity to establish internal processes to identify, assess, and correct communication deficiencies.*

Organization	Yes or No	Question 7 Comment
Northeast Power Coordinating Council	No	What determines whether a clarifier used is an “accurate alpha-numeric clarifier”? What dictates non-compliance? This is a procedural issue. The Standard should require the Functional Entities to have a communications protocol that could include this, but it should not be a standard on personnel. Complexity is being added to communications, not improvement. There are equipment designations that are commonly used and understood, and to force the use of clarifiers will disrupt operating communications.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
ACES Power Marketing Standards Collaborators	No	<ol style="list-style-type: none"> <li>1. First the requirement uses the word “accurate” instead of “correct” as stated in this question.</li> <li>2. What is meant by the term “accurate alpha-numeric clarifiers?” Can someone make up their own alpha-numeric clarifiers in the heat of the moment and expect the other party to mentally “transition” and understand what they mean? Or does it</li> </ol>

Organization	Yes or No	Question 7 Comment
		<p>have to be another established and recognized alpha-numeric clarifier? A made up alpha-numeric clarifier could be confusing to someone who isn't familiar with the clarifiers being used. This is more of a mental "transition" than determining the difference between an Emergency (which will be stated up front as a Reliability Directive as proposed in draft COM-002-3) and a normal operating instruction. We suggest that only established alpha-numeric clarifiers be used.</p>
<p><b>Response: Thank you for your comments. The word "accurate" has been removed. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>Midwest Reliability Organization NERC Standards Review Forum</p>	<p>No</p>	<p>The MRO NSRF recommends the following comments for consideration by the SDT: As written, if an operator simply states "open switch c138", they would be found non compliant. The SDT has not given any justification (reference to a FERC Directive) to why they are mandating the use of alpha-numeric clarifiers within this requirement. It is not needed to be written within this (or any other standard). It is agreed that it may be a good practice in some cases, but when written within a standard, it is driving for a zero tolerance. Entities will make a mistake and this non compliance issue will be forward via the CEA as an FFT. Section 81 of the Commission's March 15th, 2012 order questions if a violation is forwarded in an FFT format, is it really needed for reliability. This requirement needs to be deleted. If an entity wishes to use an alpha-numeric format, they can as part of their internal controls to reduce their risk of violating a different standard or for safety reasons. The requirement of using alpha-numeric as a standard will be administratively burdensome and punitive. For example: An operator states, "open switch fifteen twenty six" instead of "open switch one, five, two, six" is now subject to a potentially significant fine for no reliability benefit. Suggest dropping the Alpha Numeric clarifier requirement from the standard.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		

Organization	Yes or No	Question 7 Comment
Detroit Edison	No	<p>"use accurate alpha-numeric clarifiers" is vague. Suggest re-wording and adding verbiage: "use defined (or standard or specified) alpha-numeric clarifiers as specified in Registered Entities communication protocols."Concern with requirement 1.2-alpha-numeric clarifiers. Would like clarification if any alpha clarifier can be used or must the phonetic alphabet listed in the white paper (military Communication protocol)be used. example: for "R", is it required to use "Romeo" or can "Robert" be used?</p> <p><b>Response: The word "accurate" has been removed.</b></p> <p>Concern with VSL table for R1. Current format shows that an entity must be 100% compliant. The break down from medium to severe is based on how many elements of R1 was not followed. Suggest changing the format to how many times it was not followed rather than the number of elements.</p> <p><b>Response: The SDT has developed a different approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. See the response above.</b></p>		
Duke Energy	No	<p>We think that this is over-reaching (As currently written, the Standard erroneously focuses on "how" an entity can be compliant, rather than describing "what" an entity needs to achieve to be compliant), and creating a requirement that can't reasonably be audited or certified.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
BC Hydro	No	<p>BC Hydro does not support the full time use of alpha numeric clarifiers for all Operating Communication. In some cases we believe it detracts from the instruction being delivered. In our system, devices are identified by a combination of alpha and numeric. For example, to call transmission line 5L98, '5-Line-98' or a circuit breaker 5CB11, '5-circuit breaker-11' does not add value. This may help in some areas</p>

Organization	Yes or No	Question 7 Comment
		depending on their naming conventions. BC Hydro does not think the use of the term 'accurate' effectively describes what is permissible to be used as an alpha numeric clarifier.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Dominion	No	Dominion suggests that Requirement R1, Part 1.2 is ambiguous in that the use of alpha-numeric identifiers appears optional (but if they are used, they must be accurate). If the purpose of Part 1.2 is to USE alpha-numeric identifiers, then this statement needs to be modified to state that more directly and to give that clarity.
<b>Response: Thank you for your comments. Some Operating Instructions may not involve alpha-numeric qualifiers.</b>		
Associated Electric Cooperative JRO00088	No	AECI appreciates the SDT's desire to afford flexibility to the industry, and yet we still view this level of prescription as unnecessarily burdensome, given the current broad scope of this particular standard.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
LG&E and KU Services	No	This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT".
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
MEAG Power, Danny Dees, Steven Grego, Steve Jackson	No	Too prescriptive. The industry has performed for many decades, successfully. NERC should focus on risk and performance.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
ISO/RTO Standards Review	No	This requirement is a procedural issue and is outside the scope of the approved SAR

Organization	Yes or No	Question 7 Comment
Committee		<p>which proposes responding to the Blackout Recommendation to tighten communications protocols especially during emergencies. This proposed requirement is both procedural and does not address tightening communications of situational awareness. The SRC would suggest that the standard should require the Functional Entities to have a communications protocol that could indeed include this suggestion, but it should not be a standard on personnel.</p>
<p><b>Response: Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.”</b> Response: The OPCSDT disagrees that the Blackout Report (and FERC Order 693 and the SAR) only addresses the need to tighten protocols for Emergencies. The Blackout Report uses the phrase “<i>especially for emergencies</i>” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating communication and used this language to amplify the importance of such protocols during emergency conditions. FERC Order 693 and the SAR are very specific in that both include references to “normal” operating conditions.</p> <p>The SDT has developed a new approach to the standard that addresses your concern.</p>		
City Water Light and Power	No	<p>Again, this requirement attempts to dictate process as opposed to being a standard. The standard should only dictate the result, not how it is achieved.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Hydro One Networks Inc.	No	<p>This requirement adds added complexity to communications, not improvement. There are equipment designations that are commonly used and understood, and to force the use of clarifiers will disrupt operating communications.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
SERC OC Standards Review Group	No	<p>This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW” of communication as opposed to the “WHAT”.</p>

Organization	Yes or No	Question 7 Comment
<p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>Bonneville Power Administration</p>	<p>No</p>	<p>BPA disagrees with both clarifiers (NATO phonetic alphabet and alpha numeric) and believes the communication should be left to the discretion of each utility. This modification causes an undue burden when relaying communication; especially in a time of an emergency and dramatically increases the risk of human error. BPA recommends that the drafting team remove any and all language of NATO phonetic and alpha numeric identification of any device, (Alpha and especially numeric phonetic requirements). R2 and R3 clearly ensure that all parties are already properly communicating clearly and concisely. Should the drafting team remove the NATO phonetic and alpha numeric language, BPA would change its negative position to affirmative.</p>
<p><b>Response: Thank you for your comments. The SDT respectfully disagrees with your assertion that the use of alpha numeric clarifiers will “dramatically increase the risk of human error”. Use of phonetic clarifiers is a Human Performance tool designed to reduce the rate of human error and communication problems.</b></p> <p><b>The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>Southern Company</p>	<p>No</p>	<p>Southern does not agree with R1 and its sub-requirements as they appear to force a single communications procedure on the industry and are focused on the “HOW” of communication when they should be more focused on the “WHAT”. Also, the word "accurate" should be removed from R1.2, as it is not needed.</p>
<p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>The Dayton Power and Light Company</p>	<p>No</p>	<p>This requires using a 'correct' alpha numeric clarifier, while the proposed standard is written as 'accurate'. It would be great if there were consistency between the proposed standard and the comment form. Not sure how one can define accurate or correct. The standard indicates that NATO has one, but there are others as well. The moniker for “A” in the LAPD definition is ADAM, while NATO is ALPHA. Both are</p>

Organization	Yes or No	Question 7 Comment
		<p>'accurate and/or correct' but if I use one version and the person I'm talking to uses another, is this a violation of the standard? The language in this proposed version is better than the last (where they required the use of the NATO language) but I'm still not comfortable this proposal fixes the problem.</p>
<p><b>Response: Thank you for your comments. The word "accurate" has been removed. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>CenterPoint Energy Houston Electric, LLC.</p>	<p>No</p>	<p>Question 7 Comments: The use of correct alpha numeric clarifiers represents a "how to" and although it may be an example of a good utility practice, it should not be a requirement to the extent of not only just having to use the alpha numeric clarifiers, but required to use them correctly or "accurate" as it is currently worded in the language of proposed COM-003-1 R 1.2 draft 2. The requirement is unclear as to whether the accurate use of alpha -numeric clarifiers is required only when the clarifiers are used, or whether accurate use of alpha-numeric clarifiers are required for all oral Operating Communications. The use of any alpha- numeric clarifiers should be left up to the discretion of the communicating entities during their exchange, acknowledgement, and agreement of information of any such communication.</p>
<p><b>Response: Thank you for your comments. The word "accurate" has been removed. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>SMUD</p>	<p>No</p>	<p>Communication should not be restricted to only use of the phonetic alphabet. Referencing a "103-C" switch versus a "103-Charley" does not enhance reliability and has the potential of hindering reliable operation of the BPS by forcing the Operator Communications personnel to focus on being compliant with the correct phonetics rather than the actual instruction.</p>
<p><b>Response: Thank you for your comments. The SDT respectfully disagrees with your thought that the use of alpha numeric</b></p>		

Organization	Yes or No	Question 7 Comment
<p>clarifiers has the potential to “hinder reliable operation”. Use of phonetic clarifiers is a Human Performance tool designed to reduce the rate of human error and communication problems. The SDT has developed a new approach to the standard that addresses your concern.</p>		
Liberty Electric Power LLC	No	Again, this is beyond the proper scope of reliability standards.
<p><b>Response: Thank you for your comments. The SDT respectfully disagrees and has developed a new approach to the standard that addresses your concern.</b></p>		
PPL Generation, LLC on behalf of its Supply NERC Registered Entities	No	<p>PPL Generation, LLC on behalf of its Supply NERC Registered Entities does not believe that this sub requirement is appropriate when applied with the new definition “Operating Communication.” Common operating communications should not be considered a compliance event that requires the use of correct alpha numeric clarifiers. Under the current language, it could be interpreted that according to “Operating Communication” that every change in generation output must be stated in alpha numeric clarifiers in every instance of communication. This requirement shifts operators focus from communicating proper information to a focus on communicating using the specified terms in all instances of communication, where in everyday normal business activities and operation should not require such scrutiny.</p>
<p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Orlando Utilities Commission	No	Use a phonetic alphabet only when further clarification is needed.
<p><b>Response: Thank you for your comments. Use of phonetic alphabet only when further clarification is needed could be subjective. The receiver of the communication may have thought that they clearly heard “Open breaker 13D” when what was really said was to “Open breaker 13B”. Use of the phonetic alphabet would correct this potential error.</b></p>		
Clark Public Utilities	No	This requirement is still overly prescriptive. Practically all switches, breakers, and transformers have alpha-numeric identifiers and the proposed Requirement R1.2 will require the use of some form of alpha-numeric clarifier (either NATO or some other

Organization	Yes or No	Question 7 Comment
		<p>accurate clarifier). However, many alpha-numeric identities need no clarifier to be accurately understood. Additionally, any such mis-understandings would become obvious during the three-way communication process. The SDT needs to modify this requirement to allow the judgment of the system operator to be used in the determination of whether an alpha-numeric clarifier is needed. This judgment would be based on</p> <p>(1) common sense in understanding that some letters or numbers may sound similar when broadcast over communications equipment,</p> <p>(2) past experience with certain letters or numbers requiring clarification,</p> <p>(3) an understanding by each individual system operator (as supplemented by managerial oversight) of that system operator’s ability to correctly pronounce letters and numbers (in the English language, unless another language is mandated by law or regulation), and</p> <p>(4) confidence derived from the accurate and understandable repetition of the alpha-numeric identifiers in the three way communication process.</p> <p>Clark believes that Requirement R1.2 needs to rely on the determination by the system operator as to whether the use of an alpha-numeric clarifier is needed or not. These system operators are required to obtain certifications and ongoing training and the operating process needs to defer to the judgment of trained and certified system operators to resolve this potential communication issue.</p>
<p><b>Response: Thank you for your comments. The SDT believes that it would be more consistent and less confusing for the operators to utilize alpha numeric clarifiers at all times instead of having to go through a determination if it is needed in each operating situation.</b></p>		
<p>Indiana Municipal Power Agency</p>	<p>No</p>	<p>The question uses the word “correct” and the requirement uses the word “accurate”. The use of either word adds ambiguity to the requirement, and an entity being found compliant or non-compliant depends on how the entity and the auditor interprets</p>

Organization	Yes or No	Question 7 Comment
		the meaning of “use of an accurate alpha-numeric clarifier”. The SDT should allow the entity to pick the alpha-numeric clarifier that its company wants to use or the same clarifier that was used when the Operating Communication was given, and not give an auditor the chance to say it is not an “accurate” alpha-numeric clarifier.
<b>Response: Thank you for your comments. The word “accurate” has been removed. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Sacramento Municipal Utility District	No	See response in #10
Energy Services	No	See our responses to Questions #1, 2 and 4.
<b>Response: Thank you for your comments. See responses to these questions.</b>		
City of Austin dba Austin Energy	No	There is not enough evidence to support the need for these types of specifics. Recommendation 26 encourages NERC “to ensure that all key parties ... receive timely and accurate information.” COM-003-1 seems to interpret the recommendation by telling entities “how” to ensure information is accurate (e.g., use English, 24-hour clock, time zones, alpha-numeric identifiers, etc.). This standard reaches too far into the “how” instead of focusing on the “what,” which is accurate information. Registered entities should decide the best methods to ensure accurate information for themselves (through three-part communication, use of the 24-hour clock or otherwise).
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Colorado Springs Utilities	No	the term "correct alpha-numeric clarifier" is itself unclear. Searching on Google, I can find no other use of this term outside of this Standard. Therefore, this does not appear to be a standard term or concept. Did the SDT mean to require the use of a phonetic alphabet (NATO's or any other)? If so, please just state so. If the intent was

Organization	Yes or No	Question 7 Comment
		to permit means other than phonetic alphabets to ensure clear communication of alpha-numeric identifiers, then I suggest clarifying the Standard's language. Perhaps, "When participating in oral Operating Communications and using alpha-numeric identifiers, use a phonetic alphabet or similar means to ensure clear understanding."
<p><b>Response: Thank you for your comments. The SDT used the term “alpha numeric clarifier” as a substitute for the NATO alphabet, which generated many comments from draft 1. It gives entities freedom to use their own clarifier that conveys the correct number or letter of equipment nomenclature they are referring to. The word “accurate” has been removed.</b></p>		
Essential Power, LLC	No	If the purpose of this Standard is to improve and standardize communications, than all entities should use the same alpha numeric clarifiers.
<p><b>Response: Thank you for your comments. Previous versions of this Standard required the use of the NATO phonetic alphabet. This was seen as too prescriptive by industry. While there is nothing to prevent entities from using standardized alpha numeric clarifiers, it is not a requirement in this version of the standard.</b></p>		
Wisconsin Electric dba We Energies	No	Use of “accurate” accurate alpha-numeric clarifiers is subjective. What are they? Who decides what is “accurate”? An auditor? The NATO phonetic alphabet is really still being mandated. What if I use the NATO version and another entity uses a different one. Can we talk to each other? We will now also have to specify what phonetic alphabet we are using before any communication.
<p><b>Response: Thank you for your comments. The word “accurate” has been removed. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Manitoba Hydro	No	Manitoba Hydro agrees with the use ‘accurate alpha-numeric identifiers’ and feels that they should also be required when referring to a Transmission interface Element or a Transmission interface Facility in R1.1.4
<p><b>Response: Thank you for your comments.</b></p>		

Organization	Yes or No	Question 7 Comment
Portland General Electric - Transmission & Reliability Services	No	Requirement 1.2 requiring the use of alpha-numeric clarifiers would unnecessarily complicate operator communications, especially inter-company communications where transmission facilities have historically and are commonly identified by alpha-numeric characters. The use of three-way communications ensures accurate communications without the complications of alpha-numeric clarifiers.
<p><b>Response: Thank you for your comments. Use of phonetic clarifiers is a Human Performance tool designed to reduce the rate of human error and communication problems. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Puget Sound Energy	No	No. The current language addressing alpha-numeric clarifiers is a significant improvement over the formulation addressing the same issue in the previous draft. However, this requirement remains overly-prescriptive, especially with respect to numeric clarifiers. Even with the NATO clarifiers, not all numbers have clarifiers. As a result, it not clear when a numeric clarifier would be required and when it is acceptable not to use such a clarifier. The requirement to use alpha-numeric clarifiers should be removed from the proposed standard entirely. If the requirement is not removed in its entirety, the requirement should be modified to exclude numeric clarification.
<p><b>Response: Thank you for your comments. The word “accurate” has been removed. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Illinois Municipal Electric Agency	No	IMEA agrees with comments submitted by the SERC OC Standards Review Group.
<p><b>Response: Thank you for your comments. Please see the response for the SERC OC Standards Review Group.</b></p>		
Xcel Energy	No	1) “Accurate alpha-numeric identifier” needs to be clarified. Could each entity (or even each operator) create their own alpha-numeric identifiers? Further would it be a violation if an operator used “Charlie” in one conversation and “chalk” in another?

Organization	Yes or No	Question 7 Comment
		<p>Or, is it an expectation that the entity/operator adopts an existing list of alpha-numeric identifiers, which is published publicly?</p> <p><b>Response: The standard does not mandate any one clarifier over another. The word “accurate” has been removed.</b></p> <p>2) We recommend that device names be excluded from the requirement to use alpha-numeric identifiers when both parties are working off of written instructions. We do not feel requiring this would improve reliability. Instead, it could actually slow down the recovery of the system. For example, we have devices in the field that may be labeled 12B34-W gang switches and it makes no sense to say, “Open and tag the one, two, B as in Bravo, three, four W as in Whiskey gang switch, when both parties have “12B34-W” written in the instructions they are both working from. Three-way communications are occurring and if there is any question as to the device name, it can be caught and clarified during that process.</p> <p><b>Response: Thank you for your comments. The SDT disagrees with exempting equipment names even when written down. This is another check that the correct equipment is being operated. The SDT disagrees that use of alpha numeric clarifiers would slow down recovery.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
Ameren	No	<p>We recommend to the SDT that one industry-wide alpha-numeric clarifying system should be used. Multiple systems may add confusion by use of clarifying words that some Operators may not be familiar with. We agree with use of the NATO Spelling Alphabet.</p>
<p><b>Response: Thank you for your comments. Previous versions of this Standard required the use of the NATO phonetic alphabet. This was seen as too prescriptive by industry. While there is nothing to prevent entities from using standardized alpha numeric clarifiers, it is not a requirement.</b></p>		

Organization	Yes or No	Question 7 Comment
Idaho Power Company	No	They should specify the alphabet to use for consistency.
<p><b>Response: Thank you for your comments. Previous versions of this Standard required the use of the NATO phonetic alphabet. This was seen as too prescriptive by industry. While there is nothing to prevent entities from using standardized alpha numeric clarifiers, it is not a requirement.</b></p>		
MISO	No	<p>MISO is concerned that the phrase “accurate alpha-numeric clarifiers” is ambiguous and could lead to unintended compliance burdens. Further, MISO notes that this provision will have, at most, a minimally beneficial impact on reliability while requiring Registered Entities to expend substantial additional resources and will increase the likelihood of adverse impacts to reliability resulting from confusion caused by non-standard alpha-numeric clarifiers.</p>
<p><b>Response: Thank you for your comments. The word “accurate” has been removed. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Consumers Energy	No	<p>As there is no definition of what alpha - numeric clarifiers must be used, this leaves too much room for interpretation for audit staff.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
NextEra Energy, Inc	No	<p>Similar to the 24 clock, it appears that R1.2 does not fully consider how communications and naming conventions are used in the industry. Specifically, alpha-numeric identifiers are used when there is an uncommon naming convention. Examples of common naming conventions include AM/PM, breaker names such as (8W15), etc. As written, the requirement could be interpreted to require alpha-numeric identifiers for all alpha applications even though the industry has never had a need to use such identifiers. This will likely lead to unnecessary confusion, and, therefore, will likely not promote reliability. Moreover, the R1.2 and COM-003-1 technical paper suggest there is only one set of alpha-numeric clarifiers that are “accurate.” NextEra does not agree with this perspective, and believes it is</p>

Organization	Yes or No	Question 7 Comment
		counterproductive to narrowing a System Operator’s discretion on which alpha-numeric clarifiers he or she may use. To address these matters, NextEra recommends that R1.2 be revised to read: “When an oral Operating Communication does not use a common naming convention, alpha-numeric identifiers shall be used.”
<b>Response: Thank you for your comments. The standard does not mandate any one clarifier over another. The word “accurate” has been removed. The SDT has developed a new approach to the standard that addresses your concern.</b>		
ISO New England Inc	No	We agree with, support and have signed onto the ISO/RTO Standards Review Committee comments.
<b>Response: Thank you for your comments. Please see the response to ISO/RTO Standards Review Committee.</b>		
U.S. Bureau of Reclamation	No	By using the term "correct" alpha numeric clarifier, it implies that an incorrect alpha numeric clarifier can exist. In reality as long as an alpha numeric clarifier is used to verify the letters or numbers are conveyed the intent is made. The standard language should be revised to state that "When participating in oral Operating Communications and using alpha-numeric identifiers, use alpha-numeric clarifiers for the letters and numbers to convey the correct numbers and letters in the Operating Communication."
<b>Response: Thank you for your comments. An example of an incorrect alpha numeric clarifier would be “k as in known”. The word “accurate” has been removed.</b>		
Exelon Corporation and its affiliates	No	While Exelon agrees with the modification to allow the use of another alpha numeric clarifier, Exelon does not agree with the designation of "correct" related to alpha numeric communication. Requiring "accurate" alpha-numeric clarifiers is overly prescriptive and unclear. An entity should not be held accountable for 100% adherence to a set phonetic alphabet. For example, if a communicator and receiver use the phonetic nomenclature "motor operated disconnect one foxtrot" but in a later communication the equipment is referenced as "motor operated disconnect

Organization	Yes or No	Question 7 Comment
		<p>one fox" by the Standard as written this could be considered a violation. It should be an expectation but not a requirement as long as the transmitter and receiver use three way communications effectively. Again, the standard should emphasis entity practice for effective communication not impose an overly prescriptive set of requirements that pose compliance challenges.</p>
<p><b>Response: Thank you for your comments. The word "accurate" has been removed. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Brazos Electric Power Cooperative	No	Please see formal comments provided by APM.
<p><b>Response: Thank you for your comments. Please see response to APM.</b></p>		
Oncor Electric Delivery Company LLC	No	<p>Oncor take the position that this requirement is far too much detail and goes well beyond the 2003 Blackout recommendations. Furthermore, Oncor take the position that a more appropriate approach would be to require internal procedures that address internal communication protocols.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
South Carolina Electric and Gas	No	
Imperial Irrigation District	Yes	
JEA	Yes	<p>R1.2 is unclear. The term "alpha-numeric identifiers" is not defined. We believe examples would help. For example we assume that if we say the Northside 1, this would not be alpha-numeric but what if we used logical letters such as NS1 in internal communications. Is it all alpha-numeric communications or just illogical meaningless letters and numbers. We believe we should be able to use logical alpha numeric</p>

Organization	Yes or No	Question 7 Comment
		things like MS for motor-switch and not have to use alpha-numeric clarifiers. Also please specify if this is for both internal and external communications. Again we believe that this should be for external communications using illogical meaningless letters and numbers not for internal normal nomenclature.
<p><b>Response: Thank you for your comments. Alpha numeric clarifiers are not required for common terms like CB or MS or names like “Northside”. They would be required for Element or Facility alpha-numeric identifiers. In addition, the definition of Operating Instruction has been modified to provide clarity around when alpha-numeric identifiers are required.</b></p>		
Pepco Holdings Inc & Affiliates	Yes	However not sure if it is applicable to Reliability Directives.
<p><b>Response: Thank you for your comments. Alpha numeric clarifiers are required for an Operating Instruction, which is a “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p>		
SPP Standards Review Group	Yes	<p>We concur with the elimination of the NATO phonetic alphabet and thank the SDT for making this change. This is an excellent example of backing away from being overly prescriptive by requiring the NATO alphabet and allowing the industry to use any of several other options to ensure effective communications. We do have concerns with the use of ‘correct’ or ‘accurate’, depending on which document you refer to. What is correct? What is accurate? How does one measure compliance with these terms? We would propose to delete the word ‘accurate’ altogether. The requirement would then read:</p> <p>When participating in oral Operating Communications and using alpha-numeric identifiers, use alpha-numeric clarifiers.<sup>1</sup></p>
<p><b>Response: Thank you for your comments. An example of an incorrect alpha numeric clarifier would be “k as in known”. The word “accurate” has been removed.</b></p>		
IESO	Yes	While we agree with allowing appropriate alpha numeric qualifiers other than the

Organization	Yes or No	Question 7 Comment
		NATO phonetic alphabet, we do not support the mandatory use of these qualifiers for each and every instruction. They should only be required when clarification by either party is requested.
<p><b>Response: Thank you for your comments. Use of phonetic alphabet only when further clarification is needed could be subjective. The receiver of the communication may have thought that they clearly heard “Open breaker 13D” when what was really said was to “Open breaker 13B”. Use of the phonetic alphabet would correct this potential error.</b></p>		
Texas Reliability Entity	Yes	Consider removing the word “accurate” from part 1.2. We do not believe it adds anything to the requirement, and it may cause confusion.
<p><b>Response: Thank you for your comments. The word “accurate” has been removed.</b></p>		
NV Energy	Yes	Agree that it ought not to be restricted to NATO only, but we are confused about what "correct" means. Perhaps it means any spoken word that begins with the subject alpha character?
<p><b>Response: Thank you for your comments. An example of an incorrect alpha numeric clarifier would be “k as in known”. The word “accurate” has been removed.</b></p>

8. The SDT modified the requirement for use of identifiers to limit the applicability to operating communications involving Transmission interface Elements/Facilities and to require use of the name for that Element/Facilities specified by the Element/Facility’s owner(s). Do you agree with this modification?

**Summary Consideration:**

Many commenters believe this requirement is not necessary, stating that it is covered by Standard TOP-002.2a R18. *The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. Project 2007-03 chose to eliminate TOP-002-2a Requirement R18 on the basis that “This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. This is an administrative item, as seen in the measure, which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the difficulty in assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers.” COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.*

Other commenters believe the requirement is too prescriptive and focuses on how instead of what. *When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.*

A few commenters cited uncertainty over what Elements and Facilities are in scope of Requirement. *The SDT intends that interface BES Elements and BES Facilities are in the scope of this requirement. The benefit is that neighboring entities can quickly and knowledgeably react to changing operating conditions on the BES without getting confused over which Element or Facility they are referring to.*

Organization	Yes or No	Question 8 Comment
Northeast Power Coordinating Council	No	The applicability of this Standard is unclear in the case of Distribution Providers. The definition of Operating Communication includes “Elements” that could impact the BES. The NERC Glossary definition for Elements includes non-BES devices and

Organization	Yes or No	Question 8 Comment
		<p>equipment. Additionally, the Purpose section of the Standard states "harmful to the reliability of the BES." Since non-BES Elements could affect the BES this Standard could be deemed applicable to non-BES devices. If it is the intent of the SDT to apply this Standard to All Operating Communications concerning both BES and non-BES Facilities this should be explicitly stated in the applicability section for transparency. Otherwise clarifying language should be added to exclude non-BES Facilities. This is a procedural issue. Suggest that the Standard should require the Functional Entities to have a communications protocol that could indeed include this suggestion, but it should not be a standard on personnel.</p>
<p><b>Response: Thank you for your comments. This requirement refers to Transmission interface Elements and Facilities. The SDT has developed a different approach to the standard that addresses your concern.</b></p>		
<p>ACES Power Marketing Standards Collaborators</p>	<p>No</p>	<p>1. We don't believe this requirement is necessary. A similar requirement was removed from TOP-002-2 Project 2007-03. From the Project 2007-03 mapping document:"R18. Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network."Project 2007-03 SDT's reason for deletion of R18 from TOP-002-2:"This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers."We agree with these reasons and believe they should apply to R1 Part 1.1.4 in COM-003-1. 2. Another issue we have with the requirement is that this draft standard is not applicable to TOs or GOs yet the requirement calls for the use of "the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility." Are the auditors going to ask the TOs and GOs for their list of named Elements or Facilities when they audit the applicable entities in</p>

Organization	Yes or No	Question 8 Comment
		this standard?
<p><b>Response:</b> Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</p>		
<p>Midwest Reliability Organization NERC Standards Review Forum</p>	<p>No</p>	<p>The MRO NSRF recommends the following comments for consideration by the SDT:</p> <ol style="list-style-type: none"> <li>1. This requirement is too closely associated with TOP-002-2b, R18. As written, a BA, TOP, and GOP will be in double jeopardy of non compliance if either TOP-002-2b, R18 or COM-003, R1.1.4 is violated.</li> <li>2. A similar requirement was removed from TOP-002-2 Project 2007-03. From the Project 2007-03 mapping document: "R18. Neighboring Balancing Authorities, Transmission Operators, Generator Operators, Transmission Service Providers and Load Serving Entities shall use uniform line identifiers when referring to transmission facilities of an interconnected network." Project 2007-03 SDT's reason for deletion of R18 from TOP-002-2: "This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers." The standard is not applicable to TOs or GOs yet the requirement calls for the use of "the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility." Suggest deleting this requirement.</li> </ol>
<p><b>Response:</b> Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the</p>		

Organization	Yes or No	Question 8 Comment
<p>same equipment for the Operating Instruction.</p>		
<p>Duke Energy</p>	<p>No</p>	<p>We don't believe that this requirement is consistent with the TOP requirement to use common line identifiers. This is more restrictive, in that it mandates the use of a name specified by the asset owner, while TOP simply requires the development of common identifiers without dictating what party defines the names. We understand the issue of identifying common terms for equipment, but believe the development and use of "common identifiers" is already covered in the TOP Standard and should be eliminated altogether from COM-003.</p>
<p>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</p>		
<p>BC Hydro</p>	<p>No</p>	<p>BC Hydro supports this in most cases, especially when dealing with the RC, but in many cases there may be lack of clarity around ownership. We believe this needs to be reworded to account for designation that is agreed to by the parties that are communicating.</p>
<p>Response: Thank you for your comments. The SDT has developed a different approach to the standard that addresses your concern.</p>		
<p>Dominion</p>	<p>No</p>	<p>The requirement as written is superior to Requirement R18 of TOP-002b which requires the use of ". . . uniform line identifiers when referring to transmission facilities of an interconnected network." However, the industry can't have two different standards with different requirements for identifying transmission facilities.</p>
<p>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the</p>

<b>same equipment for the Operating Instruction.</b>		
Associated Electric Cooperative JRO00088	No	AECI agrees with SERC OC STANDARDS REVIEW GROUP's response to Question 8.
<b>Response: Please see response to SERC OC Standards Review Group.</b>		
LG&E and KU Services	No	This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW" of communication as opposed to the "WHAT". Requirement 1.1.4 does not need to be in this standard as the requirement for unique line identifiers is stipulated in TOP-002-2 R18.
<b>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</b>		
MEAG Power, Danny Dees, Steven Grego, Steve Jackson	No	Too prescriptive.
<b>Response: Thank you for your comments. The SDT has developed a different approach to the standard that addresses your concern.</b>		
ISO/RTO Standards Review Committee	No	This requirement is a procedural issue and is outside the scope of the approved SAR which proposes responding to the Blackout Recommendation to tighten communications protocols especially during emergencies. This proposed requirement is both procedural and does not address tightening communications of situational awareness.
<b>Response: Thank you for your comments. The purpose of the SAR for this project is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten</b>		

Organization	Yes or No	Question 8 Comment
<p>response time.” Additionally, the SAR is very specific in that it also includes the term “normal” operating conditions under Applicability: “Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.”</p>		
City Water Light and Power	No	This is already addressed in TOP-002 R18. Even if moved, the requirement should be focused on agreed upon identifiers and the process for coordination should be left to the entities.
<p><b>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. The SDT has developed a different approach to the standard that addresses your concern.</b></p>		
FirstEnergy	No	The requirement for line identifiers should not be included and is unnecessary. This type of requirement was also removed from standard TOP-002 in recently board approved project 2007-03. The drafting team position for the removal was the following: “This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. This is an administrative item, as seen in the measure, which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the difficulty in assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers.” Therefore we suggest the removal of R1.1.4 for the same reason.
<p><b>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</b></p>		

Organization	Yes or No	Question 8 Comment
SERC OC Standards Review Group	No	This sub-part is part of the SDT forcing a single communication procedure on the industry. This goes far too deeply into the HOW” of communication as opposed to the “WHAT”. Requirement 1.1.4 does not need to be in this standard as the requirement for unique line identifiers is stipulated in TOP-002-2 R18.
<p>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</p>		
Western Electricity Coordinating Council	No	We question the need for this part of the requirement based on the fact that it appears to be redundant with TOP-002-2b, R18.
<p>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</p>		
Bonneville Power Administration	No	BPA believes that the uniform line identifiers between utilities should be identified by mutual consent and suggests the drafting team use the language from COM-003-1 R7, “Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Operator, Transmission Service Provider, Load Serving Entity and Distribution Provider shall use pre-determined, mutually agreed upon line and equipment identifiers for verbal and written Interoperability Communications”. BPA also recognizes that uniform line identifiers are already addressed in TOP-002-2b.
<p>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). Organization	Yes or No	Question 8 Comment
<p>same equipment for the Operating Instruction. The SDT has developed a different approach to the standard that addresses your concern.</p>		
NERC Operating Committee	No	See Response 10
Southern Company	No	<p>Southern does not agree with R1 and its sub requirements as they appear to force a single communications procedure on the industry and are focused on the “HOW” of communication when they should be more focused on the “WHAT”. Furthermore, requirement 1.1.4 does not need to be in this standard as the requirement for unique line identifiers is stipulated in TOP-002-2 R18. Also, is it certain that both parties in the communication will know the name for the element/facility that is specified by the element/facility's owner(s)?</p>
<p>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</p>		
HHWP	No	<p>Recommend that R1.1.4 incorporate use of the term Uniform Line Identifiers, in conformance with R18 of TOP-002.</p>
<p>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</p>		
CenterPoint Energy Houston Electric, LLC.	No	<p>Question 8 Comments: The language in requirement 1.1.4 will require the limitation to a single identifier for an interface element or facility between neighboring entities which will require the neighboring entities to agree upon a specified single identifier. This may possibly require entities to make changes to their EMS system and their model and incur a cost to complete such tasks. Similar language is currently enforced</p>

Organization	Yes or No	Question 8 Comment
		in TOP-002-2 R18, where Entities are required to use uniform line identifiers when referring to transmission facilities of an interconnected network, making this requirement language redundant.
<p><b>Response:</b> Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction. The SDT has developed a different approach to the standard that addresses your concern.</p>		
Flathead Electric Cooperative, Inc.	No	Think this requirement is duplicative of TOP-002a, R18
<p><b>Response:</b> Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</p>		
SMUD	No	First, this requirement is redundant to Requirement R18 in the TOP-002 standard. It also put an administrative burden on the RC to know each “correct” name specified by the respective entity’s line segment causing a hindering timely operation of BPS elements.
<p><b>Response:</b> Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction. The SDT has developed a different approach to the standard that addresses your concern.</p>		
Liberty Electric Power LLC	No	This requirement is already covered under TOP-002 R18, and opens double-jeopardy

Organization	Yes or No	Question 8 Comment
		for entities by including it in a second standard.
<p><b>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</b></p>		
Orlando Utilities Commission	No	For example, the (OUC)Indian River to (FPL)Cape Canaveral #1 230kv line is equivalent to the (FPL)Cape Canaveral to (OUC)Indian River #1 230kv line. Either description is accurate and acceptable.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Indiana Municipal Power Agency	No	The requirement that requires entities to use uniform line identifiers when referring to transmission facilities of an interconnected network is in the TOP-002-2b standard (R18). Requirement R1.1.4 of COM-003-1 draft is not needed and should be deleted.
<p><b>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</b></p>		
Ingleside Cogeneration LP	No	Ingleside Cogeneration LP agrees with restricting the applicability of COM-003-1 R1.2 to Transmission interface Elements/Facilities. These are the most likely to carry more than one identifier, as each entity may use different numbering conventions. However, we see two separate types of identifiers which may need to be addressed separately. First, those provided on control room monitors often come from a centrally managed Regional database. It is not reasonable to expect System Operators to refer to a Facility owner’s one-line diagram to reference these interconnections - and may reduce reliability. Conversely, field personnel and engineers may rely on the one-line for their identifiers. The use of the owner’s

Organization	Yes or No	Question 8 Comment
		documentation is more appropriate in these cases. We will further point out that COM-003-1 does not apply to Facility owners, so it seems as though they could decline to provide identifiers if they so choose.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Roger Zaklukiewicz Consulting	No	We should always use the identifier adopted by the RTO, not one developed by the Element/Facility's owner.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern. Not all entities are included in an RTO.</b></p>		
Sacramento Municipal Utility District	No	See response in #10
Energy Services	No	See our responses to Questions #1, 2 and 4.
Salt River Project	No	The interface names that should be used are the names that are registered in the TSIN.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
South Carolina Electric and Gas	No	
Wisconsin Electric dba We Energies	No	See the Mapping Document for Project 2007-03 Real-time Operations, TOP-002 R18: "This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. This is an administrative item, as seen in the measure, which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the difficulty

Organization	Yes or No	Question 8 Comment
		<p>in assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers.”</p>
<p><b>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). Illinois Municipal Electric Agency	No	IMEA agrees with comments submitted by the SERC OC Standards Review Group.
<p><b>Response: Thank you for your comments. Please see our response to comments from SERC OC Standards Review Group</b></p>		
Ameren	No	<p>We suggest the SDT to provide clarification and guidance on precisely what Elements and Facilities are included in these terms. Since the word “interface” is not capitalized or defined in the NERC Glossary or this Standard, it will be difficult for TO, TOP, GO, GOP and DP entities to precisely identify the equipment associated with these terms. We also recommend that the SDT consider use of the term “Interconnected Facilities” as defined by Project 2007-06 System Protection Coordination for use in the new Standard PRC-027-1. Multiple definitions in multiple Standards for the same BES Elements and Facilities create unnecessary risk and</p>

Organization	Yes or No	Question 8 Comment
		uncertainty for both Auditors and Functional Entities.
<p><b>Response: Thank you for your comments. The term “interface” is used in other places without confusion. In addition, not all interface Facilities are “electrically joined by one or more Element(s) and are owned by different functional, operating, or corporate entities.” The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
American Transmission Company, LLC	No	Entities will face double jeopardy with existing Reliability Standard TOP-002-2b R18. Requirement 18 of TOP-002-2b is proposed to be removed from NERC Standards by the respective SDT because it adds no reliability benefit.
<p><b>Response: Thank you for your comments. The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</b></p>		
MISO	No	To date, System Operators have identified equipment by to/from station and voltage level. Such identification has been sufficient to ensure the accurate identification of Transmission interface Elements and Facilities. Additionally, MISO notes that internal identifiers utilized by owners may result from internal coding or naming conventions that would not be known by or comprehensible to external entities. Hence, MISO cannot support this requirement based on the potential adverse impacts to reliability that could result.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
NextEra Energy, Inc	No	See comments in response to question 7.
Texas Reliability Entity	No	The name specified by the operators of the equipment should be used, rather than the name given by the owner, and it should be jointly agreed to as the identifier for the equipment. For example, an owner name could be the “Lyndon Baines Johnson East Johnson City Substation Line 3” but the Transmission Operator refers to it as

Organization	Yes or No	Question 8 Comment
		<p>“East Johnson City 3” or “EJC3” or “Johnson 3”. The Planning Authority/Coordinator may dictate a naming convention to be used in Operations systems that are used by the System Operators (i.e. RTCA, outage scheduler, etc.). The name to be used should be clearly identifiable, concise, and easily understood by all parties involved in the Operating Communication. We suggest re-wording R1.1.4 to “When referring to a Transmission interface Element or a Transmission interface Facility, each responsible entity shall use a pre-determined, uniform identifier for each Element or Facility.”</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
ISO New England Inc	No	<p>We agree with, support and have signed onto the ISO/RTO Standards Review Committee comments.</p>
<p><b>Response: Thank you for your comments. Please see the response to the ISO/RTO Standard Review Committee comments.</b></p>		
Exelon Corporation and its affiliates	No	<p>Exelon is concerned with the requirement to use “the name” for the Element/Facility specified by the Element/Facility's owner(s). By dictating “the name” this requirement may become overly prescriptive. An entity should not be held accountable for 100% adherence to a set "specified name" for an Element/Facility. It is reasonable for entities to fully understand what Element/Facility is communicated; however, verbatim use of a "specified name" should not in itself be a requirement. For instance, if the formal name of a generating unit is "ABC Fossil Generating Station Unit 1" and an entity communicates "ABC Station Unit 1" or "ABC Generating Station 1" by the Standard as written this could be considered a violation even though it can effectively communicate the needed information. As in other sub-requirements to R1, the use of "specified name" should be an expectation but not a requirement as long as the transmitter and receiver use three way communications effectively. Further, this appears as an internal inconsistency in the standard between R1 and R2. For example, an entity owner specifies a unique name for an interface element.</p>

Organization	Yes or No	Question 8 Comment
		R1.1.4 requires the use of that unique identifier but R2 does not require verbatim response. It is not clear which part of the repeated information three part response in R2 is allowed to be non-verbatim.
<p><b>Response: Thank you for your comments. The SDT is not suggesting that this requirement need be as complex as you indicate. We think it is fairly easy to follow the owner’s naming convention. The SDT has developed a different approach to the standard that addresses your concern.</b></p>		
Brazos Electric Power Cooperative	No	Please see formal comments provided by APM.
Oncor Electric Delivery Company LLC	No	Again, Oncor take the position that this requirement contains far too much detail and goes well beyond the 2003 Blackout recommendations. Furthermore, Oncor take the position that a more appropriate approach would be to require internal procedures that address internal communication protocols.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
JEA	Yes	R1.1.4 is unclear. Does this apply to both internal and external communications? JEA believes that this should only apply to external communications only. Many entities have internal numbering systems that have been in place without incident for decades and should be able to continue to use these internal systems when performing internal communications.
<p><b>Response: Thank you for your comments. It applies when issuing Operating Instruction between functional entities. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
SPP Standards Review Group	Yes	While the industry probably understands what is meant by ‘Transmission interface Element or Facility’, the terms are somewhat cumbersome. Additionally, for situations where there may be an agreement between owners designating multiple names for an Element or Facility, we propose adding an ‘(s)’ to ‘name’. For example,

Organization	Yes or No	Question 8 Comment
		if one owner calls a line A-B and the other owner calls the line B-A and they agree to use both names interchangeably, then either would be correct. Requirement 1.1.4 would then read: When referring to an Element or Facility that is part of an interconnection between entities, use the name(s) specified by the owner(s) for that Element or Facility.
<b>Response: Thank you for your comments. The SDT has developed a different approach to the standard that addresses your concern.</b>		
City of Jacksonville Beach dba/Beaches Energy Services	Yes	None.
Colorado Springs Utilities	Yes	The possibility exists for an element/facility to be co-owned and for each owner to have a different name.
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>		
Manitoba Hydro	Yes	See question 7 comments
NV Energy	Yes	Agree, however, we suggest that there be more clarity provided about what constitutes a Transmission interface Element/Facility. Is it a connection between BA's or between TOP's within a BA?
<b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b>

9. Do you agree with the VRFs and VSLs for Requirements R1, R2 and R3?

**Summary Consideration:**

The major comment issues covered:

Commenters proposed the deletion of some or all of the requirements altogether. The commenters disagreed with the requirements and thus disagreed with the associated VRFs and VSLs. Many other commenters called for reduction of all VRF levels to low. Some believe there not be a severe VSL for R1 and that there is no justification for why some parts of R1 have higher VSL impact than others. Other commenters believe there should not be a zero tolerance VSL. *The SDT response is that due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and had to be consistent with FERC and NERC guidelines.*

Some minor comment issues are:

Commenters believe the VSL should provide for a Lower Violation Severity Level for first occurrences of the violation and additional clarity could be added in the VSLs. *The SDT response is that due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and had to be consistent with FERC and NERC guidelines.*

Organization	Yes or No	Question 9 Comment
Northeast Power Coordinating Council	No	The white paper discusses many non-utility industries use of the three-part communication. However, they are not out of compliance if they fail to use three-part communications. Only the Reliability Directives should require three-part communications (and dictate compliance). This should be enforceable only if the miscommunication results in an error on the BES. We support the use of three-part communications with limitations. There is concern over the potential for being out of compliance when there is no BES impact. Failure to meet Requirement R2, part 2.2 bullets 1 or 3 is either a Moderate or High. Failure to meet bullet 2 is a Severe VSL. It is not clear why this differentiation was adopted. The White Paper reflects on Human

Organization	Yes or No	Question 9 Comment
		<p>Performance, and how miscommunications can cause a BES error resulting in an outage, or possible cascading effects. Then the Standard (and the associated out of compliance) should apply when, and to the extent that communications lapse (e.g., when there is an impactful violation of bullets 1, 2 and/or 3) results in an impactful error on the BES. Otherwise, an out of compliance is inappropriate. Non-impactful violations should be rated “Lower VSL.”</p>
<p><b>Response: The SDT thanks the commenter for the comments provided. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
<p>ACES Power Marketing Standards Collaborators</p>	<p>No</p>	<p>1. The first Severe VSL listed for R1 says, “...did not correctly implement any of the parts...” What is the definition of the word “any” in this VSL? We’ve interpreted the VSL to mean that none of the parts of R1 were implemented. If this is the intent of the SDT, then we suggest removing this VSL since the next Severe VSL listed says, “...did not correctly implement three (3) or more of the four (4) parts...” Three or more would include all of the parts (4 of 4) not being implemented correctly. Not implementing 1 of the 4 parts is a Moderate VSL while not implementing 2 of the 4 parts is a High VSL. So, not implementing 3 or more of the parts would be a Severe VSL.2. The second Moderate VSL for R1 says, “The responsible entity did not correctly implement Part 1.2 of the requirement.” Corresponding with our comments in Question 7 above, we don’t know how this requirement will be measured since the term “accurate” in the requirement is not defined. If an entity can make up their own clarifiers, who determines if they were “accurate” and whether they were correctly implemented? Measure M1 doesn’t specify a measurement for Part 1.2 of R1.3. The High VSL for R3 should be clarified to align with our suggestion of adding the words, “before taking action” in Question 6 above.</p>
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC</b></p>		

Organization	Yes or No	Question 9 Comment
<b>and NERC guidelines.</b>		
Midwest Reliability Organization NERC Standards Review Forum	No	The MRO NSRF recommends the following comments for consideration by the SDT: System Operators receive and issue many Operating Communications a day. The VSL for one Operating Communication is Moderate. That is too high. While improving communications is a laudable goal, the zero tolerance VSL is unacceptable and will lead to a preponderance of self-reports and compliance and administrative overhead. Also overlooked is the added stress that every time a System Operator speaks they may be in violation.
<b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b>		
Detroit Edison	No	VSL table for R1. Current format shows that an entity must be 100% compliant. The break down from medium to severe is based on how many elements of R1 was not followed. Suggest changing the format to how many times it was not followed rather than the number of elements.
<b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b>		
Duke Energy	No	The VRF's should all be "Low". For example, there will be thousands of routine communications per year, and each instance of missing one alpha numeric identifier (ex. "balloon" versus "baker") would be a violation. As written, this standard would drive allocation of resources for little reliability benefit.
<b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC</b>		

Organization	Yes or No	Question 9 Comment
and NERC guidelines.		
JEA	No	R2 & R3 should be removed from the standard. They are a best practice and do not substantially affect reliability when a simple command such as increase load by 100MW for a new purchase agreement.
Response: Thank you for your comments.		
Associated Electric Cooperative JRO00088	No	AECI agrees with SERC OC STANDARDS REVIEW GROUP's response to question 9.
LG&E and KU Services	No	LG&E and KU Services suggest deletion of all three requirements
Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.		
MEAG Power, Danny Dees, Steven Grego, Steve Jackson	No	VRFs and VSLs should be eliminated across the board.
Response: Thank you for your comments. The SDT notes your comments.		
City Water Light and Power	No	These requirements should be eliminated entirely
Response: Thank you for your comments.		
Hydro One Networks Inc.	No	The white paper discusses many non-utility industries use of the three-part communication. However, they are not out of compliance if they fail to use three-point communications. Only the Reliability Directives should require three-part communications (and dictate compliance). This should be enforceable only if the miscommunication results in an error on the BES. We support the use of three-part

Organization	Yes or No	Question 9 Comment
		<p>communications. There is concern over the potential for being out of compliance when there is no BES impact. Failure to meet Requirement R2, part 2.2 bullets 1 or 3 is either a Moderate or High. Failure to meet bullet 2 is a Severe VSL. It is not clear why this differentiation was adopted. The White Paper reflects on Human Performance, and how miscommunications can cause a BES error resulting in an outage, or possible cascading effects. Then the Standard (and the associated out of compliance) should apply when, and to the extent that communications lapse (e.g., when there is an impactful violation of bullets 1, 2 and/or 3) results in an impactful error on the BES. Otherwise, an out of compliance is inappropriate. Non-impactful violations should be rated "Lower VSL."</p>
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
<p>SPP Standards Review Group</p>	<p>No</p>	<p>With the additional burden of monitoring and tracking compliance and the increased risk of the zero-tolerance VSLs without a subsequent improvement in reliability of the BES, the VRFs should be changed to Low. The VSLs should be reduced to Lower. We suggest modifying the second part of the existing Moderate VSL for Requirement 1 to include specific reference to Requirement 1 as is done in the first part of that VSL. The VSL would then read: The responsible entity did not correctly implement Requirement R1, Part 1.2. Likewise, we also suggest modifying the second part of the existing High VSL for Requirement 1 to include specific reference to Requirement 1. The VSL would then read: The responsible entity did not correctly implement one (1) of the four (4) parts of Requirement R1 when it was appropriate to use three of the four parts.</p>
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		

Organization	Yes or No	Question 9 Comment
SERC OC Standards Review Group	No	We suggest deletion of all three requirements.
<p><b>Response: Thank you for your comments. The SDT notes your comments.</b></p>		
Bonneville Power Administration	No	<p>BPA believes the VSLs for R3 are too extreme as written. The SDT needs to add emphasis and clarity to the second *AND*. The requirement only asks for one of the two bullets; the VSL could be incorrectly interpreted by and auditor that both bullets are needed. Compliance is met if: (a) the receiver repeats back the Operating Communication and waits for confirmation, or (b) requests it to be repeated because it may not have been heard correctly. Compliance is not met if neither is done. So if the entity received a communication but did not repeat it AND did not request it to be repeated, that violation would be severe. For severity levels add impact to the Bulk Electric System as a qualifier. IF Cascading outage or 1000 MW of load is lost due to failure to repeat information back *AND* wait for confirmation ( equals SEVERE). If equipment is damaged as a result (equals Moderate). If fails to repeat *AND* fails to wait for confirmation (equals LOW). BPA would change its position if categorizing a level of impact to the BES beginning with an equivalent to the severity of the violation.</p>
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
NERC Operating Committee	No	See Response 10
Progress Energy	No	Progress Energy does not agree with having "Severe VSL" for all of R1
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC</b></p>		

Organization	Yes or No	Question 9 Comment
<b>and NERC guidelines.</b>		
Southern Company	No	As mentioned in the previous comments, Southern does not agree with R1 as it is imposing a single communications procedure on the industry and is focused on the “HOW” as opposed to the “WHAT”, and does not agree with R2 and R3 as they imply that that 3-part communications are needed for all communications, not just during Reliability Directives, emergencies, or alerts. As such, Southern disagrees with the VRFs and VSLs.
<b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b>		
HHWP	No	VSL should provide for a Lower Violation Severity Level for first occurrences of the violation. For the most part violation of this standard should be addressable through FFT process.
<b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with the guidelines.</b>		
CenterPoint Energy Houston Electric, LLC.	No	Question 9 Comments: No. VRFs and VSLs for requirements R1, R2, and R3 should not be high or severe unless Adverse Reliability Impact has occurred.
<b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with the guidelines.</b>		
IESO	No	We do not agree with Requirements R2 and R3 to begin with. We therefore do not agree with the VRFs and VSLs for these two requirements.

Organization	Yes or No	Question 9 Comment
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
<p>PPL Generation, LLC on behalf of its Supply NERC Registered Entities</p>	<p>No</p>	<p>PPL Generation, LLC on behalf of its Supply NERC Registered Entities does believe that this sub requirement R1.2 should be considered a moderate violation when alpha numeric clarifiers are not used in general communication.</p>
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
<p>Clark Public Utilities</p>	<p>No</p>	<p>Failure to implement R1.2 is not necessarily a reliability problem. As stated in our previous comments, not all alpha-numeric identifiers need clarification. However, the current proposed standard would deem a failure to use a clarifier in any Operating Communication that uses alpha-numeric identifiers as a violation.</p>
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
<p>Roger Zaklukiewicz Consulting</p>	<p>No</p>	<p>The standard should not be mandating the "HOW".</p>
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
<p>Sacramento Municipal Utility District</p>	<p>No</p>	<p>We have a problem with the standard and therefore we inherently don't agree with VRFs and VSLs.</p>

Organization	Yes or No	Question 9 Comment
<p>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</p>		
Entergy Services	No	<p>We disagree only in the sense that we disagree with the requirements, therefore, the VRFs and VSLs are not relevant. We suggest deletion of all three requirements, and the insertion of one new requirement. See Response to Questions 1, 2 and 4.</p>
<p>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</p>		
Reliability First	No	<p>Reliability First votes in the Affirmative for this standard because the standard further enhances reliability by providing communication protocols when participating in Operating Communications (specifically three way communication). Clear, formal and universally-applied communication protocols will help reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Even though Reliability First votes in the Affirmative standard, Reliability First votes in the negative for the VSLs and offer the following comments for consideration:</p> <ol style="list-style-type: none"> <li>1. VSL for Requirement R2 a. When referencing “Part” numbers within the VSL, a consistent format (e.g. Requirement R2, Part 2.2 first bullet) should be used.</li> <li>2. VSL for Requirement R3               <ol style="list-style-type: none"> <li>a. The VSLs should state “oral ... Operating Communication” rather than “verbal ... Operating Communication” to be consistent with the language in the requirement.</li> <li>b. For consistency with the first part of the first bullet in Requirement R3, RFC recommends the following language be considered for the “High” VSL: “The responsible entity received and repeated an oral two-party, person-to-person</li> </ol> </li> </ol>

Organization	Yes or No	Question 9 Comment
		Operating Communication but did not wait for confirmation that the repetition was correct. (Requirement R3, first bullet)”
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with the guidelines.</b></p>		
City of Austin dba Austin Energy	No	<p>AE respectfully objects to the contents of COM-003-1 as described in these comments. If, however, AE were to assume agreement with the requirements, we offer the following comments regarding the VSLs:</p> <p>AE does not believe the R1 VSLs provide for a fair application in practice. Risk to the BES is not increased when fewer communication protocols apply to an entity. As proposed, missing 1 of 4 parts when 4 parts are required is a Moderate VSL. Missing 1 of 4 when 3 are required is a High VSL (and it never has an opportunity for a lower severity level because Moderate VSL applies only when 4 parts are required). Similarly, if an entity misses 1 of 4 when 2 are required, it should not be penalized with a Severe VSL. AE suggests the solution to this issue is to assign Moderate VSL to missing 1 of 4, High VSL to missing 2 of 4 and Severe VSL to missing 3 or more of 4, in all instances regardless of how many parts are required.</p> <p>If the structure suggested above is not adopted, AE offers the following comments for consideration:</p> <p>Within the Severe VSL column for R1, the first paragraph (missing all of the parts when four are required) duplicates the second paragraph (missing three or more when four are required.) Within the Severe VSL column for R1, the third and final paragraphs should say “two (2) or more” and “one (1) or more,” respectively, to account for all possible situations. Doing so aligns with the second paragraph which already says “three (3) or more.” Finally, with respect to the VSLs for R2 and R3, all instances of “verbal” should be changed to “oral” to match the language of the</p>

Organization	Yes or No	Question 9 Comment
		requirement.
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
Utility System Efficiencies, InC.	No	<p>We agree with the classification of VRF as medium for Requirements R1, R2, and R3; however, hopefully this will not detract from the vital importance of using three-part communications in ALL operations communications relevant to the Bulk Electric System (BES). We disagree with the VSLs for Requirements R1, R2, and R3. For R1 we don't believe it is valid to claim that various combinations of not using the 24-hour clock, or alphanumeric definitions, etc. will make any difference in the outcome of poor communications. We recommend the following approach: For R1, failure to use any of the required elements of this requirement should be documented for each incident during the audit period. Greater than three failures but less than or equal to 5 would be considered "moderate;" greater than 5 but less than or equal to 8 would be considered "high;" greater than 8 would be considered "severe." Any failure to use the required elements of this Requirement R1 which results in a reportable incident on the BES should be considered "severe." For Requirements R2 and R3, all failures to use the required three-part communications should be documented by the Registered Entity for the audit period. Greater than three failures but less than or equal to 5 would be considered "moderate;" greater than 5 but less than or equal to 8 would be considered "high;" greater than 8 would be considered "severe." Any failure to use three-part communication which results in a reportable incident on the BES should be considered "severe."</p>
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		

Organization	Yes or No	Question 9 Comment
Illinois Municipal Electric Agency	No	IMEA agrees with comments submitted by the SERC OC Standards Review Group.
Xcel Energy	No	The Moderate VSL for missing one part of the sub-requirements in R1.1.1 thru R1.1.4 is too harsh with a six month effective date. We suggest a phased in VSL or a twelve month effective date, as further explained under question 10.
<p><b>Response:</b> Thank you for your comments. We have extended the implementation time period to twelve calendar months. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</p>		
Ameren	No	We believe that the VSLs in this draft Standard create the potential for a violation or self-report for almost every single individual conversation about the BES by real-time operators. In this regard, we are concerned that the Functional Entities will greatly decrease their oral communications to minimize the risk of a self-report or violation which ultimately would undermine necessary discussions between operating entities.
<p><b>Response:</b> Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</p>		
American Transmission Company, LLC	No	System Operators receive and issue many Operating Communications each day. The VSL for “one” Operating Communication is Moderate, which is considered too high. While improving communications is a laudable goal, the zero tolerance VSL is unacceptable and will lead to a preponderance of self-reports and compliance and administrative overhead. Also overlooked is the added stress that every time a System Operator speaks, they may be in violation.
<p><b>Response:</b> Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC</p>		

Organization	Yes or No	Question 9 Comment
<b>and NERC guidelines.</b>		
MISO	No	MISO respectfully submits that no justification has been provided regarding the VRF and VSLs assigned to COM-003-0. Additionally, MISO suggests that the proposed VRFs and VSLs may be disproportionate to the actual impacts of non-compliance with the proposed standard and its requirements. For example, the proposed Standard suggests that a failure to implement one of the four parts of Requirement R1, Part 1.1 when all four parts are required is less harmful than a failure to implement one of the four parts when only two parts are required but fails to justify why the former presents a lesser risk to reliability than the latter or why a more substantial penalty would be appropriate in the latter instance. MISO respectfully suggests that the SDT revisit the proposed VRF and VSLs and revise them to ensure the consistency with the likely actual impacts on reliability.
<p><b>Response: Thank you for your comments. The VRF and VSL justification was posted with the standard. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
Seminole Electric Cooperative	No	See previous comments
Exelon Corporation and its affiliates	No	Exelon does not agree with the VRFs and VSLs for Requirements R1, R2 and R3. Requirement R1 - The Violation Severity Levels imply that if the responsible entity did not correctly implement any one (1) of the four (4) parts of R1 at any time that that entity would be non-compliant. It is not reasonable to hold an entity responsible to verify that every communication be in accordance with R1 at all times. It should be an expectation, but not a requirement. Requirements R2 and R3 - Similar to R1 it is not reasonable to hold an entity responsible to verify that every communication meet the requirement of R2 or R3 in all instances. Exelon suggests that this requirement be revised to address those instances where an actual event occurred due to improper communication or be limited to communication of a stated Reliability Directive. In general, the current VSLs for the current draft of COM-003-1

Organization	Yes or No	Question 9 Comment
		do not seem commensurate to the risk to the BES. See the response to Q10 for a reasonable approach to implementation of the intent of this requirement.
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p>		
Brazos Electric Power Cooperative	No	Please see formal comments provided by APM.
Kansas City Power & Light	No	VRFs and VSLs should be low.
Flathead Electric Cooperative, Inc.	No	
SMUD	No	
Liberty Electric Power LLC	No	
Salt River Project	No	
South Carolina Electric and Gas	No	
Ingleside Cogeneration LP	Yes	With the transition of emergency communications to other projects, it is appropriate to downgrade COM-003-1's VRFs from "High" to "Medium".
<p><b>Response: Thank you for your comments. Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with the guidelines.</b></p>

New York Power Authority		NYPA supports the comments submitted by the NPCC Regional Standards Committee (RSC).
Public Service Enterprise Group		See #10.

10. If you have any other comments or suggestions to improve the draft standard that you have not already provided in response to the previous questions please provide them here.

#### Summary Consideration:

A common theme among many entities is that the approach to COM-003-1 should be changed. Most agreed with the comments submitted by the NERC Operating Committee that applicable entities should be required to

1. develop written communication protocols that address the elements in draft 2 of COM-003-1,
2. train on those protocols, and
3. develop internal controls to find and correct deviances from those protocols.

*After discussion, the SDT agreed with the commenters and modified its approach to closely align with the proposal. In addition, the SDT felt that it would be beneficial to develop the RSAW for this standard in conjunction with NERC Compliance staff, and has posted it for comment along with draft 3 of COM-003-1.*

Another prevalent theme was questioning the necessity of the standard, specifically one that requires three part communication for routine operations.

*During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT's concern.*

Another theme was the concern that the work of the SDT was overreaching the scope of the SAR.

*The purpose of the SAR for this project is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time." Additionally, the SAR is very specific in that it also includes the term "normal" operating conditions under Applicability: "Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors."*

Another theme was that the use of three part communications should be limited to Reliability Directives only.

*A Reliability Directive, by definition, is limited to instances where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact. The SDT believes that it is necessary to specify 3 part communication as a necessary communications protocol for all Operating Instructions, not just emergency situations. The OPCPSDT believes that the potential for risk to the reliability of the BES exists for all Operating Instructions.*

Still others express a desire to combine COM-002-3 and COM-003-1 into a single standard.

*The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” This is a broader scope for communications than that for Project 2006-06.*

Another concern was that this standard addressed “how” to communicate instead of “what” to communicate.

*When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.*

Many commenters also questioned the purpose of the whitepaper that was posted by the SDT during draft 2.

*The whitepaper was intended to assist industry stakeholders understand the rationale behind the content in the standard. For further information on communication guidelines, please refer to the paper developed by the NERC Operating Committee titled “Reliability Guideline: System Operator Verbal Communication – Current Industry Practices” located at <http://www.nerc.com/filez/oc.html>.*

Several commenters expressed the desire that the language pertaining to three part communication in COM-003-1 match that in COM-002-3.

*The SDT agrees and is using the language of COM-002-3, R2 and R3 in draft 3 of COM 003-1.*

Organization	Yes or No	Question 10 Comment
Hydro One Networks Inc.		- Hydro One strongly believes that three-part communication should be limited to Reliability Directives only. Its application to virtually all communications will prove to be an additional burden for operators, burden that is not justified and would not in

Organization	Yes or No	Question 10 Comment
<p><b>Response: Thank you for your comments. A Reliability Directive, by definition, is limited to instances where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact. The SDT believes that it is necessary to specify 3 part communication as a necessary communications protocol for all Operating Instructions, not just emergency situations. The OPCSDT believes that the potential for risk to the reliability of the BES exists for all Operating Instructions.</b></p>		
<p>Xcel Energy</p>		<p>(1) Requirement R1.1 refers to both written and oral Operating Communications. It was our understanding that COM-003-1 was to be focused solely on oral communications. If that was the SDT’s intent, then we suggest striking the word “written” from this sub-requirement.</p> <p><b>Response: The scope of the SAR for Project 2007-02 is not limited to oral communications.</b></p> <p>(2) Six month Effective Date is not likely to be enough time to develop, implement, and test a new communication program. We need enough time to train the field personnel, plant control room operators and system operators to use alpha-numeric identifiers, 24-hr clock, time zone, etc. before the standard becomes effective. A twelve month implementation period would be more appropriate.</p> <p><b>Response: The SDT agrees and has made the suggested change.</b></p>
<p><b>Response: Thank you for your comments. Please see the response above.</b></p>		
<p>Central Lincoln</p>		<p>1) Central Lincoln supports the comments provided by PNGC. We have a similar situation, and believe the redirection of resources needed for compliance can only have a negative effect on our local level of service.</p> <p><b>Response: Please see our response to PNGC.</b></p> <p>2) Central Lincoln is greatly concerned regarding how this standard will be audited. We expect the Compliance Enforcement Authority, in order to avoid a data dump in the form of a six year audit period’s worth of radio recordings consisting of mainly distribution related instructions, will request searchable transcripts with pointers to</p>

Organization	Yes or No	Question 10 Comment
		<p>the relevant &gt;100 kV parts. This will represent a huge amount of time to transcribe the recordings and provide the pointers. This administrative burden in proving compliance after the fact will not result in any improvement in reliability.</p> <p><b>Response: The SDT understands your concerns and has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response Thank you for your comments. Please see the response above.</b></p>		
<p>IESO</p>		<p>1. This standard is over-reaching into routine operations as it requires 3-part communication for all instructions that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. This type of instructions occurs every hour, if not every minute. Requiring operating personnel to apply a 3-part communication procedure for each and all of these instructions is absolutely unnecessary and overburdening, and can in fact adversely affect reliability. We strongly suggest that any requirement for 3-part communication for routine operating instructions be removed.</p> <p><b>Response: The SDT believes that it is necessary to specify 3 part communication as a necessary communications protocol for all Operating Instructions, not just emergency situations. The OPCSDT believes that the potential for risk to the reliability of the BES exists for all Operating Instructions.</b></p> <p>2. The proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after “applicable regulatory approval” in the Effective Dates Section A5 on P. 4 of the draft standard COM-001, COM-002 and IRO-001, and on P. 2 of COM-001’s Implementation Plan and P. 1 of COM-002’s and IRO-001’s Implementation Plans, to the following effect:”, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.”</p>

Organization	Yes or No	Question 10 Comment
		<p><b>Response: The SDT modified the section in response to your comments.</b></p>
<p><b>Response: Thank you for your comments. Please see the response above.</b></p>		
<p>ACES Power Marketing Standards Collaborators</p>		<p>1. It is not clear that COM-003-1 R1 applies to COM-002-3. The latest draft of COM-002-3 doesn't reference the communications protocols listed in COM-003-1 R1 and the definition of Reliability Directive does not state that it is a type of Operating Communication. The only place that describes the relationship between a Reliability Directive and Operating Communications is the text box under the definition of Operating Communication in COM-003-1. There should be a better connection between the two standards to emphasize this fact. We recommend the SDTs work together to bridge this gap.</p> <p><b>Response: COM-003-1, R1 applies to all communications that involve a "command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System."</b></p> <p>2. Bullet 2 of the Implementation Plan Effective Dates is missing a word or words (section in question in parentheses): "If the version of COM-001-2 revised under Project 2006-06 is not approved before COM-003-1 is approved, then COM-001-1.1 shall expire midnight of the day (immediately the) version of COM-001-2 developed under Project 2007-02 ..." In addition, this bullet is simply too wordy and difficult to comprehend. We suggest re-wording or splitting into separate sentences for easier comprehension.</p> <p><b>Response: The SDT agrees and has corrected the bullet.</b></p> <p>3. Because all three Measures include voice recordings as evidence, the Data Retention section inappropriately and without justification raises the bar on retention of voice recordings. The section requires 365 days of voice recordings for R1 and 180 days for R2 and R3. Many registered entities keep no more than 90 days of voice recordings. Keeping more than 90 days would require unnecessary</p>

Organization	Yes or No	Question 10 Comment
		<p>additional storage. Furthermore, it is not consistent with any other NERC standard (including COM-002) that compels, at most, 90 days. Thus, many registered entities probably have evidence retention policies that actually require destruction of such recordings after 90 days.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p> <p>4. While we do not agree with all parts of the Whitepaper, we believe one major point of clarification is needed. On page 3, in the first bullet regarding a general description of how three-part communications is conducted, the face-to-face communication needs to be clarified or removed. Including face-to-face communications is not necessary for two primary reasons. First, the major reason that three-part is necessary for telephonic communications is because you cannot see the receiver and really tell if they comprehend the message. Second, this could draw in communications between operators within the control center. Since these conversations are not easily recordable, how does a registered entity prove compliance?</p> <p><b>Response: The SDT believes that Operating Communication on a face to face basis is subject to the same risk of mistakes and misunderstanding. The OPCPSDT has participated in the development of the RSAW for COM-003-1 and considered your comments.</b></p>
<p><b>Response: Thank you for your comments. Please see the response above.</b></p>		
Texas Reliability Entity		<p>1. The use of exploder or hotline calls, where a single oral communication is used to alert a multitude of entities simultaneously to issues and directions affecting the BES, should be addressed by this Standard. The use of these types of calls is economic, efficient, and should be recognized for the purpose of providing Operating Communications, including Reliability Directives. Not addressing this issue will have a serious impact on System Operators during times, normal or emergency, when clear,</p>

Organization	Yes or No	Question 10 Comment
		<p>concise, and effective communications are needed. The 2003 Blackout Recommendation #26 includes the following text: “Standing hotline networks, or a functional equivalent, should be established for use in alerts and emergencies (as opposed to one-on-one phone calls) to ensure that all key parties are able to give and receive timely and accurate information.” This proposed Standard should address the issue of what communication protocols should be applied to exploder or hotline calls.</p> <p><b>Response: The SDT has addressed all calls in draft 3.</b></p> <p>2. There is a disconnect between COM-003-1 and COM-002-3 that will create confusion within the industry regarding communications. COM-002-3 has limited applicability, restricted to use of Reliability Directives ONLY in an Emergency or Adverse Reliability Impact. COM-003-1 is limited to oral two party communications, but it applies outside of Emergency situations. With proposed IRO-001-3 contained in Project 2006-06, a Reliability Coordinator or other entity may not be certain of whether to give a directive, a Reliability Directive, or an Operating Communication, and a recipient may dispute whether the correct communication type was used. What is the intended compliance impact of using the wrong type of communication, for both the initiating entity and the receiving entity?</p> <p><b>Response: Only a Reliability Directive must be identified as such. If a “directive” is a “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System,” it is an Operating Instruction and must use the protocols identified in COM-003-1.</b></p> <p>3. COM-003-1 and COM-002-3 will cause substantial confusion as drafted because they both require three-part communication, but they use different language to describe it. That suggests that the communication protocols that are required must be different, and as an entity moves from non-Emergency into Emergency operations, its communication protocol will be expected to change. We strongly</p>

Organization	Yes or No	Question 10 Comment
		<p>suggest that a single three-part-communication protocol be set forth in one place only, and that any differences between Emergency and non-Emergency communication requirements be clearly identified.</p> <p><b>Response: The SDT agrees and is using the language of COM-002-3, R2 and R3 in draft 3 of COM 003-1.</b></p>
<p><b>Response: Thank you for your comments. Please see the response above.</b></p>		
<p>Hydro-Quebec TransEnergie</p>		<p>1. Inconsistency between the sentences in R2 of COM-003 "that issues an oral, two-party, person-to-person Operating Communications" and R3 "that receives an oral two-party, person-to-person Operating Communication". The sentence in R2 has a comma after the word oral, the sentence in R3 does not. Furthermore, what is the difference between two-party and person-to-person communication?</p> <p><b>Response: The SDT will remove the comma in R2. "Two party" was added based on concerns that the requirement would be applicable to multi addressee or burst communication. Person to person was added to address concerns of the requirements applying to "machine" messages that some entities utilize.</b></p> <p>2. For R2 of COM-003, should the Generator Operator be involved in this requirement as an authority able to issue an oral Operating Communication?</p> <p><b>Response: Based on the revised definition of Operating Instruction, a GOP can only be a receiver of an Operating Instruction.</b></p> <p>3. It's not clear when an action is defined as a Reliability Directive. Does each utility define the instruction to be included in the Reliability Directive? Our current practice is that 3 ways communication is always directive. We still don't see the need to separate the COM-002 (emergency) and COM-003 (normal operating).</p> <p><b>Response: The Reliability Coordinator, Transmission Operator, or Balancing</b></p>

Organization	Yes or No	Question 10 Comment
		<p><b>Authority will issue a Reliability Directive during Emergency and Adverse Reliability Impacts in accordance with COM-002-3.</b></p> <p>4. The requirement R1 of COM-003 should also be reflected in the COM-002 standard. Especially during the Emergency situation, the Operation Communication should be followed.</p> <p><b>Response: The SDT thanks you for your comment.</b></p>
<p><b>Response: Thank you for your comments. Please see the response above.</b></p>		
<p>Associated Electric Cooperative JRO00088</p>		<p>AECI remains unconvinced that COM-003-1 adds sufficient value to our industry reliability, for the degree of non-compliance risk it imposes. There are several issues with the supporting white paper:</p> <p>1) this paper appears void of citations supporting its assertions,</p> <p><b>Response: The SDT disagrees. There are many citations especially those dealing with human behaviors applicable to communication.</b></p> <p>2) It also fails to differentiate cited industry failures in communication, between; situations where somebody failed to communicate a field-change that significantly affected BES situational awareness, situations where the change was clearly understood and yet its situational impact was not, and situations where the affected objects were misunderstood. All of these failures are critical to our industry's assessing true value in introducing and enforcing broad-scope three-part communication, because COM-003-1 can only improve the last of those three miscommunications,</p> <p><b>Response: The SDT did not go into that detail because of ongoing discussion of violations.</b></p> <p>3) its citation, of 12 Entity's broadly adopting three-point communication, seems hardly a majority practice within our industry,</p>

Organization	Yes or No	Question 10 Comment
		<p><b>Response: The SDT would ask you to look at the load and customer impacts that sample covered. The SDT could have added another 20 entities and believes the results would not differ.</b></p> <p>4) while Entities may internally adopt similar policies, that does not mean we should risk being subject to Federal law in support of conceptual theories,</p> <p><b>Response: The formalization of communication protocols enhances reliability by reducing errors on the BES.</b></p> <p>5) Citations of similar adoptions by other industries or cultures, fail to provide useful differentiation between their critical and casual operational communications, except in the case of military, where COM-003’s proposed broad scope of communication appears to be inconsistent, while COM-002’s narrowed scope appears in alignment with the military’s adopted practices as described.</p> <p><b>Response: The OPCPSDT has military expertise that would suggest otherwise.</b></p>
<p><b>Response: Thank you for your comments. Please see the response above.</b></p>		
FirstEnergy		<p>Although we believe the team made significant improvements to the standard, and would support a 3-part communication standard, we believe the introduction of both COM-002-2 which utilizes Reliability Directives and COM-003-1 which utilizes Operating Communications cause confusion for system operators and may in fact be detrimental to reliability. We do not support two standards on three-part communication. We suggest, as we have in the past, that the subject of three-part communication be addressed in a single standard, and that the requirements be developed for simplicity. The industry is, and has been, using three-part communication for decades and although we agree it should be more consistently practiced and standardized, the required communications protocols should be simple while meeting the goal of BES reliability. Introducing complicated requirements and standards that have different definitions such as Reliability Directive and Operating</p>

Organization	Yes or No	Question 10 Comment
		<p>Communication may cause the operator to hesitate when issuing directives in real-time and every second counts when a potential system emergency must be mitigated. Therefore, FE does not support the creation of neither COM-003-1 nor COM-002-2 (see project 2006-06 vote and comments) and ask NERC to reevaluate the need to have two separate standards for three-part communication.</p>
<p><b>Response:</b> Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” This is a broader scope than that for Project 2006-06.</p>		
<p>Western Electricity Coordinating Council</p>		<p>As noted in our response to question 6, there is still a concern about having two standards for communications on changes to elements of the BES. Bifurcations may lead to the misuses of one protocol in place of another for the two standards.</p>
<p><b>Response:</b> Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” This is a broader scope than that for Project 2006-06.</p>		
<p>City of Austin dba Austin Energy</p>		<p>Austin Energy (AE) respectfully disagrees with COM-003-1 because it:</p> <p>(1) reaches beyond the SAR and</p> <p><b>Response:</b> The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” Additionally, the SAR is very specific in that it also includes the term “normal” operating conditions under Applicability: “<i>Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.</i>”</p> <p>(2) Requires “how” communication should take place instead of “what” and “when.”</p> <p><b>Response:</b> When defining common communication protocols to be used for</p>

Organization	Yes or No	Question 10 Comment
		<p><b>communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated.</b></p> <p>The scope of COM-003-1 reaches beyond the SAR by imposing protocols on normal communications when the focus of the 2003 Blackout Report, Recommendation 26 and Order 693, Paragraph 532 is on timely and accurate EMERGENCY communication. Recommendation 26 does not recommend tightened communication protocols under normal operating conditions. It recommends that NERC “work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations....” AE believes Project 2006-06 (COM-002-3) sufficiently addresses this recommendation by requiring three-part communication for Reliability Directives. If used correctly, the say-repeat-confirm method improves effectiveness of communications during alerts, emergencies and other critical time periods.</p> <p><b>Response: Response: The OPCSDT disagrees that the Blackout Report (and FERC Order 693 and the SAR) only addresses the need to tighten protocols for Emergencies. The Blackout Report uses the phrase “especially for emergencies” which the SDT interprets to mean the authors were recommending applicability of communication protocols for the total population of operating communication and used this language to amplify the importance of such protocols during emergency conditions. FERC Order 693 paragraph 532 (“This will eliminate possible ambiguities in communications during <u>normal</u>, alert and emergency conditions”) and the SAR are very specific in that both include the term “normal” operating conditions.</b></p> <p>The other source for COM-003-1 (Paragraph 532) references communications during normal conditions, but only in response to an EEI comment. The actual directive is in paragraph 535, where FERC states, “Accordingly, we direct the ERO to either modify COM-002-2 or develop a new Reliability Standard that requires tightened communications protocols, especially for communications during alerts and emergencies.” AE notes that the directive focuses on communications during alerts and emergencies, similar to Recommendation 26. AE recognizes that the SDT reads</p>

Organization	Yes or No	Question 10 Comment
		<p>Paragraph 532 to indicate a need for communication protocols even under normal operating conditions. However, AE believes that a NERC Reliability Standard is not the appropriate place to address the “how” of communication protocols under normal conditions.</p> <p><b>Response: FERC Order 693 paragraph 532 (This will eliminate possible ambiguities in communications during normal, alert and emergency conditions”) and the SAR are very specific in that both include the term “normal” operating conditions.</b></p> <p>Industry stakeholders are justifiably concerned that deviations from the requirements during normal operating conditions will inevitably occur (human performance factor) without a risk to reliability. The potential number of self-reports industry-wide carries an overly burdensome cost without an associated benefit to the BES. AE believes that efforts at the regional level (e.g., training, guidelines, etc.) would be more effective and relevant.</p> <p>In summary, AE believes the focus of COM-003-1 should be on achieving accurate and timely information (the “what” and “when”), not prescribing exactly “how” registered entities achieve it. As written, COM-003-1 goes too far into the realm of mandating best practices and claiming it is necessary for reliability.</p> <p><b>Response The SDT understands your concerns and has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. Please see our response above.</b></p>		
Pepco Holdings Inc & Affiliates		<p>COM-002 and COM-003 must be combined into one standard. COM-002 dealing with emergency, reliability situations requires 3 part communication as specified. COM-003 dealing with normal conditions, non reliability issues should not require 3 part communications.</p>
<p><b>Response: Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten</b></p>		

Organization	Yes or No	Question 10 Comment
<p>response time.” This is a broader scope than that for Project 2006-06.</p>		
<p>ITC Holdings</p>		<p>COM-003-1 and COM-002-3 cannot be processed separately since they are inextricably inter-related. In fact, they are so inter-related that there is no compelling reason provided that suggests they should be separate standards. The comment form for COM-003-1 even indicates that Reliability Directives are a subset of Operational Communication which further indicates that all of the requirements surrounding how communication is performed regardless of the nature of the content should be addressed in one standard.</p> <p><b>Response: Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” This is a broader scope than that for Project 2006-06.</b></p> <p>Further, 3 part communication is being cited as ensuring reliable operation of the BES. It is not the act of 3 part communication that ensures reliable operation. Rather, it is the effective transfer of information that does. Requiring 3 part communication for all communication will reduce the effectiveness of the communication as the novelty factor wears off and individuals only go through the motions. Active listening and truly understanding the communication is what accomplishes the intent. Use of 3 part communication for situations that the initiator determines it is warranted based on their knowledge and training is the most appropriate approach to ensure reliable operation of the BES.</p> <p><b>Response: The SDT believes that it is necessary to specify 3 part communication as a necessary communications protocol for all Operating Instructions, not just emergency situations. The OPCSDT believes that the potential for risk to the reliability of the BES exists for all Operating Instructions.</b></p>

Organization	Yes or No	Question 10 Comment
<p>Response: Response: Thank you for your comments. Please see the responses above.</p>		
JEA		Combine COM002 & COM003.
<p>Response: Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” This is a broader scope than that for Project 2006-06.</p>		
City Water Light and Power		CWLP generally echoes the SERC Operating Committee comments. Additional comments have been provided to suggest better functionality if the standard moves forward in its current form.
<p>Response: Thank you for your comments. Please refer to the response to the SERC Operating Committee comments.</p>		
LG&E and KU Services		<p>Does the industry agree that we need a standard on three part communications for normal operations? Has a lack of a standard on three part communications for normal operations created any reliability issues? If so, what are they? LG&amp;E and KU Services believes that the concerns expressed by the Blackout Report and cited as the reason for creating this NERC Project are already addressed through EOP and TOP Standards that specify what information is to be communicated, instead of how information is to be communicated. “Lack of situational awareness” (2003 Blackout Report, Recommendation 26) cannot be overcome by dictating “how” communication takes place, but instead, can be overcome by responsible individuals (NERC certified operators) ensuring that proper information is communicated. LG&amp;E and KU Services believes that the concerns expressed by the Blackout Report and FERC Order 693, Paragraph 532 are not (and need not be) addressed by this or any other NERC RS Project.</p> <p>First, the recommendation for “tightened communication protocols” (FERC Order 693, Paragraph 531) is within the context of “alerts and emergencies.”</p>

Organization	Yes or No	Question 10 Comment
		<p>Second, FERC’s Order 693, Paragraph 532 calls for “communication uniformity as much as practical on a continent-wide basis.” This is calling for uniformity in emergency communications, which was the context within which FERC was speaking, as evidenced by the previous sentence (“during emergencies”). By establishing emergency communication uniformity, “ambiguities in communications during normal, alert and emergency conditions” will be eliminated. Nothing in the Commission’s Determination was calling for establishing communication uniformity for all communications.</p> <p><b>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</b></p> <p><b>The OPCPSDT disagrees that both the Blackout Report and the FERC directive deal with tightening protocols for Emergencies only. The Blackout Report uses the language “Tighten communications protocols, especially for communications during alerts and emergencies.” The SDT believes the authors are recommending applicability of communication protocols for the total population of operating levels and wanted to amplify the importance of it “especially” during emergency conditions. FERC Order 693, paragraph 532 (<i>This will eliminate possible ambiguities in communications during normal, alert and emergency conditions</i>) and the SAR are very specific in that both include the term “normal” operating conditions. Additionally the excerpts from the text you cite (<i>“Paragraph 532 calls for “communication uniformity as much as practical on a continent-wide basis”</i>) are very clear in their intent and meaning and support the standard as drafted.</b></p> <p>LG&amp;E and KU Services suggest removing requirements R2 and R3. These requirements do not improve reliability, but instead shift Operator focus from</p>

Organization	Yes or No	Question 10 Comment
		<p>communicating proper information (“what”) to communicating in a compliant manner (“how”). System Operator need to be wholly concerned with the information they are communicating, not making sure they “say things the right way” so they will not be non-compliant. Every communication should not be a compliance event.</p> <p><b>Response: The SDT believes that it is necessary to specify 3 part communication as a necessary communications protocol for all Operating Instructions, not just emergency situations. The OPCPSDT believes that the potential for risk to the reliability of the BES exists for all Operating Instructions.</b></p> <p>While LG&amp;E and KU Services supports the addition of using the 24-hour clock format, subpart 1.1.4 is already addressed in TOP-002-2b R18.</p> <p>Including such a similar requirement here simply provides entities with a double jeopardy opportunity to be non-compliant. We suggest subpart 1.1.4 be removed, along with subpart 1.2, which again goes too far in dictating “how” and simply creates another compliance event.</p> <p><b>Response: The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. Project 2007-03 chose to eliminate TOP-002-2a Requirement R18 on the basis that “This requirement adds no reliability benefit. Entities have existing processes that handle this issue. There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue. This is an administrative item, as seen in the measure, which simply requires a list of line identifiers. The true reliability issue is not the name of a line but what is happening to it, pointing out the difficulty in assigning compliance responsibility for such a requirement, as well as the near impossibility of coming up with truly unique identifiers on a nation-wide basis. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers.” COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only</b></p>

Organization	Yes or No	Question 10 Comment
		<p><b>Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are referring to the same equipment for the Operating Instruction.</b></p> <p>We suggest subpart 1.1.3 be rewritten to explicitly allow for entities to agree upon using a particular format for communicating time. With these suggestions in mind, it would be more appropriate to put the remaining requirements into COM-001. We also suggest removing the definition for Operating Communication since this also unnecessarily creates opportunities for non-compliance.</p> <p><b>Response: When defining common communication protocols to be used for communication between entities, it is necessary to be specific on what must be communicated and how it must be communicated. Comments on prior postings of COM-003-1 rejected allowances for entities to agree upon particular protocols, feeling that the documentation of those agreements would be overly burdensome and is contrary to the purpose of the SAR, which is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” The SDT is using the term “Operating Instruction” to limit the communications that are subject to COM-003-1.</b></p> <p>LG&amp;E and KU Services have concerns about the white paper posted on the project page. Some assertions made in the white paper are not defensible, and some are not technically sound. This should not be used as support for the existing draft of COM-003.</p> <p><b>Response: The SDT believes its assertions are defensible, technically sound, and carefully researched. The White Paper is intended to assist industry stakeholders understand the rationale behind the content in the standard. For further information on communication guidelines, please refer to the paper developed by the NERC Operating Committee titled “Reliability Guideline: System Operator Verbal Communication – Current Industry Practices” located at</b></p>

Organization	Yes or No	Question 10 Comment
		<a href="http://www.nerc.com/filez/oc.html">http://www.nerc.com/filez/oc.html</a>
<p>Response: Thank you for your comments. Please see the response above.</p>		
<p>Dominion</p>		<p>Dominion acknowledges the term Reliability Directive is proposed for inclusion in the draft of COM-002-3, but we also prefer a notation be added, to clarify this is not an existing term in the current version of the NERC Glossary of Terms. As mentioned in response to Question #1; When the standard is implemented, the text box (on page 2 of the clean standard) will be removed, therefore losing any tieback to a Reliability Directive as a type of operating communication.</p> <p><b>Response: After filing with FERC and receiving FERC approval the definition will be added to the NERC Glossary of Terms. The OPCPSDT and the RCSDT were attempting to explain the relationship between the two standards to help stakeholders understand. The textbox was an attempt to explain that relationship. Draft 3 of the standard no longer contains the reference.</b></p> <p>The data retention period for this standard for normal operating communications is extensively longer than the COM-002-3 standard for emergency communications as discussed in Project 2006-06. Dominion suggests the same data retention period as COM-002-3 for Requirements 1, 2 and 3 of this standard, which is for the most recent 3 months.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p> <p>Dominion also questions why the proposed standard is applicable to Distribution Providers since changing the state of BES elements is not what they do. Therefore, they would never receive an Operating Communication instructing them to do anything to a BES element, so it would not be practical or useful for a DP to include this standard in its compliance program. DP is included as an applicable Registered Entity in COM-002. Other than a load shed Reliability Directive (during emergencies),</p>

Organization	Yes or No	Question 10 Comment
		<p>what other Operating Communication would a DP receive?</p> <p><b>Response: The SDT is aware of some DPs that operate and own BES assets. Load shedding communications are the main reason they are applicable. Load shedding can be requested during non emergency conditions.</b></p>
<p><b>Response: Thank you for your comments. Please see the response above.</b></p>		
<p>Arizona Public Service Company</p>		<p>Equipment identifiers at individual locations (generating stations as an example) have the same alpha preceding the unique device numeric. It is unnecessary, redundant and confusing to the operator to repeat the station location with an alpha clarifier.</p>
<p><b>Response: Thank you for your comments. The SDT is has developed an alternate approach to COM-003-1. Using the approach in draft 3, an entity could define in their communication protocols that the equipment identifier does not include the preceding alpha that designates the location.</b></p>		
<p>Exelon Corporation and its affiliates</p>		<p>Exelon believes that the proposed COM-003-1 exceeds what is necessary for reliability and creates other problems such that the proposed standard may in fact result in a decrease in reliability. In particular the language is overly prescriptive and presents significant compliance questions both in terms of creating a credible compliance measure and a reasonable way for entities to demonstrate compliance or conduct internal self-assessment. Exelon believes that an alternative approach to COM-003 is needed. The standard should set desired outcomes and leave the specific implementation of communication protocols to registered entities. Standards should not impede use of best practices and should encourage effective innovation.</p> <p>An alternate approach is worth consideration:</p> <p>Requirements:</p> <ol style="list-style-type: none"> <li>1. Entities must have a protocol addressing communications for operating personnel.</li> </ol>

Organization	Yes or No	Question 10 Comment
		<p>1.1. The protocol should address; three part communication, English language usage (include footnote for requirement to use legislatively prescribed language), time zone, entity unique identifiers, 24 hour clock and alpha numeric identifiers.</p> <p>1.2. All control center operating personnel should be trained on the use of the protocol. Measure: In an audit, a company would be expected to demonstrate that they had such a protocol and that they trained their operators on its use.</p> <p>This proposal would satisfy the Directives and Blackout Recommendation #26 which were to “tighten communication protocols, especially for... emergencies”. Stakeholders and the NERC BOT approved COM-002-2 which addressed communications capabilities being staffed and available for addressing a real-time emergency condition. An associated interpretation of COM-002 clarified whether routine operating instructions are “directives” or whether “directives” are limited to actual and anticipated emergency operating conditions. Our proposed changes to COM-003 are responsive to the FERC recommendation to tighten operating protocols. Other possible responses to this recommendation would be to conduct an assessment of NERC certification requirements and if found lacking in this area, strengthen them. For the reasons stated above, we urge NERC to change the focus of COM-003 from a prescriptive what to do approach and allow entities to develop and implement protocols in keeping with NERC and ISO/RTO operator certification requirements and best practices within the industry.</p> <p>Thank you for the opportunity to comment.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a similar approach in draft 3.</b></p>		
Idaho Power Company		I believe the requirements for Directive should be included in this standard and

Organization	Yes or No	Question 10 Comment
		removed from COM-002.
<b>Response: Thank you for your comments.</b>		
Illinois Municipal Electric Agency		IMEA agrees with comments submitted by the SERC OC Standards Review Group.
<b>Response: Thank you for your comments. Please see our response to SERC Operating Committee comments.</b>		
Indiana Municipal Power Agency		<p>IMPA believes that each organization should follow its internal communication protocol up to the point where a Reliability Directive is issued. IMPA does not see why NERC is stating the “how” in this standard (sub-requirements 1.1, 1.1.1 thru 1.1.4) when its common practice has been to stay away from telling the entities “how” to do a standard requirement. Therefore, IMPA believes that COM-003 should just state that an entity needs to have a communication protocol in place for issuing and receiving instructions. In addition, an entity should only have to do training on its communication protocol in order to prove compliance that it is following or using it. The record keeping or data retention of phone recordings will become very burdensome on entities, especially if they have to keep five or six years worth (back to its last audit date).</p>
<b>Response: Thank you for your comments. The SDT has developed a similar approach in draft 3.</b>		
Ingleside Cogeneration LP		<p>Ingleside Cogeneration LP agrees in principle with the need for Operators and Field Personnel to express and validate their intent before taking actions that may pose a risk to the BES. However, we have serious reservations with the use of the audit methodology to drive consistent behavior. Perhaps most significant is the assessment of violations for a single instance where an operator does not use alphanumeric identifiers or a 24 hour clock during the course of an Operating Communication. We believe that even in an extremely well managed organization that 100% adherence is statistically impossible. In our view, this flies in the face of</p>

Organization	Yes or No	Question 10 Comment
		<p>fairness - and raises serious questions about the “public/private partnership” that is supposed to be the foundation of NERC standards. This points to the “bean counting” type of Standards that NERC is trying to get away from, rather than focusing on reliability of the BES. Furthermore, entities will be assessed violations if they cannot prove that every side conversation did not take place in accordance with COM-003-1. In order to comply, we estimate it will take two or three times the time to document a non-recorded communication than it will be to actually conduct one. This is not an appropriate use of our front-line resources available time - nor does the documentation serve a reliability purpose in our view.</p> <p><b>Response: The SDT has developed a new approach in draft 3 that addresses your concerns.</b></p> <p>In addition, COM-003-1 is silent as to multiparty calls that are typical in some regions, where an entity at random is elected for the three part response for the group on conference calls, and not all parties are required to respond, but rather only participate on the call.</p> <p><b>Response: The SDT is incorporating protocols for multiparty calls in draft 3.</b></p>
<p><b>Response: Thank you for your comments. Please see the comments above.</b></p>		
Manitoba Hydro		<p>Manitoba Hydro is voting negative on COM-003-1 based on our comments in the previous questions in addition to the following:(M1/M2/M3)- it is unclear what specifically is meant by ‘on site observations’ or how ‘on site observations’ can be an effective measure of compliance with the standard’s requirements.</p>
<p><b>Response: Thank you for your comments. The measures have been modified in response to changes in the requirement language.</b></p>		
PNGC Small Entity Comment Group		<p>Modified PNGC Small Entity Group Comments:</p> <p>The PNGC comment group believes there should be a distinction in the “Applicability” section of the standard between “Scheduling Distribution Provider” and “Non-</p>

Organization	Yes or No	Question 10 Comment
		<p>scheduling Distribution Provider”. PNGC members are small rural cooperatives that are “Full service BPA customers.” This means that BPA is our power supplier and scheduling agent and therefore handles all reliability directives, scheduling, tagging, dispatching of resources and curtailments of load from breakers on BPA’s system for PNGC members.</p> <p>According to a letter from the WECC Reliability Coordinator (VRCC and LRCC) none of PNGC’s members will ever receive a “Reliability Directive”. Such a Directive would be sent to either a Balancing Authority (BA), or a Transmission Operator (TOP). We estimate there are over 100 entities that are BPA Full Service customers that are in a similar position and making this standard applicable to them does nothing to enhance reliability. A simple declarative statement in the Applicability section of the standard could focus the intent of the SDT on those entities that need it while lessening the compliance risk and clerical burden for other entities that the standard should not apply to.</p> <p>We suggest:</p> <p>4. Applicability:</p> <p>4.1. Functional Entities</p> <p>4.1.1 Reliability Coordinator</p> <p>4.1.2 Transmission Operator</p> <p>4.1.3 Balancing Authority</p> <p>4.1.4 Generator Operator</p> <p>4.1.5 Distribution Provider:</p> <p>With Real-time Operations and Scheduling desk the PNGC comment group believes the above change will lessen the compliance burden on small, non-scheduling entities while still meeting the SDT’s intent with regard to Operating Personnel Communications. We also note that FERC and NERC, on multiple occasions and in</p>

Organization	Yes or No	Question 10 Comment
		multiple filings, have indicated their openness to lessening unnecessary compliance requirements for small entities.
<p><b>Response: Thank you for your comments. The SDT notes that COM-002-3, draft 6 states that in addition to Reliability Coordinators, Balancing Authorities and Transmission Operators can also issue Reliability Directives. Draft 3 of COM-003-1 also limits protocols for Distribution Providers to those that apply to receiving Operating Instructions.</b></p>		
NERC Operating Committee		<p>NERC Operating Committee (OC) comments on COM-003 (Operating Personnel Communications Protocols) The current draft of COM-003 is prescriptive and is in fact a procedure or rather a set of discrete tasks / actions that are not focused to support the reliability intent. The NERC OC recommends that the SDT develop a purpose that speaks to operators and their responsibility to maintain reliability not a process or set of protocols that cannot account for every nuance and variable in the realm of communications and human interaction.</p> <p>Restated Purpose: To provide system operators a holistic communications program that reduces the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.</p> <p>The OC just approved a guideline for System Operator Verbal Communications. The OC feels this could be used as a basis for a new approach for COM-003-1. The OC proposes that the SDT changes the draft of COM-003 to the following three requirements:</p> <p>R1: Each RC, TOP, GOP, BA, DP shall develop a written communications procedure to address the following:</p> <ul style="list-style-type: none"> <li>o Protocols</li> <li>o Training and education</li> <li>o Internal controls (Preventive, Detective and Corrective) that demonstrates a process that will find, fix, track, trend, analyze and continuously improve</li> </ul>

Organization	Yes or No	Question 10 Comment
		<p>R2: Each RC, TOP, GOP, BA, DP shall train applicable personnel on the communication procedure developed for R1</p> <p>R3: Each RC, TOP, GOP, BA, DP shall take appropriate actions to address deficiencies revealed by internal controls.</p> <p><b>Response: The SDT has developed a similar approach in draft 3.</b></p> <p>Data retention must be rethought to focus less on significant data and evidence archiving (backwards looking) and more on the internal program to continuously improve (forward looking). Individual instances of not following the company's procedure should not be the basis of violation but instead - a demonstration of internal assessment and refinement.</p> <p><b>Response: The SDT has modified its approach to data and evidence retention.</b></p> <p>The VRF/VSL should be based on an entity either not having a program, not demonstrating their assessment and corrective action process or egregious / systemic problems with the implementation of their program.</p> <p><b>Response: The SDT has modified the VRFs and VSLs accordingly.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
Entergy Services		<p>NERC standards are not procedures and this standard attempts to impose a single procedure on the industry. Tightening of communications protocols between entities does not equate to a procedural requirement to use 3-part communications between personnel at various registered entities.</p> <p>The actual impact to reliability of routine communications between entities is minimal and further diminished by the Reliability Directive construct espoused by RC SDT (Project 2006-06), which fully addresses the reliability implications of communications.</p> <p><b>Response: The SDT is aware of draft 6 of COM-002-3 from project 2006-06 and</b></p>

Organization	Yes or No	Question 10 Comment
		<p>believes that while COM-002-3 addresses the risks to reliability during Emergencies and Adverse Reliability Impacts it does not address the risks to reliability that exist due to communication mistakes that occur during normal operating conditions. The events that generate a Reliability Directive are high impact and low frequency events. Most of the time the BES is operated in a normal state sustained by large numbers of Element and Facility changes that require Operating Communications.</p> <p>The communication protocols the SDT is proposing have been proven effective for clarifying critical content in commands or orders. Reducing the potential for mistakes on the BES enhances reliability.</p> <p>While most of the industry practices three-way communications routinely, this is not necessary to assure reliable operations. Rather, in many cases, entities are viewing this as a “best practice”, that helps to formalize communications so that Operators will develop good communications habits. The work by the RC SDT (Project 2006-06) on Reliability Directives is all that is necessary to assure BES reliability, and the approach currently espoused by OPCP SDT (Project 2007-02) in this COM-003 standard is massively redundant to that effort while not helping reliability. We agree with SERC in suggesting another approach to COM-003. Rather than to specify the solutions to achieving effective communication, COM-003 should instead focus on developing and training on an approach that is designed appropriately for each RE.</p> <p>For instance, another approach to COM-003 might be along the lines of:</p> <p>Requirement 1 (See our suggested alternate language in our response to Question 1) could be written in a manner to require the appropriate registered entities to develop a communication protocol that is appropriate for each RE. This communications protocol should address how the RE is handling:</p> <p>Time Zone Designations - for both internal and external communications Language</p>

Organization	Yes or No	Question 10 Comment
		<p>Alpha-numeric identifiers</p> <p>Three - part communications - circumstances in which is it required, etc</p> <p>Use of defined terminology. This approach would require the RE to address how it is addressing these issues, without prescribing solutions. For instance, a RE could include in its protocol a section dealing with time zone designation. In this section the RE could explain that it, and its neighbors, all are in and use the same time zone. As a result, the RE has determined that requiring the identification of time zone reference in communication is not necessary.</p> <p>Procedures should address the training of operators on the communication protocol</p> <p>Procedures should address the internal controls that the RE uses to review that its protocol is being followed.</p> <p>The compliance approach would be to: Assess whether the RE has developed a written protocol and whether the protocol addresses each item - this does not mean there is an assessment of HOW each item is assessed; assess whether the RE has trained its operators on the communications protocol and assess whether the RE is following its internal controls. Compliance with this requirement should not require 100% accuracy in compliance with the entities communication procedure by real-time operations staff. That would cause misdirection of resources and training time from issues more important to BES reliability.</p> <p><b>Response: The SDT has developed a similar approach in draft 3.</b></p> <p>Any data retention requirements should be consistent with the COM-002 reliability standard.</p> <p><b>Response: The SDT has modified its approach to data and evidence retention.</b></p> <p>What is the role of the Operating Communications Protocols White paper? Is it a position of the STD? Was there a minority opinion? Why was it not vetted with a</p>

Organization	Yes or No	Question 10 Comment
		<p>wide spectrum of industry stakeholders (we are unaware of any effort to circulate this white paper even as far as to the standing Technical Committees of NERC).</p> <p><b>Response: The White Paper is intended to assist industry stakeholders understand the rationale behind the content in the standard. For further information on communication guidelines, please refer to the paper developed by the NERC Operating Committee titled “Reliability Guideline: System Operator Verbal Communication – Current Industry Practices” located at <a href="http://www.nerc.com/filez/oc.html">http://www.nerc.com/filez/oc.html</a>.</b></p> <p>The White Paper was requested by members of the Standards Committee to provide a foundation for the team’s position on communication protocols for normal operations.</p> <p>Does the industry agree that we need a standard on three part communications for normal operations? We have seen no evidence to support this contention. This revision to COM-003 seems to have sprung into existence without any substantive industry comments indicating that the industry would benefit from having a procedure memorialized as a set of Requirements.</p> <p><b>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
Southern Company		<p>NERC standards are not procedures and this standard attempts to impose a single procedure on the industry. Where is the demonstrated need for such a standard?</p>

Organization	Yes or No	Question 10 Comment
		<p>Have communications, especially during periods of normal operations, been shown to be the root cause of many, if any, events? Registered Entities agree that there is a need of clear and concise communication between entities; however, we must avoid creating a system that is unmanageable and quite possibly results in less reliability. FERC Order 693 directs the ERO to “and (3) requires tightened communications protocols, especially for communications during alerts and emergencies”, in paragraph 532. The proposed standard goes too far, especially for communications outside of alerts and emergencies.</p>
<p><b>Response:</b> Thank you for your comments. The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” Additionally, the SAR is very specific in that it also includes the term “normal” operating conditions under <b>Applicability:</b> “Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.” The SDT has developed a new approach to the standard that addresses your concern.</p>		
<p>NextEra Energy, Inc</p>		<p>Next Era has the following additional recommended changes to increase the clarity of COM-003-1:</p> <ol style="list-style-type: none"> <li>1. A new provision on written Operating Communications that requires that the sender to receive a notification that the recipient has received and read the communication. As currently written, there is no read receipt requirement for written Operating Communications. This appears to create a possible reliability gap, given that the sender will not know that its instructions were received and read, which leaves the system in a state of limbo as to what actions will or will not be taken.</li> </ol> <p>Accordingly, NextEra recommends that a requirement be added that reads as follows:”</p> <p>When a Reliability Coordinator, Transmission Operator and Balancing Authority sends a written Operating Communication it shall include a “read receipt” requirement or</p>

Organization	Yes or No	Question 10 Comment
		<p>similar mechanism to ensure the sender has received and read the Operating Communication. If a “read receipt” is not received by the sender, the sender shall call the intended recipient or rescind the Operating Communication.”</p> <p><b>Response: The SDT has limited three part communication to oral communication. In the alternative approach to COM003-1 an entity could address that concern in its communication protocols.</b></p> <p>2. R2.1 is confusing because it attempts to mix what occurs when a response is received and when no response is received during a oral communication. To ensure no confusion occurs, as well as providing for additional practical discretion when a response is not received, NextEra recommends that R2.1 be separated into two distinct sections and be rewritten to read as follows:</p> <p>R2.2. After the response is received, do the following:</p> <ul style="list-style-type: none"> <li>o Confirm the receiver’s response is correct (not necessarily verbatim).</li> <li>o Reissue the Operating Communication if the repeated information is incorrect or if the receiver does not issue a response.</li> <li>o Reissue the Operating Communication, if requested by the receiver.</li> </ul> <p>R2.3 If no response is received, do one of the following:</p> <ul style="list-style-type: none"> <li>o Ask the receiver if the Operating Communication was received. If receiver confirms receipt of the Operating Communication, then proceed through R2.2.</li> </ul> <p>If the receiver, however, does not confirm receipt or no response is received, the sender of the Operating Communication shall either reissue or rescind the Operating Communication.</p> <p><b>Response: The SDT has changed the language to the same language contained in COM-002-3, R2 and R3 to be consistent and to reduce confusion.</b></p>

Organization	Yes or No	Question 10 Comment
		<p>3. Unlike language on Reliability Directives in IRO-001-3 - “unless compliance with the direction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory or statutory requirements” - there is no similar qualifier for Operating Communications. To provide the recipient of an Operating Communication the same rights as a Reliability Directive, NextEra requests that a new section be added:</p> <p>”The recipient of an Operating Communication is required to implement the instruction, unless compliance with the instruction cannot be physically implemented or unless such actions would violate safety, equipment, regulatory or statutory requirements.</p> <p>In the event the recipient is unable to carry out the instruction, it shall communicate this situation to the sender of the Operating Communication.”This last recommended addition should be added in both cases:</p> <p>(a) if Next Era’s response to question 6 is adopted, or</p> <p>(b) if NextEra’s response to question 6 is not adopted.</p> <p><b>Response: The SDT has developed a new approach in draft 3.</b></p> <p>.4. To provide clarity to COM-003-1, NextEra recommends that the purpose stated in the white paper be transferred to the purpose statement of COM-003-1. The white paper states that “[t]he purpose of the proposed standard is to: ‘Require that real time System Operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.’” NextEra recommends that this purpose statement replace the draft purpose statement in COM-003-1, so COM-003-1 is not misinterpreted to require three way communications outside of real-time system operations.</p> <p><b>Response: The SDT has modified the purpose statement in draft 3.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		

Organization	Yes or No	Question 10 Comment
New York Power Authority		<p>NYPA supports the comments submitted by the NPCC Regional Standards Committee (RSC).</p>
<p><b>Response: Thank you for your comments. Please see the response to the comments submitted by the NPCC Regional Standards Committee (RSC).</b></p>		
American Electric Power		<p>Our efforts in this regard should first be focused solely on Reliability Directives before expanding this work, and creating similar requirements for all other Operating Communications. Requiring three part communications for every scenario might be considered a best practice by some, but making it a mandatory practice for routine operations seems to emphasize the manner of communications rather than the operations themselves. In addition, requiring three part communications for Reliability Directives will likely result in more widespread usage for more routine operating communications, without making it a requirement.</p> <p><b>Response: The SDT has developed a different approach to the standard that addresses your concern.</b></p> <p>AEP believes that there should not be multiple project teams proposing concurrent changes to COM-001, COM-002, and COM-003. Unless there are overwhelming reasons for not doing so, these efforts should be consolidated and managed by a single project team. In addition, current efforts on COM-003 need to be co-located with the proposed changes to COM-002 within a single standard. Having multiple project teams proposing concurrent changes results in problems such as this, where a) changes are proposed to the same standard or b) similar changes are proposed to separate standards. AEP cannot support revisions on these matters until they are managed by a single project team.</p> <p><b>Response: Thank you for your comments.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		

Organization	Yes or No	Question 10 Comment
City of Palo Alto		Palo Alto supports the comments submitted by PNGC Power regarding limiting the applicability of the standard to a certain subset of Distribution Providers. Palo Alto is similarly situated as PNGC.
<b>Response: Thank you for your comments. Please see the response to the comments submitted by PNGC Power.</b>		
Brazos Electric Power Cooperative		Please see formal comments provided by APM.
<b>Response: Thank you for your comments. Please see the response to the comments submitted by APM.</b>		
Center Point Energy Houston Electric, LLC.		<p>Question 10 Comments: It appears that the SDT is using an undefined definition of Reliability Directive to propose the new definition of Operating Communication. Is the intent of the SDT to also introduce this definition for Reliability Directive with this project?</p> <p><b>Response: No. The OPCPSDT included it in COM-003-1 as a means to demonstrate the relationship between the two terms. Both standards were posted for stakeholder review at close to the same time. After filing with FERC and receiving FERC approval the definition will be added to the NERC Glossary of Terms. The OPCPSDT and the RCSDT were attempting to explain the relationship between the two standards to help stakeholders understand. The textbox was an attempt to explain that relationship. Draft 3 of the standard no longer contains the reference.</b></p> <p>The purpose is not consistent with language in other currently enforced standards. The words “could” and “possibility” needs to be removed from the language. The purpose needs to be concrete. An alternative purpose would be “To specify clear, formal, and universally-applied communication protocols for the operation of BES facilities that reduce miscommunication, which will have a negative influence on the reliability of the Bulk Electric System.</p>

Organization	Yes or No	Question 10 Comment
		<p><b>Response: The SDT has modified the purpose statement.</b></p> <p>The six month effective date following approval is too short and should be extended to 12 months to allow adequate time for training and implementation.</p> <p><b>Response: The SDT has changed the effective date to 12 months in draft 3.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>Sacramento Municipal Utility District</p>		<p>Recommendation: Not-Approve</p> <p>We feel that the direction for this communications standard is grossly in error. Focus should be on ensuring proper training programs are in place that emphasize and best prepare the System Operator for effective communication. The idea that effective communication can be scripted is entirely mis-guided and that a regulatory body might subject an entity to financial penalties for communication standards that attempt to script the language spoken, how time is referenced, naming conventions and alpha-numeric clarifiers has no precedence in industry that we are aware of.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p> <p>The United States’ Air Traffic Control protocols for communications between controllers and commercial airline pilots are very tested, well trained and effective. Controllers and pilots are trained in effective communication and the situations and pronunciation types that may lead to confusion. But they are not fined for any instance of not following them.</p> <p>From the Air Traffic Controllers Handbook,  <a href="http://avstop.com/ac/atc/2-4-1.html#2-4-12-4-3">http://avstop.com/ac/atc/2-4-1.html#2-4-12-4-3</a></p> <p>Pilot Acknowledgment / Read back</p> <p>a. When issuing clearances or instructions ensure acknowledgment by the pilot.</p>

Organization	Yes or No	Question 10 Comment
		<p>NOTE - Pilots may acknowledge clearances, instructions, or other information by using "Wilco," "Roger," "Affirmative," or other words or remarks. REFERENCE - AIM, Contact Procedures, paragraph 4-2-3.</p> <p>b. If altitude, heading, or other items are read back by the pilot, ensure the read back is correct. If incorrect or incomplete, make corrections as appropriate.</p> <p><b>Response: The protocols above are analogous to the level of communication discipline that is desired when operating the BES.</b></p> <p>Mandating the use of the English language in all communications is not in the best interest of reliability. We are not aware of any issue that has been raised of significance with the current requirement contained within COM-001-1.1, R4</p> <p><b>Response: Referencing the example you cited above, the English language is mandated worldwide in the aviation industry. The SDT believes the aviation industry utilizes strong protocols.</b></p> <p><b>COM-003-1, R1 will replace COM-001-1.1, R4 when COM-003-1 is filed and approved.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
Utility System Efficiencies, InC.		<p>Regarding Measure 1, the "on-site observation" aspect should be expanded upon and clarified. This concept would be very important to identify and document "failures" to properly follow Requirements R1, R2, and R3, during the audit period. Registered Entities should be encouraged to use such observations to coach employees and reinforce their following proper communications protocols/procedures and complying with this standard.</p>
<p><b>Response: Thank you for your comments. The measures have been modified in response to changes in the requirement language.</b></p>		
PPL Electric Utilities		<p>Regarding R1.1.3: I request the SDT consider allowing for the Applicable Functional</p>

Organization	Yes or No	Question 10 Comment
		<p>Entity to develop an Operating Procedure such that if all parties in the communications are in the same time zone that the time zone does NOT need to be used in the Operating Instruction.</p> <p><b>Response: The use of a time zone reference is mandated only if one or more of the parties are in different time zones.</b></p> <p>Regarding the VSL/VRF: I request the SDT consider adjusting the std or VSLs to allow for compliance with a 95% confidence. Such that 1 incomplete 3-part Operating Communication could be considered low or not a PV. If sampling of voice recordings provides a 95% confidence, this should be sufficient. E.g. If one sample of 30 voice recordings results in 1 incomplete 3 part and a second Sample of 30 finds no issues, the audit result should be no PV. This is a standard sampling technique.</p> <p><b>Response: Due to changes made to the current draft of the standard as a result of comments, the requirements have been significantly modified and the VRFs and VSLs had to be modified accordingly and are consistent with FERC and NERC guidelines.</b></p> <p>We thank the SDT for their efforts. PPL EU supports the value added by using 3-part communications and a phonetic alphabet as both are included in our current communications operating instructions. Even with the many Human Performance tools we use, our concern with the standard is being found non-compliant if one of hundreds/thousands of operating communications in a year is not perfect 3-part comm.</p> <p><b>Response: The SDT applauds your use of 3-part communications and a phonetic alphabet. The SDT has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
City of Garland		Requirement 1.2 should be removed from the standard. The number of directives

Organization	Yes or No	Question 10 Comment
		<p>and switching orders that have been issued in North America over time probably number in the billions. If one could determine the percentage of issues caused by miscommunications out of that large number, it would be extremely small. The reason that miscommunication issues exist is because the communication is between two human beings and where people are involved, issues will happen. A requirement for three part communications is more than sufficient to address the issue of miscommunications.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p> <p>Adding a requirement to use alpha-numeric clarifiers such as the NATO Spelling Alphabet is not going to prevent miscommunications. The only thing that adding this requirement will accomplish is to require auditors to listen to recorded conversations trying to verify that operators used alpha-numeric clarifiers and then penalizing a company if an operator does not; even though the directive or switching order was followed correctly.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
City of Tallahassee		<p>TAL is concerned that the proposed standard focuses too heavily on the communications method without consideration of a successful result. While the administrative approach/focus of this proposed language appears to be crafted with the intent of standardizing communications and thereby improving communications, it does not appear to place sufficient value on results-based performance. Should an entity take proper action on a communication that is not delivered precisely in accordance with this language, consideration of such at the Enforcement level would be warranted.</p>

Organization	Yes or No	Question 10 Comment
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>Utility Services, Inc.</p>		<p>The applicability of this standard is unclear in the case of Distribution Providers.</p> <p><b>Response: The SDT believes Distribution Providers can be receivers of Operating Communications and are applicable entities for requirements that govern protocols for receiver. Load shedding is the most common Operating Communication a Distribution Provider would receive.</b></p> <p>The definition of Operating Communication includes “Elements” that could impact the BES. The NERC Glossary definition for Elements includes non-BES devices and equipment. Additionally, the Purpose section of the standard states "harmful to the reliability of the BES." Since non-BES Elements could affect the BES this standard could be deemed applicable to non-BES devices. If it is the intent of the SDT to apply this standard to All Operating Communications concerning both BES and non-BES Facilities this should be explicitly stated in the applicability section for transparency. Otherwise clarifying language should be added to exclude non-BES Facilities.</p> <p><b>Response: The SDT intended Operating Communication to apply to the BES and has modified the definition accordingly.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>TransAlta Centralia Generation LLC</p>		<p>The current effective date only gives the registered entities 6 calendar months to be compliant with the requirements. We do not think this will be achievable. A longer implementation time is required, such as 12 months. In order to comply with standard requirements, the registered entities need to develop the internal controls, such as the procedures/operator training documents, and then provides the training to the operators. The 6 calendar months are not long enough to complete these tasks.</p> <p>In the white paper, Table 1-A shows only the three-part communication are currently</p>

Organization	Yes or No	Question 10 Comment
		<p>used in the registered entities. However, for all other requirements, such as using alpha-numeric clarifiers, the white paper does not show that these are currently used in the registered entities. Thus, there is no base to justify that 6 months is reasonable to achieve the compliance.</p>
<p><b>Response: Thank you for your comments. The SDT agrees and has made the suggested change.</b></p>		
<p>Midwest Reliability Organization NERC Standards Review Forum</p>		<p>The MRO NSRF recommends the following comments for consideration by the SDT:</p> <ol style="list-style-type: none"> <li>Concerning the “Purpose”: Recommend rewrite to state: “To specify universally-applied communication protocols that reduce the possibility of miscommunication which could impact the reliability of BES”. This shorter and to the point purpose clearly defines the intent of the Standard.</li> </ol> <p><b>Response: The SDT modified the purpose statement based on comments provided.</b></p> <ol style="list-style-type: none"> <li>R1.1.3, An entity will be found non compliant if it merely has a written BES switching order that does not contain a time, time zone or whether it is daylight savings time or standard time. The Requirement states nothing about implementing the written communication, just that it is written. The NSRF does not believe that this is the intent of the SDT.</li> </ol> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p> <ol style="list-style-type: none"> <li>This also applies to oral communications. If two operators are communicating between each other while in different time zones and executing a BES switching order, they would need to establish what time it is in both time zones, indicate whether it is daylight saving time or standard time. So, since a Reliability Directive is a component of an Operating Communication, prior to receiving an oral Reliability Directive senders and receivers would need to establish what time it is in both time zones, indicate whether it is daylight saving time or standard time and then give and receive the Reliability Directive. The NSRF does not believe that this is the intent of</li> </ol>

Organization	Yes or No	Question 10 Comment
		<p>the SDT.</p> <p><b>Response: The SDT appreciates your comments and clarifies that the statement above is the intent of the SDT, if the communication is occurring between functional entities (not internal to a specific functional entity).</b></p> <p>4. The SAR for this standard incorrectly addresses the blackout recommendation number 26.</p> <p>Recommendation 26 states:</p> <p>"26. Tighten communications protocols, especially for communications during alerts and emergencies. Upgrade communication system hardware where appropriate".</p> <p>"NERC should work with reliability coordinators and control area operators to improve the effectiveness of internal and external communications during alerts, emergencies, or other critical situations, and ensure that all key parties, including state and local officials, receive timely and accurate information."</p> <p>"NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date."</p> <p><b>Response: The SAR is an industry vetted document and believes it does support Blackout Recommendation 26. The SDT believes the Blackout report itself supports the protocols established by COM- 003-1 based on the excerpts you provided.</b></p> <p>5. Order No. 693 clearly says that the tightened protocols are primarily intended for actions during alerts and emergencies. This was partially addressed in the interpretation on COM-002 and is being addressed in Project 2006-06. Below is the summary determination in the Order on this issue."535, Accordingly, we direct the ERO to either modify COM-002 or develop a new Reliability Standard that requires tightened communication protocols, especially for communications during alerts and</p>

Organization	Yes or No	Question 10 Comment
		<p>emergencies."</p> <p><b>Response: FERC Order 693, paragraph 532 (This will eliminate possible ambiguities in communications during normal, alert and emergency conditions") and the SAR are very specific in that both include the term "normal" operating conditions.</b></p> <p>6. It is not clear that COM-003-1 R1 applies to COM-002-3. The latest draft of COM-002-3 doesn't reference the communications protocols listed in COM-003-1 R1 and the definition of Reliability Directive does not state that it is a type of Operating Communication. Suggest combining the two standards into a single communication standard.</p> <p><b>Response: COM-003-1, R1 applies to any communication that involves a "command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System."</b></p> <p>7. The white paper states "Significant events have occurred on the BES when unclear communication created or exacerbated misunderstandings that led to instability and separation." However, no specific examples were identified. During the June 7 webinar when this question was brought up, it was stated that three part communication was used during these events. This begs the question as to why this standard is needed for normal operations.</p> <p><b>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System.</b></p> <p>8. In order to assign the same level of responsibility as COM-002-2, R2, the RC, TOP, and BA should be the only applicable entities since a Reliability Directive is a sub component of Operating Communications. The RC, TOP, and BA clearly understand clear, concise and definitive communications. They are the only required entities to be NERC Certified and should be held to the highest standards. They can establish</p>

Organization	Yes or No	Question 10 Comment
		<p>other controls to mitigate their risk by training and informing DPs and GOPs that are within their control. DPs and GOPs do not need to be included in R3.</p> <p><b>Response: DPs and GOPs receive Operating Communications and must be able to execute the requirements of a receiver, so they must be included as applicable entities in COM-003-1.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>PNGC Small Entity Comment Group</p>		<p>The PNGC comment group believes there should be a distinction in the “Applicability” section of the standard between “Scheduling Distribution Provider” and “Non-scheduling Distribution Provider”. PNGC members are small rural cooperatives that are “Full service BPA customers.” This means that BPA is our power supplier and scheduling agent and therefore handles all reliability directives, scheduling, tagging, dispatching of resources and curtailments of load from breakers on BPA’s system for PNGC members. According to a letter from the WECC Reliability Coordinator (VRCC and LRCC) none of PNGC’s members will ever receive a “Reliability Directive”. Such a Directive would be sent to either a Balancing Authority (BA), or a Transmission Operator (TOP). We estimate there are over 100 entities that are BPA Full Service customers that are in a similar position and making this standard applicable to them does nothing to enhance reliability. A simple declarative statement in the Applicability section of the standard could focus the intent of the SDT on those entities that need it while lessening the compliance risk and clerical burden for other entities that the standard should not apply to.</p> <p>We suggest:</p> <p>4. Applicability:</p> <p>4.1. Functional Entities</p> <p>4.1.1 Reliability Coordinator</p>

Organization	Yes or No	Question 10 Comment
		<p>4.1.2 Transmission Operator</p> <p>4.1.3 Balancing Authority</p> <p>4.1.4 Generator Operator</p> <p>4.1.5 Distribution Provider: With Real-time Operations desk</p> <p>The PNGC comment group believes the above change will lessen the compliance burden on small, non-scheduling entities while still meeting the SDT’s intent with regard to Operating Personnel Communications. We also note that FERC and NERC, on multiple occasions and in multiple filings, have indicated their openness to lessening unnecessary compliance requirements for small entities.</p>
<p><b>Response: The SDT appreciates your comments. The SDT notes that COM-002-3, draft 6 states that in addition to Reliability Coordinators, Balancing Authorities and Transmission Operators can also issue Reliability Directives. Draft 3 of COM-003-1 also limits protocols for Distribution Providers to those that apply to receiving Operating Instructions.</b></p>		
<p>ISO/RTO Standards Review Committee</p>		<p>The SDT’s proposals do not conform to the Standards Process because those proposals do not reflect the public comments that were submitted. The Process requires the SDT to use the Industry’s comments to drive the requirements and as such the requirements should not be mandating a three part communications procedure for all “changes in status” much less the maintaining of such status. Such a request was not made by any of the commenters let alone a majority of the commenters. It would be more appropriate if the SDT asked who favored the approach being used, as opposed to asking if an “adjustment” to the requirement were acceptable. Many of the adjustments are better than if they were not there, but that ignores the fact that the requirement itself is not supported by the majority of commenters.</p> <p><b>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary</b></p>

Organization	Yes or No	Question 10 Comment
		<p>communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern. The SDT has developed a new approach to the standard based on industry feedback that addresses your concern.</p> <p>The SDT’s proposals expand the scope of the SAR by totally ignoring communications protocols used during emergencies and simply focusing on procedures imposed on personnel during normal situations. This standard over-reaches into routine operations by requiring 3-part communication for all instructions that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. This type of instructions occurs every hour, if not minute. Requiring operating personnel to apply a 3-part communication procedure for these instructions is absolutely unnecessary and overburdening, and can in fact adversely affect reliability.</p> <p><i>We strongly suggest that any requirement for 3-part communication for routine operating instructions be removed.</i></p> <p><b>Response: The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” Additionally, the SAR is very specific in that it also includes the term “normal” operating conditions under Applicability: “Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.”</b></p> <p>****FERC Order 693</p> <p>510. “The Commission proposed...</p> <p>(4) requires tightened communications protocols, especially for communications during alerts and emergencies.</p>

Organization	Yes or No	Question 10 Comment
		<p><i>"SRC Note - The above language while allowing for a requirement to go beyond emergencies, it states that the primary intent is "during alerts and emergencies". The SDT has no requirement for "alerts and emergencies" and focuses solely on normal operations.</i></p> <p><b>Response: The specified communication protocols are applicable to normal and emergency operations.</b></p> <p>532. While we agree with EEI that EOP-001-0, Requirement R4.1 requires communications protocols to be used during emergencies, we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System. We also believe an integral component in tightening the protocols is to establish communication uniformity as much as practical on a continent-wide basis. This will eliminate possible ambiguities in communications during normal, alert and emergency conditions. This is important because the Bulk-Power System is so tightly interconnected that system impacts often cross several operating entities' areas.</p> <p>230 EOP-001-0, Requirement R4 provides, in relevant part, that: "[e]ach Transmission Operator and Balancing Authority shall have emergency plans that will enable it to mitigate operating emergencies. At a minimum, Transmission Operator and Balancing Authority emergency plan shall include [c]ommunication protocols to be used during emergencies.</p> <p><i>"SRC Note - the communications ambiguities noted above do not refer to issues with interpersonal communications but rather refer to situational ambiguities.</i></p> <p><b>Response: The SDT respectfully disagrees. The wording in paragraph 532 says "This will eliminate <u>possible ambiguities</u> in communications during normal, alert and emergency conditions." There is no reference to <i>situational</i> ambiguities. The SDT interprets ambiguities in communications to mean "unclear" communication.</b></p> <p><b>With regard to EOP-001-0, Requirement R4, the SDT believes this to be an</b></p>

Organization	Yes or No	Question 10 Comment
		<p>emergency planning requirement which only states <i>“emergency plan shall include communication protocols to be used during emergencies.”</i> The requirement does not address the development of those protocols.</p> <p>540. “While the Commission identified concerns regarding COM-002-2, the proposed Reliability Standard serves an important purpose by requiring users, owners and operators to implement the necessary communications and coordination among ENTITIES.</p> <p><i>SRC Note - the above does not say “among OPERATING PERSONNEL” it says “among ENTITIES”.</i></p> <p><b>Response: The SDT respectfully points out that paragraph 540 also includes “the proposed Reliability Standard serves an important purpose <u>by requiring users, owners and operators to implement the necessary communications and coordination</u> among entities. “ The SDT believes this is another statement that sanctions the protocols the team has developed.</b></p> <p>540. (Continued)ALTERNATIVELY, with respect to this final issue, the ERO may develop a new Reliability Standard that responds to Blackout Report Recommendation No. 26 in the manner described above.</p> <p><i>“SRC note - The above is a key directive. It states tightened communications protocols [it does not say three part communications for normal actions]’Also note that the Blackout report recommendation is “an alternative” solution and not necessarily a part of the FERC proposed solution.</i></p> <p><b>Response: The SDT believes it has responded to Blackout Report Recommendation No. 26 properly and effectively. The implementation of three part communication during normal operation of the BES is tightening communications. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication</b></p>

Organization	Yes or No	Question 10 Comment
		<p>protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</p> <p>The SDT is also asked to identify the role of the posted White Paper. Is the White paper to be retained as part of the support documentation? If so, then the paper must be vetted by the Industry. The SDT did not afford the opportunity to respond to the paper. There was no indication if the paper was a unanimous SDT position or if there were any minority opinions.</p> <p><b>Response: The Operating Communications Protocols White paper is the position of the SDT.</b></p> <p><b>The White Paper was requested by the Standards Committee to support the team’s position on communication protocols for normal operations. Since the standard did not reference the White Paper there was no requirement for vetting. The SDT posted it for industry stakeholders to share the rationale for the team’s position.</b></p> <p>The SRC would offer the following “whitepaper” to help in deciding whether or not a requirement for 3 part communications for all operational communications rises to the level of requiring a mandatory standard. The “whitepaper” frames the communications issues generically providing an alternative to a zero defects standard.</p> <p>*****The strides NERC is making in the areas of Events Analysis and Human Factors will likely lead to useful practices and value-added standards. A fact-based approach to standards will lead to improved reliability. This paper attempts to quantify the problem that COM-003 is trying to address. While human error is often the first theory to explain major accidents, the follow-on investigation typically finds many factors beyond the front-line operator’s control. There is an axiom in the field</p>

Organization	Yes or No	Question 10 Comment
		<p>of quality control that attributes 80% of manufacturing defects are controllable by management rather than the cause of the front-line workers .Many people make errors that contribute to outages. Manufacturers have equipment defects, planners make incorrect design decisions, technicians draw maps incorrectly, managers cut budgets (plant maintenance, vegetation management), etc. A study of errors at nuclear power plants sheds light on the causes behind the scenes. Although 92% of all root causes were man-made, only a small number of these were initiated by front-line operators. Most originated in either maintenance-related activities or in bad decisions within the organization. In another study, a review of summaries of three major industrial events (Three Mile Island, Bhopal, and Chernobyl) identified operators as committing less than 10% of the missteps that led to the disasters. Table 1 Contributors to Major Accidents To be conservative, this paper assumes that 30% of all major human errors that impact the BPS are attributed to front-line workers (dispatchers, field operators, technicians and maintenance personnel).With regard to which front-line workers commit errors, a study of electrical system incidents at nuclear plants were generally evenly distributed between operators, maintenance personnel and technicians. As to communications problems causing trouble, an EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures. This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators’ errors were due to communication problems. Figure 1 EPRI Study Results on Operating Errors. Bringing the pieces of this discussion together, the following assumptions are used to estimate the percent of human errors on the BPS caused by operator communication breakdowns:</p> <ul style="list-style-type: none"> <li>o 30% of human failures impacting the BPS are due to front line workers</li> <li>o Front line errors were generally evenly split into 3 groups</li> </ul>

Organization	Yes or No	Question 10 Comment
		<ul style="list-style-type: none"> <li>o Dispatchers</li> <li>o Field Personnel</li> <li>o Maintenance and Relaying Technicians</li> </ul> <p>o 18% of dispatcher errors are due to communication problems.</p> <p>The net result is that using estimates of existing research shows that dispatcher communications represent roughly 2% of the human failure on the BPS. Figure 2 Summary Human Failure Estimate.</p> <p>While it has been stated that communication problems are found during the review of all system events, this is similar to saying that gravity is involved in all trips and falls. The statements are true, but the solutions to the problems are multidimensional.</p> <p>During a system event, there are hundreds, if not thousands of communications among different operators, often on situations never seen by the participants. Many of the communications are troubleshooting and information sharing that requires give and take and must be done quickly. If every communication during a disturbance needed to be 3-way, system restoration times for those disturbances would increase.</p> <p>NERC has built a solid foundation to make informed decisions in the future. The Events Analysis process, GADS, and TADS should yield data on the impacts and contributors to BPS failures. NERC’s Human Factors efforts can be used to develop good practices for all front line personnel. NERC should build on the research similar to that outlined in this paper via industry-wide surveys of operators to collect additional data, lessons-learned and tips for improvement.</p> <p>*****A quick estimate of the workload associated with COM-003, for the number of registered entities under the standard’s applicability list. If we assume 1 call each 10 minutes for a BA, TOP and RC and ¼ this amount for GOP and DP, you get the totals below. Each of these is an auditable and sanctionable event. The</p>

Organization	Yes or No	Question 10 Comment
		<p>review and self report on all of these is incompatible with the reliability impacts realized?</p> <p>BA TOP RC GOP DP Total 132 181 22 795 551</p> <p># of Entities 19008 26064 3168 28620 19836</p> <p>96,696 Calls per Day</p> <p>35,294,040 Calls per year</p> <p>*****Lastly, the SRC requests that in the next posting that the SDT include the question:</p> <p>Does the Industry:</p> <ul style="list-style-type: none"> <li>o Support continued development of a standard on personnel discussions during non-emergency conditions?</li> <li>o Support withdrawal of the standard?</li> <li>o Support the creation of an alternative non-standard (e.g. certification) that addresses the corporate protocols on communications?</li> </ul> <p><b>Response: The SDT has read the attached white paper and a file copy that had more content and found some aspects of it very supportive of the OPCPSDT efforts and decisions. It is especially noteworthy that “18% of dispatcher errors are due to communication problems.” That is what this standard is addressing.</b></p> <p><b>With regard to your last request:</b></p> <p><b>During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. Including the proposed question would be counterproductive to the Board’s direction and will not be entertained by the SDT.</b></p>

Organization	Yes or No	Question 10 Comment
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>U.S. Bureau of Reclamation</p>		<p>The standard should clarify what is evidence is considered acceptable to demonstrate compliance with R 1.2. The requirement 3 appears to require the use of voice recording to demonstrate compliance with repeating the operating communication requirement. Not all facilities in which operating instruction may be received have voice recording capability. The requirement/measure should clarify alternative evidence when such a means is not present.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern. Also please refer to the RSAW posted with COM-003-1 draft 3.</b></p>		
<p>PPL Generation, LLC on behalf of its Supply NERC Registered Entities</p>		<p>The statement, “Evidence may include, but is not limited to, voice recordings, transcripts of voice recordings, on-site observations, or other equivalent evidence,” in the Measures section of COM-003 is impractical. Any comprehensive body of evidence would be unreasonably voluminous as well as requiring far more effort to compile than could be justified. The only evidence required for Generation Owners should be a procedure on the subject and a record showing that all applicable personnel have been trained.</p>
<p><b>Response: The SDT appreciates your comments. The SDT has developed a new approach to the standard that addresses your concern. Also please refer to the RSAW posted with COM-003-1 draft 3.</b></p>		
<p>Northeast Power Coordinating Council</p>		<p>The three-part communications in COM-003-1 are expanded beyond reliability directives which unnecessarily force the inclusion of conversations which may be impractical or unnecessary. Good practice dictates that three part communication be used as a tool, but it should not be a requirement. The Standard is specifying how to accomplish, not just what is required.”</p> <p><b>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a</b></p>

Organization	Yes or No	Question 10 Comment
		<p>comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</p> <p>1.1.4 When referring to a Transmission interface Element or a Transmission interface Facility, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility” may create a detriment to reliability. Oftentimes, for switching, TOs have very detailed names for individual elements, devices, equipment which may not translate into the TOP/RC systems. However, it is known what equipment is being talked about. The requirement is unnecessary, unreasonable and burdensome.</p> <p><b>Response: The revised wording in draft 3 states:</b></p> <p style="padding-left: 40px;"><b>“When referring to a Transmission interface Element or a Transmission interface Facility, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility <i>unless another name is mutually agreed to by the functional entities .”</i></b></p> <p>The communications protocol to be followed in the event that there is a situation that requires the removal of BES (or any other power system equipment for that matter) from service on an immediate and emergency basis to protect the health and safety of the public and/or an employee/s needs to be addressed. The instructions issued to meet this condition fall under the definition of Operating Communication, but in an emergency situation the time taken for the required repetition could be catastrophic.</p> <p>This also applies to BES (or any other power system) equipment that is in imminent danger of failure, phase angle regulator or transformer tap changer runaway, or other emergency conditions.</p>

Organization	Yes or No	Question 10 Comment
		<p>This is also true of situations where the BES response to a disturbance results in a facility or facilities being overloaded real time over their STE and LTE ratings, and those facility loadings have to be reduced below their STE and LTE ratings within five and fifteen minutes respectively. The time spent for the necessary three part communication could mean the difference between maintaining continuity of service, or having to shed load.</p> <p>Suggest that wording be added to address the emergency situations described by recognizing the possibility that an operator might have to respond to a situation by issuing a “one way” order, then have a requirement for after the fact communications which would be informational as to what emergency actions were taken, and then resume normal communications protocols for subsequent actions.</p> <p><b>Response: The SDT understands the gravity of the situations you describe. While speed in response to an emergency involving life and property is critical, so is the accuracy of the command to operate the Facility and the Element that will alleviate the threat.</b></p> <p><b>The SDT has developed a new approach to the standard the team believes will mitigate your underlying concern by providing an entity the flexibility to assess its own performance with respect to following its protocols.</b></p> <p>Regarding the wording for the issuer in R2 “...that issues an oral, two-party, person-to-person Operating Communication”, and the wording for the receiver in R3 “...that receives an oral two-party, person-to-person Operating Communication”, what is the significance of the use of the comma after “oral” in R2? What is the difference between two-party and person-to-person communication?</p> <p><b>Response: The comma was an error and is removed in draft 3. Two party was added to preclude all call or multiple addressee communication. Person to person was added to denote human to human rather than human to machine.</b></p> <p>Also regarding R2, the Generator Operator should be included as an authority to</p>

Organization	Yes or No	Question 10 Comment
		<p>issue an Operating Communication.</p> <p><b>Response: The SDT discussed this and determined that a GOP would only be a receiver of an Operating Instruction.</b></p> <p>It is not necessary to separate normal and emergency communications into two standards (COM-003, COM-002). One standard should encompass both. But having two Standards, the communication protocols in COM-003 R1 should be incorporated in COM-002.</p> <p><b>Response: COM-003-1 R1 applies to all communications that involve a “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.” The SDT has changed the language in COM-003-1 concerning protocols to the same language contained in COM-002-3, R2 and R3 to be consistent and to reduce confusion.</b></p> <p>The proposals expand the scope of the SAR by ignoring communications protocols used during emergencies and focusing on procedures imposed on personnel during normal situations. This standard overreaches into routine operations by requiring three-part communication for all instructions that change or maintain the state, status, output, or input of an Element or Facility of the Bulk Electric System. Because of the real-time frequency of use these instructions, requiring operating personnel to apply a three-part communication procedure for these instructions is unnecessary and can in fact adversely affect reliability. Any requirement for three-part communication for routine operating instructions should be removed.</p> <p><b>Response: The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” Additionally, the SAR is very specific in that it also includes the term “normal” operating conditions under Applicability: “Clear and mutually established communications protocols used during real time operations under normal and</b></p>

Organization	Yes or No	Question 10 Comment
		<p>emergency conditions ensure universal understanding of terms and reduce errors.”</p> <p>During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</p>
<p>Response: Thank you for your comments. Please see the responses above.</p>		
<p>Detroit Edison</p>		<p>There is a significant amount of redundancy between COM-002-3 and COM-003-1. These two standards should be combined and one of them eliminated. COM-002 purpose states "To ensure communications by operating personnel are effective." COM-003 could be sub-requirements under R2 of COM-002. The blue box on page 2 does not clarify Reliability Directives. Suggest using the same language as the proposed definition of Reliability Directive from COM-002-3.</p>
<p>Response: The SDT appreciates your comments. COM-003-1, R1 applies to all communications that involve a “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.” The purpose of the SAR for this project is “Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time.” This is a broader scope than that for Project 2006-06.</p> <p>The blue text box and the exclusionary language regarding Reliability Directives in COM-003-1, R2 and R3 were added to address concerns over potential double jeopardy. The text box has been removed from this draft of COM-003-1.</p>		
<p>NIPSCO</p>		<p>There was a COM-002 NOP issued in January 2011, a COM-002 interpretation recently approved by NERC, and presently there is a draft of both a COM-002 and a COM-003 out for vote. These projects appear to address 3 part communication requirements in a non-consistent manner. Why not combine these efforts into a</p>

Organization	Yes or No	Question 10 Comment
		<p>single project that the industry can review and understand? The VRF/VSL difference between routine and emergency does not warrant having two standards.</p> <p>A suggested plan of attack could be to withdraw the NERC approved COM-002 interpretation from FERC and combine the COM002-COM003 drafting efforts into one project resulting in a new version of COM-002; we already have enough standards. The content of the two new drafts is good, the webinar was informative, and the work of the SDTs is appreciated.</p>
<p><b>Response: Thank you for your comments and your support. The SDT has changed the language to the same language contained in COM-002-3, R2 and R3 to be consistent and to reduce confusion.</b></p>		
Public Service Enterprise Group		<p>This standard (COM-003-1) should be combined with COM-002-3 and issued as one standard to require ONE 3-part communications protocol for both Reliability Directives and non-Reliability Directives. Both require 3-part communications; however, COM-003-1 sets ADDITIONAL communications protocols and introduces a new definition (Operating Communication) that is not contained in COM-002-3. In addition, the text box on page 2 appears to redefine “Reliability Directive” inappropriately. While the sentence confusion is the text box may be unintended, it needs to be clarified.</p>
<p><b>Response: Thank you for your comments. The SDT has changed the language to the same language contained in COM-002-3, R2 and R3 to be consistent and to reduce confusion. The blue text box and the exclusionary language regarding Reliability Directives in COM-003-1, R2 and R3 were added to address concerns over potential double jeopardy. The text box has been removed from this draft of COM-003-1.</b></p>		
Avista		<p>This standard as drafted is very prescriptive and will not ensure improved reliability. A better approach would be to require applicable entities to; develop and implement an internal communication plan that takes into consideration recommendations discussed in the proposed NERC OC System Operator Verbal Communications Guideline, implement internal controls and monitoring to ensure adherence to the</p>

Organization	Yes or No	Question 10 Comment
		communication plan, and implement an adequate communication training program.
<p><b>Response: The SDT appreciates your comments. The SDT has developed a new approach to the standard that adopts many of your suggestions.</b></p>		
Kansas City Power & Light		<p>This standard needs to be written such that it allows for entity flexibility. Many entities already have COM protocols that are used. To prove compliance in an audit, entities will we need to provide 3 years worth of voice recordings to the auditors? It would take a full-time position to review the daily voice recordings for submission and what value does this add to the reliability or security of the BES. This standard is “overkill” from what is existing standard already dictates. Overall - this standard is going to cost the registered entities way more than the realized benefits.</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
The United illuminating Company		<p>UI disagrees with the necessity for this Standard. The intent of Recommendation 26 was to improve the communications around situational awareness. The SAR states the purpose is to “efficiently convey and mutually understood for all operating conditions.” This Draft does not address the concern and a Reliability Standard will not resolve the problem. It will create a compliance burden.</p> <p><b>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT has developed a new approach to the standard and believes that it may address your concern.</b></p> <p>The White Paper does not provide justification for imposing a compliance burden of recording, reviewing and tagging every conversation in a control center for the applicability of COM-003. There is no correlation between non-emergency communication and BES reliability.</p> <p><b>Response: The OPCSDT White Paper does provide ample justification for</b></p>

Organization	Yes or No	Question 10 Comment
		<p><b>establishing a higher level of communication discipline in an industry that serves one of the most critical needs in North America. The SDT believes the correlation between any operating communication and BES reliability is high.</b></p> <p>There is no study to demonstrate that the cause of awkwardness when transitioning from non-emergency to emergency communication will be resolved by any of the requirements in this Standard. Awkwardness has been resolved by Com-002 Requirement to explicitly identify an action as a Directive.</p> <p><b>Response: The Blackout Report provides instances where the reaction of operators is described as confused and the communications are cited as unprofessional, contributing to the lack of situational awareness.</b></p>
<p><b>Response: Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>Wisconsin Electric dba We Energies</p>		<p>We agree that accurate communication is necessary and we must strive to eliminate mistakes due to miscommunications.</p> <p>In the White Paper, other industries are cited that use three-part communication. Which of these industries also imposes sanctions and penalties on a company if an operator says “for” instead of “fow-er”?</p> <p><b>Response: The SDT responded to this in the previous draft 1 and also made provisions in draft 2 to allow for the use of alpha-numeric identifiers in lieu of the strict NATO Alphabet.</b></p> <p>In order to verify compliance with this standard, there will be entities that will need to listen to thousands of hours of voice recordings (8760 hours in a year, and multiple operators). Listening to 10% of the voice recordings will be a full time job for one or more persons.</p> <p>What is the reliability benefit of this cost? Unless it is tempered with some reasonableness, this standard as written will be detrimental to reliability because it will slow down communications considerably with innumerable repeats because of</p>

Organization	Yes or No	Question 10 Comment
		<p>fear of violating the standard.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
ISO New England Inc		<p>We agree with, support and have signed onto the ISO/RTO Standards Review Committee comments. Lastly, we do not believe this rises to the level of a Standard.</p>
<p><b>Response: Thank you for your comments. Please see the responses to the ISO/RTO Standards Review Committee comments</b></p>		
Duke Energy		<p>We believe that having effective communications is an important goal; and there are instances where the use of 3-part communication is appropriate. We also believe that the industry is maturing, and the use of 3-part communication as a tool to achieve effective communication has grown (as evidenced by Table 1-A in the May 2012 COM-003-1 Whitepaper.</p> <p>This maturity and expanded use of 3-part communication has occurred without a Standard in place; and that we do not believe a Standard is needed that focuses on one way of establishing effective communication.</p>
<p><b>Response: Thank you for your comments. The SDT has modified its approach into a standard that focuses on an entity's communication protocols and the controls they have in place to evaluate and minimize deficiencies.</b></p>		
Ameren		<p>We believe that multiple communication standards (COM-002, COM-003) are not necessary and suggest that SDT work with the NERC Operating Committee members to appropriately address what requirements are necessary from operating/reliability perspective as well as any related FERC directives.</p>

Organization	Yes or No	Question 10 Comment
<p><b>Response: Thank you for your comments. Please refer to the response to the NERC Operating Committee comments.</b></p>		
<p>SPP Standards Review Group</p>		<p>We believe the standard is too prescriptive as written. The purpose of the standard is to ensure effective communications. The standard has given us a very specific listing of items that must be done in a specific manner in order to accomplish this goal. What the industry needs is flexibility in how it achieves the goal of effective communications. The standard does not recognize that flexibility.</p> <p>The Measures for Requirements 1, 2 and 3 do not contain specific references to the requirements they are associated with. There is a parenthetical following the measure that does include that reference but including the reference specifically in the measure is a stronger statement and eliminates any possibility for confusion.</p> <p>The section of M1 to be modified would then read: ‘...that the communication protocols specified by Requirement 1 were implemented...’</p> <p>The section of M2 to be modified would then read: ‘...that the communication protocol specified by Requirement 2 was implemented.’</p> <p>The section of M3 to be modified would then read: ‘...that the communication protocol specified by Requirement 3 was implemented.’</p>
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
<p>Flathead Electric Cooperative, Inc.</p>		<p>We believe there should be a distinction in the “Applicability” section of the standard between “Scheduling Distribution Provider” and “Non-scheduling Distribution Provider”. Many small WECC entities re small rural cooperatives and PUDs are Full service customers. This means that the TO/TOP is the power supplier and scheduling agent and therefore handles all reliability directives, scheduling, tagging, dispatching of resources and curtailments of load from breakers on the BES system. According to a letter from the WECC Reliability Coordinator (VRCC and LRCC) none of the smaller entities in the Pacific Northwest will ever receive a “Reliability Directive” directly</p>

Organization	Yes or No	Question 10 Comment
		<p>from teh RC. Such a Directive would be sent to either a Balancing Authority (BA), or a Transmission Operator (TOP). We estimate there are over 100 entities that are BPA Full Service customers that are in a similar position and making this standard applicable to them does nothing to enhance reliability. A simple declarative statement in the Applicability section of the standard could focus the intent of the SDT on those entities that need it while lessening the compliance risk and clerical burden for other entities that the standard should not apply to.</p> <p>We suggest:</p> <p>4. Applicability:</p> <p>4.1. Functional Entities</p> <p>4.1.1 Reliability Coordinator</p> <p>4.1.2 Transmission Operator</p> <p>4.1.3 Balancing Authority</p> <p>4.1.4 Generator Operator</p> <p>4.1.5 Distribution Provider: With Real-time Operations and Scheduling desk</p> <p>We believe the above change will lessen the compliance burden on small, non-scheduling entities while still meeting the SDT’s intent with regard to Operating Personnel Communications. We also note that FERC and NERC, on multiple occasions and in multiple filings, have indicated their openness to lessening unnecessary compliance requirements for small entities.</p>
<p><b>Response: Thank you for your comments. The SDT notes that COM-002-3, draft 6 states that in addition to Reliability Coordinators, Balancing Authorities and Transmission Operators can also issue Reliability Directives. Draft 3 of COM-003-1 also limits protocols for Distribution Providers to those that apply to receiving Operating Instructions.</b></p>		
Consumers Energy		We believe this standard attempts to redefine “Reliability Directive” and should not

Organization	Yes or No	Question 10 Comment
		do so. Specifics of communication for this standard should be centered on emergency operations and not a blanket protocol for almost all operations communications.
<p><b>Response:</b> The SDT appreciates your comments. The OPCPSDT did not redefine the term Reliability Directive. The SDT supports the term. The SDT believes the two standards will work together to improve reliability and desires to demonstrate that to industry stakeholders. During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System.</p>		
GP Strategies		<p>We disagree that all DP’s should be subject to this Standard. For many small entities, it is the TOP who will control the equipment to shed load. These DP’s do not operate a 24x7 control center for receiving such instructions. During non-business hours calls are forwarded to an answering service or an on-call technician.</p> <p>We recommend the drafting team modify the applicability as follows:</p> <p>Applicability:</p> <ul style="list-style-type: none"> <li>4.1. Functional Entities               <ul style="list-style-type: none"> <li>4.1.1 Reliability Coordinator</li> <li>4.1.2 Transmission Operator</li> <li>4.1.3 Balancing Authority</li> <li>4.1.4 Generator Operator</li> <li>4.1.5 Distribution Provider who is the 24 x 7 entity that operates their load shedding equipment when instructed by the RC, TOP, or BA.</li> </ul> </li> </ul> <p>The TOP should be the responsible entity unless the Distribution Provider has agreed on the responsibility for taking the action.</p>
<p><b>Response:</b> Thank you for your comments. The SDT notes that COM-002-3, draft 6 states that in addition to Reliability Coordinators, Balancing Authorities and Transmission Operators can also issue Reliability Directives. Draft 3 of COM-003-1 also</p>		

Organization	Yes or No	Question 10 Comment
<b>limits protocols for Distribution Providers to those that apply to receiving Operating Instructions.</b>		
MISO		<p>We support the need to strive for good communications among users, owners, and operators of the grid, but believe the standard, as drafted is misdirected. Review of research done by Electrical Power Research Institute (EPRI) and others show that dispatcher communications cause approximately 1-2% of human failure impacting the Bulk Power System (BPS) and less than 1% of all BPS failures.</p> <p><b>Response: The SDT has read the study and believes it supports the need for COM-003-1.</b></p> <p><i><u>“As to communications problems causing trouble, an EPRI study<sup>2</sup> reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures. This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators’ errors were due to communication problems.”<sup>3</sup></u></i></p> <p><b>We believe the more relevant and significant conclusion to be that, of 400 switching mishaps, 19% were caused communication failures.</b></p> <p>As drafted, this standard can actually impede reliability as there are at times better ways to communicate when group action is needed and there are times when speed or “give and take” are needed.</p> <p>More specifically, the proposed Reliability Standard clearly and significantly expands the requirement to utilize 3-way communication, to the obvious detriment of reliability. The definition of Operating Communication results in the applicability of 3-</p>

<sup>2</sup> Beare, A., Taylor, J. *Field Operation Power Switching Safety*, WO2944-10, Electric Power Research Institute.

<sup>3</sup> Bilke, T., *Cause and prevention of human error in electric utility operations*, Colorado State University, 1998.

Organization	Yes or No	Question 10 Comment
		<p>way communication to non-requests / non-directives. As a result, COM-003-1 would result in the additional expenditure of time and resources to ensure that 3-way communication is utilized even when an entity is maintaining the <i>status quo</i>. This expenditure may divert time and attention away from ensuring that changes necessary for reliability are properly understood and implemented.</p> <p><b>Response: The SDT has modified definition of Operating Communication (now Operating Instruction) to be a “command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”</b></p> <p>The standard also fails to acknowledge that Supervisory Control and Data Acquisition (SCADA) and other forms of data exchange also can form part of the feedback process in communications. For example, observation of Area Control Error (ACE) recovery and generation movement during a Disturbance Control Standard (DCS) event are better confirmation that the message was received and understood than just parroting back a phone call.</p> <p><b>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. COM-003-1 concerns human to human communications.</b></p> <p>Therefore, MISO cannot at this time support the current version of COM-003-1.</p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
<p>American Transmission Company, LLC</p>		<p>When a situation necessitating alpha-numeric clarifiers in an Operational Communication arises, per the standard requirement, it becomes mandatory. There</p>

Organization	Yes or No	Question 10 Comment
		<p>are many instances when marginally defined elements such as a carrier grounding switch, may need to be operated or changed state. If these devices can't be clearly defined as an element or facility, yet have alpha-numeric identifiers, the use of clarifiers should be discretionary.</p> <p><b>Response: The SDT's intent is to focus on those BES Elements or BES Facilities that are capable of changing the operating state of the BES.</b></p> <p>FERC Orders and recommendations point to "Tightening communications protocols, especially for communications during alerts and emergencies." The NERC standards addressing this issue are not approved yet. When they are approved by FERC, subsequently implemented, and allowed to mature, the concept of tighter protocols for normal operations may be developed.</p> <p><b>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System.</b></p>
<p><b>Response: Thank you for your comments. Please see our responses above.</b></p>		
<p>SERC OC Standards Review Group</p>		<p>Where is the demonstrated need for such a Standard? Has communications, especially during periods of normal operations, been shown to be the root cause of many, if any, events?</p> <p><b>Response: From a recently published paper "Estimating the Magnitude of the Operator Communications Problem" by Terry Bilke, the following excerpt points out the results of an EPRI study.</b></p> <p><b><i>"As to communications problems causing trouble, an EPRI study<sup>4</sup> reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors</i></b></p>

<sup>4</sup> Beare, A., Taylor, J. *Field Operation Power Switching Safety*, WO2944-10, Electric Power Research

Organization	Yes or No	Question 10 Comment
		<p><u><i>(generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures.</i></u></p> <p><b>We believe the more relevant and significant conclusion to be that, of 400 switching mishaps, 19% were caused communication failures.</b></p> <p>While there is easy agreement for the need of clear and concise communication between entities, we must avoid creating a system that is unmanageable and quite possibly results in less reliability. FERC Order 693 directs the ERO to “and (3) requires tightened communications protocols, especially for communications during alerts and emergencies.” in paragraph 532.</p> <p>The proposed standard goes too far, especially for communications outside of alerts and emergencies. NERC standards are not procedures and this standard attempts to impose a single procedure on the industry. SERC suggests another approach to COM-003. Rather than to specify the solutions to achieving effective communication, COM-003 should instead focus on developing and training on an approach that is designed appropriately for each RE.</p> <p>For instance, another approach to COM-003 might be along the lines of:</p> <p>Requirement 1 could be written in a manner to require the appropriate registered entities to develop a communication protocol that is appropriate for each RE.</p> <p>This communications protocol should address how the RE is handling the following:</p> <ul style="list-style-type: none"> <li>Time Zone Designations - for both internal and external communications language comm</li> <li>Alpha-numeric identifiers</li> <li>Three - part communications - when is it required, etc.</li> <li>Use of defined terminology</li> </ul>

Institute.

Organization	Yes or No	Question 10 Comment
		<p>Other items deemed important for the communications protocol to address - again, this would not define HOW these items are addressed This approach would require the RE to address how it is addressing these issues, without prescribing solutions. For instance, a RE could include in its protocol a section dealing with time zone designation. In this section the RE could explain that it, and its neighbors, all are in and use the same time zone. As a result, the RE has determined that requiring the identification of time zone reference in communication is not necessary Procedures should address the training of operators on the communication protocol</p> <p>Procedures should address the internal controls that the RE uses to review that its protocol is being followed.</p> <p>The compliance approach would be to:</p> <p>Assess whether the RE has developed a written protocol and whether the protocol addresses each item - this does not mean there is an assessment of HOW each item is assessed; assess whether the RE has trained its operators on the communications protocol and assess whether the RE is following its internal controls.</p> <p><b>Response: The SDT has developed a new approach to the standard that addresses your concern.</b></p> <p>Any data retention requirements should be consistent with the COM-002 reliability standard.</p> <p><b>Response: The data retention requirements have been modified based on the new approach.</b></p> <p>What is the role of the Operating Communications Protocols White paper? Is it a position of the STD? If not, was there a minority opinion? Will it be part of the standard?</p> <p><b>Response: The leadership of the Standards Committee asked the OPCPSDT to develop the White Paper as a means of explaining the rationale for the team’s decisions. The team reached consensus on content based on deep and thoughtful</b></p>

Organization	Yes or No	Question 10 Comment
		<p><b>discussion. It will not be part of the standard, nor is it referenced by the standard.</b></p> <p>Does the industry agree that we need a standard on three part communications for normal operations? Yes or No?</p> <p><b>Response: During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT’s concern.</b></p> <p>Has a lack of a standard on three part communications for normal operations created any reliability issues? If so, what are they?</p> <p><b>Response: In the paper cited in our response above, 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures. Three part communication is one essential step in addressing this reliability issue.</b></p> <p>“The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review group only and should not be construed as the position of SERC Reliability Corporation, its board or its officers.”</p>
<p><b>Response: Thank you for your comments. Please see the responses above.</b></p>		
Seminole Electric Cooperative		<p>While we absolutely support the promotion and use of 3-part oral communication protocol and the other features identified, the failure of individual persons to use "proper" and "correct" oral operational communications should NOT constitute a Standard violation. It is reasonable to require the responsible entity to have written procedures requiring such use; to have evidence of applicable personnel training on such; and to have a program for internal monitoring and enforcement of such. As</p>

Organization	Yes or No	Question 10 Comment
		written, a subjective review of many oral operational communications will arguably be identified by Compliance Auditors as medium, high or even severe levels.
<p><b>Response: Thank you for your comments. The SDT has developed a new approach to the standard that addresses your concern.</b></p>		
Liberty Electric Power LLC		Yes. The regulation of market communications between entities is not the proper subject for NERC standards. The STD proposes placing entities into the realm of zero tolerance for thousands of routine communications. This assures failure. Further, this will force entities to reallocate precious resources away from more critical reliability functions to assure compliance and allow for self-certification. As such, the proposed standard weakens the reliability of the BES. The proposed standard should be withdrawn and the SAR closed.
<p><b>Response: Thank you for your comments. Draft 3 of the standard does not include market communications. The SDT has developed a new approach to the standard that addresses your concern about the number of communications.</b></p>

END OF REPORT

## Standard Development Roadmap

*This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.*

### Development Steps Completed:

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting SAR on June 8, 2007
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007
6. Version 1 draft of Standard posted November 2009 for Informal Comments closed January 15 2010.
7. Version 2 draft of Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20 2012.

### Description of Current Draft:

This is the third draft of a new standard requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team requests posting for a 30-day concurrent Formal Comment period and Ballot.

### Future Development Plan:

Anticipated Actions	Anticipated Date
1. Drafting team considers comments, makes conforming changes, and requests SC approval to proceed to pre-ballot comment period.	July 2012
2. Second Ballot of Standards.	August 2012
3. Successive Ballot of Standards	September 2012
4. Recirculation ballot of standards.	October 2012
5. Board adopts standards.	November 2012

### **Definitions of Terms Used in Standard**

*This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.*

*When using terms or phrases contained in the Reliability Standards Glossary of Terms for communications it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms are capitalized.*

**Operating Instruction** —Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.

## A. Introduction

1. **Title:** Operating Personnel Communications Protocols
2. **Number:** COM-003-1
3. **Purpose:** To provide System Operators uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.
4. **Applicability:**
  - 4.1. **Functional Entities**
    - 4.1.1 Balancing Authority
    - 4.1.2 Distribution Provider
    - 4.1.3 Generator Operator
    - 4.1.4 Reliability Coordinator
    - 4.1.5 Transmission Operator
5. **(Proposed) Effective Date:** First day of first calendar quarter, twelve (12) calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve (12) calendar months from the date of Board of Trustee adoption.

## B. Requirements

- R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communication protocols for Operating Instructions that incorporate the following: [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning* ]
  - 1.1. Use of the English language when issuing an oral or written Operating Instruction between functional entities, unless another language is mandated by law or regulation. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.
  - 1.2. Use of the 24-hour clock format when referring to clock times when issuing an oral or written Operating Instruction.
  - 1.3. When issuing an oral or written Operating Instruction between functional entities in different time zones, when referring to clock times include the time, the time zone where the action will occur and indicate whether the time is daylight saving time or standard time.
  - 1.4. When referring to a Transmission interface Element or a Transmission interface Facility in an oral or written Operating Instruction between functional entities, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility unless another name is mutually agreed to by the functional entities.
  - 1.5. Use of alpha-numeric clarifiers when issuing an oral Operating Instruction for Facilities and Elements in instances where the nomenclature of Facilities or

Elements is in alpha-numeric format (e.g. if an entity designated a circuit breaker “12B” 12B would need alpha-numeric clarifiers if used in an oral Operating Instruction)

- 1.6.** When issuing an oral two party, person-to-person Operating Instruction, require the issuer to:
    - Confirm that the response from the recipient of the Operating Instruction was accurate, or
    - Reissue the Operating Instruction to resolve a misunderstanding.
  - 1.7.** When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
  - 1.8.** When issuing an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), verbally or electronically confirm receipt from one or more receiving parties.
  - 1.9.** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.
- R2.** Each Distribution Provider and Generator Operator shall have documented communication protocols for Operating Instructions that incorporate the following: [*Violation Risk Factor: Low*] [*Time Horizon: Long-term Planning* ]
- 2.1.** When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
  - 2.2.** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.
- R3.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R1 that: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning* ]
- 3.1.** Identifies potential deficiencies,
  - 3.2.** Assesses the deficiencies found,
  - 3.3.** Corrects the deficiencies, and
  - 3.4.** Evaluates the process based on deficiencies found external to Part 3.1 and either
    - implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or

- demonstrates that no modification to the process is necessary to address the deficiencies.
- R4.** Each Distribution Provider and Generator Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R2 that: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning* ]
- 4.1.** Identifies potential deficiencies,
  - 4.2.** Assesses the deficiencies found,
  - 4.3.** Corrects the deficiencies, and
  - 4.4.** Evaluates the process based on deficiencies found external to Part 4.1 and either
    - implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or
    - demonstrates that no modification to the process is necessary to address the deficiencies.

## C. Measures

- M1.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator, shall provide its documented communications protocols developed for Requirement R1.
- M2.** Each Distribution Provider and Generator Operator shall provide its documented communications protocols developed for Requirement R2.
- M3.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide the results of its process developed for Requirement R3.
- M4.** Each Distribution Provider and Generator Operator shall provide the results of its process developed for Requirement R4.

## D. Compliance

### 1. Compliance Monitoring Process

#### 1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

#### 1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to

provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence for Requirement R3 Measure M3 for the most recent 90 days.

Each Distribution Provider and Generator Operator shall retain evidence for Requirement R4 Measure M4 for the most recent 90 days.

If a Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

### **Compliance Monitoring and Assessment Processes**

Compliance Audit

## Operating Personnel Communications Protocols Project 2007-02

### *Unofficial Comment Form for Standard COM-003-1 —Operating Personnel Communications Protocols*

Please **DO NOT** use this form. Please use the [electronic comment form](#) located at the link below to submit comments on the proposed draft COM-003-1 Operating Personnel Communications Protocols standard. Comments must be submitted by **September 20, 2012**. If you have questions please contact Joseph Krisiak at [Joseph.Krisiak@nerc.net](mailto:Joseph.Krisiak@nerc.net) or by telephone at 609-651-0903.

[http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

### **Background Information**

Effective communication is critical for real-time operations. Failure to successfully communicate clearly can create misunderstandings resulting in improper operations increasing the potential for failure of the BES.

The Standard Authorization Request (SAR) for this project was initiated on March 1, 2007 and approved by the Standards Committee on June 8, 2007. It established the scope of work to be done for Project 2007-02 Operating Personnel Communications Protocols (OPCP SDT). The scope described in the SAR is to establish essential elements of communications protocols and communications paths, such that operators and users of the North American Bulk Electric System will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Report, Recommendation Number 26, calls for a tightening of communications protocols. FERC Order 693 paragraph 532 amplifies this need and applies it to all Operating Instructions. This proposed standard's goal is to ensure that effective communication is practiced and delivered in clear language and standardized format via pre-established communications paths among pre-identified operating entities.

The SAR indicated that references to communication protocols in other NERC Reliability Standards may be moved to this new standard. The SAR instructed the standard drafting team to consider incorporating the use of Alert Level Guidelines and three-part communications in developing this new standard to achieve high level consistency across regions. The SDT believes the Alert Level Guidelines, while valuable, belong in a separate standard and has petitioned the Standards Committee to approve the transfer to another standard or to start a separate project.

The upgrade of communication system hardware where appropriate is not included in this project (it is included in NERC Project 2007-08 Emergency Operations).

The standard will be applicable to Transmission Operators, Transmission Owners, Balancing Authorities, Reliability Coordinators, Generator Operators, and Distribution Providers. These requirements ensure that communications include essential elements, such that information is efficiently conveyed and mutually understood for communicating changes to real-time operating conditions and responding to directives, notifications, directions, instructions, orders, or other reliability related operating information.

The purpose statement of COM 003-1 states: "To provide system operators uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES."

- 1) **New NERC Glossary terms:** The SDT has changed the definition Operating Communications proposed in the Standard version 2 and added *Operating Instructions*. *Operating Instructions* more accurately define the broad class of communications that deal with changing or altering the state of the BES. Changes to the BES operating state with unclear communications create increased opportunities for events that could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures.

This term is proposed for addition to the NERC Glossary to establish meaning and usage within the electricity industry.

- 2) **Documented Communication Protocols:** The OPCP SDT has incorporated a requirement for an applicable entity to have documented communication protocols that incorporate the following elements:
  - a) **English language:** Use of the English language when issuing an oral or written Operating Instruction between functional entities, unless another language is mandated by law or regulation. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.
  - b) **24-hour clock R1 Part 1.2 and time zone reference R1 Part 1.3:**  
Use the 24-hour clock format when referring to clock times when issuing an oral or written Operating Instruction.  
  
When issuing an oral or written Operating Instruction between functional entities in different time zones, include the time, time zone and indicate whether the time is daylight saving time or standard time. (Example: 1500 EST or Eastern Standard Time)  
  
The OPCP SDT proposed this change to address comments by industry while adhering to the recommendations of the August 14, 2003 task force report.
  - c) **Line and equipment identifiers:** When referring to a Transmission interface Element or a Transmission interface Facility in an oral or written Operating Instruction between functional entities, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility unless another name is mutually agreed to by the functional entities.
  - d) **Alpha-numeric clarifiers:** Use of alpha-numeric clarifiers when issuing an oral Operating Instruction for Facilities and Elements in instances where the nomenclature of Facilities or Elements are in alpha-numeric format (e.g. if an entity designated a circuit breaker "12B" 12B would need alpha-numeric clarifiers if used in an oral Operating Instruction).

- e) **Three-part Communication:**  
**When issuing** an oral two-party, person-to-person Operating Instruction, require the issuer to:
- Confirm that the response from the recipient of the Operating Instruction was accurate, or
  - Reissue the Operating Instruction to resolve a misunderstanding.
- When receiving** an oral two-party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
- f) **One-way burst messaging system to multiple parties (all call):** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.
- g) **Three-part Communication: For Distribution Providers (DP) and Generator Operators (GOP):** When receiving an oral two-party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
- h) **One-way burst messaging system to multiple parties (all call): For Distribution Providers (DP) and Generator Operators (GOP):** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.
- 3) **Implement a process for identifying deficiencies:** (COM-003-1, R3 and R4) The SDT proposes a process to identify, assess and correct deficiencies with adherence to the documented communication protocols. The process is evaluated to determine and improve its effectiveness. Deficiencies that are identified, assessed and corrected will not be determined as non-compliant.
- 4) **VSL and VRF Changes from version two:** The OPCP SDT reviewed the VRFs and VSLs associated with R1, R2, R3 and R4 and made changes to more closely conform to NERC and FERC guidelines.

**The SDT is proposing to retire Requirement R4 from COM-001** and incorporate it into Requirement R2 of this draft COM-003-1. Since Requirement R4 from COM-001-1 carries over essentially unchanged there is no specific question related to it in this comment form.

The choice of VRFs was made on the basis of the potential impact on the Bulk Electric System of a miscommunication during Operating Instructions. Requirements R1 and R2 are assigned a Low Violation Risk Factor due to their potential direct impact on BES reliability. Requirements R3 and R4 are assigned a Medium Violation Risk due to their potential direct impact on BES reliability.

Time Horizons were selected to reflect the period within which the requirements applied. Requirements R1 and R2 must be implemented in long term planning operations and therefore

were assigned a Time Horizon of Long Term Planning. Requirements R3 and R4 must be implemented during operations planning and therefore were assigned a Time Horizon of Operations Planning. The drafting team is posting the standard for industry comment for a 30-day comment period.

The Operating Personnel Communications Protocols Drafting Team would like to receive industry comments on this draft standard. Accordingly, we request that you include your comments on this form by **September 20, 2012**.

## Comment Form

**\*Please use the [electronic comment form](#) to submit your final comments to NERC.**

1. Do you agree with the changes made to the proposed definition "Operating Instruction" (now proposed as a "*Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System?*") to be added as a term for the NERC Glossary? If not, please explain in the comment area.  
 Yes  
 No
2. The SDT has proposed that the applicable entities have documented communication protocols that incorporate elements listed in COM-003-1, R1 and R2. Do you agree with these proposed requirements? If not, please explain in the comment area.  
 Yes  
 No
3. The SDT has proposed requirements (COM-003-1, R3 and R4) for applicable entities to implement a process to identify, assess and correct deficiencies related to the entity's documented communication protocols; and to evaluate that process based on deficiencies found externally from the process. Do you agree with the proposed requirements? If not, please explain in the comment area.
4. Do you agree with the VRFs and VSLs for Requirements R1, R2, R3 and R4?  
 Yes  
 No
5. Do you have any other comments or suggestions to improve the draft standard?  
Comments:

## Operating Personnel Communications Protocols Project 2007-02

### *Unofficial Comment Form for Standard COM-003-1 —Operating Personnel Communications Protocols*

Please **DO NOT** use this form. Please use the [electronic comment form](#) located at the link below to submit comments on the proposed draft COM-003-1 Operating Personnel Communications Protocols standard. Comments must be submitted by **September 20, 2012**. If you have questions please contact Joseph Kriasiak at [Joseph.Kriasiak@nerc.net](mailto:Joseph.Kriasiak@nerc.net) or by telephone at 609-651-0903.

[http://www.nerc.com/filez/standards/Op\\_Comm\\_Protocol\\_Project\\_2007-02.html](http://www.nerc.com/filez/standards/Op_Comm_Protocol_Project_2007-02.html)

### **Background Information**

Effective communication is critical for real-time operations. Failure to successfully communicate clearly can create misunderstandings resulting in improper operations increasing the potential for failure of the BES.

The Standard Authorization Request (SAR) for this project was initiated on March 1, 2007 and approved by the Standards Committee on June 8, 2007. It established the scope of work to be done for Project 2007-02 Operating Personnel Communications Protocols (OPCP SDT). The scope described in the SAR is to establish essential elements of communications protocols and communications paths, such that operators and users of the North American Bulk Electric System will efficiently convey information and ensure mutual understanding. The August 2003 Blackout Report, Recommendation Number 26, calls for a tightening of communications protocols. FERC Order 693 paragraph 532 amplifies this need and applies it to all Operating Instructions. This proposed standard's goal is to ensure that effective communication is practiced and delivered in clear language and standardized format via pre-established communications paths among pre-identified operating entities.

The SAR indicated that references to communication protocols in other NERC Reliability Standards may be moved to this new standard. The SAR instructed the standard drafting team to consider incorporating the use of Alert Level Guidelines and three-part communications in developing this new standard to achieve high level consistency across regions. The SDT believes the Alert Level Guidelines, while valuable, belong in a separate standard and has petitioned the Standards Committee to approve the transfer to another standard or to start a separate project.

The upgrade of communication system hardware where appropriate is not included in this project (it is included in NERC Project 2007-08 Emergency Operations).

The standard will be applicable to Transmission Operators, Transmission Owners, Balancing Authorities, Reliability Coordinators, Generator Operators, and Distribution Providers. These requirements ensure that communications include essential elements, such that information is efficiently conveyed and mutually understood for communicating changes to real-time operating conditions and responding to directives, notifications, directions, instructions, orders, or other reliability related operating information.

The purpose statement of COM 003-1 states: "To provide system operators uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES."

- 1) **New NERC Glossary terms:** The SDT has changed the definition Operating Communications proposed in the Standard version 2 and added *Operating Instructions*. *Operating Instructions* more accurately define the broad class of communications that deal with changing or altering the state of the BES. Changes to the BES operating state with unclear communications create increased opportunities for events that could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures.

This term is proposed for addition to the NERC Glossary to establish meaning and usage within the electricity industry.

- 2) **Documented Communication Protocols:** The OPCP SDT has incorporated a requirement for an applicable entity to have documented communication protocols that incorporate the following elements:
  - a) **English language:** Use of the English language when issuing an oral or written Operating Instruction between functional entities, unless another language is mandated by law or regulation. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.
  - b) **24-hour clock R1 Part 1.2 and time zone reference R1 Part 1.3:**  
 Use the 24-hour clock format when referring to clock times when issuing an oral or written Operating Instruction.  
  
 When issuing an oral or written Operating Instruction between functional entities in different time zones, include the time, time zone and indicate whether the time is daylight saving time or standard time. (Example: 1500 EST or Eastern Standard Time)  
  
 The OPCP SDT proposed this change to address comments by industry while adhering to the recommendations of the August 14, 2003 task force report.
  - c) **Line and equipment identifiers:** When referring to a Transmission interface Element or a Transmission interface Facility in an oral or written Operating Instruction between functional entities, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility unless another name is mutually agreed to by the functional entities.
  - d) **Alpha-numeric clarifiers:** Use of alpha-numeric clarifiers when issuing an oral Operating Instruction for Facilities and Elements in instances where the nomenclature of Facilities or Elements are in alpha-numeric format (e.g. if an entity designated a circuit breaker "12B" 12B would need alpha-numeric clarifiers if used in an oral Operating Instruction).

- e) **Three-part Communication:**  
**When issuing** an oral two-party, person-to-person Operating Instruction, require the issuer to:
- Confirm that the response from the recipient of the Operating Instruction was accurate, or
  - Reissue the Operating Instruction to resolve a misunderstanding.
- When receiving** an oral two-party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
- f) **One-way burst messaging system to multiple parties (all call):** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.
- g) **Three-part Communication: For Distribution Providers (DP) and Generator Operators (GOP):** When receiving an oral two-party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.
- h) **One-way burst messaging system to multiple parties (all call): For Distribution Providers (DP) and Generator Operators (GOP):** When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.
- 3) **Implement a process for identifying deficiencies:** (COM-003-1, R3 and R4) The SDT proposes a process to identify, assess and correct deficiencies with adherence to the documented communication protocols. The process is evaluated to determine and improve its effectiveness. Deficiencies that are identified, assessed and corrected will not be determined as non-compliant.
- 4) **VSL and VRF Changes from version two:** The OPCP SDT reviewed the VRFs and VSLs associated with R1, R2, R3 and R4 and made changes to more closely conform to NERC and FERC guidelines.

**The SDT is proposing to retire Requirement R4 from COM-001** and incorporate it into Requirement R2 of this draft COM-003-1. Since Requirement R4 from COM-001-1 carries over essentially unchanged there is no specific question related to it in this comment form.

The choice of VRFs was made on the basis of the potential impact on the Bulk Electric System of a miscommunication during Operating Instructions. Requirements R1 and R2 are assigned a Low Violation Risk Factor due to their potential direct impact on BES reliability. Requirements R3 and R4 are assigned a Medium Violation Risk due to their potential direct impact on BES reliability.

Time Horizons were selected to reflect the period within which the requirements applied. Requirements R1 and R2 must be implemented in long term planning operations and therefore

were assigned a Time Horizon of Long Term Planning. Requirements R3 and R4 must be implemented during operations planning and therefore were assigned a Time Horizon of Operations Planning. The drafting team is posting the standard for industry comment for a 30-day comment period.

The Operating Personnel Communications Protocols Drafting Team would like to receive industry comments on this draft standard. Accordingly, we request that you include your comments on this form by **September 20, 2012**.

## Comment Form

**\*Please use the [electronic comment form](#) to submit your final comments to NERC.**

1. Do you agree with the changes made to the proposed definition "Operating Instruction" (now proposed as a "*Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System?*") to be added as a term for the NERC Glossary? If not, please explain in the comment area.  
 Yes  
 No
2. The SDT has proposed that the applicable entities have documented communication protocols that incorporate elements listed in COM-003-1, R1 and R2. Do you agree with these proposed requirements? If not, please explain in the comment area.  
 Yes  
 No
3. The SDT has proposed requirements (COM-003-1, R3 and R4) for applicable entities to implement a process to identify, assess and correct deficiencies related to the entity's documented communication protocols; and to evaluate that process based on deficiencies found externally from the process. Do you agree with the proposed requirements? If not, please explain in the comment area.
4. Do you agree with the VRFs and VSLs for Requirements R1, R2, R3 and R4?  
 Yes  
 No
5. Do you have any other comments or suggestions to improve the draft standard?  
Comments:

# Project 2007-02, COM-003-1 Operating Personnel Communication Protocols Rationale and Technical Justification

Justification for Requirements in Draft 4

## Rationale and Technical Justification

The Quality Review team for the draft 2 posting of COM-003-1 highly recommended that the OPCPSDT provide a justification or rationale document to aid reviewers in their examination of this draft of COM-003-1. The OPCPSDT agrees with the QR recommendation and has developed the following to support the standard and to help stakeholders understand the intent and scope of the standard. This version of the standard features a non traditional approach to standards that could alleviate concerns that surfaced in comments in drafts one, two and three.

### **Requirement R1**

Requirement R1 requires entities that can both issue and receive Operating Instructions to implement documented communication protocols in a manner that identifies, assesses, and corrects deficiencies. Because Operating Instructions affect Facilities and Elements of the Bulk Electric System, the communication of those Operating Instructions must be understood by all involved parties, especially when those communications occur between functional entities. An EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures.<sup>1</sup> This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators' errors were due to communication problems.<sup>2</sup> The necessary protocols include the use of the

English language (from COM-001-1.1 R4), time formatting, mutually agreed nomenclature for Transmission interface Elements, alpha-numeric clarifiers, and three part communications.

### ***Requirement R2***

Requirement R2 requires entities that only receive Operating Instructions to implement documented communication protocols in a manner that identifies, assesses, and corrects deficiencies .

The two protocols (R2 , Parts 2.1 and 2.2) required are repeat back for three part communication and clarification if an “all call” communication is unclear.

### ***Rationale***

The SDT has incorporated within this standard a recognition that these requirements should not focus on individual instances of failure as a basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on whether there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying “implement” as follows:

Each ... shall implement, in a manner that identifies, assesses, and corrects deficiencies, . . .

The term *documented communication protocols* refers to a set of required protocols specific to the Functional Entity and the Functional Entities they must communicate with. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented protocols, but they must address all of the applicable parts of the Requirement. The documented protocols themselves are not required to include the “. . . identifies, assesses, and corrects deficiencies, . . .” elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented protocols and could be accomplished through other controls or compliance management activities.

## Project 2007-2 – Operating Personnel Communications Protocol

### VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM 003-1 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

### NERC Criteria - Violation Risk Factors

#### **High Risk Requirement**

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a

cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

### **Medium Risk Requirement**

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

### **Lower Risk Requirement**

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

## **FERC Violation Risk Factor Guidelines**

### **Guideline (1) — Consistency with the Conclusions of the Final Blackout Report**

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

#### **Guideline (2) — Consistency within a Reliability Standard**

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

#### **Guideline (3) — Consistency among Reliability Standards**

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

#### **Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level**

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

**Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation**

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

Project YYYY-##.# - Project Name

VRF for COM-003-1:

There are three requirements in COM-003-1. Requirements R1, R2 and R3 were assigned a "Medium" VRF.

## NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
<p>Missing a minor element (or a small percentage) of the required performance</p> <p>The performance or product measured has significant value as it almost meets the full intent of the requirement.</p>	<p>Missing at least one significant element (or a moderate percentage) of the required performance.</p> <p>The performance or product measured still has significant value in meeting the intent of the requirement.</p>	<p>Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component.</p> <p>The performance or product has limited value in meeting the intent of the requirement.</p>	<p>Missing most or all of the significant elements (or a significant percentage) of the required performance.</p> <p>The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.</p>

## **FERC Order on Violation Severity Levels**

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

### **Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

### **Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

Guideline 2a: A violation of a “binary” type requirement must be a “Severe” VSL.

Guideline 2b: Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

### **Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.

### **Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

The drafting team will complete the following table, providing of analysis and justification for each VRF and VSL, for each requirement.

VRF and VSL Justifications – COM 003-1, R1	
Proposed VRF	Low
NERC VRF Discussion	R1 is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system The VRF for this requirement is “Low” which is consistent with NERC guidelines
FERC VRF G1 Discussion	<b>Guideline 1- Consistency w/ Blackout Report:</b> R1 falls under Recommendation 24 of the Blackout Report. The VRF for this requirement is “Low” which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	<b>Guideline 2- Consistency within a Reliability Standard :</b> The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	<b>Guideline 3- Consistency among Reliability Standards:</b> This requirement calls for the establishment of communication protocols that reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.
FERC VRF G4 Discussion	<b>Guideline 4- Consistency with NERC Definitions of VRFs:</b> Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability,

VRF and VSL Justifications – COM 003-1, R1			
	separation, or cascading failures. The VRF for this requirement is “Low” which is consistent with NERC guidelines		
FERC VRF G5 Discussion	<b>Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:</b> COM-003-1, Requirement R1 contains only one objective which is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.		
Proposed VSL			
Lower	Moderate	High	Severe
The responsible entity did not include one (1) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols	The responsible entity did not include two (2) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols	The responsible entity did not include three (3) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols	The responsible entity did not include four (4) or more of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols  OR  The responsible entity did not have documented communication protocols as required in Requirement R1.

<p><b>FERC VSL G4</b> Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	The VSL is based on a single violation and not cumulative violations
<p><b>FERC VSL G5</b> Requirements where a single lapse in protection can compromise computer network security, i.e., the ‘weakest link’ characteristic, should apply binary VSLs</p>	Non CIP
<p><b>FERC VSL G6</b> VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence</p>	Non CIP

Requirement R4 was assigned to Project 2007-02. All other requirements were assigned to Project 2006-06 and are being revised or retired under Project 2006-06.

**A. Introduction**

- 1. Title:** **Telecommunications**
- 2. Number:** COM-001-2
- 3. Purpose:** Each Reliability Coordinator, Transmission Operator and Balancing Authority needs adequate and reliable telecommunications facilities internally and with others for the exchange of Interconnection and operating information necessary to maintain reliability.
- 4. Applicability**
  - 4.1.** Transmission Operators.
  - 4.2.** Balancing Authorities.
  - 4.3.** Reliability Coordinators.
  - 4.4.** NERCNet User Organizations.
- 5. (Proposed) Effective Date:** First day of the first calendar quarter, six calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter a year from the date of Board of Trustee adoption.

**B. Requirements**

- R1.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information:
  - R1.1.** Internally.
  - R1.2.** Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities.
  - R1.3.** With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability.
  - R1.4.** Where applicable, these facilities shall be redundant and diversely routed.
- R2.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall manage, alarm, test and/or actively monitor vital telecommunications facilities. Special attention shall be given to emergency telecommunications facilities and equipment not used for routine communications.
- R3.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide a means to coordinate telecommunications among their respective areas. This coordination shall include the ability to investigate and recommend solutions to telecommunications problems within the area and with other areas.
- R4.** Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have written operating instructions and procedures to enable continued operation of the system during the loss of telecommunications facilities.
- R5.** Each NERCNet User Organization shall adhere to the requirements in Attachment 1-COM-001, “NERCNet Security Policy.”

**C. Measures**

- M1.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include, but is not limited to communication facility test-procedure documents, records of testing, and maintenance records for communication facilities or equivalent that will be used to confirm that it manages, alarms, tests and/or actively monitors vital telecommunications facilities. (Requirement 2 part 1)
- M2.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request its current operating instructions and procedures, either electronic or hard copy, that will be used to confirm that it meets Requirement 4.
- M3.** The NERCnet User Organization shall have and provide upon request evidence that could include, but is not limited to, documented procedures, operator logs, voice recordings or transcripts of voice recordings, electronic communications, etc., that will be used to determine if it adhered to the (User Accountability and Compliance) requirements in Attachment 1-COM-001. (Requirement 5)

## **D. Compliance**

### **1. Compliance Monitoring Process**

#### **1.1. Compliance Monitoring Responsibility**

NERC shall be responsible for compliance monitoring of the Regional Reliability Organizations  
Regional Reliability Organizations shall be responsible for compliance monitoring of all other entities

#### **1.2. Compliance Monitoring and Reset Time Frame**

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 calendar days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

#### **1.3. Data Retention**

For Measure 1 each Reliability Coordinator, Transmission Operator, Balancing Authority shall keep evidence of compliance for the previous two calendar years plus the current year.

For Measure 2, each Reliability Coordinator, Transmission Operator, Balancing Authority shall have its current operating instructions and procedures to confirm that it meets Requirement 4.

For Measure 3, each Reliability Coordinator, Transmission Operator, Balancing Authority and NERCnet User Organization shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor.

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

**1.4. Additional Compliance Information**

Attachment 1 — COM-001 — NERCnet Security Policy

**2. Levels of Non-Compliance for Transmission Operator, Balancing Authority or Reliability Coordinator**

**2.1. Level 1:** Not applicable.

**2.2. Level 2:** Not applicable.

**2.3. Level 3:** There shall be a separate Level 3 non-compliance for every one of the following requirements that is in violation:

**2.3.1** There are no written operating instructions and procedures to enable continued operation of the system during the loss of telecommunication facilities, as specified in R4.

**2.4. Level 4:** Telecommunication systems are not actively monitored, tested, managed or alarmed, as specified in R2.

**3. Levels of Non-Compliance — NERCnet User Organization**

**3.1. Level 1:** Not applicable.

**3.2. Level 2:** Not applicable.

**3.3. Level 3:** Not applicable.

**3.4. Level 4:** Did not adhere to the requirements in Attachment 1-COM-001, NERCnet Security Policy.

**E. Regional Differences**

None Identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1	April 6, 2007	Requirement 1, added the word “for” between “facilities” and “the exchange.”	Errata
1.1	October 29, 2008	BOT adopted errata changes; updated version number to “1.1”	Errata

### Attachment 1 — COM-001 — NERCnet Security Policy

#### Policy Statement

The purpose of this NERCnet Security Policy is to establish responsibilities and minimum requirements for the protection of information assets, computer systems and facilities of NERC and other users of the NERC frame relay network known as “NERCnet.” The goal of this policy is to prevent misuse and loss of assets.

For the purpose of this document, information assets shall be defined as processed or unprocessed data using the NERCnet Telecommunications Facilities including network documentation. This policy shall also apply as appropriate to employees and agents of other corporations or organizations that may be directly or indirectly granted access to information associated with NERCnet.

The objectives of the NERCnet Security Policy are:

- To ensure that NERCnet information assets are adequately protected on a cost-effective basis and to a level that allows NERC to fulfill its mission.
- To establish connectivity guidelines for a minimum level of security for the network.
- To provide a mandate to all Users of NERCnet to properly handle and protect the information that they have access to in order for NERC to be able to properly conduct its business and provide services to its customers.

#### NERC’s Security Mission Statement

NERC recognizes its dependency on data, information, and the computer systems used to facilitate effective operation of its business and fulfillment of its mission. NERC also recognizes the value of the information maintained and provided to its members and others authorized to have access to NERCnet. It is, therefore, essential that this data, information, and computer systems, and the manual and technical infrastructure that supports it, are secure from destruction, corruption, unauthorized access, and accidental or deliberate breach of confidentiality.

#### Implementation and Responsibilities

This section identifies the various roles and responsibilities related to the protection of NERCnet resources.

#### NERCnet User Organizations

Users of NERCnet who have received authorization from NERC to access the NERC network are considered users of NERCnet resources. To be granted access, users shall complete a User Application Form and submit this form to the NERC Telecommunications Manager.

#### Responsibilities

It is the responsibility of NERCnet User Organizations to:

- Use NERCnet facilities for NERC-authorized business purposes only.
- Comply with the NERCnet security policies, standards, and guidelines, as well as any procedures specified by the data owner.
- Prevent unauthorized disclosure of the data.
- Report security exposures, misuse, or non-compliance situations via Reliability Coordinator Information System or the NERC Telecommunications Manager.
- Protect the confidentiality of all user IDs and passwords.
- Maintain the data they own.
- Maintain documentation identifying the users who are granted access to NERCnet data or applications.
- Authorize users within their organizations to access NERCnet data and applications.

- Advise staff on NERCnet Security Policy.
- Ensure that all NERCnet users understand their obligation to protect these assets.
- Conduct self-assessments for compliance.

### **User Accountability and Compliance**

All users of NERCnet shall be familiar and ensure compliance with the policies in this document.

Violations of the NERCnet Security Policy shall include, but not be limited to any act that:

- Exposes NERC or any user of NERCnet to actual or potential monetary loss through the compromise of data security or damage.
- Involves the disclosure of trade secrets, intellectual property, confidential information or the unauthorized use of data.

Involves the use of data for illicit purposes, which may include violation of any law, regulation or reporting requirement of any law enforcement or government body.

Requirement R4 was assigned to Project 2007-02. All other requirements were assigned to Project 2006-06 and are being revised or retired under Project 2006-06.

## A. Introduction

1. **Title:** Telecommunications
2. **Number:** COM-001-~~1.12~~
3. **Purpose:** Each Reliability Coordinator, Transmission Operator and Balancing Authority needs adequate and reliable telecommunications facilities internally and with others for the exchange of Interconnection and operating information necessary to maintain reliability.
4. **Applicability**
  - 4.1. Transmission Operators.
  - 4.2. Balancing Authorities.
  - 4.3. Reliability Coordinators.
  - 4.4. NERCNet User Organizations.
5. **(Proposed) Effective Date:** First day of the first calendar quarter, six calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter a year from the date of Board of Trustee adoption. ~~May 13, 2009~~

## B. Requirements

- R1. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide adequate and reliable telecommunications facilities for the exchange of Interconnection and operating information:
  - R1.1. Internally.
  - R1.2. Between the Reliability Coordinator and its Transmission Operators and Balancing Authorities.
  - R1.3. With other Reliability Coordinators, Transmission Operators, and Balancing Authorities as necessary to maintain reliability.
  - R1.4. Where applicable, these facilities shall be redundant and diversely routed.
- R2. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall manage, alarm, test and/or actively monitor vital telecommunications facilities. Special attention shall be given to emergency telecommunications facilities and equipment not used for routine communications.
- R3. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall provide a means to coordinate telecommunications among their respective areas. This coordination shall include the ability to investigate and recommend solutions to telecommunications problems within the area and with other areas.

~~R4. Unless agreed to otherwise, each Reliability Coordinator, Transmission Operator, and Balancing Authority shall use English as the language for all communications between and among operating personnel responsible for the real-time generation control and operation of the interconnected Bulk Electric System. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.~~

~~R5.~~R4. Each Reliability Coordinator, Transmission Operator, and Balancing Authority shall have written operating instructions and procedures to enable continued operation of the system during the loss of telecommunications facilities.

~~R6-R5.~~ Each NERCNet User Organization shall adhere to the requirements in Attachment 1-COM-001, “NERCNet Security Policy.”

### C. Measures

**M1.** Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request evidence that could include, but is not limited to communication facility test-procedure documents, records of testing, and maintenance records for communication facilities or equivalent that will be used to confirm that it manages, alarms, tests and/or actively monitors vital telecommunications facilities. (Requirement 2 part 1)

~~M2. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request its current operating instructions and procedures, either electronic or hard copy, that will be used to confirm that it meets Requirement 4. The Reliability Coordinator, Transmission Operator or Balancing Authority shall have and provide upon request evidence that could include, but is not limited to operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent, that will be used to determine compliance to Requirement 4.~~

~~M3. Each Reliability Coordinator, Transmission Operator and Balancing Authority shall have and provide upon request its current operating instructions and procedures, either electronic or hard copy that will be used to confirm that it meets Requirement 5.~~

~~M4.~~**M3.** The NERCnet User Organization shall have and provide upon request evidence that could include, but is not limited to, documented procedures, operator logs, voice recordings or transcripts of voice recordings, electronic communications, etc., that will be used to determine if it adhered to the (User Accountability and Compliance) requirements in Attachment 1-COM-001. (Requirement 65)

### D. Compliance

#### 1. Compliance Monitoring Process

##### 1.1. Compliance Monitoring Responsibility

NERC shall be responsible for compliance monitoring of the Regional Reliability Organizations  
Regional Reliability Organizations shall be responsible for compliance monitoring of all other entities

##### 1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 calendar days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

##### 1.3. Data Retention

For Measure 1 each Reliability Coordinator, Transmission Operator, Balancing Authority shall keep evidence of compliance for the previous two calendar years plus the current year.

~~For Measure 2 each Reliability Coordinator, Transmission Operator, and Balancing Authority shall keep 90 days of historical data (evidence).~~

For Measure ~~3~~2, each Reliability Coordinator, Transmission Operator, Balancing Authority shall have its current operating instructions and procedures to confirm that it meets Requirement ~~5~~4.

For Measure ~~4~~3, each Reliability Coordinator, Transmission Operator, Balancing Authority and NERCnet User Organization shall keep 90 days of historical data (evidence).

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor.

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

#### 1.4. Additional Compliance Information

Attachment 1 — COM-001 — NERCnet Security Policy

### 2. Levels of Non-Compliance for Transmission Operator, Balancing Authority or Reliability Coordinator

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: There shall be a separate Level 3 non-compliance, for every one of the following requirements that is in violation:

~~2.3.1 — The Transmission Operator, Balancing Authority or Reliability Coordinator used a language other than English without agreement as specified in R4.~~

~~2.3.2.3.1~~ There are no written operating instructions and procedures to enable continued operation of the system during the loss of telecommunication facilities, as specified in ~~R5~~R4.

2.4. Level 4: Telecommunication systems are not actively monitored, tested, managed or alarmed, as specified in R2.

### 3. Levels of Non-Compliance — NERCnet User Organization

3.1. Level 1: Not applicable.

3.2. Level 2: Not applicable.

3.3. Level 3: Not applicable.

3.4. Level 4: Did not adhere to the requirements in Attachment 1-COM-001, NERCnet Security Policy.

## E. Regional Differences

None Identified.

**Version History**

<b>Version</b>	<b>Date</b>	<b>Action</b>	<b>Change Tracking</b>
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Revised
1	April 6, 2007	Requirement 1, added the word “for” between “facilities” and “the exchange.”	Errata
1.1	October 29, 2008	BOT adopted errata changes; updated version number to “1.1”	Errata

## **Attachment 1 — COM-001 — NERCnet Security Policy**

### **Policy Statement**

The purpose of this NERCnet Security Policy is to establish responsibilities and minimum requirements for the protection of information assets, computer systems and facilities of NERC and other users of the NERC frame relay network known as “NERCnet.” The goal of this policy is to prevent misuse and loss of assets.

For the purpose of this document, information assets shall be defined as processed or unprocessed data using the NERCnet Telecommunications Facilities including network documentation. This policy shall also apply as appropriate to employees and agents of other corporations or organizations that may be directly or indirectly granted access to information associated with NERCnet.

The objectives of the NERCnet Security Policy are:

- To ensure that NERCnet information assets are adequately protected on a cost-effective basis and to a level that allows NERC to fulfill its mission.
- To establish connectivity guidelines for a minimum level of security for the network.
- To provide a mandate to all Users of NERCnet to properly handle and protect the information that they have access to in order for NERC to be able to properly conduct its business and provide services to its customers.

### **NERC’s Security Mission Statement**

NERC recognizes its dependency on data, information, and the computer systems used to facilitate effective operation of its business and fulfillment of its mission. NERC also recognizes the value of the information maintained and provided to its members and others authorized to have access to NERCnet. It is, therefore, essential that this data, information, and computer systems, and the manual and technical infrastructure that supports it, are secure from destruction, corruption, unauthorized access, and accidental or deliberate breach of confidentiality.

### **Implementation and Responsibilities**

This section identifies the various roles and responsibilities related to the protection of NERCnet resources.

#### **NERCnet User Organizations**

Users of NERCnet who have received authorization from NERC to access the NERC network are considered users of NERCnet resources. To be granted access, users shall complete a User Application Form and submit this form to the NERC Telecommunications Manager.

#### **Responsibilities**

It is the responsibility of NERCnet User Organizations to:

- Use NERCnet facilities for NERC-authorized business purposes only.
- Comply with the NERCnet security policies, standards, and guidelines, as well as any procedures specified by the data owner.
- Prevent unauthorized disclosure of the data.
- Report security exposures, misuse, or non-compliance situations via Reliability Coordinator Information System or the NERC Telecommunications Manager.
- Protect the confidentiality of all user IDs and passwords.
- Maintain the data they own.
- Maintain documentation identifying the users who are granted access to NERCnet data or applications.
- Authorize users within their organizations to access NERCnet data and applications.

- Advise staff on NERCnet Security Policy.
- Ensure that all NERCnet users understand their obligation to protect these assets.
- Conduct self-assessments for compliance.

**User Accountability and Compliance**

All users of NERCnet shall be familiar and ensure compliance with the policies in this document.

Violations of the NERCnet Security Policy shall include, but not be limited to any act that:

- Exposes NERC or any user of NERCnet to actual or potential monetary loss through the compromise of data security or damage.
- Involves the disclosure of trade secrets, intellectual property, confidential information or the unauthorized use of data.

Involves the use of data for illicit purposes, which may include violation of any law, regulation or reporting requirement of any law enforcement or government body.

## Standards Announcement

### Project 2007-02 – Operating Personnel Communications Protocols

Successive Ballot and Non-Binding Poll Open Through 8 p.m.  
Thursday, September 20, 2012

#### [Now Available](#)

A successive ballot of COM-003-1 – Operating Personnel Communications and Protocols and a non-binding poll of the associated VRFs/VSLs is open through **8 p.m. Eastern on Thursday, September 20, 2012.**

#### **Instructions**

Members of the ballot pools associated with this project may log in and submit their vote for the Standard and opinion in the non-binding poll of the associated VRFs and VSLs by clicking [here](#).

**Please read carefully:** All stakeholders with comments (both members of the ballot pool, as well as other stakeholders; including groups such as trade associations and committees) must submit comments through the [electronic comment form](#). During the ballot window, balloters who wish to submit comments with their ballot *may no longer enter comments on the balloting screen*, but may still enter comments through the electronic comment form. **Balloters who wish to express support for comments submitted by another entity or group will have an opportunity to enter that information and are not required to answer any other questions.**

#### **Next Steps**

The drafting team plans anticipates posting COM-003 for a recirculation ballot in October 2012.

#### **Background**

The purpose of this project is to require that real-time system operators use standardized communication protocols during normal and emergency operations to enhance the clarity of communications, improve situational awareness, shorten response time and ultimately serve reliability. As requested in the SAR, in the development of this proposed standard, the drafting team reviewed communication protocols in other NERC standards and considered the use of alert level guidelines and three-part communications to achieve consistency across regions. The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently and in a timely manner to ensure mutual understanding by all key parties, both during alerts and emergencies and during the communication of routine operating instructions.

There are two projects that include the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination, is concerned with ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, enforceable, and sufficient to maintain reliability of the Bulk Electric System.

The Project 2006-06 Reliability Coordination drafting team (RC SDT) has limited the scope of its modifications to those that address communication during emergency operations. The RC SDT has developed a new term, “Reliability Directive,” to specifically address those communications, and this term has been approved by the ballot pool. The proposed definition of Reliability Directive is “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.” The RC SDT is proposing to require three-part communication for Reliability Directives, with a High Violation Risk Factor for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols addresses communication protocols for normal *and* emergency operations, the drafting team has proposed a new term, “Operating Instruction,” to define the scope of communications to which the COM-003-1 protocols would apply. The proposed definition of Operating Instruction is “Command from a System Operator to change or preserve the state, status, output or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”

The two standards complement each other. COM-003 establishes the practice of using communication protocols for all Operating Instructions, and provides for an entity to identify, assess and correct any deficiencies with that practice. COM-002 is focused on communications during emergency situations.

Additional information is available on the [project page](#).

### **Standards Development Process**

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Standards Announcement

### Operating Personnel Communications Protocols Project 2007-02

Formal Comment Period Open: August 22 – September 20, 2012

RSAW Posted for  
Industry Comments: August 22 – September 20, 2012

**Upcoming:**  
Successive Ballot and Non-binding Poll: September 11 – September 20, 2012

#### [Now Available](#)

A formal comment period for **COM-003-1 – Operating Personnel Communication Protocols** is open through **8 p.m. Eastern on Thursday, September 20, 2012**

In response to comments received during the last comment period and other input, the drafting team has taken a new approach to COM-003-1.

This version requires entities to establish communication protocols and then implement a process for identifying, assessing and correcting deficiencies with adherence to those communication protocols. The entity is to ensure that its process is working, rather than requiring the demonstration of absolute compliance with communication protocols at all times and identifying each deficiency as a possible violation.

Additionally, this version was drafted in conjunction with the development of the Reliability Standard Audit Worksheet (RSAW). The parallel development of these documents provided the opportunity for the drafting team to consider the compliance implications of the language in the standard and to offer input into the language of the RSAW. The RSAW is posted for informal comments along with COM-003-1.

#### **Instructions for Commenting**

A formal comment period on the draft standard is open through **8 p.m. Eastern on Thursday, September 20**. Please use this [electronic form](#) to submit comments. If you experience any difficulties in

using the electronic form, please contact Monica Benson at [monica.benson@nerc.net](mailto:monica.benson@nerc.net). An off-line, unofficial copy of the comment form is posted on the [project page](#).

**Please read carefully:** All stakeholders with comments (both members of the ballot pool as well as other stakeholders, including groups such as trade associations and committees) must submit comments through the [electronic comment form](#). During the ballot window, balloters who wish to submit comments with their ballot *may no longer enter comments on the balloting screen*, but may still enter the comments through the electronic comment form. **Balloters who wish to express support for comments submitted by another entity or group will have an opportunity to enter that information and are not required to answer any other questions.**

A comment period on the draft RSAW is open through **8 p.m. Eastern on Thursday, September 20, 2012**. The draft RSAW is posted on the [NERC Compliance Reliability Standard Audit Worksheet \(RSAW\) page](#). Please submit comments on the draft RSAW using the [RSAW comment form](#) (located under “Tools”) to [RSAWfeedback@nerc.net](mailto:RSAWfeedback@nerc.net).

### Next Steps

A webinar on COM-003-1 is planned for the week of September 17, 2012. A separate announcement will be sent when the date and time are finalized.

A successive ballot of COM-003-1 and a non-binding poll of the associated VRFs and VSLs will be conducted beginning on Tuesday, September 11, 2012 through 8 p.m. Eastern on Thursday, September 20, 2012.

### Background

The purpose of this project is to require that real-time system operators use standardized communication protocols during normal and emergency operations to enhance the clarity of communications, improve situational awareness, shorten response time and ultimately serve reliability. As requested in the SAR, in the development of this proposed standard, the drafting team reviewed communication protocols in other NERC standards and considered the use of alert level guidelines and three-part communications to achieve consistency across regions. The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently and in a timely manner to ensure mutual understanding by all key parties, both during alerts and emergencies and during the communication of routine operating instructions.

There are two projects that include the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination, is concerned with ensuring that the reliability-related

requirements applicable to the Reliability Coordinator are clear, measurable, unique, enforceable, and sufficient to maintain reliability of the Bulk Electric System.

The Project 2006-06 Reliability Coordination drafting team (RC SDT) has limited the scope of its modifications to those that address communication during emergency operations. The RC SDT has developed a new term, “Reliability Directive,” to specifically address those communications, and this term has been approved by the ballot pool. The proposed definition of Reliability Directive is “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.” The RC SDT is proposing to require three-part communication for Reliability Directives, with a High Violation Risk Factor for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols addresses communication protocols for normal *and* emergency operations, the drafting team has proposed a new term, “Operating Instruction,” to define the scope of communications to which the COM-003-1 protocols would apply. The proposed definition of Operating Instruction is “Command from a System Operator to change or preserve the state, status, output or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”

The two standards complement each other. COM-003 establishes the practice of using communication protocols for all Operating Instructions, and provides for an entity to identify, assess and correct any deficiencies with that practice. COM-002 is focused on communications during emergency situations.

Additional information is available on the [project page](#).

### Standards Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

### Operating Personnel Communications Protocols Project 2007-02

Formal Comment Period Open: August 22 – September 20, 2012

RSAW Posted for  
Industry Comments: August 22 – September 20, 2012

#### Upcoming:

Successive Ballot and Non-binding Poll: September 11 – September 20, 2012

#### [Now Available](#)

A formal comment period for **COM-003-1 – Operating Personnel Communication Protocols** is open through **8 p.m. Eastern on Thursday, September 20, 2012**

In response to comments received during the last comment period and other input, the drafting team has taken a new approach to COM-003-1.

This version requires entities to establish communication protocols and then implement a process for identifying, assessing and correcting deficiencies with adherence to those communication protocols. The entity is to ensure that its process is working, rather than requiring the demonstration of absolute compliance with communication protocols at all times and identifying each deficiency as a possible violation.

Additionally, this version was drafted in conjunction with the development of the Reliability Standard Audit Worksheet (RSAW). The parallel development of these documents provided the opportunity for the drafting team to consider the compliance implications of the language in the standard and to offer input into the language of the RSAW. The RSAW is posted for informal comments along with COM-003-1.

#### Instructions for Commenting

A formal comment period on the draft standard is open through **8 p.m. Eastern on Thursday, September 20**. Please use this [electronic form](#) to submit comments. If you experience any difficulties in

using the electronic form, please contact Monica Benson at [monica.benson@nerc.net](mailto:monica.benson@nerc.net). An off-line, unofficial copy of the comment form is posted on the [project page](#).

**Please read carefully:** All stakeholders with comments (both members of the ballot pool as well as other stakeholders, including groups such as trade associations and committees) must submit comments through the [electronic comment form](#). During the ballot window, balloters who wish to submit comments with their ballot *may no longer enter comments on the balloting screen*, but may still enter the comments through the electronic comment form. **Balloters who wish to express support for comments submitted by another entity or group will have an opportunity to enter that information and are not required to answer any other questions.**

A comment period on the draft RSAW is open through **8 p.m. Eastern on Thursday, September 20, 2012**. The draft RSAW is posted on the [NERC Compliance Reliability Standard Audit Worksheet \(RSAW\) page](#). Please submit comments on the draft RSAW using the [RSAW comment form](#) (located under “Tools”) to [RSAWfeedback@nerc.net](mailto:RSAWfeedback@nerc.net).

### Next Steps

A webinar on COM-003-1 is planned for the week of September 17, 2012. A separate announcement will be sent when the date and time are finalized.

A successive ballot of COM-003-1 and a non-binding poll of the associated VRFs and VSLs will be conducted beginning on Tuesday, September 11, 2012 through 8 p.m. Eastern on Thursday, September 20, 2012.

### Background

The purpose of this project is to require that real-time system operators use standardized communication protocols during normal and emergency operations to enhance the clarity of communications, improve situational awareness, shorten response time and ultimately serve reliability. As requested in the SAR, in the development of this proposed standard, the drafting team reviewed communication protocols in other NERC standards and considered the use of alert level guidelines and three-part communications to achieve consistency across regions. The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently and in a timely manner to ensure mutual understanding by all key parties, both during alerts and emergencies and during the communication of routine operating instructions.

There are two projects that include the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination, is concerned with ensuring that the reliability-related

requirements applicable to the Reliability Coordinator are clear, measurable, unique, enforceable, and sufficient to maintain reliability of the Bulk Electric System.

The Project 2006-06 Reliability Coordination drafting team (RC SDT) has limited the scope of its modifications to those that address communication during emergency operations. The RC SDT has developed a new term, “Reliability Directive,” to specifically address those communications, and this term has been approved by the ballot pool. The proposed definition of Reliability Directive is “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.” The RC SDT is proposing to require three-part communication for Reliability Directives, with a High Violation Risk Factor for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols addresses communication protocols for normal *and* emergency operations, the drafting team has proposed a new term, “Operating Instruction,” to define the scope of communications to which the COM-003-1 protocols would apply. The proposed definition of Operating Instruction is “Command from a System Operator to change or preserve the state, status, output or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”

The two standards complement each other. COM-003 establishes the practice of using communication protocols for all Operating Instructions, and provides for an entity to identify, assess and correct any deficiencies with that practice. COM-002 is focused on communications during emergency situations.

Additional information is available on the [project page](#).

### Standards Process

The [Standard Processes Manual](#) contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

## Standards Announcement

### Project 2007-02 – Operating Personnel Communications Protocols

#### Successive Ballot and Non-Binding Poll Results

##### [Now Available](#)

A successive ballot of **COM-003-1 – Operating Personnel Communications and Protocols** and a non-binding poll of the associated VRFs/VSLs concluded on Thursday, September 20, 2012.

Voting statistics for each ballot are listed below, and the [Ballots Results](#) page provides a link to the detailed results.

Approval	Non-binding Poll Results
Quorum: 77.70%	Quorum: 84.05%
Approval: 50.57%	Supportive Opinions: 54.07%

#### Next Steps

The drafting team is reviewing comments to determine next steps..

#### Background

The purpose of this project is to require that real-time system operators use standardized communication protocols during normal and emergency operations to enhance the clarity of communications, improve situational awareness, shorten response time and ultimately serve reliability. As requested in the SAR, in the development of this proposed standard, the drafting team reviewed communication protocols in other NERC standards and considered the use of alert level guidelines and three-part communications to achieve consistency across regions. The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently and in a timely manner to ensure mutual understanding by all key parties, both during alerts and emergencies and during the communication of routine operating instructions.

There are two projects that include the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination, is concerned with ensuring that the reliability-related

requirements applicable to the Reliability Coordinator are clear, measurable, unique, enforceable, and sufficient to maintain reliability of the Bulk Electric System.

The Project 2006-06 Reliability Coordination drafting team (RC SDT) has limited the scope of its modifications to those that address communication during emergency operations. The RC SDT has developed a new term, “Reliability Directive,” to specifically address those communications, and this term has been approved by the ballot pool. The proposed definition of Reliability Directive is “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.” The RC SDT is proposing to require three-part communication for Reliability Directives, with a High Violation Risk Factor for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols addresses communication protocols for normal *and* emergency operations, the drafting team has proposed a new term, “Operating Instruction,” to define the scope of communications to which the COM-003-1 protocols would apply. The proposed definition of Operating Instruction is “Command from a System Operator to change or preserve the state, status, output or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.”

The two standards complement each other. COM-003 establishes the practice of using communication protocols for all Operating Instructions, and provides for an entity to identify, assess and correct any deficiencies with that practice. COM-002 is focused on communications during emergency situations.

It must be made clear in the requirements that functional entities can incorporate exceptions (to address emergencies for example) in the protocols that are developed. Both of these requirements are too prescriptive. The sub-requirements drill down too deeply into the communications needed to conduct system operations.
No
It is unclear what identified reliability gap this Standard's development project is intending to fulfill given the recent adoption of the new COM-002-3 along with the OC white paper on communications protocols.
The white paper written by the OC addressed the issues covered by this Standard.

Modify R1 accordingly... R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have and follow documented communication protocols for Operating Instructions that incorporate the following: R3 & R4 Delete R3 and R4 and M3 and M4 and associated VRFs and VSLs Although R1 and R2 provide for better communications, R3 & R4... • Have little or no impact to the protection or reliable operation of the BES in the event that no responsible entity performed the requirement • Have little, if any, value as a reliability requirement Are requirements for monitoring and enforcing Reliability Standards and do not provide for Reliable Operation... • Including without

limiting the foregoing, requirements for the operation of existing Facilities • Including cyber security protection, and • Including the design of planned additions or modifications to such Facilities to the extent necessary for Reliable Operation M1 should read... • M1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator, shall provide its documented communications protocols developed for Requirement R1 and results of their internal compliance program's processes which assure that deficiencies with adherence to the documented communication protocols are identified, assessed, and corrected. M2 should read • M2. Each Distribution Provider and Generator Operator shall provide its documented communications protocols developed for Requirement R2 and results of their internal compliance program's processes which assure that deficiencies with adherence to the documented communication protocols are identified, assessed, and corrected. In addition, we recommend revision to the RSAW to be reflective of the removal of both R3 and R4.

Individual

No

The definition of the new term, "Operating Instruction," uses the NERC Glossary term "System Operator," which is defined as "An individual at a control center...whose responsibility it is to monitor and control that electric system in real time." The lack of clarity regarding what constitutes a control center leaves doubt as to which instructions would be covered by the standard.

No

The SDT shift from a zero-tolerance standard to a procedure required standard is admirable. Thank you for the open-mindedness and willingness to change direction after much hard work went into the original proposal. However, the requirements for specific content in the required procedure still goes beyond the proper role of the standard. Suggested revision - eliminate R1 and R2, replace with new R1: "Each (covered entity) shall have documented procedure(s) for communications with other users of the Bulk Power System. Such procedure(s) shall have provisions which, in the judgment of the registered entity, reduce the opportunity for miscommunications." This lowers the chances of miscommunications without dictating the content of business practices.

No

There is no statement of periodicity in R4, leaving entities guessing until the time of audit regarding the criteria for sufficient review. R4 also would appear to require a great deal of review of communications in order to satisfy the requirement to identify potential defects. One of the suggestions on the NERC Webinar for COM-003 was to review a "half-hour of communications" every week. This is especially intrusive on smaller entities with a single compliance individual, as more than an hour of that person's work-week would be spent randomizing, retrieving and listening to routine communications. This effort would reduce the reliability of the bulk power system as efforts with greater effect are reduced to comply with this requirement. Suggest requiring an annual review of communications procedures with staff instead.

No

The need for a prescriptive standard remains in doubt. The SDT has responded to comments questioning this need with a cite of a single study. The applicability of this study to GOPs is unclear. We do not know the details, and question the number of cited miscommunications which involved GOPs. Further, we are unclear as to the number of miscommunications which involved two entities, as opposed to an entity giving direction to their own field operator. Such single-entity communications would not be covered by the proposed standard. Lowering miscommunications is an admirable goal, and again the SDT deserves commendation for their willingness to rethink the direction of the proposed standard. However, the standard, if needed, should be limited to requiring an entity to have communications procedures, and to reinforce those procedures on a periodic basis. The content of those procedures should properly be left to the best judgement of the individual entity.

Individual

No

Requirement R1.6 provides inadequate protection against a misunderstanding when directives are issued. Granted, the Requirement does obligate the party receiving the directive to repeat back the

directive. However, if the recipient repeats the directive back to the person issuing the directive, and the "repeat back" indicates the recipient has misunderstood the directive, this Requirement merely obligates the person issuing the directive to state the directive again. The Requirement places no obligation on the person issuing the directive, who knows he has been misunderstood, to explicitly and clearly bring to the attention of the recipient that the recipient has misunderstood. All the party issuing the directive has to do is repeat what he has already said. The party issuing the directive is under no obligation to make it clear that there has been a misunderstanding. With respect, I suggest having the person issuing the directive merely repeat it if he's been misunderstood, with no explicit statement that there has been a mistake, leaves open the potential for the recipient to be unaware he has misunderstood and to execute a misunderstood directive. As an example, consider the following exchange. Transmission Operator to Field Operator: "Jim, open Breaker 104-696". Field Operator repeats back "I understand open Breaker 104-699". Transmission Operator, noting the error, states "Open Breaker 104-696". The field operator, having not been explicitly made aware there has been an error, opens Breaker 104-699. (Presumably, he would not do so had the Transmission Operator made him aware of the misunderstanding with an explicit statement that there has been an error.) Suggestion: Add verbiage to R1.6 obligating the person issuing the directive to make an explicit statement to the recipient that there has been an error if the recipient repeats the order back incorrectly. Presently, the standard imposes no such obligation on the person issuing the directive. One possible way to reword the standard might be: "...shall ensure the recipient of the directive repeats the information back correctly; and, if the repeat back is correct, shall acknowledge the response as correct. If the repeat back is incorrect, the person issuing the directive will state "You are wrong and have misunderstood the directive". The person issuing the directive will then repeat the directive correctly. This process will continue until the recipient repeats the directive back correctly.

VSLs for R3 and R4: There is no contemplation of the entity failing to assess deficiencies (3.2 and 4.2) or failing to correct deficiencies (3.3, 4.3).
Section C. Measures: The measures are unclear as to what exactly the requirement to 'provide' entails? Would this be upon request or periodically? Please clarify. Section D. Compliance: Compliance Enforcement Authority is defined as CEA and then the full term Compliance Enforcement Authority is continually used throughout. The acronym or words should be used consistently. Section D. Compliance: There is no specification for R1 and R2 retention.

The current definition of Operating Instruction, particularly "command from a System Operator" sounds like a Reliability Directive. We recommend revising the SAR of COM-003-1 to retire the definition of Reliability Directive and COM-002-3. There is no delineation between when COM-003-1 and COM-002-3 would apply, which could potentially subject registered entities to double jeopardy. For example, an Operating Instruction that occurs during an Emergency could open up the potential for a finding of non-compliance under both COM-002-3 and COM-003-1. We suggest that the SDT work with the RC SDT to clearly define when COM-002-3 and COM-003-1 would apply. A single communication should not result in multiple penalties.
No
(1) The SDT should strike all sub-parts of R1 and R2 and allow registered entities to define their own communications protocols based on internal policies and procedures; not from overly-prescriptive reliability standards. The SDT stated that COM-003-1 is shifting paradigms and putting the responsibility on the registered entity to monitor, assess and correct its own deficiencies. If that is true, then the registered entity should have the freedom to decide what elements are to be included in its communication protocols. R1 and R2 are administrative in nature and unnecessary. There is no need to include 9 sub-parts on how to achieve proper communications. (2) The standard, as currently written, does not allow a registered entity to implement superior practices, such as multi-modal communication (multiple mediums of communicating) or other superior communication methods and technologies. There are other ways to achieve efficient and accurate operating communications and the drafting team should modify the requirements to allow the registered entity to determine the best method of communication. There will be a disincentive for registered entities to seek out new technologies to improve communication if the standard remains with the current sub-parts. More discussion on each sub-part below. (3) R1, part 1.1, use of the English language. The SDT should not require use of the English language because the vast majority registered entities in North America speak English, except for a small number of entities in Canada and Mexico. If anything, the requirement should be modified to state that, "If the English language is not used by System Operators, there must be a legal justification, such as another language is mandated by law or regulation." Not using the English language is a much greater risk to reliability. The majority of companies that speak English should not have to maintain compliance policies to reaffirm something that everyone knows that they are doing. The real issue here is if an entity does not use English language, auditors should verify how they communicate internally and what controls are in place when the non-English speaking entity communicates with English-speaking neighbors. The SDT should not put the burden of compliance on English speakers. The team should focus on the entities that pose a risk to the BES by not using the English language and the increased potential for miscommunications from translation errors. (4) R1, part 1.2, the 24-hour clock, daylight/standard time. This sub-part does not take into account real time, such as "perform an action in 5 minutes."

The purpose statement of the SAR is to provide System Operators with uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the BES. Requiring an operator to use the 24-hour clock for an action that is about to occur could cause more confusion and increase the possibility of miscommunication. The SDT should consider either inserting exceptions for the 24-hour clock for real time activities, or strike the 24-hour clock from the requirements. (5) R1, part 1.3, Standard or Daylight Savings. This sub-part also poses a risk for actions performed during real time operations and could increase the likelihood for error. For example, if WECC RC (daylight) was trying to communicate to a registered entity located in Arizona (no daylight savings time) to open a breaker. What is more effective, asking the entity to open a breaker in 5 minutes or at 11:05? In that scenario, 11:05 may be an hour difference because WECC RC is on daylight and Arizona is not, and the operators would be focusing on whether they accounted for the time changes and could potentially lose focus of the task at hand – opening the correct breaker. The SDT should consider either inserting exceptions for daylight savings/standard time for real time activities, or strike daylight savings/standard time from the requirements. (6) R1, part 1.4, Transmission interface Element or Facility. As discussed above, this sub-part is unnecessary and should be struck from the standard. A registered entity should be able to define its own communication protocol and the associated internal controls to ensure effective operating communications. Further, the Real-time Transmission Operations SDT (Project 2007-03) eliminated TOP-002 R18 which referred to the same concept as part 1.4, “uniform line identifiers when referring to transmission facilities.” The reason the Real-time TOP SDT removed the language from the new standard was because the “requirement adds no reliability benefit. ...There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue.” Project 2007-03 was approved by the NERC Board of Trustees on May 9, 2012. Why is the OPCP SDT introducing language that the NERC Board has approved to remove from the requirements? There needs to be more awareness of the other projects and actions by the NERC Board. To be consistent, we recommend striking this sub-part in its entirety. (7) R1, part 1.5, Alpha-numeric Clarifiers. As discussed above, this sub-part is unnecessary and should be struck from the standard. A registered entity should be able to define its own communication protocol and the associated internal controls to ensure effective operating communications. (8) R1, part 1.6 and 1.7, Three-part Communication. As discussed above, these sub-parts are unnecessary and should be struck from the standard. There are more effective methods of communicating besides using three-part communication. Multi-modal communication utilizes several mediums (verbal, visual and other sensory cues) to enhance communication and may include three-part, but could also include other equally efficient and effective methods to communicate, such as through interactive smart phones and other remote communication devices. Different strategies may be needed for different utilities and their communication objectives. For instance, strategies and tools may be combined to meet a wide variety of communication functions to meet the needs of system operations, including utilizing new technologies to improve human performance when performing day-to-day operations. Three-part communications could be a part of the protocol, but three-part should not be in the requirements because it limits utilities from employing other methodologies are equally effective or superior to three-part communications. A registered entity should be able to define its own communication protocol and the associated internal controls to ensure effective operating communications. (9) R1, part 1.8 and 1.9, One-way Burst Messaging. As discussed above, these sub-parts are unnecessary and should be struck from the standard. An all call communication that is incorrect has just a big of an impact on reliability than one that is not understood. Also, the SDT does not take into account all the various technologies that exist in the marketplace; what does an entity do for an “all call conference call” where there are numerous humans on the line? R1, part 1.6 refers to “two party, person to person” and part 1.8 is limited to “one-way” communication. There is a gap here – does the SDT intend to exclude the “all call conference call” from the requirements? What happens if there are errors in the sent message? Would internal controls be the remedy? If the all call communication is not understood and there was no request for clarification, would an internal control resolve this issue or would the auditor find a PV? Also, sub-part 1.8 only requires confirmation from one party, even though the burst message could have been a request for eight parties to reply. There is a gap in reliability if all parties do not reply in that example. These sub-parts need additional information for clarity. Same comment for DP/GOP below. (10) R2 should allow DPs and GOPs to define their own communications protocols based on internal policies and procedures and there should not be a requirement to include sub-parts 2.1 and 2.2. (11) R2, part 2.1, Receiving a Three-part Communication. As discussed above, this sub-part is unnecessary and should be struck from the standard. There are more effective methods of

communicating besides using three-part communication. Multi-modal communication utilizes several mediums (verbal, visual and other sensory cues) to enhance communication and may include three-part, but could also include other equally efficient and effective methods to communicate, such as through interactive smart phones and other remote communication devices. Different strategies may be needed for different utilities and their communication objectives. For instance, strategies and tools may be combined to meet a wide variety of communication functions to meet the needs of system operations, including utilizing new technologies to improve human performance when performing day-to-day operations. Three-part communications could be a part of the protocol, but three-part should not be in the requirements because it limits utilities from employing other methodologies are equally effective or superior to three-part communications. A registered entity should be able to define its own communication protocol and the associated internal controls to ensure effective operating communications. (12) R2, part 2.2, One-way burst messaging for DP and GOP. As discussed above, this sub-part is unnecessary and should be struck from the standard. Please see (9) above for more discussion of one way burst messaging.

No

(1) We support the concept of internal controls that the SDT has proposed. We agree that finding a violation for each instance is burdensome and unreasonable and evaluating internal controls is a more efficient use of resources. However, we are concerned about the evaluation of internal controls from Regional audit staff. How is NERC planning to train the Regional auditors to ensure consistency during compliance audits? There is too much room for auditor subjectivity, especially when evaluating whether a single communication was deficient. There are so many communications that could occur on a daily basis and there is not clear guidance when the Regions will find or not find a possible violation in an audit. (2) In the webinar, SDT chair stated that a registered entity that catches a high percentage of deficiencies, then their process is working, but if the entity is only catching 50% then the entity needs to correct the process. There is currently no percentage or other guideline or metric to determine if an entity's process is sufficient. If this is the SDT's intent, please provide further detail. (3) We recommend the SDT provide additional information in the Rationale and Technical Justification document to include a guideline to show how the Regional auditors would assess compliance with a control-based standard. It seems that the trend in both COM-003-1 and CIP v5 is to find the errors and fix them without the need to self-report. How are the Regions going to determine when a PV is to be issued? The Technical Justification and the RSAW do not provide enough information when a communication deficiency crosses the threshold of becoming a violation. How does a registered entity know when to self-report? (4) We recommend adding more detail, perhaps including an application guidelines section as other risk-based standards, for acceptable remediation of deficient communications. For example, if an operator failed to use the 24-hour clock during an Operating Instruction, would a simple reminder be sufficient or would the operator need to attend a full-blown training session? What documentation would be required? It seems that a reminder would remedy the deficiency, but then that would have to be documented. The internal controls used to remedy deficiencies could turn into another documentation exercise instead of focusing on effective communication. We recommend the SDT consider ways of satisfying remediation without creating an unnecessary administrative burden for maintaining compliance. (5) Please clarify R3, part 3.4, "deficiencies found external to Part 3.1." Does the SDT mean that there would be deficiencies found in an audit? Who is the external entity finding these deficiencies? Does the SDT intend for registered entities to hire external consultants? Is this the RC notifying the DP that it has not communicated appropriately? Would these externally found deficiencies result in audit report recommendations?

No

(1) We agree with the VRF classifications. (2) We agree with the VSLs for R1 and R2. We note that there is a typo in Severe VSL for R2 – there is no part 2.3 in the standard. (3) We disagree with the Time Horizons for R1 and R2. Developing documented communications protocols are not long term planning, these activities are operations planning. (4) We disagree with the VSLs for R3 and R4. In particular, the binary nature of implementing communication protocols needs to be reconsidered. During the September 6 webinar, both Gerry Cauley and Mike Moon stated that internal controls should focus on fixing deficiencies and auditors were not to find PVs for single instances of noncompliance. Based on these statements, the VSLs should not be binary if the auditors are not to find PVs for single instances. Also during the webinar, Mike Moon stated that the auditors are to make recommendations in their audit reports to improve their processes, and not to be an "enforcement hammer" for each individual deficiency. The way the VSLs are drafted, each instance will be severe.

We recommend that the SDT revise the VSLs to allow for auditors to make recommendations instead of findings of potential noncompliance. (5) R3 VSL, "The Responsible Entity did not demonstrate that no modification to the process was necessary to address the deficiencies found external to Part 3.1." This is a documentation issue and should not result in a severe VSL classification. (6) There was a lot of discussion in the webinar about Regional auditors not finding a violation, but there needs to be clear guidelines describing when an auditor will find a PV. The VSLs currently describe a violation when a deficiency is not remediated, but that same instance could result in no finding at all, depending on how the individual auditor interprets the situation. This level of subjectivity is too high; the SDT needs to revise the VSL table to reflect a more reasonable approach, perhaps by including more information and examples of situations that might be viewed as non-compliance (communication breakdown) but because of internal controls, there should be no finding of non-compliance. In the alternative, the SDT could develop a guidance document outlining when an auditor is to find a PV and include examples to ensure consistency. The RSAW does not provide any additional clarity. (7) In the webinar, there were several references to "systemic or chronic" communication deficiencies. The VSLs do not reference any types of trends, but that seems to be the focus of compliance. We suggest revising the VSLs to focus on broader issues, such as systemic deficiencies that remain unresolved.

(1) If the Regional auditor is to make recommendations to registered entities on how to improve the COM-003-1 internal controls, would the Regions allow an initial safe harbor to assess the entity's program? If Regional auditors find PVs on the initial audit, that practice would go against the spirit of self-correcting and would stifle the entity's actions to monitor, assess, and correct deficiencies. The SDT should consider this sort of initial assessment in the implementation plan. (2) If there is discussion of combining COM-002 and COM-003 in the future, why not combine them now? It would be a better use of the ERO's resources to produce a single communication standard while both SDT projects are in development instead of going back through the entire process at some point in the future. (3) A Reliability Directive appears to be a subset of the Operating Instruction definition, which is basically an Operating Instruction that occurs during an Emergency. We suggest collaborating with the RC SDT to clarify the bounds of each definition to avoid overlap. As discussed above, it would be appropriate to combine the COM-002 and COM-003 and associated definitions to avoid confusion. (4) There is no requirement for data retention for R1 or R2. Again, we recommend striking these requirements. Thank you for the opportunity to comment.

Individual

Yes

Yes

Yes

These appear to be Internal Controls and they look good.

We want to see COM-002 and COM-003 combined, therefore we voted Negative. The Internal Controls in R3 & R4 are workable.

Individual

Yes

Thank you for making this change. Central Lincoln believes the SDT is on the right track to limit the scope of the standard to communications originating from System Operators. This will be less burdensome for many registered entities as well as the Compliance Enforcement Authorities.

Yes

We appreciate the work the SDT has done to ensure the standard is not about having zero communication defects, and is more about process.

Yes

1) We note that per the proposed definition of Operating Instruction, only commands regarding the states of BES Elements or Facilities are covered. We also note that per the Statement of Compliance Registry Criteria, Distribution Providers need not own or operate BES Elements or Facilities in order to be registered as DPs. This puts DPs without these facilities in the position of documenting protocols for and processes for finding deficiencies for communications that don't occur. We note the SDT stated in the last Consideration of Comments "DPs that operate BES Facilities or BES Elements and receive Operating Instructions are subject to the need for clear communication to avoid misunderstandings that could impact the BES", and we agree. We suggest: "4.1.2 Distribution Provider that operates Bulk Electric System Facilities or Elements and receives Operating Instructions"

2) The references to Part 3.1 in Sub-requirement 3.4 and Part 4.1 in Sub-requirement 4.4 make no sense, since the standard has no such sections. We assume the SDT meant Sub-requirements 3.1 and 4.1 respectively, and suggest that "Part" be replaced by "Sub-requirement." 3) We agree with the SDT's attempt to move away from zero defect compliance, and Requirements 1 and 2 and the RSAW all support this. We're afraid the CEA may still be able to find non-compliance for a single defect based on the language of R3 or R4. For example a CEA finds a single OI that referred to a 12 hour clock time in violation of the entity's protocol developed under R1.2. This is not a violation, but the CEA goes on to discover that the entity failed to identify the deficiency under R3.1. While the entity can show they have a process that has in fact identified and corrected deficiencies, the CEA maintains they failed to implement the process for this one instance and finds a violation. When the entity points to the RSAW that states the CEA should make recommendation rather than finding a violation, the CEA states they audit to the language of the standard requirement as stated in Footnote 1 of the very same RSAW.

All actions that result in a potential violation must be reviewed and analysed to identify and correct deficiencies. Communication issues are no different. Requirements 3 and 4 are not required.

No

Analysis during Annual Review of work procedure for R1 and R2 automatically includes an analysis of the process and development of corrective actions.

Individual

Yes

No

Yes

Yes

Regarding Q2, Austin Energy (AE) believes that parts 1.1 through 1.5 of R1 are unnecessary. Three-part communication, as described in parts 1.6 through 1.9, is the preferred method for ensuring that both parties understand an Operating Instruction. It provides a sufficient mechanism for clear, concise and accurate communication. AE believes that creating a protocol that requires System

Operators to essentially relearn the way to speak (specifically using alpha-numeric identifiers) will only create confusion as operators try to follow protocol and catch/correct themselves. Additionally, the constant use of alpha-numeric identifiers in transmission switching orders that contain many, many steps will become burdensome. AE believes that its current use of three-part communication during these switching orders is more effective. Regarding Q4, the phrase "Parts 2.1 to 2.3 (3)" in the Severe VSL for R2 should be "Parts 2.1 and 2.2"

Individual

Yes

No

It must be made clear in the requirements that functional entities can incorporate exceptions (to address emergencies for example) in the protocols that are developed. Both of these requirements are too prescriptive. The sub-requirements drill down too deeply into the communications needed to conduct system operations.

No

It is unclear what identified reliability gap this Standard's development project is intending to fulfill given the recent adoption of the new COM-002-3 along with the OC white paper on communications protocols.

The white paper written by the OC addressed the issues covered by this Standard. Also the requirements 1.6, 1.7 and 2.1, 2.2 seem to be redundant with the requirement R2 of COM-002-2. Both touch on the issue of ensuring misunderstandings by requiring the parties to repeat, restate, rephrase or recapitulate the information transmitted/received. If adhering to the philosophy of Project 2013-02 Paragraph 81 of FERC, we should remove unnecessary requirements as part of NERC's Find, Fix and Track Process

Individual

Yes

Occidental Energy Ventures Corp. ("OEVC") agrees that it is important to specify that the command came from a System Operator. This allows us to leverage existing recording and monitoring systems to capture the event. The previous definition was open ended – which would have required us to expend an unknowable dollar amount in an attempt to capture every conversation related to a BES Facility or Element.

Yes

Although in general, OEVC does not believe that process documents should be the primary reliability consideration, it is the appropriate strategy in this case. Clearly, all of us want to eliminate Operator miscommunications – which make up nearly 20% of all BES mishaps – but it is impossible to assure 100% compliance over the course of thousands of System Operator communications. Furthermore, the effort required to capture the evidence needed by audit teams would overwhelm our resources, as well as those of the Regional compliance organizations. In our view, the path chosen by the drafting team is consistent with NERC's Risk-based Compliance program. It drives attention in areas that reliability data shows to be deficient, but recognizes that the benefit of COM-003-1 must outweigh the costs and resources required to implement it.

No

OEVC supports the concept underlying R3 and R4, but believe that far more detail must be provided in the measures and/or the RSAW. In general, we read these requirements as pertaining to System Operator monitoring and feedback processes that take place either in real-time or after the fact through the review of recordings. However, there may be other suitable options such as comprehensive Operator logging or even regular awareness training. Our concern is that without further clarification, auditors may choose to interpret these requirements to mean that 100% of all conversations must be monitored and assessed. This would result in a cost-prohibitive situation, with little incremental improvement in reliability. Every effective quality program relies on statistically significant sample assessments – and there must be an acceptable sample size defined. Furthermore,

OEVC would like to see the Cost Effective Analysis Process (CEAP) used in this initiative. Our initial assessment is that at least one resource will need to be added at our four generation facilities in order to supplement our Operator quality monitoring program to accommodate COM-003-1. However, this is based upon our assumptions of a statistical monitoring method – which is very sensitive to the number of samples required. If other industry stakeholders come to the same conclusion, the result could drive upward pressure on electricity rates – and should be compared to the expected benefits of the initiative.

The definition of the new term, "Operating Instruction," uses the NERC Glossary term "System Operator," which is defined as "An individual at a control center...whose responsibility it is to monitor and control that electric system in real time." The lack of clarity regarding what constitutes a control center leaves doubt as to which instructions would be covered by the standard. Another disagreement with the proposed definition of "Operating Instruction" is that it inappropriately imposes three-part communication for routine communications of changes of generation output. Common operating communications to and from generation plants should not be considered compliance events requiring

the use of alphanumeric clarifiers. Such a requirement may shift operators' focus from providing proper information under critical situations to using the specified terms for every minor communication, distracting them rather than sharpening their concentration. The standard should specify the classes of TO/TOP-to-GOP communications that constitute compliance events, the formal designations by which such communications can be recognized, and the parties authorized to issue such commands.

No

Clarification is needed regarding what GOP procedures are to cover, ref. our comments to question #1 above.

No

There is no statement of periodicity in R4, leaving entities guessing until the time of audit regarding the criteria for sufficient review. R4 is also open-ended regarding scope, potentially requiring review of every voice communication for every plant for the audit period. Everyday communications do not merit such scrutiny, which would reduce rather than improve the attention that can be given to matters of significance. All standards (not just COM-003-1) should clearly specify pass/fail criteria and the associated evidence requirements. R4 should be split into DP and GOP sections, with the GOP requirement being: R4. Each Generator Operator shall conduct in each calendar year a review session with the operations function for registered entities, regarding the documented communication protocols specified in Requirement R2. Corrective action shall be implemented and documented for any potential deficiencies coming to light as a result of this review.

Individual

OG&E is in support of Southwest Power Pool Comments. OG&E also had individual comments (though I am now not allowed to submit via the questionnaire; therefore, will submit here). Q1: No We prefer the use of the word "Instruction" vs "Command", though we understand that word is already part of the term being defined. Could be open to using the term "Request" or "Order" or "Direction". Q2: No R2.1 does not read well. We would recommend changing to "When receiving an oral two party, person-to-person Operating Instruction, the recipient is required to repeat, restate, rephrase, or recapitulate the Operating Instruction." Regarding R2.2, we are struggling to identify what would be considered a "one-way burst messaging system". Perhaps examples could be provided to clarify what the SDT is trying to address. Consider adding similar language that is currently provided in TOP-001-1a R3 "...shall comply with reliability directives issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances the Transmission Operator, Balancing Authority or Generator Operator shall immediately inform the Reliability Coordinator or Transmission Operator of the inability to perform the directive so that the Reliability Coordinator or Transmission Operator can implement alternate remedial actions." to allow for those circumstances in which a Distribution Provider or Generator Operator may not be able to respond to the Operating Instruction. Q3: The word "potential" in R3.1. and R4.1. could be subjective. Please remove this word such that both R3.1. and R4.1. state "Identifies deficiencies,". Q4: No We believe R3 and R4 should be considered Low VRF as they are establishing the process that supports R1 and R2 which are already designated as Low VRF. We do not think the subsequent process should have a higher VRF than the original requirement. Other Comments: OG&E continues to believe that the COM-003 standard, while obviously the result of significant effort and good intentions, is unnecessary. Even though we believe that three-part communication is a best practice, and we utilize it for switching and reliability-related instructions, we do not believe that it should be mandated through an enforceable standard. COM-002 addresses three-part communications during emergency conditions and we believe that is sufficient. With respect to the Paragraph 81 project, NERC should be focused on retiring standard requirements that meet the following criteria: (a) have little or no impact on reliability, (b) administrative, purely documentation, redundant, or hinders protection of the BES, and (c) Lower VRF/VSL, lower tier Actively Monitored Standard, etc. The industry has yet to be provided sufficient evidence that the lack of three-part communication during normal operations has been the direct cause, or even a contributing cause, to reliability failures. While a good idea in concept, the COM-003 standard is likely to take significant effort to interpret, understand and implement, at a time when industry is already overburdened with real reliability issues that we already know to be problematic. The documents

referenced in the Rationale and Technical Justification document supporting the need for this standard should be made available for review if the drafting team is using them as support for the justification for COM-003.

Individual

Yes

Yes

R1.3 should allow the use of prevailing time in addition to Daylight Savings and Standard time. Prevailing time eliminates the need to differentiate between daylight savings or standard time in notices and reduces confusion since the clocks are changed at a scheduled time by the US Government.

Yes

United Illuminating supports the language in COM-003 R3 and R4. Since the quantity of Operating Instructions will be very large it is more important to have a process to monitor the communication protocols and correct deficiencies.

Yes

It is not clear whether the protocols in COM-003 apply to Reliability Directives in Com-002. It can be reasoned that a Reliability Directive is a form of Operating Instruction. A double jeopardy situation is created. Also the COM-003 R3 and R4 requirements would be inappropriately applied to Reliability Directives. UI believes there is a difference between Reliability Directives and Operating Instructions and the difference should be maintained. A Directive occurs during an Emergency and has a higher risk than an Operating Instruction. Directives should be limited in occurrences and therefore is not conducive to sampling or error correction as opposed to Operating Instructions which occur multiple times in a day and are numerous. The data retention requirement of 90 days is reasonable. But UI is concerned with the approach to monitoring requiring an inventory of every conversation that occurred in that 90 day period to identify it as an Operating Instruction. Finally UI supports EEI's comment.

Individual

No

ReliabilityFirst does not agree with the changes made to the proposed definition "Operating Instruction". The definition of Operating Instruction begins with the word "Command". ReliabilityFirst is unsure what the word "command" means and believes it could be mistaken as a directive. ReliabilityFirst requests further clarification on the meaning of the word "command". ReliabilityFirst recommends the following for consideration: "Communication of instruction from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.

No

Requirements R1 and R2 require the responsible entities to have documented communication protocols for Operating Instructions, but does not require the responsible entity to implement the protocols. Absent implementation of the protocols, there is no need for the protocols themselves if the responsible entity is not required to follow them. ReliabilityFirst recommends the following wording as an example for Requirement R1: "Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have and implement a documented communication protocols for Operating Instructions..."

No

ReliabilityFirst believes the words "identifying deficiencies" (within R3 and R4) is ambiguous and could be open to interpretation. ReliabilityFirst believes the drafting team should further clarify the deficiencies in which will be required to be identified in Requirement R3 and R4.

Yes

ReliabilityFirst thanks the SDT for their work but has a question related to the Implementation Plan.

The SDT indicated in the consideration of comments report (from the draft 2 posting) the standard's six calendar month implementation time frame has been extended 12 calendar months to provide an adequate amount of time for training and implementation. As noted above, there is a conflict since the draft standard does not require implementation of the protocols. ReliabilityFirst believes absent any implementation requirement, the six calendar month implementation time frame is adequate for an entity to have documented communication protocols for Operating Instructions.

Individual

No

We do not see the need to define the term "Operating Instructions" for a number of reasons: For years, system operators deal with operating instructions on a daily if not minute basis. Having a defined term, and calling such communication as "Command" is totally unnecessary, and can confuse operators from what they understand to be the meaning of operating instructions. The main intent of this standard is to ensure no miscommunication between operating personnel, a part of which is proposed to be fulfilled by exercising 3-part communication for operating instructions.

Notwithstanding our disagreement to having such a requirement in this standard, such a requirement can be developed without having to define a term that adds nothing to the universal understanding of the term but which can confuse operators. For example, Requirement R1 can be revised to: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented protocols for communicating operating instructions that will change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System, which incorporate the following: 1.1 1.2 ....

No

We disagree with the need to repeat and confirm operating instructions (Part 1.6 to 1.9 and R2) meant to be used for normal operating system conditions. As indicated in our previous comment, the term Reliability Directives and the recently approved COM-002-3 cover instructions not only emergency conditions but also conditions that can result in Adverse Reliability Impact. Requiring operating entities to exercise 3-part communications (repeating and confirming) for routine operating instructions that maintain the states or do not change the status of the BES Facilities, or simple actions such as removing a transmission line which has no impact on the BES, or simple switching, or adjusting a small amount of generation output, is totally unnecessary, and can in fact overburden System Operators and harm reliability. And we respectfully disagree with the SDT's response to our previous comment regarding the applicability of the term "Reliability Directive" in which the SDT claims that the term "Reliability Directive" in the approved version of COM-002-3, "...in the context of COM-002-3, is specifically for Emergency operating conditions" and "...covers a very narrow band of low frequency, high impact events. The definition covers not only emergency, but also Adverse Reliability Impacts" Further, the definition does not explicitly indicate, nor is it implied, that such conditions are "of low frequency, high impact events." To address the BoT's concerns expressed when approving the interpretation of COM-002-2, the term Reliability Directive now defined in COM-002-3 together with the NERC Operating Committee's guideline on System Operator Verbal Communication fully cover the condition under which 3-part communication need to be (to address Adverse Reliability Impacts) or should be (where deemed appropriate) exercised. We do not see the need for having a standard requirement for 3-part communication for conditions other than when Reliability Directives are issued. Regarding the other parts in Requirement R1, i.e. 1.1 to 1.5, these are good operating practices but are not absolutely necessary the "must follow" protocols that rise up to a continent-wide reliability standard level.

No

We do not see the need for these two requirements at all. Assuming Requirements R1 and R2 were to stay (which we disagree), Responsible Entities need to comply with these requirements to develop documented communication protocols for Operating Instructions that incorporate all parts in R1 and R2. Any deficiencies with adherence to the documented communication protocols specified in R1 and R2 will be assessed non-compliance, and sanction and remedial actions will be imposed to correct such deficiencies. Having two requirements to obligate entities that already violated the standard is totally unnecessary, and redundant and may result in double jeopardy.

No

We do not agree with the need for most if not all of these requirements, and therefore do not agree

with the proposed VRFs and VSLs.
We do not see the need for this standard. We feel that Reliability Standards should have performance based objectives, rather than prescriptive requirements that outline "how" to meet an objective. This draft is not consistent with this approach. If the majority of the industry also express a similar view, we urge the SDT to bring this to the Standards Committee's attention, and seek its advice on way forward, including stopping this project altogether.
Group
SERC OC Standards Review Group
Gerry Beckerle
Ameren
No
We do not see a significant difference between Operating Instructions and Operating Communications, and we believe neither definition is necessary.
No
We support having a documented communications protocol, but do not support prescriptive elements. Below is an example of language we could support. All the subparts of R1 and R2 need to be rewritten along these lines. "R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communication protocols for Operating Instructions that address the following: .... 1.6. The conditions under which an issuer is expected to: • Confirm that the response from the recipient of the Operating Instruction was accurate, or • Reissue the Operating Instruction to resolve a misunderstanding."
No
We would suggest changing R3 and R4 to align with our suggestions for R1 and R2: "R3. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a process for identifying deficiencies with adherence to their documented communication protocols that each entity developed in accordance with Requirement R1 that:"
Yes
We could agree within the context of our comments listed above.
The SERC OC Standards Review Group does not agree that the mandatory/prescriptive procedure for three part communications in essentially all oral communications will improve reliability of the BES. The standard needs to be changed to better reflect industry comments from this comment period and the previous ballot. The comments expressed herein represent a consensus of the views of the above named members of the SERC OC Standards Review Group only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Individual
Yes
Yes
Yes

Regarding R1.4, drafting team should clarify whether "interface" means interfaces between neighboring entities or between functional entities. Regarding R1.8, does the drafting team have an appropriate response time-frame for the confirmation to occur from recipients? Regarding R1.9 and R2.2, these requirements seem unnecessary and unauditible. An audit team can evaluate whether the documented communications protocol contains language to address these requirements; however, evaluating the actual execution would be subjective. It is not possible to determine whether a recipient understood a message clearly and whether clarification was required. Further, it will be difficult for entities to identify deficiencies with this requirement, as required by R3, for the same

reasons.

CenterPoint Energy appreciates the revisions made to the current draft of COM-003 based on stakeholder feedback; however, the company maintains a negative vote based on the following: Requirements 1.1 through 1.5 are overly prescriptive. We recommend deletion of stated sub requirements as an effort to move away from detailed micro requirements. Additionally, CenterPoint Energy recommends deletion of R3 and R4. The "internal controls" concept can be incorporated into the remaining requirements. CenterPoint Energy would vote affirmative if the SDT revised the proposed standard as indicated below: R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses, and corrects deficiencies, documented communication protocols for Operating Instructions that incorporate the following: 1.1 When issuing an oral two party, person-to-person Operating Instruction, require the issuer to: • Confirm that the response from the recipient of the Operating Instruction was accurate, or • Reissue the Operating Instruction to resolve a misunderstanding 1.2. When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction. 1.3. When issuing an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), verbally or electronically confirm receipt from one or more receiving parties. 1.4. When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood. R2. Each Distribution Provider and Generator Operator shall implement, in a manner that identifies, assesses, and corrects deficiencies, documented communication protocols for Operating Instructions that incorporate the following. [Violation Risk Factor: Low] [Time Horizon: Long-term Planning] 2.1 When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction. 2.2 When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.

Duke Energy
Greg Rowland
Duke Energy
No
Duke Energy is very encouraged by the changes made by the Standard Drafting Team in the current version of COM-003-1. The shift to requiring a communications protocol and a process for identifying and correcting deficiencies is a major step in the right direction. Our concern with the definition is that additional clarity is needed to distinguish the definition of Operating Instruction from the definition of Reliability Directive so that entities know which communications COM-003-1 applies to. This could be accomplished by changing the definition of Operating Instruction; replacing the word "Command" with "Normal communication", and replacing the word "preserve" with the word "maintain". The revised

definition would read as follows: "Normal communication from a System Operator to change or maintain the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System".

No

1) In Requirements R1 and R2, the word "incorporate" should be changed to "address". This change will align the language of the requirements with the language of the RSAW, providing flexibility to entities in how their communications protocols will be structured. This change will also help to alleviate some of the following concerns. 2) In R1.1, 1.3 and 1.4 clarify the meaning of the phrase "between functional entities". Do these sub-requirements apply to Operating Instructions between individuals located in the same functional entity? 3) In R1.7, the phrase "repeat, restate, rephrase, or recapitulate" seems excessive. Suggest changing to just "repeat or rephrase". 4) R1.6 and 1.7 are describing 3-part communication. Suggest combining 1.6 and 1.7 5) R1.8 and 1.9 address "one-way burst messaging", but it's not clear whether, or to what extent, 3-part communication is required.

Yes

No

1) Consistent with our comment to Question 2 above regarding changing the word "incorporate" to "address" in Requirements R1 and R2, this change should also be made in the VSLs for R1 and R2, changing the word "include" to "address". 2) The Severe VSL for R2 incorrectly references a Part 2.3, whereas it should just refer to both Parts 2.1 and 2.2

Individual

Yes

Yes

Yes

Yes

Individual

Yes

Yes

Yes

The proposed requirements (COM-003-1, R3 and R4) are in line with Risk-Based Reliability Compliance Monitoring.

Yes

Requirement R1.5 should be an optional step to assist in resolving any misunderstanding found in requirement R1.6. Alpha-numeric clarifiers, Requirement R1.5, in every three part communication of an operating instruction is an activity that adds little if anything to promote the protection of the BES and can hinder/distract from the reliable operation of the BES.

Individual

Yes

No
LES requests the drafting team provide additional clarification regarding R2.1 as it relates to “oral two party, person-to-person” communication occurring between the System Operators and field crews. Does the drafting team intend for the communication protocols to be used for all communications between the System Operators and field crews (such as for normal day-to-day switching of distribution elements) or only as it occurs between defined functional entities? Within the Draft 2 consideration of comments under “Outstanding Unresolved Issues”, the drafting team states that “The SDT clarified that COM-003-1 only applies to communication between functional entities. For example, if a TOP System Operator is issuing an Operating Instruction to an individual that is internal to that TOP, three part communication is not required by this standard”. Although LES supports this clarification, it’s incorporation into the requirement is not obvious. Recommend the drafting team modify R2.1 as follows to ensure this clarification remains evident within the standard going forward: R2.1. When receiving an oral two party, person-to-person Operating Instruction between functional entities, the recipient is required to repeat, restate, rephrase, or recapitulate the Operating Instruction.
Yes
Yes
The Severe VSL for R2 should be modified to instead state “The responsible entity did not include Parts 2.1 to 2.2 of Requirement R2, in their documented communication protocols”. The current VSL incorrectly references Part 2.3 of R2 which does not exist.
LES believes additional clarification is needed to more clearly delineate who is considered to be the Generator Operator (the power plant operator vs. system operator) responsible for compliance with COM-003-1. As currently drafted, the Generator Operator, as the recipient of Operating Instruction, must have and utilize documented communication protocols per R2. In the event generation re-dispatch were to be requested, is it the power plant operator performing the task or the system operator requesting the execution of the task responsible for using the documented communication protocols?
Individual
No
Although NextEra Energy, Inc. (NextEra) is encouraged by the refinements made to draft COM-003-1, NextEra believes additional refinements are necessary for COM-003-1 to promote reliability, and in no way hinder reliability. NextEra’s perspective is heavily influenced by the years of experience of its system operators in their role as a large Transmission Operator, Reliability Coordinator agent and Balancing Authority. Specifically with respect to the definition of Operating Instruction, NextEra recommends that the definition more closely track the syntax of the definition of Reliability Directive in COM-002-3, and, thus, read as follows: Operating Instruction – a command from a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to change or preserve the state, status, output of an Element or Facility of the Bulk Electric System.
No
NextEra opposes any communication protocol in COM-003-1 that is not mirrored in COM-002-3. NextEra views the implementation of two different communication protocols -- one for Reliability Directives and one for Operating Instructions as problematic and not consistent with the promotion of a reliable Bulk Electric System. This concern is heightened by the fact that there are more specific protocols for Operating Instructions which are lower in the communication hierarchy when compared to Reliability Directives. Such a model is counterintuitive. If implemented, this model will also likely be counterproductive, increase confusion among System Operators and may unnecessarily cause a risk to the Bulk Electric System. The inherent risk caused by the lack of synergy and consistency between COM-003-1 and COM-002-3 could be resolved by combing the Standard Development projects and having the SDTs work together to produce one uniform work product. Therefore, NextEra urges the COM-003-1 SDT to request that the Standards Committee join the COM-002-3 and COM-003-1 efforts, so that one uniform three-way communication protocol can be developed and implemented that promotes reliability. Further, in addition to comments that NextEra has previously submitted, it asks that the following changes be made: R1.1 Delete “between functional entity” as unnecessary and delete the second sentence altogether (or clarify it), because it is unclear and may add confusion. In

the context of an Operating Instruction, it is best that English be used between Transmission Operators and Balancing Authorities for external and internal communications related to Operating Instruction. To allow for alternative languages to be used internally when an Operating Instruction is given will likely result in difficult transitions between internal and external conversations which may unintentionally result in a risk to the Bulk Electric System via an external miscommunication using a language other than English. Thus, NextEra prefers that English be promoted and used for internal and external communications related to Operating Instructions. R1.4 Add a comma after "Facility" in the fourth line. R1.8 Use the term "entities" instead of "parties" in the second line. Entities is a more widely recognized term than parties in the context of the Reliability Standards. Also, for clarity, re-write the end of 1.8 to read ". . . confirm receipt from each entity." The current wording states "confirmed receipt from one or more receiving parties" seems to miss the point that what the sender needs is confirmation from each entity that was sent the message. R1.9 Similarly, replace the term "parties" in line two with "entities".

No

Although NextEra supports Reliability Standards that are more risk and result based and provide for a corrective bandwidth or prosecutory discretion for possible violations, as drafted, R3 and R4 need refinement to meaningfully and clearly implement any of the above concepts. Therefore, NextEra recommends that R3 and R4 both be re-written to read as follows: R3 Absent a possible violation that resulted in (or could have resulted in) a significant risk to the Bulk Electric System, no violation of R1 and its subrequirements shall be found, provided that the Balancing Authority, Reliability Coordinator, and Transmission Operator has implemented a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R1 that: . . . R4 Absent a possible violation that resulted in (or could have resulted in) a significant risk to the Bulk Electric System, no violation of R2 and its subrequirements shall be found, provided that the Distribution Provider and Generator Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R2 that: . . .

No

NextEra does not support VSLs that are checklist or document related. Rather NextEra favors VSLs that balance results and performance against reliability risk. As drafted, the current VSLs are a checklist approach to measuring reliability risk and compliance, which is not particularly helpful or meaningful. Thus, NextEra suggests that VSLs be re-drafted to measure whether the entity posed an actual risk to the Bulk Electric System based on how it delivered or received an Operating Instruction.

NextEra proposes the following as an alternative approach that more closely mirrors COM-0002-3 and includes the internal controls language in R4 and R5. R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as an Operating Communication, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as an Operating Instruction to the recipient. R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Instruction shall repeat, restate, rephrase or recapitulate the Operating Instruction. R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Instruction shall either: • Confirm that the response from the recipient of the Operating Instruction (in accordance with Requirement R2) was accurate, or • Reissue the Operating Instruction to resolve any misunderstandings. R4 Absent a possible violation that resulted in (or could have resulted in) a significant risk to the Bulk Electric System, no violation of R1 or R3 and its subrequirements shall be found, provided that the Balancing Authority, Reliability Coordinator, and Transmission Operator has implemented a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R1 and R3 that: 4.1. Identifies potential deficiencies, 4.2. Assesses the deficiencies found, 4.3. Corrects the deficiencies, and 4.4. Evaluates the process based on deficiencies found external to Part 3.1 and either • implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or • demonstrates that no modification to the process is necessary to address the deficiencies. R5 Absent a possible violation that resulted in (or could have resulted in) a significant risk to the Bulk Electric System, no violation of R2 and its subrequirements shall be found, no violation of R2 and its subrequirements shall be found, provided that the Distribution Provider and Generator Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R2 that: 5.1. Identifies potential deficiencies, 5.2. Assesses the deficiencies found, 5.3. Corrects the deficiencies, and 5.4. Evaluates the process based on deficiencies

found external to Part 3.1 and either • implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or • demonstrates that no modification to the process is necessary to address the deficiencies.

PacifiCorp

Sandra Shaffer

PacifiCorp

Yes

No

PacifiCorp does not feel that the requirements listed in R1.5 regarding the use of alpha-numeric clarifiers when issuing an oral Operating Instruction is warranted. The requirements listed in R1.6, and R1.7 requiring the strict used of three-way communication should alleviate any possibility of miscommunication, which PacifiCorp understands to be the drafting team's intent in the development of separate Requirement R1.5. Also, implementing the use of alpha-numeric clarifiers poses additional risk due to the introduction of ambiguous language.

No

PacifiCorp supports the addition of non-zero defect language which follows the CIP model. [model PacifiCorp suggests that the language in Requirement R3 be modified and simplified as follows: "R3. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement R1 in a manner that identifies potential deficiencies, assesses deficiencies found, and corrects those

deficiencies.”
No
It is not clear to PacifiCorp why the VSLs are so much higher for R2 when R1 applies to Balancing Authorities, Reliability Coordinators, and Transmission Operators, and thus has a potentially broader application than R2. R2 applies to Distribution Providers and Generator Operators. Also, it is not clear why the R2 VSL R2.3, as there is no R2.3 in the current draft.

We believe that three-part communications should only be necessary for directives. Also COM002 and COM003 should be merged into one standard.
Individual
No
Operating Instruction Definition is too broad; this essentially imposes on affected entities the need to use 3-part communication all the time. Additionally the broadness of the definition may cause compliance difficulties between COM-003-1 and COM-002 if the requirements are not looked at holistically between the two. A recommendation would be to combine the requirements into one standard.
No
R1.2 Prescribed use of a 24 hour clock format seems over-bearing R1.3 The use of “functional entities”- includes more entities than the applicability section and uses terms from the functional model which goes beyond registered entities, may be some confusion here. R1.4 Transmission interface Element Transmission interface Facility These terms may need to be defined. They may be ambiguous to some entities as to what is intended R1.5 Use of alpha-numeric clarifiers in some instances inhibit efficient communication, without increasing the effectiveness of the communication or reducing the risk to the BES. In keeping with the requirement of entities to document its protocols, it should be left to the entities of regions to define this. R2 Is missing a sub-requirement that requires a clarification of two party communication that is not understood.
No
R3 & R4 As written are confusing and do not convey the intent of the SDT. Below is recommended re-write: Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a process that assesses conformance and performance to the R1 documented protocols. This process shall include identifying deficiencies, assessing the deficiencies and correcting the deficiencies when feasible. R3.4 & R4.4 This should be removed as a sub-requirement and made its own requirement Below is recommended re-write: Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall [insert time period] evaluate its process required by R3 (R4) for deficiencies. Identified deficiencies shall be assessed and corrected when feasible. If no deficiencies found this is to be documented.
No
VRF R3 & R4 NERC VRF Discussion: R3 (4) is a requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is “Medium” which is consistent with NERC guidelines The violation of R3 (R4) does not result in informal communication; it results in not identifying it. It is not a failure to identify that poses the risk to the

BES, but the actual communication. The process implemented in R3 (R4) identifies, assesses, and attempts to correct deficient communication practices in an attempt to make future communications better. The process in R3 (R4) has no real-time impact on the BES, it aims at having real-time impact on operators who have real-time impact on the BES. For these reasons the VRF should be "Low" FERC VRF G1 Discussion: Discussion references wrong FERC Recommendation; should have referenced Recommendation 26 rather than 24. Additionally, the SDT wrongly implies that Recommendation 26 applies to COM-003-1. Recommendation 26 "Tighten communications protocols, especially for communications during alerts and emergencies..." applies to COM-002, thus removing it from FERC VRF G1 allowing for a VRF of "Low" to be assigned. FERC VRF G3 Discussion: Though analogous to R2 of COM-002-2 they are not the same. One can argue that the importance of "directive" to the BES is greater than the importance of an "Operating Instruction" to the BES and thus the risk to the BES is less for R3 (R4) of COM-003-1, and accordingly should be assigned a lower VRF than R2 of COM-002-2 to promote consistency between the standards, while also elevating the importance of COM-002-2 over COM-003-2. Said another way (Though each requirement addresses communication protocol, the potential effects of the failure to follow the protocol are different in that one deals with Directives and Emergency conditions and the other with Normal operations. So the VRF's shouldn't necessarily be the same.) FERC VRF G4 Discussion: The violation of R3 (R4) does not result in informal communication; it results in not identifying it. It is not a failure to identify that poses the risk to the BES, but the actual communication. The process implemented in R3 (R4) identifies, assesses, and attempts to correct deficient communication practices in an attempt to make future communications better. The process in R3 (R4) has no real-time impact on the BES, it aims at having real-time impact on operators who have real-time impact on the BES. For these reasons the VRF should be "Low" FERC VRF G5 Discussion: The SDT has argued that R3 & R4 each contain only one objective (identification of deficiencies). An Alternative read suggests the R3 & R4 as written each have six objectives: 1. Identify deficiencies in 3-part communication as defined by protocols in R1 2. Assess identified deficiencies in 3-part communication 3. Correct identified deficiencies in 3-part communication 4. Identify deficiencies in process implemented in R3 (R4) 5. Assess identified deficiencies in process implemented in R3 (R4) 6. Correct identified deficiencies in process implemented in R3 (R4) VSL Justification R3 (R4) The SDT has argued that R3 & R4 each contain only one objective (identification of deficiencies). An Alternative read suggests the R3 & R4 as written each have six objectives: 1. Identify deficiencies in 3-part communication as defined by protocols in R1 2. Assess identified deficiencies in 3-part communication 3. Correct identified deficiencies in 3-part communication 4. Identify deficiencies in process implemented in R3 (R4) 5. Assess identified deficiencies in process implemented in R3 (R4) 6. Correct identified deficiencies in process implemented in R3 (R4) Because there are multiple objectives in R3 (R4) there is an opportunity for more granularities to the proposed VSL.

Applicability Section: Functional Entities Section may not be broad enough to capture all entities participating in communication for example a TO may have a switchman receiving Operating Instructions from a TOP; the way the standard is written the TO would not be required to participate in 3-part communication making it difficult for the TOP to fully implement its Communication Protocols. M3 & M4 impose more requirements on the registered entity than are be required in R3 & R4 respectively. For example R3 requires the implementation of a process, the measure looks for the results of the process, the measure should be measuring the implementation not the result of the process.

COM-003 cannot be a zero defect standard. We propose rewording R3 to state: "Each Reliability Coordinator, Transmission Operator and Balancing Authority shall implement the requirements in R1 in a manner that identifies, assesses, and corrects deficiencies, if any. Where the entity is identifying, assessing and correcting deficiencies, the entity is satisfactorily meeting the requirements or COM-003." If there is no leeway given, requirement 1 of this standard will generate a very large number of

violations and in our opinion it would become one of the most violated standards very quickly.

This is redundant with the continual improvement methodologies that the NERC process already has in place. If a company finds, through a self assessment or NERC audit, that they are not meeting a requirement in a standard, then the NERC process is to either self report, or be found in violation. In either case the entity must complete their deficiency in the standard in order for the mitigation to be approved by their regional entity. To have to have written process for this in order to meet R3 and R4 is redundant with the requirements on how NERC views the elements of a successful compliance program. Smaller entities do not have the man power for redundancies such as this. I would rather see R3 and R4 dropped from the standard for the reasons above. Most if not all companies will correct issues through the self report process and mitigation plan approval process.
No
See comments from SPP
As stated drop requirements R3 and R4 as they seem redundant with the overall NERC program of reporting and mitigation plan approval.

While AEP would not argue against the definition of "Operating Instruction" as proposed, we object to its inclusion as we disagree with the concept of requiring three part communications for more routine operations. Our efforts in this regard should first be focused solely on Reliability Directives before expanding this work, and creating similar requirements for all other Operating Communications. Requiring three part communications for every scenario might be considered a best practice by some, but making it a mandatory practice for routine operations emphasizes the manner of communications rather than the operations themselves. In addition, requiring three part communication in such a broader scope could actually diminish the perceived urgency during more urgent situations where such communications are more appropriate. In any event, requiring three part communications for Reliability Directives will likely result in more widespread usage for more routine operating communications, without making it a requirement. AEP believes that there should not be multiple project teams proposing concurrent changes to COM-001, COM-002, and COM-003. Unless there are overwhelming reasons for not doing so, these efforts should be consolidated and managed by a single project team. In addition, current efforts on COM-003 need to be co-located with the proposed changes to COM-002 within a single standard. Having multiple project teams proposing concurrent changes results in problems such as this. where a) changes are proposed to the same standard or b)

similar changes are proposed to separate standards. AEP cannot support revisions on these matters until they are managed by a single project team. If the team believes it should still proceed in their current efforts, then there probably is no need for requiring three part communications for Reliability Directives (COM-002 R2). As a result, COM-002 R2 should be retired and this definition should include emergency situations as well.

No

AEP disagrees with the concept of requiring three part communications for more routine operations, and as a result, also disagrees with requiring that entities have documented communication protocols as proposed.

No

AEP disagrees with the concept of requiring three part communications for more routine operations, and as a result, also disagrees with R3 and R4 which require that the entity shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R1 and R2.

No

AEP disagrees with the concept of requiring three part communications for more routine operations, and as a result, has no comment at this time on the proposed VRFs and VLSs.

AEP does not agree with the perceived necessity of this standard, but does support the overall concept of the drafting team's building controls into the standards as well as proposing RSAWs during the comment that perpetuate the ideas and concepts of the drafting team.

The definition of Operating Instruction introduces a "Command" as opposed to COM-002 that defines and requires identification of a "Reliability Directive", yet there is no obligation to follow a Command nor to identify the communication as containing a Command. Fatal flaw with the proposed definition. The requirement to have a protocol is likely an ok approach with an objective to achieve well understood communications and without the laundry list of things that must be in the document. Then given the RC-BA-TOP have stringent training requirements in PER-005, duplicating the requirements for good training and personnel proficiency evaluation lends itself to mandate a how to accomplish this for a specific task. In addition, the type of oversight implied in COM-003 is overreaching by NERC.

Group

Dominion

Connie Lowe

Dominion

No

Dominion requests clarification of "Command" verses "Directive". Neither "Command" nor "Directive" is defined in the NERC Glossary of Terms – some guidance/reference is needed. The word "command" seems more forceful, how does a command differ from a directive?

No

We appreciate the SDT's response to stakeholder comments in the previous draft, but still find sub-requirements R1.1, R1.2, R1.3 to be too prescriptive. We agree that these entities should mutually agree on (1) the language they will use to communicate and (2) the manner in which they will communicate time (24 hour, zone, zulu, etc). Below are some additional suggestions; Dominion also disagrees that Distribution Provider is listed as an Applicable Entity. Distribution Provider load is not

considered part of a BES Element or Facility. The SDT response to an earlier comment on this issue was that the SDT is aware of some DPs that operate BES equipment. If that is the case, then the standard should be applicable to only those DPs that operate BES Elements or Facilities – not the numerous DPs who do not. R2 should be clarified to read as follows: “For Distribution Providers, and Generator Operators that operate BES Elements shall have documented communication protocols for Operating Instructions that incorporate the following: R1.1 – In lieu of the English language requirement, Dominion recommends defining the use of a common language for verbal or written communications for Operation Instruction(s). English shall be the default language unless otherwise mandated by the entity’s document or mandated by law, regulation, or mutual agreement. Under R.1.2 and R1.1.3, It doesn’t matter (and may not be exactly clear) in what time zone the action will occur. A transmission line can cross time zone boundaries. What is important is that all operators involved have the same understanding of what is going to happen, when, and who is to do it. If a TOP that operates in two different time zones already has a protocol that establishes one zone or the other as their time standard, will they have to revise their protocol and use two different zones? Dominion would recommend the following language to read as follows: Clock-time communications shall be precise and include the following: Use of a 24-hour format or 12-hour format with AM/PM designation Specification of the applicable Time-Zone when multiple Time-Zones are covered Specification of Standard Time or Daylight Saving Time for Operating Instructions that will be implemented beyond the present/current day R1.4 – This requirement is overly redundant as it is also covered by TOP-002 R18. Under R.1.8 and R.1.9, Dominion feels this would create an unnecessary burden to document routine notifications that rely on a burst messaging system and do not have any effect on the Bulk Power System. A one-way burst messaging system is typically used to quickly inform/advise. It is designed as one-way to provide efficiency and should not be used for Operating Instructions. It would be much simpler to state that, “for the communications of Operating Instructions (regardless of the technology employed), the message must be repeated or confirmed by the recipient, and validated by the sender.” This approach focuses on “Operating Instructions” and not the technology employed. The requirement as currently written does not allow for exceptions due to routine or informative communications. (Example: NERC Alerts to the Industry based are based on severity level and do not always require receipt of message by the Registered Entity). R2 – Why not simply include DP and GOP in R1? R4 – Why not simply include DP and GOP in R3? Dominion also recommends defining 3 Part Communication in the NERC glossary as a result of this standard to help eliminate confusion. We need to have the System Operator maintain a focus on reliability through precise communications without unduly adding unnecessary requirements that create a burden without adding value. The mandatory use of Time-Zones for parties communicating within the same Time-Zone, or the use of Standard/Daylight Savings Time for current day activities adds an administrative burden with no value to reliability.

No

No, Dominion does not agree that these requirements are needed. As part of any certification to R1 and R2, we would expect the entity to perform some sort of analysis to determine whether its communication protocols meet the intent of the purpose stated for this standard. We do not believe imposing a mandatory requirement to perform this analysis inherently increases reliability.

No

For the reasons cited in the comments above

Implementation plan – page 1; Revisions or Retirements to Approved Standard – Proposed Replacement Requirement(s), states; “COM-003-1 Requirement R1 Part 1.1.1 R1. Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, and Transmission Operator shall have documented communications protocols that incorporate the following: “ Distribution Provider and Generator Operator needs to be removed, also after communications protocols, ‘for Operating Instructions’ needs to be added (to match the R1 Requirement, if accepted as written). Mapping document, Page 1; Comments, states: “R1 Each Balancing Authority, Distribution Provider, Generator Operator, Reliability Coordinator, Transmission Operator, and Transmission Owner shall have documented communications protocols that incorporate the following: [Violation Risk Factor: Low] [Time Horizon: Long-term Planning ]” Distribution Provider and Generator Operator needs to be removed. Also after communications protocols, ‘for Operating Instructions’ needs to be added (to match the R1 Requirement, if accepted as written).

The NSRF would like to thank the SDT for allowing entities to identify, assess, and correct deficiencies per R3 and R4. The proposed COM-003-1 uses the verb of "issuing" in R1.1, 1.2, 1.3, 1.4, 1.5, 1.6, and 1.8, and uses the verb of "receiving" in R1.7, 1.9, 2.1, and 2.2. Since these are real-time actions and FERC Order 693, section 532 states in part, "This will eliminate ambiguities in communications during normal, alert, and emergency conditions", The NSRF recommends that the proposed definition of Operating Instruction have the words "in Real-time" at the end of the definition. The definition of System Operator also uses the term in real time in its definition. R1.3 Some entities already have an agreed upon time zone standard such as MISO. MISO operates on Eastern Standard Time (EST) and has a business practice manual stating that. Suggest the requirement be modified to state: "that unless the operating entities already have an agreed upon operating time zone" then operations occurring across time zone boundaries should include a time-zone designation. R1.5 Naming conventions for terminal equipment can be long. For example, switch, P2ZDQEN. In a switching order, this switch name may be mentioned several times and with each communication there is a required echo. The Alpha-numeric requirement is a one-size fits all solution and is not needed in all situations. Recommend the following as an alternative to the above language; The risk of unclear communication is addressed by R1.6 and R1.7. R1.5 should be reworded to require alpha-numeric clarifiers when reissuing an Operating Instruction to resolve a misunderstanding (per R1.6). R1.4 The SDT has not made the case for the reliability benefit of the requirement for standardized names. Again, this requirement is being retired from TOP-002. "TOP-002-2a Requirement R18 on the basis that "This requirement adds no reliability benefit. Entities have existing processes that handle this issue." This requirement creates a compliance process where one is not needed. Each entity will be required to document and maintain each facility name and who is the responsible owner for the facility name. Suggest this requirement be removed. A list would be required for "every" element of the BES between entities to assure that the proper names are used in all Operating Instructions. The NSRF

does not see the reliability benefit of using this naming convention since TOP-002 is already enforceable. R.1.8 and R.1.9, The NSRF feels this would create an unnecessary burden to document routine notifications that rely on a burst messaging system and do not have any effect on the Bulk Power System. A one-way burst messaging system is typically used to quickly inform/advise. It is designed as one-way to provide efficiency and should not be used for Operating Instructions. It would be much simpler to state that, "for the communications of Operating Instructions (regardless of the technology employed), the message must be repeated or confirmed by the recipient, and validated by the sender." This approach focuses on "Operating Instructions" and not the technology employed. The requirement as currently written does not allow for exceptions due to routine or informative communications. (Example: NERC Alerts to the Industry based on severity level and do not always require receipt of message by the Registered Entity). R1.8 states in part, " When issuing an oral Operating Instruction through a one-way burst messaging system...". The NSRF does not understand how an oral Operating Instruction can be made through a one-way messaging system? Unless, the Operating Instruction was captured on an answering machine or on an un-listened to voice mail message system. The NSRF views this as an electronic source to electronic source, as explained in the "note to auditor" within the proposed RSAW states, "Communication that is generated by an electronic source to another electronic source is not to be included as "oral or written Operating Instruction". If the NSRF is correctly assuming this, then no verbal or electronic confirmation is required. Please clarify. R2. As stated in the Purpose statement, "To provide System Operators uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES." The NSRF concurs with this statement but questions why "all" DPs and GOPs are included in COM-003-1, Applicability section? The NSRF recommends that the Applicability section have 4.1.2 updated to read "For Distribution Providers, and Generator Operators that operate BES Elements shall have documented communication protocols for Operating Instructions that incorporate the following". On page 7, under Severe VSL it states: "The responsible entity did not include Parts 2.1 to 2.3 (3) of Requirement R2, in their documented communication protocols", part 2.3 does not exist, please clarify if this is to mean "part 2.2"? The NSRF recommends R3 to be updated to state: "Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement R1 in a manner that identifies, assesses, and corrects deficiencies, if any. Where the entity is identifying, assessing, and correcting deficiencies, the entity is satisfactorily performing the requirement. Justification for R3. The above rewrite requires implementing a deficiency process, which puts the focus of R3 on a deficiency process and not on implementing R1. The proposed language changes says to implement R1 and does not require a specific process for deficiencies. This is consistent with CIP standards Version 5 draft 3 and Generally Accepted Government Auditing standard strategies (the yellow book or GAGAS). The proposed second sentence provides clarity on satisfactory performance expectations in the requirement. Note this proposed language should also be applied to R4.

No

See ACES comments. Additionally, if it is determined that all of the elements need to be kept in the standard, the list of elements needs to be improved. Some of the elements are noun phrases (e.g., 1.1 and 1.2) and some are instruction statements. All elements should be noun phrases. It is grammatically improper for a list to have more than one type of phrase and, more significantly, may lead to confusion about compliance obligations. Instruction statements could be construed to require perfect performance of those elements, but that does appear to be the intent of the SDT.

<p>- We request clarification on the rationale for limiting communication protocol requirements for DPs and GOPs. We believe that the communication protocol should contain essentially the same elements regardless of the function an entity performs. Consequently, we recommend combining R1 and R2 to state: "Each responsible entity (BA, RC, TOP, DP, GOP) shall have documented communication protocols for the communication of Operating Instructions. This protocol should contain following elements: ..." - In order to improve readability we recommend that the Sub-Requirements R1.1 through R1.9 be re-arranged and grouped. For example, R1.7 and R1.9 deal with information receiving. They should be combined into one with two sub-requirements or bullets. The same can be done with R1.3, R1.6 and 1.8 which deal with issuing Operating Instructions. - Requirement 1.6: We suggest that for clarity purposes the SDT rewords the first bullet as follows: "Confirm that the recipient's response of the Operating Instruction as per R1.7 was accurate, or" - Requirement 1.9: The requirement asks the recipient to request clarification when the communication is not understood. We believe that the requirement is not measurable and as such it should be deleted. Additionally, it represents common sense because in any type of communication if one party does not understand all or part of the conversation, it is natural that he/she will ask for clarification. - Requirement 2.2: Hydro One recommends deleting this section for the same reasons mentioned in our comment for Requirement 1.9 (measurability). - It must be made clear in the requirements that functional entities can incorporate exceptions in their protocols, for example, to address emergencies. As proposed, both of these requirements are too prescriptive. The sub-requirements drill down too deeply into the communications needed to conduct system operations.</p>
No
<p>- It is unclear what identified reliability gap this Standard development project is intending to address, given the recent adoption of the new COM-002-3 along with the OC white paper on communications protocols. - Hydro One believes that, as written, the requirements are too prescriptive. We think that the SDT should concentrate and focus on specifying WHAT is required to achieve the reliability objective of the standard rather than on HOW to go about achieving such objective. With this in mind, we recommend deleting R3.1 through R3.4 and R4.1 through R4.4. Additionally, in line with our comment regarding R1 and R2 we believe that these two requirements should be combined as well. We would like to propose following wording: "Each responsible entity shall develop and implement a process for identifying and addressing deficiencies found in the adherence to the documented communication protocol specified in Requirements R1 and R2."</p>
Yes
The white paper written by the OC addressed the issues covered by this Standard.

<p>(1)We believe the drafting team has made some great strides to get this to be a useful standard for industry. The idea that we have a process for self-correction instead of self-reporting is a good concept. However, the reasons for our “No” vote is that the current wordings in the latest draft still need some changes to provide clarification. In this regard, we agree in principle with alternate language provided by NextEra (which we have modified slightly) and have also provided additional clarifying comments and recommendations. (R1) When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as an Operating Instruction, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as an Operating Instruction to the recipient. (R2) Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Instruction shall repeat, restate, rephrase or recapitulate the Operating Instruction. (R3) Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Instruction shall either: (a)Confirm that the response from the recipient of the Operating Instruction (in accordance with Requirement (R2) was accurate, or (b) Reissue the Operating Instruction to resolve any misunderstandings. (2)Along with the revised language proposed above, we request the drafting team to clarify the concept of what constitutes an Operating Instruction (or command) because the current understanding is too broad. We strongly believe that it should focus only on instructions related directly to BES reliability and which are not considered Reliability Directives covered under COM-002, and that it should not include normal or routine dispatching instructions of generators. (3)Given the revised language proposed in comment (1) above, the definition of Operating Instruction should be revised to replace the term 'System Operator' with 'Reliability Coordinator, Transmission Operator, or Balancing Authority', since these functions are the ones who will initiate the Operating Instruction. (4)"Transmission interface Element" and "Transmission interface Facility" both are not in the NERC glossary as defined terms and they need to be added to the NERC glossary or clearly defined in the standard. (5)We suggest a 24 month Implementation Plan upon approval of COM-003. This would allow Registered Entities time to develop their compliance processes. (6)We request that the drafting team consider the possibility of substituting the CIP v.5 'zero defects' language in COM-003 in order to minimize potential confusion. (7)We request that any of the "violations" shown in the VSL table on pages 7, 8, and 9 should not qualify for a high or severe level and at the most these should either be categorized as low or, but no more than, moderate level. (8)In the VSL table for R2, in the column under Severe VSL, it states that "The responsible entity did not include Parts 2.1 to 2.3 (3) of Requirement R2..." Requirement R2 does not have a Part 2.3, only 2.1 and 2.2. (9)If the drafting team retains the current language we are concerned about the prescriptive language in R1 and R2. We request that the drafting team in both R1 and R2 have the word “incorporate” changed to “consider” or “address”, thereby making the requirements less prescriptive.</p>

<p>The Operating Instruction definition is no help beyond the “existing” Operating Command definition, as the later exists neither within the NERC Glossary downloaded this morning, 9/20/2012, nor within the Clean COM-003-1 copy downloaded for final review. The proposed Operating Instruction definition would add value, were the BES Definition itself properly scoped to only those assets and functions that undoubtedly affect the reliable Operation of bulk power system. However the BES Definition is, by NERC and FERC desire and design, too broad, and so our industry must now attempt containment of compliance scope and risk within multiple standards, including COM-003-1. As a result, AECI determines this Operation Instruction definition to insufficient to responsibly exclude conversations that have little to no effect upon the BES reliability.</p>
No

AECI believes the sub-parts of this requirement to be overly prescriptive, whereas communication clarity should be the stated requirement. The sub-parts should appear only as examples of elements to be considered for improving clarity. Less is better, as evidenced by additional qualifiers already necessary to sub-requirement R1.1. (see suggested language in comment 5 below.)

Yes

This could work, were wording per concepts already suggested per questions 1 & 2 and question 5, such that the documented evidence of an effective program, precludes violations of any individual requirement. In interest of providing our industry with greater consistency in wording and format throughout future standards, AECI strongly suggests that this SDT review the current draft release of CIP Version 5's draft (for ballot), and similarly format these requirements. However please see AECI's general observations concerning COM-003-1 in comment 5 below.

No

It could be appropriate, were the expectations properly bounded similar to the wording outlined for Question 5 below.

In general, AECI believes that NERC and FERC should completely reevaluate the necessity of COM-003-1. COM-003 still appears to overreach the cited 2003 blackout recommendation #26, whereas industry-approved changes to COM-002 do meet the expectation, pertaining to verbal communication protocols: "Tighten communications protocols, especially for communications during alerts and emergencies..." However AECI also offers the following observations: 1) Recommendation #26 is hardly top of the list. (Lessons-learned is that future industry recommendations really must be careful in what they recommend for improvements, because those can and will be extrapolated into future requirements.) 2) Recommendation #26 "especially" highlights alerts and emergencies, not normal operational communications, yet the scope of COM-003 pertains to any normal communication that would alter the state of anything BES, including mundane operational conditions that have questionable effect upon the BES reliability. 3) In AECI's opinion, there is greater risk of non-compliance with this standard for the industry, than non-compliance with the NERC BOT in their insistence to move it forward. The EEI suggested wording, recited below, helps to mitigate this risk, but still at cost of additional and often unnecessary communication overhead. Specific to the wording of COM-003-1 draft, AECI does believe the direction of EEI's wording, submitted in comment response to this draft, could help the industry with mitigating some risk of non-compliance to the proposed standard. In lieu of our being able to view EEI's posted comments, we recite them below:

=====  
Begin the EEI draft as circulated in emails earlier this week=====  
R1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as an Operating Communication, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as an Operating Communication to the recipient. R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Communication shall repeat, restate, rephrase or recapitulate the Operating Communication. R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Communication shall either: • Confirm that the response from the recipient of the Operating Communication (in accordance with Requirement R2) was accurate, or • Reissue the Operating Communication to resolve any misunderstandings. R4 Absent a possible violation that resulted in (or could have resulted in) a significant risk to the Bulk Electric System, no violation of R1 or R3 and its subrequirements shall be found, provided that the Balancing Authority, Reliability Coordinator, and Transmission Operator has implemented a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R1 and R3 that: 4.1. Identifies potential deficiencies, 4.2. Assesses the deficiencies found, 4.3. Corrects the deficiencies, and 4.4. Evaluates the process based on deficiencies found external to Part 3.1 and either • implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or • demonstrates that no modification to the process is necessary to address the deficiencies. R5 Absent a possible violation that resulted in (or could have resulted in) a significant risk to the Bulk Electric System, no violation of R2 and its subrequirements shall be found, provided that the Distribution Provider and Generator Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R2 that: 5.1. Identifies potential deficiencies, 5.2 Assesses the deficiencies found, 5.3. Corrects the deficiencies, and 5.4. Evaluates the process based on deficiencies found external to Part 3.1 and either • implements modifications to the process when the evaluation determines that modification of

the process is necessary to address the deficiencies found; or · demonstrates that no modification to the process is necessary to address the deficiencies. =====End the EEI draft as circulated in emails earlier this week=====

Individual

No

The definition of the new term, "Operating Instruction," uses the NERC Glossary term "System Operator," which is defined as "An individual at a control center...whose responsibility it is to monitor and control that electric system in real time." The lack of clarity regarding what constitutes a control center leaves doubt as to which instructions would be covered by the standard. Another disagreement with the proposed definition of "Operating Instruction" is that it inappropriately imposes three-part communication for routine communications of changes of generation output. Common operating communications to and from generation plants should not be considered compliance events requiring the use of alphanumeric clarifiers. Such a requirement may shift operators' focus from providing proper information under critical situations to using the specified terms for every minor communication, distracting them rather than sharpening their concentration. The standard should specify the classes of TO/TOP-to-GOP communications that constitute compliance events, the formal designations by which such communications can be recognized, and the parties authorized to issue such commands.

No

Clarification is needed regarding what GOP procedures are to cover, ref. our comments to question #1 above.

No

There is no statement of periodicity in R4, leaving entities guessing until the time of audit regarding the criteria for sufficient review. R4 is also open-ended regarding scope, potentially requiring review of every voice communication for every plant for the audit period. Everyday communications do not merit such scrutiny, which would reduce rather than improve the attention that can be given to matters of significance. All standards (not just COM-003-1) should clearly specify pass/fail criteria and the associated evidence requirements. R4 should be split into DP and GOP sections, with the GOP requirement being: R4. Each Generator Operator shall conduct in each calendar year a review session with the operations function for registered entities, regarding the documented communication protocols specified in Requirement R2. Corrective action shall be implemented and documented for any potential deficiencies coming to light as a result of this review.

No

The VRFs and VSLs are divided into long-term planning and operation planning categories. These terms are not explained in the standard, so the difference between them is unclear. They do suggest however that, in accordance with our comment #1 above, this standard is not meant to apply to routine transmission system operator-to-plant communications.

The SDT received many comments questioning the need for the standard. They are relying on a single EPRI study that claims 19% of 400 studied switching errors (76 events) resulted from miscommunication, but this statistic is meaningless without context. Specifically: -Did any of these 76 events involve GOPs? If not, is it appropriate to make COM-003-1 applicable to these entities at all, much less for routine communications of minor importance? -How many events involved oral communication, vs. written miscommunication? Of the oral miscommunications, how many involved miscommunication between separate entities, as opposed to internal entity miscommunication? After all, internal miscommunications, which may be the vast majority of the events, will not be covered by the standard.

PJM

No

The proposal to standardize the meaning of "Operating Instruction" will likely cause more problems

than it solves. The concept of "to change or preserve the state, status..." is ambiguous enough for CEAs to still apply the requirement to virtually all verbal conversations. Such a proposed definition may help clarify what the SDT intends to address, however, by making such a common word a Glossary term potentially will result in the Industry having to redefine their own manuals and procedures in which they use the phrase "Operating Instruction". For years, system operators have dealt with operating instructions on a daily if not minute basis. To them, operating instructions are necessarily a communication to alter or preserve the state and status of the BES condition or BES Element/Facility. Having a defined term, and calling such communication a "Command" is totally unnecessary, and can confuse operators from what they understand to be the meaning of operating instructions. Any proposed standard must clearly limit the application of the communication protocol requirements to communications that impact reliability. As proposed, the standard does not do this. Based on the existing language and the proposed Defined term Operating Instruction, the scope could readily be interpreted to include numerous communications that have nothing to do with system reliability. To remedy this, the SDT should either revise the proposed term in accordance with Order 693's limited scope, or delete this term and focus the standard on reliability directives, which is in line with Order 693.

No

The SRC fully supports the concept that certain aspects of our business are better viewed based on the internal controls used by the entity. The SRC recognizes that the intention of the SDT is to be flexible. However, the nature of a standard is to eliminate that flexibility by not addressing how compliance will be monitored in the controls approach and by prescribing specific items for inclusion in the protocols. An entity is less likely to create a highly sophisticated best practice protocol if the RSAW subjects that entity to penalties for implementing that protocol. While presenters at the COM-003 Webinar presentation stated that violations are not based on implementing the steps of the protocols, the draft RSAW (dated July 2012) states: If the CEA finds in subsequent, follow up audits or other compliance monitoring activities that the same or similar deficiencies continue to occur after the entity was provided the feedback by the CEA, the CEA will seek to understand what changes the entity made to their process based on prior recommendations. If changes to the entity's process are not implemented to identify, assess and correct deficiencies, the Auditors may make a determination of possible non-compliance with Requirement 3, Part 3.4. The proposed requirements (R1 and R2) are a significant improvement from the previous postings. Requirement R1 is still too prescriptive. The elements within R1 make the requirement a checklist of rules and do not add to the reliability of the power system and do not address the reliability needs requested in Recommendation 26 and Order 693. The reliability need for clear protocols was in reference to "situational awareness" issues (i.e. when is the system in jeopardy and who makes that decision to respond - See references provided below). The reliability need was not related to common verbal mistakes. The proposed requirements do not address those needs. The SRC believes that IRO-016-1 does address those issues and needs. 2003 Blackout Report Section: Data Exchanged for Operational Reliability (pages 50-51) Voice Communications: Voice communication between control area operators and reliability is an essential part of exchanging operational data. When telemetry or electronic communications fail; some essential data values have to be manually entered into SCADA systems, state estimators, energy scheduling and accounting software, and contingency analysis systems. Direct voice contact between operators enables them to replace key data with readings from other systems' telemetry, or surmise what an appropriate value for manual replacement should be. Also when operators see spurious readings or suspicious flows, direct discussions with neighboring control centers can help avert problems like those experienced on August 14, 2003. SRC COMMENT - This is clearly focused on establishing communications where they potentially may not occur. It is not focused on prescribing particular terminology or protocols based on the belief that existing practices are inadequate. Page 109 Effectiveness of Communications Under NORMAL conditions, parties with reliability responsibility NEED TO COMMUNICATE important and prioritized information to each other in a timely way, to help preserve the integrity of the grid. This is especially important in emergencies. During emergencies, operators should be relieved of duties unrelated to preserving the grid. A common factor in several of the events described above was that information about outages occurring in one system was not provided to neighboring systems. SRC COMMENT - The above discussion is not related to terminology or repeating information. The concern focuses on the failure to provide appropriate information, which, as discussed above, as well as in Order 693, is focused on "important" and "prioritized" information. This is a limited set of communications that the proposed standard's new term Operating Instruction exceeds in scope. Pages 161-162 26. Tighten communications protocols, especially for

communications during alerts and emergencies. Upgrade communication system hardware where appropriate. NERC should work with reliability coordinators and control area operators to improve the EFFECTIVENESS of internal and external communications during alerts, emergencies, or other critical situations, and ENSURE that all key PARTIES, including state and local officials, RECEIVE timely and accurate information. NERC should task the regional councils to work together to develop communications protocols by December 31, 2004, and to assess and report on the adequacy of emergency communications systems within their regions against the protocols by that date. On August 14, 2003, reliability coordinator and control area communications REGARDING CONDITIONS in northeastern Ohio were in some cases ineffective, unprofessional, and confusing. INEFFECTIVE COMMUNICATIONS contributed to a LACK OF SITUATIONAL AWARENESS and PRECLUDED EFFECTIVE ACTIONS to prevent the cascade. Consistent application of effective communications protocols, particularly during alerts and emergencies, is essential to reliability. Standing hotline networks, or a functional equivalent, should be established for use in alerts and emergencies (as opposed to one-on-one phone calls) to ensure that all key parties are able to give and receive timely and accurate information. [SRC COMMENT: Recommendation 26 is clearly about communicating information about "conditions" and not about communicating the commands to a particular "asset". The proposed standard is unresponsive to the issues raised in the Blackout and by FERC. By not addressing the core reliability issues raised by the very report that drove this Project, the SDT is jeopardizing the reliability of the power system. The SRC strongly urges the SDT to reconsider this posting and to either rescind the Project and accept that IRO-016-1 has adequately responded to the Blackout Report, or to revise its proposal to directly address the issues noted above. If R1 is not rescinded as suggested above, then the prescriptive subparts 1.1 thru and including 1.6 should be removed.

No

The SRC fully supports the concept that functional entities' internal controls be used to monitor the effectiveness of their own protocols. The SRC suggests that any requirement to implement a plan may significantly reduce the incentives to create more effective protocols because of the Compliance uncertainty related to measuring effective internal controls. Requirement 3 requires entities to implement their process and to identify deficiencies with adherence to the protocol. The less complex a plan is the lower the number of deficiencies and therefore the lower the number of reports. Moreover, the RSAW states that the applicable entity could be found non-compliant if the entity did not follow an auditors suggested changes to remedy those deficiencies. Thus this standard would incent writing simple protocols.

No

The SRC does not agree with the VSLs of R3 and R4 . The SRC feels that it is not binary and actually fits the Requirements with Parts that Contribute Unequally to the Requirement in the VSL guideline document. While part 3.3 is the most critical, an entity would certainly not get any reliability benefit if you don't do parts 3.1 – 3.3 or 3.3 in itself, which could be a severe VSL. But if an entity performs parts 3.1 – 3.3 and does not perform part 3.4, it should not be a severe VSL because you are getting a substantial amount and majority of the reliability benefit from performing 3.1-3.3. Failure to do part 3.4 should be a high VSL perhaps, but it is not all binary. If an entity fails to do 3.2, it may be a medium only.

The SRC requests that the SDT include a milestone in the implementation plan that requires NERC and the industry to reach agreement on how internal controls will be monitored by the CEAs BEFORE this standard is effective. The SRC believes that this standard could be improved by modifying the subparts of R1 and R2 to include parts that are communication protocols directly relevant to the improving situational awareness and shortening response time. Requirements R1.1, 1.2 in theory shorten response time by providing a commonly understood language and clock format for Operating Instructions but are unnecessary in practice. The modification includes the removal of: • R1.3 as it does not improve situational awareness or shorten response time. This is such a small population of Operating Instructions and any real time Operating Instructions will be immediate. This is overly prescriptive and provides little if any reliability benefit. This is not a documented reliability concern in any investigation, FERC Order, Blackout report, etc. that the SRC is aware of. • R1.4 as it does not improve situational awareness or shorten response time. It may actually confuse entities that have established practices that may have to make changes to accommodate this requirement part. This is overly prescriptive and provides little if any reliability benefit. This is not a documented reliability concern in any investigation, FERC Order, Blackout report, etc. that the SRC is aware of. • R1.5 as it does not improve situational awareness or shorten response time. It may actually confuse entities

that have established practices that may have to make changes to accommodate this requirement part. This is overly prescriptive and provides little if any reliability benefit. This is not a documented reliability concern in any investigation, FERC Order, Blackout report, etc. that the SRC is aware of. • R1.6 and R1.7, and 2.1 as it does not improve situational awareness or shorten response time. It actually lengthens response time and does not improve situational awareness as it does not address the content of the communication. This is already addressed through COM-002-3 and will only add to confusion for entities to have a COM-003-1 requirement in the overlap it creates. This is not a documented reliability concern in any investigation, FERC Order, Blackout report, etc. that the SRC is aware of where lack of 3 part communication directly contributed to a adverse reliability impact on the BES. The NERC OC established guidelines that outline best practices for industry and are sufficient to communicate such best practices. As the drafting team has communicated in its previous white paper, a significant amount of industry already employs 3 part communication during normal and emergency situations. Requirements R1.8, 1.9, and 2.3 could shorten response time by providing a protocol for quickly disseminating information from one to multiple parties. The drafting team should craft the standard to address communication between functional entities and not within entities to properly address FERC Order and Blackout Recommendation that clearly speaks to communication protocols between entities. To not do so is expanding upon the scope of the SAR, creates confusion, and is not focusing on the reliability concerns cited in the FERC Order 693 and Blackout Report Recommendation #26. The draft RSAW introduces subjective concepts as well as a new requirement. An auditor is to: • The CEA is to ... • Understand the process .... • The CEA is to review a sample of the entity's communication activities to verify whether the entity is identifying, assessing, communicating and correcting deficiencies. If the entity had implemented corrections, the sample is to be pulled from activities conducted after any corrections to the entity's process were implemented or, if the correction had been recently implemented, the CEA is to consider the impact the correction will have when reviewing the samples. This sample size will be based on the auditor's confidence in the entity's ability to identify, assess, and correct its deficiencies. • Where the auditor ... • If an auditor cannot verify that the entity is adequately identifying [SRC: suggest changing "is" to "is not"], assessing, and correcting its own deficiencies due to limitations in its process, the auditor will not have a finding of non-compliance. The auditor will provide the entity with recommendations as necessary. If the CEA finds in subsequent, follow up audits or other compliance monitoring activities that the same or similar deficiencies continue to occur after the entity was provided the feedback by the CEA, the CEA will seek to understand what changes the entity made to their process based on prior recommendations. ["same or similar deficiencies" is subjective and opens the compliance to CEA vision of what is "similar".] New Requirement: If the CEA finds in subsequent, follow up audits or other compliance monitoring activities that the same or similar deficiencies continue to occur after the entity was provided the feedback by the CEA, the CEA will seek to understand what changes the entity made to their process based on prior recommendations. If changes to the entity's process are not implemented to identify, assess and correct deficiencies, the Auditors may make a determination of possible non-compliance with Requirement 3, Part 3.4.

Southern Company

Antonio Grayson

Operations Compliance

No

Southern does not agree with the definition of "Operating Instruction" as it continues to be too broad and encompass routine communications between System Operators and other system personnel and other functional entities. While Southern agrees that 3-part communications is a good utility practice that has been used by operating entities for many years, Southern disagrees with the broadness of "Operating Instructions" as in some of these cases, 3-part communications are not required to protect the reliability of the system. In fact, this prescriptive requirement, if used on all communications that could fall under "Operating Instructions" (i.e. very general information at times), would take System Operators time from other tasks that are more critical to maintaining reliability. Please note that there are numerous (i.e. in the millions) of conversations between operating entities each year and some important tasks could be missed or delayed if required to follow a standard script for everything. If the SDT agrees with Southern's comments related to Requirements 1 and 2, then the definition of "Operating Instruction" would be unnecessary as each operating entity would define the times when

3-part are necessary, which in Southern's case, would be broader than emergency communications and reliability directives, but not so broad that it would cover general exchange of information between operating entities.
No
Southern supports having a documented communications protocol, but we do not support the prescriptive elements of this version of the standard. The protocols should give the entity the flexibility to define the conditions where they expect 3-part communications and the verbal cues they use to tell the recipient they expect 3-part communication or that action is required. Southern suggest the following changes to R1 and R2 and could support these changes in future drafts of this new standard.
Yes
Provided that the SDT incorporate the changes suggested for R1 and R2, Southern generally agrees with the concept of implementing a process to identify and correct deficiencies without compliance exposure for each deficiency. However, this is a new concept and we do have questions as to how it will be implemented. For example, how many discrepancies would it take for an entity to identify before requiring a self report rather than waiting to present the log of deficiencies found and corrected during an audit?
Yes
While Southern agrees that 3-part communications is a good utility practice that has been used by operating entities for many years, Southern disagrees with the broadness of the types of communications the SDT is suggesting for requiring 3-part communications. In some of these cases, 3-part communications are not required to protect the reliability of the system. In fact, this prescriptive requirement, if used on all communications that could fall under "Operating Instructions" (which can be very general information at times), would take System Operators time away from other tasks that are more critical to maintaining reliability. Please note that there are numerous (i.e. in the millions) of conversations between operating entities each year and some important tasks could be missed or delayed if required to follow a standard script for everything.
Individual
No
Previous version has a description regarding Reliability Directives. This version does not address Reliability Directives and the relationship to an Operating Instruction. Is a Reliability Directive a subset of Operating Instruction? Is a "directive," as mentioned in several standards, an Operating Instruction?
No
This Standard does not address electronic Operating Instructions, thus creating a possible gap. For example, ERCOT (acting as the BA) uses ICCP links to issue electronic dispatch instructions to generators (ERCOT Protocol 6.5.7.4). The recipient of the electronic dispatch instruction must acknowledge receipt of the dispatch instruction to ERCOT electronically, within one minute and must include the receiving operator's identification with the electronic acknowledgement (ERCOT Protocol 6.5.7.8(5)). ERCOT regional rules have similar language as current NERC standards regarding compliance with dispatch instructions, which include electronic dispatch instructions (ERCOT Protocol 6.5.7.9). Consider adding "Reliability Coordinator" or "Functional Entities" in 1.1 statement where TOPs and BAs are singled out: "Transmission Operators and Balancing Authorities may use an alternate language for internal operations."
No
If a deficiency is identified and then training is provided to attempt to correct it, what happens if the same deficiency is identified again? Is the entity considered to have failed to correct its identified deficiency? Does the entity need to file a self report when the second deficiency occurs? Texas RE agrees with the premise of having a process for identifying issues, but at some point if a pattern of deficiencies continues, when does a violation occur?
No
R2 Severe VSL references "Parts 2.1 to 2.3 (3)" when a "2.3" does not exist (this issue is also in the

VRF/VSL Justification document). The VSLs for R3 and R4 say nothing about assessing and correcting identified deficiencies per 3.2, 3.3, 4.2 and 4.3.

(1) Requirements R2 and R4 should also apply to Load-Serving Entities (TOP-001-2 R1, VAR-001-3 R5), Purchasing-Selling Entities (VAR-001-3 R5), and Generator Owners (VAR-001-3 R11, VAR-002-1.1b R5) so that all entities receiving Operating Instructions are covered. For M3 and M4 the process should be included as well as results. (2) Capitalize "responsible entity" in VSL language for R1 and R2 as was done in R3 and R4. (3) RELIABILITY GAP: We believe a reliability gap exists because no standard generally requires compliance with Operating Instructions, Reliability Directives and other valid instructions. We realize this issue may be considered to be outside of the scope of this project, but we are quite concerned that reliability is compromised because operating entities can elect to ignore valid instructions for economic or other reasons, and that much more attention is being given to the form of the instructions than to requiring that they be obeyed. VRF/VSL JUSTIFICATION: (4) In the VRF/VSL Justification document there is only reference to 3 requirements in the COM-003-1 Standard (page 5). There are 4 requirements. (5) The "Low" VRF rating for R1 and R2 seems unjustified based on the following points: 1) In the VRF/VSL Justification document there is the following statement at the top of page 5: "Requirements R1, R2 and R3 were assigned a "Medium" VRF." 2) In the Rationale and Technical Justification document there is the following statement: "Because Operating Instructions affect Facilities and Elements of the Bulk Electric System, the communication of those Operating Instructions must be understood by all involved parties, especially when those communications occur between functional entities. An EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures. This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators' errors were due to communication problems." If there is not a process, would there not be more errors? 3) In the VRF/VSL Justification document there is the following statement: "In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System" and "Communication protocol and facilities" is listed. R1 and R2 attempt to address this issue. (6) In the VRF and VSL Justification document, at page 15 and page 20, the FERC VRF Guideline 3 Discussion is inconsistent with R3 and R4 language respectively (R3 and R4 do not call for "use of formal three part communication").

Individual

MidAmerican Energy supports MRO NSRF comments

No

MidAmerican has concerns that Operating Instructions as defined is too broad.

Yes

Yes

Yes

MidAmerican would recommend the following changes to R3 as a primary consideration to allow COM-003-1 to move forward. COM-003 is only acceptable as a non-zero defect standard. R3 should be rewritten as follows: Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement R1 in a manner that identifies, assesses, and corrects deficiencies if any. Where the entity is identifying, assessing, and correcting deficiencies, the entity is satisfactorily performing the requirement. Make similar changes to R4. R3 as posted requires implementing a deficiency process, which puts the focus of R3 on a deficiency process and not on implementing R1. The proposed language changes focus the requirement to implement R1 and does not require a specific process for deficiencies. This is consistent with CIP standards Version 5 draft 3 and Generally Accepted Government Auditing standard strategies (the yellow book or GAGAS). The proposed second sentence provides clarity on satisfactory performance expectations in the requirement.

Individual

Agree

We agree with and support the comments submitted by NPCC, the SRC, and ERCOT.

Individual
Yes
Yes
Yes
Yes
Yes
Puget Sound Energy appreciates the opportunity to submit comments on the proposed standard, as well as the work of the standards drafting team in developing a workable approach to the implementation of operating communication protocols. The purpose statement in the proposed standard uses the term "System Operators". As defined in the NERC Glossary, System Operators include individuals who work for Balancing Authorities, Transmission Operators, Generator Operators and Reliability Coordinators. However, the standard also applies to Distribution Providers, an entity not covered by the term System Operator. As a result, I recommend that the standard drafting team expand the purpose statement to accurately reflect the applicability of the standard. Perhaps the statement could be revised to begin "To provide individuals who may issue or receive Operating Instructions with uniform communications protocols...".

APPA, LPPC and TAPS
Allen Mosher
American Public Power Association
Yes
Yes
Yes
In response to comments received during the last comment period and in an effort to draft a standard that focuses on risk control rather than zero tolerance metrics, the drafting team has taken a new approach to COM-003-1. This version requires responsible entities to establish communication protocols and then implement a process for identifying, assessing, and correcting deficiencies with adherence to those communication protocols. This new standard is drafted such that the entity is to ensure that its process is working, rather than requiring the demonstration of absolute compliance with communication protocols at all times and identifying each deficiency as a possible violation. In addition, this version of the standard was drafted in conjunction with the development of the Reliability Standard Audit Worksheet (RSAW). The parallel development of the standard and the RSAW provided the opportunity for the drafting team to consider the compliance implications of the language in the standard and to offer input into the language of the RSAW. APPA staff, LPPC and TAPS have reviewed the proposed standard and have not identified any material concerns and support the drafting team's new approach. We of course urge the drafting team to give full consideration to all substantive comments on the proposed standard and RSAW. We do anticipate that commenters will identify editorial changes that will clarify the proposed standard. Such changes are unlikely to affect our support for the standard.

FirstEnergy
Sam Ciccone
FirstEnergy Corp.

No
Although we believe the definition is on the right track, the wording may inadvertently cover many conversations between operators and personnel that do not impact the reliable operation of the BES. We ask the team to consider clarification, examples, or inclusions/exclusions much like the new definition of BES. For instance, tasks that may involved transmission lines associated with IROLs or SOLs, and other critical tasks.
No
We support many of the protocols as a minimum to standardize communications across the industry. However, we believe some of the sub-parts of R1 contain language which may be too prescriptive and in some cases language is missing for special situations. ♣ 1.2 – We understand the importance of knowing the time of day but an operator can specify “am” or “pm” instead of using the 24 clock format. The requirement should be less prescriptive to allow this. ♣ 1.3 – This requirement as written may confuse the parties communicating. We suggest it be reworded in a simple fashion as follows: “Assure both parties understand the correct time being used in the communication.” ♣ When the receiver of an operating instruction is unable to comply they should be allowed to notify the operator of the restriction (e.g. based on safety, loss of life, or damage to equipment) so that the operator is able to implement other actions to perform the desired operation. This should be added in the language requiring three-part communication in requirements R1 and R2.
Yes
FirstEnergy supports this new concept being introduced by NERC. It allows entities to sharpen their internal controls while not being penalized for minor non-compliance situations that do not impact the BES. The only question we raise is how this will be implemented in the CEAP. The draft RSAW for COM-003-1 is silent on this issue and we ask that NERC give more guidance on it as this paradigm develops.
Yes
♣ To have clear communication protocols NERC must develop clear and concise standards that include non-prescriptive language that provides entities with the latitude to operate their systems as they are accustomed to while requiring a heightened awareness of the importance of clear communications while operating those systems. From discussions in various industry forums, there seems to be much confusion as to the intent of COM-003 versus COM-002. For instance, is a Reliability Directive as defined by the Project 2006-06 team in COM-002-3 a subset of an Operating Instruction as defined in COM-003-1? If so, then we recommend the retirement of COM-002-3 as a standard since COM-003-1 covers all communications. One standard that requires 3-part communication is sufficient and no reliability gap would exist if COM-002-3 is retired. FE and the industry want to contribute to effective reliability and believe tight standardized communication protocols are critical. But if confusion and needlessly burdensome requirements result from the development of these COM standards, we believe this could have an adverse affect on reliability. In COM-002-3, requiring an operator to pause to determine if he or she should utter the phrase “this is a Reliability Directive” can escalate an emergency situation and not help alleviate it. Regardless of the situation, when the Operator issues a command it must be carried out by the receiver with confirmation that the receiver has understood what needs to be done and when it needs to be done. COM-003-1, with some wording adjustments, accomplishes this reliability goal. We support COM-003-1 Draft 3, on its own without COM-002-3, along with some adjustment to requirement language to relieve prescriptiveness and needless language while adding some clearer guidance on the internal control requirements detailed in R3 and R4. ♣ The measures as proposed simply reiterate the requirement and provide no useful information. We suggest they either be removed or be elaborated to include useful examples of evidence and possibly incorporate some of the information found in the RSAW.
Individual

Nowhere in the Blackout Report, Order 693, nor the SAR does it indicate that communication protocols used during normal and emergency operations need to be identical - only that there are standardized communications for normal operations and standardized protocols for emergency communications. The term Operating Instruction as included in the requirements of the draft standard does not take into consideration that communications during alert or emergency conditions have a heightened need to be effective (Blackout Report Recommendation 26). A much better approach is to rely on operating personnel to determine when an Alert or Emergency condition exists to change from standardized communication used for normal operation to a different standard protocol for emergency operation. Operating personnel have substantial training requirements, including explicit requirements for training on emergency operations, which provide the basis for allowing operating personnel to make this determination. A standard phrase to identify that protocols for Alert or Emergency conditions are to be used (such as "I am issuing a Reliability Directive") would trigger the need to switch from protocols for normal operation to protocols for emergency conditions. This approach also addresses concerns that complacency will set in if identical protocols are used for normal and emergency communications. Active listening is much more likely when using a protocol that is used only for emergency conditions which occur much less frequently than normal operations.

Individual

Yes

Yes

No

The current wording necessitates creating a process to evaluate a process that evaluates protocols. We believe this is unnecessarily cumbersome and confusing. The addition of extra controls from the last version to this version lends nothing to improving reliability or improving the function of the standard. Accordingly, the NERC SC recently approved the SAR for the Paragraph 81 initiative to eliminate certain requirements from the Reliability Standards with little effect on reliability. The SAR identifies criteria to be used to identify those requirements that could easily be identified for removal. It would seem that the draft R3 and R4 would meet the criteria identified for P81. GTC recommends the deletion of R3 and R4. Alternatively, at a minimum, we suggest improvements to requirements R3 and R4 as currently drafted. We suggest changing all instances of the word "process" to "protocols" in both part 4s and also removing "found external to Part 4.1" from both part 4s. Finally we suggest removing parts 2 and 3 simply to keep the requirements from becoming redundant with the changes made to their respective part 4s.

No

The VSLs for requirements R3 and R4 are too severe. We understand that they were designated as binary, which led them to automatically be designated as severe VSLs. However, it is our position that these requirements are no more binary than requirements R1 or R2 and that their VSLs should be rewritten. We propose: Moderate VSL: The responsible entity did not include one (1) of the four (4) parts of Requirement R3 in its implementation of a process for identifying deficiencies with adherence to documented communication protocols specified in Requirement R1. High VSL: The responsible entity did not include two (2) of the four (4) parts of Requirement R3 in its implementation of a process for identifying deficiencies with adherence to documented communication protocols specified in Requirement R1. Severe VSL: The responsible entity did not include three (3) or more of the four (4) parts of Requirement R3 in its implementation of a process for identifying deficiencies with adherence to documented communication protocols specified in Requirement R1 or did not have such a process.

PPL Corporation NERC Registered Affiliates

Brent Ingebrigtsen
LG&E and KU Services
No
<p>The PPL Companies do not agree with the proposed definition of Operating Instruction as the standard appears to be focused on imposing three part communications on the industry for all normal / routine operating communications. Imposing requirements for three part communication for Operating Instructions may have the effect of elevating all communications to the state of Reliability Directive (as defined in COM-002-3). Splitting communications requirements across different standards introduces the potential of unnecessary confusion. Communications involving the changing of the state, status, output, or input of a facility, occur very frequently and potentially even more frequently on preserving the state of the system. Many of these communicated changes, in and of themselves, would not have an impact on reliability. However, there are times (examples could be during a DCS event, an SOL, or an IROL) when even seemingly insignificant changes to the system must be made promptly, although the system has not reached the level of emergency or instability. It is at these times, "when action must be taken", which the miscommunication of the action or inaction could lead to amplifying the risk to the system. Further, the focus of the standard is on operations and therefore the communications subject to the requirement should be those requiring action in the Real-time Operations Time Horizon. The definition of which is included in the NERC document located at <a href="http://www.nerc.com/files/Time_Horizons.pdf">http://www.nerc.com/files/Time_Horizons.pdf</a>. Suggest modifying the proposed definition as follows: Operating Instruction – Command, other than a Reliability Directive, from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System in which action must be taken in the Real-time Operations Time Horizon.</p>
No
<p>The PPL Companies do not agree with the proposed requirements as they are administrative in nature. Should the requirements remain, we suggest the following be considered: R.1. Each Responsible Entity shall implement, in a manner that identifies, assesses and corrects deficiencies, one or more documented communication protocols that address each of the following Requirements R1.1 through R1.3 applicable to such Responsible Entity: R1.1. When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed pursuant to an Operating Instruction, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the communication as an Operating Instruction to the recipient. R1.2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Instruction shall repeat, restate, rephrase or recapitulate the Operating Instruction. R1.3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Instruction shall either: • Confirm that the response from the recipient of the Operating Instruction (in accordance with Requirement R1.2) was accurate, or • Reissue the Operating Instruction to resolve any misunderstandings. For purposes of clarity, the term "implement" in Requirement R1 does not mean that there were no failures to follow the protocol in specific cases. The following language is suggested for the measures related the proposed R1.1 through R1.3: Measures The Responsible Entity shall have documented communications protocols developed for Requirements R1.1 through R1.3. Additional examples of evidence may include, but are not limited to, the Responsible Entity: • trained or otherwise educated the affected personnel about the protocols • established controls to identify failures to follow the protocols • assessed identified failures to follow the protocols • took appropriate actions to correct the identified failures</p>
No
<p>The PPL Companies agree with the concept of internal controls and/or the elimination of zero defect requirements. However, the concept of internal controls to identify, assess, and correct deficiencies related to documented communications protocols should be imbedded in R1 as proposed in our response to question 2. We do not agree with the specific details in the internal controls/elimination of zero defect language that is currently included in R3.1 – R3.4 and R4.1 – R4.4. Incorporating the new language proposed by the PPL Companies in R1 makes COM-003 more consistent with the approach being followed in the NERC CIP Version 5 standards. The added language proposed by the SDT in R3 and R4 creates uncertainty as to whether COM-003 is imposing greater requirements than CIP Version 5 regarding identifying, assessing, and correcting deficiencies and the documentary evidence</p>

that is required.

It appears the SDT may be basing the perceived need for communication protocols during normal operations on a misunderstanding of the findings in an EPRI report. The SDT responded to multiple comments questioning the need for communication requirements during normal operations by quoting a paper (Bilke, T., Cause and prevention of human error in electric utility operations, Colorado State University, 1998) that cited an EPRI study. The SDT stated, "[w]e believe the more relevant and significant conclusion to be that, of 400 switching mishaps, 19% were caused [by] communication failures." It is concerning that the SDT may be basing their conclusions on erroneous data. The EPRI report in fact indicates only 14.5% were "cited" as "faulty communication", not necessarily "due to" or "caused" as the SDT response would indicate. Nearly half of those 58 (14.5%) of the 399 incidents reviewed resulted from most commonly not communicating "critical information", i.e. failing to "call in" or communicate in the first place. The EPRI report reads as follows: "Faulty communications were cited [emphasis on "cited"] in 58 (14.5%) of the 399 incidents reviewed. The most common kind of communication error was failure to communicate critical information, which occurred in 22 (39%) of the 58 cases. Examples are: failure to conduct a thorough pre-job briefing, failure to call in before operating a switch, failure to communicate about equipment problems, or failure to question some unusual aspect of an order. " Mandating "how" communications occur will not address the failure of "what" critical information needs to be communicated. Furthermore, it is concerning that the SDT "believes that the potential for risk" necessitates requirements applicable to all operating communications as stated in their response to comments during draft 2. It is impossible to eliminate the potential for risk in all circumstances. What is important is that the SDT assess risk to the BES as a result of certain actions or inactions and that the Reliability Standard reduce that risk in an efficient and cost effective manner.

Yes

we commend the SDT for doing a good job of writing a difficult standard and avoiding the "zero-defect" problem (the problem of just having just one violation in tens of thousands be punishable by fines) and we support the approach taken. If we think of managing operations, we think of the process: Step 1 - Vision, goals, policies - what do we want to accomplish? Step 2 - Protocols, plans, procedures, programs, processes, methodologies - how will we do it and who will do what? Step 3 - Do it Step 4 - Measure, monitor - did we accomplish what we set out to do? Step 5 - Learn, adjust, back to 1. The problem with the prior draft of COM-003, before this latest draft, is that the standard essentially micromanaged industry by causing auditors to monitor actual communications, e.g., the auditors would be doing step 4, which ends up with the zero-defect problem. We have seen other standards that have this zero defect problem, e.g., PRC-005 has a requirement for step 2 of the process above, to have a program, and then for step 3 of the process, to do it in accordance with the program, which results in the zero-defect problem. We've seen still other standards avoid the zero defect problem by only requiring step 2, but with no requirement to actually do it, e.g., the currently enforceable CIP-001 has requirements for step 2 of the process above for sabotage reporting procedures, but, has no requirement to actually follow those procedures if a sabotage event occurs, which leaves questions of accountability. The SDT for COM-003 is doing the appropriate thing and backing up one level to measure how effectively we are managing our own operations, and this is the first time I've seen a standard developed in this clever fashion of developing requirements for Step 2 (protocols) and Steps 4 & 5 (measure, monitor, learn, adjust) of the process above, but not Step 3 of the process. However, Step 3 would need to be performed for the entity to comply with Steps 4&5, meaning we are still accountable for "doing it". The method that the SDT is using to ensure we have

the appropriate operations management mechanisms in place seems a clever and pragmatic approach. We have one suggestion to improve R3. R3 requires entities to "implement" a process for identifying deficiencies. Use of the word "implement" implies that all deficiencies must be identified, which means that the auditors would need to independently identify deficiencies and compare notes, which reintroduces the "zero-defect" problem. FMPA recommends replacing "implement" with "institute".

The RSAW seems to re-introduce the "zero-defect" problem by directing auditors to sample actual recordings of communications to see if the entity identified all deficiencies. The RSAW ought to be changed to get away from sampling actual voice communications altogether and simply review the evidence of the entity doing its own internal monitoring. For instance, the entity might decide to randomly sample a few hours a month itself and identify deficiencies in those hours, that should be the only voice recorded evidence required and not any other hours that the entity did not randomly sample. In addition, the evidence for correction of deficiencies is not more voice recordings, but rather evidence of revised protocols, processes, procedures, or evidence of disciplinary action. So, FMPA believes the RSAW needs a lot of work.

Individual

No

We believe this is a standard that requires procedures or documents but has nothing to do with performance. These types of standards lead to auditors making a wide range of interpretations.

This is an attempt to make a requirement for 3 way communication for all operating communications. Not all operating conversations avail themselves to that format. The concept is good but allowances must be made for other situations.

Individual

See comments under question # 5.

Yes

Yes

Xcel Energy feels this new draft of COM-003-1 is greatly improved than prior versions. We are especially in favor of the internal controls approach the team has taken. However, while we have identified several areas of concern with this latest draft, our issue with R1.5 is the single item that is preventing us from voting affirmative. As indicated in our previous comments, our issue is that we do not believe alpha-numeric identifiers should be required for all oral Operating Instructions. Instead, we feel this should be an optional tool that the operator may use where clarity in the Operating Instruction is needed or anticipated. (For example, the operator may use alpha-numeric clarifiers to restate the original Operating Instruction, when it was apparent from the receiver's repeat back that the details of the Operating Instruction were not accurately understood.) Below are additional issues and modifications Xcel Energy would like to see addressed: 1) Since a Distribution Provider may issue Operating Instructions that would impact the BES, we feel they should be added to the applicability under R1 and R3. 2) We recommend that the term "functional entities" be capitalized in R1.1, and a reference added to Section A4 of the standard. This way it is clear that the term includes all entities under the standard (Section 4) and not just the entities under R1.

Individual

No

The definition of "System Operator" includes BA, RC, TOP, and GOP. Because GOP is included the definition, "System Operator" should be replaced by "Balancing Authority, Reliability Coordinator, or Transmission Operator." See also Project 2010-16: Definition of System Operator.

No

There should not be a requirement for entities in R1 and R2 to have documented communications protocols. The subparts specify the protocol requirements. R1 should merely state: "Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall use the following communication protocols for Operating Instructions:" R2 should be similar involving DP and GOP functions

No

These questions apply equally to R3 and R4. In R4.1, what is a "potential" deficiency? In R4.3, how can one correct a deficiency since that happened in the past? In R4.4, how does one evaluate the process based on deficiencies identified that are "external to Part 4.1"? (Part 4.1 is the process for identifying deficiencies.) We are also concerned about the draft RSAW for R3 and R4. The RSAW has two bullets for R3 and R4. One states "Where the auditor can verify that the entity is identifying, assessing, and correcting its own deficiencies, the auditor will not have a finding of non-compliance." The second bullet states "If an auditor cannot verify that the entity is adequately identifying, assessing, and correcting its own deficiencies due to limitations in its process, the auditor will not have a finding of non-compliance." The auditor will provide the entity with recommendations as necessary." Per the RSAW for R3 or R4, how will an auditor verify that an entity is not "adequately identifying, assessing, and correcting its own deficiencies due to limitations in its process"? In other words, what evidence will be required by the auditor, and how many months of communications records should be kept? Because of the volume of communications, sampling may be required. Unless one listens to 100% of communications recording, one cannot be sure one is identifying all deficiencies. Is 100% deficiency detection the goal? Furthermore, M3 or M4, which only require the entity to provide the results of its process in R3 and R4, are not mentioned in the RSAW. Measures are supposed to represent one acceptable form of compliance and should be acceptable in the RSAW. Finally, if R1 and R2 are changed as recommended in #2 above (i.e., remove the requirement for an entity to have documented communications protocols and just require it to adhere to protocols in R1 and R2), incidents of non-compliance with the protocols will be detected via R3 and R4. We first recommend that M1 and M3 have the same measures – M1 and M2 would both read "Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide the results of its process developed for Requirement R3." The same would apply for M2 and M4, which would both read "Each Distribution Provider and Generator Operator shall provide the results of its process developed for Requirement R4." If this were done, the draft RSAWs two bullets discussed should have these phrases modified for R3 and R4, with the modification shown in capital letters: • In R3, modify "the auditor will not have a finding of non-compliance FOR EITHER R1 OR R3" in two bullets. • In R4, modify "the auditor will not have a finding of non-compliance FOR EITHER R2 OR R4" in two bullets.

We did not evaluate these.

PSEG fully supports the use of 3-part communications. In our previous comments, we stated "This standard (COM-003-1) should be combined with COM-002-3 and issued as one standard to require ONE 3-part communications protocol for both Reliability Directives and non-Reliability Directives." We reiterate that request and believe that the SDTs should be combined into a single SDT and develop one standard. COM-002-3 addresses Reliability Directive communications, while COM-003-1 addresses Operating Instructions communications. The same Registered Entities are subject to both standards. Both require 3-part communications (a "protocol"), but COM-003-1 has more extensive requirements. Having two standards is harmful for these reasons: • The lack of a common protocol would result in communications confusion among these entities for this reason: some Operating Instructions are Reliability Directives, but not all Reliability Directives are Operating Instructions. • Finally, without a common communications protocol, entities would need to be concerned about what protocol they are using for compliance purposes; this would hinder the efficiency of communications and therefore reliability. The single SDT should be charged with the following tasks: 1. Both draft standards have pluses and minuses listed below, and the SDT shall consider these and take the best from each to develop a single standard with a common protocol. a. Both standards require 3-part communications (a "protocol"), but COM-003-1 has more extensive requirements, such as the use of alpha-numeric clarifiers and a 24-hour clock format. [PSEG prefers the COM-002-1 simplified protocol.] b. Reliability Directive communications need to be identified as such by the sender as part of its protocol; Operating Instructions do not contain a similar requirement. [PSEG prefers that both

Reliability Directives and Operating Instructions be identified by the sender.] c. The protocol for Operating Instructions explicitly addresses both written and oral communications; the protocol for Reliability Directives is not specific. [If identified as such by the sender, PSEG does not object to written and oral communications being addressed in a single standard; however, only oral communications should require the use of 3-part communications.] d. The protocol for Operating Instructions exempts "one-way burst messaging" from a requirement for 3-part communications with one practical exception – the receivers must request clarification from the sender if the communication is not understood; the protocol for Reliability Directives does not address explicitly exempt such communications, implying that 3-part communications is required for them. [PSEG prefers the "one-way burst" language in COM-003-1 for both Reliability Directives and Operating Instructions.] e. The Operating Instructions protocol must be separately documented by each entity; no such documentation is required for Reliability Directives. If documentation is required in a posted standard developed by the SDT, the SDT shall explain the reliability benefits of documentation and why the protocols in the standard, which are themselves communications performance requirements, are insufficient as "documentation." [PSEG prefers no documentation of protocols since they are performance requirements in the standard.] 2. COM-003-1 requires a process for identifying and correcting deficiencies." COM-002-3 does not. [Instead of the COM-003-1 language, PSEG prefers a requirement that adopts the CIP version 5 language: "R#. Each applicable entity shall have a process that identifies, assesses, and corrects deficiencies in the use of communication protocol." ] 3. The SDT shall describe the potential measure or criteria for success for determining the successful implementation of the single standard. 4. "Generator Operator" is included the Glossary definition of "System Operator," which in turn is used in the Operating Instruction definition. "System Operator" shall be replaced by "Balancing Authority, Reliability Coordinator, or Transmission Operator" in the Operating Instruction definition. Generator Operators receive Operating Instructions but do not issue them. See also Project 2010-16: Definition of System Operator – the goal of this project is to remove Generator Operator from the definition of System Operator. (The Standards Committee should consider increasing the priority of this project so that this problem is addressed systematically in the System Operator definition.)

Individual

Yes

No

This requirement will be burdensome to small Distribution Providers where communications from a System Operator will not ever occur. Requiring entities to prepare for nonexistent reliability gaps is not acceptable. DPs should be allowed to document via RC, TO, and BA letters of agreement that establishes System Operator communication protocol is not required. These small DPs can only shed load in a reliability emergency, and in some cases would need to do so manually. Further, such load would be more effectively dropped by the TOP functioning as the DP's Transmission Service Provider.

No

See response to question two.

Individual

No

We can accept the definition but want to bring to the attention of the Drafting Team that the description of OI in the Background section of the Comment form, "Operating Instructions more accurately define the broad class of communications that deal with changing or altering the state of the BES", does not agree with the Definition being balloted. The inclusion of the phrase "or preserve" changes the definition. Nowhere in the discussion of the need for Operating Instructions or communication protocols is there discussion of or justification for including the "or preserve" statement. Exelon can support the modified definition but we believe it will cause entities to oppose this standard at ballot and create confusion when implementing controls and auditing to the modified definition.

No
Exelon agrees with all requirements except R1.1.3 and R1.1.4. We disagree that R1.1.3, "include time zones" when issuing operating instructions is necessary. Operating instructions are typically issued in real time; an instruction to do something "now" or at the "top of the hour" does not require the use of time zones. R1.1.4 has the effect of requiring verbatim use of a specified name; this should not be a requirement as long as the transmitter and receiver use three way communications effectively to assure understanding of the element to be operated. Additionally, TOP-002-R18 already requires use of "uniform line identifiers when referring to transmission facilities of an interconnected network". The statement to use the TO specified name or a mutually agreed to name is not necessary in light of TOP-002.
Yes
Exelon agrees with the proposed requirement but thinks it could be improved before final adoption. The Requirement as written is confusing. For example, R3 is to identify deficiencies with respect to the entities protocols. R3.1 addresses "potential" deficiencies. It is unclear what a potential deficiency is. We suggest using deviations from the entities protocol in place of deficiencies or potential deficiencies. Similarly we question how an entity will demonstrate that modifications to their program are not required in light of the assessment being done in response to deviations from the protocol. We believe R3.4 should be clarified. We believe its purpose is to direct an entity to take action if an external entity (auditor) identifies a deviation from the entity protocol. We do not think the response to identifying a deviation / deficiency should vary based on how it was identified. Once identified (R3.1), a deviation / deficiency should be assessed (3.2) Corrected (3.3) and when necessary (3.4) the program should be modified to account for the deficiency. Since a similar effort to utilize an internal controls approach is underway in the CIP Version 5 drafting, it may be valuable for COM-003 to also utilize the same language of "in a manner that identifies, assesses, and corrects deficiencies." Exelon supports the effort to utilize an internal controls approach but remains concerned compliance auditing and the potential for interpretations related to the requirement. We urge NERC, in collaboration with the Regional Entities to develop a clear roll out plan prior to implementation of COM-003 so that stakeholders and auditors understand the compliance obligations for this new approach.
We would like to point out that the OI definition includes another defined term, "System Operator". In the Glossary, this is defined as is an individual at a control center, including a Generator Operator. Control center is not currently defined but has a proposed definition in CIP version 5 that puts limits on which generator operators (# of units) work in "control centers". If approved as part of CIP version 5, this definition of Control Center is likely to cause confusion when applying this and other standards. Will OI apply to all Generator Operators or just those working in "Control Centers" as defined by CIP ver 5. In spite of our concerns with the current draft, Exelon intends to vote affirmative on this ballot for COM-003. Significant improvements have been made but there is opportunity to make additional changes before the final ballot.

No
We suggest changing 'command' to 'order'. The definition would then read 'An order from a System Operator...'
No
The wording in R2.1 is awkward, we suggest the following: When receiving an oral two party, person-to-person Operating Instruction, the recipient is required to repeat, restate, rephrase, or recapitulate the Operating Instruction. The one-way burst messaging in R1.9 and R2.2 is confusing to us in that we don't understand how you request clarification over a one-way messaging system. As written there is no 'out' for an entity that cannot perform the Operating Instruction as given. An entity has the option of not performing a Reliability Directive if that directive violates regulatory, safety, equipment, or statutory requirements (TOP-001, R3). A similar exemption needs to be incorporated

into COM-003.
No
Delete 'potential' in R3.1 and R4.1.
No
The Severe VSL for R2 contains a typo and should be reworded to read: 'The responsible entity did not include Parts 2.1 to 2.2 of Requirement 2...' We would suggest that the VRFs for R3 and R4 be reduced to Low. The VRFs for R1 and R2 are Low. R3 and R4 are processes that monitor R1 and R2; therefore, they should not be treated more severely than R1 and R2.
The processes outlined in R3 and R4 would be sufficient in themselves but with the requirements of PER-005 regarding identifying gaps and training to eliminate those gaps, it would appear that R3 and R4 add unnecessary duplication. Why do we need to have the same requirements in two different standards? Do some of the issues that are being addressed in the Paragraph 81 project come into play here? Given the approval of COM-002-3 which places requirements on the DP and GOP when receiving a Reliability Directive, there appears to be the possibility of confusion regarding specific requirements on the DP and GOP in COM-003. During the COM-003 webinar, the comment was made that if COM-003 is approved, there may be a new project that would attempt to more efficiently coordinate the two standards. We would be supportive of that effort. The papers referenced in the Rationale and Technical Justification document supporting the need for this standard should be made available for review if the drafting team is using them as support for the justification for COM-003.
Individual
No
NERC defines the term "System Operator" as "an individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time." NERC does NOT define a "control center" which could be problematic when it comes to how an entity views a control center and how an auditor defines a control center. IMPA believes that there is too much ambiguity when using the words "to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System." IMPA recommends that the entity giving the Operating Instruction declares it to be one which eliminates many potential problems of applying a definition of an Operating Instruction. The receiver of the Operating Instruction immediately knows what the following instructions will be and will know to apply the proper communication protocol instead of trying to figure out if the definition of Operation Instruction applies to what the entity just said.
No
IMPA believes it should be made clear that Operating Instructions and the use of documented communication protocols are required by these two requirements for when Operating Instructions are given by a Balancing Authority, Reliability Coordinator, or Transmission Operator to a Distribution Provider or Generator Operator. The current requirements could apply to a generator station (Generator Operator) who receives Operating Instructions from its Market Operations (also the same Generator Operator entity). The Market Operations would not need to follow the communication protocol since it is issuing the Operating Instructions, but the generator station would have to follow the communication protocol since it is receiving the Operating Instruction. IMPA does not believe that the SDT intended to include communications between a Generator Operator's Market Operations and its remote power plant.
No
IMPA recommends adding clarification to the words "deficiencies found external to Part 3.1 (4.1)" so that entities and auditors know that these requirements allow deficiencies found outside of the entity's process including deficiencies that had previously passed the entity's process) will be able to go through the entity's process of assessing and correcting without the auditor giving a finding of non-compliance, since the entity itself failed to identify the potential deficiency in R3.1. or R4.1. The clarity can be added in the standard itself or in the RSAW- it currently is not stated in the standard and it is especially absent in the RSAW under Section 2 on page 4 of 5 or Section 2 page 5 of 5. It is also not clear how many times an entity will be allowed to identify, assess, and correct the same deficiency or similar deficiencies before an auditor can find an entity in non-compliance with R3 and R4 (including subrequirements of each). It appears that the SDT is saying that as long as an entity is

making the changes provided in the feedback by the CEA to its process to identify, assess and correct that it will not be found non-compliant for all same or similar deficiencies that continue to occur – there is no set number as long as the entity is trying to improve its process or communication protocols, is this correct? If so, IMPA supports this practice and would like to see clarity added.

no comment

IMPA believes the best quality of evidence for proving compliance to most of the sub-requirements under R1 and for requirement 2.1 will be voice recordings. IMPA agrees with keeping this evidence for 90 days, but to keep these voice recordings for potential 6 years (back to our last audit date) will be very costly when it comes to storage. We understand that other evidence can be used to show compliance back to our last audit date, but what other quality evidence besides voice recordings will be acceptable to prove compliance to these requirements? IMPA recommends making the data retention of this standard just 90 days regardless of the last audit date. Performance should be focused on the short past time of 90 days and not what the entity did five or six years ago, which is irrelevant when one is forward looking or wanting to improve.

Individual

No

MISO believes that the proposed definition of “Operating Instruction” is overly broad and ambiguous. System Operators engage in thousands of communications each year. Many of these are geared toward confirming system conditions, data, or information and/or gathering information in anticipation of responding to conditions observed on the Bulk Electric System. The definition’s breadth and ambiguity are likely to give System Operators pause before they engage in necessary communications to determine whether or not such communications would be Operating Instructions. This would delay necessary information and data gathering by System Operators, which delay would likely be detrimental to the reliability of the BES. Conversely, to avoid confusion regarding which communications are Operating Instructions and to avoid potential delays, System Operators may opt to treat, as Operating Instructions, all or many communications that should not fall within the scope of this definition, resulting in every communication being subject to this standard. Under either scenario, because of the System Operators’ caution and desire to avoid possible penalization by NERC and FERC, the net effect of this definition is detrimental to the reliability of the BES. Further, because of delays in issuing or initiating communications, there is significant potential that penalty exposure from other NERC Reliability Standards (in addition to that identified in the COM-003-1 Reliability Standard, e.g., resulting from a deficiency in implementing or failing to implement specified protocols and/or three-way communication, a deficiency in the review process, which is now significantly expanded beyond that envisioned during the drafting of this standard) could be increased. Accordingly, System Operators are likely to apply the protocols applicable to Operating Instructions under R1 of COM-003 to all communications, whether or not they qualify as Operating Instructions. This result would be overly burdensome, and its inefficiency could hamper System Operators’ ability to perform their necessary reliability functions. As a result, MISO does not support the proposed definition of Operating Instruction at this time.

No

MISO does not agree with the proposed requirements of COM-003-1, R1 and R2. Although MISO agrees that clear communications are important to system reliability, it respectfully submits that any requirement for System Operators to have a communication protocol should allow the subject System Operators to define when and how the protocol would apply. In addition, MISO respectfully submits that System Operators should retain greater flexibility in deciding which elements to include in their respective protocols. For instance, the protocols should allow the System Operator to outline how and when to use blast calls and messaging systems. Thus, despite its conceptual support for a communication protocol for System Operators, MISO is concerned that the requirements currently set forth in COM-003-1 are, in many cases, overly-prescriptive, and, rather than enhancing system reliability, could actually undermine it. As explained above, because the definition of the term “Operating Instruction” is overly broad and ambiguous, System Operators may treat most, if not all, communications as Operating Instructions. Applying the required elements of the communication protocols for Operating Instructions to most communications would be inefficient and could adversely affect the ability of System Operators to perform their reliability functions. Indeed, while MISO agrees that clear communications in system operations are important, an excessive reliance on the three-

way communications protocols detailed in the proposed standard can be an unnecessary distraction for personnel operating the Bulk Electric System, hampering as opposed to enhancing overall system reliability. MISO's primary point of disagreement with the current Standard is therefore one of scope. MISO recommends that the SDT replace "Operating Instruction" with the existing proposed definition for the term "Reliability Directive" in Project 2006-06, Reliability Coordination. Limiting the scope of applicability for utilization of the communication protocol required by COM-003-1, R1 and R2 would prevent System Operators from applying the communication protocol to virtually all communications out of an abundance of caution and, unlike the current draft of COM-003-1, would not be an undue distraction from the reliability functions performed by these operators. Further, as explained in its comments on Draft 2 of COM-003, MISO does not support including certain of the proposed required elements in the communication protocol for Operating Instructions and does not believe these issues have been sufficiently addressed by Draft 3. First, MISO does not agree with the proposed requirement to indicate time zone and Standard or Daylight Saving Time when issuing an oral or written Operating Instruction between functional entities in different time zones. This requirement would result in the expenditure of significant time, resources and attention by System Operators for a minimal benefit to reliability. Accordingly, this modification appears to place upon operators an unjustified, onerous requirement. MISO respectfully requests that the SDT reconsider this requirement. Second, MISO continues to believe that the requirement to use alpha-numeric clarifiers when issuing Operating Instructions to or Facilities and Elements in instances where the nomenclature of Facilities or Elements is in alpha-numeric format is ambiguous and could lead to unintended compliance burdens. MISO respectfully submits that if alpha-numeric clarifiers are to be required, NERC should adopt a uniform set of clarifiers to ensure that all System Operators communicate efficiently and effectively. However, MISO reiterates its belief that mandating the use of alpha-numeric clarifiers will have, at most, a minimally beneficial impact on reliability while requiring Registered Entities to expend substantial additional resources. Finally, MISO disagrees with the proposed requirement that Operating Instructions reference the name specified by the owner for a Transmission interface Element or Transmission interface Facility. To date, System Operators have identified equipment by to/from station and voltage level. Such identification has been sufficient to ensure the accurate identification of Transmission interface Elements and Facilities. Additionally, MISO notes that internal identifiers utilized by owners may result from internal coding or naming conventions that would not be known by or comprehensible to external entities. Hence, MISO cannot support this requirement, based on the potential adverse impacts to reliability that could result.

No

MISO respectfully submits that COM-003-1, R3 and R4 require clarification in two regards. MISO first notes that requirements R3.4 and R4.4, which require Registered Entities to evaluate "the process based on deficiencies found external to [R3.1/R4.1]," are written in a confusing manner. More specifically, it is not clear what the phrase "found external to" means and, therefore, Registered Entities cannot know or understand when their compliance obligations under these requirements are applicable. In addition, MISO respectfully submits that the SDT must add clarifying language to COM-003-1 to clarify that an individual failure to execute elements of a System Operator's communication protocol is not, on its own, a compliance violation, provided that the System Operator evaluates adherence to its protocol as required by Requirements R3 and R4. MISO is concerned that the current draft of COM-003-1 could give rise to double penalties for individual failures to execute one of the elements of a communication protocol. Without clarifying language in the Reliability Standard itself, any Registered Entity that fails to adhere to its communication protocol required by COM-003-1, R1 and R2 would likely self-report this failure, and would subsequently complete a mitigation plan that addresses -- and implements new processes to prevent the repetition of -- the failure. An additional requirement to evaluate adherence to the communication protocol would be redundant and would not increase or bolster reliability -- and, further, would only increase the potential for Registered Entities to violate yet another requirement of a Reliability Standard. Thus, unless COM-003-1 is revised to clarify that a Registered Entity's failure to implement an element of its communication protocol for Operating Instructions is not a compliance violation in and of itself and, therefore, is not subject to self-reporting under NERC and Regional Entities Compliance Monitoring and Enforcement Program ("CMEP"), MISO cannot support proposed Requirements R3 and R4 at this time.

No

MISO appreciates the changes that the SDT has made to the VRFs and VSLs in response to comments and to ensure that the VRFs and VSLs are consistent with FERC and NERC guidelines. However, MISO

cannot support either the VRF or the VSLs for R3 and R4 as it does not agree: (1) that there is a direct impact on reliability that results from an entity's internal self-assessment and (2) with the expressed rationale. Further, MISO notes that COM-003-1, R3 and R4, primarily require internal administrative processes or documentation thereof. MISO respectfully submits that internal administrative processes have not previously been linked to direct impacts on the reliability of the BES.

The RSAW states that the applicable entity could be found non-compliant if the entity did not follow an auditor's suggested changes to remedy those deficiencies. This requirement is not found in COM-003-1 itself, and the RSAW therefore includes requirements that are beyond the scope of the Standard it supports. The draft RSAW also introduces subjective concepts that place uncontrolled discretion in the hands of auditors. For instance, the RSAW states that the size of the sample of the entity's communication activities reviewed to verify whether the entity is identifying, assessing, communicating and correcting deficiencies "will be based on the auditor's confidence in the entity's ability to identify, assess, and correct its deficiencies." MISO submits that sample size should be determined mathematically and in a manner that can itself be audited. Indeed, NERC's own Sampling Methodology Guidelines and Criteria states that "Statistical sampling helps ensure a high confidence level of compliance for the larger population of documents when a smaller population is statistically sampled . . . Statistical sampling should be employed when auditing all processes, procedures and any documentation-related evidence (documents, logs, voice recordings, etc.) when a sample is required because the entire population cannot be audited." Allowing an auditor to determine sample size based on an abstract concept such as confidence is contrary to NERC's own sampling methodology; would prevent Registered Entities from challenging such sample sizes; and could allow auditors to make such decisions punitively.

Jamison Dye

Transmission Reliability Program

Yes

No

In R1.5, BPA disagrees with the mandatory use of alpha numeric communication protocols for internal communications. BPA believes that these communication protocols should apply only to external communications between system operators for the TOP, GOP, and BA. BPA suggests that the drafting team update R1.5 to specify that "Transmission Operators and Balancing Authorities may adopt methods other than alpha-numeric clarifiers to ensure accurate communication of Operating Instructions for internal operations." BPA suggests that R1.1 should be modified to make clear that the use of English should be mandated for communications between entities in separate regions where the common language in one of the regions may not be English. In response to Draft 2, Essential Power LLC commented that "The use of English should be mandated for communications between entities in separate regions where the common language in one of the regions may not be English. Allowing an entity to use a language other than English when communicating with regions where English is the required language is counter to the purpose of the Standard and could in fact jeopardize reliability through miscommunication." The SDT stated that it "agreed with (Essential Power, LLC's) comments (shown below) and clarifies that is the intent of the requirement", but this intent is not clear in the requirement as written because it does not specify that the language mandate needs to apply to both entities. Additionally, there is no expressed limitation that the language(s) acceptable in these circumstances be limited to only the language(s) specified by such law or regulation. To resolve these issues, we propose that COM-003-1 R1.1 be modified to read as follows: Use of the English language when issuing an oral or written Operating Instruction between functional entities, unless another language is mandated by law or regulation FOR BOTH ENTITIES; IN WHICH CASE, ACCCEPTIBLE USE IS EXPANDED TO INCLUDE THOSE SPECIFIED LANGUAGES. Transmission Operators and Balancing Authorities may use an alternate language for internal operations.

No

BPA supports the move to the identify, assess, and correct deficiencies approach that eliminates the

need for the entity to report each deficiency as a potential violation. BPA believes that based on the current R1 and R2, it is not reasonable to expect entities to review all communications in order to be compliant with R3 and R4. BPA suggests that the drafting team update R3.1 and R4.1 to state that entities shall implement a process that "identifies potential deficiencies through sampling".

No

BPA does not agree with the VRFs and VSLs. R3 & R4 should include a range of VSLs. A documentation error such as a failure to record that modification of a process was not necessary would not merit a severe VSL if training was implemented as an appropriate solution to an identified deficiency.

Individual

No

No

Operating Instructions are issued in real time and are expected to be implemented promptly. Including the "time zone" in oral communications is not necessary. COM-003 and COM-002 need to fully coordinate.

Individual

No

ERCOT agrees with the SRC comments, and has these additional comments: As proposed, the term "Operating Instruction" could include communications that have nothing to do with reliability – e.g. communications that are market related and have no impact on system reliability. That outcome is inconsistent with FERC’s direction in Order No. 693. FERC’s discussion of this issue in Order 693 focuses on alerts and emergencies - "We adopt our proposal to require the ERO to establish tightened communication protocols, especially for communications during alerts and emergencies..." (693 at P 531) "Accordingly, we direct the ERO to either modify COM-002-2 or develop a new Reliability Standard that requires tightened communications protocols, especially for communications during alerts and emergencies." (693 at P 535) In addition, the scope of FERC’s concerns is limited to communications that impact the reliability of the BPS – "We note that the ERO’s response to the Staff Preliminary Assessment supports the need to develop additional Reliability Standards addressing consistent communications protocols among personnel responsible for the reliability of the Bulk-Power System." (693 at P 531) "...we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System." (693 at P 532) Simply because FERC noted the benefits to communications during normal conditions does not mean the standard has to apply to those circumstances. All FERC said was that implementing consistent protocols will likely provide benefits across all operating conditions. The focus of the concern was clearly alerts and emergencies, and limiting the application of the standard to those conditions will provide benefits to relevant communications during normal conditions. However, as written, the standard is overbroad and inconsistent with the Commission’s directives in Order 693. Consistent with this discussion, the IRC believes the most effective way to remedy this issue is to eliminate the proposed term and focus the standard on conditions that actually have a reliability impact. This can be achieved focusing the requirements on Reliability Directives.

No

The overarching premise of NERC standards is that they typically establish the "what" and not the "how" (Order 672 at P 260). The proposal to mandate specific communication protocols contravenes that approach and undermines the value inherent therein. Allowing entities to establish their own protocols to meet a desired end result facilitates means that best suit particular entities and also allows for improvements based on experience. Prescribing specific protocols would preclude such benefits. The proposed requirements are better suited as non-binding illustrative approaches / best

practices. These could be presented as suggested approaches, for example, in an attachment to a standard that establishes a general requirement to have communication protocols in place, but they should not be mandated. FERC did state that in some cases it may be appropriate to prescribe specific implementation rules in the standards if the how is inextricably linked to the standard and may need to be specified by the ERO to ensure the enforcement of the Reliability Standard. The Commission went on to note that for some standards leaving out implementation features could: (1) sacrifice necessary uniformity in implementation of the Reliability Standard; (2) create uncertainty for the entity that has to follow the Reliability Standard; (3) make enforcement difficult; and (4) increase the complexity of the Commission's oversight and review process. None of these conditions apply to communication protocols. For this matter, a general requirement relative to reliability directives is adequate with implementation left to the functional entities. This is already addressed in COM-002 R2, and, therefore, COM-003 is not needed. Communication protocols are more appropriately addressed by an entity's internal controls rather than a Reliability Standard, because this approach provides the benefits described above (i.e. 1) application of suitable protocols based on an entity's structure and relationships and other relevant rules and 2) flexibility for improvement of such protocols over time). The proposed standard eliminates these benefits by prescribing specific items for inclusion in the protocols. Again, the scope of the proposed standard is askew relative to the reliability concern at issue. The proposed standard is unresponsive to the issues raised in the Blackout and by FERC. By not addressing the core reliability issues raised by the very report that drove this Project, the SDT is jeopardizing the reliability of the power system. Accordingly, the focus of the proposed standard is misplaced and, if approved, will do nothing to address the reliability concerns identified in the blackout report and Order 693, but rather will do nothing but impose ineffective and inappropriate obligations that will create liability risk with no corresponding reliability benefit. ERCOT strongly urges the SDT to reconsider this posting and to either rescind the Project and accept that IRO-016 has adequately responded to the Blackout Report, or to revise its proposal to directly address the issues noted above. If R1 is not rescinded as suggested above then the prescriptive subparts 1.1 thru and including 1.6 should be removed, and R1 should be revised to include "applicable communication protocols".

No

ERCOT agrees with the SRC comments, and has these additional comments: ERCOT fully supports the concept that functional entities' internal controls be used to monitor the effectiveness of their own protocols. However, these matters are not suitable for reliability standards. Imposition of mandatory controls applicable to all functional entities is inappropriate because of the wide variety of organizational structures that necessarily requires flexibility with respect to developing appropriate controls for each entity's specific circumstances. Furthermore, entities' internal controls are beyond the scope of the Section 215 reliability purview generally, and they are inconsistent with the risk based initiative being pursued by NERC because they do not impact/are not related to actual reliability impacts. Furthermore, this deficiency review process is ambiguous and, accordingly, lends itself to inefficient and ineffective CMEP results. As an initial matter, what constitutes a deficiency will be an issue that is vulnerable to subjective disagreements. Even assuming there is agreement on that issue, what constitutes an appropriate remedy for a deficiency in terms of assessment and correction will similarly be susceptible to subjective disagreements. Finally, with respect to the obligation to evaluate the deficiency identification process itself, again, the potential for the introduction of subjective compliance review will be problematic in practice in terms of reviewing whether the decision whether to implement a modification or not, and, if a modification is implemented, whether the revision is adequate.

No

ERCOT agrees with the SRC comments.

As discussed above, the proposed standard is not consistent with the reliability issue/concern raised in the blackout report, and, therefore, in Order 693, given that the 693 discussion was relative to the concern raised in the blackout report. The mandates in the proposed standard do not provide reliability value. COM-002 and other standards that address situations that pose actual reliability risks already requires appropriate entities to communicate with each other during emergencies, which is the real focus of the blackout report and Order 693. In those circumstances 3-part communications are required in a clear, concise and definitive manner. This effectively ensures that the recipient understands the communication, which practically obviates the need for specific, mandatory terminology, practices and protocols. Accordingly, for these reasons and the reasons discussed above,

the need for COM-003 is suspect. In fact, it is arguable that it provides marginal to nil reliability value, but yet presents potential liability exposure to the relevant functional entities. The SDT should consider another approach to addressing the concerns in the blackout report and Order 693. Specifically, any responsive effort should focus on ensuring communications occur relative to specific system conditions that truly reflect reliability concerns, and any such communications should be appropriately distributed to ensure dissemination is only to appropriate entities that may be impacted and/or can assist in remedying the situation. In the alternative, the proposed standard should be revised consistent with these comments, and in accordance with the principle that a reliability standard should establish the what, not the how. In addition, the ERCOT offers the following specific comments. As noted above, as drafted the term Operating Instruction is overly broad relative to the scope intended by FERC and the Blackout Report, and, in fact, could include purely market related discussions that have no reliability impact. Yet, the proposed standard requires 3-part communication for all such interactions. There is no reliability value to 3-part communications for such interactions. Accordingly, this requirement should be removed. The proposed standard also requires entities issuing an all-call, or similar multiple party communication, to receive confirmation, electronic or verbal, from at least one of the recipients that the message was received. The nature of all calls provides a structural means to distribute messages to a host of recipients. The mediums used for this purpose ensure that the messages are delivered. There is no need to require confirmation as proposed in the standard. Furthermore, there is little reliability benefit. Accordingly, for these types of communications confirmation should not be required. Finally, 1.9 requires recipients of multi-party communications to ask for clarification if they do not understand the message. It is difficult to understand how compliance with this requirement will be reviewed, and what value it will have. For example, if an entity never asks for clarification but an audit determines the entity failed to follow a directive, the CEA staff may question whether the entity complied with the obligation to request clarification, but the entity may believe that clarification was not necessary and failure to follow the instruction was due to some other reason. As with other aspects of the proposed standard, this lends itself to subjective disagreements in practice. Furthermore, it is unnecessary, because an entity that does not understand a directive will ask for clarification.

Individual

No

Oncor offers instead a new glossary term called "Operating Communication" in order to support alternate language proposed for R1 and R2: Operating Communication – Communication from a System Operator that when executed results in the change or preserves the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System

No

According to the 2003 Black Out Report, "Ineffective communications contributed to a lack of situational awareness and precluded effective actions to prevent the cascade. Consistent application of effective communication protocols, particularly during alerts and emergencies, is essential to reliability" Oncor is not aware of any evidence to support the position that lack of communication protocols contributed to the NE Black Out of 2003, the 2008 Florida Black Out or the more recent SW Black Out. Oncor also takes the position that many of the ideas prescribed within the standard are already being effectively implemented as industry Best Practice. Oncor is concerned that implementing the specific elements as prescribed in the standard will result in confusion, and could compromise personnel safety. Oncor offers the following alternative language. R1 "When a Reliability Coordinator, Transmission Operator or Balancing Authority requires actions to be executed as an Operating Communication, the Reliability Coordinator, Transmission Operator or Balancing Authority shall identify the action as an Operating Communication to the recipient. " Oncor also offer the following alternative language for R2 "R2. Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider that is the recipient of an Operating Communication shall repeat, restate, rephrase or recapitulate the Operating Communication."

No

Oncor also takes the position that all of the ideas prescribed within these requirements including the implementation, assessment, evaluation and correction of communication protocols, are already being effectively implemented as industry Best Practice. In addition, Oncor requests that NERC substitute the CIP v.5 'zero defects' (Each Responsible Entity shall implement, in a manner that identifies,

assesses, and corrects deficiencies, one or more documented processes) language in COM-003 in order to minimize potential confusion. Oncor offers the following substitute language for R3 and R4. R3. Each Reliability Coordinator, Transmission Operator, and Balancing Authority that issues an Operating Communication shall either: • Confirm that the response from the recipient of the Operating Communication (in accordance with Requirement R2) was accurate, or • Reissue the Operating Communication to resolve any misunderstandings.

No

#### **Additional Comments Received:**

#### **AESO Successive Ballot for Project 2007-02 (COM-003-1)**

AESO has issues with some of the content of this reliability standard as follows:

1. The AESO does not support mandating the use of alpha-numeric identifiers as included in requirement R1.5. We deem that this may be part of good operating practices, but does not support this to be a mandatory obligation enforceable by law.
2. The AESO does not support requirement R3 to implement a process for identifying deficiencies with adherence to the communication protocols in requirement R1. It is the opinion of the AESO that if the failure to fully implement an operating instruction results in a reliability issue that it should be caught through routine event analysis, including the analysis used in EOP-004 when determining whether a disturbance report is required. The AESO does not support a separate process to be developed to identify deficiencies with adherence to the specified communication protocols.

#### **Grant Count PUD**

Grant fully supports the intent of the proposed language for COM-003 and recognizes the significant effort towards emphasizing identification, assessment and corrective actions that promote reliability. However, we believe that the language contained under R1.5 will hinder normal operations. If R1.5 could be altered to include language such as "alpha-numeric clarifiers shall be used when necessary to clearly communicate Operational Instructions", then we would cast an affirmative vote. The acknowledgement portion of three way communications will allow either the recipient or issuer of the Operational Instructions the ability to confirm that the message was received accurately or not. If not, then the use of clarifiers is appropriate. But the use of alpha-numeric clarifiers in ALL Operational Instructions is burdensome and unnecessary.

#### **Edison Electric Institute**

EEl generally supports the proposed COM-003 structure and content. We believe that COM-003 will provide a good response to both FERC Order No. 693 (P. 540) and Blackout Recommendation #26 in the U.S./Canada joint Blackout Report. EEl commends the drafting team for its work and for laying out a pragmatic framework for tightened communications protocols.

Since the new proposed draft marks a significant change from the previous direction, EEl understands that some issues need to be considered. Some can be addressed by the drafting

team and others are likely beyond the scope of the team. In general, companies seek to ensure that mandatory requirements when applied in the future will avoid causing confusion in real-time. For example, the definition of “Operating Instruction” in draft COM-003-1<sup>(1)</sup> may need some clarification to make sure that it sufficiently differentiates such communications from a “Reliability Directive” issued under COM-002-3.<sup>(2)</sup>

Clarification may be needed to synchronize the COM-003 process requirements with protocols in already-approved COM-002-3<sup>(3)</sup>. We view these as relatively minor changes that would not require substantial changes to the draft COM-003 language.

In addition, companies also have questions regarding language referred to as ‘internal controls’ or ‘zero defects’ language, and how NERC and the regions will apply various judgments on potential violations under this new and untested concept. While both CIP v.5 and draft COM-003 take aim at certain symptoms, it is difficult for companies to see how NERC will actually perform these tasks since no field experience has been tested or broadly communicated with stakeholders. Instead of this piecemeal approach, EEI has strongly believed for several years that NERC should address this issue as a strategic matter and develop a comprehensive plan that would set both compliance and enforcement on a more sustainable foundation. The resources being applied to compliance and enforcement across the electric industry need to be efficiently applied. EEI continues to urge NERC to make commitments to develop a comprehensive framework that will redesign the program.

“**Reliability Directive:** A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.”

# Consideration of Comments

## Operating Personnel Communications Protocols Project 2007-02

The Operating Personnel Communications Protocols Drafting Team thanks all commenters who submitted comments on the proposed draft COM-003-1 Operating Personnel Communications Protocols standard. This standard was posted for a 45-day public comment period from August 22, 2012 through September 20, 2012. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 80 sets of comments, including comments from approximately 232 different people from approximately 141 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's [project page](#).

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at [mark.lauby@nerc.net](mailto:mark.lauby@nerc.net). In addition, there is a NERC Reliability Standards Appeals Process.<sup>1</sup>

### Summary Consideration:

**The SDT agreed with the commenters from draft 2 and modified its approach to closely align COM-003-1 draft 3 with the proposal by the NERC Operating Committee that applicable entities should be required to:**

- a) **develop written communication protocols that address the elements in draft 2 of COM-003-1,**
- b) **train on those protocols, and**
- c) **develop internal controls to find and correct deviances from those protocols.**

**In addition, the SDT developed the RSAW for this standard in conjunction with NERC Compliance staff, and posted it for comment along with draft 3 of COM-003-1. Most Draft 3 commenters supported this approach and many requested additional clarification and confirmation that the majority of communication protocol deficiencies will be addressed in a non-zero defect environment; and that the documented communication protocols would permit flexibility to reflect the operating environment and circumstances that an entity experiences when operating the BES.**

<sup>1</sup> The appeals process is in the Standard Processes Manual: [http://www.nerc.com/files/Appendix\\_3A\\_StandardsProcessesManual\\_20120131.pdf](http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf)

A prevalent theme in draft 3 was questioning the necessity of the standard, specifically one that requires three part communication for routine operations. This was also a continuation of similar comments from draft 2.

**During its discussion of the approval of the Interpretation of COM-002-2 R2, the NERC BOT stipulated in its approval the expedited development of a comprehensive communications program, which would address necessary communication protocols for use in the operation of the Bulk Electric System. The SDT determined that protocols concerning three part communication (when it is necessary and what is required) during normal operations was a necessary step in addressing the BOT's concern. The SDT remains resolute in its position to require three part communication in documented communication protocols.**

Another theme that was repeated in draft 3 comments from draft 2 was the concern that the work of the SDT was not addressing the intentions of the SAR, related directives and orders.

**The SDT disagrees and cites language from those documents. The purpose of the SAR for this project is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time." Additionally, the SAR is very specific in that it also includes the term "normal" operating conditions under Applicability: "*Clear and mutually established communications protocols used during real time operations under normal and emergency conditions ensure universal understanding of terms and reduce errors.*"**

Another repetitive theme was that the use of three part communications should be limited to Reliability Directives only.

**A Reliability Directive, by definition, is limited to instances where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact. The SDT believes that it is necessary to specify 3 part communication as a necessary communications protocol for all Operating Instructions, not just emergency situations. The OPCSDT believes that the potential for risk to the reliability of the BES exists for all Operating Instructions.**

Still others expressed a desire to combine COM-002-3 and COM-003-1 into a single standard.

**The SDT does not disagree, but that is outside the scope of the SAR for this project. The purpose of the SAR for this project is "Require that real time system operators use standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time." This is a broader scope for communications than that for Project 2006-06.**

#### **Definitions: (Question 1)**

About half of the draft 3 commenters disagreed with the new proposed term Operating Instructions, introduced in Draft 3 and defined as: "*Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.*"

**Commenters stated:**

- The proposed term Operating Instruction is confusing and the large extent of operations to which it potentially applies could create an overwhelming compliance exposure due to the large number of communications described in the definition.
- The term would include general discussions and discussions on options and alternatives that take place to determine courses of action to address BES operating concerns.
- The term, Operating Instruction, and its relation to the proposed term “Reliability Directive” from COM-002-3 is unclear.

**To eliminate the confusion expressed by commenters; and to clarify the scope and intent of an Operating Instruction, the SDT has revised the definition to read:**

*“Operating Instruction — A ~~c~~Command ~~from~~ by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions. “*

**Requirements: Question 2**

***Requirement R1 (Issuers and receivers of Operating Instructions, RCs, BAs and TOPs) and R2(receivers only - of Operating Instructions, DPs and GOPs) (requires entities to have documented communication protocols to use the English Language, 24 Hour Clock, and Time Zone reference, Common interface identifiers, and alpha-numeric clarifiers, three part communication, and all call communication during oral and written Operating Communication):***

- In response to Question 2 dealing with the English language, 24 hour clock and time zone reference, common interface identifiers, and alpha-numeric clarifiers, a large majority of the commenters still believe that all of subparts are too prescriptive. **The SDT acknowledges this and has defended it as necessary for this standard in drafts 1, 2 and 3. When developing common communication protocols to be used for communication between entities, it is necessary to have a standard structure to build the protocols. Absent such structure it would be unlikely that protocols would be developed in a manner that would be recognizable among the communicating entities leading to greater confusion. While the Parts of R1 and R2 call for specific content, draft 3 and draft 4 Requirements permit greater latitude to create protocols that fit the environment in which an entity must operate.**
- There was a lack of agreement on requiring the use of the English language as part of a communication protocol. Some commenters support requiring the use of English, and indicated

that communicating in a language other than English would cause confusion, while others contested requiring English exclusively, stating in some areas the use of other languages in a localized environment may be effective. **The SDT believes that English should prevail in almost all cases and those situations where another language would be required by law would be a rare exception. Furthermore, this requirement only applies to communication initiated by a System Operator at one functional entity to another functional entity.**

- Commenters were also divided on the use the 24 hour clock and time zone references as part of a communication protocol. Those who indicated support stated they felt it added clarity to communications. Other commenters stated that the 24 hour clock and time zone references are too prescriptive and should be eliminated. **The SDT believes use of the 24 hour clock and time zone references, when a clock time is used, clarifies the time element of communications, which will enhance reliability by avoiding time related mistakes that could affect the reliability of the BES. The SDT points out in this response that these protocols are to be used only when a specific clock time is cited. The SDT accepts relative time such as: “ in the next 10 minutes, on the hour or half hour” as clear and unambiguous and not requiring the use of the 24 hour clock and time zone references.**
- Commenters in draft 3 indicated that “alpha-numeric clarifiers” are of no value and would only lead to confusion and delays by System Operators. **The SDT has chosen to retain the inclusion of alpha-numeric clarifiers as a means of clarifying Operating Instructions. The use of such clarifiers, which an entity can develop to suit their preferences, eliminates the ambiguity of similar sounding letters and numbers. Their use, based on the experience of other organizations that use them, becomes a natural part of communication language.**
- Many commenters stated that Requirement R1 Part 1.4 is not necessary, stating that it is covered by standard TOP-002 R18. “Project 2007-03 chose to eliminate TOP-002-2a Requirement R18. Entities have existing processes that handle this issue. This is an administrative item. The bottom line is that this situation is handled by the operators as part of their normal responsibilities, and no one is aware of a switching error caused by confusion over line identifiers.” **The SDT is aware that Requirement R18 is being eliminated by the RTOSDT as part of project 2007-03. P COM-003-1, while reintroducing the concept of line identifiers, limits the scope to only Transmission interface Elements or Transmission interface Facilities (e.g. tie lines and tie substations). This ensures that both parties are readily familiar with each other’s interface Elements and Facilities eliminating hesitation and confusion when referring to equipment for the Operating Instruction. This shortens response time and improves situational awareness. Additionally the SDT has added the commenters’ recommended language “....., unless otherwise mutually agreed,”- to permit entities to develop mutually acceptable nomenclature.**
- Many commenters indicated that the scope of Operating Instructions and the associated requirements were too broad and that the sheer numbers of Operating Instructions would

overwhelm the entities in terms of monitoring and evidence retention. They also are concerned that under these Requirements, operators would be distracted to focus more on complying with the specifications for three part communication rather than effectively responding to incidents, thereby reducing reliability. **The SDT believes universal communication protocols are critical to avoid mistakes that would result in reduced reliability on the BES, which is within the scope of the SDT's SAR. After consideration of comments in these questions, as well as question 10, the SDT modified its approach in COM-003-1, draft 3 to a control based standard where such deficiencies are corrected generally without a finding of non compliance. While there may be many such deficiencies or deviations the entity has the ability to improve performance and compliance without a potential violation for each incident. This is an equivalent approach to the one provided in the CIP version 5 standards, which was recently approved by industry.**

- Several stakeholders continue to identify potential conflicts between COM-003-1 and the recently approved COM-002-3 standard, which also addresses the use of three-part communications. Some stated that the applicability of the two standards was confusing and called for one communication standard to reduce the confusion. A few commenters continue to stress this should be limited to COM-002-3. In COM-002-3 the proposed requirements focus on the use of three part communication when issuing and receiving "Reliability Directives." As proposed in COM-002-3, a Reliability Directive is a directive issued to address an Emergency or an Adverse Reliability Impact. **The OPCP SDT believes the scope of their SAR extends during and beyond communications during emergency situations, thereby necessitating a new standard such as the proposed COM-003-1. The OPCP SDT proposes use of three-part communication for all Operating Instructions, under normal and emergency conditions, and has worked with the RCSDT to ensure that COM-002-3 and COM-003-1 are complementary to achieve this objective.**

#### **Requirements: Question 3**

**Requirement R3 (Issuers and receivers of Operating Instructions: RCs, BAs and TOPs) and R4 (receivers only of Operating Instructions: DPs and GOPs) (requires entities to implement a process to identify, assess and correct deficiencies and to review and improve the process.)**

- Many commenters, even those who voted no on Question 3 supported the SDT's decision to incorporate internal controls. Some of their concerns were if regional CEAs are "onboard" with the SDT's approach. **The SDT has collaborated with NERC compliance and jointly developed the RSAW for COM-003-1. NERC Compliance and NERC executives have been speaking to industry, Regional Entities and regulators to advocate for control based standards citing the absolute need for this approach to address burdensome and unreasonable requirements and to promote a more efficient use of resources.**
- A large number of commenters, for various reasons recommended that the SDT consider using a similar format and language to emulate the CIP v.5 standards which are also nascent control based standards and to address concerns over their understanding of R3 and R4. The commenters stated that it would be more consistent and less confusing. **The SDT discussed the**

commenters' concerns and concluded that adopting the same general format for COM-003-1 would add value by improving consistency and remaining effective as a standard to improve communication and reliability on the BES.

**"R1 (and R2-DP and GOP). Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:"**

**R3 and R4 are eliminated, but the CEA still follows the same guidance with regard to deficiencies and the quality of an entity's implementation of the communication protocols in a manner that identifies, assesses and corrects deficiencies. The COM-003-1 RSAW, VSLs, VRFs and Measures have been updated to reflect this change.**

#### **VRFs and VSLs**

The SDT acknowledges there were many comments on draft 3 regarding VSLs and VRFs and we appreciate the contributions. **The SDT has dramatically changed draft 4 and all of the VRFs and VSLs have been adjusted to reflect those changes. The adoption of the language similar to CIP v.5 and the subsequent elimination of R3 and R4 will require another set of industry comments.**

#### **Additional Issues addressed by the SDT:**

Small numbers of commenters raised issues around:

- Some commenters questioned why the standard addressed "all call" types of communications (Requirement 1, Part 1.9 and Requirement 2, Part 2.2). ***The SDT added language to (Requirement 1, Part 1.9 and Requirement 2, Part 2.2) to clarify how these Requirements apply when all calls are used to communicate based on requests from many commenters in COM-003-1, draft 2.***

#### **Outstanding Unresolved Issues:**

Whether "read" receipts for written Operating Instructions should be addressed in the Measures. - **This is in reference to the parts of R1 and R2 which are applicable only to oral Operating Communication, so the SDT made no change,**

- Exclusion for Face to Face Operating Instructions in a control room, - **The SDT clarified that COM-003-1 only applies to communication between functional entities. For example, if a TOP System Operator is issuing an Operating Instruction to an individual that is internal to that TOP, three part communication is not required by this standard. If a TOP System Operator is issuing an Operating Instruction to an individual in another TOP or another functional entity (e.g. Distribution Provider, Generator Operator), then three part communication is required by this standard. If a TOP System Operator is issuing an Operating Instruction to an individual**

**that is not in a functional entity, then three part communication is not required by this standard.**

**Index to Questions, Comments, and Responses**

\_Toc335986474

- 1. Do you agree with the changes made to the proposed definition “Operating Instruction” (now proposed as a “Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System?”) to be added as a term for the NERC Glossary? If not, please explain in the comment area.....25
- 2. The SDT has proposed that the applicable entities have documented communication protocols that incorporate elements listed in COM-003-1, R1 and R2. Do you agree with these proposed requirements ? If not, please explain in the comment area.....51
- 3. The SDT has proposed requirements (COM-003-1, R3 and R4) for applicable entities to implement a process to identify, assess and correct deficiencies related to the entity’s documented communication protocols; and to evaluate that process based on deficiencies found externally from the process. Do you agree with the proposed requirements? If not, please explain in the comment area of the last question.....96
- 4. Do you agree with the VRFs and VSLs for Requirements R1, R2, R3 and R4?..... 131
- 5. Do you have any other comments or suggestions to improve the draft standard?..... 147

**The Industry Segments are:**

- 1 — Transmission Owners
- 2 — RTOs, ISOs
- 3 — Load-serving Entities
- 4 — Transmission-dependent Utilities
- 5 — Electric Generators
- 6 — Electricity Brokers, Aggregators, and Marketers
- 7 — Large Electricity End Users
- 8 — Small Electricity End Users
- 9 — Federal, State, Provincial Regulatory or other Government Entities
- 10 — Regional Reliability Organizations, Regional Entities

If you support the comments submitted by another entity and would like to indicate you agree with their comments, please select "agree" below and enter the entity's name in the comment section (please provide the name of the organization, trade association, group, or committee, rather than the name of the individual submitter).

**Summary Consideration:**

The OPCPSDT has reviewed the section and responded to Oklahoma Gas & Electric’s comments. They are absorbed in the question 5 summary.

Organization	Agree	Supporting Comments of “Entity Name”
American Transmission company	Agree	ATC endorses and supports those comments submitted by the Edison Electric Institute(EEI)on behalf of ATC and other REAC members.
City of Clewiston	Agree	please see FMPA's formal comments.
Dairyland Power Cooperative	Agree	MRO NSRF and MISO
Flathead Electric Cooperative, Inc.	Agree	Central Lincoln
Illinois Municipal Electric Agency	Agree	Florida Municipal Power Agency and Indiana Municipal Power Agency
ISO New England Inc.	Agree	We agree with and support the comments submitted by NPCC, the SRC, and ERCOT.
Nebraska Public Power District	Agree	Midwest Reliability Organization (MRO) NERC Standards Review Forum (NSRF); ANDSouthwest

Organization	Agree	Supporting Comments of "Entity Name"
		Power Pool (SPP) RTO
Orange and Rockland Utilities	Agree	Consolidated Edison and Northeast Power Coordinating Council
US Army Corps of Engineers	Agree	US Bureau of Reclamation
Brazos Electric Power Cooperative, Inc.		ACES Power Marketing
MidAmerican Energy		MidAmerican Energy supports MRO NSRF comments
Oklahoma Gas & Electric		<p>OG&amp;E is in support of Southwest Power Pool Comments. OG&amp;E also had individual comments (though I am now not allowed to submit via the questionnaire; therefore, will submit here).</p> <p>Q1: No We prefer the use of the word "Instruction" vs "Command", though we understand that word is already part of the term being defined. Could be open to using the term "Request" or "Order" or "Direction".</p> <p><b>Response: The SDT received many comments on draft 2 (previous version) that the word "instruction" in the body of the definition was unclear as what type of communication was covered by the definition. The word "command" is absolute and strong; leaving no doubt as to the type of communication the definition is</b></p>

Organization	Agree	Supporting Comments of "Entity Name"
		<p><b>describing.</b></p> <p>Q2: No R2.1 does not read well. We would recommend changing to ""When receiving an oral two party, person-to-person Operating Instruction, the recipient is required to repeat, restate, rephrase, or recapitulate the Operating Instruction."</p> <p><b>Response: The SDT understands your recommendation, but used this type of grammatical structure to specify to the entity that they must require the recipient to respond as specified.</b></p> <p>Regarding R2.2, we are struggling to identify what would be considered a "one-way burst messaging system". Perhaps examples could be provided to clarify what the SDT is trying to address.</p> <p><b>Response: These are systems several entities use to convey Operating Instructions to groups of entities for such things as requesting VARs , increases or decreases of input or output. They employ many forms of technology. The most common is a group telephone call that has an option for a receiver of an issued Operating Instruction to select a "number" to acknowledge receipt. The technologies are many and vary in functionality. Each entity would be able to customize their Communication protocols in R1 and R2 to reflect the capabilities of their system.</b></p>

Organization	Agree	Supporting Comments of "Entity Name"
		<p>Consider adding similar language that is currently provided in TOP-001-1a R3 "...shall comply with reliability directives issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances the Transmission Operator, Balancing Authority or Generator Operator shall immediately inform the Reliability Coordinator or Transmission Operator of the inability to perform the directive so that the Reliability Coordinator or Transmission Operator can implement alternate remedial actions." to allow for those circumstances in which a Distribution Provider or Generator Operator may not be able to respond to the Operating Instruction.</p> <p><b>Response: The SDT does not want to add repetitive language that could possibly create a double jeopardy situation. We would prefer the TOP-001-1a R3 requirement to govern this type of scenario. COM-003-1 deals with operating communication protocols, not the actions themselves.</b></p> <p>Q3: The word "potential" in R3.1. and R4.1. could be subjective. Please remove this word such that both R3.1. and R4.1. state "Identifies deficiencies,".</p> <p><b>Response: This language has been eliminated in the latest draft of the standard.</b></p>

Organization	Agree	Supporting Comments of "Entity Name"
		<p>Q4: No</p> <p>We believe R3 and R4 should be considered Low VRF as they are establishing the process that supports R1 and R2 which are already designated as Low VRF. We do not think the subsequent process should have a higher VRF than the original requirement.</p> <p><b>Response: The SDT believes the R3 and R4 process provides an entity great opportunity strengthen and improve their communication protocols. The Medium VRF is appropriate because a process that is dysfunctional and yields growing numbers of deficiencies is creating the atmosphere for miscommunication and undesirable impacts on the BES. The team has incorporated R3 and R4 into R1 and R2, and has assigned a medium VRF for these requirements.</b></p> <p>Other Comments: OG&amp;E continues to believe that the COM-003 standard, while obviously the result of significant effort and good intentions, is unnecessary. Even though we believe that three-part communication is a best practice, and we utilize it for switching and reliability-related instructions, we do not believe that it should be mandated through an enforceable standard. COM-002 addresses three-part communications during emergency conditions and we believe that is sufficient. With respect to the Paragraph 81 project, NERC should be focused on retiring</p>

Organization	Agree	Supporting Comments of "Entity Name"
		<p>standard requirements that meet the following criteria:</p> <ul style="list-style-type: none"> <li>(a) have little or no impact on reliability,</li> <li>(b) administrative, purely documentation, redundant, or hinders protection of the BES, and</li> <li>(c) Lower VRF/VSL, lower tier Actively Monitored Standard, etc. The industry has yet to be provided sufficient evidence that the lack of three-part communication during normal operations has been the direct cause, or even a contributing cause, to reliability failures. While a good idea in concept, the COM-003 standard is likely to take significant effort to interpret, understand and implement, at a time when industry is already overburdened with real reliability issues that we already know to be problematic.</li> </ul> <p>The documents referenced in the Rationale and Technical Justification document supporting the need for this standard should be made available for review if the drafting team is using them as support for the justification for COM-003.</p> <p><b>Response: The SDT respectfully disagrees with your comment. COM-003-1 does address the human factor in communication. Human beings can and will make mistakes during verbal exchanges . These mistakes have the potential to create risk for BES operations. FERC Order 693, the Blackout Report and the SAR call for "tighter"</b></p>

		<p>communications and that is exactly what COM-003-1 provides.</p> <p>The SDT cited those references from the "OC white Paper" authored by Terry Bilke which was appended to the Response to Comment for COM-003-1, draft 2 by a commenter.</p>
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
PNGC Comment Group		<p>The PNGC Comment Group is fully in support of Central Lincoln PUD's comments.</p>
Wisconsin Electric Power Co.		<p>Midwest ISO</p>

1. Do you agree with the changes made to the proposed definition “Operating Instruction” (now proposed as a “Command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System?”) to be added as a term for the NERC Glossary? If not, please explain in the comment area.

#### Summary Consideration:

Many commenters state the proposed definition of “Operating Instruction” is overly broad and ambiguous. System Operators engage in thousands of communications each year. Many of these are geared toward confirming system conditions, data, or information and/or gathering information in anticipation of responding to conditions observed on the Bulk Electric System. The definition’s breadth and ambiguity are likely to give System Operators pause before they engage in necessary communications to determine whether or not such communications would be Operating Instructions. *The SDT believes the draft 4 language changes, many recommended by commenters, will reduce the perceived ambiguity. The OPCSDT has added clarifying language to the definition for draft 4 which is now:*

***Operating Instruction — “A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”***

Other commenters cite this would delay necessary information and data gathering by System Operators, which would be detrimental to the reliability of the BES. “System Operators may opt to treat, as Operating Instructions, all or many communications that should not fall within the scope of this definition, resulting in every communication being subject to this standard. That because of the System Operators’ caution and desire to avoid possible penalization by NERC and FERC, the net effect of this definition is detrimental to the reliability of the BES. Further, because of delays in issuing or initiating communications, there is significant potential that penalty exposure from other NERC Reliability Standards (in addition to that identified in the COM-003-1 Reliability Standard, e.g., resulting from a deficiency in implementing or failing to implement specified protocols). This result would be overly burdensome, and its inefficiency could hamper System Operators’ ability to perform their necessary reliability functions.” *The SDT believes that entities should be aware that under COM-003-1, draft 3 and now draft 4 they must identify, assess and correct deficiencies with adherence to communication protocols, not absolute adherence to the protocols, with potential non-compliance for each deficiency. The emphasis is on monitoring and correction.*

*The use of communication protocols, based on its history in other industries, becomes a second nature routine. The SDT believes the general level of professionalism in the ranks of BES System Operators support a routine transition to these communication protocols.*

Finally there were many recommendations to change for language and terms in the definition by commenters. *The SDT used many of the recommendations provided by commenters. The suggestions added clarity and in other cases streamlined the flow of the standard. The team responded to commenters whose suggestions were not used with explanations as to why not.*

Organization	Yes or No	Question 1 Comment
ACES Power Marketing Standards Collaborators	No	The current definition of Operating Instruction, particularly “command from a System Operator” sounds like a Reliability Directive. We recommend revising the SAR of COM-003-1 to retire the definition of Reliability Directive and COM-002-3. There is no delineation between when COM-003-1 and COM-002-3 would apply, which could potentially subject registered entities to double jeopardy. For example, an Operating Instruction that occurs during an Emergency could open up the potential for a finding of non-compliance under both COM-002-3 and COM-003-1. We suggest that the SDT work with the RC SDT to clearly define when COM-002-3 and COM-003-1 would apply. A single communication should not result in multiple penalties.
<p><b>Response:</b> The OPCPSDT thanks you for your comments. There is no violation of COM-003-1 in the example provided. The requirements of COM-003-1 call for documented communication protocols implemented in a manner to identify, assess and correct deficiencies.</p>		
SERC OC Standards Review Group	No	We do not see a significant difference between Operating Instructions and Operating Communications, and we believe neither definition is necessary.
<p><b>Response:</b> The OPCPSDT thanks you for your comments. The SDT disagrees and has used “Operating Instructions” to narrow the definition to preclude general discussion communications. The SDT believes that a definition is necessary to identify direct</p>		

Organization	Yes or No	Question 1 Comment
<b>commands by a System Operator that alter the configuration of the BES.</b>		
Duke Energy	No	Duke Energy is very encouraged by the changes made by the Standard Drafting Team in the current version of COM-003-1. The shift to requiring a communications protocol and a process for identifying and correcting deficiencies is a major step in the right direction. Our concern with the definition is that additional clarity is needed to distinguish the definition of Operating Instruction from the definition of Reliability Directive so that entities know which communications COM-003-1 applies to. This could be accomplished by changing the definition of Operating Instruction; replacing the word “Command” with “Normal communication”, and replacing the word “preserve” with the word “maintain”. The revised definition would read as follows: “Normal communication from a System Operator to change or maintain the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System”.
<b>Response: The OPCPSDT thanks you for your comments. The SDT addressed the relationship between the definition of Operating Instruction and the definition of Reliability Directive in draft 2. The SDT believes a Reliability Directive, during an Adverse Reliability Impact or an Emergency that that requires a change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System, is a subset or a type of an Operating Instruction.</b>		
Dominion	No	Dominion requests clarification of “Command” verses “Directive”. Neither “Command” nor “Directive” is defined in the NERC Glossary of Terms - some guidance/reference is needed. The word “command” seems more forceful, how does a command differ from a directive?
<b>Response: The OPCPSDT thanks you for your comments. Neither term is a definition and the two words are synonyms. The word command is forceful and more clearly underscores what an Operating Instruction is and what it is not. The SDT does not see a need to add it to the NERC Glossary because of the clear dictionary meaning of the term.</b>		

Organization	Yes or No	Question 1 Comment
Associated Electric Cooperative Inc - JRO00088	No	<p>The Operating Instruction definition is no help beyond the “existing” Operating Command definition, as the later exists neither within the NERC Glossary downloaded this morning, 9/20/2012, nor within the Clean COM-003-1 copy downloaded for final review. The proposed Operating Instruction definition would add value, were the BES Definition itself properly scoped to only those assets and functions that undoubtedly affect the reliable Operation of bulk power system. However the BES Definition is, by NERC and FERC desire and design, too broad, and so our industry must now attempt containment of compliance scope and risk within multiple standards, including COM-003-1. As a result, AECl determines this Operation Instruction definition to insufficient to responsibly exclude conversations that have little to no effect upon the BES reliability.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT is not clear on the intent of your comment. The “BES definition” is out of the scope of this question and does not have a bearing on the “Operating Instruction” definition. The definition of “Operating Instruction” is a proposed definition that will not appear in the NERC Glossary until the standard is filed and approved by FERC. The SDT has not created a term named “Operating Command” and is not aware of its existence in the NERC glossary. The SDT has stated many times that general conversation or discussion of options is not an “Operating Instruction.” The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</b></p> <p><b>Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</b></p>		
ISO/RTO Standards Review Committee	No	<p>The proposal to standardize the meaning of "Operating Instruction" will likely cause more problems than it solves. The concept of “to change or preserve the state, status...” is ambiguous enough for CEAs to still apply the requirement to virtually all verbal conversations.</p> <p><b>Response: The SDT disagrees. The language is very specific and is related</b></p>

Organization	Yes or No	Question 1 Comment
		<p>to “commands from system operators” rather than any verbal conversations. The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</p> <p><i>Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</i></p> <p>Such a proposed definition may help clarify what the SDT intends to address, however, by making such a common word a Glossary term potentially will result in the Industry having to redefine their own manuals and procedures in which they use the phrase "Operating Instruction". For years, system operators have dealt with operating instructions on a daily if not minute basis. To them, operating instructions are necessarily a communication to alter or preserve the state and status of the BES condition or BES Element/Facility.</p> <p>Having a defined term, and calling such communication a “Command” is totally unnecessary, and can confuse operators from what they understand to be the meaning of operating instructions. Any proposed standard must clearly limit the application of the communication protocol requirements to communications that impact reliability. As proposed, the standard does not do this. Based on the existing language and the proposed Defined term Operating Instruction, the scope could readily be interpreted to include numerous communications that have nothing to do with system reliability. To remedy this, the SDT should either revise the proposed term in accordance with Order 693’s limited scope, or delete this term and focus</p>

Organization	Yes or No	Question 1 Comment
		<p>the standard on reliability directives, which is in line with Order 693.</p> <p><b>Response: The SDT believes the definition is clear and the word “command” does convey an order to take an action, rather than to carry on a general conversation.</b></p> <p><b>The word command is not defined. The capital letter is there because it was the first word in the definition. The SDT rewrote the sentence in draft 4 to read “A command.”</b></p> <p><b>The SDT is also confident the definition is within the scope of FERC Order 693.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
FirstEnergy	No	<p>Although we believe the definition is on the right track, the wording may inadvertently cover many conversations between operators and personnel that do not impact the reliable operation of the BES. We ask the team to consider clarification, examples, or inclusions/exclusions much like the new definition of BES. For instance, tasks that may involved transmission lines associated with IROLs or SOLs, and other critical tasks.</p>
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT believes the definition is focused on reconfiguration of the BES and a command from to System Operator to initiate such a reconfiguration. The SDT believes there is a reliability risk from a mishap if the communication of a command if it is ambiguous or misunderstood. The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</b></p> <p><b>Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</b></p>		

Organization	Yes or No	Question 1 Comment
PPL Corporation NERC Registered Affiliates	No	<p>The PPL Companies do not agree with the proposed definition of Operating Instruction as the standard appears to be focused on imposing three part communications on the industry for all normal / routine operating communications. Imposing requirements for three part communication for Operating Instructions may have the effect of elevating all communications to the state of Reliability Directive (as defined in COM-002-3).</p> <p><b>Response: The SDT believes that communications protocols for all normal / routine operating communications as well as emergency operating communication mitigate the same risks. An unintended reconfiguration of the BES due a miscommunication can be damaging under any operating condition. Three part communication is a proven and effective protocol that reduces that risk.</b></p> <p>Splitting communications requirements across different standards introduces the potential of unnecessary confusion. Communications involving the changing of the state, status, output, or input of a facility, occur very frequently and potentially even more frequently on preserving the state of the system. Many of these communicated changes, in and of themselves, would not have an impact on reliability. However, there are times (examples could be during a DCS event, an SOL, or an IROL) when even seemingly insignificant changes to the system must be made promptly, although the system has not reached the level of emergency or instability. It is at these times, “when action must be taken”, which the miscommunication of the action or inaction could lead to amplifying the risk to the system.</p> <p><b>Response: The SDT agrees. Miscommunication transcends operating states. Universal and consistently applied protocols are proven instruments that mitigate that risk.</b></p> <p>Further, the focus of the standard is on operations and therefore the</p>

Organization	Yes or No	Question 1 Comment
		<p>communications subject to the requirement should be those requiring action in the Real-time Operations Time Horizon. The definition of which is included in the NERC document located at <a href="http://www.nerc.com/files/Time_Horizons.pdf">http://www.nerc.com/files/Time_Horizons.pdf</a> .Suggest modifying the proposed definition as follows: Operating Instruction - Command, other than a Reliability Directive, from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System in which action must be taken in the Real-time Operations Time Horizon.</p> <p><b>Response: The SDT believes the suggested language would narrow the intended focus of the definition. The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</b></p> <p><b>Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
SPP Standards Review Group	No	We suggest changing ‘command’ to ‘order’. The definition would then read ‘An order from a System Operator...’
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT acknowledges that the term order adds clarity, but the term command is even more distinct.</b></p>		
Southern Company	No	Southern does not agree with the definition of “Operating Instruction” as it continues to be too broad and encompass routine communications

Organization	Yes or No	Question 1 Comment
		<p>between System Operators and other system personnel and other functional entities. While Southern agrees that 3-part communications is a good utility practice that has been used by operating entities for many years, Southern disagrees with the broadness of “Operating Instructions” as in some of these cases, 3-part communications are not required to protect the reliability of the system. In fact, this prescriptive requirement, if used on all communications that could fall under “Operating Instructions” (i.e. very general information at times), would take System Operators time from other tasks that are more critical to maintaining reliability. Please note that there are numerous (i.e. in the millions) of conversations between operating entities each year and some important tasks could be missed or delayed if required to follow a standard script for everything.</p> <p><b>Response: The SDT believes the definition is clear and that the word command conveys an order to take an action rather than to carry on a general conversation. The SDT believes the communication protocols in COM-003-1 would not take any additional time and would become a natural part of operators’ communications as they do within other industries that employ communication protocols.</b></p> <p>If the SDT agrees with Southern’s comments related to Requirements 1 and 2, then the definition of “Operating Instruction” would be unnecessary as each operating entity would define the times when 3-part are necessary, which in Southern’s case, would be broader than emergency communications and reliability directives, but not so broad that it would cover general exchange of information between operating entities.</p> <p><b>Response: The SDT is not advocating the use of three part communication to convey general information. The SDT agrees their use should be addressed in R1 and R2 in the required documented communication protocols.</b></p>

Organization	Yes or No	Question 1 Comment
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
<p>Liberty Electric Power, LLC</p>	<p>No</p>	<p>The definition of the new term, “Operating Instruction,” uses the NERC Glossary term “System Operator,” which is defined as “An individual at a control center...whose responsibility it is to monitor and control that electric system in real time.” The lack of clarity regarding what constitutes a control center leaves doubt as to which instructions would be covered by the standard.</p>
<p>Response: The OPCPSDT thanks you for your comments. The SDT sees no reason to define “control center” as it is a very commonly used and understood term in the industry. The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</p> <p><i>“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”</i></p>		
<p>TransAlta Centralia Generation LLC</p>	<p>No</p>	<p>The definition of the new term, “Operating Instruction,” uses the NERC Glossary term “System Operator,” which is defined as “An individual at a control center...whose responsibility it is to monitor and control that electric system in real time.” The lack of clarity regarding what constitutes a control center leaves doubt as to which instructions would be covered by the standard.</p> <p>Response: The SDT sees no reason to define “control center” as it is a very commonly used and understood term in the industry. The SDT has made several changes to the definition in draft 4 that add additional clarification.</p> <p>Another disagreement with the proposed definition of “Operating</p>

Organization	Yes or No	Question 1 Comment
		<p>Instruction” is that it inappropriately imposes three-part communication for routine communications of changes of generation output. Common operating communications to and from generation plants should not be considered compliance events requiring the use of alphanumeric clarifiers. Such a requirement may shift operators’ focus from providing proper information under critical situations to using the specified terms for every minor communication, distracting them rather than sharpening their concentration.</p> <p>The standard should specify the classes of TO/TOP-to-GOP communications that constitute compliance events, the formal designations by which such communications can be recognized, and the parties authorized to issue such commands.</p> <p><b>Response: The SDT believes the use of three part communications is a proven communication protocol that has wide spread use and is an effective means of eliminating miscommunication of commands on the BES. The SDT believes it will help sharpen the operator’s concentration rather than distracting them.</b></p>
<p><b>Response: The OPCSDT thanks you for your comments. Please see our responses above.</b></p>		
ReliabilityFirst	No	<p>ReliabilityFirst does not agree with the changes made to the proposed definition “Operating Instruction”. The definition of Operating Instruction begins with the word “Command”. ReliabilityFirst is unsure what the word “command” means and believes it could be mistaken as a directive. ReliabilityFirst requests further clarification on the meaning of the word “command”. ReliabilityFirst recommends the following for consideration: “Communication of instruction from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.</p>

Organization	Yes or No	Question 1 Comment
<p>Response: The OPCPSDT thanks you for your comments. A command is an order given by someone in authority. The SDT believes the definition is clear and that the word command means to take an action that conveys an order rather than to carry on a general conversation. The language suggested above was featured in draft 2 where commenters stated it was not clear. The word command is more focused and direct.</p>		
<p>Independent Electricity System Operator</p>	<p>No</p>	<p>We do not see the need to define the term “Operating Instructions” for a number of reasons: For years, system operators deal with operating instructions on a daily if not minute basis. Having a defined term, and calling such communication as “Command” is totally unnecessary, and can confuse operators from what they understand to be the meaning of operating instructions. The main intent of this standard is to ensure no miscommunication between operating personnel, a part of which is proposed to be fulfilled by exercising 3-part communication for operating instructions. Notwithstanding our disagreement to having such a requirement in this standard, such a requirement can be developed without having to define a term that adds nothing to the universal understanding of the term but which can confuse operators. For example, Requirement R1 can be revised to:</p> <p>R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented protocols for communicating operating instructions that will change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System, which incorporate the following: 1.11.2....</p>
<p>Response: The OPCPSDT thanks you for your comments. The SDT believes the definition is clear and that the word “command” conveys an order to take an action rather than to carry on a general conversation. The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</p>		

Organization	Yes or No	Question 1 Comment
<p><i>“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”</i></p>		
<p>NextEra Energy Inc.</p>	<p>No</p>	<p>Although NextEra Energy, Inc. (NextEra) is encouraged by the refinements made to draft COM-003-1, NextEra believes additional refinements are necessary for COM-003-1 to promote reliability, and in no way hinder reliability. Next Era’s perspective is heavily influenced by the years of experience of its system operators in their role as a large Transmission Operator, Reliability Coordinator agent and Balancing Authority. Specifically with respect to the definition of Operating Instruction, NextEra recommends that the definition more closely track the syntax of the definition of Reliability Directive in COM-002-3, and, thus, read as follows: Operating Instruction - a command from a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to change or preserve the state, status, output of an Element or Facility of the Bulk Electric System.</p>
<p><b>Response:</b> The OPCPSDT thanks you for your comments. The SDT has incorporated much of your recommended language into draft 4 of COM-003-1. The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</p> <p><i>Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</i></p>		
<p>Northeast Utilities</p>	<p>No</p>	<p>Operating Instruction Definition is too broad; this essentially imposes on affected entities the need to use 3-part communication all the time. Additionally the broadness of the definition may cause compliance</p>

Organization	Yes or No	Question 1 Comment
		difficulties between COM-003-1 and COM-002 if the requirements are not looked at holistically between the two. A recommendation would be to combine the requirements into one standard.
<p><b>Response: The OPCSDT thanks you for your comments. The SDT notes your recommendation, but that is outside the scope of the SAR for this project. This Issue has been discussed at the Standards Committee.</b></p>		
American Electric Power	No	<p>While AEP would not argue against the definition of “Operating Instruction” as proposed, we object to its inclusion as we disagree with the concept of requiring three part communications for more routine operations. Our efforts in this regard should first be focused solely on Reliability Directives before expanding this work, and creating similar requirements for all other Operating Communications. Requiring three part communications for every scenario might be considered a best practice by some, but making it a mandatory practice for routine operations emphasizes the manner of communications rather than the operations themselves. In addition, requiring three part communication in such a broader scope could actually diminish the perceived urgency during more urgent situations where such communications are more appropriate. In any event, requiring three part communications for Reliability Directives will likely result in more widespread usage for more routine operating communications, without making it a requirement.</p> <p><b>Response: The SDT believes that communications protocols for all normal / routine operating communications as well as emergency operating communication mitigate the same risks. An unintended reconfiguration of the BES due a miscommunication can be damaging under any operating condition. Three part communication is a proven protocol that is effective in preventing misunderstandings. FERC Order 693, P 532 supports communication protocols for normal as well as emergency BES</b></p>

Organization	Yes or No	Question 1 Comment
		<p><b>communication.</b></p> <p>AEP believes that there should not be multiple project teams proposing concurrent changes to COM-001, COM-002, and COM-003. Unless there are overwhelming reasons for not doing so, these efforts should be consolidated and managed by a single project team. In addition, current efforts on COM-003 need to be co-located with the proposed changes to COM-002 within a single standard. Having multiple project teams proposing concurrent changes results in problems such as this, where</p> <ul style="list-style-type: none"> <li>a) changes are proposed to the same standard or</li> <li>b) similar changes are proposed to separate standards.</li> </ul> <p>AEP cannot support revisions on these matters until they are managed by a single project team. If the team believes it should still proceed in their current efforts, then there probably is no need for requiring three part communications for Reliability Directives (COM-002 R2). As a result, COM-002 R2 should be retired and this definition should include emergency situations as well.</p> <p><b>Response: The SDT notes your recommendation, but that is outside the scope of the SAR for this project. This Issue has been discussed at the Standards Committee.</b></p>
<p><b>Response: The OPCSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Essential Power, LLC</p>	<p>No</p>	<p>The definition of the new term, “Operating Instruction,” uses the NERC Glossary term “System Operator,” which is defined as “An individual at a control center...whose responsibility it is to monitor and control that electric system in real time.” The lack of clarity regarding what constitutes a control center leaves doubt as to which instructions would be covered by the standard.</p>

Organization	Yes or No	Question 1 Comment
		<p>Response: The SDT sees no reason to define “control center” as it is a very commonly used and understood term in the industry. The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</p> <p><i>“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”</i></p> <p>Another disagreement with the proposed definition of “Operating Instruction” is that it inappropriately imposes three-part communication for routine communications of changes of generation output. Common operating communications to and from generation plants should not be considered compliance events requiring the use of alphanumeric clarifiers. Such a requirement may shift operators’ focus from providing proper information under critical situations to using the specified terms for every minor communication, distracting them rather than sharpening their concentration. The standard should specify the classes of TO/TOP-to-GOP communications that constitute compliance events, the formal designations by which such communications can be recognized, and the parties authorized to issue such commands.</p> <p>Response: The SDT believes the use of three part communications is a proven communication protocol that has wide spread use and is an effective means of eliminating miscommunication of commands on the BES. 		<p>“Operating Instructions” apply to applicable functional entities that issue and receive them to and from other applicable functional entities.</p>
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
Texas Reliability Entity	No	<p>Previous version has a description regarding Reliability Directives. This version does not address Reliability Directives and the relationship to an Operating Instruction. Is a Reliability Directive a subset of Operating Instruction? Is a “directive,” as mentioned in several standards, an Operating Instruction?</p>
<p>Response: The OPCPSDT thanks you for your comments. The SDT advocates that a <i>Reliability Directive</i> and any other <i>directive</i> is a subset of Operating Instructions when it is a command from a System Operator to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.</p>		
MidAmerican Energy	No	<p>MidAmerican has concerns that Operating Instructions as defined is too broad.</p>
<p>Response: The OPCPSDT thanks you for your comments. The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</p> <p>“Operating Instruction —A command by a System Operator of a <i>Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.</i>”</p>		
Public Service Enterprise Group	No	<p>The definition of “System Operator” includes BA, RC, TOP, and GOP. Because GOP is included the definition, “System Operator” should be replaced by “Balancing Authority, Reliability Coordinator, or Transmission Operator.” See also Project 2010-16: Definition of System Operator.</p>

Organization	Yes or No	Question 1 Comment
<p>Response: The OPCPSDT thanks you for your comments. The SDT has incorporated your recommended language into draft 4 of COM-003-1.</p> <p><i>“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”</i></p>		
<p>Exelon</p>	<p>No</p>	<p>We can accept the definition but want to bring to the attention of the Drafting Team that the description of OI in the Background section of the Comment form, "Operating Instructions more accurately define the broad class of communications that deal with changing or altering the state of the BES", does not agree with the Definition being balloted. The inclusion of the phrase "or preserve" changes the definition. Nowhere in the discussion of the need for Operating Instructions or communication protocols is there discussion of or justification for including the "or preserve" statement. Exelon can support the modified definition but we believe it will cause entities to oppose this standard at ballot and create confusion when implementing controls and auditing to the modified definition.</p>
<p>Response: The OPCPSDT thanks you for your comments. The word “preserve” is used to denote efforts to hold the current state or status of a BES Element or Facility; in other terms a command not to make any changes to the system to preserve the existing operating state. The SDT changed it from “maintain” because of confusion cited by draft 2 commenters stating it created a possible reference to maintenance and repair activities.</p>		
<p>Indiana Municipal Power Agency</p>	<p>No</p>	<p>NERC defines the term “System Operator” as “an individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.” NERC does NOT define a “control center”</p>

Organization	Yes or No	Question 1 Comment
		<p>which could be problematic when it comes to how an entity views a control center and how an auditor defines a control center.</p> <p><b>Response: The SDT sees no reason to define “control center” as it is a very commonly used and understood term in the industry.</b></p> <p>IMPA believes that there is too much ambiguity when using the words “to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System.” IMPA recommends that the entity giving the Operating Instruction declares it to be one which eliminates many potential problems of applying a definition of an Operating Instruction. The receiver of the Operating Instruction immediately knows what the following instructions will be and will know to apply the proper communication protocol instead of trying to figure out if the definition of Operation Instruction applies to what the entity just said.</p> <p><b>Response: The SDT points out the beginning of this definition sentence is “Command from a System Operator ..... “ which we believe eliminates that ambiguity. The OPCSDT has added clarifying language to the definition for draft 4 which is now:</b></p> <p><b><i>“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”</i></b></p> <p><b>The SDT also believes an entity is permitted to address the declaration option by creating it in the documented communication protocols in R1</b></p>

Organization	Yes or No	Question 1 Comment
		and R2.
Response: The OPCPSDT thanks you for your comments.		
MISO	No	<p>MISO believes that the proposed definition of “Operating Instruction” is overly broad and ambiguous. System Operators engage in thousands of communications each year. Many of these are geared toward confirming system conditions, data, or information and/or gathering information in anticipation of responding to conditions observed on the Bulk Electric System. The definition’s breadth and ambiguity are likely to give System Operators pause before they engage in necessary communications to determine whether or not such communications would be Operating Instructions. This would delay necessary information and data gathering by System Operators, which delay would likely be detrimental to the reliability of the BES. Conversely, to avoid confusion regarding which communications are Operating Instructions and to avoid potential delays, System Operators may opt to treat, as Operating Instructions, all or many communications that should not fall within the scope of this definition, resulting in every communication being subject to this standard.</p> <p>Under either scenario, because of the System Operators’ caution and desire to avoid possible penalization by NERC and FERC, the net effect of this definition is detrimental to the reliability of the BES. Further, because of delays in issuing or initiating communications, there is significant potential that penalty exposure from other NERC Reliability Standards (in addition to that identified in the COM-003-1 Reliability Standard, e.g., resulting from a deficiency in implementing or failing to implement specified protocols and/or three-way communication, a deficiency in the review process, which is now significantly expanded beyond that envisioned during the drafting of this standard) could be increased. Accordingly, System Operators are likely</p>

Organization	Yes or No	Question 1 Comment
		<p>to apply the protocols applicable to Operating Instructions under R1 of COM-003 to all communications, whether or not they qualify as Operating Instructions. This result would be overly burdensome, and its inefficiency could hamper System Operators’ ability to perform their necessary reliability functions.</p> <p><b>Response:</b> The SDT believes the draft 3 language for the definition of an Operating Instruction is clear. A “command” should never be confused with or interpreted as casual or informational conversation. A command is a very distinct and forceful word where generally the only response expected is compliance. The OPCPSDT has added clarifying language to the definition for draft 4 which is now:</p> <p><i>“Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.”</i></p> <p>Previous commenters have cited the professionalism of the majority of System Operators. Based on those comments and the experience of the OPCPSDT as operators we are confident System Operators will be able to easily manage all of the protocols.</p> <p>The SDT also requests that MISO look at this draft standard in the context of its identify, assess and correct features that permit the entity to improve reliability by correcting deficiencies without being subject to a finding of non compliance.</p> <p>As a result, MISO does not support the proposed definition of Operating</p>

Organization	Yes or No	Question 1 Comment
		Instruction at this time.
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
ERCOT	No	<p>ERCOT agrees with the SRC comments, and has these additional comments: As proposed, the term “Operating Instruction” could include communications that have nothing to do with reliability - e.g. communications that are market related and have no impact on system reliability. That outcome is inconsistent with FERC’s direction in Order No. 693. FERC’s discussion of this issue in Order 693 focuses on alerts and emergencies - “We adopt our proposal to require the ERO to establish tightened communication protocols, especially for communications during alerts and emergencies...” (693 at P 531)”Accordingly, we direct the ERO to either modify COM-002-2 or develop a new Reliability Standard that requires tightened communications protocols, especially for communications during alerts and emergencies.” (693 at P 535)In addition, the scope of FERC’s concerns is limited to communications that impact the reliability of the BPS - “We note that the ERO’s response to the Staff Preliminary Assessment supports the need to develop additional Reliability Standards addressing consistent communications protocols among personnel responsible for the reliability of the Bulk-Power System.” (693 at P 531)”...we believe, and the ERO agrees, that the communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System.” (693 at P 532)Simply because FERC noted the benefits to communications during normal conditions does not mean the standard has to apply to those circumstances. All FERC said was that implementing consistent protocols will likely provide benefits across all operating conditions. The focus of the concern was clearly alerts and emergencies, and limiting the application of the standard to those conditions will provide benefits to relevant communications during normal conditions.</p>

Organization	Yes or No	Question 1 Comment
		<p><b>Response: The SDT continues to believe the very documents you cite as not supporting any drafts of COM-003-1 do indeed support and sanction the requirements developed by the SDT. The SDT remains properly focused on the guidance provided by the Blackout Report, FERC order 693 and the SAR and from the agencies that developed those documents. The SDT summarizes by quoting “communications protocols need to be tightened to ensure Reliable Operation of the Bulk-Power System.” The SDT has developed a standard that effectively and fairly “tightens communication”.</b></p> <p>However, as written, the standard is overbroad and inconsistent with the Commission’s directives in Order 693. Consistent with this discussion, the IRC believes the most effective way to remedy this issue is to eliminate the proposed term and focus the standard on conditions that actually have a reliability impact. This can be achieved focusing the requirements on Reliability Directives.</p> <p><b>Response: The SDT will continue to develop COM-003-1 consistent with the directives and guidance contained in FERC Order 693.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>Oncor Electric Delivery Company LLC</p>	<p>No</p>	<p>Oncor offers instead a new glossary term called “Operating Communication” in order to support alternate language proposed for R1 and R2:Operating Communication - Communication from a System Operator that when executed results in the change or preserves the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System</p>
<p><b>Response: The OPCPSDT thanks you for your comments. “Operating Communication” was the original term the SDT presented in draft 2. Commenters stated it was too ambiguous. The SDT has added the phrase “that when executed” to draft 4.</b></p>		

Organization	Yes or No	Question 1 Comment
Brazos Electric Power Cooperative, Inc.	No	See ACES comments.
<b>Response: The OPCPSDT thanks you for your comments. Please see our responses to ACES comments.</b>		
Ameren	No	See response to question 5.
<b>Response: The OPCPSDT thanks you for your comments. Please see our responses to question 5.</b>		
MRO NSRF	No	
Central Lincoln	Yes	Thank you for making this change. Central Lincoln believes the SDT is on the right track to limit the scope of the standard to communications originating from System Operators. This will be less burdensome for many registered entities as well as the Compliance Enforcement Authorities.
<b>Response: The OPCPSDT thanks you for your comments.</b>		
Occidental Energy Ventures Corp.	Yes	Occidental Energy Ventures Corp. ("OEV") agrees that it is important to specify that the command came from a System Operator. This allows us to leverage existing recording and monitoring systems to capture the event. The previous definition was open ended - which would have required us to expend an unknowable dollar amount in an attempt to capture every conversation related to a BES Facility or Element.
<b>Response: The OPCPSDT thanks you for your comments.</b>

2. The SDT has proposed that the applicable entities have documented communication protocols that incorporate elements listed in COM-003-1, R1 and R2. Do you agree with these proposed requirements ? If not, please explain in the comment area.

#### Summary Consideration:

Commenters state that it must be made clear in the requirements that functional entities can incorporate exceptions (to address emergencies for example) in the protocols that are developed. **The SDT believes that there is enough flexibility in the development of the documented communication protocol documents for the entity to account for exceptions to deal with emergencies or exceptional circumstances that may exist among communicating entities.**

Other commenters note these requirements are too prescriptive. The sub-requirements drill down too deeply into the communications needed to conduct system operations. sub-parts of R1 and R2 and allow registered entities to define their own communications protocols based on internal policies and procedures; not from overly-prescriptive reliability standards. They state the registered entity should have the freedom to decide what elements are to be included in its communication protocols. R1 and R2 are administrative in nature and unnecessary. There is no need to include 9 sub-parts on how to achieve proper communications. **The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirements serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop. Beyond the framework specified in the parts, an entity has the flexibility to develop the protocols to fit their particular situation.**

**There were many other comments on each of the Parts for R1 and R2. Most cited the individual need for each. The SDT responded to each comment by demonstrating the contribution each protocol makes to communication clarity, which in turn increases the level of reliability.**

Some commenters disagree that the Distribution Provider is listed as an Applicable Entity. The Distribution Provider load is not considered part of a BES Element or Facility. "The SDT response to an earlier comment on this issue was that the SDT is aware of some DPs that operate BES equipment. If that is the case, then the standard should be applicable to only those DPs that operate BES Elements or Facilities - not the numerous DPs who do not."

**If a DP has never or will never receive an Operating Instruction it would not be an applicable entity. If the DP has or could receive Operating Instruction it must comply with the standard. The DP would have to confirm their situation with the CEA.**

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	It must be made clear in the requirements that functional entities can incorporate exceptions (to address emergencies for example) in the protocols that are developed. Both of these requirements are too prescriptive. The sub-requirements drill down too deeply into the communications needed to conduct system operations.
<p><b>Response: The OPCSDT thanks you for your comments. The SDT believes the language of the requirement R1 and R2 permits the entity to assess whether variations from the required protocol were valid. The exceptions referenced in your comments are TOP-001-2, R1 and IRO-001-3, R2.</b></p>		
ACES Power Marketing Standards Collaborators	No	<p>(1) The SDT should strike all sub-parts of R1 and R2 and allow registered entities to define their own communications protocols based on internal policies and procedures; not from overly-prescriptive reliability standards. The SDT stated that COM-003-1 is shifting paradigms and putting the responsibility on the registered entity to monitor, assess and correct its own deficiencies. If that is true, then the registered entity should have the freedom to decide what elements are to be included in its communication protocols. R1 and R2 are administrative in nature and unnecessary. There is no need to include 9 sub-parts on how to achieve proper communications.</p> <p><b>Response: The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirement serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop.</b></p> <p>(2) The standard, as currently written, does not allow a registered entity to implement superior practices, such as multi-modal communication (multiple mediums of communicating) or other superior communication methods and technologies. There are other ways to achieve efficient and accurate operating communications and the drafting team should modify the requirements to allow the registered entity to determine the best method of communication. There will be a disincentive for registered entities to seek out new technologies to improve</p>

Organization	Yes or No	Question 2 Comment
		<p>communication if the standard remains with the current sub-parts. More discussion on each sub-part below.</p> <p><b>Response: The SDT believes there is nothing in the standard that precludes an entity from embracing technology or incorporating best practices. The language of R1 and R2 states [an entity] “shall have documented communication protocols for Operating Instructions that incorporate the following.” If technology supplants or improves communication accuracy it can be incorporated in the documented communication protocol.</b></p> <p>(3) R1, part 1.1, use of the English language. The SDT should not require use of the English language because the vast majority registered entities in North America speak English, except for a small number of entities in Canada and Mexico. If anything, the requirement should be modified to state that, “If the English language is not used by System Operators, there must be a legal justification, such as another language is mandated by law or regulation.” Not using the English language is a much greater risk to reliability. The majority of companies that speak English should not have to maintain compliance policies to reaffirm something that everyone knows that they are doing. The real issue here is if an entity does not use English language, auditors should verify how they communicate internally and what controls are in place when the non-English speaking entity communicates with English-speaking neighbors. The SDT should not put the burden of compliance on English speakers. The team should focus on the entities that pose a risk to the BES by not using the English language and the increased potential for miscommunications from translation errors.</p> <p><b>Response: The SDT believes the language of the requirement requires the use of the English language among functional entities which is consistent with COM-001-1.1, R4, which will be replaced by COM-003-1.</b></p> <p>(4) R1, part 1.2, the 24-hour clock, daylight/standard time. This sub-part does not take into account real time, such as “perform an action in 5 minutes.” The purpose statement of the SAR is to provide System Operators with uniform communications</p>

Organization	Yes or No	Question 2 Comment
		<p>protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of the BES. Requiring an operator to use the 24-hour clock for an action that is about to occur could cause more confusion and increase the possibility of miscommunication. The SDT should consider either inserting exceptions for the 24-hour clock for real time activities, or strike the 24-hour clock from the requirements.</p> <p><b>Response: The SDT believes the language of the requirement allows the entity to determine the use of the 24 hour clock time only if they state an <i>actual clock time</i> or to use relative time periods if they chose to use relative time consistent with your example.</b></p> <p>(5) R1, part 1.3, Standard or Daylight Savings. This sub-part also poses a risk for actions performed during real time operations and could increase the likelihood for error. For example, if WECC RC (daylight) was trying to communicate to a registered entity located in Arizona (no daylight savings time) to open a breaker. What is more effective, asking the entity to open a breaker in 5 minutes or at 11:05? In that scenario, 11:05 may be an hour difference because WECC RC is on daylight and Arizona is not, and the operators would be focusing on whether they accounted for the time changes and could potentially lose focus of the task at hand - opening the correct breaker. The SDT should consider either inserting exceptions for daylight savings/standard time for real time activities, or strike daylight savings/standard time from the requirements.</p> <p><b>Response: The SDT believes the language of the requirement allows the entity to determine the use of a time zone <i>if you use a clock time</i> or to use relative time periods if they chose to use relative time as your example demonstrates. The SDT does not want to dictate the “how” under this format. The protocol should be uniform, clear and must increase reliability.</b></p> <p>(6) R1, part 1.4, Transmission interface Element or Facility. As discussed above, this sub-part is unnecessary and should be struck from the standard. A registered entity</p>

Organization	Yes or No	Question 2 Comment
		<p>should be able to define its own communication protocol and the associated internal controls to ensure effective operating communications. Further, the Real-time Transmission Operations SDT (Project 2007-03) eliminated TOP-002 R18 which referred to the same concept as part 1.4, “uniform line identifiers when referring to transmission facilities.” The reason the Real-time TOP SDT removed the language from the new standard was because the “requirement adds no reliability benefit. ...There has never been a documented case of the lack of uniform line identifiers contributing to a System reliability issue.” Project 2007-03 was approved by the NERC Board of Trustees on May 9, 2012. Why is the OPCP SDT introducing language that the NERC Board has approved to remove from the requirements? There needs to be more awareness of the other projects and actions by the NERC Board. To be consistent, we recommend striking this sub-part in its entirety.</p> <p><b>Response: The OPCPSDT is aware of the disposition of TOP-002 R18. The OPCPSDT, in the context of communication clarity and to tighten communications, believes that a common naming convention for interface BES Facilities and Elements of neighboring entities reduces response time and enhances situational awareness.</b></p> <p>(7) R1, part 1.5, Alpha-numeric Clarifiers. As discussed above, this sub-part is unnecessary and should be struck from the standard. A registered entity should be able to define its own communication protocol and the associated internal controls to ensure effective operating communications.</p> <p><b>Response: The requirement does allow an entity to develop its own protocol around alpha numeric clarifiers. The protocol should be uniform, clear and must increase reliability.</b></p> <p>(8) R1, part 1.6 and 1.7, Three-part Communication. As discussed above, these sub-parts are unnecessary and should be struck from the standard. There are more effective methods of communicating besides using three-part communication. Multi-modal communication utilizes several mediums (verbal, visual and other sensory cues) to enhance communication and may include three-part, but could also include</p>

Organization	Yes or No	Question 2 Comment
		<p>other equally efficient and effective methods to communicate, such as through interactive smart phones and other remote communication devices. Different strategies may be needed for different utilities and their communication objectives. For instance, strategies and tools may be combined to meet a wide variety of communication functions to meet the needs of system operations, including utilizing new technologies to improve human performance when performing day-to-day operations. Three-part communications could be a part of the protocol, but three-part should not be in the requirements because it limits utilities from employing other methodologies are equally effective or superior to three-part communications. A registered entity should be able to define its own communication protocol and the associated internal controls to ensure effective operating communications.</p> <p><b>Response: There is flexibility in R1 and R2 to incorporate technology that will enhance human performance. The SDT believes that until technology that can absolutely ensure that communications are clear and accurate proliferate throughout the BES; most Operating Instructions will be exchanged human to human. Three part communication is an effective tool that is used to increase the accuracy of verbal communication.</b></p> <p>(9) R1, part 1.8 and 1.9, One-way Burst Messaging. As discussed above, these sub-parts are unnecessary and should be struck from the standard. An all call communication that is incorrect has just a big of an impact on reliability than one that is not understood. Also, the SDT does not take into account all the various technologies that exist in the marketplace; what does an entity do for an “all call conference call” where there are numerous humans on the line? R1, part 1.6 refers to “two party, person to person” and part 1.8 is limited to “one-way” communication. There is a gap here - does the SDT intend to exclude the “all call conference call” from the requirements?</p> <p><b>Response: The “all call conference call” would not be subject to the requirements if it only deals with general information. If the “all call conference call” results in “Operating Instructions” those “Operating Instructions” would be subject to an</b></p>

Organization	Yes or No	Question 2 Comment
		<p><b>entity's communication protocols.</b></p> <p>What happens if there are errors in the sent message? Would internal controls be the remedy?</p> <p>If the all call communication is not understood and there was no request for clarification, would an internal control resolve this issue or would the auditor find a PV? Also, sub-part 1.8 only requires confirmation from one party, even though the burst message could have been a request for eight parties to reply. There is a gap in reliability if all parties do not reply in that example. These sub-parts need additional information for clarity. Same comment for DP/GOP below.</p> <p><b>Response: The standard only addresses communication protocols not human performance errors. Managing human performance is the responsibility of the entity's organization. The protocols exist to prevent the error.</b></p> <p><b>The reason to have one recipient reply is to confirm to the issuer that the Operating Instruction was sent. There are many diverse technologies over many communication medias that the entity can reflect their in their own documented communication protocols.</b></p> <p>(10) R2 should allow DPs and GOPs to define their own communications protocols based on internal policies and procedures and there should not be a requirement to include sub-parts 2.1 and 2.2.</p> <p><b>Response: Our responses above address this comment.</b></p> <p>(11) R2, part 2.1, Receiving a Three-part Communication. As discussed above, this sub-part is unnecessary and should be struck from the standard. There are more effective methods of communicating besides using three-part communication. Multi-modal communication utilizes several mediums (verbal, visual and other sensory cues) to enhance communication and may include three-part, but could also include other equally efficient and effective methods to communicate, such as through interactive smart phones and other remote communication devices. Different</p>

Organization	Yes or No	Question 2 Comment
		<p>strategies may be needed for different utilities and their communication objectives. For instance, strategies and tools may be combined to meet a wide variety of communication functions to meet the needs of system operations, including utilizing new technologies to improve human performance when performing day-to-day operations. Three-part communications could be a part of the protocol, but three-part should not be in the requirements because it limits utilities from employing other methodologies are equally effective or superior to three-part communications. A registered entity should be able to define its own communication protocol and the associated internal controls to ensure effective operating communications.</p> <p><b>Response: If those technologies exist and are acquired and provide absolute clarity among Functional Entities, the entity can employ them and redraft their protocol to reflect more effective functionality of the system.</b></p> <p>(12) R2, part 2.2, One-way burst messaging for DP and GOP. As discussed above, this sub-part is unnecessary and should be struck from the standard. Please see (9) above for more discussion of one way burst messaging.</p> <p><b>Response: The SDTs response to (9) covers the SDTs position. The SDT thanks you for a very comprehensive review.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
<p>SERC OC Standards Review Group</p>	<p>No</p>	<p>We support having a documented communications protocol, but do not support prescriptive elements. Below is an example of language we could support. All the subparts of R1 and R2 need to be rewritten along these lines.</p> <p>”R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall have documented communication protocols for Operating Instructions that address the following:</p> <p>....1.6. The conditions under which an issuer is expected to:</p> <ul style="list-style-type: none"> <li>o Confirm that the response from the recipient of the Operating Instruction was</li> </ul>

Organization	Yes or No	Question 2 Comment
		accurate, or o Reissue the Operating Instruction to resolve a misunderstanding.”
<p><b>Response: The OPCPSDT thanks you for your comments. The SDT replaced the word incorporate” with “include” which we believe is consistent with your suggestion.</b></p>		
Duke Energy	No	<p>1) In Requirements R1 and R2, the word “incorporate” should be changed to “address”. This change will align the language of the requirements with the language of the RSAW, providing flexibility to entities in how their communications protocols will be structured. This change will also help to alleviate some of the following concerns.</p> <p><b>Response: The SDT replaced the word incorporate” with “include” which we believe is consistent with your suggestion.</b></p> <p>2) In R1.1, 1.3 and 1.4 clarify the meaning of the phrase “between functional entities”. Do these sub-requirements apply to Operating Instructions between individuals located in the same functional entity?</p> <p><b>Response: As stated in the sub requirements they apply to Operating Instructions between functional entities. They do not apply to individuals in the same functional entity. The SDT recommends that they should, but will leave that to the entity.</b></p> <p>3) In R1.7, the phrase “repeat, restate, rephrase, or recapitulate” seems excessive. Suggest changing to just “repeat or rephrase”.</p> <p><b>Response: The SDT used the same language as COM-002-3 because the industry believes the different language of the requirements originally used in each standard was confusing.</b></p> <p>4) R1.6 and 1.7 are describing 3-part communication. Suggest combining 1.6 and 1.75) R1.8 and 1.9 address “one-way burst messaging”, but it’s not clear whether, or to what extent, 3-part communication is required.</p>

Organization	Yes or No	Question 2 Comment
		<p>Response: Part 1.6 and 1.7 are separate in order to fairly divide the requirements for the issuer and for the receiver.</p> <p>“All calls” or “one-way burst messaging” are not subject to three part communication because the SDT believes that it would be impractical for many receiving parties to acknowledge receipt and repeat the message. The acknowledgement by one or more receiving entity is a confirmation to the issuer that the all call message went out.</p>
<p>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</p>		
<p>Dominion</p>	<p>No</p>	<p>We appreciate the SDT’s response to stakeholder comments in the previous draft, but still find sub-requirements R1.1, R1.2, R1.3 to be too prescriptive. We agree that these entities should mutually agree on</p> <ul style="list-style-type: none"> <li>(1) the language they will use to communicate and</li> <li>(2) the manner in which they will communicate time (24 hour, zone, zulu, etc).</li> </ul> <p>Response: The SAR and 2003 Blackout Report specified consistent and uniform communication protocols. The parts to the requirement serve as a frame to sustain a basis for standardizing the type of protocol the entity should develop.</p> <p>Below are some additional suggestions;</p> <p>Dominion also disagrees that Distribution Provider is listed as an Applicable Entity. Distribution Provider load is not considered part of a BES Element or Facility. The SDT response to an earlier comment on this issue was that the SDT is aware of some DPs that operate BES equipment. If that is the case, then the standard should be applicable to only those DPs that operate BES Elements or Facilities - not the numerous DPs who do not.</p> <p>Response: The SDT also is aware that many DPs are receivers of load shedding instructions which are Operating Instructions. They are subject to communication</p>

		<p><b>protocols on that basis.</b></p> <p>R2 should be clarified to read as follows: “For Distribution Providers, and Generator Operators that operate BES Elements shall have documented communication protocols for Operating Instructions that incorporate the following:</p> <p>R1.1 - In lieu of the English language requirement, Dominion recommends defining the use of a common language for verbal or written communications for Operation Instruction(s). English shall be the default language unless otherwise mandated by the entity’s document or mandated by law, regulation, or mutual agreement.</p> <p><b>Response: The SDT believes that the language of the requirement allows the entity to develop the communication protocol in terms that are more effective for reliability in the entity’s own operating environment.</b></p> <p>Under R.1.2 and R1.1.3, It doesn’t matter (and may not be exactly clear) in what time zone the action will occur. A transmission line can cross time zone boundaries. What is important is that all operators involved have the same understanding of what is going to happen, when, and who is to do it. If a TOP that operates in two different time zones already has a protocol that establishes one zone or the other as their time standard, will they have to revise their protocol and use two different zones?</p> <p><b>Response: No, as long as they include that time zone in the Operating Instruction.</b></p> <p>Dominion would recommend the following language to read as follows: Clock-time communications shall be precise and include the following:</p> <p>Use of a 24-hour format or 12-hour format with AM/PM designation</p> <p>Specification of the applicable Time-Zone when multiple Time-Zones are covered</p> <p>Specification of Standard Time or Daylight Saving Time for Operating Instructions that will be implemented beyond the present/current day</p> <p><b>Response: The SDT believes that the standard permits an entity to develop the</b></p>

		<p>language you suggested above in the entity’s protocols required in R1 and R2.</p> <p>The only concern the SDT has with what you suggest is the use of a 12-hour format with AM/PM designation. The SDT believes this can easily be misunderstood creating increased potential for a miscommunication The SDT knows of no entity that uses an ‘am – pm’ term for critical communications.</p> <p>R1.4 - This requirement is overly redundant as it is also covered by TOP-002 R18.</p> <p><b>Response: The SDT believes neighboring entities should have a clear understanding of each other’s BES Elements and BES Facilities to increase situational awareness and to shorten response time. TOP-002 R18 will be eliminated by the RTOSDT.</b></p> <p>Under R.1.8 and R.1.9, Dominion feels this would create an unnecessary burden to document routine notifications that rely on a burst messaging system and do not have any effect on the Bulk Power System. A one-way burst messaging system is typically used to quickly inform/advise. It is designed as one-way to provide efficiency and should not be used for Operating Instructions. It would be much simpler to state that, “for the communications of Operating Instructions (regardless of the technology employed)( apply above comments), the message must be repeated or confirmed by the recipient, and validated by the sender.” This approach focuses on “Operating Instructions” and not the technology employed. The requirement as currently written does not allow for exceptions due to routine or informative communications. (Example: NERC Alerts to the Industry based are based on severity level and do not always require receipt of message by the Registered Entity).</p> <p><b>Response: The SDT does not want to document routine notifications. The requirement requires develop communication protocols for “Operating Instructions.”</b></p> <p><b>It would be unwieldy for a large number of all call recipients to all respond to an all call “Operating Instruction” which is why the SDT called for confirmation from at</b></p>

Organization	Yes or No	Question 2 Comment
		<p>least one (if an entity wants more it can request it) recipient to ensure transmission of the “Operating Instruction.”</p> <p>R2 - Why not simply include DP and GOP in R1?</p> <p>R4 - Why not simply include DP and GOP in R3?</p> <p><b>Response: The SDT points out that R1 and R3 are applicable to entities that issue and receive Operating Instructions, while R2 and R4 are applicable to entities that only receive Operating Instructions. The SDT did not want to stipulate that entities that do not issue Operating Instructions must have protocols that only apply to issuance.</b></p> <p>Dominion also recommends defining 3 Part Communication in the NERC glossary as a result of this standard to help eliminate confusion. We need to have the System Operator maintain a focus on reliability through precise communications without unduly adding unnecessary requirements that create a burden without adding value. The mandatory use of Time-Zones for parties communicating within the same Time-Zone, or the use of Standard/Daylight Savings Time for current day activities adds an administrative burden with no value to reliability.</p> <p><b>Response: The SDT defined three part communication in draft 1 of the standard. Industry comment was universally against the definition.</b></p> <p><b>The addition of accurate time information is not administrative. The time element of an Operating Instruction is critical and should be clearly conveyed and understood so it does not result in a compromised system due to an unexpected operation at the wrong time.</b></p>
<p><b>Response: The OPCPSDT thanks you for your comments. Please see our responses above.</b></p>		
Hydro One	No	<p>ï€ We request clarification on the rationale for limiting communication protocol requirements for DPs and GOPs. We believe that the communication protocol should contain essentially the same elements regardless of the function an entity performs.</p>
